That Bruno thought of the Copernican sun in the context of the magic of Ficino’s *De Vita Coelitus Comparanda* is indicated in the report of his lectures at Oxford, in which he is said to have repeated the Ficinian text while also maintaining the opinion of Copernicus. This report fits in with passages in Bruno’s works in which the sun appears in a magical context, and particularly with his

defense of the Copernican opinion against the Oxford doctors in *La cena de le ceneri*, where he describes Copernicus as “only a mathematician” who has not seen the true meaning of his discovery as he, Bruno, has seen it. When a speaker in these dialogues asks what is the cause of Earth’s movement around the sun, the reply is an almost verbatim quotation from *Corpus Hermeticum* XII, in which Hermes Trismegistus explains that the energy of life is movement and that therefore nothing in the living universe is immobile, not even Earth. Bruno applied these words as an explanation of the cause of Earth’s movement around the sun. The Copernican opinion had, for him, confirmed the “Egyptian” philosophy of universal animation. He also repeated from the same Hermetic treatise one of his most characteristic doctrines: that there is no death in nature, only change.

Thus Bruno’s acceptance of Copernican heliocentricity did not rest on Copernicus’s mathematical arguments. On the contrary, Copernicus as a mere mathematician was despised by him as a superficial person who had not understood the true meaning of his discovery. Bruno was always “against” mathematics. Although he had some acquaintance with the scientific basis of the Copernican theory, it was not on mathematical grounds that Bruno defended Copernicanism from reactionary Aristotelians, but on animist and magical grounds. In fact, when the passages on the sun in the different works are compared, it becomes apparent that Copernican heliocentricity was for Bruno a kind of celestial portent of the approaching return of “Egyptian” philosophy and religion. “Aristotelianism” was for Bruno a symbol of all that is dead and dry—or, as he would say, “pedantic”—in philosophy and religion (the two were for him inseparable), compared with his own philosophy and religion—in contact, so he believed, with living, divine nature.

## NEW VISION OF THE UNIVERSE

The essence of the Hermetic writings is that they give a religious impulse toward the world. It is within the setting of the universe, not through any divine mediator, that the Hermetic gnostic achieves his religious experience. The closest parallel to Bruno’s imaginative leap upward through the spheres is the description in the Hermetic *Pimander* of how man “leant across the armature of the spheres, having broken through their envelopes.” So did Bruno break through the spheres in his ecstatic ascent to his new vision of the universe. The immediate source of his vision of infinite space and innumerable inhabited worlds was Lucretius’s poem *De Rerum Natura*, but Bruno transformed the Epicurean and Lucretian notions

by imparting animation to the innumerable worlds—a feature totally absent from Lucretius’s universe—and by imparting the function of being an image of the infinite divinity to the infinite. The godless universe of Lucretius turns in the Brunian vision into a vast extension of Hermetic gnosis; in order to receive this within himself, man, that “great miracle,” as he is defined in the *Asclepius*, must expand himself infinitely. The *magnum miraculum est homo* passage is quoted from Trismegistus near the beginning of the *De Immenso* as a preliminary to the new vision of the world to be revealed in the poem.

This infinitely extended All was nevertheless One. The unity of the All in the One is a basic theme of the Hermetic writings and also of Bruno’s. The unity of the All in the One is for Bruno “a most solid foundation for the truths and secrets of nature. For you must know that it is by one and the same ladder that nature descends to the production of things and the intellect ascends to the knowledge of them; and that the one and the other proceeds from unity and returns to unity” (*De la causa, principio e uno*, in *Dialoghi italiani*, edited by Giovanni Aquilecchia, p. 329).

This is the philosophy conducive to magic—that the magus can depend on the ladders of occult sympathies running through all nature. When this philosophy is not only a magic but also a religion, it becomes the religion of the Hermetic pseudo Egyptians who, as Bruno says in the *Spaccio de la bestia trionfante*, “with magic and divine rites ... ascended to the height of the divinity by that same scale of nature by which the divinity descends to the smallest things by the communication of itself” (*Dialoghi italiani*, p. 777). Bruno’s philosophy and religion are one and the same, and both are Hermetic. This accounts for the main aspects of his philosophy, his panpsychism and his monism, and also for the magic and the references to magical practices with which his books are filled.

Like all Renaissance magi, Bruno was a syncretist and drew from his vast reading many philosophies which had accreted to the Hermetic core. The pre-Socratics, Plato and the Platonists, the Scholastics (Bruno revered Thomas Aquinas as a great magus), Nicholas of Cusa—all were incorporated into the central theme. Bruno’s chief textbook of magic was Agrippa’s *De Occulta Philosophia*; he also used the conjuring books of Trithemius and admired, and perhaps practiced, the Paracelsian medicine.

## ART OF MEMORY

The side of Bruno’s work that he regarded as the most important was the intensive training of the imagination

in his occult arts of memory. In this he was continuing a Renaissance tradition that also had its roots in the Hermetic revival, for the religious experience of the Hermetic gnostic consisted in reflecting the universe within his own mind or memory. The Hermeticist believed himself capable of this achievement because he believed that man's *mens* is in itself divine and therefore able to reflect the divine mind behind the universe. In Bruno, the cultivation of world-reflecting magic memory becomes the technique for achieving the personality of a magus, and of one who believes himself to be the leader of a religious movement. Strange though these beliefs and practices are, Bruno had some profound things to say in his books on memory concerning the imagination, which he made the sole cognitive power (sweeping away the divisions of the Aristotelian faculty psychology by a kind of inner anti-Aristotelianism), and on the mental image in relation to the psychology of the "inspired" personality. When the magical aspect (which includes such practices as the use of talismans or images of the stars as mental images) is discounted or allowed for, Bruno's bold explorations of the inner world may become important to the historian of psychology.

#### SIGNIFICANCE AND INFLUENCE

The emphasis on the Hermetic and magical side of Bruno's thinking does not discredit his significant contribution to the history of thought. He exemplifies the Hermetic religious impulse as a motive force behind the imaginative formulation of new cosmologies. From within his own frame of reference, this highly gifted man made guesses that may have given hints to seventeenth-century thinkers. A notable example is his transformation of the Democritean atoms, of which he read in Lucretius, into magically animated monads; this may well have been a stage leading to Leibniz's monadology, and there are other curious links between Bruno and Leibniz. Although Bruno was obviously not in the line leading to the mathematical advances, his extraordinary vision of an immensely expanded universe, ruled by the laws of magical animism, may be said to prefigure, on the Hermetic plane, the new cosmology of the seventeenth century. Drained of its animism, with the laws of inertia and gravity substituted for the psychic life of nature as the principle of movement, Bruno's universe would turn into something like the universe of Isaac Newton, moving under laws placed in it by a God who is not a magician but a mathematician and a mechanic. In the Hermetic phase of European thought, which was the immediate prelude to the seventeenth-century revolution, Bruno is

an outstanding figure. Regarding him in this light, the old legend of the martyrdom of the advanced thinker becomes almost true again, although not in the old sense.

## BRUNSCHVICG, LÉON (1869–1944)

Léon Brunschvicg, the French idealist philosopher, was born in Paris and educated at the Lycée Condorcet, where he won awards in science as well as in classics and philosophy. He received both the *licence ès lettres* and the *licence*

*ès sciences* from l'École Normale Supérieure in 1891. During the following nine years he taught philosophy at lycées in Lorient, Tours, and Rouen. His doctoral thesis, *La modalité du jugement*, was presented to the Sorbonne in 1897, and published in Paris the same year. In 1900 he returned to Paris to teach at his old lycée, later moving to the Lycée Henri IV and l'École Normale de Sèvres. In 1909 he was named professor of general philosophy at the Sorbonne. Except for the period 1914–1918, when he served in the armed forces auxiliary and as adviser to the government on educational reform, Brunschvicg held various chairs at the Sorbonne until the German occupation of Paris in 1940. He then settled in Aix-en-Provence and finally in Aix-les-Bains until his death.

Brunschvicg was one of the founders of the *Revue de Métaphysique et de Morale* (1893) and of the Société française de Philosophie (1901). In 1919 he was elected to the Académie des Sciences morales et politiques, serving as president in 1932. A prolific writer, editor of Blaise Pascal, and well known for his studies of René Descartes and Benedict de Spinoza, Brunschvicg was a major figure in French intellectual life for nearly half a century.

The "critical idealism" of Brunschvicg primarily recalls Immanuel Kant's analysis of the conditions of knowledge, but Brunschvicg's method was historical rather than deductive: He wished to grasp the mind's activity as it has revealed itself in the history of mathematics, science, and philosophy. In general perspective, Brunschvicg may be seen as heir to two currents in nineteenth-century French philosophy: the tradition of epistemological idealism descending through Charles Renouvier from Kant and Antoine Cournot, and the metaphysical idealism of Maine de Biran, Félix Ravaisson, Jules Lachelier, and Jules Lagneau.

For Brunschvicg, the goal of philosophical reflection was to disclose intellectual activity tending toward self-consciousness as it progressively constitutes knowledge. He therefore frequently characterized history as "the progress of consciousness" (*le progrès de la conscience*). The double meaning of this expression—the progress of conscience as well as of consciousness—also suggests the moral dimension of Brunschvicg's monistic idealism. Viewed subjectively, the process is a conversion from naive acceptance of reality as external to an affirmation of the primacy of the mind as it provides intelligibility. Brunschvicg equated this with recognition of the supremacy of intelligence in a moral sense, which is to say that self-knowledge progresses toward refinement of conscience and moral autonomy. According to Brunschvicg, personal conversion reflects an absolute historical devel-

opment undetermined in form but immanently oriented toward spiritual values (of which Unity is highest) and self-knowledge on the part of humanity as a whole.

The critique of this process, Brunschvicg insisted, cannot depend on a priori assumptions, nor can it hope to specify categories or functions of thought; such analysis would only falsify the mind's essential freedom and inventiveness. The emphasis on creative spontaneity suggests a relationship with Henri Bergson that Brunschvicg was proud to acknowledge, but not to the extent that he wished to embrace Bergson's intuitionism. Although Brunschvicg preferred the general terms *mind* and *intelligence to thought* and *reason*, this does not imply a commitment to nonintellectual modes of understanding. At the heart of his work lay studies in the history of science and of mathematics. Brunschvicg regarded scientific progress not only as a triumph of intellect but also as an exemplification of humankind's growing self-understanding. In this way, he defended a moral or "spiritual" conception of science as opposed to positivistic and conventionalistic theories. In his view, the truth of a theory essentially depends on the creative vitality of the mind as it assimilates what is given as nonmental, and as it judges, in turn, the adequacy of this synthesis.

In *La modalité du jugement*, Brunschvicg attempted to delineate the mind's developing accord with being or the real in a theory that classifies judgments according to the forms of "internality" and "externality." Brunschvicg took judgment, rather than the concept or category, as fundamental because he saw it as a synthesizing or unifying act, combining form and content. The form of "externality" was interpreted (evidently following Johann Gottlieb Fichte) as a restraining activity that the mind imposes dialectically on its own creative freedom or "internality."

In *Les étapes de la philosophie mathématique* (Paris, 1912), Brunschvicg examined the highest expression of "internality," mathematical judgment, which he regarded as uniquely appropriate to science because it is at once a free creation—not to be justified through physical interpretation—yet inseparable from experience in its origin and in its "collaborative" task of assimilating being to the understanding. Brunschvicg substantiated this theme in *L'expérience humaine et la causalité physique* (Paris, 1922), which further revealed an implicit dualism and a reluctance to employ categories or principles of analysis, however provisional.

Brunschvicg's last decade was marked by works of a religious nature, following a comprehensive history of philosophy, *Le progrès de la conscience dans la philosophie*

*occidentale* (Paris, 1927), intended to bear witness to humanity's spiritual unification. "Our destiny is to tend toward unity." Religious value apparently attaches to a particular dimension of the "progress of consciousness": The assimilation of being to consciousness insofar as the process is regarded as immanently guided by the value of unity. In this assimilation, humankind moves toward self-identification through the communion of shared intelligence.

Although it appears likely that Brunschvicg felt a moral or spiritual ideal to be predominant in his career, he will perhaps be best remembered as an interpreter of the French philosophical tradition and as a leading spokesman for the life of reason and the value of science.

## BUBER, MARTIN (1878–1965)

Martin Buber, the religious existentialist, was born in Vienna and spent his childhood in L'viv, Galicia, at the

home of his grandfather Solomon Buber, a businessman and well-known scholar of rabbinic literature. From 1896 to 1900 he studied philosophy and art history at the universities of Vienna, Leipzig, Berlin, and Zürich. He was early active in the Zionist movement, especially in its cultural and religious aspects, and in 1901 he was appointed editor of the Zionist journal *Die Welt*. Instrumental in the founding of the publishing house Jüdischer Verlag in 1902, in 1916 he founded the German Jewish monthly *Der Jude*, which, until it ceased publication in 1924, was the most respected and literate voice of German Jewry. From 1924 until 1933 Buber was professor of the philosophy of Jewish religion and ethics at Frankfurt-am-Main University, the only chair in Jewish religion at any German university. In 1920 he and Franz Rosenzweig founded the Freies Jüdisches Lehrhaus, an institute for adult Jewish education; and with Adolf Hitler's coming to power Buber devoted his energy to strengthening the religious and spiritual resources of German Jewry in the face of the unprecedented challenge posed to it. Buber continued in the institute until 1938, when he left for Palestine, where he was appointed professor of sociology of religion at the Hebrew University. With Y. L. Magnes he led the Yihud movement, devoted to Arab-Jewish understanding and to the creation of a binational state. In 1952 and 1957 he traveled widely in the United States, lecturing at many universities and to diverse student groups. While his acceptance of various German awards in the postwar period led to criticism from some Jewish quarters, Buber remained steadfast in his encouragement of those German circles that realize the magnitude of the Nazi crimes against the Jews and seem genuinely repentant. He died in Jerusalem.

Buber's basic insight, an insight that runs through all of his work and that determines his approach to everything he touches, is the realization that there is a basic difference between relating to a thing or to an object that I observe, and to a person or a "Thou" that addresses me and to whose address I respond. In its simplest form, this is the difference between the way people usually relate to inanimate things on the one hand and to living persons on the other. Inanimate objects are watched, while persons are spoken to. However, the distinction cannot be drawn simply on this basis. A person as well as an inanimate thing can be viewed as a thing, or, in Buber's terminology, an "It." Whenever we take an "objective" attitude toward a person, whenever we view him as part of the world and caught in its causal chain, we are in an "I-It" relationship, even though the object happens to be a person. The "I-It" relationship is characterized by the fact that it is not a genuine relationship because it does not

take place between the I and the It. When another person is an It to me, I am, first of all, perfectly alone. I gaze at him and view him from every possible direction, I observe his place in the scheme of things, and I find elements that he has in common with other persons and things and elements that distinguish him from them. All of this, however, takes place within me; I am judging and I am observing, and the external world is relevant only to the extent that it enters my being.

It is otherwise in the "I-Thou" relationship. Here the relationship is genuine because it is between me and the Thou that addresses me. This Thou is no longer one thing among other things of the universe; the whole universe is seen in the light of the Thou, and not the Thou in the light of the universe. In fact, it is not only the object in the "I-Thou" relationship that is different from that in the "I-It" situation; the very "I" is different in the two situations. There is no "I" that sometimes relates to a Thou and sometimes to an It. If that were the case, both the It and the Thou would be objects that float into the I's field of vision and then out of it, leaving the I essentially unaffected. Instead, Buber argues, the I of the I-It is a different I from that of the I-Thou because it is not the I as such that has preeminent reality, but the relations I-It and I-Thou. The I appears and is shaped only in the context of some relationship with either an It or a Thou and can never be viewed independently of such a relationship.

Buber further states that the I-It relationship is maintained with only part of ourselves in it. There is always a part of us that remains outside the relationship and views it from some vantage point. In the I-Thou relationship, on the other hand, our whole being must be involved. Should I attempt to hold back any part of myself, I will find myself in an I-It situation because there will be a part of me that is not participant but spectator, a sure sign of the I-It. This means that the I-Thou relationship carries with it much greater risk than the I-It, since there is no withholding of the self possible, as in the I-It. In the I-It situation the part of the self that remains outside the relationship cannot be injured by the other party because he cannot reach it. In the I-Thou relationship there is no such security because the Thou of the I is addressed with the whole of the I, and any response elicited necessarily pertains to this total I. In the I-Thou relationship, therefore, everything possible is risked without any defensive position being left to which the I can withdraw in case of need. However, this is not the only risk involved in the I-Thou situation. The Thou who is addressed cannot be viewed in the context of any causal, deterministic framework. He must be encountered in the

full freedom of his otherness, an otherness that is addressed and that responds in the total unpredictability of human freedom. The moment the responses of the Thou are calculated, the moment the I asks itself what impression its speech and being will make on the Thou, it is relating to an It instead of to a Thou.

Because of this, Buber tells us, there is never a present for the I–It relationship, only a past. This is so because all objective knowledge about a human being is knowledge about his past, of what he has been rather than of what he is. If the present moment is to have genuine novelty, if it is not perfectly determined by the events of the past, then it must be possible for the present to produce a break with the past in the form of a response that could not have been calculated from a knowledge of the past. In the I–Thou relationship we are therefore genuinely living in the present because we are prepared for any and every response to our address, the expected as well as the unexpected—and it is this that constitutes genuine listening. The difference between a pseudo listening and a genuine listening is that while in the pseudo listening situation the listener pretends to listen, what he hears is determined by his past knowledge of the person he is listening to or by his theories concerning the nature of man. Genuine listening does not know ahead of time what it will hear; in the full uniqueness of the present it listens to the speech of the other without filtering what it hears through the screen of its own prejudgments. The purpose of genuine listening is therefore really to hear what the other is saying, constantly being aware that he is saying something that is new and not just a revelation of his nature, which the hearer has already identified and which is fixed as the other’s “psychology.”

It is in the religious context that the significance of Buber’s distinctions emerges most clearly. In contrast to much of mysticism that aims at the obliteration of the abyss between the self and the Absolute in the ecstasy of mystical union, the essence of biblical religion, as conceived by Buber, is the dialogue between man and God in which each is the other’s Thou. “The extended lines of relations meet in the eternal Thou,” writes Buber in the opening sentence of the final portion of *I and Thou*. Life is an endless transition from the Thou to the It and back to the Thou. Sooner or later, the time comes when even the most cherished Thou recedes, when a spiritual tiredness overtakes the most authentic I–Thou relationship and turns it into the I–It. There is one Thou, argues Buber, who by his very nature cannot become an It. A man may hate God and curse him, he may turn away from him when the suffering of human destiny becomes

unbearable; but no man can reduce God to the status of a thing who no longer addresses him and who becomes one object among others in the world for him. Much of traditional theology, for Buber, errs in dealing with God as if he could be turned into an It. Time and again, however, man turns from thinking about God to addressing him, and it is then that he communicates with the living God, as distinct from merely giving intellectual assent to the God of the philosophers. This is true even when the Absolute Thou addressed is not called God. “But when he, too, who abhors the name, and believes himself to be godless, gives his whole being to addressing the Thou of his life as a Thou that cannot be limited by another, he addresses God.”

In the course of his long career Buber applied these basic ideas to a diversity of fields. In a number of works devoted to biblical interpretation, he developed in detail his view of the Bible as the record of Israel’s dialogue with God. He wrote a definitive work on the relation between Christian and Jewish faith. In this work he distinguishes between the Jewish *emunah* and the Greek *pistis*, the former of which, according to Buber, is faith in the sense of trust while the latter is faith in the sense of belief in the truth of propositions. Jewish faith, as found in the Hebrew Bible, is Israel’s trust in the faithfulness of God’s word as that word is spoken in dialogue. The faith of the New Testament, particularly in its Pauline version, is heavily influenced by Greek philosophical elements that are reflected in the emphasis on salvation as resulting from belief in the truth of propositions concerning the divinity and resurrection of Jesus. In Paul, Buber thus sees a profound departure from the Hebrew biblical spirit, a departure that is no more than partial and implicit in the Gospels.

In his later years Buber’s interest to some extent turned to psychotherapy, in which he emphasized the necessity for the therapist not to hide behind the teachings of his school and not to forget that psychotherapy is above all dialogue in which therapist and patient speak to each other. When seen in this light, the therapist encounters the patient for the individual he is and is ready for the unexpected that the theoretical categories of his discipline do not prepare him for. Similarly, in the field of social philosophy Buber contrasted Marxist socialism, with its centralized control and allegiance to impersonal and inevitable historical forces, with the socialism of the community in which the authenticity of the I–Thou relationship is the foundation on which the living community is built and to which it must return, again and again, for renewal. In the Israeli kibbutz Buber saw an exempli-

fictionation of the communal or “Utopian” socialism for which he stands.

### **Bibliography**

Publication of the collected works of Buber in German, *Werke*, was begun in 1962 by Kösel Verlag in Munich. The first three volumes appeared by 1964.

Buber's most important work is *Ich und Du* (Berlin, 1922), translated by R. G. Smith as *I and Thou* (New York: Scribners, 1958). *Die Frage an den Einzelnen* (Berlin: Schocken, 1936), translated by R. G. Smith in *Between Man and Man* (Boston: Beacon, 1955), develops the basic themes in some detail. *Der Glaube der Propheten* (Zürich, 1950), translated from the Hebrew by C. Witton-Davies as *The Prophetic Faith* (New York: Macmillan, 1949), is one of Buber's best biblical studies. *Paths in Utopia*, translated by R. F. C. Hull (London: Routledge, 1949), is Buber's study of social philosophy; *Two Types of Faith*, translated by N. P. Goldhawk (London: Routledge and Paul, 1951) is his study of Judaism and Christianity.

Other writings that have been translated into English are *Eclipse of God; Studies in the Relation between Religion and Philosophy*, translated by Maurice Friedman et al. (New York: Harper, 1952) and *Bilder von Gut und Bose* (Cologne, 1952), translated by R. G. Smith and M. Bullock as *Good and Evil; Two Interpretations* (New York: Scribners, 1953); *Pointing the Way: Collected Essays*, translated and edited by Maurice Friedman (New York: Harper, 1957); and *Martin Buber, Writings*, a selection edited and introduced by Will Herberg (New York: Meridian, 1956).

Maurice Friedman's *Martin Buber: The Life of Dialogue* (Chicago: University of Chicago Press, 1955; New York: Harper, 1960) is a thorough secondary work with an extensive bibliography.

## BUCKLE, HENRY THOMAS (1821–1862)

Henry Thomas Buckle, the English historian, was the son of a prosperous businessman who left him sufficient money to devote his life to private study and writing. In common with a number of other dominant thinkers of the Victorian age—such as J. S. Mill, Herbert Spencer, and T. H. Huxley—he was largely self-educated. As he was a delicate child, it was thought unwise for him to undertake work involving much intellectual effort or strain, with the consequence that he was (as he put it) “never much tormented with what is called Education, but allowed to pursue my own way undisturbed ... whatever I may be supposed to know I taught myself.” Thus he was taken from school, at his own request, at the age of fourteen, never went to a university, and conducted his subsequent reading and research (which by any standards were vast) in the absence of all external supervision or direction. Buckle expressed no regret at not having gone to Oxford or Cambridge, considering both universities to be in a contemptible condition and believing himself in any case to be equipped with natural aptitudes and talents that more than compensated for the lack of a rigorous academic training. Certainly his gifts were far from negligible. He had an excellent memory, he could express himself both in writing and in conversation with great fluency and eloquence, and he was a first-class linguist (by the age of thirty he could read eighteen foreign languages and speak six); he possessed, moreover, an immense capacity for methodical work, together with an intense intellectual curiosity and a meticulous eye for detail.

Buckle led a comparatively uneventful life, his energies being to a large extent absorbed by the ambitious project of writing a history of civilization, to which, from his early twenties, he had decided to dedicate his career. But though the preparation of this enormous enterprise always remained his chief concern, he was not without other interests. He was, for example, a brilliant chess player, achieving an international reputation; he traveled widely, in Europe and beyond; and by the end of his life he had established a wide circle of acquaintances, including William Makepeace Thackeray, Charles Kingsley, Charles Darwin, and John Stuart Mill. For Mill in particular he had the highest admiration, and in 1859 he wrote a long review in *Fraser's Magazine* praising Mill's essay “On Liberty”—a review that created considerable stir at the time, since in it Buckle drew public attention to the fantastic sentence of twenty-one months' imprisonment recently passed upon a man for inscribing on a gate

words offensive to Christianity. Although Buckle never married, he liked feminine society and secretly kept a mistress; when, after his death, the truth ultimately leaked out, it caused consternation and dismay among some of his close friends and relatives.

### SIGNIFICANCE OF THE HISTORY

Buckle died at the age of forty while touring the Middle East. Only two volumes of his *History of Civilisation in England* had appeared, and these represented no more than an introduction to the vast work he had envisaged writing. Yet they had been sufficient to achieve for their author sensational fame, not merely in his own country but also throughout Europe and in the United States; Darwin applauded the work's brilliance and originality; and an influential American writer, Theodore Parker, attributed to it an importance in the history of thought comparable to that of Francis Bacon's *Novum Organum*. Buckle's reputation has since suffered a heavy decline, and many of the claims made on behalf of his work at the time of its publication seem grotesquely exaggerated today. Even so, what he wrote represents (as Henry Sidgwick pointed out) the first major attempt on the part of a thinker versed in the tradition of British empiricism and inductivism to enter the treacherous field of historical speculation, and to offer a comprehensive and detailed theory of historical development of the type that previously only Continental philosophers had ventured to provide. For this reason alone it preserves a certain interest and is still worth studying.

### BUCKLE'S INTENTIONS

Buckle was fully aware of what had been done by some of his predecessors in Germany and France; and references to their works, particularly to those of Johann Gottfried Herder and Auguste Comte, are to be found scattered among the footnotes that abound throughout his own volumes. Like Herder, he was eager to connect the facts of human history with the conditions imposed by different forms of natural and geographical environment; like Comte, he wished to present the course of history as exemplifying a fundamental pattern of progress and improvement. But he rejected the tendency to revere past ages, and to exalt imagination at the expense of rational and scientific modes of thinking, that often manifested itself in Herder's writings; and he equally distrusted the strain of aprioristic dogmatism and respect for authoritarian methods of social control that he detected in Comte's historical system, calling the latter's theory of government "monstrously and obviously impracticable."

Buckle's allegiance lay chiefly with the ideals set out by English radicals and Utilitarians early in the nineteenth century, and it was these that finally determined the valuations embodied in his conception of social and historical progress.

### HUMAN ACTIONS SUBJECT TO LAWS

Early in his book Buckle raised the question, "Are the actions of men, and therefore of societies, governed by fixed laws, or are they the result either of chance or of supernatural interference?" He supposed these possibilities to represent exhaustive alternatives, and argued that either variety of the latter hypothesis was plainly unacceptable.

So far as the theory of supernatural interference was concerned, this, together with the associated theological doctrine of predestination, must remain a "barren hypothesis," since no conceivable experience could count for or against its truth. On the other hand, the view that what occurs in the realm of human affairs is the product of chance was demonstrably false; it had, however, been given an aura of spurious respectability by metaphysical philosophers who had carried the principle in question over into the sphere of individual human psychology. There it emerged as the famous doctrine of free will, according to which a mysterious, undetermined power of free choice is held to be directly vouched for by the evidence of the introspective consciousness. But in Buckle's opinion it is precisely such blind reliance upon the findings of individual introspection that has been the besetting sin of "metaphysicians," leading them to construct their impressive-looking, though nonetheless mutually incompatible, systems in accordance with a radically mistaken procedure.

By contrast, in order to achieve a realistic conception of the nature and workings of the human psyche it is necessary to adopt an external and general view of human behavior analogous to that taken by natural scientists in the investigation of nonhuman phenomena: From this altered standpoint it can indeed be seen that the actions of men are subject to regularities as strict and mathematically exact as those that operate in other spheres of scientific inquiry. As a conclusive demonstration of his thesis, Buckle cited the evidence afforded by large-scale statistical surveys concerning the numbers of marriages contracted, and of murders and suicides committed, in particular countries and towns during successive years; the relative uniformity of the results obtained would, he held, be unintelligible on any other assumption than that

there are certain social laws capable of keeping the level constant.

When discussing this topic, Buckle on occasions fell into confusions; he did not, for example, always distinguish between the necessary and the sufficient conditions of an occurrence, and was prone to disregard the difference between causal laws and statistical frequencies. In consequence he sometimes interpreted the statistical data in a misleading way, suggesting that the sole effective determinant of individual actions was what he called “the general condition of society.” He also spoke as if the mere existence of a proportional average, observed to hold over a period of time, necessitated, with a kind of irresistible momentum, the commission of a particular number of crimes in any given year. As a result, a picture is presented wherein human beings appear as the helpless victims of social forces over which they can exert no effective influence or control—a conclusion in no way entailed by the premises from which Buckle initially proceeded.

#### ORIGIN AND DEVELOPMENT OF CIVILIZATION

Be this as it may, it is noticeable that when Buckle approached his principal theme—the genesis and development of civilization—he made little further reference to precise numerical regularities or frequencies; although he still spoke of “laws,” it was the broad, indeterminate, and sometimes very doubtful generalizations concerning the factors influencing the evolution of human societies that he chiefly appealed to in providing his explanations. Thus, the fundamental agents of social growth were deemed to be material or, to use his term, “physical,” and were listed as being “Climate, Food, Soil, and the General Aspect of Nature.” These—and not, as some previous theorists had alleged, innate racial characteristics or mysterious “national spirits”—originally determine the divergent forms of organization and progress achieved by different historical cultures.

**FOOD SUPPLY AND CIVILIZATION.** Buckle believed that the degree of civilization attained by a society depended upon its wealth and upon the manner in which this wealth was distributed; such factors were in turn dependent upon the population of the country concerned, and the size of the population was determined by its food supply. In countries where cheap food was plentiful, the population increased in a fashion that led to the labor market’s becoming overstocked; as a consequence there was unemployment and also poverty, since there is an inevitable tendency in societies where there is a sur-

plus of labor for laborers to be underpaid and for immense economic inequalities to develop. He cited such examples as Egypt, Peru, Mexico, and India, where riches were concentrated in very few hands and where the vast majority of the inhabitants lived in a miserable and depressed condition: “Among nations subjected to these conditions, the people have counted for nothing, they have had no voice in the management of the state, no control over the wealth their own industry created.”

**EUROPEAN CONDITIONS IDEAL.** Buckle, in fact, considered that the ideal conditions for the development of civilization were to be found in Europe. Here the food supply was not so abundant as to lead to overpopulation, nor was it so scanty as to make the accumulation of wealth and the enjoyment of leisure (on which intellectual progress depends) impossible. Here, also, the temperate climate was favorable to enterprise and the energetic exploitation of natural resources; moreover, the aspect that nature presented to human beings was of a less extreme and unpredictable character than in other parts of the world. Thus, men did not regard it with superstitious awe as a terrifying and insuperable power, but saw it instead as something that obeys regular laws and is therefore capable of being tamed and utilized for their purposes. It followed (he thought) that Europe could be distinguished from all other centers of human society by the circumstance that it was human rather than natural or physical factors that had determined the course taken by its history and progress. Man was here the master of nature, and consequently the key to the development of European culture lay in the influence exercised by “the laws of the human mind.”

#### KNOWLEDGE DETERMINED DIRECTION OF CULTURE

It might be expected that Buckle would go on to state what these laws of the human mind were, using them to explain patterns of social change in European history in a fashion comparable to that suggested by Mill in Book VI of his *System of Logic* when he spoke of the possibility of deriving principles governing historical development from the “ultimate” laws of human psychology. Buckle can scarcely be said, however, to have adopted this procedure, perhaps because he believed that the psychological and historical data available at his time were insufficient to make it practicable. Instead, he contented himself mainly with trying to show that it was the advance and diffusion of knowledge, and particularly of scientific knowledge, that had in the last analysis given European

history its characteristic overall direction—"the progress Europe has made from barbarism to civilization is entirely due to its intellectual activity."

Other factors were considered, but only to be ruled out. Thus Buckle claimed—as if (rather surprisingly) it were a self-evident truth—that men's moral opinions had remained essentially unaltered for thousands of years: How then could these have been responsible for the far-reaching transformations that had overtaken European nations like England and France in the course of their historical evolution? Likewise, he rejected the claims of religion, literature, and government to be "prime movers of human affairs." Acceptance of a particular religious creed is a symptom rather than a cause of the condition in which a given society finds itself. The literature of a country merely reflects and serves to fix the degree of civilization already attained; it does not initiate further achievement. So far as the influence of government is concerned, Buckle maintained that the rulers of a nation were only "creatures of the age, never its creators." Enlightened legislation occurs only as a consequence of the pressure exerted by changes in the climate of opinion, these being due in the first instance to the efforts of "bold and able thinkers" who belong to the intellectual, and not the governing, classes; nor will such legislation be effective unless the ground has been prepared for it and "the age is ripe."

### POLITICAL THOUGHT

Writing very much as an exponent of the principles of laissez-faire radicalism, Buckle displayed an intense distrust of governmental interference and "protectionism," which tended to be identified in his mind with the suppression of free opinion and free trade. Accordingly, he argued that most beneficial legislation is negative in character, taking the form of repealing the bad enactments passed by earlier generations; and, generally speaking, he restricted the legitimate functions of government to such things as the maintenance of order and the preservation of public health. The moral drawn is that the ineluctable laws of historical development should be permitted to take their course freely and without impediment; unlike many other philosophers of history, Buckle did not try to combine a doctrine of historical inevitability with a comprehensive positive program of political action and social reconstruction.

### BUCKLE'S SIGNIFICANCE

There is much that is intellectually naive in Buckle's theory of history, and it is easy to find inconsistencies and

non sequiturs among his arguments; Leslie Stephen's gibe that Buckle's "mental fibre was always rather soft" is not wholly beside the mark. His uncritical use of vague abstractions like "intellectual progress" and the "spirit of a time" often led him into treating vacuous truisms as significant discoveries, and the collectivist conception of historical change that pervades much of his work contrasts oddly with the influence he ascribes to individual scientists and economists in promoting social advance. Nevertheless, the impact of his ideas upon his age was undeniably great, and his criticisms of previous and current historiography were not without important long-term effects. Like Karl Marx, though with far less insight and imagination, he helped to turn the eyes of historians away from the political surface of events, making them look more closely at the technological and economic realities of human life that lie beneath; at the same time, through his determinism, he provided a corrective to the tendency toward excessive moralizing that his contemporaries exhibited in their treatment of the past. And, by enlarging the perspective of historical study to include cultures and societies remote in time or space from his own, he made a definite, if limited, contribution to widening the horizons and counteracting the provincialism of future students of human affairs.

## BUDDE, JOHANN FRANZ

(1667–1729)

The German philosopher, theologian, and historian Johann Franz Budde, or Buddeus, was born in Anklam, Pomerania. He entered the University of Wittenberg in 1685 and became an assistant there in 1689. Budde was appointed professor of moral philosophy at Halle in 1693, full professor of theology at Jena in 1705, and church councilor at Gotha in 1715. Although he insisted on his independence from all schools and considered himself an eclectic, he was close to Pietist thought and to the philosophy of Christian Thomasius, his colleague at Halle.

Budde's most significant work in theoretical philosophy was his *Institutiones Philosophiae Eclecticae* (2 Teile, Halle, 1703). In the first section, in which he expounded his logical doctrines and the intent was chiefly methodological, the influences of John Locke and Thomasius are apparent. Budde derived error from original sin and prescribed means for restoring the "good health" of the mind. He regarded ontology as a part of logic and as consisting in a simple explanation of basic metaphysical terms. According to Budde, these terms had a purely instrumental value because he refused to confer upon metaphysics the rank of independent and universal science. Rather, he interpreted it as the science of the most general nouns used in theology and philosophy.

In the second section of the *Institutiones*, Budde first discussed natural philosophy in a phenomenistic manner, holding that we cannot know the real nature of things, but only their appearances and effects. He attempted to reconcile the physical animism or spiritualism typical of Pietist natural philosophy with mechanism. He frequently appealed to the Bible and gave an important place to final causes. At the end of this section he discussed spirits and God, whose existence he demonstrated by rational proofs.

In practical philosophy (*Elementae Philosophiae Practicae*, Halle, 1697) Budde followed Hugo Grotius, Samuel von Pufendorf, and Thomasius. He completely denied human freedom, referring the possibility of good actions to God's grace and restricting accountability to a narrow and extrinsic sphere of material liberty. He devoted much space to discussions of practical psychology and prudence, for he believed that such practical psychology was a better means than abstract instruction of healing the human will from sin. However, revelation is essential to this healing process.

As with the Pietists, practical philosophy is central to Budde's thought. He also agreed with the Pietists in stressing the will's independence of the intellect, in his emphasis on psychology in practical philosophy and on spiritualism in cosmology, and in the importance he placed on revelation. However, Budde was much more systematic than Thomasius, who was likewise very much influenced by Pietism. Budde joined the Pietists in their fight against Christian Wolff, and in 1723 he wrote a pamphlet attacking Wolff.

Although in practical philosophy Budde agreed with the Pietists, in theology he tried to reconcile the views of orthodoxy and Pietism. Because he held that man has an original religious impulse, he gave an important position to natural religion. He presented cosmological, physicotheological, and historical proofs of God's existence, and tried to refute atheism by argument.

Budde was one of the most learned men of his time. His writings on the history of Jewish philosophy (*Introductio ad Philosophiam Ebraeorum*, Halle, 1707), on general history of philosophy, and on the history of theology (*Historia Theologiae Dogmaticae et Moralis*, Frankfurt, 1725) were excellent in their time and are still valuable for the information they contain.

## BUDDHISM

Buddhism derives its name from the Sanskrit word *buddha* (awakened, wise, or learned), which was one of the many epithets given to Siddhārtha Gautama (c. 563–c.

483 BCE), the founder of the set of theories and practices that are now called Buddhism. Traditional accounts of Gautama's life are more inspirational and hagiographical than historical in nature, and any attempt to extract a historical record from them is likely to prove frustrating, although the attempts of such authors as Hans Wolfgang Schumann (1989) and Michael Carrithers (1983) to find a credible story of Gautama's life are well worth reading.

According to traditional accounts Gautama left his wife and newborn child to seek his liberation from suffering and followed various teachers who ultimately failed to satisfy his needs. He then set out on his own and found the liberation he sought through meditation and self-discipline. At first disinclined to teach, because he felt his teachings would appeal to few people, he finally decided to tell others what he had discovered. Soon after his death, his disciples met and repeated all they could remember being taught by him, and these recollections were committed to memory. All the rules he had set down for the community of his disciples were collectively known as the *vinaya*. The collections of his other teachings on good character, contemplative exercises, and the theory behind them were known collectively as *sutras*. The *vinaya* and *sutras* supposedly collected shortly after Gautama's death became a closed canon for some Buddhists; other Buddhists eventually accepted as canonical a large corpus of other literature. Although there is a great deal of agreement between what is found in both the closed and extended canon, there is also a good deal of difference. In what follows, an attempt will be made to make note of where there is agreement and where there is divergence of opinion among Buddhists.

The epithet Buddha emphasizes Gautama's claim to have awakened, as if from a slumber, to seeing things as they really are. Another epithet commonly given to Gautama is *jina* (conqueror), which emphasizes his having overcome his internal enemies, the passions. In much of the Buddhist canonical literature Gautama refers to himself as *Tathāgata*, an epithet that has been explained in various ways by later Buddhists; one possible interpretation is that the *Tathāgata* knew the truth or understood things as they really are. Traditionally being a follower of Buddhism consists in going for refuge to the Buddha, the *dharma* (the goal of Buddhist practice), and the *sangha* (the community of virtuous people). In what follows, each of these terms will be discussed with reference to how understanding of them has changed down through the centuries.

## THE BUDDHA

During the time when the Buddha Gautama was alive, going for refuge to him meant becoming his disciple and agreeing to follow his teachings and the rules of his community. After his death, however, the meaning of going for refuge to the Buddha changed. The action came to mean making an effort to cultivate in oneself the virtues associated with buddhas in general, for the claim attributed to Gautama was that he was the most recent in a series of buddhas, all of whom had taught the same thing to the people of their generation and all of whom had had the same set of virtues. The set of virtues associated with buddhas are called the factors of awakening. Canonical texts always talk about thirty-seven mental factors that are required for awakening. These factors are the sum of seven different lists of wholesome mental qualities. When all redundant terms are eliminated from these lists, however, there are just ten different factors: wisdom, courage, concentration, mindfulness, inner joy, mental and emotional flexibility, equanimity, faith, right resolve, and good moral habit.

Wisdom is explained as understanding and discrimination, and it includes awareness of one's own body and mind, reflections on the inevitability of death, and recognition that all complex beings change and therefore are not worth striving for. Wisdom also entails realizing that no one is fully in control of one's own body, mind, or personality and that therefore these things are not really one's self, and none of them really belongs to anyone; rather, everything that comes into being is an essentially impersonal event. Because the factors conditioning any one event are beyond reckoning, no one can be in control of all of them; since it is possible to alter some of the conditions in one's life, however, discipline and practice are not in vain, however difficult they may be.

Courage consists in having the resolve and energy to do virtuous and wholesome actions that benefit oneself and others. Concentration is defined as having a healthy mentality focused on a single topic at a time. Mindfulness is defined as good memory, and especially recalling the importance of virtue in all situations and remembering to cultivate it. Inner joy is described as zest and enthusiasm for being virtuous and helping others do the same. Flexibility is defined as workability and pliability of one's thoughts and emotions, which are the opposite of intellectual and emotional rigidity, obsessiveness, and the tendency to pass judgment on others. Equanimity means indifference to pleasure and pain, and impartiality with respect to people. Faith is described as conviction and trust in the teachings of the Buddha as a result of experi-

encing the initial benefits of practicing what he taught. Right resolve consists in the resolve to cultivate wholesome and to eliminate unwholesome mental states. Good moral habit includes thinking, speaking, and acting in ways that conduce to the well-being of oneself and others, and it manifests in earning one's livelihood in ways that minimize damage done to other living beings and to their environment.

Even though it was considered possible for a person to cultivate all these virtues while living an ordinary family life, it was said to be much easier to succeed if one first renounced family life and lived alone or in a community of like-minded friends. For this reason, the ideal setting for Buddhist practice has nearly always been seen to be a monastery.

For the first several centuries in the history of Buddhism, the Buddha was venerated as a man who had been born an ordinary man and who had struggled to discover and eliminate the root causes of rebirth and its inevitable difficulties. After a long life of teaching others how to eliminate their own causes of rebirth, he died a serene death, knowing that he had helped many others to become awakened and liberated from their suffering. He likened himself to a physician who had studied the symptoms of a disease, made a diagnosis, and prescribed a course of treatment. Like a physician, he could only encourage his patients to take the necessary course of treatment; he could not do their work for them. After some five or six centuries, however, this description of the Buddha's career lost its appeal to many people, and new movements evolved within Buddhism that portrayed buddhas in importantly different ways.

One of the most influential of these new portrayals of what a buddha is appeared in a Mahayana Buddhist text, probably written in the second or third century CE, known as the Sutra of the White Lotus of the True Doctrine, commonly referred to simply as the Lotus Sutra. This complex and highly polemical text repudiates the earlier Buddhist doctrine that the Buddha was born, lived, and died, never again to be reborn in any form anywhere. The Lotus Sutra puts forth the view that all particular buddhas, including Gautama, are but manifestations of an eternal entity known as Shakyamuni Buddha, who is omniscient, omnipotent, and perfectly compassionate but otherwise beyond human comprehension. Shakyamuni Buddha, being transcendent, can be known to human beings only by taking human form. All the buddhas of the past, present, and future should be known to be manifestations of this cosmic buddha.

Moreover, the most important teaching of all these manifestations of Shakyamuni Buddha is that every sentient being in the universe is destined to become a fully enlightened buddha, for all beings, and not just those who are known now to be buddhas, are essentially one with the enlightened mind called Shakyamuni Buddha. Announcing this message in various ways, the Lotus Sutra pronounces harsh condemnation of those who teach that the goal of Buddhism is to attain nirvana, if that is understood as the end of the cycle of rebirths. Monks who teach that Buddha Gautama was an ordinary human being who achieved extraordinary things and that he eventually died never to be reborn, are denounced in the Lotus Sutra as charlatans and pseudo-Buddhists whose teachings could prevent others from attaining perfect enlightenment. The immediate destiny of such monks is a long and painful stay in hell, but even they, assures the Lotus Sutra, will eventually realize full and perfect enlightenment.

A second sort of new portrayal of a buddha figure is found in a genre of literature that has come to be known as Pure Land sutras. The term *pure land* is a translation of a Chinese expression that is in turn an interpretation of a Sanskrit expression that means "a happy land" or "a land of ease." The principal innovation in this genre of sutras is the notion that there are buddhas who attained buddhahood only after amassing an incalculable amount of merit through austerities and good works. After attaining buddhahood these buddhas used their merit to create realms in which all the distractions posed by hardships are unknown so that inhabitants of these realms could devote all their energy to cultivating virtue and striving for nirvana. People from our burdensome world are said to be able to gain entry in one of these realms of ease simply by calling on the name of the buddha who created it.

By far the most popular of these buddhas was Amitābha, whose name means "he whose light is unmeasured." The invocation of Amitābha's name became one of the most common practices among Buddhists in East Asia. In some places, and especially in Japan, some followers of the Lotus Sutra held Amitābha (Amida in Japanese) practitioners in contempt because of the latter's reluctance to regard Amitābha as a manifestation of Shakyamuni. The various views that Buddhists have held on what exactly the nature of a buddha is have been described in detail and with considerable philosophical refinement by Paul J. Griffiths in *On Being Buddha: The Classical Doctrine of Buddhahood* (1994).

## THE DHARMA

Those who followed the closed canon of Buddhist texts teach that the dharma to which a Buddhist goes for refuge is nirvana, which is seen as the ultimate goal of all Buddhist practice and theory. Ultimately, nirvana is defined as the cessation of rebirth after one's present life comes to an end, but the term also refers to the cessation of psychological afflictions while one is still alive. The principal afflictions discussed in Buddhist teachings are greed, hatred, and delusion. Greed is understood broadly as all craving for material possessions, physical and psychological comforts, physical and psychological pleasures, celebrity, approval, and anything that one regards as desirable. Hatred includes irritation, resistance, anger, and any sort of aversion or wish for dissociation from something. Delusion includes any sort of misunderstanding or misjudgment that could result in unsuccessful action.

These three root afflictions are said to be the principal causes of all distress and discontent. Eliminating them results in being content with whatever situation that may present itself. In many Buddhist texts it is said that contentment arises not merely from the absence of afflictions but from the presence of their opposites. Thus, when greed is replaced by generosity, hatred by love, and delusion by wisdom, then one is truly contented, and when these replacements are permanent, then one has attained liberation from suffering in this life.

While the dharma to which a Buddhist goes for refuge is nirvana, the term *dharma* also refers to virtue in general and to anything, such as teachings and practices, that help one to cultivate virtue. The most important of the virtues is wisdom, since it plays a role in the cultivation of all other virtues. Wisdom is said to arise in three stages. The first stage consists in learning what wise people have said and how they have acted. The second consists in reflecting on what one has learned through study. And the third consists in realizing in one's own life what the wise people of the past have discussed. This third stage includes a variety of contemplative exercises that have been designed to improve a person's mentality. For each of the virtues discussed earlier as those associated with buddhas, specific meditative exercises have been designed.

In canonical Buddhism the attainment of nirvana is usually described as incremental. The analogy most frequently used is that one's mentality is like gold ore, which is a mixture of precious metal and various unwanted minerals. Refining ore to get pure gold requires a gradual elimination of the unwanted minerals through various

chemical and mechanical processes. Similarly, one's mentality is a mixture of wholesome and unwholesome habits that mute the effectiveness of the wholesome traits. Refining one's character requires the gradual elimination of bad habits through study, reflection, and cultivation, and the culmination of all this refinement is nirvana. In some forms of later Buddhism, however, a different conception of nirvana arose. In this new view nirvana, understood not as the mere absence of affliction but as the constant presence of tranquillity, lucidity, and bliss, is the fundamental nature of all things. Thus, all consciousness is fundamentally calm, lucid, and contented, and the so-called afflictions are temporary obscurations of that lucidity. The most common analogy for this view of nirvana is that of the sun, which shines all the time but is sometimes temporarily obscured by clouds. In this view of consciousness the condition of enlightenment is innate and permanent.

Nirvana, therefore, is not the cessation of existence but the realization that consciousness is beginningless and endless and constantly tranquil. In some forms of this doctrine it is said that ultimately there is only one mind, namely, the Buddha's; all apparently individual minds are but episodes of this one Buddha mind. Since the Buddha's mind can only be wholesome, it follows that all those who are apparently individuals are also wholesome, and all mental events, including those called unwholesome or vicious are in fact virtuous. Delusion, then consists in a failure to recognize the innate wholesomeness of all existence. In some formulations of this position delusion consists in thinking in terms of oppositions at all; thus, it is delusional to think in terms of the contrast between virtue and vice, wholesomeness and unwholesomeness, delusion and wisdom, liberation and bondage, buddha and ordinary person, and so forth.

## THE SANGHA

The word *sangha* means "community." The community to which a Buddhist goes for refuge is the so-called noble (*ārya-sangha*) community, which comprises all those who have reached one of the four stages leading to and including nirvana. Since it is seen as nearly impossible for an individual to make the necessary refinements in character that lead to nirvana, it is considered almost essential for one to keep company with virtuous people who will understand and support one's resolve to cultivate virtue and attain nirvana. In the hopes of providing a community of people dedicated to virtue and thus providing a noble sangha, the Buddha Gautama founded a monastic community as well as a community of lay disciples. Ide-

ally, these formal communities should include enough members of the noble community to be of benefit to the world as a whole, and so to help these visible communities not only to be virtuous but also to be seen to be virtuous, Gautama set forth various sets of precepts. Lay disciples are expected to refrain from five harmful activities: killing, stealing, sexual transgressions, lying, and intoxication. Novitiates seeking ordination into the monastic community are expected to refrain from ten harmful actions and thoughts: the first four of the five expected of the laity plus refraining from harsh speech, gossip, frivolous speech, attachment, anger, and false views. Monastics are expected to observe more than two hundred vows, depending on which monastic order they belong to. Four of those vows are considered so important that any person who breaks them is dismissed from the monastic order for the rest of his or her life; these four vows are refraining from killing a human being, from the theft of anything that human beings regard as property, from any kind of sexual intercourse with any other being living or dead, and from making false claims about one's spiritual attainments.

The study of the monastic rules (*vinaya*) suggests that the principal purposes of the monastic community were twofold: to provide an ideal environment for individuals to cultivate virtue and to serve as a visible community that demonstrated to the society at large that a life of material simplicity dedicated to the cultivation of virtue and self-contentment is far more satisfactory than a life of material acquisitiveness dedicated to seeking possessions and the approval of others. Taking monastic vows is not seen as necessary for the attainment of nirvana, but is seen rather as the taking on of responsibilities to be of service to society at large. Some scholastics favor the view, based on passages in canonical texts, that, while it is not necessary to be a monastic to attain nirvana, it is impossible for anyone who has attained nirvana to remain a lay person for more than one day. Others, however, take the view that renunciation is itself a kind of attachment and that a liberated person would be able to live a normal lay life without becoming either attached to or afraid of its pleasures. This latter attitude can be found in many Buddhist movements within East Asia, and especially Japan, and in some movements in Tibetan Buddhism.

The Buddha Gautama made several observations about statecraft. He made these observations by telling stories, which often had a satirical edge. One attitude that emerges in these stories is that government came into human society at a time when morality was breaking

down, and, since government was devised by people living in morally broken down cultures, government is itself as likely to exacerbate the problem as alleviate it. That notwithstanding, those whose task is to provide governance can sometimes benefit by the counsel of wise people, although not all governments are equally willing to heed wise counsel.

In his own instructions to kings, Gautama urged them, above all else, to provide to all citizens the means to earn their own livelihoods. This could best be achieved by taxing the wealthy and distributing resources to the needy and by educating the unskilled. A king who fails to do these things, said Gautama, is most likely to bring about a society in which the poor have no means of living other than stealing from the wealthy, and the wealthy then hire guardians to protect their wealth. This situation in turn leads to both the thieves and the mercenary guardians arming themselves to protect themselves against one another, and it leads to the wealthy seeking ever stricter laws and more severe punishments, until nearly everyone is armed and afraid. As fear and suspicion grows, violence increases, and as violence increases, the life expectancy of people declines. Eventually, said Gautama, the decline will become so dramatic that most people will die only shortly after reaching the age of reproduction, and children will be left to raise themselves, and morality will become so rare that people will have forgotten even the word *virtue*, let alone know what it stands for. All this can be avoided by governments that are more interested in protecting the poor than in serving the wealthy, said Gautama, and such governments are more likely to occur if wise and learned men and women remain actively engaged in society. Even monks who have renounced the family life should take an interest in providing wise counsel to governments. The ideal of providing selfless service to one's society was particularly emphasized in some of the Mahayana sutras that came into prominence in the first several centuries CE.

The entire philosophy of Buddhism is traditionally summarized in a formula called the four noble truths: (1) all forms of existence involve some suffering, (2) suffering arises because of unrealistic expectations, (3) suffering can be eliminated by eliminating unrealistic expectations, and (4) there is a method to be followed to eliminate them. The method itself is summarized in the formula: "Do what is beneficial, avoid doing harm, and keep the mind pure."

CHAN AND ZEN  
DGE-LUGS  
HUA YAN  
MADHYMAKA  
YOGĀCĀRA

### CHAN AND ZEN

Zen is the latest Japanese development in a number of similar Buddhist traditions known as “Chan” in China, “Seon” in Korea, and “Thiền” in Vietnam, all supposedly having origins in India. It is an open question whether there is a sufficient degree of homogeneity to label this multifarious tradition “Chan” or “Zen.” A safe alternative would be to treat each of the regional variations as distinct traditions, or even to handle the numerous subcategories in each of the East Asian regions as not necessarily

connected with each other, at least not in the sense of a historical continuity.

One factor that makes these traditions especially complex is their emergence at various times and in various settings without being submitted to a central religious authority that would have defined their identity, their doctrine, and their structure as a religious unity. The multifarious nature of these traditions does not mean that Zen institutions did not participate in games of power; they certainly did. The vicissitudes of these lineages result from influences that cannot be reduced to institutional fates and orientations, or to their connections with political contingencies. This is because in most cases their self-proclaimed criterion for religious authority was spiritual realization.

### ZEN AGENDAS

While there is no unified tradition, this presentation uses the word “Zen” to indicate the fuzzy field comprising all the traditions mentioned above. For the sake of simplicity it is convenient to adopt the widely used Japanese pronunciation, except when referring to a specific geographical area.

Since many Zen lineages and most Buddhist schools seek to disentangle the nexus of our projections even on sacred matters, awareness of our own hermeneutic circle is a necessary prerequisite for examining the possible confluence between traditional and philosophical approaches to Zen. One of the sources that have shaped the understanding of Zen is the agendas of those who first introduced it to Western audiences and readers. Fortunately, a growing array of sharp studies is now available to facilitate the deconstruction and subsequent understanding of how missionaries, apologists, and romantics contributed to fabricating a contemporary notion of Zen. These studies examine why, for instance, Daisetsu Suzuki (1870–1966) in his own time and context chose to present Zen as the finest product of “Japanese spirituality,” and even to claim, “As I conceive it, Zen is the ultimate fact of all philosophy and religion” (1961, p. 268). Works by Faure, McRae, and Wright provide an insightful analysis of this crucial dimension and some of the necessary antidotes. One of their achievements is to reveal contradictions inherent in the discourse of apologists who denied their own historicity.

### THE CONCEPT OF MEDITATION

“Zen,” pronounced “Chan” in Chinese, has an interesting linguistic background. The Chinese compound “channa”

was used to phonetically transcribe the Pali terms “jhāna” or “jhān,” from which it derives. “Dhyāna” being the Sanskrit equivalent for the Pali “jhāna,” popularizers often simplify this etymology by explaining “chan” as if it derived from “dhyāna.” Eventually “chan,” the first half of the compound, became a word in itself, retaining some of its original implications.

Indian Buddhists chiefly used the word “jhāna” as a generic term for meditation (singular) and as a technical term for particular meditative states (plural). For example, in the *Sutta-nipāta*, “jhāna” is always singular, and appears in contexts such as “One who possesses the strength of wisdom, born of the moral precepts and restraints, who is tranquil in mind and delights in *meditation*, who is mindful, free from attachment, free from fallowness of mind and the Intoxicants, is called a sage by the wise” (I.12, verse 212; Saddhātissa 1985, p. 22; italics added). Here “meditation” is apt, as long as the English word is understood in its pseudo-etymological sense of (*re*)centering the mind, an approximation for one of the definitions of “jhāna,” the mind “focused on one point” (Skt., *ekagrātā*), and as long as the object of this concentration is understood as being nondiscursive.

The technical usage of “jhānas” in the plural refers to particular meditative states, often translated as “absorptions” or “enstasis.” In the Buddhist canon the *jhānas* gradually were systematized to include four stages. An even more elaborate description of these stages in the canon mentions how the practitioner moves through these four successive absorptions, then enters the four “attainments” (*samāpattis*), which culminate in the ninth stage with cessation of perception and feeling (Pali, *saññāvedayitanirodha*), better known as the attainment of cessation (Skt., *nirodha-samāpatti*).

Despite the importance of these nine meditative states, no Indian Buddhist school ever focused exclusively on the practice of absorptions or the practice of meditation. Such developments in the Chinese cultural sphere constitute a huge semantic leap and a complete reinterpretation of the tradition. (See Griffiths [1993] on *jhānas*.)

## THE EMERGENCE OF CHAN AS A DISTINCT MOVEMENT

Details of how Buddhism entered East Asia around the first century CE and gradually spread within the Chinese cultural sphere remain surprisingly ill defined. At a certain point after the end of this transmission process, in some circles, meditation ceased to be considered as only

one of the three central methods of self-cultivation (morality, concentration, and insight), and groups of practitioners started identifying themselves as adepts of Chan, understood in the sense of “meditation.”

When did Chan Buddhism emerge as a distinct movement, historically and geographically? Here again caution is required, because those seeing themselves as spokespersons for Chan largely defined their identity in contrast with other Buddhist schools prevalent at that time. If we adopt the scheme proposed by John McRae (2003), this phase began with proto-Chan around 500–600 CE, which coincides with the growing success of the rival Tiantai lineage. In the following stage,

at the beginning of the eighth century the self-described successors to this community exploded on the national scene, and in the process they described themselves as an identifiable religious movement using the lineage model. No matter how diverse and multifaceted the Chan movement was at this point in time, no matter how fuzzy the boundaries were between it and other realms of Chinese religious life, from this point onward Chan had achieved a significant level of sectarian identity. (McRae, p. 121)

Yet in the Chinese context it would be inaccurate to speak of members of an organized “meditation school.” Even in the ninth century, Guifeng Zongmi (780–841) included in his *Chan yuan zhu quanji duxu* (Preface to the collected writings on the source of Chan) a list of Chan teachers that included the Tiantai patriarch Zhiyi (538–597) (Gregory 1991). Put differently, “Chan” in the sense of meditation never exclusively belonged to the Chan School. For one, it was part of the Buddhist legacy and played a central role in the practice of other lineages, such as the Tiantai School. For another, as John McRae convincingly argues, the organization of Chinese Buddhism never implied a sectarian-centered administrative system. Despite a heavy bureaucratic apparatus and the government-sponsored system that emerged in the Song dynasty (960–1279), monasteries were mostly administered in rotation by the different lineages, and in China sectarian borders never became as strictly delimited as in premodern and modern Japan.

Sectarian developments took a further turn in Japan during the Tokugawa period (1600–1867) and evolved into the present rigid structures at the beginning of the Meiji era (1868–1912). Yet even in Japan until at least the eighteenth century, the expression “Chanzong” (Jpn., *Zenshū*) meant the Chan lineage or the principle of Chan,

and by no means referred to the Zen School or any institutionalized sect. The latter connotation emerged in Japan after the Meiji Restoration, when in 1872 the new Ministry of Doctrine created a single school labeled “Zen sect” including the Rinzai, Sōtō, and Ōbaku denominations. However, this forceful attempt to centralize Buddhist institutions met such strong clerical opposition that the government quickly stepped back. It recognized the independence of the Rinzai and Sōtō schools in 1874, then the autonomy of the Ōbaku School in 1876.

Geographically, where did Chan emerge? Saying that it emerged in the Chinese cultural sphere, rather than in China, aims at avoiding the easy assumption that China (understood as the modern nation) was the one and only cradle in which the Chan tradition grew up. This point is still controversial. Thich Nhất Hanh, a leading representative of the Vietnamese Thiên tradition, claims that the area of Jiaozhou, a colony of southern China from 111 BCE until 939 CE corresponding to present Thuan Thanh in northern Vietnam, saw the emergence of such a tradition at a much earlier time. He argues, “Buddhism was first introduced to Vietnam from India via the sea trade routes, beginning around the first century CE. Many people think that Buddhism came to Vietnam through China, but in fact it arrived first in Vietnam from India and was subsequently introduced to southern China from Vietnam” (2001, p. 4). This idea is appealing, especially to demonstrate that the Vietnamese Buddhist tradition is older than that of its former Chinese oppressor, but the additional suggestion that Buddhism was introduced to southern Vietnam (Cham at the time) from Jiaozhou seems difficult to support. Further, Nhất Hanh’s presenting Kuong Tang Hôi (Chin., Kang Senghui; d. 280) as the first patriarch of Zen in Vietnam is questionable. Unfortunately, Nhất Hanh’s ambiguous use of the word “Zen” and his agenda to demonstrate the antiquity of the Vietnamese tradition with a candidate who predates proto-Chan by more than two centuries undermine the reliability of his perspective. (For a balanced evaluation of the construction of Vietnamese orthodoxy, see Nguyen’s [1997] study.)

### THE PHILOSOPHICAL TURN

There are contemporary philosophers who seek inspiration in Zen or Buddhism, and there is a philosophical endeavor within the tradition itself. The former case stretches from intellectual curiosity to the commitment of Nishida Kitarō (1870–1945), whose Zen practice laid the basis for a major part of his philosophical work. Yet even Nishida claimed not to formulate a Zen philosophy,

but only to reflect about universal philosophical problems in the light of his personal understanding of Buddhism. In any case, Nishida and his philosophical project must be appreciated within the context of the Japanese industrial revolution. Japan was engaged in importing techniques and culture from the West at a high pitch. To compensate for the unbalance caused by this new situation, Japanese thinkers sought to highlight the unique aspects of Japanese culture. This desire found expression in efforts by Nishida and others to demonstrate the compatibility or superiority of the alleged intuitive thinking of the East with the newly imported Western rationality. (About Nishida, see Heisig 2001, Tremblay 2000, and Yusa 2002.)

The philosophical articulation of the tradition itself is a more difficult subject. The difficulty stems not from the alleged absence of rationality in the East Asian Buddhist tradition, a critique overcome by the dedicated work of a generation of scholars. Rather, it results from the absence of a clear demarcation between Zen philosophy and Buddhist philosophy. Kasulis observes that, despite a huge literary production, traditional Zen accounts fail to justify their distrust of verbal distinctions or dualistic formulations “simply because it has already been offered by traditions influential in the very emergence of Zen Buddhism” (1981, p. 15).

Here the term “Zen Buddhism” (an oddity coined by Daisetsu Suzuki that should be avoided in scholarly contexts) confirms the suspicion that philosophical questioning cannot be confined to Zen alone, insofar as it constitutes a subcategory of the Buddhist worldview. Past attempts to present Zen as special and unfathomable are now better understood for what they were: sectarian proselytism. This observation does not prevent one from asking whether, after all, the Zen traditions have a specific philosophical perspective to offer.

### SPECIFIC FEATURES OF ZEN

The quest to discover the real self, with subtle nuances sometimes labeled as “awakening” or “seeing one’s true nature,” is not a uniquely Zen feature. No doubt it occupies a central place in the Zen traditions, but it equally belongs to all Buddhist schools, being precisely what makes them Buddhist. Yet each particular Buddhist approach definitely displays a different flavor. For instance, Pure Land practices favor more devotional attitudes, while the Tiantai or Huayan traditions tend to privilege a more intellectual apprehension of the Buddhist path. Specific features can be found in the style of teaching, in the emphasis on particular types of cultiva-

tion, in doctrinal formulations or textual records, in rituals, and in the interactions with distinctive sociohistorical contexts. The use of vernacular Chinese in the Chan literature to duplicate or imagine dialogical encounters also constitutes a new genre.

The special features of the various Zen lineages did not pop up from some transhistorical background. Scholars now unanimously agree that most of the above-mentioned features of Chan in the Chinese cultural sphere found some degree of standardization during the Song dynasty. This means that even philosophical investigations into the spiritual cultivation of past Zen practitioners must cope with a double-layered filter: the construction of various orthodoxies in the Song period and subsequent interpretations by proselytes, which often replicate or amplify the first filter. With this in mind, let us nevertheless examine an example of a Zen teaching device where the context appears sufficiently explicit.

#### CRITICAL VOICE OR RHETORICAL DEVICE

One of the literary monuments of the Song period is the *Blue Cliff Record* (*Biyān lu*), a Chan anthology with commentaries by Yuanwu Keqin (1063–1135). The following dialog is provided here as it stands as case 11 in the *Hundred Cases of Xuedou*, the older version containing only the cases selected by Xuedou Zhongxian (980–1052) without Yuanwu’s commentary:

Huangbo taught the Sangha saying: “All of you people are stuffing yourselves with wine lees! If you keep roaming this way, how could this [decisive] moment [ever] arrive? Are you aware of the *nonexistence* of Chan teachers in the whole Tang China?”

At this point, a monk emerged [from the crowd] saying: “What about all those [like you] who help students and lead the Sangha?”

Huangbo.—“I didn’t say Chan is nonexistent, only teachers are nonexistent.” (Taishō 48: 151b11–b16)

Previous translations used the expression “gobblers of dregs,” which sounds good in English and has the advantage of evoking lowlifes, but remains unsatisfactory. The provocation at the beginning of the passage refers to wine lees to make listeners aware that just as eating wine lees leads to intoxication, so depending on teachers and repeating teachings without personal insight is delusive.

Another overlooked dimension of this passage is the allusion of this metaphor to the Buddhist canon. The *Nir-*

*vāna Sūtra* tells an elaborate story about an ignorant king debating with a wise physician. The physician describes a marvelous medication that counteracts the effects of poison. This drug is actually a particular type of milk produced under strict conditions:

If the cows don’t eat *wine lees*, smooth grasses, or barley chaff, their calves will choose the good [path]. For grazing they will neither stay in the highlands nor come down to swamps. They will drink in limpid streams and won’t be forced to run. They will not gather in herd with the bulls. Their drinking and eating will be adjusted; they will fit walk or immobility and find their place. Milk [produced] this way perfectly eliminates all ailments. (Taishō 12: 378c04–07)

Should this metaphor remain obscure, several commentators offer keys to understanding it. Huiyuan (523–592) of Jingying Temple provides a straightforward explanation: “If the cows represent the bodhisattvas ... , *wine lees* represent ignorance, smooth grasses represent avidity, and barley chaff represents anger” (Taishō 37: 651a19–21).

In this light, the utterance attributed to Huangbo (d. c. 850) is far from simple rudeness to his audience or a dismissive critique of contemporary teachers. This teaching is a rhetorical device pointing at the auditors’ fundamental ignorance and need to rediscover true autonomy. Whether Huangbo really uttered these words is best answered by Wright’s careful statement: “The Huang Po texts available for our reading should be attributed not to any one creative individual or mind, but rather to the Zen tradition in China as it took shape over many centuries” (1998, p. 18).

The above excursion into the maze of intertextuality serves three purposes. First, it illustrates the immaturity of most Chan translations. Second, it shows the interdependence of Chan texts and Buddhist classics, and the need for further integration of the two fields. Third, it allows one to envision these dialogs in the context of monastic practice.

#### THE PRIORITY OF SOTERIOLOGICAL CONCERNS

If a common thread binds together the different Zen lineages, it may seem to be their uncompromising emphasis on awakening, based on the premise that the means and the end ultimately are not separate. In his characterization of Buddhism in general, Guy Bugault notes the priority of the soteriological dimension over theoretical

constructs, saying, “Accurately speaking, Buddhism at its original stage was neither a religion nor a philosophy, but a psychosomatic discipline including three elements: morality (*śīla*), concentration (*samādhi*), and intellectual discernment or *acies mentis* (*prajñā*). None of them can function without the other” (1994, p. 43, translated from the French).

As with the poisoned arrow representing existential dis-ease (Pali, *dukkha*), the most urgent task is to remove it, speculations about its nature or shape being no more than delusive thought. Acute intellectual discernment is required to remove the arrow. The subtle boundary separating concentration and intellectual discernment is itself a theme worthy of examination, from both the Zen and philosophical perspectives. If there is a philosophical aspect specific to the Zen traditions, it is not so much in their striving to remove the arrow than in their emphasis on going beyond it, aiming at removing all traces of the operation.

Michel Mohr (2005)

## DGE-LUGS

The Dge-lugs (pronounced “geluk”) tradition of Tibetan Buddhism, the tradition followed by the Dalai Lamas, traces its origins to the towering Tibetan philosopher and monastic reformer Tsong kha pa (1357–1419) and his two closest disciples, Rgyal-tshab (pronounced “gyelt-sap”) (1364–1432) and Mkhas grub (pronounced “kay-drup”) (1358–1438), whose views have come to represent orthodoxy for the tradition. According to traditional hagiographies, Tsong kha pa studied with more than sixty of the greatest scholars in Tibet during his early life and went on to compose numerous treatises and commentaries on the entire spectrum of Buddhist thought and practice, leaving a set of collected works that numbers nineteen volumes. His philosophical works address virtually all the major topics in Buddhist philosophical discourse, including issues of ontology, metaphysics, epistemology, logic, soteriology, and hermeneutics, among others. Aided by historical and political conditions Tsong kha pa’s works, those of his disciples, and the monastic and educational systems he initiated made the Dge-lugs tradition the dominant philosophical tradition in Tibet. Indeed, Tsong kha pa was such a powerful intellectual force in Tibet that all subsequent philosophers, including those who disagreed with him, felt compelled to acknowledge and address Dge-lugs-type criticisms that they anticipated their views might incur.

While there is much in common among Dge-lugs philosophers in terms of their philosophical positions and methods, it would be misleading to suggest that the Dge-lugs tradition and its notable philosophers are univocal in their philosophical presentations. Many lively debates and polemic directed at fellow members of the Dge-lugs tradition can be found in the works of the great thinkers of the tradition, including Tsong kha pa’s direct disciples Rgyal-tshab and Mkhas grub, as well as later thinkers such as ’Jamdbyangs bzhad pa (1648–1721), Rje btsun Chos kyi ’gyal mtshan (1469–1544), and Lcang skya rol baī rdo rje (1717–1786), among others. Despite this marked diversity of opinion, there is nonetheless a relatively standard Dge-lugs philosophical presentation that those in the tradition generally agree on. The intra-tradition debates tend to focus on lofty and quite subtle points, while the mainstream Dge-lugs philosophical worldview accepted across the tradition remains as the foundation for debates about such subtle points of contention.

Many significant features of Dge-lugs philosophy stand in contrast with other Buddhist traditions. Among the most significant is the marked emphasis Dge-lugs

philosophers place on the study of the Indian Buddhist philosophical tradition they inherited and on what they understand to be the correct interpretation of that tradition. Thus any discussion of Dge-lugs philosophy must be approached through an examination of how the earliest Dge-lugs masters interpreted and represented Indian Buddhist philosophical history.

## DGE-LUGS MADHYAMAKA

While the works of many Indian philosophers have impacted Dge-lugs philosophy, the Dge-lugs tradition traces its intellectual lineage most significantly through two important Indian philosophers: Nāgārjuna (c. first century C.E.) and Candrakīrti (c. 600–650). Nāgārjuna, author of the *The Fundamental Wisdom of the Middle Way* (*Mūlamadhyamakakārika*), among other texts, is considered the founder and systematizer of the school of Mahayana philosophical thought known as Madhyamaka or the Middle-Way School. Virtually all Tibetan Buddhist schools consider themselves to be Mādhyamikas, followers of Nāgārjuna’s tradition in one form or another and the Dge-lugs are no exceptions in this regard. The central idea that guides the thought of Nāgārjuna and the Madhyamaka School is the notion of emptiness (*śūnyatā*). When Mādhyamikas such as Tsong kha pa use the term “emptiness,” they mean that an object lacks a fixed or unchanging nature. To say that a pot, for example, is empty (metaphysically empty) is to say that it lacks a permanent nature or essence, an independent, intrinsic identity.

The Dge-lugs presentation of the middle way owes much to their reading of the history of their Indian Madhyamaka predecessors. When Dge-lugs philosophers and scholars study the history of Indian Madhyamaka, they begin by recognizing that Nāgārjuna and his student Āryadeva are considered authoritative by all subsequent commentators and interpreters of Madhyamaka thought. According to Tsong kha pa’s assessment of the history of Indian Madhyamaka, an important philosophical split occurred in Madhyamaka discourse several centuries after Nāgārjuna when Buddhapālita (c. 470–540?) wrote a commentary on Nāgārjuna’s *Fundamental Wisdom of the Middle Way*. This was followed by a criticism of that treatise by Bhāvaviveka (c. 500–570?) and a subsequent defense by Candrakīrti of Buddhapālita’s position against those criticisms leveled by Bhāvaviveka. Much of this debate in the Indian tradition revolved around the appropriate form of reasoning to be utilized by Madhyamaka philosophers. With this point in mind, later Tibetans such as Tsong kha pa distinguished subschools of Indian Mad-

hyamaka philosophy, in part on the basis of the form of reasoning that their proponents utilize.

Buddhapālita's commentary, simply titled (in English) *Buddhapālita's Commentary on [Nāgārjuna's] "Fundamental Wisdom of the Middle Way"* is a lucid exposition of Nāgārjuna's text that utilizes a method known as consequentialist argument (*prasaṅga*). Much as in Nāgārjuna's text, Buddhapālita's form of argumentation examines the positions of philosophical rivals to reveal the absurd consequences of holding such positions. In other words, consequentialist arguments attempt to reduce the philosophical positions of opponents to absurdities. All philosophical opponents of Mādhyamikas maintain that some things are not empty, have a true nature or essence, and have independent, permanent existence. For all such contemporary opponents, Buddhapālita, like Nāgārjuna before him, attempted to reveal what he saw to be the absurd positions entailed by their various positions asserting true existence. Though the logical innovations of Dignāga (c. 480–540) were beginning to make headway into Mahayana discourse, Buddhapālita avoided these innovations in logic, such as the use of independent argument (*svatantrānumāna*), thus avoiding commitment to a counterposition when criticizing his opponents. Dge-lugspas have tended to presume that Buddhapālita was simply and faithfully following the method of Nāgārjuna.

Bhāvaviveka, in contrast, argued that Mādhyamikas must assert their own philosophical position. Simply to criticize others without establishing one's own position, the emptiness view, is inadequate. And to establish one's own position, Bhāvaviveka argued, one must use independent inferences. Thus, in *Prajñā-pradīpaḥ: A Commentary on the Madhyamaka Sūtra*, his commentary on Nāgārjuna's *Fundamental Wisdom of the Middle Way*, Bhāvaviveka offers a pointed criticism of Buddhapālita's failure to establish a Madhyamaka thesis, as well as an exposition of the need to use independent argument (*svatantrānumāna*) to fulfill that task. Accordingly, Dge-lugspas categorized Bhāvaviveka's particular brand of the middle way as Svātantrika-Madhyamaka. In contrast, Dge-lugs doxographers describe Buddhapālita and his defender Candrakīrti (described below) as Prāsaṅgika-Mādhyamikas, because they insist on primarily using consequentialist arguments (*prasaṅga*).

Candrakīrti (c. 600–650) is the third important figure in this Indian Madhyamaka debate, according to Dge-lugs authors. Candrakīrti composed several philosophical texts, two which are important to Dge-lugs philosophers on the central issue of the appropriate form of reasoning

for proponents of Madhyamaka views: his *Introduction to the Middle Way (Madhyamakāvatāra)* and *Lucid exposition of the middle way (Prasannapadā Madhyamakavṛtti)*. In these texts Candrakīrti philosophically defended Buddhapālita against the criticisms leveled by Bhāvaviveka. Candrakīrti argued not only that Buddhapālita was correct to use only consequentialist arguments, but also that using independent arguments are incompatible with Madhyamaka tenets.

In the Dge-lugs reading of this debate, there is a fundamental ontological problem with using independent arguments. Such usage implies acceptance of an inherent, absolute, or unchanging nature in phenomena, and this implication is utterly contrary to the most basic Madhyamaka tenet—that all phenomena are empty of just such a nature or essence. Dge-lugs philosophers such as Tsong kha pa argued that because one characteristic of an independent inference is a commonly appearing subject in the inference, the inference implies that the subject must have some sort of absolute existence. For example, in the independent inference “This book is impermanent because it is produced,” the subject, this book, must appear in precisely the same way, in a way which is common to both the proponent and opponent of the argument. If it does not, then the two debaters are just talking past each other. If it does have a precise and common mode of appearance to both the proponent and opponent, then it must have some absolute mode of existence, some intrinsic identity, some sort of inherent nature.

Thus, the mere use of independent arguments runs utterly contrary to the Madhyamaka view, according to Tsong kha pa and his Dge-lugs followers. Although Tsong kha pa considered Buddhapālita to be a Prāsaṅgika-Mādhyamika from his views and method, he considered Candrakīrti to be the “founder” of the Prāsaṅgika-Madhyamaka view, since he was the first clearly to articulate the importance of using consequentialist arguments and the contradictions involved when Mādhyamikas use independent arguments.

An interesting feature of Tsong kha pa's middle way is that though he recognized the limits of language, he still insisted on rationality and the laws of logic in his investigations and conclusions concerning the ultimate. In this sense, notes Georges Dreyfus in *The Sound of Two Hands Clapping*, Tsong kha pa ought to be considered a realist. Śāntarakṣita, an eighth-century scholar who was a key figure in the early dissemination of Buddhism in Tibet, was a late Indian Mādhyamika who incorporated the logico-epistemological (*pramāṇavāda*) innovations of Dignāga and, more prominently, Dharmakīrti (seventh

century) into his particular brand of the middle way. Though Śāntarakṣita was considered to be a Svātantrika-Mādhyamika with whom he took issue on several counts, Tsong kha pa nevertheless preserved, and even intensified, Śāntarakṣita's emphasis on the role of reason in his Madhyamaka method. The particularities of how Tsong kha pa integrated the logico-epistemological tradition into Madhyamaka analysis are central to the insights that made his thought unique.

To turn now to the Tibetan Madhyamaka tradition, for Dge-lugs philosophers, an issue central to all Madhyamaka philosophical analysis and inseparably tied to the issue of an appropriate logic is the issue of the two types of truth: ultimate truth (*don dam bden pa* [Tibetan], *paramārthasatya* [Sanskrit]) and conventional truth (*kun dzob bden pa, saṃvṛtisatya*). Truths in this context are objects of knowledge. Hence it makes sense to talk of truths existing. Since its earliest formulation in the works of Nāgārjuna, Madhyamaka thinkers have used a presentation of the two types of truths as a primary marker against which they have delineated their positions on central Buddhist topics in ontology and epistemology.

Dge-lugs philosophers illuminated the distinctions they drew between ultimate and conventional truths by contrasting their positions as Prāsaṅgika-Mādhyamikas with the position of their Madhyamaka rivals, the so-called Svātantrika-Mādhyamikas, such as Bhāvaviveka. This takes place in the treatises of Tsong kha pa and his direct disciples and also in a genre of philosophical literature prominent in monastic study and known as tenet-system texts or doxographies. In this literature, Dge-lugs authors present major systems of non-Buddhist and Buddhist philosophical thought in a hierarchically organized fashion. Each of the tenet systems (or at least the Buddhist systems) are presented in terms of a host of philosophical categories of analysis, such as the two truths, definitions of consciousness and objects of consciousness, delineation of the path, delineation of the fruits of the path, and so on. Consistency in analytic categories across the presentation of schools of thought facilitates easy comparisons between systems and usefully allows one easily to ascend a hierarchy of philosophical positions in a dialectical fashion by contrasting the present system with the less subtle and less accurate system just below it.

For example, one can easily compare all four Buddhist schools' definitions of ultimate truths, conventional truths, consciousness, and the like, by seeing that school *x* defines a conventional truth in one way, school *y* in another, and school *z* in yet another. Often the views presented in this literature do not precisely mirror those of

any single Indian author, but rather are amalgamations of the views of several presumably like-minded thinkers and of unstated positions considered to follow logically from other stated positions. As mentioned above, for Dge-lugs thinkers, the highest and most accurate Buddhist philosophical description of the nature of reality is the Prāsaṅgika-Madhyamaka. Just below that position in the hierarchy is the Svātantrika-Madhyamaka view. Thus, the Svātantrika view is most commonly contrasted with the Prāsaṅgika-Madhyamaka position to help illuminate the Dge-lugs-Prāsaṅgika view.

When Dge-lugs authors discuss the issue of the two types of truths, they employ a number of key technical terms. Jeffrey Hopkins mentions sixteen terms in his book *Meditation on Emptiness*, of which the six most commonly used are the following:

- Ultimately established existence (*don dam par grub pa*)
- Truly established existence (*den par grub pa*)
- Existence established in reality (*yang dag par grub pa*)
- Existence established by way of the intrinsic identity/characteristics of an object (*rang gi mtshan nyid kyi grub pa*)
- Existence established by way of the inherent nature of an object (*rang bzhing gyis grub pa*)
- Existence established from its own side (*rang ngos nas grub pa*)

According to Dge-lugs philosophers such as Tsong kha pa, all Mādhyamikas, including the Prāsaṅgikas and the Svātantrikas, held that the first three terms on the list accurately describe ultimate truths, since such truths lack (are empty of) ultimately established existence, truly established existence, and existence established in reality. An example of an ultimate truth for either a Svātantrika-Mādhyamika or a Prāsaṅgika-Mādhyamika would be the lack of any ultimately established existence or truly established existence in this book, for example. The lack of ultimately or truly established existence refers to the absence of any objective existence, any independent absolute mode of being, any fixed independent essence, within this book. Thus far, according to Dge-lugs thinkers, both subschools of Madhyamaka thought are in agreement.

The disagreement between the two subschools concerns their positions on the ontological status of conventional truths. According to Dge-lugs thinkers, while all Mādhyamikas, when presenting ultimate truths, argue

that phenomena lack an ultimate nature, the Svātantrika-Mādhyamikas accept that conventional truths exist in the latter three ways listed above; that is, they exist by way of their own intrinsic identity, by way of inherent nature, and from their own side. This, according to Dge-lugspas, is how the Svātantrika-Mādhyamikas could view their position as maintaining a middle ground between absolute permanence and absolute nonexistence, or nihilism. They avoid the extreme of permanence by saying that phenomena ultimately lack true existence. They avoid the extreme of nihilism by claiming that phenomena conventionally exist by way of their own characteristics, by way of their intrinsic nature, or from their own side.

In relation to the logical issues discussed above, because phenomena conventionally exist from their own side or by way of their own intrinsic identity/characteristics, objects such as books and tables can serve as commonly appearing subjects in independent inferences. An inherent nature or intrinsic characteristics on the side of the book, for example, cause an ignorant, unenlightened consciousness to recognize that object and correctly impute the conventional designation “book” on the basis of a nondefective conventional cognition. Such an imputation has a referent as object, to which it correctly points with a conventional designation (“book”).

Dge-lugspas found this position, which they attributed to Svātantrika-Mādhyamikas, highly problematic. They argued that all six technical terms mentioned above to describe the ontological status of things are coextensive. If an object can be described in one of the six ways, it can be described in all six ways. Dge-lugspas thus argued that ultimate truths *and* conventional truths do not exist in any of the ways described above. They argued that if objects are established by way of their own intrinsic identity, by way of some sort of inherent nature of their own, or from their own sides, even conventionally, then objects must have some sort of ultimate nature. Dge-lugspas would criticize their Madhyamaka opponents by arguing that although they claim that some objects exist only conventionally, if they assert that the objects inherently possess some nature of their own in any way, even conventionally, this is really just a masked way of continuing to cling to some independent essence or nature in the objects ultimately. For an object to cause a conventional consciousness to correctly recognize and label it, there must be something true or absolute in the object. Thus in the Prāsaṅgika-Madhyamaka position held by Dge-lugspas, both ultimate and conventional

truths lack all six criteria (sixteen as listed by Hopkins) of ultimate and conventional truths.

While Svātantrikas accept that conventional truths exist inherently, by way of their own characteristics, and from their own sides, Dge-lugspas, such as the Prāsaṅgikas, reject the idea that even conventional truths are established in this way. Conventional truths are actually falsities. There is nothing true about how minds under the sway of ignorance conceptualize these falsities. This is not to say that the world does not exist out there. It is just to say that we are utterly deluded when we engage with the world because we impose fixed essences in things when no such essences exist. And this is what Svātantrikas are doing when they claim that even mere conventional truths inherently exist. For Dge-lugspas, such as the Prāsaṅgika-Mādhyamikas, conventional truths are true only for a consciousness for which the actual nature of reality is obscured. They do not exist as they appear to a conventional consciousness. Dge-lugspas such as Tsong kha pa held that they avoided the extreme of nihilism by accepting the functionality of conventional phenomena despite the falsity of their appearances.

It is important to keep in mind that this is a standard Dge-lugs presentation of this history and these ideas. While Dge-lugs authors associated specific Indian Madhyamaka thinkers with these subschools of Madhyamaka thought, there does not appear to be evidence in Indian sources before the twelfth century of any explicitly named subschools of Madhyamaka thought. Prior to this time, the thinkers discussed here and labeled “Prāsaṅgika-Madhyamaka” or “Svātantrika-Madhyamaka” in the Dge-lugs literature identified their own views as simply Madhyamaka.

## THE DGE-LUGS CURRICULUM AND SCHOLASTIC METHODS

Any discussion of Dge-lugs philosophy must move beyond ideas and also discuss the curriculum and methods employed in Dge-lugs institutions, which direct a significant amount of their focus to philosophical study. Tsong kha pa initiated a scholastic approach to Buddhism that, although presented to lesser degrees before him in Tibet, marked a significant departure from the mystical gnosis of individuals as sources of authority for the tradition before him. Tsong kha pa emphasized reasoning, which could be learned, in time, only in monastic universities, thus advancing a shift in authority from individuals to institutions and a wholesale reform of monastic culture, which he saw as deteriorating in Tibet during his time. As time went on and the monastic colleges grew, the

degree of scholasticism grew with it. Key figures from the Dge-lugs monastic colleges began to compose textbooks (*yig cha*) as manuals for study in attempt to present coherent, consistent, totalizing systems of thought immune to critique, especially internal contradiction. This move toward scholasticism certainly reinforced institutional authority, but the importance of mystical gnosis of expert scholar-adepts was far from lost in the Dge-lugs tradition, though the reins on the careers of independent yogis were significantly tightened in this tradition.

The Dge-lugs tradition maintains a large monastic component that includes three major monastic seats—Sera, Drepung, and Ganden—and several colleges within those monastic seats. Traditionally, the monastic seats housed between 5,000 and 10,000 monks in each, with good portions of the monks engaged in the philosophical curriculum of one of the monastic colleges. Even in exile in south India, Sera and Drepung each had more than 5,000 monks in residence in 2005. The colleges of the three monastic seats all have a similar curriculum that culminates in a degree known as “geshe.” A geshe degree is somewhat akin to a doctorate in Buddhist philosophy. It generally takes somewhere between fifteen and twenty-five years to complete the curriculum, which includes study and memorization of all the major philosophical texts of the tradition, extensive periods of debate (usually four to six hours a day, six days per week), and study of the major commentaries and textbooks of the college, which serve as the interpretive frame through which to engage the major treatises of the Indian and Dge-lugs traditions. Though most monks at Sera, Drepung, and Ganden begin the geshe training, only a small percentage successfully complete the degree because of the difficulty of the subject matter and the rigors of the curriculum, again, much like a doctoral program in the West.

Each of the monastic colleges cover the same basic subjects, though they use different monastic textbooks (*yig cha*), commentaries that present the interpretive frameworks of their particular colleges. Here in the monastic textbooks one begins to find differences in interpretation on subtle philosophical points between authors within the Dge-lugs tradition. Often scholars from the different monastic colleges will take great pride in the monastic textbooks of their particular colleges and the interpretive framework they employ for understanding the philosophical views of Tsong kha pa, Candrakīrti, and other great philosophers. Within the curriculum there are preliminary subjects covering the basics of topics such as the forms of reasoning and debate, soteriolog-

ical grounds, and paths; types of minds/consciousnesses according to the Buddhist tradition; the philosophical tenet systems of the four Indian Buddhist schools; and so on. Once these preliminary subjects are successfully completed, the Dge-lugs scholar progresses on to the five subjects of the geshe curriculum, which include the perfection of wisdom, maplike descriptions of states of consciousness as the practitioner removes obstacles to enlightenment and progresses along the Buddhist path, logic and epistemology, Madhyamaka philosophy, cosmology, and monastic ethics. These five subjects include topics on ethics, metaphysics, ontology, hermeneutics, karma, and personal identity among others. For each of these subjects, years are dedicated to primary philosophical texts, which are memorized and then studied intensively with a teacher, who gives the students informed oral explanation on the texts. Students then debate the ideas and fine-tune their understanding in the debate courtyards. Progress exams are given regularly, and the final exam includes a multi-day public debate with top scholars in the tradition.

Many of those who complete this geshe curriculum successfully go on for a sort of postdoc for one to three years at one of the two major tantric colleges, Gyume or Gyuto. Here they study the theory and practice of the major tantric meditational cycles in the Dge-lugs tradition. Completing all these requirements usually qualifies the student as a teacher. Thus, authority is granted primarily through institutions, though this curriculum ideally cultivates—and indeed, was constructed to cultivate—experiential/gnostic authority as well.

The Dge-lugs tradition of Tibetan Buddhism is perhaps the most scholarly and philosophical of all the world’s Buddhist traditions. As a living Buddhist tradition, it makes for a fascinating area of investigation, not only for those interested in the history of Buddhist philosophy in general, but also and particularly for those interested in understanding the ideas and structure of a living Buddhist tradition, and understanding how philosophy and philosophical study are integrated with a larger human path.

## HUA YAN

The Hua yan school of Buddhism developed in China between 600–1000 CE, flourishing at the end of the Tang dynasty. It relies for much of its doctrine on exegesis of

the Mahayana Buddhist scripture known as the *Hua yan Jing*. The name *Hua yan* (Japanese: *Kegon*) is intended to be the Chinese translation of the Sanskrit *Avataṃsaka*, which means "flower garland." The term is ostensibly the title of a Sanskrit sutra, the *Mahāvaiṣṭhīya Buddhāvataṃsaka Sūtra*. The Hua yan school developed a *panjiao* (system of classification of Buddhist doctrines), which takes the *Hua yan Jing* to be the most profound of all the Buddhist sutras. This is because it was, according to legend, spoken by the Buddha while in the throes of his awakening experience.

## CENTRAL TEXTS

The term *vaiṣṭhīya* in the title indicates that the text is a composite one, cobbled together from several other texts of various lengths and origins. Some parts of the text, for example the *Daśabhūmika* and the *Gandavyūha*, do exist in a Sanskrit original. In addition, some parts of the text are laden with Chinese phoneticizations of Sanskrit terms, which also indicate a likely Indian origin. The rest is more or less likely to be of indigenously Chinese origin, passed off as or uncritically taken to be translations of Sanskrit originals. For this reason, the origins of the Hua yan tradition are linked to the evolution of a fully sinicized Buddhism.

This is complicated by the fact that many of the key, pivotal translators and advocates of these materials were not indigenously Chinese but in fact were from Central Asia. China and India were kept culturally autonomous for a long time because of the daunting obstacle presented by the Himalayas, so early contact actually was more likely to take place in areas of easy access to the Silk Road. This complicated matters because of the cultural homogenization that also followed along with such developments. Since the latter part of the twentieth century, there has been much study about the extent to which the flow of ideas from many cultures along the Silk Road influenced the development of the uniquely Chinese forms of Buddhism.

There are two arguably complete versions, or translations, of the text in Chinese. The earliest consists of sixty chapters, produced by Buddhahadra in about 420. Traditionally, this has been used by Hua yan writers as the standard text. In 699 a version in eighty chapters was produced by Śikṣānanda. The only complete English translation of the Hua yan sutra, in three volumes, was produced by Thomas Cleary in the late 1980s. For reasons he does not explain, Cleary translates Śikṣānanda's version, although it is not as historically important as Buddhahadra's text.

In addition, there do exist various Chinese versions of parts of the sutra, such as the *Gandavyūha*, for which is there is a Sanskrit original.

Another text of crucial importance to the development of the Hua yan tradition is the *Dasheng Qixin Lun* (Mahayana awakening of faith). This text is also arguably an apocryphal text, written in Chinese but taken as a translation of a nonexistent Sanskrit text ostensibly titled *Mahayānaśraddhotpāda*. This text is cited by all the prominent Hua yan writers and is thus granted a substantial authority. This text has been linked to the ontologization of Buddhism as it developed in the Chinese context, perhaps due to Central Asian and Silk Road influences. Ideas that take shape in this text include such metaphysical notions as buddha nature and *tathāgatagarbha* (womb of buddhahood), which some scholars take to be countertheoretical to basic Indian Buddhist premises of the pointlessness of metaphysical assertions and speculations. In fact, within modern Japanese Zen traditions, there are those who suggest that East Asian Buddhism in general is not Buddhism. These critical Buddhists point precisely to the type of foundational *tathāgatagarbha* thinking that can be directly linked to the *Awakening of Faith* and its influence as topical, non-Buddhist elements that encroach on the central insights.

### PATRIARCHAL LINEAGE

According to the retrospective view of Zongmi (780–841), there are four patriarchs or lineage figures in the Hua yan tradition, and he styles himself as the fifth patriarch. This comes to be seen as the orthodox lineage by the subsequent tradition. This standard list of patriarchs includes Dushun, Zhiyan, Fazang, Chengguan, and Zongmi. This is a retrospective lineage, which means that it is not at all clear that Dushun and Zhiyan saw themselves as members of a Hua yan school. This attribution is applied after the fact, as the tradition comes to consider the sources of its own emphases.

Dushun is said to have lived from 558 to 640. Although apparently prominent as an adept and miracle worker in his time, he is most influential as the purported author of a text known as the *Hua yan Fajie Guanmen* (Meditative approaches to the Hua yan Dharmadhātu). This text introduces the Four *Dharmadhātu* model that will be discussed later on, and thus provides a solid basis for the later developments in Hua yan thought.

Zhiyan (602–668), the second patriarch, is not as well known. His most prominent contribution to the discourse is the so-called Ten Mysteries. These are basically a series of metaphors for interpenetration and mutual cau-

sation, and many of them are in fact redundant. Regardless, this language persists in the work of Fazang, perhaps the grand systematizer of Hua yan thought.

Although attributed as the third patriarch, Fazang (643–712) may have been the first to think of himself as founding or joining a specific school of thought. Fazang's family was of Central Asian origin, in Samarqand, a prominent center on the Silk Road. A prolific writer, he wrote somewhere between sixty and one hundred works on various topics, the most important being commentaries on the *Hua yan Jing* and the *Mahayana Awakening of Faith*. He rose to prominence at the court of the empress Wu, after a series of performances in which he used such examples as a room of mirrors to demonstrate Hua yan principles of interpenetration and nonobstruction. Fazang's school stood in contrast to the school of Xuanzang, who had gone to India to learn Sanskrit and translate scores of Buddhist texts into Chinese. This conflict can be seen as being between the Indic and the sinicized forms of Buddhism. Ultimately, Fazang's view prevails, for a variety of philosophical, cultural, and political reasons. This may be an early and important stage in the sinicization of Buddhism.

Chengguan, the fourth patriarch, lived from 738 to 840. The lineage is somewhat obscure here, as Fazang's actual disciple, Huiyan, was understood by the later tradition to have corrupted the teaching. Chengguan, who was born after Fazang died, was nevertheless seen as the fourth patriarch in the sense that he is believed to have restored the integrity of Fazang's teachings. He did seem to have led a renewed interest in the school on the part of the ruling class and the scholars.

The last of the orthodox patriarchs is Zongmi (780–841). Zongmi is best known for his syncretic concerns, including his interest in sorting out the various schools of Buddhism, especially Chan Buddhism. Because of his interest in *panjiao*, his works are a treasure house of historical information about the schools of Buddhism active at his time. What is perhaps most significant about Zongmi is his concern with reconciling and synthesizing Hua yan and Chan Buddhism. In fact, Zongmi is sometimes attributed with lineage roles in both the Chan and Hua yan traditions, though these claims cannot be accepted uncritically. This leads to an oversimplification expounded by the famous Japanese Zen scholar Daisetz Suzuki, who argues that Hua yan is theoretical and establishes the principle behind Zen that is practical. However, this is too polemic a description of the situation, since Chan and Zen have a long textual and theoretical history, while Hua yan does provide practices of its

own, for instance the meditation on the Four *Dharmadhātus* discussed later in this entry.

Besides the so-called orthodox lineage just discussed, there are also a number of figures who belong to what might be called heterodox lineages in the sense that they follow exegetical lines of reasoning not adopted by the later traditions. These include, as mentioned, Fazang's student, Huiyuan, and the iconoclastic Li Tongxuan.

### THE FOUR DHARMADHĀTUS

Perhaps the most fundamental concept in all of Hua yan Buddhist thinking is the synonymy of emptiness and dependent arising. Emptiness (Sanskrit: *śūnyatā*; Chinese: *kong*) is a traditional Buddhist notion that refers to the absence of self-being in all things and events. It does not mean that things do not exist—it means that all things that exist do so in dependence on other things, which is the meaning of dependent arising (Sanskrit: *pratītyasamutpāda*; Chinese: *yinyuan*). Hua yan, consistent with characteristic Chinese attitudes, placed focus on the positive side of this formulation, that even though empty, things actually do exist.

This is perhaps most clearly expressed in the model of the Four *Dharmadhātus* as initially formulated in Dushun's seminal text, *Meditative Approaches to the Hua yan Dharmadhātu*, and subsequently developed further by Chengguan. The term *dharmadhātu* is a way of referring to the realm of all *dharma*s (events). In other words, the *dharmadhātu* is the world in the most comprehensive sense. This model of the world is represented sometimes, especially in the work of Fazang, in terms of the metaphor of Indra's jeweled net. This net consists of many-faceted gems, each of which reflects every other gem, and reflects itself reflected in every other gem.

The formula of the Four *Dharmadhātus* is proposed as a support for meditation practices. Although they are often rendered in such a way as to suggest that there are four separate realms, they more properly represent four types or orders of perspectives on experience. The first is the tacit, uncritical commonsense lower-order perspective, and the others are higher-order or meditative perspectives. The goal seems to be a type of perspectival flexibility, which corrects the obsessive-compulsive tendency to identify with a single perspective by acknowledging the multiplicity of perspectives available and by adopting higher-order perspectives that reconcile the inconsistencies present between lower-order perspectives. This is like standing in a hallway with two people on either end. I can see one or the other, because of my limited perspective, but I cannot see both simultaneously. If

I were to stand above the hallway somehow and look down on it, I might be able to see both at once. Higher-order perspectives similarly circumscribe and sustain perspectives that appear incompatible at the surface level.

The first of these types of perspectives is termed *shi*, often rendered as “phenomenon” or “event.” This is the tacit, ordinary, conventional perspective adopted and identified with by most people most of the time. It takes events at more or less face value—it does not raise questions about metaphysics or ontological or epistemological status. There is virtually an infinite set of possible perspectives at this level. Garma C. C. Chang, in *The Buddhist Teaching of Totality* (1971), offers the example of a glass of water. The water is seen by a chemist as H<sub>2</sub>O, or a universal solvent. It is seen by a firefighter as something to extinguish flames. It is seen by a thirsty person as something to drink. It is in fact all these things, potentially, though at any given time it may function in one or another way. The problem with this perspective arises when it is universally applied, even in cases when other perspectives seem to conflict with it. Although admittedly a silly example, if a firefighter were dying of thirst but could only see the water as a means of extinguishing fires, then he might die of thirst before he would think to drink the water. An obstinate application of disjunctive perspectives is counterproductive and causes frustration or suffering, the elimination of which is the goal of Buddhism in general.

The second type of perspective is represented by the word *li*, which translates as “rule” or “underlying or abstract principle.” In that general sense, *li* is what all *shi* have in common. To shift perspective to the *li* is to resolve all distinctions into some commonality. For example, one can either see coffee and tea as separate things, which would be the level of *shi*, or one can see them as all being water, which is the level of *li*. However, in the case of Hua yan metaphysics, the *li* is *śūnyatā* (emptiness). What all things have in common is that they all lack self-causation or causal autonomy. Everything depends on everything else. The Buddhist texts warn, however, not to ontologize emptiness and make it into a thing. It is the nature of things, which is not a thing in itself. So whereas in the first *dharmadhātu* things are seen as distinct things, in the second they are all seen as empty of self-being.

The third *dharmadhātu* is called *lishi wuai* (nonobstruction of *li* and *shi*). From this perspective, the emptiness of things does not interfere with the thingness of things. This would be experience things as in some sense distinguishable while simultaneously experiencing them as indistinguishably empty.

This does not, however, yet constitute full accomplishment. The final *dharmadhātu* is *shishi wuai* (nonobstruction between phenomena and other phenomena). By realizing that the emptiness of things does not interfere with the thingness of things, one is then able to realize that the specific nature of any one thing does not interfere with the specific nature of any other one thing. As Zongmi says in his commentary to Dushun's text, "all distinct phenomenal dharmas interfuse and penetrate in all ways" (Fox 1988, p. 299). In terms of the example used earlier in the description of the first *dharmadhātu*, the potability of the water does not interfere with the fire extinguishing properties of the water, which does not interfere with the solvency of water. All these manifestations are all potential manifestations of the same phenomenon. This is how the Buddha sees the world according to the Hua yan tradition, as omnipotentially present in a world of infinitely fractal possibilities. This is a liberation from the fixation on a single, lower-order perspective.

To put this model using modern concepts, one might look at a baseball as a baseball, intended for a certain use in a certain game according to certain rules. One would not be wrong in doing so, but one can also see the baseball as more basically composed of atoms. One would also not be wrong, of course. When one sees the baseball as a baseball, one sees what makes it different from everything else. When one sees the baseball as atoms, one sees what the baseball has in common with everything else, that is, one overlooks the distinctions between things. At the level of the third *dharmadhātu*, one is able to see that the phenomenal and atomic natures of the object do not interfere with each other. It is both atoms and a baseball. Meanwhile, the fourth level encourages one to see the baseball in either its phenomenal or atomic sense as overlapping with every other ostensible object in the universe. This is not far fetched. Phenomenally, one might point out that a baseball would not exist if there was not a game and a population to play it, and so is not entirely separable from those other events. Atomically, one notes that objects share ions with their environments in such a way as to constitute overlapping. It would not even make sense to suggest that an atom could exist in complete isolation, since in fact the atom is made of parts as well, which are made of parts, possibly ad infinitum, as modern string theorists suggest.

Fazang is particularly famous for a couple of metaphors used to demonstrate this principle of nonobstruction and mutual penetration. He is said to have made a huge impression on the empress Wu with these

demonstrations, attracting much in the way of imperial support for his writing and translation projects. In one case he is said to have had constructed a room with mirrors on all four walls, as well as in the corners, floor, and ceiling. A torch and statue of the Buddha were placed in the center, and the result was reflections within reflections, each mirror reflecting the other mirrors reflecting itself. This suggested to Fazang a way of explaining how everything can simultaneously be the cause and the effect of everything else. As Chang notes in the *The Buddhist Teaching of Totality*, Fazang is said to have exclaimed that "[t]he principle of the simultaneous arising of different realms is so obvious here that no explanation is necessary" (1971, p. 24). Fazang is also known for using a golden statue of a lion to illustrate a similar principle. Although from one point of view the lion has distinguishable hairs and claws and limbs and teeth, from another point of view the lion is entirely and homogeneously gold.

It is worth pointing out that such an omnicausal model conflates the various types of causal relations that Aristotle, for example, distinguishes, such as efficient, material, final, contiguous, and other types of causal relations. By contrast, the purpose of the model is not to distinguish causal subtleties but to stimulate contextual and perspectival flexibility.

In general, the practice of Hua yan can be described as the attempt to deconstruct one's typically logocentric preoccupation with a fixed perspective, by engaging in a series of exercises that cultivate perspectival flexibility. This is seen to liberate one from the oppression of identifying with a single perspective, which leads to conflict and frustration.

There are many possible parallels between Hua yan thought and Western philosophers and philosophies. For instance, Alfred North Whitehead's process philosophy has been compared to Hua yan's emphasis on the actualization of events out of potentiality, an idea that is also present in modern quantum mechanics. Gestalt and other forms of cognitive psychologies share with Hua yan an emphasis on the importance of perspectival flexibility. In particular, contemporary phenomenological approaches have much in common with Hua yan's concern with the phenomenon qua phenomenon, and both share an emphasis on the importance of experience and perspective that renders metaphysical and absolute statements speculative and counterproductive.

## MADHYAMAKA

Madhyamaka is one of the two major schools of Mahāyāna Buddhist philosophy (the other being Yogācāra. It traces its origins to the work of the South Indian philosopher Nāgārjuna (c. 150 CE), who first gave systematic philosophical expression to insights articulated in the earliest Mahāyāna sūtras, the *Prajñāpāramitā* literature. Central to those texts was the claim that all things thought to be ultimately real are in fact “empty” or devoid of intrinsic

nature. The Madhyamaka school arose out of efforts to defend this claim and explore its consequences. The Madhyamaka understanding of the concept of emptiness, and the dialectical strategies used to establish its validity, played central roles in the development of Mahāyāna thought in India and subsequently in Tibet and East Asia.

### EMPTINESS AS LACK OF INTRINSIC NATURE

When the Mādhyamikas say that all things are empty (*śūnya*), what they mean is that nothing bears an intrinsic nature (*svabhāva*). To understand this claim, one must consider the concept of intrinsic nature as it was developed in the scholastic Abhidharma phase of Buddhist philosophy. It is a basic teaching of Buddhism that suffering is caused by one's ignorance of the truth of nonself: that one does not have a separately existing self and that what one thinks of as an enduring person just consists in a causal series of impermanent, impersonal physical and mental events. Philosophers of the Abhidharma schools sought to buttress this conclusion by arguing that all partite entities (wholes made up of parts) are conceptually constructed and thus not ultimately real. This would enable them to claim that the person is conceptually constructed out of the psychophysical elements making up a causal series and so is not itself objectively real.

The general argument is that a partite thing such as a chariot borrows all its properties from the properties of its parts: There is no fact about a chariot that cannot be explained strictly in terms of facts about its parts and their relations. This is taken to show that positing the chariot as an additional entity is superfluous, something one is inclined to do only because of facts about one's interests and cognitive limitations. Since this holds as well for the person, as a whole made up of the elements in a causal series, it follows that one's view of oneself as an enduring substance reflects a failure to distinguish between a mere useful fiction and what is ultimately or mind-independently real.

This reductionist line of thought in the Abhidharma rests on the assumption that there are entities that are ultimately real. To say that persons and other partite things are not ultimately real because they are conceptually constructed is to assume that there are those ultimately real things out of which partite things are constructed. Now conceptually constructed things were held to borrow their properties from the properties of their parts. So Abhidharma thinkers concluded that ultimately real things must have their natures intrinsically. Only that is ultimately real, they claimed, that “is found

under analysis,” that is conceptually irreducible. The Madhyamaka claim that all things are empty is meant to contest the Abhidharma view that there could be such things. Through a wide variety of arguments the Mādhyamikas seek to demonstrate the absurd consequences that would follow if it were held that there are entities with intrinsic nature.

### THE ARGUMENT FROM CAUSATION

One such argument concerns the causal relation. It is a fact of one’s experience that existing things are impermanent, and this would seem to hold for whatever is ultimately real. But it is also a fact of one’s experience that things do not come into or go out of existence in an utterly random way. There seem instead to be patterns of regular succession. So an adequate account of the nature of reality seems to require that ultimately real things be said to arise and cease in accordance with causal laws. At this point the Mādhyamikas raise a simple question: Are cause and effect identical or distinct? Consider the first possibility. Certain Indian philosophers held that the effect is identical with the cause—that causation represents just the manifestation of what already exists in the cause in unmanifest form. But this view is readily dismissed. For it requires that there already exist something with the intrinsic nature of the effect before the effect is produced. And in that case one must wonder why one would set about trying to produce the effect. One might build a fire because one is cold and wants the heat of fire. But if the fire already existed in its cause, the fuel, then its heat should already be present there, so it would be pointless to build a fire.

If, on the contrary, cause and effect were distinct things, two difficulties would follow. First, if these are genuinely distinct things, some account must be given as to why things of the first sort regularly give rise to things of the second sort. Why should fuel give rise to fire and not, say, to cheese? The stock answer to this question is that fuel possesses the causal power to produce fire. But now it must be asked whether this causal power is a third thing that is distinct from both cause and effect or is rather identical with one or the other. If it is distinct from the cause, one may then ask why this sort of cause should be conjoined with just this sort of causal power. This quickly leads to an infinite regress: A second causal power will be required to account for the occurrence of the first, a third for that of the second, and so on. But if the causal power is identical with the cause, then no answer has been given to the original question, and likewise if the causal power is identical with the effect.

The second problem for the view that cause and effect are distinct things is that it is then unclear when the cause produces the effect. To call one thing the cause of another is to say that the first produces the second, so surely there must be some time when this productive activity takes place. There are three possibilities here: when the effect already exists, when the effect does not yet exist, and when the effect is coming into existence. The first is clearly ruled out, since production of something that already exists would be redundant. The second is likewise wrong, for something may be said to be productive only if there is some actually existing product. And with respect to things that are ultimately real, there could be no third time during which they are coming into existence. With respect to partite things like chariots it makes sense to speak of a process of assembly during which the entity is undergoing production. But this is possible only because the chariot is made of parts. Something impartite that bore its nature intrinsically could only be said to be either existent or nonexistent; a third intermediate time is ruled out for such a thing. The upshot of all this is that it appears impossible to account for the causal relations that should obtain among things with intrinsic natures.

### THE ARGUMENT FROM THE PROPERTY-BEARER RELATION

A second Madhyamaka argument for emptiness involves examining the relation between an ultimately real thing and its intrinsic nature. Either these are distinct or they are identical. If they are distinct, a number of difficulties follow. First, there is the problem of saying what the entity itself is like apart from its intrinsic nature. Since the notion of a pure propertyless substrate seems incoherent, this problem is likely to prove intractable. But there is also the difficulty that then the entity’s acquiring its nature will depend on causes and conditions. Such dependence seems incompatible with calling its nature intrinsic; it then seems more appropriate to say that the entity borrows its nature from other things.

Suppose then that the entity and its intrinsic nature are identical—that one’s distinction between the thing and its nature merely reflects the concepts one uses. In that case an occurrence of what one calls fire is really just the occurrence of heat (the property of being hot). But then the question arises how fires are to be individuated. Suppose there are two distinct fires of equal intensity. Each fire is just its heat, and the two heats are identical in nature. Ordinarily, one would say that the two occurrences of heat are distinct because each occurs in a distinct particular (the fire whose heat it is). But on the

hypothesis under scrutiny there are no particulars over and above the property of heat; the occurrence of what one judges to be a particular fire just is the occurrence of heat. One might then suppose that each fire is individuated in terms of the discrete space that it occupies. But then the question arises what makes two spaces discrete? Suppose the intrinsic nature of a space is its nonresistance. Since one is now supposing that the existence of a space just is the occurrence of a certain nonresistance, it is not clear what will make two spaces distinct, unless it is their being occupied by distinct entities, such as two fires. But now one has come full circle. So it looks as if the hypothesis that entity and intrinsic nature are identical does not hold up to critical scrutiny either. It appears that no adequate account can be given of how something could have an intrinsic nature.

### MADHYAMAKA AS NIHILISM

A host of similar arguments against things with intrinsic nature was developed by Mādhyamika philosophers such as Nāgārjuna, Āryadeva (170–270), Buddhapālita (c. 500), Bhāvaviveka (500–570), and Candrakīrti (c. 600–650). Nāgārjuna's targets were chiefly views held by Ābhidharmikas, but Āryadeva extended the scope of Mādhyamika dialectics to include the views of non-Buddhist Indian philosophers, a practice that becomes systematic in Bhāvaviveka's *Tarkaḥvālā*. Suppose that these arguments succeed in showing that nothing could bear an intrinsic nature. Suppose also that the Ābhidharmikas were correct in concluding that only something with an intrinsic nature could be ultimately real. What would then follow? What should one make of the Mādhyamika doctrine of emptiness? Modern scholars have put forward a wide variety of interpretations, but there is also some difference of opinion among classical Indian authors. One modern reading, that of Thomas E. Wood (1994) and David Burton (1999), that is also the common view of the Mādhyamikas' ancient Indian critics is that the doctrine of emptiness is tantamount to metaphysical nihilism, the thesis that reality is ultimately devoid of existing things. The stock characterization of the Mādhyamikas that one finds in the writings of their classical opponents is that the Mādhyamikas believe nothing whatever exists.

Of course, the thesis of metaphysical nihilism is virtually self-refuting: If nothing whatever existed, the thought could not occur that it might be true. Still, attributing this thesis to the Mādhyamikas might not seem unfair. If there is reason to believe that only things with intrinsic nature could be ultimately real, then

demonstrating the incoherence of the concept of a thing with intrinsic nature seems equivalent to showing that ultimately nothing whatever is real. One major difficulty with this interpretation, however, is that it is explicitly argued against by the Mādhyamikas. Thus, Nāgārjuna points out that to understand the thesis that no ultimately real things exist, one must first understand what it would mean for there to be ultimately real things. But an ultimately real thing would have to be something with intrinsic nature. Since the Mādhyamikas claim there can be no such things, they would say one cannot understand the thesis that ultimately nothing exists. So perhaps they should not be interpreted as seeking to establish metaphysical nihilism.

### DO MĀDHYAMIKAS AFFIRM CONTRADICTIONS?

Of the remaining interpretations of emptiness found in the modern scholarship, only some find support in the original sources. (Of course, the lack of such support need not detract from the philosophical significance of an interpretation.) For instance, Graham Priest and Jay L. Garfield (2002) claim Nāgārjuna as perhaps the first exponent of dialetheism, the view that there are true contradictions that arise at the limits of thought. As evidence, they cite his assertion that it cannot be ultimately true that all things are empty (*Madhyamakakārikā* chapter 22, verse 11). The notion of ultimate truth at work here derives from the Abhidharma distinction between two kinds of truth: conventional and ultimate. Only statements concerning ultimately real things can be said to be ultimately true; statements concerning such mere conceptual fictions as chariots and persons can only be conventionally true. For Abhidharma, then, the set of ultimately true statements would give the complete account of all those things with intrinsic natures; it would be a complete description of the ultimate nature of reality.

Now the Mādhyamikas claim to have shown that the only statement that can truly be made about those things that are thought to be ultimately real is that they are empty. But in the verse in question Nāgārjuna says that this cannot be ultimately true. Indeed, he says it is not ultimately true that all things are empty, or that they are nonempty, or both or neither. The reason for this is that emptiness is itself a mere conceptual fiction. So any statement about emptiness could at best be conventionally true. Priest and Garfield take Nāgārjuna to be thereby asserting both that the ultimate truth cannot be characterized and that it can be characterized (namely as being

uncharacterizable). But this is not how Mādhyamika commentators have understood the verse. Instead, they assimilate it to the Buddha's treatment of the so-called indeterminate questions (*avyākṛta*). When, for instance, the Buddha was asked whether the enlightened person survives death, does not survive death, both survives and does not survive, or neither survives nor does not survive death, the Buddha rejected all four possibilities. One can consistently do this, they explain, because all share an implicit presupposition—that there ultimately is such a thing as an enlightened person—and this presupposition should be rejected. By the same token, the commentators say, Nāgārjuna should be understood as rejecting the presupposition that there is such a thing as the ultimate truth. In that case he asserts neither that the ultimate truth is uncharacterizable nor that it can be characterized. He does not hold that a contradiction is true.

### MADHYAMAKA AS SKEPTICISM

Other interpreters of the doctrine of emptiness, such as Thomas McEvilley (1982) and Bimal Krishna Matilal (1986), see it as a form of skepticism. This reading is suggested by the Mādhyamika response to objections coming from Indian epistemologists. The thrust of these objections is that since the Mādhyamikas hold all things to be empty, they must hold that all means of knowledge are empty. But in that case it cannot be known that all things are empty, so the Mādhyamika claim is a mere dogmatic assertion. Part of the Mādhyamika response involves calling into question the epistemologist's project of determining which are the means of knowledge. For instance, they argue that a given procedure can be known to be a means of knowledge—a reliable cause of veridical belief—only if one already possesses some means of knowing which beliefs are true. Thus, any attempt to determine which are the means of knowledge either is circular or else leads to an infinite regress.

An argument of this sort might be used to support the skeptic's claim that one can never know which, if any, of one's beliefs amount to knowledge. But this is not how the Mādhyamikas themselves see such arguments. For one thing, the skeptical conclusion requires the additional assumption that one can only know some statement *p* if one knows that one knows *p*—an assumption that neither the Mādhyamikas nor their opponents seem to have held. Second, nowhere do the Mādhyamikas appeal to the sorts of error possibilities that are the skeptic's stock in trade, such as perceptual illusions, hallucinations, dreams, and the like. Indeed, the Mādhyamikas do not deny that, conventionally, certain procedures can

count as means of knowledge. What they deny is just that anything could ultimately be a means of knowledge, that anything could have the intrinsic character of reliably causing veridical beliefs as part of its mind-independent essential nature. The Mādhyamika epistemological stance seems to be that something can be a means of knowledge only through its relations to other things that are themselves equally empty of intrinsic nature. The resulting view may have its affinities with some forms of skepticism (particularly Pyrrhonian skepticism). But its chief concern is not to call into question the possibility of knowledge, but to deflate the pretensions of a certain sort of epistemological realism.

### THE MĀDHYAMIKAS AS MYSTICS OR AS QUIETISTS?

Two interpretations of emptiness seem more firmly grounded in the self-understanding of the Mādhyamika tradition. The first sees emptiness as leading to a kind of mystical silence. Mādhyamika arguments are said to demonstrate that no set of concepts can ever adequately represent the world. This realization is said to then usher in a nondiscursive grasping of the nature of reality (perhaps through a kind of intuition that is cultivated in meditation). On this interpretation, emptiness serves to point to an ultimate reality that lies beyond the reach of philosophical rationality. The second of the two, by contrast, sees emptiness not as pointing to an ineffable ultimate, but as indicating that the very idea of an ultimate nature of reality is incoherent. The exercise of philosophical rationality leads not to the silence of the beyond, but back to the conventional. For Mādhyamika dialectic reveals the error in the notion of an ultimate truth that represents how things are independently of all facts about the cognizer. This shows that truth can only be transactional, a matter of what facilitates interactions among creatures like us. The notion of a truth that potentially outstrips all our conceptual resources is revealed to be no more than a useful fiction.

The "mystical silence" reading of emptiness has been championed by T. R. V. Murti (1955) and David Seyfort Rugg (1977) among others. The second reading is commonly called a quietist interpretation, since it grows out of the attempt by Frederick J. Streng (1967) to read elements of the later Ludwig Josef Johann Wittgenstein into Nāgārjuna. But as developed by Tom J. F. Tillemans (2002), it has clear affinities with both antirealist and minimalist conceptions of truth. Both readings may be seen as seeking to explicate the claim that insight into emptiness results in a kind of nondual awareness.

Mahāyāna Buddhist texts commonly claim that final liberation from suffering requires a kind of seeing that transcends all problematic dualities. On the mystical silence interpretation it is the dualism fostered by conceptualization that is to be overcome, for without concepts one cannot make such invidious distinctions as that between cognizing subject and object. On the quietist reading it is the dualism of ultimate and conventional truth that is erased through knowledge of emptiness. Presumably, this duality is problematic because the notion of ultimate truth as correspondence to mind-independent reality fosters a subtle form of belief in a self, namely that expressed through attachment to metaphysical theories.

Each reading is not without its own difficulties. For the mystical silence view, the chief problem is to explain how Madhyamaka then differs from other views that posit an ineffable ultimate, such as the absolute monisms of Advaita Vedānta and Parmenides of Elea. For the quietist there is the difficulty of explaining how there can be truth without there being such a thing as how the world is anyway. This problem is sometimes addressed by claiming that what emptiness really shows is just that no entity has a nature that is independent of its relations to other things. But to the extent that this addresses the problem of grounding truth in mind-independent reality, it contravenes the quietist claim to be showing a way out of the trap of metaphysical theories.

### THE SVĀTANTRIKA-PRĀSAṄGIKA DISTINCTION

Modern studies of the Mādhyamikas have profited enormously from contact with the Tibetan tradition, a tradition for which Mādhyamika thought continues to play a crucial role. But there are cases in which reliance on Tibetan doxographical categories has led to distortion of the Indian Mādhyamika sources. A case in point is the alleged distinction between two schools of Madhyamaka: Svātantrika and Prāsaṅgika. This distinction was invented by Tibetan doxographers, and it is a matter of some dispute to what extent it reflects substantive differences in the views of the Indian thinkers covered by the classification. It is in any event clear that Indian Mādhyamikas did not see themselves as falling into two camps to which these labels could be applied.

Those who accept the distinction identify a dispute between Bhāvaviveka and Candrakīrti as its point of origin. The dispute concerns the proper methodology for a Mādhyamika. The arguments of Bhāvaviveka's Mādhyamika predecessors were usually expressed in the *reductio ad absurdum* (*prasaṅga*) style: The hypothesis to

be refuted (e.g., that something with intrinsic nature could be an effect) is considered and then shown to lead to some absurd result (e.g., that its intrinsic nature is actually extrinsic). Employing the methods of the Buddhist logician Dinnāga, Bhāvaviveka sought to convert such *reductios* into independent arguments (*svatantra anumāna*). Thus, one would have:

It is not the case that ultimately an entity arises from distinct causes and conditions. Because of depending on them for its nature.

Whatever depends on other things for its nature is not ultimately real, like the chariot. Candrakīrti disagrees, claiming that the Mādhyamikas may only use *reductios*. But since the two types of argument turn out to be formally equivalent once the *reductio* has been fully spelled out, it may not be clear what the dispute is actually about.

The difference Candrakīrti sees between them is this: In giving a *reductio* one need not assert anything to be the case oneself; the proponent merely shows the opponent the inconsistency in his or her view, thereby impelling the opponent to withdraw assent from his or her thesis. In the case of an independent argument, on the contrary, both the proponent and opponent must agree about such things as the subject (in this case, an entity), the pervasion (that what is dependently originated is not ultimately real), and the example (the chariot). But the Mādhyamika proponent holds that entities can only exist conventionally, while the opponent thinks some entities are ultimately real, so the two sides do not agree about the subject. And likewise for the other elements of the argument that require consensus. From the perspective of the Mādhyamikas, the opponent is simply, hopelessly wrong about everything. So there can be no common framework for resolving their disagreement. Instead, the Mādhyamikas should just give their opponents the rope with which to hang themselves.

### SYNCRETISM IN MADHYAMAKA

One may wonder if the opponent will be so obliging toward a proponent who seems to speak a different (and perhaps unintelligible) language. But there may be a deeper point here. Those Tibetan commentators such as Tsong-kha-pa (1357–1419) who align themselves with the Prāsaṅgika allege that Svātantrikas have not fully realized emptiness, since they continue to posit intrinsic natures, albeit at just the conventional level. And it is true that those Mādhyamikas who are identified as Svātantrikas exhibit a tendency toward syncretism, seeking to incorporate the views of overtly metaphysical Buddhist schools within an overall Mādhyamika framework.

This tendency is especially clear in Śāntarakṣita (eighth century), who embraces Dharmakīrti's formulation of the Yogācāra school's subjective idealist ontology and epistemology. But it can already be seen in Bhāvaviveka, who champions the Sautrāntika school's realism about physical objects and its associated representationalist theory of sense perception. In neither case is the other school's view identified as anything more than the best way of representing conventional truth. As Mādhyamikas, Śāntarakṣita and Bhāvaviveka remain committed to the position that the only ultimate truth is that there is no ultimate truth (i.e., that all things, including emptiness, are empty). Still, they do take a position on the question whether external objects exist conventionally.

Candrakīrti does as well. He sides with Bhāvaviveka in rejecting the idealist view. But his reasons are different. Where Bhāvaviveka tries to answer Yogācāra arguments against the existence of physical objects, Candrakīrti simply dismisses the arguments. For him such arguments can only show that physical objects are ultimately empty—something a Mādhyamika already knows. But by the same token mental states (which the idealist thinks are real) are equally empty. So the availability of philosophical arguments against the conventional belief in external objects cannot show that they are not conventionally real. While Bhāvaviveka thinks the use of philosophical rationality can lead to improvements in one's conventional account of the world, Candrakīrti thinks it can only lead to the ultimate truth of emptiness. Conventional truth neither needs nor can it sustain either refinement or defense at the hands of philosophers. It is just simply that which is given through the everyday practices of ordinary people.

Given this difference in attitude, one can see why Svāntarikas might be described by their critics as positing conventionally real intrinsic natures. It is, after all, philosophical analysis that gives rise to the demand for things with intrinsic nature. So if philosophical rationality is allowed to play a role in shaping one's conventional worldview, the resulting theory will be committed to there being such things, the things at which analysis stops. And to Candrakīrti, Bhāvaviveka's demand that the Mādhyamikas give independent arguments and not mere *reductios* looks like a requirement that the Mādhyamikas construct a philosophically defensible version of the conventional truth. This will inevitably lead in the direction of syncretism, and with it the danger that the Mādhyamikas will become ensnared in metaphysical theories. The Prāsaṅgika side in this dispute is not without its dangers as well though. For on its account, conventional

truth does not allow of progressive improvement, it can only be utterly overthrown. The result would seem to be a strong form of relativism about conventional truth. And an opponent could always use this to turn back the Prāsaṅgika's *reductio* arguments, in effect saying to the Mādhyamikas, "We simply disagree about whether there is an inconsistency in my position, and in such matters there is no right and wrong." What this dispute brings out, then, is a tension that seems inherent in the concept of truth, a tension that is also reflected in current debates between realists and antirealists.

Indian Madhyamaka came to an end in the late twelfth century, when all Buddhist philosophical activity ceased in India following the Turkish invasion. Madhyamaka has continued to play a prominent role in Tibetan Buddhism to this day. It also enjoyed some popularity among Chinese Buddhist philosophers, playing an important role in the development of the Huayan school. Perhaps a case might even be made for its having had a profound impact on Chan Buddhism. Chan formally eschews the study of precisely those sorts of doctrinal texts that form the core of Mādhyamika practice. But it does make extensive use of paradox in some of the methods it has devised for helping the adept attain enlightenment. Analysis of the structural features of those paradoxes and their uses might reveal more than merely superficial resemblances with the dialectical strategies of Madhyamaka.

YOGĀCĀRA

The origins of Yogācāra Buddhism—one of the two mainstream schools of Indian Mahāyāna Buddhism (the other being Madhyamaka)—are obscure, but tradition credits its founding to two half-brothers, Asaṅga and Vasubandhu (c. fourth century). Many of Yogācāra’s distinctive terms and models, such as eight consciousnesses, three self-natures, and *vijñapti-mātra* (explained later in this entry), had already appeared in certain Mahāyāna scriptures such as the *Saṅghinirmocana Sūtra* (Sūtra elucidating the hidden connections), but the expansion of those ideas in the prolific writings of Asaṅga and Vasubandhu gave the school its foundation. Yogācāra attempted to absorb the full range of teachings and practices that had arisen over the centuries since the time of the Buddha—from the elaborate scholastic schemas of the Abhidharma schools to the reformulation of Buddhist doctrine in terms of emptiness (*śūnyatā*) posed by early Mahāyāna literature—to fashion a detailed, systematic, coherent, step-by-step path to unsurpassable complete awakening (*anuttarā-samyak-saṃbodhi*) and nirvāṇa.

Since Buddhism identified the root problem as ignorance, Yogācāra devised methods for uncovering and correcting the cognitive errors inherent in the way the mind works. Yogācāra’s sustained attention to cognitive issues such as consciousness, perception, psycholinguistic conditioning, and epistemology, coupled with claims such as “external objects do not exist,” has led some to misinterpret Yogācāra as a form of metaphysical idealism. For Yogācāra, however, consciousness is not an eternal sub-

stance or immutable substrate. Rather, individual consciousnesses arise and cease each moment because of everchanging causes and conditions, these discrete moments of consciousness linked in sequential causal chains, giving the illusion of a continuous self-identity or selfhood. Overcoming ignorance meant first eliminating this false view of self and subsequently seeing things as they truly are. Yogācāra developed perhaps the most sophisticated examination and description in all of Buddhism of how the mind works—in psychological, epistemological, logical, emotional, cognitive, meditative, developmental, and soteric modes.

## HISTORICAL OVERVIEW

Though the historical details of the lives of the early Yogācāras have been obscured by later legends—some so unreliable that a few scholars swayed by miscues theorized that tradition had conflated two different Vasubandhus who lived at different times, a theory no longer accepted—enough of their prolific writings has survived (though not always in the original Sanskrit) for us to appreciate the depth and complexity of their thinking. Legend holds that Asaṅga, after years of fruitless meditation, was about to give up when the future Buddha, Maitreya, appeared to him, instructing him in hitherto unknown scriptures. Some of his writings are ascribed to Maitreya, others to Asaṅga himself (the Chinese and Tibetan traditions differ on which texts to ascribe to which). Most important among his works are the encyclopedic *Yogācārabhūmi* (Stages of yoga practice), *Mahāyānasamgraha* (Compendium on Mahāyāna), *Abhidharmasamuccaya* (Abhidharma compilation), and *Madhyānta-vibhāga* (Differentiating the middle from the extremes). Vasubandhu at first studied Vaibhāṣika Buddhism at its headquarters in Kashmir, composing a detailed summary of its doctrines titled *Abhidharmakośa* (Treasury of Abhidharma). Under Asaṅga's influence, Vasubandhu became a Yogācāra, adding a commentary to his *Kośa* that critiqued the Vaibhāṣika positions, incorporating ideas and phraseology found in Asaṅga's works. Along with many commentaries on Mahāyāna scriptures (most no longer extant), his most important works are his commentary on *Madhyānta-vibhāga*, *Triṃśikā* (Thirty verses), *Viṃśatikā* (Twenty verses), and four of the earliest Buddhist treatises on logic.

Yogācāra subsequently split into two wings: (1) an Abhidharmic wing primarily engaged in commentary writing and doctrinal exposition, its main figures being Sthiramati (sixth century), Dharmapāla (sixth century), and Xuanzang (seventh century); and (2) an

epistemological-logic wing that for centuries became the vanguard of Indian epistemology and logic, its main figures including Dignāga (fifth century), Dharmakīrti (seventh century), and Ratnakīrti (c. eleventh century). By the seventh century Yogācāra dominated the leading Indian Buddhist centers at Nālandā and Vālabhi. Texts like the *Laṅkāvatāra Sūtra* blended Yogācāra with *tathāgatagarbha* (Buddhahood-potentiality) thought.

Translators introduced Yogācāra writings to China in the early fifth century, where it dominated for the following two centuries. It became influential in Korea and Japan in the seventh century, and though it eventually was overshadowed by other forms of East Asian Buddhism that themselves were offshoots of Yogācāra-*tathāgatagarbha* hybrids, periodically East Asians have renewed interest in Yogācāra. Yogācāra was also influential during the formative years of Tibetan Buddhism, and has remained part of the Tibetan Buddhist curriculum until the present.

## VIJÑĀPTI-MĀTRA

The core of Yogācāra doctrine is expressed by the term *vijñāpti-mātra*, usually translated “consciousness-only” or “representation-only.” Despite repeated strenuous denials in Yogācāra texts that *vijñāpti-mātra* means that only consciousness exists or that consciousness alone is real, over the centuries many non-Yogācāras have interpreted it that way. Since consciousness (*vijñāna*) is the domain in which all contemplation, examination, theorization, and knowledge about reality occurs, its facticity is undeniable, though, for Yogācāra, consciousness is neither ultimate reality nor the solution to life's problems. Rather, consciousness itself is the problem. The grammatically causative term *vijñāpti* means “what makes known,” signifying that consciousness actively constructs the appearances it apprehends and appropriates. Since to appear within a perception or cognition means to appear within an act of consciousness, we are usually not directly aware of anything outside of consciousness. Whatever one is aware of or thinks about necessarily occurs to one only within consciousness. *Vijñāpti-mātra* means that we confuse our imaginary projections for the world itself. Since this confusion pervades ordinary mental operations, it ends only when those operations cease.

Yogācāra explains that each individual is a distinct consciousness stream or mental continuum (*citta-santāna*) that, like a river, changes moment by moment in accord with causes and conditions, giving the illusion of a continuity of identity despite the perpetual reconfiguring of the water. It has no fixed, invariant identity or self.

The stream flows from moment to moment and from life to life. These distinct consciousness streams can affect and communicate with other streams, learning from and teaching each other, and mutually influencing each other. Hence, Yogācāra rejects both solipsism and the idea of an overarching universal mind. If, as solipsists claim, each mind is closed off from others, how could Buddhas and others teach anyone anything? If we cannot learn from others, then Buddhism itself becomes superfluous and untenable. If everything shares a single mind, then that mind would have to be either deluded or enlightened. If deluded, then enlightenment for individuals would be impossible; if enlightened, then either unenlightened individuals should be impossible, or else they are already enlightened just as they are, which again would render individual practice and Buddhism meaningless.

*Vijñapti-mātra* is not the denial of anything real outside an individual mind. Even *rūpa* (sensorial materiality) is accepted, since physicality is known through the senses and cognition; sensations should not be confused, however, with abstract concepts or theories about materiality. Sensation is real (Asaṅga calls the five senses pure); conceptualization is not real in the same way, especially when it imports notions of selfhood or substantialism, or posits appropriational entities. That would be the sort of error the term *vijñapti-mātra* is designed to caution against.

Everything we know, conceive, imagine, or are aware of, we know through cognition, including the notion that entities might exist independent of our cognition. Cognitive objects appear within acts consciousness; Yogācāra never denies that. By definition, they cannot appear elsewhere. What Yogācāra denies in the term *external object* is the concept of externality, not the object itself. Although the mind does not create the physical world, it generates the interpretative categories through which we know, classify, and interact with the physical world, and it does this so seamlessly that we mistake our interpretations for the world itself. Those interpretations—conditioned conventionalisms expressed as desires, preferences, and anxieties—become obstructions (*āvaraṇa*) that prevent us from seeing what is actually the case. In simple terms, we are blinded by our own self-interests, our own prejudices, our desires. We think like others because we have undergone similar conditioning and reinforce that conditioning by congregating with those who are like-minded. Such consensus is bred from tautology, not universality.

Unenlightened cognition is an appropriative act. Yogācāra texts do not speak about subjects and objects; instead, perception is analyzed in terms of sentient beings and cognitive fields, or, more often, graspers (*grāhaka*)

and what is grasped (*grāhya*). The Buddhist notion of karma is intimately connected to the notion of appropriation (*upādāna*). As explained in the earliest Buddhist texts, suffering and ignorance are produced by karma. Karma is defined in Buddhism as any intentional activity of body, speech, or mind. Intention is the crucial factor, and, since intention is a cognitive condition, whatever is noncognitive must be also nonkarmic and nonintentional. Thus, by definition, whatever is noncognitive can have no karmic implications or consequences. Intention means to direct one's attention toward some thing or purpose, to desire something. Physically, linguistically, or mentally, we try to "get it."

Put another way, only cognitive acts can have karmic repercussions. Cognitive acts include meaningful bodily gestures that communicate intentions (such gestures are also called *vijñapti*). Thus, to overcome ignorance and suffering by eliminating karmic conditioning, Buddhists need only focus on what occurs within the domain of cognitive conditions (*citta-gocara*).

Categories such as external object and materiality (*rūpa*) are cognitive constructions. *Materiality* is a word for the colors, textures, sounds, and so on that we cognize in acts of perception, and it is only to the extent that they are perceptually apprehended and ideologically grasped, thereby becoming objects of attachment, that they have karmic significance. Materialism is not the problem. There is nothing intrinsically good or bad about gold, for example; rather, our ideas about gold's value and uses, which we project and then act upon, lead to good or bad consequences. The incessant propensity (*anuśaya*) to appropriate what consciousness projects is the problem. These projections are not just things, but moral qualities, status, ideals, religious and national doctrines and identities, the holding of opinions, whatever we can make our own, or make ourselves to be. For Buddhism, attachment to ideas and theories is much deeper and more problematic than attachment to physical things, since the latter is rooted in and merely an expression of the former.

A deceptive trick is built into the way consciousness operates at every moment. Consciousness constructs a cognitive object in such a way that it disowns its own creation, pretending the object is "out there," to render that object capable of being appropriated. Even while what we cognize is occurring within our act of cognition, we cognize it as if it were external to our consciousness. This is called *abhūta-parikalpa*, imagining something exists in a locus in which it is absent. Realizing *vijñapti-mātra* means exposing this trick at play in every act of consciousness, catching it in the act, as it were, and thereby

eliminating it. Consciousness engages in this deceptive game of projection, dissociation, and appropriation because there is no self. The most deep-seated erroneous view to which sentient beings cling, according to Buddhism, is *ātmadr̥ṣṭi*, the view that a permanent, eternal, immutable, independent self exists. No such self exists, and deep down we know that. This makes us anxious, since it entails that no self or identity endures forever. To alleviate that anxiety, we attempt to construct a self, to fill the anxious void, to do or acquire something enduring. Projecting objects and ideas that one can appropriate and cling to is the way consciousness contributes to this project. If I own things (e.g., ideas, theories, identities, and material objects), then “I am.” If there are eternal or universal objects that I can possess, then I, too, must be eternal or universal. To undermine this erroneous appropriative grasping, Yogācāra texts say: Negate the object, and the self is also negated (e.g., *Madhyānta-vibhāga*, 1:4, 8).

Intentional acts also have moral motives and consequences. Since effects are shaped by their causes, an act with a wholesome intent would tend to yield wholesome fruits, while unwholesome intentions produce unwholesome effects.

### THREE NATURES

Yogācāra devised a model of three self-natures (*trīsvabhāva*) to explain *vijñapti-mātra* more concisely. The pervasive mental constructions that obstruct our view of what truly is the case are called *parikalpita* (imaginative construction). The actual webs of causes and conditions at play are called *paratantra* (dependent on other [causes]). Other-dependence is so-called to emphasize that no thing exists independently, self-caused, eternal, invariant; everything arises dependent on causes and conditions other than itself, in the absence of which it ceases to be. Ordinarily, *paratantra* is infested with *parikalpita*. *Pariniṣpanna* (consummation) is the removal of *parikalpita* from *paratantra*, leaving only purified *paratantra*.

Since the notion of self-nature is itself a *parikalpita* idea that presumes selfhood, it, too, must be eliminated. Thus, the three self-natures are actually three nonself-natures (*tri-niḥsvabhāva*). *Parikalpita* is devoid of self-nature since it is unreal by definition. *Paratantra* lacks self-nature, since other-dependence precludes self-nature. *Pariniṣpanna*—the Yogācāra counterpart to the Madhyamaka notion of *śūnyatā* (emptiness), which signifies the lack of self-nature in everything—is defined as the absence of self-nature. Thus, the three self-natures are ultimately understood as three nonself-natures.

### EIGHT CONSCIOUSNESSES

According to Buddhism, consciousness arises as a by-product of the contact of a sense organ with its corresponding sphere of sense objects. The eye contacting visibles (e.g., colors and shapes) produces visual consciousness; likewise for the remaining four senses (hearing, smell, taste, and touch). The mental organ, *manas*, operates similarly. Coming into contact with the sphere of mental objects (*mano-dhātu*), mental consciousness (*mano-vijñāna*) arises. Hence, there are six sense organs and six corresponding sense realms, which, combined with the six types of resultant consciousnesses, makes eighteen factors altogether. Yogācāra accepted these eighteen factors but found them inadequate to explain several issues that had become important for Buddhists, including the sense of selfhood, appropriative propensities, continuity of experience, and how projection worked. To address these issues, Yogācāra expanded the mental level, resulting in eight rather than six types of consciousness. *Mano-vijñāna* became the sixth sense organ, a kind of empirical consciousness that discerns mental objects as well as the activities of the five senses; *manas* became the seventh consciousness, responsible for appropriating experience as “mine” and thus infesting experience with a sense of selfhood (thus also called *kliṣṭa-manas*, “defiled mind”). The eighth consciousness, *ālaya-vijñāna*, was a novel innovation.

Yogācāra used a seed metaphor to describe the process of karmic conditioning. Experience engenders a seed that is planted out of sight (unconsciously retained in the *ālaya-vijñāna*), where it remains latent until catalytic conditions bring it to fruition (karmic result, *vipāka*), engendering new seeds of the same type. This was a powerful metaphor in agrarian societies. As a warehouse (*ālaya*) to these seeds, the *ālaya-vijñāna* was called the all-seeds consciousness (*sarva-bījaka-vijñāna*). Since it was the conduit and repository of their fruitions, it was also called *vipāka-vijñāna* (karmic requital consciousness). Since the *ālaya-vijñāna* always operates, even when the other seven consciousnesses temporarily cease (e.g., in deep sleep), it was also called foundational consciousness (*mūla-vijñāna*). Although it stores karmic seeds and engenders their projection, the *ālaya-vijñāna* is a karmically neutral mechanical process (*anivṛta*, *avyākṛta*). *Manas* appropriates the activities of the other consciousnesses, thinking they are “my” experience, and appropriates the *ālaya-vijñāna* as a “self.”

Karmic continuity ceases by overturning the basis (*āśraya-parāvṛtti*), in which the *ālaya-vijñāna* and the other consciousnesses cease to function. The conscious-

nesses (*viñāna*) lose their discriminative (*vi-*, compare the English prefix *dis-*) projective propensities and become direct cognitions (*jñāna*). *Ālaya-viñāna* becomes the “great mirror cognition” (*mahādarśa-jñāna*), no longer appropriatively storing or engendering new seeds; instead, like a mirror, it reflects everything impartially without attachment. *Manas* loses its self-prejudicial nature and becomes the equalizing immediate cognition (*samatājñāna*), equalizing self and other. *Mano-viñāna*, which discriminates cognitive objects, becomes immediate cognitive mastery (*pratyavekṣamā-jñāna*), and properly discerns the particular and general characteristics of things. The five sense consciousnesses, now unhindered by the mental obstructions of the sixth and seventh consciousness, become immediate cognitions that accomplish what must be done (*kṛtyānuṣṭhāna-jñāna*), thereby engaging the world effectively. Yogācāra texts differ on which overturning occurs at which stage of practice, but they agree that full enlightenment entails accomplishing all of them.

#### ASAṄGA ON LANGUAGE AND NONLINGUISTIC THINGS

In his texts—notably the *Madhyānta-vibhāga* and the *tattvārtha* ([relation of] referents and real things) chapter of the *Yogācārabhūmi*—Asaṅga challenges the Madhyamaka claim that emptiness (*śūnyatā*) is the ultimate and final position, the true Middle Way, not by denying the importance and validity of emptiness, but by taking the analysis one extra step. For Asaṅga, emptiness is a tool for eliminating false views, especially the false view of selfhood attributed to beings or things. But once these views are emptied, something remains, namely reality understood as emptied of false conceptualizations.

A quick summary of the *tattvārtha* chapter of Asaṅga’s *Yogācārabhūmi* may illustrate how he refashioned rival teachings, in this case redefining emptiness (*śūnyatā*) and the Middle Way, while providing a useful summary of his philosophy. For Madhyamaka the Middle Way (*madhyamā-pratīpad*, from which Madhyamaka derives its name) entails that all things are empty (*śūnya*)—meaning they are devoid of self-essence or own-being (*svabhāva*)—because they are dependently arisen from causes and conditions that are themselves empty. Thus, existent things are conventionally real but ultimately empty.

Asaṅga responds by describing four types of people, each experiencing a different phenomenological sphere of reals (*tattva*) and conceptual-linguistic referents (*artha*): (1) ordinary people, (2) philosophers, (3)

Hīnayāna adepts, and (4) Mahāyāna adepts, the latter denoting accomplished Bodhisattvas and Buddhas. The first are naive realists, immersed in a cognitive field of compulsive presuppositions (*nīścītādhimukti-gocara*), who accept things as established by convention. What appears to be real to an ordinary person has been conceptually and linguistically constructed from one’s own discriminative imaginings (*vikalpa*) and remains unquestioned. Philosophers apply rational epistemological methods to logically investigate things and accept as real what has been logically proven by an articulate, discursive person. Hīnayāna adepts who have eliminated the affective obstructions (*kleśāvaraṇa*) realize there is no real referent corresponding to the notion self. They see a person as the five aggregates only (*skandha-mātra*; the five are form, hedonic tone, linguistic conceptualizing, embodied karmic conditioning, and consciousness), conditionally arisen, devoid of an imagined self.

By seeing that not only people, but all things lack selfhood, Mahāyāna adepts eliminate all obstructions to knowable realities (*jñeyāvaraṇa*). Asaṅga then enters a detailed discussion on the relation between the linguistic ideational sphere (nominal reality, *prajñapti*) and its cognitive basis (nonarticulable, nonconceptual things, *vastu*), providing numerous reasons for why they are not reducible to each other, nor entirely separable from each other. For Asaṅga emptiness signifies cleansing cognition of erroneous conditioning and views, so that reality is cognized nonerroneously. Emptiness is not a final state, but a purificatory, antidotal process that eliminates erroneous conceptualizations; once they are eliminated what remains is reality. Since this remainder is nonconceptual and therefore nonlinguistic, it cannot be adequately rendered in words without re-reducing it to the conceptual sphere.

Put simply, to perceive something blue is nonlinguistic (and hence indescribable to a blind person), though one can conceive of it as “something blue.” The concept *blue* is neither the same nor different from the perception. Without *vastus*, referential articulations (*abhilāpya*) would have no basis; without such articulations, the nature of *vastus* could not be defined or intellectually understood. To think that *vastus* are merely nominal realities is more pernicious than believing in self, Asaṅga argues, since believing in self is to be mistaken about only one type of knowable, whereas to reject all *vastus* is to be mistaken about everything. Not holding the extreme views that (1) nonexistent things (like self) exist or (2) that all cognizables are nonexistent is, for Asaṅga, the true

Middle Way. Neither *prajñapti* nor *vastu* is rejected completely or accepted naively.

In his *Madhyānta-vibhāga*, implicitly deploying the theory of three natures to explain Buddhist practice, Asaṅga illustrates how emptiness and cultivating positive insight (*pariṇiṣpanna*) act as an antidote (*pratipakṣa*) to the pervasive false mental constructions (*parikalpita*) one projects as lived experience, resulting in reality being experienced just as it is (purified *paratantra*). In the *Mahāyānasamgraha* Asaṅga asserts that bondage and liberation cannot be explained coherently without reference to the *ālaya-vijñāna*, since it conveys the seeds and habits (*vāsanā*) that make bondage and liberation possible. Even brief contact with true Buddhist teachings (*saddharma*) may instill a propensity (*śruta-vāsanā*), outside one's conscious awareness, toward enlightenment and Buddhahood. Asaṅga claims this propensity, called *mano-jalpa* (mental murmuring), is utterly different from and irreducible to the *ālaya-vijñāna*; it gradually destroys the *ālaya-vijñāna* from within, like a germ infecting a host. Eliminating the *ālaya-vijñāna* results in Buddhahood. To label Asaṅga an idealist would be a gross mischaracterization.

#### VASUBANDHU'S TWENTY VERSES

In the *Viṃśatikā* (Twenty verses) Vasubandhu, following Asaṅga's lead, refutes the realism of naive and philosophical realists. The realists assert that the objects we perceive exist outside of consciousness, which is the reason that these objects remain stable through (1) time and (2) space; (3) different people can have differing perceptions of a thing and yet reach a consensus about it; and (4) the objective world operates by determinate causal principles, rather than imaginary, ineffective fantasies.

Vasubandhu addresses each of these four claims with numerous counterarguments, including an analogy to dreams. In dreams seemingly external objects appear as if in time and space, even though no actual external object is present to cause them, thus proving that while consciousness is a necessary and sufficient condition for objects to appear in perception, the presence of actual external objects is neither necessary nor sufficient. For Vasubandhu, as for Asaṅga, the perceptions of ordinary people are like a dream, a mental projection based on conditioned predispositions. That different beings have differing perceptions of the purportedly same thing proves this. Updating Vasubandhu's example, that flies and humans perceive and react to excrement in radically different ways, demonstrates that what each perceives is a projection based on its own conditioning, or its own

mental seeds (*bījās*) acquired from past experiences (perhaps in past lives). Moreover, karma (action) is collective, in that we gravitate toward beings or types who perceive as we do, erroneously justifying the seeming universality of our group perspective.

Thus, the varying perception argument supports rather than undermines the Yogācāra position. Note that the dream example and the varying perception example not only neglect to disprove that something outside the activities of consciousness may play a role in its perceptions; on the contrary, both require that there be such a thing for the examples to make sense at all. The observation that dreams imitate waking perceptions minus the presence of actual objects requires that we appreciate the contrast; the object in contention between flies and humans is obviously not reducible to the perceptual projections of either.

Vasubandhu is not arguing for either a subjectivism or a metaphysical relativity, but he is pointing out that we mistake our imaginings for reality, obstructing our view of things as they are. Projective imaginings blocking our vision can have powerful karmic consequences, as Vasubandhu shows in his response to the realist's claim about causal efficacy. He uses the example of a wet dream. Though the erotic cognitive object is a mental construction, without an actual external or physical corresponding object present, the imaginative act causes actual seminal emission, a physical effect produced outside the dream and recognized as such on awakening. The monastic vow of celibacy treats wet dreams as an infraction of the monastic code. Even though dreams are only fantasies, they have real karmic consequences. The deluded mind produces real effects that can only be fully known after awakening, once delusion has ceased. Awakening means enlightenment—the term *bodhi* (awakening) can also mean “enlightenment”—the cessation of the deluded mind. Even though we act in a collective deluded world of our own construction, our actions have real causal consequences.

The realist objects that objects perceived while awake seem stable in time and space, whereas objects in dreams do not. Vasubandhu replies that objects and events seem less clear and consistent in dreams because one's mind is overcome by sleepiness so one is not “thinking clearly.” Furthermore, one does not know that the objects in a dream are only dream-objects until one awakens. Vasubandhu's reply to the question of whether we can know other minds extends the dream analogy: Even our own minds are opaque to us since our mental capacities are dim and sleepy. However, one who is awakened (the

literal meaning of *Buddha*) can know other minds more clearly than we know our own. Not only can we know other minds (if we awaken), but we constantly influence each other for better and for worse (though we may not notice that within our individual dreams). Thus, karma is intersubjective. Moreover, since the more awake one is the more causally effective one's mind becomes, sages and buddhas can exert powerful effects on the world, including devastating destruction, and even life and death.

## THE FIVE STAGES

Precise details of the stages in which the mental stream is purified of pollutants (*āsrava*), filtering out karmically unwholesome seeds while nourishing and fortifying the wholesome ones, vary across different Yogācāra texts. A five-stage model is found in several foundational texts and has become the standard account:

(1) During the provisioning stage (*saṃbhārāvasthā*) one gathers and stocks up on “provisions” for the journey. The provisions consist of orienting oneself toward the pursuit of the path and developing the proper character, attitude, and resolve to accomplish it. This stage commences at the moment the aspiration for enlightenment (*bodhicitta*) arises.

(2) Next is the experimental stage (*prayogāvasthā*), in which one converts Buddhist theory into praxis. *Prayoga* also means “intensifying effort,” or applying oneself with increasing vigilance. While increasing meditative abilities, one begins to suppress the grasper-grasped relation and commences on a careful and detailed study of the relation between things, language, and cognition.

(3) The next stage is deepening understanding (*prativēdhāvasthā*), also called the Path of Corrective Vision (*darśana-mārga*). One works on realizing the emptiness of self and *dharmas* while reducing the obstructions (*kleśāvaraṇa* and *jñeyāvaraṇa*). This stage ends when one acquires some insight into non-conceptual cognition (*nirvikalpa-jñāna*), that is, cognition devoid of interpretive or imaginative overlay.

(4) In the Path of Cultivation (*bhāvanā-mārga*), non-conceptual cognition deepens. The grasper-grasped relation is utterly eliminated, as are all cognitive obstructions. This path culminates in the full Overturning of the Basis, or enlightenment.

(5) In the final stage (*niṣṭhāvasthā*) one abides in unsurpassable complete awakening and engages the world through the four immediate cognitions (mir-

ror cognition and so on). All of one's activities and cognitions are postenlightenment (*prṣṭhalabdha*), and one compassionately endeavors to alleviate the suffering and ignorance of others.

## BUDDHIST EPISTEMOLOGY

For Buddhist thinkers philosophy should aid one in eliminating suffering and obtaining happiness. They maintain that to achieve those ends, one must eliminate ignorance (*avidyā*), a fundamental mental flaw that is suffering's basic cause. Although variously construed ignorance inevitably involves the mistaken belief that a fixed, unchanging personal essence, or *ātman*, lies at the core of each person's identity. Hence, to eliminate ignorance one must eradicate that belief, and to do so Buddhist philosophers stress the importance of seeing things as they are (*yathābhūtarasāna*), a corrective cognitive state through which one knows that persons necessarily lack essence. The need to give an account of such a state leads to a concern with epistemology in Buddhist thought from its earliest period (500 BCE–100 CE) in South Asia.

Although early Buddhism evinces a nascent epistemology, precise and sophisticated accounts of knowledge do not begin until adequate tools are developed by South Asian philosophers, primarily non-Buddhists, starting no later than the first century CE. The Buddhist theorist Vasubandhu initially appropriates these tools, but Dignāga first employs them in a manner that reflects all the issues addressed by later Buddhist epistemologists. Finally, Dharmakīrti modifies and expands Dignāga's work in such a manner that all subsequent Buddhist epistemologists in India and Tibet cast their work as interpretations of Dharmakīrti's philosophy. Hence, for the purposes of this entry, *Buddhist epistemology* refers to the thought of Dharmakīrti and his subsequent interpreters in both India and Tibet, where epistemological works continue to be composed. In their voluminous writings Buddhist epistemologists express a variety of competing views developed in distinct historical contexts. Nevertheless, they largely agree on the following central theories and principles.

## MODEL OF KNOWING

Buddhist epistemologists examine knowledge in terms of a knowledge-event or act of knowing (*pramiti*). Their account rests on the claim that the mind consists of a series of causally related, instantaneous mental moments, each of which is ontologically irreducible. Thus, as a mental event the act of knowing is ontologically identical to a mental moment. The act of knowing occurs when the mind comes into a direct or indirect causal relation with an object such that, with other conditions in place, the next mental moment contains an image (*ākāra*) of the object. Due to the ontological unity of a mental moment, the notion that the mental moment contains an image of the object is metaphorical; in fact, the image is ontologically identical to that mental moment itself. Nevertheless, from a phenomenal standpoint the act of knowing presents itself with two images, the aforementioned object-image (*grāhyākāra*) and a subject-image (*grāhakākāra*). The latter accounts for the sense of subjectivity in the act of knowing, whereas the former accounts for the content of the cognition.

On the Buddhist theory of mind all cognitions must have an object, which is to say that all cognitions have an object-image. Not every cognition, however, is an act of knowing. Instead, only two types of cognitions—perception (*pratyakṣa*) and inference (*anumāna*)—can be acts of knowing because only they can satisfy two criteria: they are reliable (*avisamvāda*) and they are motivators of action (*pravartaka*). Reliability concerns the justification of knowledge. The fact of being a motivator of action is a psychological feature that reflects teleological and ontological concerns.

## RELIABILITY

For Buddhist epistemologists, an act of knowing—whether it be a perception or an inference—is reliable in that it directs one to an object with the desired telic efficacy (*arthakriyā*). On this criterion an act of knowledge is distinguished from an unreliable cognition in one of two ways: Either it directs one to an object that can fulfill a particular goal, or it presents itself as the fulfillment of that goal. Suppose, for example, that one is cold, and that one seeks to warm one's hands at a fire. Because the hearth contains a fire that is capable of fulfilling one's goal, the perception of a fire in the hearth is deemed reliable. When one reaches the hearth, the sensation of heat on one's hands is itself the fulfillment of one's goal. Thus, that cognition of heat is also reliable.

By grounding reliability in telic efficacy Buddhist thinkers seek to justify beliefs by interpreting them as

descriptions of their objects' causal characteristics. Hence, the ultimate arbiter of a cognition's reliability is the way in which it presents its objects in causal terms. If it presents the object's causal characteristics such that the object is capable of functioning in the expected fashion, then the cognition is reliable; otherwise, it is not. In some cases the evidence for the desired functionality is given with the cognition itself: for example, the sensation of warmth requires no other cognition to verify that one is feeling warm. Such cognitions are said to be intrinsically (*svataḥ*) reliable, and this applies to all inferences and some perceptions. In other instances of perception another cognition must verify the cognition's content. One may only glimpse the fire from a corner of the room, and one must appeal to inferential evidence (such as smoke) or a subsequent perception to verify that one was indeed seeing fire. A perception that requires such confirmation is said to be extrinsically (*parataḥ*) reliable.

### PURPOSE AND MOTIVATION

Arguments for a cognition's reliability generally serve to justify a belief. Thus, one's belief that "there is a fire in the hearth" is true inasmuch as the cognition that includes that belief reliably represents the causal characteristics of the object in question. For that cognition to be an act of knowing, however, that cognition must include other dispositions. Of prime importance is the desire to know (*jijñāsa*) without which the cognition could not arise: it may be true that "there is a fire in the hearth," but without some purpose one will not have a cognitive event in which that belief occurs. Thus, for Buddhists the account of knowledge as justified true belief is inadequate if that account ignores the role played by cognitive dispositions, especially those related to purpose.

In appealing to dispositions related to purpose Buddhist epistemologists hold that the reliability of a belief shifts according to the purpose to which it is tied. One might believe, for example, that the object on one's table is an unbreakable vase, although it is in fact fragile. Relative to the purpose of containing a bouquet, the cognition in which that belief occurs is reliable, since the vase can function so as to hold flowers. But relative to the aim of cracking a walnut's shell, a cognition in which that belief occurs would not be reliable, since the vase lacks the causal capacity to crack open a nut. By thus evaluating complex beliefs within various teleological contexts, Buddhist thinkers can accept some philosophical claims in one context, while rejecting them in another—a strategy that is central to Buddhist soteriology.

In relating reliability to purpose Buddhist epistemologists argue that an act of knowing must not only be reliable but must also be a motivator of purposeful action. Frequently, this assertion is formulated as a requirement for novelty, whereby an act of knowing reveals a previously unknown object (*ajñātārthaprakāśa*). On either version—motivation or novelty—this requirement points not only to the role of purpose but also to the notion that an act of knowing reduces doubt. That is, the cognition must pass a threshold whereby the person, usually idealized as judicious (*prekṣāvanta*), is willing to act on a particular goal based on the content of that cognition. The early epistemologist Dignāga appears less concerned with the utter removal of doubt, but Dharmakīrti and most subsequent thinkers maintain that an act of knowing grants apodictic certainty, even if certainty must sometimes be supplied by a subsequent cognition.

Finally, the notion that an act of knowing must motivate action is also tied to ontological issues. The chief concern here is to eliminate the possibility that universals could be the objects of perception. As will be evident in the following text, the Buddhist strategy is to make perception the actual motivator of action, while relegating the determinate content of perception to a subsequent judgment, which is not strictly speaking the motivator.

### PERCEPTION AND ILLUSION

As one of the two types of cognitions that are both reliable and motivate action, a perception is an act of knowledge. The Buddhist model of perception is causal and eidetic: an object interacts with a sense-organ such that, with other factors in place, the next moment of mind occurs with an image or simulacrum (*sādrśya* or *sārūpya*) of the object. Unlike inference, in perception the image is produced directly by the object, and the reliability of perception is based on this direct causal relation.

As a mental moment, a perception is causally conditioned by the previous mental moment, including all the dispositions and physiological conditions that contribute to its occurrence. In a perception, however, not only the previous mental moment but also the perceived object is contributing causally to the occurrence of the perception. Hence, the causal character of the mental moment that is a perception is restrained (*niyata*) by the causal characteristics of the object to which it is in relation through the sense organ. Thus, a perception is reliable—it accurately reflects the object's causal characteristics—because the causal constraints imposed by the object on the perception's contents are indicative of that object's causal characteristics. To put it another way, the perception of blue is

a reliable indicator of its object's causal characteristics because when that content—an image of blue—is the undistorted effect of an object, it can only be produced by an object with the causal capacity to produce a blue image.

This appeal to a causal relation between perceptual content and object compels Buddhist epistemologists to face the problem of illusion. A favorite Tibetan example is the “blue snow mountain”: When one looks at a snowy Himalayan peak on a clear day, the snowcap appears blue because it reflects the sky's color. Here, the cognition is a spurious perception (*pratyakṣābhāsa*) because it lacks reliability, in that snow is not blue. But since the perceptual content—the image—is distorted by causal factors not given with the object, the content itself does not provide any basis for recognizing that distortion. Instead, some other perception or inference would need to reveal that distortion. Still, as noted earlier, some perceptions are alleged to be intrinsically reliable, such that they do not require confirmation by a subsequent act of knowing. What then would distinguish those perceptions such that, unlike the sight of “blue snow,” they could never be spurious?

Buddhist epistemologists do not provide an easy answer to this question, but their theory of perceptual judgment provides a partial response. On their view perception itself is indeterminate in that it involves no conceptual or linguistic operation. A purely indeterminate cognitive event, however, cannot be either reliable or unreliable because it conveys no knowledge about the causal characteristics of its object in relation to one's goal. Hence, the reliability of a perception consists in that it leads to an immediately subsequent perceptual judgment (*tatprṣṭhalabdhanīścaya*) that does provide that knowledge. Strictly speaking, only the judgment is reliable or unreliable, in that it only describes the object in a determinate fashion. Nevertheless, since the form of that judgment is causally constrained by the image presented by indeterminate perception, the perception itself is considered reliable.

Returning, then, to the problem of illusion, the theory of perceptual judgment means that an uninterpreted perception could not itself be an act of knowing because, lacking any depiction of its object's causal characteristics, it could not be reliable. But when the subsequent judgment describes the object, it must do so in relation to a particular goal. One explicit outcome of this in theory is that a perception may only be partially reliable in that it can lead to correct judgments in regard to one goal, but not in regard to some other goal. For example, the per-

ceptual content interpreted as “blue snow” might be unreliable in regard to one's need to identify a blue object, and yet it may still be reliable in regard to the need to identify snow. Although the implications of this claim are left covert, it seems likely that for Buddhist epistemologists one factor in the intrinsic reliability of some perceptions is that the goals in question are such that the perceptual content could never be erroneously interpreted. In other words the teleological context constrains the perceptual judgment such that incorrect interpretations of the perceptual content cannot occur in those cases.

## PERCEPTUAL JUDGMENT AND ONTOLOGY

Besides its role in intrinsic reliability, the theory of perceptual judgment is also closely allied to Buddhist ontological concerns. For Buddhist epistemologists to exist is to be knowable (*jñeya*), and since knowledge is a causal process, an existent entity must therefore be causally efficient; likewise, any causally efficient entity must exist. The paradigmatic case of an entity's causal efficiency is its capacity to produce an image of itself in a perceiver's mind, and it is for this reason that Dharmakīrti remarks, “To exist is to be perceived” (*sattvam upalabdhir eva*). Moreover, since any object of perception must exist, Buddhists are careful to exclude the possibility of perceiving any metaphysically objectionable entity, such as a fixed personal essence. Largely because a personal essence is considered a special case of a universal, Buddhists likewise reject the existence—and hence the perception—of universals. Instead, only particulars (*svalakṣaṇa*) truly exist, and particulars alone are the objects of perception because only particulars are causally efficient.

Perception cannot include universals, and linguistic or conceptual cognitions must include universals. Hence, perception must be a sheer apprehension of an object that is not linguistic or conceptual in character. But as noted earlier, the criterion of reliability requires a determinate cognition, which is necessarily conceptual or linguistic in form. Hence, on the one hand, perception must be the immediate apprehension of a particular through a nonconceptual image in the mind and, on the other hand, to be reliable and to motivate action, that nonconceptual content must be interpreted by a determinate cognition. The solution is to relegate the determinate aspect of a perception to an immediately subsequent judgment, and in doing so Buddhists avoid the notion that linguistic or conceptual entities—that is, universals—are the objects of perception.

## INFERENCE AND THE PROBLEM OF REFERENCE

Besides perception, inference is considered an act of knowing. As with perception, inference is a cognitive event in which an image of the object appears. Unlike perception, however, the image in an inference is not directly produced by the object. Instead, it bears an indirect causal relation to the object in two ways, namely, by way of the relations on which an inference relies and by way of the process of constructing universals.

The Buddhist approach to universals is central to their theory of inference because inferences are conceptual or linguistic acts of knowing. Moreover, their theory arises in response to the way their non-Buddhist rivals address the problem of reference. In short, these rivals claim that, for words to successfully refer to their proper referents, they must always have a relation to those referents and only to those referents. The word *cow*, for example, should refer only to a cow, and not to something different, such as a horse. Each individual cow, however, is different from every other cow. Hence, if the word *cow* were to stand in a direct relation to one individual cow, it should always refer only to that individual. Such would be the case because the word *cow* should never refer to something that is different from its proper referent, and if the proper referent of the word *cow* were a particular cow, then by referring to some other cow, the word *cow* would be referring to something different from its proper referent. And if the word *cow* can refer both to its proper referent and something other than its proper referent, why should it not refer to a horse?

Most South Asian thinkers solve this familiar problem in the philosophy of language by positing the existence of real universals (technical terms for which include *sāmānya*, *jāti*, and *ākṛti*). On this model, the word *cow* does not have a direct relation to any particular cow. Instead, it is directly related to the universal “cowness.” Nevertheless, the word *cow* still refers successfully to each individual cow because the universal cowness is necessarily instantiated in each individual cow. A word such as *cow* thus refers to each particular cow by virtue of the universal cowness to which both the word and each particular are related. On this view one can thus say that all cows are the same not because each individual is identical, but because each individual instantiates that one universal cowness.

This model is problematic for Buddhists because it would justify the false belief in a personal essence. That is, just as cowness is present in each different cow in time and space, so, too, a personal essence would be present in

all the different spatiotemporal instances of what people consider to be one person. To avoid this outcome, Buddhist epistemologists therefore deny the ultimate reality of universals as things in the world. Thus, for them the universe is populated by spatiotemporally unique particulars, and nothing more. All cows are in fact unique; one only thinks that they are the same because one constructs a universal or sameness (*sāmānya*) for them. So too, each spatiotemporal instance of a person is actually unique. “John” at birth and “John” at forty-five are actually different. When one constructs a sameness that warrants one’s use of the label “John,” one falsely believes that the sameness is not constructed, but real.

## THE EXCLUSION THEORY

Although Buddhist epistemologists deny the ultimate existence of universals, they nevertheless adopt their rivals’ approach to reference. They are therefore obliged to formulate a theory that, while denying the ultimate reality of universals, accounts for the way that universals may be contingently constructed so that words may refer to their referents. Buddhists develop a model known as the exclusion theory (*apohavāda*), and to do so they once again resort to causality. In brief, the sameness required to construct the universal cowness is formulated by appealing to the causal characteristics of the individuals in question. More specifically, even though all individual cows are in fact utterly unique and distinct, one may ignore the differences among them and focus instead on the way they are different or excluded from all other entities. That difference or exclusion from other entities is a matter of causality: All cows are the same in that they are all equally different from those entities that are not capable of the causal functionality that one expects when one uses the word *cow*.

Here as well, the paradigmatic case for causal functionality is a perceptual image. Thus, all cows are the same in that they produce the same effect, namely, the same perceptual image in the mind. The problem, however, is that just as each cow is a unique individual, so, too, each perceptual image should also be a unique mental particular. Hence, Buddhist epistemologists must argue that all those images are the same, and to do so they use the same reason: Those images are the same because they all have the same effect, which in this case is a second-order determination of sameness (*ekapratyavamarśajñāna*). The obvious question here is: What warrants the sameness of all those determinations? If one again asserts that they all have the same effect, then the argument ends in an infinite regress. Well aware of this

problem, Buddhist epistemologists follow Dharmakīrti's argument: The sameness of those second-order determinations is not constituted by the fact that they all produce the same effect; rather, they are counted as the same because they are phenomenally presented in that fashion. In short, each instance of the judgment, "That is a cow," just seems the same.

Dharmakīrti's answer to the problem of infinite regress may seem ad hoc, but it probably reflects a subtle approach to conventionality. In brief, Dharmakīrti apparently holds that some conventions—including causality—are so stable that they may be treated as invariable when they are used in nomological arguments about the interpretation of perceptual content. Most Buddhist epistemologists, however, do not pursue this controversial aspect of Dharmakīrti's thought and instead leave such concerns to philosophers of the *Madhyamika* or Middle Way school.

## RELATIONS IN INFERENCE

The exclusion theory and the attendant problem of infinite regress may leave several questions unasked, but Buddhists seem satisfied with its use, perhaps because it so greatly simplifies the theory of inference. On their view, all inferences take this basic form: "S is P because S is E," where S is the subject of the proposition to be proven, P is the predicate, and E is the evidence. A common example would be: "The mountain is a locus of fire because it is a locus of smoke." The success of the inference depends on the pervasion (*vyāpti*), which by the time of Dharmakīrti is understood as a necessary relationship between evidence and predicate. Dharmakīrti formulates this relation as a necessary rule of unaccompanied nonarising (*avinābhāvaniyama*). In other words the evidence cannot occur if it is not accompanied by the proximate occurrence of the predicate, or to put it another way the predicate is necessarily predicable of any subject to which the evidence is correctly predicated.

Buddhist epistemologists describe this invariable relation between evidence and predicate as being of only two kinds: either the evidence is the effect of the predicate, or else the evidence stands in a relation of identity (*tādātmya*) to the predicate. The causal relation is operative in the inference of fire from smoke; the identity relation is operative in an inference such as, "This is a tree because it is an oak."

Both in the case of the causal relation and the identity relation the success of the Buddhist analysis of inference depends heavily on the exclusion theory of meaning and reference. For example, when one infers the presence

of fire from seeing smoke, the inference succeeds precisely because of the meaning of the concept smoke. That is, an instance of smoke is excluded from all those other entities that do not have the causal characteristics of smoke. One of those characteristics is central to the inference: namely, that any entity properly called smoke is necessarily caused by an entity that can be properly described as fire. Hence, if one's perceptual content has been correctly interpreted, the identification of the object as smoke already gives one the information needed to infer the presence of fire. The same type of account holds true in the identity relation: the concept or term *oak* can only be properly applied to an entity that also has all the causal characteristics that make it suitable to be called a tree. In this way the inferential process is a matter of recognizing the relation between concepts, sometimes through the help of empirical examples.

The exclusion theory thus provides a seemingly analytical relation between the concepts employed in an inference, and inferences are therefore treated as intrinsically reliable. This suggests that inference is largely a matter of understanding the conventions that govern the use of concepts. The problem, however, is determining whether those conventions accurately depict the causal characteristics of real things. How does one determine, for example, that smoke is necessarily produced by fire? Here, one encounters the general problems of induction, and while Buddhist epistemologists propose various empirical means of overcoming such problems, it would be difficult to argue that they have fully succeeded.

## BUFFON, GEORGES-LOUIS LECLERC, COMTE DE (1707–1788)

The French naturalist and author Georges-Louis Leclerc, Comte de Buffon, enjoyed international acclaim for the artistic expression of his own grandiose, often brilliant theories and for presenting in similar fashion the discoveries of leading contemporaries, particularly in the field of natural science.

### LIFE

Born at Montbard, son of an upper middle-class magistrate, Buffon was first educated by the Jesuits of Dijon. Details about his personal life are sparse and uncertain. It is generally believed that, after studying law and despite a marked proclivity for mathematics, he went to Angers at the age of twenty-two to study medicine while indulging in botany and horsemanship. His stay ended abruptly when, presumably having killed an opponent in a duel for no verifiable reason, he set out on travels through France and Italy with the irresponsible young duke of Kingston. His mother's death in 1731 recalled him to Montbard where, as heir to her wealth, he turned the family manor into a château. Assuming the name of de Buffon, he adroitly enlarged his estates, which, in due course, were raised to an earldom.

The rest of his long life was divided between Montbard and Paris; no evidence has yet appeared supporting the belief that he also spent a year in England. When only twenty-six, he was, through influence in high places, elected to the Academy of Science after having presented a paper on mathematical probability. He was soon engaged in silviculture and publishing experiments on the means of preserving and strengthening wood, and his

reputation as a scientist was further enhanced by a translation in 1735 of Stephen Hales's *Vegetable Staticks* and, five years later, of Isaac Newton's *Method of Fluxions*, for which he wrote a much admired preface on the history of calculus.

From 1739 until his death he was curator of the Jardin du Roi in Paris, which, under his direction, expanded greatly and became an important scientific center. By 1740 he had begun work on his monumental forty-four-volume *Histoire naturelle*, the most ambitious and comprehensive history of natural science until recent times. Buffon was aided in this enormous task by reports from correspondents scattered throughout the world and by a team of highly specialized collaborators at home.

The first three volumes of the *Natural History*, including *Theory of the Earth* and *History of Man*, appeared in 1749. Published by the royal press, they were exempt from censorship. Almost immediately, however, they incurred the wrath of the Sorbonne for the bold views that ran counter to the book of Genesis. Out of deference to religious authority, Buffon penned an act of submission, only to proceed serenely in the same audacious manner.

Along with the volumes on quadrupeds (1753–1767), birds (1770–1783), and minerals (1783–1788) were the so-called *Supplements* (1774–1779), which included his justly famous work on Earth's geological periods, *The Epochs of Nature* (1778). After Buffon's death the vast project was brought to a close by B. G. E. Lacépède, with eight volumes on oviparous quadrupeds, snakes, fish, and whales.

Buffon's *Discourse on Style*, delivered upon the occasion of his admission to the French Academy in 1753, remains the best known of his shorter pieces. It contains the celebrated dictum: "The style is the man himself," the meaning of which has often been simplified to the point of misinterpretation.

### THOUGHT

Buffon's death in Paris shortly before the French Revolution was mourned by the leading journals of Europe as the passing of one of the great figures of the century. His place in the history of ideas has since been undergoing a gradual reassessment still far from settled; certain areas of agreement have, nevertheless, been established. It is generally accepted that while he often engaged in scientific investigation, either through personal observation or through wide reading, his true inclination was for generalization. Influenced especially by Bacon, Newton, Gott-

fried Wilhelm Leibniz, and John Locke, he held seminal views that frequently inspired others to push his inquiries to fruitful conclusions. He rejected the popular conception of God as the Great Clockmaker and, instead of final causes, he looked for natural causes to explain the world about him. He insisted, and the stand was unusual for the day, that religion and science should be strictly separated. Thus, he evolved the theory that our planetary system had resulted from the glancing blow of a comet against the sun's molten surface. Perhaps the most original contribution of Buffon's cosmogony to science was to have introduced a new concept of the vast expanses of geological time. His published calculation of Earth's age as some 80,000 years, rather than the traditional estimate of 6,000, was in itself a generous concession to the prevailing spirit of the day; in his unpublished manuscripts he deals with figures that run into the millions.

Not an evolutionist in the modern sense, he nevertheless persistently stressed change at least in varieties, if not in species, of animal life. This and similar propositions or speculations led Charles Darwin to acclaim Buffon as the first author in modern times to have treated transformism in a scientific spirit. Moreover, in biology he rightly opposed epigenesis to the more widely accepted preformation theory of generation, though his ideas on "inner molds," "organic molecules" and spontaneous generation have long since fallen into disrepute. "He may be said to have asked all the questions which were to be answered in the course of the succeeding century," the oft-quoted comment of Henry Fairchild Osborn, perhaps remains the best generalization to date on Buffon's contribution to posterity.

## BULGAKOV, SERGEI NIKOLAEVICH

(1871–1944)

Sergei Nikolaevich Bulgakov, a Russian economist, philosopher, and theologian, was a leading twentieth-century religious philosopher in the tradition of Vladimir Solov'ev. Bulgakov was born in Livny, Russia, the son of a priest. He attended a church school in Livny and spent four years in a theological seminary before enrolling in the faculty of law at the University of Moscow in 1890. He was graduated in 1894 and began teaching political economy at the Moscow Technical School in 1895. From 1898 to 1900 he traveled in western Europe and Great Britain, gathering material for his master's dissertation, *Kapitalizm i zemledelie* (Capitalism and agriculture; 2 vols., St. Petersburg, 1900). Through this and other writings on economic and social questions he soon acquired a national reputation. After teaching in Kiev for five years, he returned to Moscow in 1906 to become professor of political economy at the Moscow Institute of Commerce; in the same year he was elected to the second state Duma as a Constitutional Democrat. In 1912 he received a doctorate from the University of Moscow, and in 1917 he was named professor of political economy at that institution.

Although Bulgakov was a leading "legal Marxist" in the 1890s, he even then acknowledged the philosophical supremacy of Immanuel Kant and soon began to depart from orthodox Marxism on socioeconomic issues as well. In his master's dissertation he argued that Karl Marx's the-

ory of the centralization of production is inapplicable to agriculture, where small-scale production is more stable and viable than large-scale. When, in the early years of the twentieth century, Bulgakov underwent a religious crisis, he abandoned Marxism completely, first for the idealistic position represented in his book of essays, *Ot Marksizma k idealizmu* (From Marxism to idealism; St. Petersburg, 1903), and subsequently for a mystical, “Sophiological” interpretation of the Russian Orthodox faith showing the direct and extensive influence of Solov’ev and Pavel Florenskii and the ultimate influence of Plato and Friedrich Wilhelm Joseph von Schelling. In 1909 Bulgakov contributed to the celebrated miscellany, *Vekhi* (Landmarks), in which ex-Marxist Russian intellectuals, including Nikolai Berdiaev and Petr Struve, criticized the radical intelligentsia. Bulgakov first outlined his positive religious philosophy in his doctoral dissertation, *Filosofia khoziaistva* (The philosophy of the economy; Moscow, 1912) and over the years 1911–1916 he composed the work in which this philosophy received its fullest expression, *Svet nevechernii* (The unfading light; Moscow, 1917).

During the same period Bulgakov studied for holy orders, and in 1918 he was ordained a priest in the Russian Orthodox Church. He moved to the Crimea, where he became professor of political economy and theology at the University of Simferopol’, but in 1921 he lost this position because he was a member of the clergy. At the end of 1922 he was expelled from Russia along with many other non-Marxist scholars and writers. He settled first in Prague and lived from 1925 in Paris, where he took part in founding the Orthodox Theological Institute, serving as its dean and professor of dogmatic theology until his death. During these years Bulgakov wrote extensively on theological subjects and took an active part in ecclesiastical conferences in many countries, becoming an internationally known church figure. Some of his later theological works, particularly *Agnets Bozhii* (The lamb of God; Paris, 1933) and *Nevesta Agntsa* (The bride of the lamb; Paris, 1945) also carried further the development of his distinctive philosophical outlook.

Basic to this outlook is a cosmology that, although marked in its expression by obscurities and progressive modifications, centered consistently on the following themes: (1) The world, or cosmos, is an organic whole animated by a “world soul” or entelechy that is revealed in the structure, function, and connection of its parts. (2) God, or the Absolute, in creating the cosmos “out of nothing,” created it not as something external or alien to him (for then it would limit the Absolute, which is impossible), but as an emanation of his own nature; the world is God as

becoming, the divine nature fused with nothingness. (3) Mediating between the Absolute and the cosmos, uniting them both within itself, is a “third being”—Sophia, the principle of divine wisdom. As the world of Platonic Ideas, Sophia is the ideal basis of the cosmos; as the object of divine love, purely receptive and conceiving everything within herself as the womb of being, Sophia is “eternal femininity”; as the principle of the Divine within the created, she is the “world soul,” or entelechy; as a participant with the Trinity in the generation of the cosmos, she is a kind of “fourth hypostasis” in God. In his later works Bulgakov distinguished between the “divine Sophia” in God and the “created Sophia” in the cosmos, but he still emphasized their ultimate metaphysical identity and thus the consubstantiality of God and the cosmos.

Bulgakov resisted the pantheistic implications of his position, preferring to call it a form of panentheism, and strove to provide solutions to the chief philosophical problems it raised, such as the problems of evil and human freedom. He attributed evil to the nothingness or nonbeing that is the substratum of the cosmos: Through the willfulness of created beings, nothingness is actualized as a chaotic force erupting into the created world, which in itself is not evil but simply incomplete. He provided for human freedom through a doctrine of self-creation: man is free even in the act by which he comes into existence, for God allows man to collaborate in his own creation; at the same time, however, Bulgakov also asserted that Sophia guides history by a kind of necessity.

Like Florenskii, Bulgakov laid great stress on the antinomic character of rationality and looked to divine revelation through religious experience for knowledge of the highest truths, but his epistemological views in general received no thorough, original development or synthesis; the same is true of his scattered treatments of ethical questions and of his aesthetic reflections—the latter appearing principally in *Tikhie dumy* (Quiet meditations; Moscow, 1918). The work Bulgakov himself regarded as his most strictly philosophical product—*Filosofia imeni* (Philosophy of the name)—was written in 1919 but first published posthumously in Paris in 1953. It is an exhaustive study of language, with particular application to theology, in which Bulgakov argued that words are not mere outward signs of meanings but are internally related to them as animate symbols.

Bulgakov’s later works abounded in imaginative theological conceptions, including a doctrine of universal salvation and original treatments of the Incarnation and of the theological differences between Roman Catholicism and Orthodoxy. Some of his theological views, par-

ticularly his Sophiology, were severely censured in the early 1930s by the Moscow patriarchate, which affirmed that the doctrine of Sophia is incompatible with the Trinitarian nature of God and that it falsely introduces a distinction between masculine and feminine principles into the divine essence.

## BULLOUGH, EDWARD

(1880–1934)

Edward Bullough was a British aesthetician and literary scholar. He taught modern languages at Cambridge University, holding University lectureships in German and then Italia. He never held a philosophy fellowship or chair, but he gave the first lectures on aesthetics at Cambridge, beginning in 1907, and was widely read in aesthetics. He also conducted psychological research on

aesthetic responses in collaboration with Cambridge psychologists.

Bullough is known in aesthetics primarily on the basis of a single article, “‘Psychical Distance’ as a Factor in Art and an Aesthetic Principle,” originally published in *The British Journal of Psychology* in 1912, in which he maintains that aesthetic experience depends on a distancing from “our practical, actual self,” thereby “permitting only such reactions on our part as emphasise the ‘objective’ features of the experience.” By means of such distance, we can escape what is merely idiosyncratic but still experience a “*personal* relation, often highly emotionally coloured,” to the object, whether work of art or nature.

Bullough’s proposal stands in the long tradition of theories of disinterestedness dating back to Shaftesbury and Hutcheson and of the “aesthetic attitude” dating back to Schopenhauer. Bullough’s innovation in this tradition is to treat aesthetic distance as a factor in both the creation and reception of art (it is obviously not involved in the creation of nature), and as a variable in the sense that different degrees of distance are appropriate for different kinds of objects, artists, and audiences. The experience of a particular object could thus suffer from either underdistancing or overdistanting. Bullough’s emphasis on the variability of distance was suggested at least in part by his experiments on different aesthetic responses to colors, reported in a series of articles from 1907 to 1910, and led him to emphasize the variability rather than uniformity of individual tastes. In this regard he distanced himself from the traditional theory of disinterestedness.

The 1912 article does not, however, fully explain the value of distancing oneself from objects. For Bullough’s fuller account of the “aesthetic consciousness” that can be produced by the proper degree of distance from an object and its value to us, one must turn to his lectures on aesthetics, which were posthumously published in 1957. Here, after a thorough review of the problems of previous approaches to aesthetics, Bullough argues that “the aesthetic attitude is neither scientific nor ethical ... neither explanatory nor final, but *contemplative*,” giving “a plasticity and relief to objects and experiences which they inevitably lose” in ordinary scientific or practical contexts, an experience we obviously enjoy (Bullough 1957, p. 75). Here again Bullough stands in a long tradition, going back at least to Kant, but his view is distinguished by his emphasis on the availability of “aesthetic consciousness” in both quotidian and artistic contexts, and on its role in the creation and the reception of works of art. Bullough also stresses in a distinctive way in which “aesthetic consciousness” is a form of “objectivity,”

although it is distinct from both scientific objectivity and from the “egotistical *subjectivity* of practical consciousness.”

Bullough’s conceptions of aesthetic distance and aesthetic consciousness were harshly criticized by later analytical philosophers, such as George Dickie. But his use of these concepts to characterize a valued form of experience and to ground the possibility of a general “aesthetic culture” going beyond the specific realm of art save his reflections from the critique that these concepts cannot yield a satisfactory definition of art proper, which was not Bullough’s goal.

## **BULTMANN, RUDOLF** (1884–1976)

Rudolf Bultmann, the biblical historian and theologian, was born in Wiefelsted, Oldenburg, Germany. He studied at Marburg, Tübingen, and Berlin and taught first at Marburg and then at Breslau and Giessen. In 1921 he became professor of New Testament studies at Marburg, where he remained until his retirement in 1951.

Bultmann’s work and the controversies it has generated are of undoubted importance for the philosophy of religion. His ventures in “demythologizing” the New Testament and in reinterpreting its content “existentially” have raised (and have tried to answer) crucial questions about the logical status of religious language and the nature of Christian belief.

### **CHRISTIAN FAITH**

Bultmann’s thought was inspired by his keen sense of the remoteness and unacceptability of the thought forms of New Testament Christianity to most people of the twentieth and twenty-first centuries. We do not and cannot see our world as a theater of conflict between supernatural powers, the demonic seeking to possess and destroy us, and God intervening to secure our salvation. Moreover, miracle stories lie at the very heart of New Testament

belief: “If Christ be not raised, your faith is vain” (1 Corinthians 15:17). Thus, the critical question is: Must a man, in order to be a Christian, commit himself simultaneously to two mutually incompatible world pictures—that of twenty-first-century science and that of first-century prescientific speculation? According to Bultmann, to attempt this is to make Christian belief unnecessarily difficult. It is equally unrewarding to view Christianity as a strictly and objectively “historical” religion and anxiously to sift all the evidence for and against the recorded events of the life of Jesus. The evidence is substantial enough to show that Jesus indeed lived and that he made a quite extraordinary impact upon certain contemporaries. But if religious faith is to stand or fall with the historicity of, say, the birth stories or the Easter narratives, if its degree of assurance must rationally be tempered with the historical probabilities, the assurance will be pitifully uncertain, and faith will almost certainly fall.

To these perplexities Bultmann offers a bold remedy. The Christian may properly grant that a very large part of the New Testament message is couched in mythical language and does not record objective history. This mythical material is not, however, an embarrassment, and it need not be discarded. It can be interpreted as indirect description not of the cosmos but of the conditions and possibilities of human existence. Historical studies derive their real seriousness not from sheer factuality but from what they discover about viable ways of life and viable options for human decision. Among such options, the Christian gives preeminence to that displayed in the accounts of the cross and the resurrection. For it is through these that God makes available a distinctively “authentic” and free mode of existence to all humanity.

### **INFLUENCE OF HEIDEGGER**

“Authentic” is Martin Heidegger’s term. It is only one of Bultmann’s many borrowings from *Sein und Zeit*. There is a prima-facie oddness here—a Christian theologian reinterpreting the New Testament teachings in terms of concepts drawn from atheist existentialism. Nevertheless, the concepts are undeniably relevant and, within limits, illuminating. There are clear and suggestive analogies between Heidegger’s general picture of inauthenticity and the New Testament’s accounts of life “in” and “after” the flesh, the life of the “natural man” who is alienated from God. In both views humans are uneasy, anxious, and guilty over their condition. If to Heidegger Angst reveals that man is “not at home” in the world, the New Testament affirms that here we have no continuing city

but seek one to come. To both we are strangers and pilgrims.

On the “authentic” type of existence, there are both marked similarities and differences in the views of Heidegger and Bultmann. Heidegger’s account centers upon a total acceptance of the fundamental conditions of our life. This involves, for any man, a realization of his own death, not as some vague, unpleasant, but indefinite future event, but as something whose constant presence, in possibility, should modify his sense of his own existence at every moment. Christianity, too, speaks of renouncing the world and a life entangled with the world, of “dying” to the life of self. It has, however—or ought to have—some very different things to say about life eternal.

Heidegger’s authentic man sees and accepts the limitations on his freedom imposed by the given circumstances of his life as so far lived (“facticity”); he sees the present moment as the locus of decision, and it is in the future that he will work out those authentic possibilities of existence for which he decides. The Judeo-Christian tradition also has a dualism of facticity and freedom: It claims both that man was created “out of the dust of the ground,” stressing the given factuality of human existence, and that God “breathed into his nostrils the breath of life,” endowing him with freedom to pursue his diverse possibilities.

How can we discover our authentic possibilities? In answering this question both Heidegger and Bultmann point to the thoroughly temporal, historical nature of human life. History discloses human possibility. For Bultmann the Christian is he who, in R. G. Collingwood’s term, “incorporates” the essentials of the New Testament story in his present thought and action.

Bultmann’s account of the human situation is, therefore, an “existential” analysis, and to call it that is to contrast it both with the findings of empirical psychology and with a philosophical analysis of nonpersonal structures. Far from being based on empirical investigations, existential analysis tries to uncover the concepts that are, and have to be, employed in any such researches—the fundamental concepts of personal existence.

But there are complexities to be noted here. Although to Bultmann the New Testament has much to say about the general human predicament, we must not analyze its discourse exhaustively as delineating permanent and universal human possibilities. The authentic life, crucially, is available to a man only by virtue of divine grace and through his appropriating the Word revealed in Christ.

## DEMYTHOLOGIZING

There is, however, an uneasy duality in Bultmann’s thought. Almost everything in the New Testament is to be understood as describing modes of personal existence, but not so the central claim of the kerygma itself, the claim that God decisively acted in Christ. This contains a reference to God that cannot be eliminated. Yet it must be noted that although Bultmann refuses to “dekerigmatize,” others (Fritz Buri, for instance) have tried to do just that. They have been unable to stop at what looks to them like a halfway house and have taken the kerygma too as material for existential analysis.

Other theologians have offered various arguments to show that Bultmann’s position is too extreme. They claim that he has underestimated the importance of objective history, that he has made too many concessions to twentieth-century skepticism, that his existentialist concepts cannot express the full meaning, the nuances, the complex mesh of associations of the biblical writings, that the myth must be kept intact.

It is not surprising, therefore, that the controversy over demythologizing has been intense and involved. This entry shall single out for brief discussion only a few of the most crucial issues, beginning with the question of Bultmann’s existentialism.

**CRUCIAL ISSUES.** (1) Without doubt, Heidegger’s existential analysis has provided Bultmann with a valuable nonmythical vocabulary, able to express an important part of the New Testament message. However, there are certainly some points at which his analyses appear to clarify the Christian position but in fact tempt a theologian to distort it seriously. For example, if Christianity were no more than a philosophy of life, then matters of objective history would not be crucial to it. So long as we knew that someone had lived roughly the sort of life Jesus allegedly lived, we could at least take the “imitation of Christ” as an ideal for human living. “Possibility,” in this rather weak sense, would be enough. But if we want to go beyond that (as Bultmann certainly does) and claim that God was actually imparting himself in a quite distinctive and decisive way in the events of Jesus’ life, then it is a matter of immense seriousness to learn what these events were. We cannot have a historical religion, in that strong sense, without historical vulnerability. For all its subtlety (most likely because of its subtlety), the existential analysis of historicity deflects attention from this uncomfortable fact.

One should not conclude, however, that Bultmann has never stated a coherent and clear position on his-

toricity and Christian belief. In *History and Eschatology* (1957) he expressed himself much more lucidly in alternative terms derived from Collingwood. But the link between his position in this book and traditional Christian theology has become very tenuous indeed. Whatever the impression we receive from other writings of Bultmann, in *History and Eschatology* the Gospel seems to be about human self-understanding from first to last; dependence on objective historicity has receded to the vanishing point.

(2) Several important and difficult New Testament concepts seem to yield very readily to existential analysis; yet these concepts remain philosophically problematic. The concept of “body” has clear existential meaning—related to Heidegger’s concept of what it is to “exist-in-a-world.” Likewise, “eternal life,” in the New Testament, characterizes a manner, or quality, of living. Yet even if much of the meaning of these expressions is translatable into existentialist language, there surely remains a vital part that is not. The existential analysis by itself cannot answer such a question as “Does our existence end with our bodily death?” Nor does it help solve the problems of meaning and logic (particularly problems of personal identity) that arise over concepts like life after death and the resurrection of the dead.

(3) Because the life and personality of Jesus play so muted a part in this theology, and because the summons to authentic existence tends to be rather individualistic in its emphasis, it is very difficult to build up an adequate account of Christian discipleship and Christian love on Bultmann’s foundations. The quality of the Christian ethical life has always been determined by the believer’s response not simply to the bare proclamation that a new life has been made available to him, but to the concrete particularities of the life and teaching of Jesus. One guesses that a theology like Bultmann’s can succeed in expressing this quality only through implicit dependence on a more conservative view of the New Testament that is still secretly operative in the religious imagination.

(4) From the philosopher’s point of view, perhaps the most urgent need is for Bultmannian theology to construct a much more precise logical map of its key concepts, myth, mythology, and analogy. “Mythology,” Bultmann wrote, “is the use of imagery to express the other worldly in terms of this world and the divine in terms of human life, the other side in terms of this side.” But Bultmann does not want to conclude that discourse about God is always, and necessarily, mythological. To speak mythologically is to represent God as a kind of superentity, observably acting upon and interacting with

natural entities. However, Bultmann has claimed (in *Kerygma and Myth*) that it is possible to speak of God’s “acts” analogically, and to do so with the help of concepts borrowed once again from the field of human personal existence.

Bultmann is here in pursuit of what may well be a valuable distinction, but it has not been at all clearly articulated. The different modes of discourse about God are not rigorously defined, and thus a good deal of uncertainty is left about appropriate tests for sense and non-sense, truth and falsity, in claims about God. It is by no means obvious, for instance, whether one can really think through those existential, “analogical” utterances about God without implicitly relying upon a mythological picture of God as a superperson and superentity. Further, since both mythological discourse and analogical discourse are indirect or oblique, we need to ask whether any direct, literal talk about God is possible, or whether it is necessarily all oblique. If it must all be oblique, the problem of how we can refer to God and relate the myths and analogies to him surely becomes unmanageable. If it is not all oblique, then we still need to discover what, and how much, can be affirmed directly and literally about God. The temptation is to resort to theological makeshifts—to analyze virtually all talk about God in terms of human self-understanding, but to rely, devotionally and pastorally, upon an unanalyzed transcendent remainder, of which, however, no clear account is given in a systematic theology.

All these puzzling instabilities in Bultmann’s thought are not careless or stupid blunders of reasoning. They are illuminating, disturbing indications of how immensely hard it is to steer between, on the one hand, a wholly secularized Christianity, a humanism, and, on the other, a religion of the supernatural and the miraculous.

## BURCKHARDT, JAKOB

(1818–1897)

The Swiss cultural historian Jakob Burckhardt was born in Basel, the son of a Protestant minister. He began his university education as a theology student, but lost his faith in orthodox Christianity comparatively early and turned instead to history. He spent part of his formative years in liberal and freethinking circles in Germany; it was in Germany, too, that he discovered and worked under Leopold von Ranke, probably the most potent and lasting influence upon his future career as a historian. On his return to Switzerland in the 1840s, Burckhardt was at first attracted to the political and religious dissensions that he found there. The violence to which they subsequently led, however, was repulsive to his temperament; and he retired to Italy, having, in his own words, “given up political activity forever.” Some time later he finally settled in Basel, dedicating himself, as professor of history and history of art, to the routine of teaching and lecturing that was to occupy him continuously up to the last years of his life.

Burckhardt’s chief writings were all published before he was fifty: *The Age of Constantine the Great* (1852), *Cicerone* (1855), *The Renaissance in Italy* (1860), and *The History of the Renaissance* (1867). In addition to these major works, he also gave a number of lectures between 1868 and 1871 on the general study of history, the notes for which were preserved and eventually published posthumously under the title of *Weltgeschichtliche Betrachtungen* (Reflections on world history). These are remarkable, not only for the prophetic insight they display in their analysis of contemporary trends, but also for the many subtle and individual observations they contain concerning the purposes of historiography and the theoretical problems it poses. They were attended by Friedrich Nietzsche, who at the time was professor of classics at Basel and whose later essay, *The Use and Abuse of History*, bears the impress of some of Burckhardt’s ideas.

Burckhardt did not regard his lectures as representing a contribution to “philosophy of history” in the then current sense. Indeed, he made it clear at the outset that he was profoundly suspicious of fashionable schemes and systems that attempted to exhibit the course of historical development as conforming to a rationally ordered pattern, and referred with special scorn to the Hegelian conception of history as the “inevitable march of the world spirit.” For him such projects were the manifestation of a crude and vulgar “optimism”; they sprang from the arrogant and egotistical assumption that “our time is the con-

summation of all time” and tended to “justify” the crimes and disasters of previous ages as necessary to the promotion of what came afterward. Burckhardt thought that the role of moral judgment in history could not be spirited away in this complacent manner; but neither, on the other hand, should the historian allow his view of the past to be distorted by moral predilections peculiar to his own time and society. What was above all requisite for true historical understanding was a contemplative, disinterested sense of the abiding and tragic aspects of human existence. Only through such detachment from prevailing concerns and preoccupations could the historian transcend the barriers that separate the mental life of one age from that of another.

Burckhardt admired Arthur Schopenhauer, and he tended to extend to the historian a position in some ways similar to that which the German philosopher had reserved for the artist. It was not merely that works of art and culture provided the historian with his most fertile material for the interpretation of previous phases of human experience; history itself was (or should be) a form of art. The mechanical piling up of the results of specialized research, dear to so-called scientific historians, was not enough; there must also be “intuition,” an imaginative ability to re-create the vision of life underlying the relics left by former times. To see the past in these terms was to see it as the expression of the inexhaustible creative power of the human mind—great individuals, great artistic achievements, great moments of civilization, all exemplified in different ways its potentialities. Scholarship, painstaking investigation, were indeed essential, but they must be properly used and directed. Only thus could a particular source or authority throw light on the character of a person, the significance of a style, the pervasive atmosphere of a period.

Ultimately, Burckhardt claimed, the subject of historical study was man himself, not the hypostatized abstractions of the philosophers of history. These philosophers, by implying that the historical process followed a fixed and predetermined course, betrayed a fundamental blindness to its most striking feature, the revelation of individual originality and creativity. Likewise, their “astrological impatience” to set limits to its future by talk of world plans and metaphysical goals was not only unwarranted; it failed to respect the very conditions of uncertainty and suspense that make human achievement possible. From this point of view, and insofar as the development of humankind is concerned, “a future known in advance is an absurdity.”

Toward the close of the nineteenth century the tide of historical speculation began to recede. Philosophers, rather than continuing to offer sweeping interpretations of the human past, turned their attention toward examining the distinctive characteristics of historical thought and inquiry. In retrospect, Burckhardt can be seen to occupy an interesting position in this development. Though not a philosopher himself, he nonetheless anticipated in his own reflections on historical procedure some of the ideas that later found philosophical expression in the writings of Wilhelm Dilthey and Benedetto Croce.

## BURIDAN, JOHN

(c. 1300–1361)

John Buridan, or Johannes Buridanus, was a philosopher and arts master at the University of Paris. Little is known

about his early life other than that he hailed from Picardy in the north of France, most likely from the town of Béthune. As a young man he studied at the Collège Lemoine in Paris, where he was awarded a benefice or stipend for needy students, and then at the University of Paris, where he earned the degree of master of arts and received his license to teach in the 1320s. He spent his entire academic career at the University of Paris, twice serving as its rector. He was a respected figure who was often asked to settle jurisdictional disputes and assist in other matters of academic governance.

Two features of Buridan's career are distinctive. The first is that he remained a teaching master in the faculty of arts without ever moving on to take a higher, doctoral degree in theology, which was the more typical career track for philosophers at the time. Why he decided not to join the more prestigious ranks of the theologians he does not say, but given his philosophical talent and stature at the University, it is safe to assume that he had his reasons for remaining where he was. One possibility, which is suggested by some of his remarks about the relation between philosophy and theology, is that he believed philosophy to be an essentially secular enterprise, which he would have to abandon if he became a theologian. Whether this represents an important first step in the direction of modernity awaits further investigation, but at the very least, Buridan was passionately committed to the autonomy of philosophy as a discipline proper to the faculty of arts, not theology.

The other distinctive feature of Buridan's academic career is that he remained a secular cleric rather than joining a religious order such as the Dominicans or Franciscans. The popularity of these orders in the thirteenth century had revitalized the study of theology, raising it to speculative heights it has not seen since. But as the larger orders began to institutionalize the training of their novices outside the university and develop their own intellectual traditions—with Thomas Aquinas being championed by the Dominicans and Bonaventure and John Duns Scotus by the Franciscans—serious disputes arose not only within religious orders but between them, a phenomenon that led to the development of different schools of philosophy: Thomistic, Scotistic, and so on (hence the term *Schoolmen*). As a secular cleric, Buridan could safely ride above these disputes, without being obliged to defend or explain the authorities of any particular tradition. This theoretical independence can be seen in the occasionally eclectic character of his remarks.

Most of Buridan's writings are in the form of commentaries on Aristotle, whose texts were the primary sub-

ject of study in the medieval arts curriculum. These commentaries survive in two forms: *expositiones* or literal commentaries and *quaestiones* or question commentaries, both of which have their origins in the way Buridan actually taught. He would begin by giving his students a line-by-line exposition of a portion of Aristotle's text and follow this up with a problem or question raised by the passage although not explicitly discussed in it, such as whether the intellect has the capacity to recall previous thoughts, analogous to the power of memory in the sensitive part of the soul (see Aristotle, *De Anima* III.5, 430a24). Arguments for and against would be inventoried, after which Buridan would give his own—sometimes lengthy—resolution of the question, with responses to arguments on the opposite side. A similar method was used by Thomas Aquinas in composing the *Summa Theologiae*.

Buridan wrote commentaries on all of the major works of Aristotle. But because he lectured more than once on a given text over the course of his long career, some commentaries exist in more than one version, and the evolution in his thinking about a particular issue can occasionally be seen in these different versions. In addition to the commentaries, he wrote a massive logic textbook, the *Summulae de Dialectica* (Compendia of dialectics), as well as a number of shorter, independent treatises on controversial topics such as the *Tractatus de relationibus* (Treatise on relations), *Tractatus de universalibus* (Treatise on universals), and *Tractatus de consequentiis* (Treatise on consequences). He was by any measure a prolific author.

Buridan's influence is immediately evident in the work of his younger contemporaries at Paris: Albert of Saxony, Marsilius of Inghen, and Nicole Oresme. But his commentaries and his *Summulae de Dialectica* continued to be read and commented on for several generations. Manuscripts and early printed editions of his writings were carried by his students and followers to the new universities in Heidelberg, Kraków, Prague, and Vienna, where they served as primary texts in courses on logic and Aristotelian philosophy. In this way, the *via Buridani* continued to influence European thought well into the early modern period.

## LOGIC

Buridan's view of logic is best conveyed by the opening line of Peter of Spain's *Summulae Logicales* (Compendia of logics), the thirteenth-century textbook on the basis of which Buridan prepared his logical masterwork, the *Summulae de Dialectica*: "*Dialectica est ars artium, ad omnium*

*methodorum principia viam habens* (Dialectic is the art of arts, having access to the principles of all other inquiries).” More than just a method, logic is the grammar of philosophical discourse, the discipline whose procedures govern rational inquiry in virtually every field investigated by the arts master, from metaphysics and cosmology to natural philosophy and ethics. Buridan composed the nine treatises of his *Summulae* so that they exhibit an orderly progression of teachings based on the proposition, beginning with propositions themselves (I), moving down to the significance and referential function of their component terms (II–IV), then back up to propositions again, considered as parts of more complex patterns of reasoning: syllogisms (V), topics (VI), fallacies (VII), and demonstrations (VIII). The work closes with a series of logical exercises (IX). The order of the *Summulae* reflects Buridan’s assumptions about the semantic character of human understanding, which is in turn a reflection of the metaphysical structure of creation.

Buridan is usually classed as a terminist logician. The terminists (sometimes referred to as the *moderni* or *moderns*) were a diverse group of thirteenth- and fourteenth-century philosophers who regarded the semantic properties of terms (literally, the “ends [*termini*],” or subjects and predicates, of propositions) as the primary unit of logical analysis. His main contribution was to modernize and systematize the old logic of Aristotle and Boethius using the newer techniques of the terminists, though in the process he offered innovative solutions to traditional problems in the philosophy of logic. His solutions to logical paradoxes such as the liar are still being discussed today. Consider, for example, the sentence, “Every proposition is false,” assuming “that all true propositions are annihilated while the false ones remain, and then Socrates propounds only this: ‘Every proposition is false’ ” (*Summulae* 9.8, seventh sophism). Is Socrates’ proposition true or false? Buridan argues that it is false, and his reasoning shows his mastery of the semantic nuances of the question. “Every proposition,” he says, “virtually implies another proposition in which the predicate ‘true’ is affirmed of the subject that supposits for [the original proposition]” (*Summulae* 9.8, seventh sophism). Thus, for the truth of any proposition P, it is required not only (1) that the subject and predicate terms of P stand for the same thing or things, but also (2) that P imply another proposition, “P is true,” which must also be true—otherwise there would be a true antecedent and a false consequent. Accordingly, the constituent terms in the proposition uttered by Socrates—“Every proposition” and “false”—stand for the same things, since in the

posited case, “all true propositions are annihilated and the false ones remain, and then Socrates propounds only this: ‘Every proposition is false.’” So the first condition is satisfied. But the implied proposition, “P is true” (where P is the name of “Every proposition is false”), is false because its constituent terms, “Every proposition is false” and “true,” do not stand for the same thing, since *ex hypothesi*, P stands for the antecedent proposition “Every proposition is false,” not for things that are true. But this gives us a true antecedent and a false consequent, and so the consequence does not hold. Therefore, the sophism is false.

## METAPHYSICS

Buridan viewed metaphysics as the highest form of philosophical inquiry, yet his *Questions on Aristotle’s Metaphysics* is among the shortest of his commentaries. There appear to be two reasons for this. First, he is not optimistic about the possibility of humans coming to know the ultimate nature of reality in this life because he doubts whether people are ever in a position to be acquainted with the natures or essences of things as such. Most of the time one must make do with inferences based on sense, memory, and experience, and the latter experience shows that even the firmest empirical conviction is subject to revision. Second, Buridan is adamant that metaphysics belongs to philosophy, not to theology, and hence that it cannot take its principles or starting points from Scripture or religious doctrine: “metaphysics differs from theology in the fact that although each considers God and things that pertain to divinity, metaphysics considers them only as regards what can be proved and implied, or inductively inferred, by demonstrative reason. But theology has for its principles articles [of faith], which are believed quite apart from their evidentness, and further, considers whatever can be deduced from articles of this kind” (*Questions on Aristotle’s Metaphysics*, I.2). This leads him to assert the autonomy of philosophers—and implicitly of the arts masters as well—in a rather striking way: metaphysics, or philosophical wisdom, cannot be ordained by theology because its methods, which are rooted in its principles, are different. Philosophy is accordingly not inferior to theology, just different. This was an important step toward the modern view of philosophy as a secular enterprise.

Buridan was also a nominalist, though it is better to think of late-medieval nominalism as a parsimonious way of doing philosophy than as a commitment to denying the existence of real or Platonic universals. The method in Buridan’s metaphysics is his logic. He tries

wherever possible to apply the *Summulae*'s analytical techniques to the interpretation of Aristotle, and his approach is critical in that it tends to view traditional questions in metaphysics as based on confusions of logic or language. Thus, when asked whether universals really exist outside the soul, he replies by clarifying the meaning of the common term *universal* with respect to its correlative terms, *individual*, *particular*, and *singular*. His rejection of realism is expressed in the same fashion: universal terms have no ultimate significate, nothing outside the soul they can make known as such. What such terms mean is other terms: the primary signification of *universal* is "predicable of many," which makes it a term of second intention, or a term of terms, since only terms are predicable. Likewise, when the term *universal* occurs in a proposition, it signifies not a *what* but a *how*, that is, how one conceives of something—in this case, that the term so designated is "indifferent to many suppositis," or individuals.

Clearly, Buridan thinks that the careful and systematic analysis of language is the best way of dealing with such metaphysical problems. The trouble usually begins with untutored persons who think that each and every substantive term must correspond to a thing, or that true predication must involve the real inherence of attributes in subjects rather than making the more modest assumption that the subject and predicate terms simply stand for the same thing(s).

## NATURAL PHILOSOPHY AND ETHICS

Buridan's natural philosophy and ethics are also shaped by the methods of the *Summulae*. Thus, his treatment of infinite magnitudes in his *Questions on Aristotle's Physics* focuses on clarifying the different senses of the term *infinite*: nothing is infinite if by that one means an actually existing infinite magnitude, although one can always imagine a magnitude greater than the one being considered, and do so without limit. The concept of infinity is thereby redeemed for natural science as a mode, or way of thinking.

Buridan also played a key role in the demise of the Aristotelian picture of the cosmos in the later Middle Ages. His major contribution was to develop and popularize the theory of impetus, or impressed force, to explain projectile motion. Rejecting the Aristotelian idea of *antiperistasis*—according to which the tendency of a moving projectile to continue moving (think of a ball after it has left the hand of a thrower) is due to a proximate but external moving cause (the air surrounding it, in this case)—Buridan argued that only an internal

motive force, transmitted from the mover to the projectile, could explain its continued motion. The theory did not originate with Buridan, but he is perhaps the first to have seen that a force of this kind need not be self-dissipating: "[A]fter leaving the arm of the thrower, the projectile would be moved by an impetus given to it by the thrower," he says, "and would continue to be moved as long as the impetus remained stronger than the resistance, and would be of infinite duration were it not diminished and corrupted by a contrary force resisting it or by something inclining it to a contrary motion" (*Questions on Aristotle's Metaphysics*, XII.9). This is a long way from Aristotle, and not all that far from Galileo.

Despite its revolutionary implications, Buridan did not use impetus to transform the science of mechanics. He remained unapologetically Aristotelian in other respects, continuing to hold, for example, that motion and rest are contrary states of bodies. He should instead be thought of as someone who tried hard to reshape Aristotelian physics in the face of an increasingly mechanistic worldview.

Buridan's method in natural science is empirical in the sense that it emphasizes the evidentness of appearances, the reliability of a posteriori modes of reasoning, and the application of naturalistic models of explanation—such as the concept of impetus—to natural phenomena. Purely theological considerations are dismissed as irrelevant: "[O]ne might assume that there are many more separate substances than there are celestial spheres and celestial motions, viz., great legions of angels [*magnae legiones angelorum*], but this cannot be proved by demonstrative arguments originating from sense perception" (*Questions on Aristotle's Metaphysics*, II.9). Buridan concedes that an omnipotent God could deceive people in ways they could never detect, but this is tempered by his confidence, for which he cites empirical evidence, that people's ordinary powers of perception and inference are sufficiently reliable to make "the comprehension of truth with certitude possible for us" (*Questions on Aristotle's Metaphysics*, II.1). He had little patience for skeptical arguments (such as those he believed were advanced by his Parisian contemporary, Nicholas of Autrecourt), objecting that it is absurd to demand that all knowledge be demonstrable by reduction to the principle of non-contradiction. Natural philosophy is about what happens for the most part, assuming the common course of nature.

Despite Buridan's prolific output, stellar reputation, and profound influence on later thinkers, most philosophers know of him only in connection with Buridan's

Ass, the traditional example in which a donkey starves to death because it has no reason to choose between two equidistant and equally tempting piles of hay. This is doubly unfortunate because this example is nowhere to be found in Buridan's writings, though there are versions of it going back at least to Aristotle (see *De Caelo* 295b32). The best explanation of its association with Buridan is that it began as a parody of his account of free choice by later critics, who found absurd his idea that the will's freedom could consist in inaction, or more specifically, in its ability to defer or send back for further consideration any practical judgment that is not absolutely certain. But Buridan's Ass, which is apparently possessed of reason, would have surely seen the good in ceasing to deliberate once his hunger or thirst became too acute, and would have permitted his sensory appetite to lead him to whichever appeared first.

## BURKE, EDMUND

(1729–1797)

Edmund Burke, the British statesman and political philosopher, was born in Ireland to a family of modest means. His mother's family was Catholic, his father's Protestant. He was raised a Protestant and educated at a Quaker school and at Trinity College, Dublin, where he took the equivalent of a first-class honors degree in classics. He went to London to read law but was never called to the bar. He devoted most of his time to authorship and literary journalism. Robert Dodsley, a leading London bookseller of the time, loyally backed him; by 1757, Dodsley had published two books by Burke, *A Vindication of Natural Society* (1756) and *Philosophical Inquiry into the Origin of Our Ideas on the Sublime and the Beautiful* (1756), had given him employment as editor of *The Annual Register*, and had contracted to pay him £300 for an *Abridgement of the History of England*.

*A Vindication of Natural Society* is a satire on the views of Henry St. John Bolingbroke. It claimed to be a recently discovered work by Bolingbroke and was designed to ridicule the idea that the rise of civilized society is attended by misery and suffering. The parody was written with such conviction, however, that many

assumed it was in fact the work of Bolingbroke, and even when it was known that Burke was the author, some critics still thought it was a sincere expression of his true opinion.

Burke's book *On the Sublime and the Beautiful* is more important; indeed, it might well be said to signalize the point at which aesthetic taste in England changed from the classical formalism of the earlier years of the eighteenth century to the romanticism of the later years. Burke attacked the rationalist, classicist notion that clarity is an essential quality in great art. He argued, on the contrary, that what is greatest and noblest is the infinite, and that the infinite, having no bounds, cannot be clear and distinct. He argued that the imagination, moreover, is most strongly affected by what is suggested or hinted at and not by what is plainly stated. Burke also maintained that fear plays a large part in our enjoyment of the sublime. Such fear is diminished by knowledge, but sharpened by veiled intimations. Obscurity, not clarity, is the property of the most powerfully moving art; and, Burke added, "It is our ignorance of things that causes all our admiration and chiefly excites our passions."

Both of Burke's first two works were well received, but neither set him on the road to any further achievement. The *Annual Register* was a success, although Burke regarded it as mere hackwork. He never finished the projected *History of England*. Burke's growing interest in questions of ethics and politics provided him, in time, with an escape from the frustrations of Grub Street. He entered the House of Commons at the age of thirty-seven, and this new life brought him satisfactions he had never known in his earlier career. He became an outstanding parliamentarian; what distinguished him and made him a philosopher among politicians, however, was his capacity to look beyond the matters of the day and to articulate general principles in terms of which he believed the problems of the day should be judged.

A diligent study of Burke's letters and manuscripts brings home the extent to which his approach to politics was a religious one. What is often spoken of as his "empiricism" appears in this light to be better described as Christian pessimism. As a Christian, Burke believed that the world is imperfect; he regarded his "enlightened" contemporaries' faith in the perfectibility of man as atheistical as well as erroneous. Thus, whereas the fashionable intellectuals of his time looked for the progressive betterment of the world through the beneficent influence of Reason and Nature, Burke maintained that the moral order of the universe is unchanging. The first duty of rulers and legislators, he argued, is to the present, not to

the future; their energies should be devoted to the correction of real ills, not to the promotion of an ideal order that exists only in the imagination.

Burke put great faith in the inherited wisdom of tradition. He held that the moral order of the temporal world must necessarily include some evil, by reason of original sin. Men ought not to reject what is good in tradition merely because there is some admixture of evil in it. In man's confused situation, advantages may often lie in balances and compromises between good and evil, even between one evil and another. It is an important part of wisdom to know how much evil should be tolerated. To search for too great a purity is only to produce fresh corruption. Burke was especially critical of revolutionary movements with noble humanitarian ends because he believed that people are simply not at liberty to destroy the state and its institutions in the hope of some contingent improvement. On the other hand, he insisted that people have a paramount duty to prevent the world from getting worse—a duty to guard and preserve their inherited liberties and privileges.

These considerations explain the so-called inconsistencies often attributed to Burke, who supported the movement for the independence of Ireland and the rebellion of the American colonists against the English government, but bitterly opposed the French Revolution. The reason for this seeming inconsistency was that Burke regarded the Irish movement and the American rebellion as actions on behalf of traditional rights and liberties that the English government had infringed on. The French Revolution was quite different, he argued, because it was designed to introduce a wholly new order based on a false rationalistic philosophy. Burke did not object to a resort to force as such; it was the aims of the French revolutionists to which he objected. Similarly, Burke approved of the English Revolution of 1688 because he saw it as designed to restore the rights of Englishmen and to secure the hereditary succession to the throne. The French Revolution, on the contrary, was intended to establish the so-called rights of man and the republican ideals of liberty, equality, and fraternity at the expense of personal property, religion, and the traditional class structure of a Christian kingdom.

In one of his most celebrated works, *Reflections on the Revolution in France* (1790), Burke attacked those of his contemporaries who made an abstraction of liberty, and who invited people to seek liberty without any real knowledge of what they meant by it. He claimed that he himself loved "a manly, moral, regulated liberty as well as any gentleman in France," but he would not "stand for-

ward and give praise” to an “object stripped of all concrete relations” and standing “in all the solitude of a metaphysical idea.” As for equality, Burke insisted that it was contrary to nature and therefore impossible to achieve; its advocates, moreover, did “great social harm,” for by pretending that real differences were unreal, they inspired “false hopes and vain expectations in those destined to travel in the obscure walk of laborious life.” Burke dismissed talk of fraternity as so much “cant and gibberish”; such splendid words were simply the pretexts of the French revolutionists; the causes of the French revolution, however, were “men’s vices—pride, ambition, avarice, lust, sedition.”

Burke’s view of the ancien régime in France was in many ways a romantic one; he was certainly no less a “man of feeling” than was Jean-Jacques Rousseau, whom he detested. But Burke was essentially a religious man living in a rationalistic age. Although he often spoke the language understood by that age—the language of calculation, expediency, utility, and political rights—he had a mind that his contemporaries, and many others, could not readily comprehend. Burke was conscious, above all things, of the reality and unavoidability of evil, and was thus led to claim that the only hope for humankind was to cling to safeguards that had stood the test of time. His hopes for bliss lay in heaven; on earth, his policy was to defend the tolerable, and sometimes the bad, against the immeasurably worse.

Until recently Burke was considered too unsystematic, too empirical, too “unphilosophical,” and too much of a theorist to deserve serious attention. His conservative views were uncongenial to left-wing historians, such as Harold J. Laski and Richard Wollheim, who found him inconsistent. In 1948, however, the Sheffield Public Library (Yorkshire, England) acquired the Wentworth Woodhouse manuscripts, and the largest known collection of Burke’s private papers became available to scholars for the first time since the writer’s death. The study of these papers did much to enhance Burke’s reputation as a political philosopher of signal importance and originality.

## BURLEY, WALTER

(c. 1274–c. 1345)

Walter Burley, renowned logician, natural philosopher and theologian, was born in 1274 or 1275, perhaps at Burley-in-Wharfedale or Burley, near Leeds, in Yorkshire, England. He studied and taught both at Oxford (c. 1294–c.1309) and at the University of Paris (c.1309–1327). Based in England from 1327–1341, he perhaps spent his last years in retirement in southern France and Italy (1341–1344).

### OXFORD

Burley was a master of arts by 1301 and is mentioned as a fellow of Merton College in 1305. He appears to have heard John Duns Scotus lecture on the *Sentences*, probably in the academic year 1298–1299, and adopts some Scotistic positions in later works: that being *qua* being is the primary and adequate object of the intellect, and that the intellect understands the singular as singular. If Bur-

ley began to study theology at Oxford, he and William of Ockham, whose studies began c.1307–1308, may have been fellow students. Burley's writings from this period, as Jan Pinborg (1937–1982) has rightly observed, "comprise an almost complete course of logic," including *Quaestiones in librum Perihermeneias* and *Quaestiones super librum Posterior Analytics*, as well as treatments of specific topics, *De suppositionibus* and *De consequentiis*. There are commentaries on Aristotle's natural philosophy as well, including *Questions on the De anima of Aristotle*, Book 3.

## PARIS

Burley's career in Paris, assuming some prior study of theology, could be reconstructed as follows. Between 1309 and 1314 he was an *auditor* of lectures on the scriptures and the *Sentences* of Peter Lombard, from 1314 to 1317 a *biblicus* (lecturer) on the scriptures, and from 1317 to 1318 a *sententiarius* although his lectures on the *Sentences* are lost. The *Tractatus Primus*, however, recounts a controversy on accidental form with his master, Thomas Wilton, which arose out of his *principium* on Book IV. Its argumentation exhibits a layering of logic and physics in a way that makes Burley a precursor of the Oxford *calculators*, such as Richard Swineshead and John Dumbleton (fourteenth century). In support of his claim that contrary forms, such as hot and cold, belong to the same ultimate species, he argues first *from logic* that things equidistant from an extreme are of the same species. Then, *from Aristotle in natural philosophy*, he argues that if a cooled body is immediately reheated, at some instant, *B*, preceding the first instant the body is cold, *A*, it will have a degree of heat, and at some instant, *C*, succeeding *A*, it will have a degree of cold, both of which degrees will be formally equidistant from maximum heat and thus in the same species. This argument also reflects contemporary debates over first, the *latitude* of forms, the intensive range of possible degrees that an instance of a species of quality may possess; and second, the *first and last instants* of change, the subject also of his *disputatio* at Toulouse, *De primo et ultimo instanti* of the same period.

In 1321, now a priest, he received his last leave of absence for two years of study and had completed his studies by the end of 1323 at the latest. He is referred to as *doctor of sacred theology* in 1324. His teaching career was short since he had left Paris by the beginning of 1327.

## BURLEY AND OCKHAM

Perhaps in the same year (1317–1318) that Burley was lecturing on the *Sentences* at Paris, William Ockham was

doing likewise at Oxford. It is clear that from his first exposure to Ockham's *Sentences* commentary, Burley found it necessary to oppose him on a number of important issues in logic and natural philosophy. It was not a one-sided engagement. Ockham borrows from Burley's *Tractatus primus* (before 1324) in his *Quaestiones* on the *Physics*, which Burley in turn uses and criticizes in his own final commentary on the *Physics*, the first six books of which were written after 1324–7. In the *Summa logicae* Ockham both uses and attacks Burley's *De suppositionibus*. Burley counterattacks in his second version (after 1323) of *De puritate artis logicae*. While Ockham's *Logic* is organized in the traditional way around terms, propositions, and arguments, Burley's is organized around the general rules of consequences, thus giving priority to propositional logic.

Burley's explanation of the supposition of terms differs from Ockham's, who holds that first, universals do not exist in re, and second, that they are not constitutive parts of the essence of individuals. On the contrary, Burley holds that universals do exist in re although not apart from singulars. Therefore, according to Burley, when the term *human* in a sentence has *simple supposition* or stands for what is common or universal, it stands for what it primarily signifies: the humanness in Socrates or Plato. For Ockham, however, when *human* has simple supposition, it stands for a common concept, humanness in the mind. The only thing a term can signify or refer to is the individual, for instance when *human* supposits *personally* for Socrates, Plato, and so on. Burley eventually ceded ground to Ockham on the issue of universals as constitutive parts, holding that the universal form merely discloses the individual's essence (for instance, human). Ockham's position that universals are only general concepts implies that science, which is of the universal, must be about spoken, written, and mental propositions while for Burley, science is founded on *real propositions*, that is, propositions whose subjects and predicates are real entities, either singular or universal, but whose copulas are purely mental.

As well as resisting Ockham's reduction of res to singular things, Burley objects to Ockham's reduction of Aristotle's categories to substance and quality. In his *De formis*, (c. 1324–1326), he holds that quantity is a form separate from the quantified body, and he also argues that motion is a form over and above the body in motion, increased and decreased by a succession of specifically distinct forms (*De intensione et remissione formarum*, written after 1323). This explanation, which can be called a *succession* theory, extends to all changes in the degree of a qual-

ity a thing may possess: how the just person comes to have more justice, or that something cold becomes somewhat hot. Every increase in justice or heat, every acceleration of motion, results from the acquisition of a new, more perfect form and the loss of the old, less perfect form.

## ENGLAND

Burley's departure from Paris was coincident with the coronation of Edward III (1312–1377), who sent him with a deputation in February 1327 to the papal court in Avignon and again in 1330, now as one of the king's *beloved clerks*, men in the royal service, usually of humble beginnings, who were often the king's agents on diplomatic missions. Again, from September 1338 until Easter 1339, Burley went "beyond the seas on the king's service" (*Calendar of Patent Rolls*, 1338–1340, p. 123).

Burley's academic career ended when he left Paris, and it seems that he had no significant scholarly projects in hand during the next seven years. However, some time after Richard Bury was enthroned as bishop at Durham in 1334, Burley became a member of his household. Bury's patronage and the intellectual energy of the circle he gathered around him would fuel Burley's renewed career as a scholar.

Between 1334 and 1337 Burley completed a commentary on Books 1–6 of the *Ethics*, added Books 7 and 8 to his final commentary on the *Physics*, and revised his commentary on the *Ars vetus*. He began to revise the commentary on *Ethics* 1–6 and add a commentary on 7–10 in 1338–1339. In the commentaries on the *Physics* and *Ars vetus* are found Burley's references to the *moderni*, those thinkers encountered first during his Paris years, who threaten the purity of the font of all philosophy: Aristotle. The doctrines that Burley identifies as being those of the *moderni* are not confined to any single philosophical discipline, and appear, by Burley's account, to form a systemic threat to philosophy itself. His commentary on Aristotle's *Politics*, begun in 1338–1339, is, along with his *Ethics* commentary, heavily dependent on Thomas Aquinas's expositions of those works (written between 1269–1272). Nevertheless, they contain doctrines original with Burley, for example, in the *Politics*, that of the "co-rulership" of kings with those who are "their friends and the friends of the government" (fol. 186r) and doctrinal divergences from Aquinas, for example, in the *Ethics*, the role of the speculative intellect in understanding the precepts of natural law (1500, fol. 103r).

Upon completion of the four expositions of Aristotle (c.1340), Burley, who was now in his mid-sixties, appears

to have sought some disengagement from the rigors and antagonisms of scholarly life, which may have led to his journey to Italy, probably in 1341.

## SOUTHERN FRANCE AND ITALY

In 1341 Burley engaged in a *disputatio de quolibet* in the arts faculty at Bologna, an event that has been connected with his supposed Averroism. Burley was not an Averroist, however, if this term implies someone who adopts positions contrary to the Christian faith on the authority of Averroes. This is clear from the beginning of his career in his questions on *De anima*, Book 3, where he concludes that "neither is the material intellect one in all, nor also the agent intellect" (3.44). Then in Paris, where his master was the Averroist Wilton, his short work *De potentiis animae* reiterates this position.

The *De vita et moribus philosophorum* was long thought to have been the fruit of Burley's retirement in southern Europe. However, large sections from it are found in a manuscript dated 1326, when Burley was in Paris, which, together with the claim that no attribution of the work to him is earlier than the fifteenth century, has led to a presumption against Burley's authorship of this immensely popular work. Nevertheless, this evidence is not conclusive, and given his habits of appropriating large amounts of text from other authors and frequently reworking his own texts, it is not impossible that the *De vita et moribus philosophorum* passed through Burley's hands at some point in its history.

On 23 November 1343, Burley was in Avignon to present a copy of his commentary on the *Politics* to his old Parisian acquaintance Pierre Roger, now Clement VI (1291–1352). This gift, complete with an elegant letter and a miniature showing the presentation, could have been both in appreciation and expectation of further patronage. Indeed, Burley obtained the rectory at Great Chart, Kent, on 19 June 1344, the last date he is known to have been alive.

Walter Burley exerted considerable influence both on his contemporaries and on philosophical thought into the sixteenth century, to which the number of early printed editions of his commentaries on Aristotle testify. This influence may be attributed, firstly, to the originality and the clarity of the positions he maintained in the controversies of his day, both in logic and natural philosophy. He contributed significantly to the debates concerning supposition theory, consequences, *obligationes*, and *sophismata*. In natural philosophy his theory of the *first and last instants* of change, which distinguishes between *permanent* and *successive* things or states, becomes a stan-

dard view, and the *succession* position, which he defends in his classic work, *On the Intension and Remission of Forms*, is frequently cited, being both opposed and defended, into the sixteenth century.

His skill at the traditional exercise of commentary on Aristotle was also acknowledged. In glossed Latin manuscripts of Aristotle and Averroes, he is one of the commentators most frequently cited, especially in connection with the *Ethics*, *Politics*, *Physics*, and logical works of Aristotle. In addition, manuscripts of Burley's commentaries on these works had a wide circulation. Early printed editions of an important collection of *auctoritates* of Aristotle and other philosophers carry his textual comments, along with those of Averroes, Robert Grosseteste, Albert the Great, and Thomas Aquinas. A revival of interest in Burley's thought, particularly his logic and natural philosophy, was underway by the 1960s, and earlier assessments of him as an unworthy opponent of Ockham have not survived a closer study of his work, which has revealed its originality and depth.

## BURTHOGGE, RICHARD

(c. 1638–c. 1698)

Richard Burthogge, the English physician and idealist philosopher, was born in Plymouth. After taking an arts degree at Lincoln College, Oxford, he studied medicine at the University of Leiden and returned to his native country to practice near Totnes in Devonshire. Of pacific and conciliatory disposition, he seems to have wavered in the religious controversy between Catholicism and Puritanism, and in philosophy, between Lockean sensationalism and Cambridge Platonism. He distinguished between

heresy and error, maintaining that the former “must be eradicated,” but the latter tolerated for humanity’s sake. His life is obscure, and little is known of it beyond that information revealed in his writings, which have a certain importance as anticipations of Immanuel Kant.

We know the world, according to Burthogge, only through our own ideas, and these do not give us its real nature. On the contrary, our ideas transform the nature of things into qualities that are purely subjective. Similarly, our values are our own; and such relative judgments as those involving categories of cause and effect, or whole and part, are arrived at through the constitution of our minds, not discovered embedded in *rerum natura*. The things themselves, though remaining unknowable, nevertheless cause ideas to arise in our minds. Here Burthogge foreshadowed Kant’s paradox of the relation between *noumena* and *phenomena*. Burthogge’s view that the human mind projects relations into the external world exemplifies his Neoplatonic streak. However, this strain was accompanied by a Lockean one which led him to assert that no confidence could be placed in an idea contradicted by sensation. Burthogge thus seems to have accepted John Locke’s theory of two kinds of ideas, those of sensation and those of reflection.

For Burthogge, there were also two kinds of truth—metaphysical and logical. Metaphysical truth is found in the conformity between our ideas and those in the mind of God; logical truth, in the conformity between our ideas and the things of which they are ideas. We cannot apprehend the former kind of truth; but since the latter involves knowing the unknowable, logical truth is reduced to consistency. Burthogge would not accept the doctrine of innate ideas, because if we had such ideas, we would be able to discover truth through introspection alone. He asserted dogmatically that there is a coherent system of ideas, duplicating the system of things, even though no individual possesses it. This system, he maintained, exemplifies God’s ideas.

In his treatise on the soul of the world, Burthogge supported the Neoplatonic concept of a plastic nature permeating the universe and accounting for its “harmony.” This is breathed into things by God himself but is not to be identified with God. If nothing else, this treatise is valuable as an example of the philosophy of nature which was acceptable to learned men of the time.

Burthogge, in sum, is one of the anomalies of the history of philosophy. He advanced startlingly “modern” ideas, side by side with fantasies no longer taken seriously.

## BUSINESS ETHICS

Discussions of ethics and business trace back to the writings of Plato and Aristotle and persist in the modern philosophical writings of Karl Marx, John Rawls, and others. Although business ethics as a specialized field of study did not emerge until the 1970s, it has grown sharply since. Philosophers, political scientists, business academics, and social psychologists have written systematically about a variety of issues such as the moral status of the corporation, the ethical foundations of the market, fairness in advertising, bribery, corporate governance, human rights and multinational corporations, and business obligations to the environment. During that time, rival theories for interpreting business ethics have emerged and been debated.

Traditional philosophers such as Plato, Aristotle, Aquinas, and Kant discuss issues of the right and wrong in economic activity. They sometimes examine specific business ethics puzzles, including the ethics of the profit motive, just price in trade, usury in lending, and ethics in negotiation. Thomas Aquinas writes at length about the

question raised first by Cicero of whether a grain merchant carrying grain to a community stricken by famine is obliged to reveal to the townspeople that other merchants behind him are bringing more grain. (Aquinas concludes that, contra Cicero, the merchant is not so obliged because no businessperson has an obligation to make a prediction which, if it turned out to be false, would rob him of a “just” price.) Moreover, questions about broad economic design are ubiquitous in the history of philosophy. For example, the issue of the communal ownership of property (in modern terms, communism and socialism) was first brought into sharp relief by Plato, was critiqued by Aristotle, and has been the subject of bitter controversy ever since.

For convenience, it is helpful to conceive business ethics as having three parts, where each part corresponds to the level of entity being analyzed: namely,

1. Individual businesspersons: including employees, entrepreneurs, investors, traders, and consumers
2. Business systems, including economic systems, cultural norms, and regulatory and judicial systems.
3. Business organizations, including corporations, trade associations, and international financial organizations such as the WTO, the World Bank, and the IMF.

Each of these three entities gives rise to both questions of right and wrong (normative issues) and to questions of fact (empirical issues). Because empirical issues are not, properly speaking, philosophical ones, and despite the fact that a large and important empirical literature now exists (authored by sociologists, economists, and business academics), this article will not attempt to analyze and explain that empirical literature.

## INDIVIDUAL BUSINESSPERSONS

Philosophers have debated the issue of the individual’s pursuit of money and profit for centuries. Plato famously denied top-status positions of ruler or guardian in his ideal state, the Republic, to business people (indeed to all owners of property) out of fear that their pursuit of wealth would corrupt their political virtue. It remained for the eighteenth-century philosopher, Adam Smith, author of the *Wealth of Nations*, to make the pursuit of profit at least moderately respectable: “It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard of their own interest. We address ourselves not to their humanity, but

to their self-love and never talk to them of our own necessities, but of their advantage.” (p. 13.)

Smith meant to draw attention to the fact that efficient economic transactions frequently rely on self-interested or profit-oriented motives rather than more noble motives such as benevolence. In his view, then, our shared goal of achieving a healthy, efficient economy justifies a significant amount of profit-seeking and self-interested activity in business. His well known “invisible hand” provides a metaphor for explaining how free markets seem to direct the inevitable, if regrettable, self-interest of businesspersons toward the common good.

One’s ethical evaluation of profit-seeking by businesspersons may be influenced by one’s antecedent commitments to ethical theory. Smith’s invisible hand relies heavily on consequential considerations: Individual acts and motives are judged ethically through their consequences. For Adam Smith, then, we should sometimes tolerate darker, self-interested motives in business so long as the consequences produce social benefits. Yet a non-consequential approach to ethics—one placing more emphasis on the quality of the motive or the principle of the individual’s action—lacks appeal directly to such a practical justification. A nonconsequential approach must justify profit-seeking, if at all, by nesting the profit motive under other, less selfish motives, such as attempting to benefit one’s family, one’s community, or society by way of pursuing profit.

Critics have objected to a broad, self-centered view of business because it appears to presume selfishness or, at the very least, psychological egoism. The focus in much of modern economics is upon developing increasingly sophisticated conceptual mechanisms to maximize the achievement of economic goods such as money, market share, or profits, all of which seem to exclude the pursuit of “higher” interests such as benevolence, social welfare, and environmental integrity. Even well-known economists such as Amartya Sen have asserted that the rational economic man, *homo economicus*, is dangerously close to being a “rational fool.” Opposing economists respond, however, that the maximization of individual preferences can easily include the satisfaction of other-oriented preferences such as helping the poor or protecting the environment. A businessperson may simply prefer saving the environment to maximizing his income. Whether such other-oriented preferences can be subsumed comfortably within the mathematically inclined methods that dominate modern-day economics remains hotly debated.

## BUSINESS SYSTEMS

Disputes are common about the extent to which self-interested motives are acceptable in economic behavior. These disputes overlap with others about the desirability of forms of business systems. Just as Adam Smith did, modern economists often stress the societal benefits of free, self-interested market activity. They note that markets free from government interference encourage free exchanges among individuals, and, in turn, business productivity. A realm of perfectly free exchanges, indeed, is often said to establish a condition called “Pareto Optimality”: a state in which no one can be made better off without someone being made worse off.

Not surprisingly, then, debates in business ethics have frequently centered on the assumptions of traditional economic theory. Microeconomic theory (which constitutes a part of what is sometimes called neoclassical economic theory) views market participants as rational agents seeking to maximize their own utility. In more recent economic writings “utility” is interpreted to mean the maximal satisfaction of one’s individual preferences.

Whether economic theory contains an embedded bias towards selfishness or not, most economists agree that market participants can encounter situations where a businessperson’s rational self-interest collides with the social welfare. One of the most notable of these situations is the “prisoner’s dilemma” discussed by game theorists, wherein rational self-interest leads each player to defect in certain contexts where cooperation is clearly the best long-term strategy for all. Because prisoner’s-dilemma situations are believed to arise frequently in business transactions, it follows that even fully self-interested businesspersons should have an interest in developing techniques of cooperation, both for themselves and others. Indeed, some philosophers have even argued that nearly all morality can be derived from such rational pursuit of self-interest through cooperation.

Others theorists argue that business ethics is simply impossible so long as market freedom is the dominant value. They assert that, in addition to problems such as the prisoner’s dilemma, persistent discrimination, sexual harassment, environmental pollution, false advertising, financial scandals, child labor, and bribery require a more of a “visible hand” (usually government’s) than an “invisible” one.

Nonetheless, even defenders of heavier regulation of business grant that often law is relatively impotent in ensuring business ethics. For example, law tends to lag behind the knowledge emerging in an industry, so that it

often comes too late to correct abuse. Scientists in the asbestos industry in the United States knew about the dangers of asbestos long before laws could be drafted to regulate asbestos harm. Moreover, laws tend to apply to the jurisdiction from which they emanate. Hence, U.S. or German law is nearly powerless to control multinational corporations operating in host countries. This point has special force in many developing host countries where laws are unsophisticated and poorly enforced.

Conflicting cultural values can frustrate ethical decisions. For example, in countries where “grease” payments are common, are businesspersons justified in paying customary bribes to government officials? Or consider issues of human rights. In countries where educational opportunities are inadequate, is it acceptable to hire a fourteen-year-old for full-time employment? Does it make a difference that, as sometimes happens, the majority opinion among adults in a given country holds that child labor is ethically acceptable? Business ethicists have proposed a variety of theories to help solve such dilemmas. Most deny that all employment conditions between the home and host countries of the corporations must be comparable; if that were true, it is argued, employees would, for example, receive exactly the same pay (or at least the same pay adjusted for cost-of-living differences) for the same work. But such wage parity would freeze out almost all foreign investment by multinational corporations in the developing world. Instead, the dominant approach has been to specify a floor of rights that apply to labor conditions and that all corporations must respect.

## BUSINESS ORGANIZATIONS

Some disagree that a corporation can ever be “responsible” or “irresponsible.” They note that corporations have exceedingly narrow personalities; they are chartered for the purpose of making money for their investors. They have, in the words an English jurist, “no pants to kick or soul to damn.” Can such organizations be said to have a conscience or moral responsibility? A few theorists regard the corporation as analogous to a large bureaucratic machine and for this reason hold it to be misleading to speak of a corporate “conscience.” In turn, they reject the very idea of corporate ethical responsibility. Only individual businesspersons, not corporations, are the true bearers of ethical responsibility. They thus deny moral agency to the corporation, denying that a corporation attains the status of an actor for which such moral predicates as “is responsible” and “is blameworthy” are appropriate. In contrast, theorists who see the corporation as either a large, abstract “person” (the corporation in most

legal systems is regarded as a *persona ficta*, a fictional person) or an organization possessing a decision-making structure capable of rational deliberation are called moral-agency theorists. They believe that corporations *are* capable of behaving responsibly or irresponsibly.

Assuming, then, that the corporation is even the kind of thing that can behave responsibly or irresponsibly, the question next arises about what a corporation's "being responsible" means. Three major approaches to this question have been offered. These may be labeled: the Classical Framework, the Stakeholder Framework; and the Social Contract Framework.

### THE CLASSICAL FRAMEWORK

The "classical" framework asserts that the moral responsibility of the corporation is nothing other than maximizing profits for its investors. This approach is associated with modern economic theory and writings of Frederick Hayek and Milton Friedman. The view holds that the sole moral responsibility of the corporation, and in turn of the managers who serve as agents for the shareholders, is to enhance the interests *only* of the owners of the corporation, the shareholders. The corporation is often seen by its classical defenders as a nexus of contracts among free-acting individuals whose peculiar advantage lies in its ability to reduce transaction costs among participants by, for example, offering organizational remedies in lieu of expensive, individual contracts among individuals.

Critics of this approach are quick to point out that corporate executives are not publicly elected officials and as such are poor choices for shouldering decision-making promoting the common good. Indeed, often corporate executives have been associated with bad choices, as when large U.S. companies in Chile decades ago helped unseat the country's democratically elected president. Do we really want, these critics ask, to entrust corporate officials with the common good?

### THE STAKEHOLDER FRAMEWORK

On the stakeholder theory, managers have obligations primarily to shareowners but also have certain ethical obligations to other groups called "stakeholders"—those who have a stake in the corporation's activity, including customers, stockholders, employees, and people who live in areas affected by the corporation. Disagreements exist about precisely who should be included as stakeholders, but almost all theorists agree that three principal groups of stakeholders are customers, employees, and stockholders. Hence, the stakeholder framework agrees with the

classical framework in assigning special importance to the interests of stockholders. The difference between the stakeholder view and the classical view, however, is that stakeholder theorists do not limit the responsibilities of corporate managers entirely to satisfying stockholder interests. Managers, in turn, must make tradeoffs among the interests of the corporation's stakeholders if they are to manage well. Some stakeholder theorists argue that by working to enhance the interests of all stakeholders, the company will also maximize the long-run interests of the stockholders. But other theorists disagree, arguing that some stakeholders must inevitably receive less in order for the stockholder to achieve a maximum return on his investment.

### THE SOCIAL CONTRACT/SOCIAL CONTRACTS FRAMEWORK

This view construes corporate and managerial obligations in terms of implicit "contracts" that exist in and among companies, industries, political units, and other relevant economic communities. For example, it has been argued that an implicit "social contract" exists between corporations and society requiring that corporations refrain from exploiting their workers or from destroying the environment; in return for the special favors it receives from society—unlimited longevity (because in most legal systems a corporation is a "persona ficta" or fictional person, it never dies) and limited liability (investors in corporations are responsible for the actions and debts of the corporation only up to the extent of their invested money). In a similar vein, it has been argued that an implicit social contract exists in most societies requiring that jobs and advancements allocated by a consideration of the qualifications of the applicant rather than his or her gender or race. Beginning in the 1990s, the idea of a social contract was extended by some to include the possibility of a multiplicity of social contracts, interpreted as the implicit set of agreements that exist within and among communities of economic actors, including corporations, trade associations, unions, industries, and professional associations.

Other business ethics issues arise for for-profit corporations. One of these is the factual question of whether a corporation that has better ethics will make more money in the long run than a corporation with worse ethics. Scores of empirical studies on this topic have been conducted, although the answer remains elusive. There is also the question of how a good corporation should be structured. What form of corporate governance should a corporation adopt? Should it include employees on its

board of directors? Should employees participate in the management of the corporation, and should they perhaps be given automatic status as shareholders?

Lurking in the backdrop of many discussions of corporate ethics is the issue of what power, if any, managers should have in making ethical decisions. Suppose, for example, that competitive market forces eclipse any moral “space” that managers might have. In such an instance, the entire notion of “business ethics” seems irrelevant. If “ought implies can” and if business managers are captive to the dictates of the market, then how can one say that they “ought” to behave well? On this view, the only way to reform business behavior is to change the surrounding market or regulatory environment—that is, to force business to recognize that its self-interest lies in ethical behavior. Most business ethicists, however, agree that corporations have at least some discretionary space. The empirical debate centers on how much.

## BUTLER, JOSEPH

(1692–1752)

Though he has not left us a complete philosophical system, Joseph Butler produced a moral philosophy that is still held in the highest esteem, and a philosophical theology of considerable long-term value. Butler was the eighth child of a prosperous draper. His father enrolled him in a dissenting academy, but he decided to join the established church and entered Oriel College, Oxford, in 1714. While still at school he had engaged in a philosophical correspondence with Samuel Clarke and at Oxford was befriended by Edward Talbot, son of the Bishop of Salisbury. Clarke and Talbot’s father were instrumental in Butler’s being appointed, after graduation, as Preacher at the Chapel of the Rolls. A selection of his sermons there was published in 1726 under the title *Fifteen Sermons Preached at the Rolls Chapel*. In 1729 a second edition appeared, with an important new preface. Bishop Talbot’s patronage continued with Butler’s entering the living of Houghton, and later that of Stanhope, in Talbot’s later diocese of Durham. While at Stanhope Butler wrote his other major work, of which the full title is *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*. This appeared in 1736, and appeared in a second edition in the same year. By then Butler had entered royal circles. His school friend Robert Secker had drawn him to the attention of Queen Caroline, who appointed him Clerk of the Closet in 1736, conversed with him frequently on theological and philosophical matters, and received the sacrament from him on her deathbed in 1737. The king promised her that he would advance Butler and made him Bishop of Bristol in 1738. There is an unsubstantiated story that he was offered the see of Canterbury in 1747 and declined it. In 1751 he

became Bishop of Durham but was not destined to preside there for long because his health rapidly declined. He died in 1752, and was buried in Bristol. He never married.

### BUTLER'S AIMS AND METHODS

Butler's personal history shows that he was, in C. D. Broad's words, "a thoroughly unworldly man whom the world treated very well." His integrity and intellectual prowess were widely recognized, and the patronage he received merely ensured that he did not suffer for them. His writings are often hard reading (and the sermons must often have been hard listening), not because they are unclear but because Butler aims at clarity exclusively and often sacrifices elegance in pursuit of it.

Butler is a Christian priest who seeks his readers' spiritual welfare. So, although his theoretical skills are considerable, they are wholly subordinated to his practical concern for the exercise of virtue and the proper consideration of the claims of religion. In urging these, however, he does not appeal to revelation. Nor does he use the *a priori* arguments in ethics and theology employed by Clarke, although he says he agrees with these. Butler's own methods are empirical ones. His ethical arguments are designed to show that the exercise of virtue is the expression of our true human nature and that vice violates it. His religious apologetic is based on the same appeal to probability that he thinks necessary for prudent conduct in everyday life. His famous attacks on selfish and hedonistic theories of human nature are designed to remove what he sees as the morally dangerous influence of faulty philosophy and are not intellectual explorations undertaken for their own sake.

### ETHICS

In the *Rolls Sermons*, Butler seeks to encourage his worldly-wise hearers to practice virtue by arguing that to do so is to live in accordance with our nature. Virtue is the natural form of life for us, and vice is unnatural. He assumes, as his hearers would also have done, at least nominally, that the motives and capacities in our nature are placed there by God for our good, and he maintains that a realistic attention to those motives and capacities will show that living virtuously represents their natural exercise.

His argument has two main stages. The first stage is an account of the components of human nature, and the second is a claim about its structure and about the implications of that structure for our conduct. He argues that our nature is misrepresented by those (particularly Hobbes) who think that we are always selfish and by those who hold

that we are always motivated by the desire for pleasure. If either of these theories were true, genuinely virtuous action would be impossible. Butler holds instead that our nature contains within it several distinct principles. There are, first, the "particular passions, appetites, and affections" such as the desires for food or possessions, or the emotions like joy or anger. There is, next, the "general affection of self-love," which is the desire for one's own long-term interest or happiness (which Butler interprets as the proper satisfaction or expression of one's own particular passions). It is self-love that causes us to restrain our present appetites in the interest of our long-term health, for example; and Butler clearly thinks of it as requiring rational calculation. Thirdly, there is the "natural principle" of benevolence. Butler uses this term as a general name to include all those desires we have for the good of others. (Scholars disagree over whether he also thinks of it as a rational principle in the same way that self-love is.) He identifies it with the love of one's neighbor.

Finally, and most important, our nature includes conscience. He describes this as "a principle of reflection in men, by which they distinguish between, approve and disapprove their own actions." Its judgments pronounce actions and motives to be "in themselves just, right, good" or "evil, wrong, unjust," and when it makes such judgments it "magisterially exerts itself." So conscience judges actions and motives in an intuitive manner and judges them as being of certain kinds, not as having good or bad consequences.

In defending his account of the components of our nature, Butler appeals primarily to our common experience. He also produces classic arguments against Hobbesian and other theories that say our motives are always selfish or are always directed toward pleasure. Experience seems to show us many examples of actions done from benevolence, and only *a priori* commitment to theory can incline us to doubt that our motives are often as they seem. Furthermore, self-love is only the motive for some actions and not for all. And although we do indeed gain pleasure from the successful pursuit of objects we desire, it is these objects themselves, and not the pleasure we derive from them, that we are pursuing.

But our nature is not merely one in which all these principles are to be found. It is one in which they form a system or constitution in which there is a built-in order of superiority and subordination. When we act in accordance with this order, we act naturally and so virtuously; when we violate it, we act unnaturally and so viciously. Butler introduces this claim with reference to the natural superiority of self-love to particular desires. If an animal

enters a baited trap in pursuit of food, it acts naturally because it follows the desire that is the strongest. But if a human knowingly satisfies a desire at the expense of his or her long-term good, then he or she acts unnaturally by ignoring the proper superiority of self-love to the ruinous desire. There is, therefore, a crucial distinction to be made in human nature between the strength of some motivating principle and its authority. In prudent behavior they coincide; in imprudent behaviour they clash.

Butler's key ethical doctrine is that of the natural supremacy not of self-love but of conscience. To live virtuously is to do what conscience approves and avoid what it disapproves. This does not mean that Butler identifies virtue with acting from duty (or conscientiousness); for conscience may well add its approval to actions that are already motivated by desire or by self-love. But when we are inclined to do something conscience rejects, or fail to desire what it enjoins, it may well have to supply its own motivating influence.

Butler thinks we usually have no difficulty in identifying right actions. He also thinks that these very largely coincide with the promptings of benevolence. But in the "Dissertation on Virtue" appended to the *Analogy*, he firmly rejects the utilitarian suggestion that virtue and benevolence can be identified. We lack the detailed knowledge of consequences for this to be true, so virtue consists rather in doing those acts that conscience approves—that is, acts of the right kind. That such acts will lead to the general good must be left to providence. He also thinks that providence must ensure that following conscience will not prove to be at odds with the demands of self-love and that benevolence (or love of neighbor) and self-love will also prove, in the end, to coincide.

Butler's case for the supremacy of conscience is therefore based on four related claims: that conscience has a natural authority, that is manifest in the way it makes its judgments; that to disregard it is to behave unnaturally; and that doing what conscience tells us is in the end for our good, even though we may not immediately discern this. These arguments are designed to persuade those who feel they know well enough what conscience tells them to do, but are still inclined to ask whether this is a compelling reason to do it. He tells them that if they recognized the place conscience has in their natures, they would see that it is.

The Rolls Sermons are notable for Butler's shrewdness, theoretical acumen, and wise moral psychology. They contain interesting and durable treatments of themes such as compassion, resentment, forgiveness, and self-deception.

## PHILOSOPHICAL THEOLOGY

Butler's ethical sermons are still widely read, and their arguments have not dated. His religious apologetic has fared less well, even though it was better known in the century after his death. The reason for its present lack of influence is the fact that the debates to which it was intended to be a contribution have long since ceased. Butler's intent in the *Analogy of Religion* was to respond to the attacks on Christian orthodoxy made by the Deists. The Deists believed that the rational order of the cosmos revealed by science shows that our world had a creator, but they rejected Christian claims to revelation, maintaining that we only have need of "natural religion"—that is, the moral guidance of conscience and a vague general reverence for God. A deity who is rational in the way the design in nature shows God to be would have no need of special revelation, miracle, or priest craft to instruct us. Butler sees it as his task to restore the traditional connection between belief in God and openness to revelation in the face of this criticism.

Butler wants to encourage his readers, whom he assumes accept the reality of God, to pay close attention to the claims of Christianity and not dismiss them. He thinks that these claims have strong evidence in their favor; but his aim in the *Analogy* is less to show this than to persuade those who doubt it that they would still be prudent to examine them with care. He repeatedly stresses the importance of the claims that Christianity makes and the rashness of disregarding them. Probability, he tells us famously, is the guide of life. This assertion, though it is not accompanied by any philosophical analysis of the concept of probability, has two implications in Butler's thought. First, just as we have, in daily life, to base decisions on likelihoods rather than certainties, so in religious matters we must recognize our intellectual limitations and base our faith on what experience and reflection teach us is likely to be true rather than demand an unattainable certainty. Second, just as in life we often have to base decisions on the fact that there is a small chance of events that it would be foolish not to be prepared for, so in religious matters we should take the claims of revealed religion seriously as long as they have some degree of probability, even if it is a very modest one.

Butler opens the first part of the *Analogy*, on natural religion, with a case for a future life, a case that makes no appeal to providence. The key argument that he uses rests on a distinction between a person's possession of powers and the possession of means for their exercise. Although physical death clearly removes all sign of the capacity to exercise our powers, we cannot assume that it destroys

those powers themselves; just as there are many examples in nature of radical transformation in the history of living creatures, so we can reasonably expect the continuance of human powers hereafter. (In a well-known appendix to the *Analogy*, “Of Personal Identity,” he further argues that our consciousness reveals to us that we are identical beings in the “strict and philosophical” sense—that is, fundamentally unchanging spiritual substances.)

In the remainder of Part I, Butler draws an analogy between the early and mature stages of human life on the one hand and the present life and the future life taken together on the other. He argues that we can discern clear signs that God teaches us the value of prudent and moral behavior in the early years of life in order to equip us to make good choices in our adult years and that we can reasonably infer that the exercise of virtue in the present life should be viewed as a training that fits us to enter the next. We are, he says, in a state of moral probation—a concept that partially anticipates John Hick’s “soul-making” theodicy of the mid-twentieth century. God’s government of the world is a “scheme imperfectly comprehended”; our ignorance of it, which Butler repeatedly emphasizes, is nevertheless only partial.

Part II defends revealed religion against deist criticisms. There should be no general presumption against miracles, because occasional divine violations of natural law might still be manifestations of “general laws of wisdom” and thus teach us, even though we could not predict them; and even though biblical prophecies may not have involved foresight on the part of their writers, if one thinks of God as the ultimate author of the book in which they are recorded, they can still reveal a divine purpose. Butler’s basic defense, however, is that the recognition of our limitations should deter us from supposing that we know enough of God’s purposes to dismiss the claims of revelation without careful study and that the overwhelming importance of Christian claims, if they are true, makes it frivolous and imprudent not to consider them with care, even if their probability may not at first seem high. He insists that with our limitations we should not expect more certainty in religious matters than we do in comparable secular ones, where our knowledge is also often merely partial—a form of argument that anticipates later demands by Christian apologists for philosophers to accord intellectual parity to the claims of religion. He also tells us that the claims of Christianity should be considered as a whole rather than piecemeal and that the case for its acceptance must be a cumulative one.

Butler’s theology suffers in retrospect because Hume has made us question whether we can properly draw the

analogy between this life and another on which the arguments of Part I of the *Analogy* depend, because only one of the terms of this analogy has been an object of experience. It has also seemed dated because the assumption of divine government that Butler and the Deists shared are no longer current. But many features of his reasoning can be detached from these two handicaps. His emphasis on our intellectual limitations, his doctrine of probation, and his insistence that the case for Christianity is a cumulative and probable one, all have present-day counterparts, and his detailed defenses of revealed religion are easily detachable from their contexts.

### **Bibliography**

There is no complete edition of Butler’s works in print at present. The best available is *The Works of Joseph Butler*, edited by J. H. Bernard, 2 vols. London: Macmillan, 1900. Next best is *The Works of Bishop Butler*, edited by W. E. Gladstone, 2 vols., Oxford, 1897. (Gladstone breaks up Butler’s paragraphs, which Bernard numbers but leaves intact; and Bernard’s notes are often helpful.) Butler, Joseph, *Fifteen Sermons and Dissertation upon the Nature of Virtue*, edited by T. A. Roberts, London: S.P.C.K., 1970, is a good recent edition of the *Rolls Sermons*. The most accessible reprint of the sermons it contains, and of the *Dissertation*, is *Five Sermons Preached at the Rolls Chapel and a Dissertation upon the Nature of Virtue*, edited by Stephen L. Darwall, Indianapolis: Hackett, 1983. There is no extant edition of the *Analogy of Religion*, although libraries and bookstores often have nineteenth-century reprints of it because it was required reading for Anglican ordinands for many years. As of this writing, a new edition of Butler’s sermons is expected from Oxford University Press (U.K.) in 2006, edited by David McNaughton.

There are two general books about Butler and his times that are valuable: W. A. Spooner, *Bishop Butler*, London: Methuen, 1901; and Ernest Campbell Mossner, *Bishop Butler and the Age of Reason*, New York: B. Blom, 1971. A recent collection that contains fine essays on all aspects of Butler’s life and work is Christopher Cunliffe, ed., *Joseph Butler’s Moral and Religious Thought: Tercentenary Essays*, Oxford: Clarendon Press, 1992. Terence Penelhum, *Butler*, London: Routledge, 1985, covers his ethical teachings and attempts to rescue his philosophical theology from undeserved neglect. Austin Duncan-Jones, *Butler’s Moral Philosophy*, Harmondsworth: Penguin, 1952, is a high-quality treatment of the ethics. There are many good essays and chapters about Butler. On the ethics, the best beginning is Chapter 3 of C. D. Broad’s *Five Types of Ethical Theory*, London: Routledge, 1930. A severe critique of Butler that argues his doctrine of the naturalness of virtue leads to incoherence is Nicholas L. Sturgeon, “Nature and Conscience in Butler’s Ethics,” *Philosophical Review* 85 (1976), 316–356. On this and the issue of the

supremacy of conscience, see Stephen Darwall, "Conscience as Self-Authorizing in Butler's Ethics" in Cunliffe (1992), 209–242. The notion of the naturalness of virtue is explored with originality in Alan Millar, "Butler in God and Human Nature" in Cunliffe, 293–315. Another excellent essay is Jerome Schneewind, "The Divine Corporation and the History of Ethics," in *Philosophy in History*, edited by R. Rorty, J. B. Schneewind, and Q. Skinner, 173–192, Cambridge, U.K.: Cambridge University Press, 1984.

For a long time the only good treatment of Butler's theology was C. D. Broad, "Bishop Butler as Theologian," in C. D. Broad, *Religion, Philosophy, and Psychological Research*, London: Routledge, 1953, 202–219. The situation improved with Anders Jeffner's *Butler and Hume on Religion*, Stockholm: Diakonistyrelsens Bokforlag, 1966. Penelhum, *Butler* (above), carries the debate further. See also especially the essays by David Brown ("Butler and Deism," 7–28), Basil Mitchell ("Butler as a Christian Apologist," 977–1116), and T. A. Roberts ("Butler and Immortality," 169–188) in Cunliffe. The importance of Butler's thinking as a stimulus to Hume is explored in Paul Russell, "Butler's 'Future State' and Hume's 'Guide of Life,'" *Journal of the History of Philosophy* 42 (2004): 425–448. It is clear that Section 11 of Hume's *Enquiry concerning Human Understanding*, "Of a Particular Providence and Of a Future State," is for the most part an attempt to undercut the use of analogical reasoning found in Butler's *Analogy*. John Hick's "soul-making" theodicy is to be found in his *Evil and the God of Love*, London: Macmillan, 1966.

The best place to begin study of Butler's religious thought, however, is Sermon 15 of the *Rolls Sermons*, "Of the Ignorance of Man," which prefigures much of the prudential apologetic that the *Analogy* develops in detail.

## BUTLER, SAMUEL

(1835–1902)

The English writer and critic Samuel Butler was the author of the satirical novels *The Way of All Flesh*, *Erewhon*, and *Erewhon Revisited*, as well as several discussions of philosophical biology and the theory of evolution. He was the son of the Reverend Thomas Butler, whom he depicted as a domestic tyrant in *The Way of All Flesh*. Butler was sent to Cambridge by his father in the hope that he would become a clergyman, but after graduating he refused to take orders because of doubts about the Christian creed. In 1859 he emigrated to New Zealand, where he became a successful sheep farmer and for a time a convert to Darwinism. Returning to England in 1864 with enough money to live on, he began a career as an author, painter, and musician. The subject of evolution continued to occupy his mind for many years. It forms the substance of several essays and four books: *Life and Habit* (London, 1878), *Evolution, Old and New* (Lon-

don, 1879), *Unconscious Memory* (London, 1880), and *Luck or Cunning?* (London, 1887). These works reflect a mounting hostility to the ideas of Charles Darwin and a desire to champion those of Erasmus Darwin and the Chevalier de Lamarck. This hostility first made its appearance in *Erewhon* (London, 1872).

## EVOLUTION

Butler was neither a scientist nor a philosopher. His discussions of evolution are the work of a literary man with strong intellectual interests but little capacity for exact thought. He was at his best when giving scientific and philosophical ideas an original twist that often put them in quite a new light. To many fellow Victorians he seemed an irreverent skeptic or even an atheist; but in fact, he wanted to retain religion while discarding the Christian creed and to discard Darwin while retaining evolution. This outlook pervades all his major writings.

The central weakness of Darwinism, according to Butler, was its failure to identify the cause of the variations on which selection was said to operate. They were described as random or accidental, which would mean that the course of evolution has been a matter of luck. The older evolutionists, such as Erasmus Darwin and Lamarck, were far sounder in their views, for they attributed the cause of variations to the activity of organisms and to the inherited effects of the use or disuse of their various functions. Not luck, they claimed, but cunning displayed by organisms in coping with their environment lies at the basis of evolution. Hence, the activity of organisms is profoundly purposive. The great mistake of Charles Darwin was to dismiss teleology from the domain of living things, for they then become indistinguishable from machines.

In an essay of 1865 Butler toyed with the idea that machines are adjuncts to organisms, like extra, though inferior, limbs, by means of which organisms have become more highly evolved. Hence, "a leg is only a much better wooden leg than anyone can manufacture." This led Butler to consider the problem of how living things have come to produce their natural organs and to equip themselves with adaptive habits. The answer, he asserted, is that the individual plant or animal must "know" at the start what to do. A fertilized ovum possesses the knowledge it needs to make itself into an embryo and subsequently into an adult organism. This knowledge is really a remembering of what its ancestors did in the past. Hence, we must postulate an "unconscious memory" at work in all living things, binding successive generations and providing the basis for the transmission of acquired characteristics.

Butler then leaped to two sweeping conclusions. First, consciousness and intelligence exist throughout the whole organic world. "For the embryo of the chicken, we claim exactly the same kind of reasoning power and contrivance which we claim for the amoeba, or for our own intelligent performances in later life." Second, since evolution involves a continuous process of derivation, there must be an "identity" between parents and offspring: the latter are not different individuals but *are* the parents at a later evolutionary stage. "Birth has been made too much of." A newborn infant is simply part of an unbroken biological process, not an utterly separate individual. Accordingly, there is a deep unity of all life, so that it constitutes "in reality, nothing but one single creature, of which the component members are but, as it were, blood corpuscles or individual cells."

With the aid of these conclusions, Butler sought to justify an idealistic and religious interpretation of evolution. In *Unconscious Memory* he contended that his earlier separation of the organic from the inorganic was unwarranted. "What we call the inorganic world must be regarded as up to a certain point living, and instinct with consciousness." Hence, "all space is at all times full of a stuff endowed with a mind," and "both stuff and mind are immaterial and imperceptible, so long as they are undisturbed, but the moment they are disturbed, the stuff becomes material and the mind perceptible." Evolution is therefore the life history of this primordial world stuff, "to which no name can be so fittingly applied as 'God.'"

Many of Butler's criticisms of Darwinism have been made irrelevant by the rise of the science of genetics. Yet he was justified in urging those criticisms at the time and in calling attention to vacillations in Darwin's thought on basic issues. If Butler had been more scrupulous in his own thinking and less facile with his pen, his works on philosophical biology might have had greater survival value.

## THEOLOGY

Butler's rather unusual theology is set forth in three essays, posthumously published as *God the Known and God the Unknown* (London, 1909). He there contended that an adequate concept of God requires him to be a living person with a material body. To regard God as *merely* a spirit is tantamount to atheism. At first Butler held that the divine body is just the totality of life, the "one single creature" whose unconscious memory is part of the divine mind. When he rejected the distinction between the organic and the inorganic, his view shifted from a "panzoistic" conception of God to pantheism. He intended to rewrite his theology in the light of this shift,

but never managed to do so. One odd belief he expressed was that the grand design of the cosmos points to the existence of "some vaster Person who looms out behind our God, and who stands in the same relation to him as he to us. And behind this vaster and more unknown God there may be yet another, and another, and another." This pyramiding of deities was one of the many items with which Butler enlivened the Victorian scene.

## SOCIAL THOUGHT

Despite the barbs he directed at the institutions of his day, Butler's social outlook was conservative. He took the position that those who are rich and successful are the highest types thus far produced in the evolutionary process. Poor men are biological misfits; hence, the sooner they disappear and leave room for those better able to take care of themselves, the better. In the imaginary society of Erewhon, "if a man has made a fortune of over £20,000, they exempt him from all taxation, considering him a work of art and too precious to be meddled with." Butler's account of this society is not so much a blueprint of utopia as a device for satirizing the beliefs and practices of middle-class Englishmen by inverting accepted values. Thus, in Erewhon bodily illness was considered a punishable crime, whereas moral failings deserved sympathy and were given therapeutic treatment. Instead of fostering machinery, the Erewhonians, after a long struggle, destroyed it when they realized that machines, like organisms, were evolving and would soon acquire a mastery over men. In *Erewhon Revisited* (London, 1901), Butler depicted a community showing signs of degeneration, as if to underline the conclusion that a social order is an impermanent evolutionary product and inevitably alters. Yet here again no consistent point of view was worked out.

## BYZANTINE PHILOSOPHY

The age of the Byzantine Empire stretches from the end of late antiquity to the fall of Constantinople in 1453. During Byzantine times scholars who copied and studied or even lectured on the texts of ancient philosophers are known and praised chiefly for their efforts to transmit and to keep alive the philosophical traditions of antiquity. To take the obvious case of Plato's and Aristotle's works, there are more than 260 Byzantine manuscripts of dialogues by Plato and at least 1,000 Aristotelian texts. This does not mean, however, that all Byzantine scholars should be regarded as mere copyists. There were among them important figures who, being philosophers themselves, not only carefully studied and commented on ancient philosophical works but also wrote their own treatises on central philosophical problems.

How did the Byzantines conceive of philosophy and of themselves as philosophers? John of Damascus (*Dialectica* 1:56), for instance, gives six complementary definitions of philosophy:

- (1) the knowledge of beings as beings;
- (2) the knowledge of things divine and human;
- (3) a preparation for death;
- (4) the assimilation of man to God as far as humanly possible;
- (5) the art of arts and the science of sciences;
- (6) the love of wisdom.

These six definitions, which were often cited by other Byzantine philosophers too, can also be found in the works of the Neoplatonists of the Alexandrian school (for example, David, *Prolegomena* 20.27–31). They are clearly derived from Aristotelian (1, 5), Stoic (2), and Platonic (3, 4) conceptions of philosophy, attesting thus to the Byzantines' solid knowledge and eclectic use of the different traditions in ancient philosophy.

However, the Byzantines were by no means unanimous about the importance of ancient philosophy, or of "the wisdom from without," as they called pagan philosophy in contrast to Christian theology, which they called "the wisdom from within." Some, under the influence of St. Paul and authors like Tatian, considered ancient philosophy useless and dangerous because it corrupts the Christian view of things and leads to heresies. Others, under the influence of Basil the Great and Gregory of Nyssa, claimed that ancient philosophy, if used in a cautious way, could be a preparation for the true faith, help

in its elucidation, and serve as a dialectical weapon against heresies. Moreover, Byzantine philosophers like John Italos and Barlaam of Calabria undertook the task, in some cases at high personal risk, of defending ancient philosophy in its own right, but also as a means for a better understanding of Christian dogma.

The term *philosophy* could also be used in Byzantium in a much wider sense to include encyclopedic knowledge, including mathematical sciences such as astronomy. Sometimes, following some of the Church Fathers, the term could be used to refer to a life of contemplation as exemplified by Christian monasticism. But that philosophy was partly understood as the Christian way of contemplative life does not necessarily mean that philosophy collapsed into theology. On the contrary, the borders between philosophy and theology were reasonably clearly defined in Byzantium.

The view expressed by some Church Fathers, for instance by Clement and by Origen, that philosophy is the handmaiden of theology (*philosophia theologiae ancilla*), was not the dominant position in the Byzantine East. Byzantine philosophy seems to have managed to preserve its autonomy. Even though many of the problems with which Byzantine philosophers were concerned, like that of divine providence, did indeed arise in the context of a Christian theological tradition, these problems nonetheless constitute genuine philosophical issues that would be of interest to any philosopher, even one who did not believe in Christian dogma. For example, the following are some of the issues that profoundly and systematically occupied many Byzantine philosophers: the creation or origin of the world, the existence of God, the ontological status of universals, the character of the perceptible world, the problem of evil and human free will, the relation between soul and body, the necessary requirements for a good life, the possibility of a just state, the connection between faith and reason, the skeptical challenge to knowledge.

But did the Byzantine philosophers express original views in discussing these issues? There is no doubt, of course, that Byzantine philosophical writings are quarries of information about earlier philosophical doctrines, which would have been otherwise completely lost or only meagerly documented. Besides, whatever attitude the Byzantines took towards ancient philosophy, it was impossible for them to escape altogether from its influence. It was ancient philosophy that clearly provided them with a well-articulated theoretical framework and with the philosophical language that served as the basis for their own philosophical discourse. At the same time,

however, the Byzantine philosophers offered in their commentaries and treatises numerous clarifications, developments, criticisms, and modifications of ancient doctrines, some of which are philosophically interesting and remarkably subtle.

Even when they simply paraphrased or briefly commented on ancient philosophical texts, the Byzantines presented different degrees of independent thinking; sometimes they gave a slightly different argument to support an established position, sometimes they made a small but interesting addition to an ancient doctrine, and sometimes they considerably diverged from the view generally accepted in antiquity. But this should not be understood as suggesting that the Byzantine philosophers were interested in being original; like most of their late ancient predecessors they would have firmly rejected such a suggestion.

Nevertheless, Byzantine philosophy as a whole exhibits a distinctive character that differentiates it from the previous period in the history of philosophy. For it is clear that many of the views and doctrines presented by the Byzantines originated in their aim to reconcile their Christian tradition with ancient philosophy. For instance, they taught Aristotle's logic as generally useful, but mainly as a preparation for more theoretical studies; they disagreed, however, with his doctrine of the eternity of the world and his understanding of God as the first unmoved mover who moves the heavens but exerts no providence on the details of the sublunary world, including individual human beings. Instead, Byzantine philosophers considered Plato's metaphysics to be closer to the Christian worldview, especially on issues like the immortality of the soul and the creation of the world; still, for doctrinal reasons they could not accept the Platonic theory of metempsychosis and the separate existence of eternal ideas or forms.

Hence, Byzantine philosophers seem to have followed the eclectic tradition of late antiquity and combined aspects of Plato's and Aristotle's theories, although always strongly influenced by Neoplatonic philosophers like Proclus. The Byzantines also engaged in a limited dialogue with the other schools of ancient philosophy; for instance, they were interested in criticizing elements of Epicurean or Stoic doctrine, and they critically examined the implications of the Skeptics' views on the possibility of human knowledge. This is the picture at least up to the fifteenth century, when the leading intellectuals of the time, George Gemistos Pletho and George Scholarios Gennadios, started emphasizing the contrast between ancient philoso-

phers and believed that they should take sides, presenting themselves either as Platonists or as Aristotelians.

## BYZANTINE PHILOSOPHERS

In Byzantium there were no institutions of higher education in which philosophers could be trained as philosophers. The main purpose of institutional higher studies was to train civil servants. The figure of the Byzantine philosopher, therefore, emerges as somewhat of a polymath and an erudite scholar, who, moreover, might make use of his knowledge and rhetorical skill to play an active role in the political life of his times. Philosophical instruction was mainly private, but it sometimes received support from the Emperor and the Church, as in the case of the so-called University of Constantinople, which was founded in 1045 by Constantine Monomachos. Such support, however, also meant occasional intervention by the secular or ecclesiastical authorities, as when John Italos was put on trial and condemned for advocating the systematic use of philosophical analysis in clarifying theological issues.

In general, the philosophical curriculum would start with Aristotle's logic, considered as the instrument of all sciences (Porphyry's *Isagoge*, Aristotle's *Categories*, *De interpretatione*, and *Prior Analytics* 1.1–7); then ethics, teaching a rationally ordered moral life of the soul as joined to the body; and finally, through physics and the *quadrivium* (arithmetic, geometry, astronomy, and harmonics), to Platonic or, more precisely, to Neoplatonic metaphysics, which is the highest philosophical science because it has to do with knowledge of first principles and brings the soul nearer to assimilation to the divine.

The genres of philosophical writing in Byzantium are quite diverse. For teaching purposes the Byzantine scholars produced marginal notes and explanatory paraphrases on ancient philosophical works, but also extended commentaries, sometimes in question-and-answer form, small handbooks, or large surveys of philosophy. They also wrote small treatises on specific topics or longer works, occasionally in dialogue form, with the aim of rebutting the views of their opponents and to explain and defend their own theories. To all these we should further add their letters and orations, which frequently made reference to philosophy.

The real starting point of Byzantine philosophy is usually placed in the ninth and tenth century, when the so-called Byzantine humanists, men like the Patriarch Photios, Arethas, or Leo the Mathematician, started again studiously to read, edit, and comment on the works of ancient philosophers. Having said that, however, the dis-

tinctive character of Byzantine philosophy undoubtedly owes a lot to the influence of the previous period, which was dominated by the thought of the Church Fathers such as Basil the Great, Gregory of Nyssa, Pseudo-Dionysius, Maximus the Confessor, and John of Damascus.

Photios (820–891), who is famous mainly for his *Bibliothēke*, a vast compilation of ancient Greek literature, also taught Aristotelian logic and wrote, for this purpose, comments on Aristotle's *Categories*. In addition, he composed a number of small treatises in which he criticized both Plato's and Aristotle's views, especially their theories on universals; he himself claimed that universals have no independent existence but are conceived by God and are instruments of God's will. Arethas (c. 850–944) also commented on Aristotle's *Categories* and Porphyry's *Isagoge*, but he is better known for having been instrumental in the transmission of ancient texts, in particular the Platonic corpus. He commissioned the transcription of a complete copy of Plato's works, to which he added marginal notes; the first part of his Plato text is extant as the famous Clarkianus 39 manuscript in the Bodleian Library of Oxford. Unfortunately, we know little about Leo the Mathematician (c.790–869), who seems to have taught philosophy at the so-called Magnaura School in Constantinople.

There is a significant development from the humanistic Photios and Arethas interests to the way the Byzantines in the eleventh and twelfth century, the period of the Comneni, viewed the philosopher as someone with a hard-earned and unsurpassed knowledge in all branches of learning, and especially as someone who formed his own views on the philosophical topics discussed by the ancients. Michael Psellos (1018–1078) was one of the most erudite and intriguing figures of the Byzantine Middle Ages. He was given the honorific title "first among the philosophers" and taught all branches of philosophy. He commented on Aristotle's logic (*Categories*, *De interpretatione*, *Prior Analytics*) and his physics, and he wrote a large number of short treatises discussing particular problems raised by his pupils; he also compiled a short encyclopaedia with the title *De omnifaria doctrina*. He was greatly influenced by Proclus, whom he considered as an authority among ancient authors. In his attempts to advance philosophical learning he was often attacked concerning his theological orthodoxy, so that he often had to be careful to distance himself from heretical doctrines, as in his writings on the *Chaldaean Oracles*.

John Italos (c.1025–1082), a pupil of Psellos, who was condemned by the Church of Constantinople for his extensive use of logical reasoning in theological matters,

wrote treatises discussing the Aristotelian categories and commented on Aristotle's logic (*De interpretatione*, *Topics*). Eustratios of Nicaea (c.1050–1120) and Michael of Ephesus (c.1050–1129) belonged to the intellectual circle around Anna Comnena and took part in her project to produce commentaries on Aristotle's works.

Eustratios wrote commentaries on Aristotle's *Posterior Analytics* and *Nicomachean Ethics*, whereas Michael of Ephesus commented on Aristotle's metaphysics, logic (*Sophistici elenchi*), ethics, and natural philosophy (*Parva naturalia*, *De partibus animalium*, *De generatione animalium*, *De motu animalium*, and *De incessu animalium*). Their work, in which they followed ancient commentaries (some of which are now lost) but also added their own insightful remarks, was instrumental in the transmission and revolutionary rediscovery of Aristotelian thought in the Latin West. Finally, Nicholas of Methone (d. 1165) wrote at the same time a detailed refutation of Proclus's *Elements of Theology*. During the short period after the Latin conquest of Constantinople in 1204, when the center of Byzantine intellectual life moved to Nicaea in Asia Minor, the main intellectual figure was Nikephoros Blemmydes (1197–1272), who wrote a much-used handbook of physics and logic that also was translated in Latin.

Lastly, the final centuries of the Byzantine empire, which are known as the Palaeologan period, saw a renewal of interest in the sciences, particularly in mathematics and astronomy. George Pachymeres (1242–1310) composed a summary of Aristotelian philosophy and wrote Neoplatonic commentaries, supplementing Proclus's commentary on Plato's *Parmenides*. Theodore Metochites (1270–1332) criticized Aristotelian physics and metaphysics in debate with Nikephoros Choumnos (c. 1250–1327), who in turn attacked the orthodoxy of Neoplatonic psychology. Sophonias and Leo Magentinos paraphrased works of Aristotle; Sophonias paraphrased Aristotle's *Categories*, *Sophistici elenchi*, and *De anima*, while Leo Magentinos paraphrased Aristotle's *De interpretatione*, *Prior Analytics*, and *Sophistici elenchi*.

Moreover, three important intellectuals of the fourteenth century, namely Nikephoros Gregoras (1290/3–1358/61), Barlaam of Calabria (c. 1290–1348), and Gregory Palamas (c.1296–1359), got involved in a fierce dispute over the use of logical reasoning in theology. Gregoras claimed that logical studies should be regarded as completely useless and should be therefore altogether dismissed, whereas Barlaam and Palamas adopted a more complex attitude toward logic. They both stressed that logic is indeed useful in defending Christian dogma

against pagans and heretics, but they disagreed about the limits of the use of logical reasoning in clarifying or establishing the truth of Christian belief; whereas Barlaam argued that logical methods can be used to prove the Christian beliefs, Palamas insisted that logical arguments are of no help in our attempt to acquire knowledge of God and of his attributes. The controversy between Gregoras, Barlaam, and Palamas extended to a second stage, known as the Hesychast debate, which centered on the method of prayer and contemplation of the Byzantine monks, who claimed to be able to achieve communion with God through inner quietude and silence.

In the fifteenth century, around the time of the fall of Constantinople, a main focus of Byzantine philosophers was, as mentioned above, stressing the differences between Plato and Aristotle and determining the superiority of the one over the other. George Gemistos Plethon (c. 1360–c. 1453) is famous for his renewal of Proclus's Neoplatonism as a theological and political alternative to Christianity. In his treatise *De Platonis et Aristotelis philosophiae differentia* he argued for the superiority of Plato over Aristotle; in his *Laws* he presented an utopia based primarily upon Plato and the Neoplatonists. George Scholarios Gennadios (c. 1400–1424) thought that Pletho's utopia was heretical and should be consigned to the flames. He defended Aristotle's works and was more favourable to Latin scholasticism. He commented on Aristotle's logic (*Categories*, *De interpretatione*), natural philosophy (*Physics* 1–3, *Parva naturalia*), and Aristotle's *De anima*. He also translated part of Petrus Hispanus's *Summulae logicales* and works by Thomas Aquinas, for instance the *De fallaciis* and his commentary on the *Posterior Analytics*. Bessarion (1403–1472), who had studied under Pletho, tried to mediate the dispute between Pletho and Scholarios, and gave a sympathetic summary of Plato's philosophy, which he thought reconcilable with Aristotelianism. He, like Pletho, greatly helped to bring works of Plato and Aristotle to the attention of Italian humanists.

From the second half of the thirteenth century onward, there were translations into Greek of Western Latin texts, especially logical texts: Manuel Holobolos (fl. 1267) translated Boethius's *De topicis differentiis* and *De hypotheticis syllogismis*; Maximos Planudes (c. 1255–c. 1305) translated Boethius's *De consolazione philosophiae* and Augustine's *De trinitate*; Demetrios Kydones (c. 1324–97/8) and his brother Prochoros Kydones (c. 1333–69/70) translated Augustine, Anselm, and Thomas Aquinas. But it was only in the fifteenth century that Byzantine and Western philosophers actually began to

talk to one another, to read one another's books, and to be influenced by others' traditions and views. Still, although the Byzantine scholars like John Argyropoulos—who went to Italy and worked there as teachers of Greek, editors of Greek texts and translators, and as teachers of philosophy—exerted a fertile influence on the West, Byzantium itself in general remained closed to Western scholasticism.

## THE STUDY OF BYZANTINE PHILOSOPHY

Byzantine philosophy remains a little-explored field. Most of the writings of Byzantine philosophers are yet unpublished or are available only in old and often quite inadequate editions. The nineteenth-century Berlin series *Commentaria in Aristotelem Graeca*, which was supposed to include all commentaries on Aristotle's works, actually includes a very small selection of Byzantine commentaries. Translations of and commentaries on Byzantine philosophical works are hardly ever available. In addition, there are important unresolved issues about the authorship of many Byzantine philosophical texts, and we often have no reliable information concerning their sources. But even when we do have careful editions of the philosophical works of Byzantine thinkers, their philosophical contribution for the most part still needs to be critically assessed. Being regarded either as mere scholars or as religious thinkers, Byzantine philosophers have not been studied on their own merit, and their works have hardly been scrutinized as works of philosophy.

The interest of the scholars of the nineteenth and early twentieth century, who worked with great care on some Byzantine philosophical texts, was not primarily philosophical. Philosophers, on the other hand, understandably were discouraged both by the rhetorical style of the Byzantine writings and by the theological interests displayed in much of Byzantine philosophy. Therefore, although distinguished historians have in the past tried to reconstruct the intellectual life of the Byzantine period, we still lack even the beginnings of a systematic understanding of the philosophical works produced in Byzantium. It is particularly telling that there is no adequate recent monograph even on the most prominent Byzantine philosopher, Michael Psellos.

After World War II, however, we see significant changes in the study of Byzantine philosophy. These changes clearly are connected with the rediscovery and philosophical reappraisal of the Western medieval philosophical tradition and of certain areas in ancient philosophy, such as the works of the Neoplatonists and of the

ancient commentators. Critical editions of texts are appearing regularly, in particular in the series *Corpus Philosophorum Medii Aevi—Philosophi Byzantini* (The Academy of Athens) and in the Bibliotheca Teubneriana. Moreover, books and articles are now being published that investigate the teaching of philosophy in Byzantium and the original philosophical contributions of Byzantine philosophers in a philosophically more adequate and serious way. Nevertheless, much more work is required to achieve a reliable overview of Byzantine thought. Following the rising interest of the last decades of the twentieth century, it now seems important to encourage further the systematic study and critical assessment of the individual works of Byzantine thinkers. Most importantly, we need to take their works seriously as philosophical writings; putting aside our prejudices and misconceptions, we need to make a renewed effort to reconstruct and to do justice to Byzantine philosophy.

## ALBERT THE GREAT

(before 1200–1280)

According to the near-contemporary testimony of Tolomeo of Lucca (*Historia Ecclesiastica* [1317], 22.19) and confirmed by other, later sources, Albert the Great (Albertus Magnus) was more than 80 years old when he died on November 15, 1280, establishing the turn of the thirteenth century as the *terminus ante quem* of his birth. He was born in the town of Lauingen in Schwaben in the diocese of Augsburg, at the time a part of Bavaria, the son of a knight in the service of the counts of Bollestadt. He was already a student in the *studium litterarum* at Padua when, in 1223, Jordan of Saxony came in search of recruits to the Dominican Order among the young men in residence at the new university. Albert received the habit from Jordan sometime around Easter of 1223 and was sent to Cologne for his novitiate. By 1228 he had become a lecturer (*lector*), and he served in that office in Dominican communities at Haldesheim, Freiberg, Regensburg, and Strassburg. In 1243 or 1244 he was sent to Paris by John of Wildeshausen, where he became a master of theology in 1245 and lectured on Peter Lombard's *Sententiarum* (Sentences).

In the fall of 1245 Thomas Aquinas was sent to Paris, also at the direction of John of Wildeshausen, and in 1248 he and probably other Dominicans accompanied Albert to Cologne, where Albert was to establish the first *studium generale* (or liberal-arts college) in Germany. He served as Provincial of Teutonia from 1254 to 1257, during which time he was summoned before the papal curia to defend the Dominican Order against the attacks of William of Saint-Amour. He was well received by the curia, and his lectures and debating were found to be extraordinary. In January of 1260 Pope Alexander IV

appointed him bishop of Regensburg, but he served less than two years before submitting his resignation, after instituting many reforms in his diocese. Although retired, he was directed by Pope Urban IV, in 1263, to preach to the Germans a crusade to the Holy Land, and this he did, until Urban's death in 1264.

It is said that after the death of Thomas Aquinas, Albert traveled to Paris one last time to defend the views of his former student, but this story, related at the canonization proceedings for Aquinas in 1319, is not fully consistent with other known facts about Albert's final years and, indeed, appears to interpret the events in Paris in 1277 in a manner that places far too much importance on the connection, if any, between Aquinas and the doctrines that were being formally condemned. The complete absence of any official correspondence after August 18, 1279, in the face of a full and active participation in the life of the Church and his order right up until that date, has suggested to some that Albert's memory, and perhaps other aspects of his mental life, had begun to fail him at that time, but there is no good reason to suppose, as some have done, that this decline began as early as 1277. Whether he was already in decline or not, he and his Dominican brothers were apparently not unprepared when death finally took him away on November 15, 1280.

### WRITINGS

Albert was committed to the preservation and propagation of the philosophical ideas of antiquity, in particular the philosophy of Aristotle, which he saw himself as introducing to the Latin west. Like Aristotle, he produced a body of philosophical work that spanned the discipline in both breadth and depth. As in the case of Aristotle, some of the works attributed to Albert in his corpus are

not actually from his hand, and other works known to have been written by him have yet to be found. Little is known with any certainty about the chronology of the corpus, but there are good reasons for thinking that the bulk of his philosophical writings, in particular, his Aristotelian paraphrases, were completed between the years 1250 and 1270.

His corpus can be divided into three main categories: philosophy (nine treatises in logic, five in metaphysics, and three in ethics), theology (thirty treatises), and what we would call natural science but what throughout the medieval period was known as natural philosophy (twenty-two treatises). His method in most of his writings is the paraphrastic style employed by Avicenna (ibn Sīnā), as opposed to the line-by-line commentary characteristic of the works of Averroes (ibn Rushd), and his logical works in particular are deeply influenced by the work not only of Avicenna but also of al-Fārābī and Robert Kilwardby. Although Aristotle's scientific writings had been condemned in 1210 by Innocent III and the University of Paris established a commission to purge the Aristotelian corpus of heretical ideas in 1231, Albert encountered no difficulty in making use of Aristotelian ideas when he began to work on his *Summa de creaturis* (Treatise on creatures), before 1246, and his commentary on the *Sententiarum* of Peter Lombard, completed in 1249. It was probably not until the condemnation of 1277 that Aristotelianism as such encountered any serious resistance at the universities.

## PHILOSOPHY

Part of what was at issue in the condemnation of 1277 was the relation between philosophy and theology, which the so-called Latin Averroists argued were separate disciplines corresponding to entirely distinct objects of knowledge, and hence governing different sorts of truths. The truths of theology were grounded in divine revelation and prophecy, while those of philosophy were grounded in human reason, and the mendicant orders were concerned to keep the two disciplines separate, on the grounds that philosophy, an inherently skeptical discipline, might intrude itself into theology in an unwarranted way, calling into question conclusions drawn in a domain in which it had no authority. In this context, Albert's insistence on the importance of knowing and understanding the philosophy of the ancient Greeks is striking and serves to illustrate his intellectual integrity.

Albert's approach to ancient philosophy has been criticized by late-twentieth-century historians of philosophy as an unrealistic syncretism of Aristotelianism and

Neoplatonism. The complaint is that the two systems are philosophically and philologically incompatible, and any attempt to reconcile them is not only doomed to failure but is also methodologically misguided. It is worth noting, however, that this view is itself grounded in historical research based upon certain a priori assumptions about the relation between Plato's philosophical system and Aristotle's. Albert's Neoplatonism was essentially the Neoplatonism of the Greek commentators on Aristotle, which was itself an attempt to syncretize Plato and Aristotle, and it is fair to say that in antiquity the disparities between the two systems were not viewed as they have been by modern commentators. In fact, Albert, in offering a Neoplatonic harmonization of the two systems, is simply following the example, not only of his Arabic sources, but of a tradition that extends back to the Hellenistic period. The view that the systems are beyond harmonizing is of rather recent vintage and is subject to modification.

## METAPHYSICS

Albert's metaphysics focused primarily on a theory of causation that can be traced to such sources as Aristotle, Avicenna, Pseudo-Dionysius, and the *Liber de causis* (*The Book of Causes*). He adapted the Neoplatonic notion of emanation of form, but in his system the causation is by attraction rather than by pure emanation from the One. He preferred attraction to pure emanation because he identified the One with the Good, and the Good, by its very nature, is diffusive of itself and of being (*diffusivum sui et esse*), that is, it causes other things to be by means of a kind of "calling to resemblance." (Albert here treats the word for good, "bonum," as cognate with the verb "boare" [to call]. This appeal to homespun etymology was also common in antiquity, particularly in Plato but also in Aristotle.) By virtue of this "calling to resemblance," the Good is not merely the first mover, as Aristotle's unmoved mover is, but is also the first producer, that is, the Creator—a role for the First Cause that is not found in Aristotle's *Metaphysics* (bk. ?), but rather is drawn from the *Liber de causis*, which Albert regarded as Aristotelian in provenance.

## LOGIC

Albert's logical works consist, for the most part, of paraphrases of the treatises of the *Organon* (from Gr. "organōn," instrument, tool), so-called in the medieval period because logic was viewed not as a part of philosophy but rather as an implement that is necessary for the advancement of philosophy. The *Organon* consisted of

Aristotle's *Categories*, *De interpretatione* (On interpretation), *Topics* (including the *De sophisticis elenchis* [On sophistical refutations]), *Prior Analytics*, and *Posterior Analytics*. Yet Albert moved beyond Aristotle in a number of areas, most notably in his treatment of universals, which was grounded on the notion of form found in Plato and Aristotle. Aristotle had objected to the separability of the Platonic form and argued that forms are immanent in particulars. Drawing again upon Aristotle's Greek commentators, Albert argued that the universal must be analyzed into three *modi essendi*, or modes of being. Although a universal is a metaphysical unity, it may be considered under three aspects: as an entity in its own right, really existing separately from a particular, as in the mind of God (*ante rem*); as an entity that informs a particular, causing it to be the thing it is (*in re*); or as an entity in human thought (*post rem*). The distinction between the universal *in re* and the universal *post rem* is grounded in the Aristotelian notion of abstraction, which is discussed in more detail below under the heading of "Natural Science." Although Albert achieves here another notable syncretism, it is worth noting that he does not treat universals as substantial forms, as Plato and Aristotle both do.

## NATURAL SCIENCE

Albert's interest in the natural world was driven by his belief that all knowledge is interconnected, and he pursued scientific questions with such intensity that critics, such as Henry of Ghent (*De scriptoribus ecclesiasticis* 2.10) suggested that he neglected theology and philosophy. Of particular interest with regard to his scientific writings is his attitude toward the distinction between rationalism and empiricism, a distinction that had been of great interest in antiquity but that had faded during the early medieval period as a consequence of both the ascendancy of rationalism under the influence of Neoplatonism and the decline in scientific investigations during periods of social and political upheaval. Working against the grain of the prevailing rationalism, Albert's attitude towards work in the natural sciences was decidedly empiricist: *experimentum solum certificat in talibus* ("Experience alone gives certainty in such matters") (*De vegetabilibus et plantis*, VI, 2.1). Although "experimentum" (here translated "experience") is reminiscent of our word "experiment," the modern concept of scientific experiment, in which a hypothesis is tested against observational data for confirmation or falsification, was unknown at this time.

For Albert, as for his contemporary Roger Bacon, the other great experimentalist of the thirteenth century, sci-

entific "experiment" consisted in the gathering of observational data only, not the comparative analysis of data against hypotheses with controlled variables (The Latin word "experimentum" is cognate with the Greek word "empeiria" [experience], from which we get the English word "empiricism.") As in Aristotle's treatises on nature, observational data served only to illustrate or confirm a priori hypotheses, never as a means of hypothesis formation. But Albert is not a strict Aristotelian in this matter. For natural philosophers in the Aristotelian tradition, such as Aquinas, experience must be understood in terms of an inductive process leading from sense perception of particulars to the formation of general concepts in the soul, as described in Aristotle's *Metaphysics* (A.1) and *Posterior Analytics* (B.19).

In this account, the specific features of particulars are the proper objects of sense perception, but memory functions to gather together the perceptual information from similar particulars into what Aristotle calls an *empeiria* (experience) of the natural kind involved, and the rational faculty called *nous* in Greek (variously translated into English as either intellect or understanding) abstracts from *empeiria* an intelligible object, which then resides in *nous* and is a likeness (*homoïōma*) of the immanent form present in the particulars. Since these intelligible objects are different in kind from the perceptual objects that are the proper objects of the perceptual faculties, Aristotle is properly regarded not as an empiricist but as a rationalist. Nonetheless, experience clearly plays an essential role in the acquisition of knowledge of universals.

For Albert, although scientific knowledge is of the universal, the mechanism by which the universal comes to reside in the soul is by the "calling to resemblance" of the emanation of the intelligences. Intelligences illuminate the human rational faculty in accord with the doctrine of causation by attraction, and universal concepts form in the soul not because of the capacity of human intellect to abstract them but because the First Cause uses the intellect in its causal process. In Albert's and Bacon's reliance on experience, though different in kind from later notions of experience, we see the beginnings of the movement that would, by the time of the Renaissance, establish empiricism as the dominant scientific attitude, an attitude that, in time, would drive a wedge between natural philosophy and first philosophy and separate the natural sciences from philosophy.

## COUNTERFACTUALS

A conditional is a sentence, statement, proposition, or thought of the form

If A then C

"A" is called the *antecedent* of the conditional and "C" the *consequent*. Philosophers have traditionally divided conditionals into two main groups, *indicative*, which can be symbolized as  $[A \rightarrow C]$ , and *subjunctive* ( $[A \square \rightarrow C]$ ). The so-called *counterfactual* conditionals that have been the subject of so much discussion in analytic philosophy are subjunctive conditionals of the form

If it were to be the case that X then it would be the case that Y (if X were to happen, then Y would happen)

and

If it had been the case that X, then it would have been the case that Y (if X had happened, then Y would have happened)

Subjunctive conditionals of the form "If she be gone, he is in despair" are not at issue.

It is because the antecedents of such subjunctive conditionals usually state something that is not in fact the case or "contrary-to-fact," or is at least assumed not to be the case by the thinker or utterer of the conditional, that they have come to be known as *counterfactuals*.

It is not clear that there is any interesting difference between present and future tense indicative and subjunctive conditionals. It is not clear, for example, that there is any important semantic difference between one saying "If it were raining they would not be playing" and "If it's raining, then they're not playing." Nor is it clear that there is any important semantic difference between one saying "If she goes to the party, he will not go" and "If she were to go, he would not go," or between one saying "If salt is mixed with water it dissolves (will dissolve)" and "If salt were to be mixed with water it would dissolve." The idea that there is an important difference here is perhaps an artifact of the empiricist outlook dominant in analytic philosophy in the last century, which endorsed the "regularity theory of causation" and the associated idea that laws of nature could be adequately expressed by the "material conditional" of standard first-order logic.

However that may be, the difference between indicative and subjunctive conditionals seems clearer in the case of past-tense conditionals. Consider

If Georges Agniel and his friends did not discover the Lascaux caves, then someone else did

and

If Georges Agniel and his friends had not discovered the Lascaux caves, then someone else would have

The difference of meaning is immediately apparent and is sufficiently shown by the fact that although one takes the first to be true, one has no reason to believe the second.

The commonly used labels ("indicative," "subjunctive," and "counterfactual") do not, however, perspicuously mark out the set of conditionals that concern philosophers when they discuss counterfactuals. The indicative/subjunctive distinction is purely syntactical and simply fails to pick out the right set of conditionals. On the one hand, "If the Palestinians declared statehood now, the Israelis would retaliate" is a counterfactual that is not grammatically subjunctive. On the other hand, one

can utter a subjunctive conditional of the form “If X had happened, then Y would have happened” without having any intention to assert or imply the falsity of the antecedent. Suppose I am a detective who suspects that a criminal did A although none of my colleagues believe me. I note that the criminal did something peculiar, that is, B, and remark truly that if she had done A, she would have had to have done B in support of my case, without in any way implying that the state of affairs specified in the antecedent is not the case (alternatively, I may say this before dispatching someone to find out whether she did B). Again, I may set you a puzzle, asking you to work out what I have done, and give you clues, pointing out that if I had done X then this would have happened, that if I had done Y then this other thing would have happened, without ever asserting or implying that I did not do X or Y. Again, I may truthfully assert both “If I had come to the party I would have got drunk” and “If I had not come to the party I would have got drunk” without for a moment thinking or implying, inconsistently, that both these antecedents are false.

The purely syntactical criterion is no good, then, and blanket use of the term “counterfactual” to cover all the subjunctive conditionals that concern philosophers is no better. It remains true, nevertheless, that when one asserts a subjunctive conditional one almost invariably suggests that the state of affairs specified in the antecedent is not in fact the case. This entry will therefore use the traditional term “counterfactual” in this discussion, and contrast counterfactuals generally with indicatives in spite of the difficulties just noted.

## THEORIES OF CONDITIONALS

Any theory of counterfactuals will be part of a general theory of conditionals, and the question arises as to what form a general theory of conditionals should take. Many favor a truth-conditional approach, that is, one that analyzes conditionals by offering an account of the conditions under which statements of the form “If A then C” are true or false (possible-worlds and metalinguistic accounts of conditionals are examples of truth-conditional approaches). Others seek to analyze conditionals by reference to the conditions under which they can be justifiably asserted or accepted as true (e.g., see Edgington 1986). An attractive alternative is John L. Mackie’s (1973) condensed argument/supposition account, according to which conditionals are condensed arguments or suppositions and so not strictly true or false at all.

A central issue for any theory of conditionals is whether indicatives and counterfactuals should receive a uniform treatment, that is, one that uses the same theoretical apparatus across the board. David K. Lewis (1973, 1976) and Frank Jackson (1977, 1979) both reject this idea, offering nonuniform theories that fix the truth-conditions of indicatives and counterfactuals in different ways. Mackie (1973), by contrast, offers a uniform account of all conditionals in terms of the single basic notion of suppositions, and Robert C. Stalnaker (1968), having given an account of all conditionals in terms of possible worlds, accounts for the intuitive difference between indicatives and counterfactuals by appeal to pragmatic considerations.

Central to this debate is the question whether one bases one’s account of indicative conditionals on the material conditional of standard first-order logic, often symbolized as “ $A \supset C$ ,” which is true just in case its antecedent is false or its consequent is true (the truth-value of the whole is determined in a purely truth-functional way by the truth-values of the parts). Lewis and Jackson are among those who think that the material-conditional approach can give an adequate account of all indicative conditionals (others think that it can only provide a necessary and not a sufficient condition), but a unified material-conditional account of both indicatives and counterfactuals seems a nonstarter. The material-conditional account, for example, classifies

If the moon had been made of cheese, I would be immortal

as just as surely true as

If this apple had been made of copper, it would have conducted electricity

simply on the ground that the antecedent is false. But one is much more discriminating about the truth-values of counterfactual conditionals than this account allows. That is why Lewis and Jackson, having accepted the material-conditional theory for indicatives, adopt a nonuniform general theory of conditionals, Lewis (1973) offering a possible-worlds account of counterfactuals and Jackson (1977) a causal account.

A further issue concerns whether one can give a uniform account of the logic of indicatives and counterfactuals. The following inference patterns

(I1) If A then C, therefore, if not-C then not-A (contraposition)

(I2) If A then B, if B then C, therefore, if A then C  
(hypothetical syllogism)

(I3) If A then B, therefore, if A and C then B  
(strengthening the antecedent)

are valid for the material conditional, but are widely agreed not to hold for counterfactual conditionals (e.g., consider the failure of (I3), in the move from the true claim “If he had walked on the ice, it would have broken” to the false claim “If he had walked on the ice and had been holding a large bunch of helium balloons, the ice would have broken”). While a nonuniform account can allow that these inference patterns hold for indicatives but fail for counterfactuals (see Lewis [1973] and Jackson [1979], who attempts to explain away apparently invalid indicative cases like “if he has made a mistake, then it is not a big mistake, therefore, if he has made a big mistake, he has not made a mistake” in terms of failure of assertibility), a uniform account must hold that if they fail for counterfactuals then they also fail for indicatives (see Stalnaker 1968).

### THEORIES OF COUNTERFACTUALS

Turning now to counterfactuals, one finds three main approaches. The metalinguistic account initiated by Nelson Goodman in 1947 (see also Chisholm 1955, Mackie 1973, Tichy 1984) analyses counterfactuals in terms of an entailment relationship between the antecedent plus an additional set of statements or propositions, and the consequent. The causal approach offered by Jackson in 1977 (see also Kwart 1986) is closely related but deserves a separate category because it appeals essentially to causal concepts in its analysis of counterfactuals, thereby ruling out the popular strategy of using counterfactuals in an analysis of causation (one of the first to do this was Hume 1748/1975, p. 76; see also Lewis 1986b). Finally, there is the possible-worlds approach initiated by William Todd (1964), Stalnaker (1968), and Lewis (1973), which analyses counterfactuals in terms of similarity relations between worlds. This entry will consider them in turn, after hereby putting aside, as unimportant to the present concerns, all counterfactuals that are true (or false) as a matter of logic or *a priori* necessity, such as

If Q had been P it would have entailed P (Q)

If this number had been 2 it would have been even  
(odd)

If this circle had been square it would have had fewer  
than (more than) seven sides

THE METALINGUISTIC APPROACH. According to Goodman’s (1947) metalinguistic approach a counterfactual asserts a certain connection or consequential relation between the antecedent and the consequent. Since in the case of the counterfactuals that concern this discussion the antecedent does not entail the consequent as a matter of logic or *a priori* necessity, certain other statements, including statements of laws and existing particular conditions, must be combined with the antecedent to entail the consequent. These counterfactuals, then, are true, if true at all, only if (and if) the antecedent combined with a set of statements S that meets a certain condition  $\phi$  entails the consequent as a matter of law. The theory is metalinguistic because counterfactuals are treated as equivalent to metalinguistic statements of the relevant entailments.

A notorious difficulty for this theory has been to give an adequate specification of condition  $\phi$ . Consider  $[A \Box \rightarrow C]$ . Given that the assumption, in the case of a counterfactual, is that A is false, one may reasonably assert  $\sim A$ . However, if  $\sim A$  were admissible into S, then with A one would get the contradiction  $[A \& \sim A]$ , and since it is generally accepted that anything can be inferred from a contradiction, anything could be inferred from the conjunction of A and S, including C. All counterfactuals would therefore turn out to be true (*a priori* false counterfactuals have been excluded). To prevent this trivialization, the statements that constitute S must be (logically) compatible with A. This excludes  $\sim A$ . A further requirement noted by Goodman is that the statements that constitute S must be compatible with  $\sim C$ ; for if they were not, C would follow from S itself, and A and the laws would play no role in the inference to C.

With this in hand Goodman offers the following analysis: “A counterfactual is true if and only if (iff) there is some set S of true sentences such that S is compatible with C and with  $\sim C$ , and such that  $[A \& S]$  is self-compatible and leads by law to C; while there is no set S' compatible with C and with  $\sim C$  and such that  $[A \& S']$  is self-compatible and leads by law to  $\sim C$ ” (Goodman 1947, p. 120; for a discussion of this last condition, see Bennett 2003; Parry 1957). Restricting S with the notion of compatibility does not seem to be enough, however, for counterfactuals that clearly seem false still threaten to turn out true. Consider

(1) If match m had been struck, it would have flared

and

(2) If match m had been struck, it would not have  
been dry

Despite the restrictions on S, one gets the unacceptable result that (1) and (2) both turn out true. To see this, assume that it is a law that (L) when oxygen is present, dry matches flare when struck. Start with the situation of the dry match (D), the presence of oxygen (O), and suppose that the match has not been struck ( $\sim$ S) and has not flared ( $\sim$ F). O, D, and L are compatible both with S and with  $\sim$ F, and with S, they imply F. Thus, (1) is true. Now, however, suppose  $\sim$ F: that in fact the match has not flared.  $\sim$ F, O, and L are compatible both with S and with D, but with S they imply  $\sim$ D. Thus, (2) is true.

To eliminate this unwanted consequence, Goodman (1947) suggests that the relevant conditions in S must be cotenable with the antecedent. A is cotenable with B if it is not the case that B would have been false if A were true.  $\sim$ F is thus compatible with S but not cotenable with it, because if the match had been struck (S), it would have flared (F). So (1) is true and (2) is false. However, this solution results in a circular definition or a regress, for counterfactuals are defined in terms of cotenability and cotenability is defined in terms of counterfactuals. Goodman proposed no solution to this problem (for a short discussion, see Bennett 2003, pp. 310–312).

**THE CONDENSED ARGUMENT-SUPPOSITIONAL APPROACH.** Closely related to the metalinguistic account is Mackie's (1973) condensed argument or suppositional account according to which all conditionals, including all counterfactuals, are condensed or abbreviated arguments that leave certain auxiliary premises unstated. Generally, to assert  $[A \square \rightarrow C]$  is to assert C within the scope of the supposition A (Mackie replaced the notion of a condensed argument by that of a supposition in an attempt to cover certain atypical conditionals that do not readily expand into arguments, e.g., "If that's a Picasso I'm a Martian").

There are two central ways in which Mackie's (1973, 1974) account differs from Goodman's (1947). First, Mackie abandons any metalinguistic element. In fact, according to Mackie, this feature of Goodman's account is the reason to reject it. Mackie argues that it simply "does not ring true" that when one asserts counterfactuals one is performing a higher-level linguistic act whose subject is a lower-level linguistic act. If-sentences are about the world, not about what is said about the world.

Second, Mackie relaxes the cotenability requirement on A and S. One does not need to provide an exact criterion of cotenability. All that one needs is the idea that the speaker assumes the cotenability of A and S and a notion of cotenability that can, he claims, be elucidated simply in

terms of it being reasonable to combine a belief that S with A.

This suggestion is closely in line with what are sometimes called third-parameter views of counterfactuals (see Tichy 1984, who attributes this view to Chisholm 1955; Mill 1868; Ramsey 1931). According to this view, when a speaker asserts a counterfactual, he or she implicitly assumes a set of propositions. The counterfactual is true just in case the antecedent of the counterfactual and the assumed propositions entail the consequent and the implicitly assumed propositions are true. Since the implicitly assumed propositions depend on the attitudes of the speaker, no analysis of these propositions can be given and so the cotenability problem does not arise.

One point strongly in favor of such views is their ability to deal with ambiguous counterfactuals. Consider

If Caesar had been in command in Korea, he would have used the atom bomb

If Caesar had been in command in Korea, he would have used catapults

Although both counterfactuals can plausibly be asserted, they make different predictions about what would have happened. By introducing a third parameter this ambiguity can be located in the set of implicitly assumed propositions. The first counterfactual is asserted by someone who is assuming that Caesar was alive during the actual Korean War, and the second counterfactual is asserted by someone who is assuming that Caesar was involved in a war in Korea during Caesar's actual lifetime.

Jonathon Bennett (2003, pp. 305–308) objects to Chisholm's (1955) version of this solution to the cotenability problem, arguing that it implausibly requires that the asserter of  $[A \square \rightarrow C]$  have the assumed propositions in mind, although one can, for example, be sure that the lights would have gone off if one had turned the oven on again without knowing about the faulty electrical wiring in one's kitchen. He further argues that there are no limits to what a speaker could assume in asserting  $[A \square \rightarrow C]$ , and that this lets in unwanted counterlogical conditionals like "if that piece of cast iron were gold some things would be malleable and not malleable."

**THE CAUSAL APPROACH.** Another theory closely related to the metalinguistic approach is Jackson's (1977) causal theory of counterfactuals, so-called because of the central role that causality plays in it. To determine the truth-value of a counterfactual one takes the causal laws at the actual world at a time. These determine the state of the world at later times. One then takes the state of the

world at the antecedent time, changes it as little as possible to make the antecedent true, and determines whether the causal laws predict subsequent states that make the consequent true.

More formally,  $[A\Box\rightarrow C]$  is true at all the A-worlds satisfying the following:

- (i) Their causal laws are identical with ours at the time of the antecedent and after
- (ii) Their antecedent time-slices are the most similar to ours in particular facts
- (iii) They are identical in particular fact to our world prior to the time of the antecedent

Sequential counterfactuals assert that if something had happened at one time, something else would have happened at a later time, and one difficulty for the theory is presented by asequential counterfactuals like:

If I had had a coin in my pocket, it would have been a Euro.

If Flintoff had not taken the winning wicket, Harmison would have (where this is understood as meaning that sooner or later one of them would have taken the winning wicket)

Jackson (1977) proposes to analyze asequential counterfactuals in terms of sequential counterfactuals. For example, one asserts the counterfactual about Flintoff and Harmison when one thinks that if Flintoff had failed to take the final wicket, events would have ensured Harmison's taking it (they were the only bowlers left and Australia was batting so poorly).

Jackson's account appeals to similarities between worlds. Does that mean that he is really giving a possible-worlds account of counterfactuals? Although he no longer objects to being classified as a possible-worlds theorist, in 1977 he drew a sharp division between his causal account and the possible-worlds account. He argued that a causal theorist about counterfactuals could avoid ontological commitment to possible worlds because the relevant similarities were things like the mass of an object or the magnitude of a force, similarities that could be characterized by reference to features of the actual world without any appeal to possible worlds.

**THE POSSIBLE WORLDS APPROACH.** In asserting a counterfactual one is of course standardly considering possibilities, how things would or might have been if certain other things had not been as they were, how things would or might be if things were not as they are, and the most influential treatment of counterfactuals has been

the possible-worlds approach, which proposes to analyze counterfactuals by giving a rigorous account of their truth conditions and logical behavior using possible-worlds semantics. Stalnaker (1968) and Lewis (1973) are the most influential proponents of this view, and the basic idea is that the counterfactual  $[A\Box\rightarrow C]$  is true just in case the closest possible A-worlds (worlds where A is true) are C-worlds (worlds where C is true), and the central notions are those of a possible world and the closeness relation. Both Stalnaker and Lewis introduce the idea of a "logical space," which is, roughly, a space of possible worlds. They locate the actual world in a "similarity structure" in such a logical space and make use of this similarity structure to determine the truth-values of counterfactuals.

More formally, for Stalnaker (1968)

$[A\Box\rightarrow C]$  is true iff A is impossible or C is true at  $f(A, w^*)$

where  $f$  is a "selecting" function that takes the antecedent A and the actual world  $w^*$  as arguments and delivers a unique possible world as a value. The counterfactual is true if C is true at the possible world that  $f$  delivers as the value.

How exactly does the selection function select? The informal answer is that the selection is based on an ordering of possible worlds with respect to their similarity or resemblance to the actual world. More formally, for Lewis (1973)

$[A\Box\rightarrow C]$  is true iff either there is no A-world or some  $[A\&C]$  world is more similar to the actual world than any  $[A\&\sim C]$  world

It is convenient to represent Lewis's truth conditions in this way, with direct reference to similarity, although in his original presentation the ordering relation is explicated in terms of a system of spheres of worlds (for any possible world, all other possible worlds can be placed on spheres centered on that world, the sizes of the spheres representing how close those worlds are to that world. All worlds on a given sphere are equally close to the centered world, and inner spheres are closer to the centered world than outer spheres).

Lewis (1973) and Stalnaker (1968) agree that if the antecedent of a counterfactual is impossible then the counterfactual is trivially true. For Lewis, this is because there is no such A-world; for Stalnaker, function  $f$  selects the impossible world in which every statement is true. (It is not however clear that all impossible counterfactuals are alike in respect of truth. There is, intuitively, a difference between "If Picasso had been a sonnet, he would

have had fourteen lines” and “If Picasso had been sonnet, he would have had compound eyes,” and Daniel Nolan [1997] and others argue that impossible worlds, like possible worlds, can be ranked with respect to comparative similarity to the actual world.) Lewis and Stalnaker also agree that inference patterns like contraposition, hypothetical syllogism, and strengthening the antecedent ((I1) to (I3) earlier) are invalid for counterfactuals. However, they disagree about the conditional excluded middle:  $[[A \Box \rightarrow C] \vee [A \Box \rightarrow \neg C]]$  for all A and C. Stalnaker accepts it because according to his account there will always be one closest possible world, whereas Lewis accepts ties among closest possible worlds and so the principle is not universally true.

Stalnaker and Lewis also agree in analyzing the “closeness” relation in terms of similarity between worlds. However, what makes one world more similar to the actual world than another world? Kit Fine (1975) and Bennett (1974) object that Lewis’s (1973) theory does not provide the correct truth conditions if closeness of worlds is understood in terms of our everyday intuitive notion of similarity. Intuitively, the counterfactual

If Nixon had pushed the button, there would have been a nuclear holocaust

seems true, and yet it is false by the lights of one commonsense notion of similarity, according to which a world in which a nuclear holocaust does not occur although Nixon presses the button is much more similar to our unholocausted world than a world where a nuclear holocaust does occur.

Lewis responds to this objection in “Counterfactual Dependence and Time’s Arrow” (1979), claiming that a possible-worlds theory of counterfactuals does not need to appeal to any everyday notion of overall similarity. It is rather up to the theorist to work out a way of weighing factors relevant to overall similarity that will deliver the right truth-values for counterfactuals. Lewis offers the follows systems of weights:

- [i] It is of the first importance to avoid big, widespread, diverse violations of law
- [ii] It is of the second importance to maximize the spatiotemporal region throughout which perfect match of particular fact prevails
- [iii] It is of the third importance to avoid even small, localized, simple violations of law
- [iv] It is of little or no importance to secure approximate similarity of particular fact, even in matters that concern us greatly (Lewis 1979, p. 473)

According to this system of weights, the Nixon counterfactual turns out true. Consider a world in which Nixon pushes the button and there is no nuclear holocaust; rather, events proceed in such a way as to match those in our world with perfect similarity. The trouble with claiming that this is the most similar world is that Nixon’s pressing the button would have numerous effects (including the button’s warming slightly, the subsequent state of Nixon’s memory, and so on), and only a large miracle could wipe out all these changes. The worlds closest to ours are the ones that agree with our actual world until Nixon presses the button and then continue on in accordance with the laws of the actual world. (However, for a reformulation of the Nixon objection in the light of this reply, see Tooley 2003).

Many philosophers shy away from the apparent metaphysical commitments of the possible-worlds approach. For what is a possible world? Lewis’s (1986c) answer that possible worlds are concrete entities, each as real as the actual world, seems to most hopelessly implausible, but there are many other views. Stalnaker’s (1968) and Bennett’s (2003) possible worlds, for example, are maximally consistent sets of propositions; Saul Kripke’s are stipulations; and others hold that possible worlds are combinatorial constructions out of elements of the actual world.

Whatever one’s view, and whether or not one wishes to appeal to possible worlds, counterfactual conditionals are the vehicles of two of the most fundamental forms of thought: “What if?” and “If only.” They are central to imagination and invention, essential to curiosity and regret, essential, along with conditionals in general, to the fundamental capacities for debating, supposing, speculating, and hypothesizing that constitute the heart of one’s intelligence.

Michelle Montague (2005)

## EUDAIMONIA

Strictly speaking, the term "eudaimonia" is a transliteration of the Greek word for prosperity, good fortune, wealth, or happiness. In philosophical contexts the Greek word "eudaimonia" has traditionally been translated simply as "happiness," but a number of contemporary scholars and translators have tried to avoid this rendering on the grounds that it can suggest unhelpful connotations in the mind of the uncritical reader. (For example, it does not refer to an affective state, nor is it coextensive with the classical utilitarian conception of happiness, though both of these notions may, in some thinkers, count as aspects of *eudaimonia*.) Since the word is a compound of the prefix "eu-" (well) and the noun "daimōn" (spirit), phrases such as "living well" or "flourishing" have been proposed as possible alternatives. But the consensus appears to be that "happiness" is adequate if the term is properly understood within the philosophical context of antiquity.

Aristotle wrote that all agree that *eudaimonia* is the chief good for humans, but that there is considerable difference of opinion as to what *eudaimonia* consists in (*Nicomachean Ethics* I.2, 1095a15–30). The portrait of Socrates presented in Plato's early, Socratic dialogues has Socrates endorsing the view that *eudaimonia* consists in living a just life, which requires knowledge in the form of a kind of foresight (see especially *Gorgias*). In his later works (for example, the *Republic*), Plato continued to argue that virtue is sufficient for happiness, and that non-moral goods do not add to *eudaimonia* (the so-called sufficiency thesis).

As is well known, Aristotle agreed that virtue is a necessary condition for *eudaimonia* but held that it is not sufficient (the so-called necessity thesis). On his account, "eudaimonia" is most properly applied not to any particular moment of a person's life, but to an entire life that has been well lived. While virtue is necessary for such a

life, Aristotle argued that certain nonmoral goods can contribute to *eudaimonia* or detract from it by their absence. There is some controversy among scholars as to how Aristotle finally characterized the happy life, the life marked by *eudaimonia*. Throughout the first nine books of the *Nicomachean Ethics*, he appears to think that a happy life is a life that centrally involves civic activity. The virtues that mark the happy person are themselves defined as states of the soul that arise out of certain interactions taking place in social relations. But in book X, Aristotle's argument appears to be that a life of contemplating the theoretical (*theoria*) is the happiest sort of life, and that civic involvement can actually detract from this sort of activity (though the private life of contemplation appears to presuppose the public life, since without the public life to produce goods and services, the philosopher is incapable of living in isolation).

Where Socrates, Plato, and Aristotle agreed was in the objective nature of *eudaimonia*, which set them sharply apart from the popular morality of their day. In a famous passage from the *Gorgias* (468e–476a), Socrates shocks Polus by arguing that a wrongdoer is actually worse off than the person whom he wrongs, and that any wrongdoer is bound to be unhappy until he is punished. The person who has been wronged, by contrast, may be happy in spite of whatever physical suffering he may undergo at the hands of the wrongdoer. The *Gorgias* concludes with a myth about the fate of the human soul after death that makes it clear that only the state of the soul, not the physical state of the body, determines whether one is happy or unhappy.

Although Aristotle did not agree that happiness cannot be diminished at all by physical suffering, it is not because he thought that feelings are decisive for happiness. On the contrary, he argued for an objective standard of human happiness grounded in his metaphysical realism. In *Nicomachean Ethics* (I.7), he argued that human excellence ought to be construed in terms of what ordinarily characterizes human life (the so-called function or *ergon* argument). This argument is clearly grounded in his doctrine of causation, according to which any member of a natural kind is characterized by four causes: a formal cause, a material cause, an efficient cause, and a final cause. The final cause is inextricable from the formal cause: To be a certain kind of thing is just to function in a certain way, and to have a certain sort of function is just to be a certain kind of thing. The human function (*ergon*) is to be found in the activity of our rational faculties, particularly practical wisdom (*phronēsis*) and learning (*sophia*). Since the activity of both of these faculties is

ordered not by subjective considerations but by the formal constraints of reason itself, human excellence is objectively determined: To live well is to live a life characterized by the excellent use of one's rational faculties, and this excellence is marked by successfully applying general rules for virtuous living to particular situations calling for moral deliberation.

Aristotle rejected alternative accounts of happiness as falling short of his ideal in some way (*Nicomachean Ethics* I.5, 1095b14–1096a10). The life of political honor, for example, reduces happiness to the degree to which one is esteemed by others, thus disconnecting happiness from the operation of one's own proper function. A more popularly held view equated happiness with pleasure, a view that Aristotle quickly dismissed as failing to distinguish humans as a natural kind from other animals that also feel pleasure and that rely on it as a motivating force in their daily quest for survival. For Aristotle, as for Plato before him, the hedonistic view overlooks the essential function of human rationality: to order and control human appetites and desires, channeling them into activities that, in the long run, best ensure human flourishing. Indeed, it is this very order and control that distinguishes human society from all other forms of life, so that there is an intimate connection between human excellence and the political life. This connection is subject to a certain tension, however, since both Plato, in the *Republic*, and Aristotle, in his life of theoretical contemplation, make social order a necessary condition for human excellence while simultaneously arguing that personal happiness in some sense involves disconnecting oneself from the community at large.

The Stoics agreed that happiness is our ultimate end, for which all else is done, and they defined this as consistently living in accordance with nature. By this they meant not only human nature but the nature of the entire universe, of which we are a part, and the rational order that both exhibit. Practical reason thus requires an understanding of the world and our place in it, along with our resolute acceptance of that role. Following nature in this way is a life of virtue and results in a "good flow of life," with peace and tranquility.

The Epicureans also took *eudaimonia* to be the end for humans, but they defined "eudaimonia" in terms of pleasure. Yet many of the things we take pleasure in have unpleasurable consequences, which on balance disrupt our lives, and so do not provide us with the freedom from concerns (*ataraxia*) and the absence of physical pain (*aponia*) that characterize true happiness. These traits, they believed, must be secured through the exercise of

moderation, prudence, and the other virtues, yet they are not valued for their own sakes but as instrumental means to a life of pleasure and happiness.

This form of hedonistic eudaemonism is to be contrasted with the hedonism of the Cyrenaics, the main exception to Aristotle's statement that all agree that the highest good is *eudaimonia*. Sketchy accounts of the elder Aristippus suggest that his hedonism involved giving free reign to sensual desires (Xenophon, *Memorabilia* 11.1.1–34), so as always to be capable of enjoying the moment, making use of what was available (Diogenes Laertius 11.66). Later Cyrenaics refined this position as seeking to enjoy sensual pleasure to the full without sacrificing autonomy or rationality. Their conception of pleasure emphasized bodily pleasures, understood as either a kind of movement (*kinēsis*) or the supervening state of the soul (*pathos*). Because they regarded such transient states as the highest good, the Cyrenaics rejected the view that *eudaimonia*, a comprehensive and long-term type of fulfillment, is the end that should govern all our choices.

## EXPERIMENTATION AND INSTRUMENTATION

Experiment, William Herschel wrote, is a matter of "putting in action causes and agents over which we have control, and purposely varying their combinations, and noticing what effects take place" (Herschel 1966, p. 76). In this sense, the earliest recorded scientific experiments appeared in biological and medical contexts. In the second century CE, the physician Galen performed detailed animal experiments to find out about the functions of various organs. In the sixteenth century, Andreas Vesalius, pioneer in dissection, carried out elaborate experiments; and William Harvey, notwithstanding his Aristotelian orientation, supported his discovery of the circulation of the blood with painstaking experimental arguments. It is highly plausible that the practice of alchemy also served as an early source of experimentation. From the thirteenth century on, alchemists used laboratory equipment in order to create new agents and were arguing against the overly narrow interpretation of the art-nature divide in Aristotelian philosophy.

A third area where experimentation took place before the scientific revolution was supplied by Ptolemy's optics. Ptolemy, active in the second century CE, formulated an experimental, quantitative law of the refraction of light at the boundary of air and water and performed experiments to investigate binocular vision. In continuing this tradition in the early eleventh century CE, the Arab Ibn al-Haytham (Alhazen) wrote an impressive experimental treatise on optics in which he related in a mathematically demanding way the physics and geometry of light to the anatomy of the eye. Al-Haytham's work was translated into Latin in the thirteenth century and decisively influenced later optical research for a long time. Because of this and similar developments, Crombie saw experimental science of the modern world created by thirteenth-century philosophers of the West transforming Greek geometrical method and uniting it with the experimental habit of the practical arts.

All these different attempts of probing nature through experimental trials certainly contributed to the final emergence of experimentation in the seventeenth century as a self-conscious, methodically controlled and systematically used form of scientific experience. Galileo's

new conception of motion, which was based on experiment and measurement from about 1604 on, played an instrumental and decisive role in this (Schmitt 1969). In the second half of the century, scientific academies devoted themselves to the new science and became the primary centers of experimental activity.

From the seventeenth century on, experimentation increasingly meant the implementation of new or improved scientific instruments. Following a suggestion of Thomas S. Kuhn, we can group these instruments mainly into two categories according to their origin in the classical or the Baconian tradition of physical science (Kuhn 1976). The classical sciences comprise those mathematical disciplines like astronomy, geometrical optics, statics, harmonics, and geometry itself, which were first constituted in classical antiquity and experienced their major developments already then. With the exception of harmonics, the close connections of these fields with each other lasted way up into the nineteenth century. The instruments belonging to this tradition were often called “mathematical instruments” and are of a restricted variety: ruler and compass, balance, clock, and geometrical-astronomical devices. They served as aids to “mixed mathematics,” which allowed for certain physical attributes in addition to the abstract mathematical ones. To experiment with them mostly meant to confirm a belief that was established beforehand by rational considerations, or to detail a fully established theory in a special respect. Many experiments performed in this tradition proved to be in reality only thought experiments—mental constructions of possible experimental situations whose results were thought to be predictable already from everyday experience. Even Galileo participated sometimes in this attitude.

The second tradition to which we can attribute many of the new instruments of the period is the Baconian one whose disciplines owe their status as sciences mainly to the experimental movement of the seventeenth century and to the practice of “natural histories,” including those of the different practical arts that experienced a tremendous re-evaluation at the time. The barrier between the craft and scholarly traditions, which had so far separated the mechanical from the liberal arts, began to break down. To the Baconian sciences belong the studies of heat, electricity, magnetism, chemistry, metallurgy, glass making, and the like. The instruments of these fields were used to investigate nature under previously unobserved or non-existent conditions and were often called “philosophical instruments.” During the next decades, the Baconian movement brought forth the telescope, the

microscope, the thermometer and the barometer, the air pump, electric charge detectors, the Leyden jar, and many other contrivances. It is interesting to see that these instruments were primarily used in a qualitative way and that a strictly quantitative application came only very late, mainly at the end of the eighteenth or during the early nineteenth century when the two traditions, the classical and the Baconian, started to merge with each other. From about the middle of the seventeenth century on, the Baconian movement had adopted some form of the atomic or corpuscular philosophy and became the official “experimental philosophy” of the Royal Society.

### PHILOSOPHICAL ASSESSMENTS OF EXPERIMENTATION AND INSTRUMENTATION

In the second book of his *Physics*, Aristotle had developed a contrast between “*physis*” and “*techné*,” that is, between natural entities that have an innate principle of change—like plants, animals and humans, but also stones and clouds—and those that are artificially constructed, like bedsteads and clothes. Until the scientific revolution, Aristotelians used this nature-artifact divide as an argument against the epistemological relevance of experimentation. In order to understand nature, they claimed, one must not intervene with her order. Intervention would either invalidate nature’s innate principles or play her a trick with mechanical contrivances, but would not lead to any genuine knowledge of natural reality. Instead, one must let nature pursue her own course and purposes and gain knowledge of her principles by closely observing them. The fact that *techné* or art is declared by Aristotle to be able to complete nature’s unfinished processes or to imitate her does not change this state of affairs. To complete nature in regard to the behavior of a natural entity meant to remove all obstacles that might have come in its way; and to imitate nature denoted the general maxim to bring form and matter of an entity in an intricate union as nature does it with her beings.

It seems that the major author in providing a *philosophical* bridge over the art-nature divide was Francis Bacon (1561–1626). This justifies Kuhn’s choice of using Bacon’s name for a whole new tradition of experimentation. Bacon argued that art was only a special way of arranging a state of affairs in which nature herself will then produce an intended result. He redefined Aristotle’s concept of form and took it as the key to the operational features of a natural being, leaving out the teleological dimension. The discovery of operational rules of an entity can now be identified with the true form or real

essence of relations among its simple natures. Consequently, Bacon rejected Aristotle's three other causes besides the formal one and took forms as "nothing more than those laws and determinations of absolute actuality which govern and constitute any simple nature, as heat, light, weight, in every kind of matter and subject that is susceptible of them" (*Nov. Org.* ii, XVII).

As a result, knowledge of our world cannot, according to Bacon, be read off from its surface, so to say. We can work our way through to the "viscera naturae," or nature's intestines, only by methodical and experimental procedures of induction. Perhaps Bacon's major insight was that simple enumerative induction, as taught by Aristotle, that is, induction without experiment and without the method of exclusion, is not enough to tell essential correlations from accidental ones.

Bacon's procedure of induction was taken as a valuable method of creating new empirical theories and laws way up into the twentieth century. The Baconian tradition culminated during the nineteenth century in John Stuart Mill's elaboration and refinement of Bacon's and Herschel's inductive rules. There is, however, a tendency visible in Mill to take experiment not quite with the same force as Bacon had taken it. For Bacon, experiment is inevitable if one wants to snatch secrets from nature—they never show up by themselves. Yet for Mill, situations are conceivable where observation can serve the same purpose as experiment: "For the purpose of varying the circumstances [in order to find out the real laws] we may have recourse ... either to observation or to experiment; we may either *find* an instance in nature suited to our purposes, or, by an artificial arrangement of circumstances, *make* one. The value of the instance depends on what it is in itself, not on the mode in which it is obtained: its employment for the purposes of induction depends on the same principles in the one case and in the other, as the uses of money are the same whether it is inherited or acquired. There is, in short, no difference in kind, no real logical distinction, between the two processes of investigation" (*System of Logic*, III, vii, 2).

The belief that there is no "logical distinction" between observation and experiment became a matter of course for almost all the schools of philosophy of science of the entire twentieth century until the 1980s. It is interesting to see how an excellent nineteenth-century experimentalist, Hermann von Helmholtz, resisted this tendency, although he followed Mill in many other and important respects. His reasons, however, were different from Bacon's: If I can vary the conditions of an event in different respects, he argued, I can be sure that *my inter-*

*vention* is the cause of observed change because I know of my will's impulse. If, however, I can only passively *observe* correlations without any help from me, I can never be sure whether these make up genuine causal relations or only accidental covariation (Helmholtz 1903). Whereas for Bacon it is the coyness of nature that compels humans to experiment, for Helmholtz it is the epistemological limitation of the passive mind that forces them to intervene in nature's course.

One of the strongest and most influential anti-inductive texts ever written is a chapter in Pierre Duhem's *Aim and Structure of Physical Theory* of 1906, titled "Physical Theory and Experiment." In order to show the general inadequacy of inductivism, Duhem picked the "Newtonian method" to pieces, as it appeared both in the hands of Newton himself as well as with Ampère's electrodynamics. He brilliantly showed that there is no question in Newton's celestial mechanics of any extraction of hypothesis by induction from experimenting, as Newton himself required in the *General Scholium*, nor in Ampère's mathematical theory of electrodynamic phenomena of any deduction "only from experiment," as stated already in the title of Ampère's treatise of 1827.

As a logical consequence, Duhem concluded that "in the course of its development, a *physical theory is free to choose any path it pleases provided that it avoids any logical contradiction; in particular, it is free not to take account of experimental facts.*" It has to take account of them only "when the theory has reached its complete development" (Duhem 1974, p. 206; Duhem's emphasis). In order that experiment can unfold its true function—the testing of theories—it must be preceded by theory. Duhem intensified the priority of theory when he demanded that "this test by facts should bear exclusively on the conclusions of a theory, for only the latter are offered as an image of reality; the postulates serving as points of departure for the theory and the intermediary steps by which we go from the postulates to the conclusions do not have to be subject to this test."

Duhem's criticism was later taken up and continued by Karl Popper. In exactly the same spirit as Duhem, Popper decreed that "the theoretician puts certain definite questions to the experimenter, and the latter by his experiments tries to elicit a decisive answer to these questions and to no others" (Popper 1959, p. 107). For Popper therefore, it is only the theoretician who shows the experimenter the way, and never the other way around. The only function left for experiment is to liberate us from sterile and false theories. With Popper, experiment has altogether become the handmaiden of theory.

Duhem had even gone one step further than Popper in questioning the capability of experiment to fulfill this critical task of refuting theories as well. Even if a theory is mature enough to be tested, experiment cannot mechanically decide between it and its rival. “An experiment in physics can never condemn an isolated hypothesis but only a whole theoretical group” (p. 183). And it is hardly ever possible to decide trenchantly which of the many assumptions of a theoretical system is doubtful and responsible for the experimental contradiction. “The physicist concerned with remedying a limping theory resembles the doctor and not the watchmaker” (p. 188). A watchmaker, Duhem maintained, can take the broken watch apart and examine each component separately until he finds the defective one. The doctor, however, cannot dissect the patient to find out the problem, but has to guess its seat by inspecting disorders affecting the whole body. And even if all the assumptions of a theoretical group were known to be true except one, the rival group would not have been established as superior. This would be shown only if every possible alternative were conclusively eliminated. But we never know of course what alternatives remain to be discovered.

All these considerations led Duhem to explicitly condemn Bacon’s idea of a “crucial experiment.” Bacon had suggested that there do exist experiments that conclusively decide between competing theories. They do this in the way of *instantiae cruces* or “fingerposts” that are set up at crossroads to indicate the several directions. In 1951, W. V. O. Quine joined Duhem in rejecting crucial experiments. He generalized Duhem’s argument to *all* of our empirical tenets. An unexpected unsuitable empirical observation does not only contradict a theoretical system, as Duhem had told us, Quine argued, but *all* our beliefs and theories: “Our statements about the external world face the tribunal of sense experience not individually but only as a corporate body. ... The unit of empirical significance is the whole of science” (Quine 1961, p. 41f.). Quine used this claim for a searching critique of logical empiricism. One consequence of this is that any assumption apparently refuted by observation can be retained as true, so long as we are willing to make appropriate changes elsewhere in the system of our beliefs. This holistic argument for the underdetermination of theories by experience has become known as the “Duhem-Quine thesis.”

The series of philosophical arguments to denigrate the role of experiments continued further into the 20th century. The logical empiricist Hans Reichenbach coined the influential distinction between “context of discovery”

and “context of justification” which had been developed earlier by the philosophers Alois Riehl, Gottlob Frege and others under different names (Reichenbach 1951). According to this dichotomy, all the actual historical and social circumstances of the creation of a scientific theory, including its experimental generation, if there was one, cannot be used as reasons to justify it. Experiment can be good as a heuristic guide to hit upon a useful theory, but it is neither necessary nor sufficient for the validity of its results. As a result of Reichenbach’s division all attention focused on the epistemology of theory and none on discovery and the possibilities of experiment.

Although Thomas S. Kuhn is routinely regarded as major critique of both logical empiricism with its forerunner Duhem and of Popper’s critical rationalism, he was surprisingly enough in large agreement with his predecessors as far as the subordinate role of experiment is concerned—at least in his central work *The Structure of Scientific Revolutions* of 1962/1970. Unlike Reichenbach, however, Kuhn wanted to overcome the separation of discovery and justification, but the admissible discovery part of his logic considered the founding of theories again in overarching paradigms, but not in experiments. In this he followed his teacher Alexandre Koyré and others, who saw the success of modern science in the superiority of mathematically oriented Platonism over Aristotelianism with its “brute, common-sense experience” and over all other experimentally and technologically oriented historical endeavors. For Koyré as for Kuhn a scientific revolution is foremost an “intellectual mutation” (Koyré 1943, p. 400), i.e. a revolution of thought and not of momentous experimental innovation. Paradigms have priority over theories “in their conceptual, observational, and instrumental applications” (Kuhn 1970, p. 43). True experimental research is only possible, if questions to nature are posed in a suitable mathematical language. According to such a view, a history of experimentation could not only be a contingent epiphenomenon of the development of paradigms and would not have much explanatory value. (The contrary view is defended by deSolla Price 1984.) Only when in his later work he began to appreciate the Baconian sciences as an autonomous movement did Kuhn start to appreciate the possibility of a meaningful history of scientific experimentation (Kuhn 1976).

In retrospect, the discussion of experiment in philosophy of science from the late nineteenth century until the 1980s appears as a series of increasingly negative results: We know more and more what experiments don’t accomplish and we understand better and better where earlier

epistemic pretensions of experimentation find their limits. As a result, we can diagnose an “invisibility of experiment.” In the same way as scientific revolutions of a field are, according to Kuhn, normally invisible to the scientific profession of the present, so experiments and their development remain largely invisible to philosophy of science because their exclusive role of testing theories seems ingrained in the ideology of its practitioners.

### THE NEW EXPERIMENTALISM

Since the early 1980s, however, a change has taken place in the attitude of the study of science toward experiment. One can detect a growing awareness of the rich history of experimentation and of the vast variety of its (non-demonstrative) functions. This swing of appreciation is primarily due to detailed work of historians and sociologists of science. It is true that historiography never ceased to deal with experiment, but it had rarely put it into the center of its interest. Socio-historical analysis has now come to concentrate much more on the microstructure of experiment than before and has started to consider all kinds of other sources besides official reports, like diaries and laboratory notebooks. Especially rich sources are Faraday’s laboratory notebooks and letters, Ampère’s “dossier” in the archive of the Académie des Sciences and Hans Krebs’ laboratory diaries and interview protocols (Gooding 1990, Steinle 2005, Holmes 1993, Graßhoff 2000). Historians even went so far as to replicate historical experiments with rebuilt apparatus and to hereby bring to light neglected or otherwise hidden dimensions of experimentation (Heering 2000). Sociologists tried to show that the formulation of experimental results requires special structures of communication in the scientific community and that there is a good deal of negotiation involved until an experimental result is considered as achieved (Shapin and Shaffer 1985, Licoppe 1996; for a discussion see Holmes 1992). The variety of fields from where these case studies come from raise hopes that the traditional concentration on physics in relation to experiment will soon be done with once and for all.

It was Ian Hacking’s *Representing and Intervening* that set the ball rolling in philosophy of science. There are two phrases from Hacking’s book that became the slogans of “new experimentalism”: “If you can spray them, then they are real” and “Experimentation has a life of its own” (Hacking 1983, pp. 23, 150). The first catchphrase stands for a novel argument in favor of scientific realism. The philosopher’s favorite theoretical entity is the electron—never given directly to our senses, but central to modern particle physics. There is an endless debate between sci-

entific realists and their opponents whether explanatory success of a theory is ground for belief in the reality of its theoretically postulated entities. Hacking does not think very highly of this “inference to the best explanation,” on which the ordinary scientific realist bases her belief in the reality of the electron. He rather sets high hopes in the fact that if you spray, say, a niobium ball with electrons, it makes a difference in the world: it decreases the charge of the niobium ball. “From that day forth,” Hacking confesses, “I’ve been a scientific realist.” In a way, Hacking’s argument is a version, adapted to scientific antirealism, of Dr. Johnson’s refutation of Bishop Berkeley’s metaphysical antirealism concerning matter by kicking a stone. “It is not thinking about the world but changing it that in the end must make us scientific realists.”

With the second catchphrase Hacking opposes the alleged theory-domination of experimentation: There actually exists experimental practice, he argues, that is *not* subordinate to theory and this practice actually proves to be very important. This claim is backed up with many intriguing examples. But liberating experiment from permanent condemnation to the role of theory’s handmaiden does not automatically show what other roles it can take on and what the principles of their variations are. About this, Hacking does not say very much. The only other role he addresses in detail is, as he says, the experiment’s “chief role”: the “creation of phenomena.” Some aspects of this role have been brought to light in Steinle’s concept of “exploratory” experiments or in Heidelberger’s notion of “productive” instruments (Steinle 2005; Heidelberger 1998, 2003).

All in all, Hacking seems to be largely content with a “Baconian fluster of examples of many different relationships between experiment and theory” (Hacking 1983, p. 66). This has surely proven to have been enough to initiate a “Back-to-Bacon movement, in which we attend more seriously to experimental science” (p. 150) as it had been Hacking’s intention. But, if neo-Baconianism is sound, it is not enough as an explanation of what happens or should happen with other theoretical commitments of general philosophy of science, like, for example, the theory-ladenness of observation. This doctrine—dear to many philosophers of science for other reasons—comes, at least *prima facie*, into conflict with Hacking’s faith in the priority of experiment.

In the wake of renewed interest in experiment, several substantial studies and edited volumes have appeared. Many of them are divided over the philosophical issue whether experiment can decide between competing theories and thus have an objective meaning or

whether social and political factors are in the end responsible for scientific development. There is, for example, Pickering's sociological history of particle physics or Collins's study of gravity wave detection maintaining the social construction of scientific evidence whereas Franklin and Mayo argue for the existence of strategies that secure reliable experimental outcomes and thus of rational belief. It would be wrong, however, to perpetuate the polarization between history, sociology, and philosophy of science. One of the results of taking experiment more seriously is precisely the insight that these dichotomies have to be transcended. An attempt into this direction has been made by Rheinberger who takes "experimental systems" as functional research units, especially of the life sciences (see Hagner and Rheinberger 1998 for a programmatic overview.) They are made up of research objects, theories, experimental arrangements, instruments, as well as disciplinary, social, cultural and institutional constellations that for some time crystallize in a certain stable configuration.

#### EXPERIMENTATION AND THEORY-LADENNESS

The idea of theory-ladenness of experience enabled a powerful and effective criticism of logical empiricism. This is the view already encountered with Popper that there are no theory-neutral data and that the meaning of observational terms fundamentally depends upon the theoretical context in which they occur. This view can easily be strengthened to serve as the cornerstone of a constructivist and anti-empiricist account of science: The categories in terms of which we carve up our experience are not read off from the external world but follow from prior theoretical or other commitments of its observers, either individually or socially.

The implications of theory-ladenness for a view of scientific experimentation are straightforward: If observations are theory-laden and if experimentation involves observation of results, then experimentation has to be theory-laden too. Since experiments, according to this view, make sense only in relation to some theoretical background, they cannot play a role that is independent from theory.

Now, the question arises: If new experimentalism is right, do we have to give up the idea of theory-ladenness? It is difficult to imagine a straightforward "yes" as an answer, because the general spirit in which the idea of theory-ladenness has been formulated is largely the same as that of the idea that experimentation has a life of its own. It is the spirit addressed by Hacking at the begin-

ning of his book in which philosophers finally realized that they "long made a mummy of science"—the same spirit which, in the face of history and the reality of the laboratory, denies the "Popper/Carnap common ground." To deny theory-ladenness would to some extent feel like a return to logical empiricism and thereby of mummification, even if the autonomy of experiment is the reward.

Before some kind of dénouement of this question is formulated, let us have a closer look at theory-ladenness as it appeared in the work of its most important originators. One of the first propagators of this outlook was Pierre Duhem who wrote: "An experiment in physics is the precise observation of phenomena accompanied by an *interpretation* of these phenomena; this interpretation substitutes for the concrete data really gathered by observation abstract and symbolic representations which correspond to them by virtue of the theories admitted by the observer. ... The result of an experiment in physics is an abstract and symbolic judgment" (Duhem 1974, p. 147). It would not be enough for an experimental report to state, as a layman would express it, that a piece of iron carrying a mirror oscillates. Instead it should read that the electrical resistance of a coil is measured. This shows that the physicist draws conclusions from experiment only in abstract and symbolic terms "to which you can attach no meaning if you do not know the physical theories admitted by the author." In sciences less advanced than physics like physiology or certain branches of chemistry "where mathematical theory has not yet introduced its symbolic representations" and where causal explanation reigns instead of a causally neutral description, the experimenter can reason "directly on the facts by a method which is only common sense brought to greater attentiveness" (p. 180).

This kind of theory-ladenness by theoretical interpretation, as we can call it, is very often confounded with another sort which was provided by Norwood Russell Hanson in 1958 and which can be called "theory-ladenness by prior belief or knowledge." "Seeing an object *x*," Hanson wrote, "is to see that it may behave in the ways we know *x*'s do behave" (Hanson 1958, p. 22). As a result of this, Tycho and Kepler watching the sun at dawn would literally see different things: Tycho who believes in the geocentric theory sees the sun beginning its diurnal circuit, whereas Kepler as defender of heliocentrism sees the earth spinning back into the light of the sun. "Analogously," Hanson wrote, "the physicist sees an X-ray tube, not by first soaking up reflected light and then clamping on interpretations, but just as you see this page before you."

In addition, theory-ladenness in science means “causality-ladenness” for Hanson, being loaded with causal meaning. He does not exclude theory-neutral talk after all, but it only happens in the oculist’s office or like circumstances but not in scientific observation or experimentation. This shows that Hanson rejects all of Duhem’s points: (1) Seeing an experimental result is not interpreting it; (2) both the layman and the physicist have prior beliefs and therefore both their seeing is theory-laden; and (3) physical theory (as well as common beliefs about the world) is causal theory and not just causally neutral description. Whereas for Hanson any injection of causality into the mere registering of facts is bound to render them theoretical, for Duhem, theory begins with the representation of (causal) relations in an abstract, causally neutral structure.

In Thomas Kuhn’s work we find several different conceptions of theory-ladenness that are not always separated clearly. The most frequently used is similar to Hanson’s, except that it is not prior knowledge that shapes perception, but paradigm and that it stresses and utilizes the psychology of perception even more than in Hanson: “Something like a paradigm is prerequisite to perception itself. What a man sees depends both upon what he looks at and also upon what his previous visual-conceptual experience has taught him to see” (Kuhn 1970, p. 113).

In order to exhibit his other uses of theory-ladenness, let us have a look at Kuhn’s treatment of scientific discovery. Kuhn admits the possibility of “fundamental novelties of fact,” that go *against* a well-established paradigm. Without this possibility, as he himself realizes, science could only develop in a theoretical manner and never by adjustment to facts. “Discovery commences with the awareness of anomaly, i.e., with the recognition that nature has somehow violated the paradigm-induced expectations that govern normal science” (Kuhn 1970, pp. 52–53).

Where, according to Kuhn, does a violation of the paradigm-induced expectations come from? Does it come from a causal process that violates the received view or from a new theoretical interpretation that makes old facts appear in a new light? It seems that in Kuhn, it is almost always the *theoretical interpretation*, the assimilation to theory, that is decisive for discovery and hardly ever any causal experience. “Assimilating a new sort of fact demands a more than additive adjustment of theory, and until that adjustment is completed—until the scientist has learned to see nature in a different way—the new fact is not quite a new fact at all.” That sounds more as if new facts and causal processes were created by new para-

digms than the other way around. Lavoisier, we are told, for example, was enabled through his new paradigm “to see in experiments like Priestley’s a gas that Priestley had been unable to see there himself” and was “to the end of his life” unable to see p. 56).

The only case where Kuhn explicitly admits that discovery has been effected by a genuinely novel causal experience appears to be the case of the X-rays. “Its story opens on the day that the physicist Roentgen interrupted a normal investigation of cathode rays because he had noticed that a barium platino-cyanide screen at some distance from his shielded apparatus glowed when the discharge was in process” (p. 57). Although Kuhn seems to consider this observation theory-laden, I maintain that, in Duhem’s sense, it is not. If it were, Roentgen, by definition of theory-ladenness, would have been able to interpret it in light of the theories of physics he had at his disposal. But here it is exactly the point that his theories deserted him and he could *not* find a place for this new experience in his customary theoretical structure. For this reason he interrupted his investigation and asked himself why the screen had come to glow. Yet the novel observation is certainly theory-laden in the sense of Hanson, because Roentgen immediately looked for a causal relationship between his apparatus and the glowing of the screen, although this went completely against all his expectations!

Kuhn seems to say that Roentgen would never have paid attention to the glowing screen if he had not disposed of deeply entrenched theories of physics that *prohibited* such a phenomenon. If this is true then we have here a third sense of the notion of theory-ladenness before us. It frames a psychological hypothesis about the ease with which a phenomenon is detected or paid attention to in the light of a *contradicting* paradigm: An observation is theory-laden in this sense if it were improbable that an observer would have made it (that an observer would have noticed it or would have attributed any importance to it) without her holding a theory beforehand that created expectations *to the contrary*. It would be better to drop the term “theory-ladenness” for this case altogether and instead call it “theory-guidance” because the experimental result made sense to Roentgen as an observation in its simple causal structure already *without* the theoretical background of the theory that guided it or any other one. “Theory-guidance” refers to a psychological disposition how well one is prepared to notice a particular phenomenon in certain situations.

After Roentgen had noticed the anomaly, he conducted various experiments in order to explore the *cause*

of the incident: “Further investigations—they required seven hectic weeks during which Roentgen rarely left the laboratory—indicated that the cause of the glow came in straight lines from the cathode ray tube, that the radiation cast shadows, could not be deflected by a magnet, and much else besides. Before announcing his discovery, Roentgen had convinced himself that his effect was not due to cathode rays but to an agent with at least some similarity to light” (Kuhn 1970, p. 57). This is perhaps the only place in his book where Kuhn uses the term “cause” (or an equivalent) in relation to an experimental investigation. The quotation shows vividly that Roentgen did not conduct his experiments in order to test a theory but to expand our knowledge of causal connections in relation to the scientific instruments and devices involved.

What does our discussion suggest therefore as the most adequate description of Roentgen’s early experiments? They were certainly theory-guided in the sense of Kuhn and they were, or immediately became, causality-laden in the sense of Hanson, but not (or not yet) theory-laden in the sense of Duhem (which Kuhn also shares). Kuhn is right when he suggests that only after the phenomena had received an abstract and symbolic representation can we speak of a “discovery” of X-rays. Yet before this interpretation has taken place, we can say that an anomaly has occurred and that it can be replicated in certain ways; not more, but also not less.

If the case of the X-rays is in this way correctly understood, then Kuhn can give in to Hacking without losing anything essential and admit that experimentation can be, and very often is, autonomous and free from theory. The lesson to learn is to distinguish between two kinds of experiments: those that are causal, but not (yet) embedded in a theoretical structure and those that presuppose the knowledge of such a framework. This emphasis of an autonomous “lower level” in experimentation is not a relapse into positivist observation statements and protocol sentences allegedly giving meaning to theory. The claim rather is that two types of experimentation should conceptually be kept apart: experimentation at the causal level, where the manipulation of instruments and objects under scrutiny takes place, and experimentation taking place at the theoretical level, where the results at the causal level are represented in a theoretical superstructure.

## MODALITY AND LANGUAGE

Modality is a category of linguistic meaning having to do with the expression of possibility and necessity. A modalized sentence locates an underlying or preajacent proposition in the space of possibilities (the term *preajacent* was introduced by medieval logicians). *Sandy might be home* says that there is a possibility that Sandy is home. *Sandy must be home* says that in all possibilities Sandy is home. The counterpart of modality in the temporal domain should be called temporality, but it is more common to talk of tense and aspect, the prototypical verbal expressions of temporality. Together, modality and temporality are at the heart of the property of displacement (one of Charles F. Hockett's design features of human language) that enables natural language to talk about affairs beyond the actual here and now.

There are numerous kinds of expression that have modal meanings, the following is just a subset of the variety one finds in English:

- (1) Modal auxiliaries  
Sandy must/should/might/may/could be home.
- (2) Semimodal verbs  
Sandy has to/ought to/needs to be home.

(3) Adverbs

Perhaps, Sandy is home.

(4) Nouns

There is a slight possibility that Sandy is home.

(5) Adjectives

It is far from necessary that Sandy is home.

(6) Conditionals

If the light is on, Sandy is home.

It is traditional to use English modal auxiliaries or semimodal verbs as the primary source of illustrative examples. This is in spite of the fact that these elements have a rather curious set of grammatical properties. Indeed, it appears that modal meanings are part of a natural logical vocabulary and thus elements with modal meanings easily become part of the inventory of grammatical or functional morphemes, which are typically associated with idiosyncratic, nonproductive grammatical characteristics (for a cross-linguistic survey of this process, compare Bybee, Perkins, Pagliuca 1994).

### KINDS OF MODAL MEANING

One can distinguish different kinds of modal meaning. Alethic modality (Greek: *aletheia*, meaning “truth”), sometimes logical or metaphysical modality, concerns what is possible or necessary in the widest sense. It is in fact hard to find convincing examples of alethic modality in natural language, and its inclusion in this list is primarily for reason of historical completeness. The following categories, however, are of primary importance in the study of natural language. Epistemic modality (Greek: *episteme*, meaning “knowledge”) concerns what is possible or necessary given what is known and what the available evidence is. Deontic modality (Greek: *deon*, meaning “duty”) concerns what is possible, necessary, permissible, or obligatory, given a body of law or a set of moral principles or the like. Bouletic modality, sometimes boulo-maic modality, concerns what is possible or necessary, given a person’s desires. Circumstantial modality, sometimes dynamic modality, concerns what is possible or necessary, given a particular set of circumstances. Teleological modality (Greek: *telos*, meaning “goal”) concerns what means are possible or necessary for achieving a particular goal. In the descriptive literature on modality, there is taxonomic exuberance far beyond these basic distinctions.

### FLEXIBILITY OF MEANING

Many modal expressions can be used to express many or all these kinds of modal meaning. Witness the English semimodal *have to* in the following set of examples:

(7) It has to be raining. [after observing people coming inside with wet umbrellas; epistemic modality]

(8) You have to go to bed in ten minutes. [stern father; bouletic]

(9) Visitors have to leave by six p.m. [hospital regulations; deontic]

(10) I have to sneeze. [given the current state of one’s nose; circumstantial]

(11) To get home in time, you have to take a taxi. [teleological]

Some modal expressions are more specialized in what kind of meanings they can carry. The English auxiliary *might* is most comfortable expressing epistemic modality.

(12) It might be raining.

Some modals only occur in specialized environments. The modal *need* with a bare infinitive complement can only occur in negative environments:

(13) a. You need not worry.

b. \*You need worry.

(14) Nobody need worry.

Such negative polarity modals occur in other languages as well (compare the Dutch *hoeven* and the German *brauchen*).

### POSSIBLE WORLDS SEMANTICS

In technical work on natural language semantics, modality is analyzed with the machinery of possible worlds semantics, developed by logicians for the artificial language of modal logic. The most influential incarnation of this idea is found in the work of the semanticist Angelika Kratzer (1981, 1991).

The starting tenet is that modal expressions express quantification over possible worlds—regardless of what those might be (most practitioners have few ontological scruples). Possibility modals correspond to existential quantification, while necessity modals correspond to universal quantification. Different kinds of modal meaning correspond to different choices of sets of possible worlds as the domain of quantification. These sets of possible worlds are assigned to the world in which the complex sentence is evaluated (the evaluation world) by an accessibility relation.

The accessibility relation underlying epistemic modality delivers as the domain of quantification for the modal those worlds that are compatible with what is known, with the available evidence in the evaluation world. Similarly, deontic modality quantifies over worlds that satisfy the relevant body of law or principles. Bouletic modality quantifies over worlds that conform to what the relevant person desires.

Actually, Kratzer (1981, 1991) argues that modal meaning does not just rely on an accessibility relation but also on an ordering of the accessible worlds. The clearest argument for this complication of the semantics comes from deontic cases. Imagine a city whose traffic bylaws outlaw the practice of double parking at any time for any reason. The bylaws further specify that anyone who is found guilty of double parking must pay a considerable fine. Robin has been found guilty of double parking, so the following sentence seems to be true:

(15) Robin must pay a fine.

Notice, however, that in all the worlds that conform to the traffic bylaws there never occurs any double parking, since that is against the law. Therefore, in none of those worlds does Robin pay a fine for double parking. Thus, the simple possible worlds analysis incorrectly predicts the sentence to be false.

Kratzer's (1981, 1991) analysis makes modal expressions doubly relative: they need to be interpreted relative to (1) a set of accessible worlds (modal base), and (2) an ordering of those worlds. For the case in hand, the accessible worlds would be those where Robin's actions hitherto are what they are (double parking occurs) and that from then on develop in many conceivable ways. The ordering would be that induced by the traffic bylaws, which would favor among the accessible worlds those where Robin pays a fine. The truth-conditions of this example are then that in all the favored worlds among the accessible worlds Robin pays a fine. The sentence could be made false either if Robin did not in fact double park or if the traffic bylaws do not in fact require a fine.

The surface variety of modal meanings is thus a product of the interplay of three factors: (1) the quantificational strength (possibility, necessity, and shadings in between, e.g. slight possibility), (2) the modal base, and (3) the ordering source.

Epistemic modality has an epistemic modal base and either no ordering or an ordering based on plausibility or stereotypicality. Deontic modality has a circumstantial modal base (because one may have to abstract away from one's knowledge that the right thing will not be done)

and an ordering source based on a body of law or principles. Bouletic modality again has a circumstantial modal base and an ordering source based on a relevant person's desires.

There is much detailed research remaining to be done on the fine distinctions between different modal expressions. Consider, for example, the fact that *ought to* and *have to* somehow differ in strength in their deontic use:

(16) You ought to call your mother, but of course you don't have to.

Or, consider the fact (explored by Ninan 2005) that deontic *should* and deontic *must* differ whether one can admit that the right thing will not happen:

(17) I should go to confession, but I'm not going to.

(18) #I must go to confession, but I'm not going to.

There is also an interesting literature on fine details of epistemic meaning. Work by Ian Hacking (1967), Paul Teller (1972), and Keith DeRose (1991) shows that there is much additional complexity and context-dependency behind the phrases *what is known* or *the available evidence*, which are typically used to characterize epistemic accessibility. In particular, the context may specify whose knowledge or evidence base is relevant to the claim made with an epistemically modalized sentence.

## CONTEXT-DEPENDENCY AND LEXICAL SPECIALIZATION

Kratzer (1981, 1991) argues that rather than treating the multitude of modal meanings as a case of (accidental) polysemy, it should be seen as the outcome of context-dependency. In other words, modal expressions have in of themselves a rather skeletal meaning and it is only in combination with the background context that they take on a particular shade of meaning (such as epistemic or deontic). She points to ways of making explicit what the intended conversational background is:

(19) According to the hospital regulations, visitors have to leave by six p.m.

(20) Considering the evidence before us, it has to be raining.

In the absence of such explicit markers, natural language users need to rely on contextual clues and reasoning about each other's intentions to determine what kind of modal meaning a particular sentence is intended to express in its context of use.

As seen earlier, some modals are not entirely subject to the whims of context but impose their own preferences as to what kind of modal meaning they would like to express. English *might* likes to be epistemic (with some interesting exceptions, such as the use in *You might try to put the key into this slot*, which has the force of a suggestion). This kind of behavior is not uncommon for expressions that are context-dependent: pronouns refer to contextually furnished individuals but may include restrictions on what the context can furnish, for example, the gender marking on *she* requires that the context furnish a female individual.

It has been shown that there is a recurring historical development where a modal expression that initially has a nonepistemic meaning only (something that for opaque reasons is often called a root modal) develops over time into an expression that also has epistemic meanings (e.g., Nordlinger and Traugott [1997] document this development for the case of English *ought to*).

#### THE ARGUMENT STRUCTURE OF MODALS

So far, this entry has been presupposing that modality concerns the possibility or necessity of a prejacent proposition. There is, however, an ancient and persistent doctrine that another kind of modality concerns the possible or necessary existence of a relation between a subject or agent and a predicate. For example, one finds the claim that deontic modality can at least sometimes concern what an agent is permitted or obliged to do.

(21) Sandy ought to call his mother.

The propositional analysis has it that the sentence expresses the necessity of the prejacent proposition that Sandy calls (will call) his mother, relative to the current circumstances and a body of ethics, for example. The predicate-level analysis has it that the sentence expresses that the agent Sandy and the property of calling his mother stand in a certain modal relation. Some authors call this the *ought to be* versus *ought to do* distinction. Certain sentences are clearly cases of propositional-level *ought to be* modality:

(22) There ought to be a law against double parking.

For sentences with an agentive subject, it is an open question, debated in the technical literature, whether a predicate-level or propositional-level analysis is correct. Whatever one's position in this debate is, one has to admit that some sentences with human subjects still do not express an obligation imposed on that subject:

(22) Jimmy ought to go in his crib now. [said of a six-month-old baby]

#### FURTHER AND RELATED CATEGORIES

At the outset, this entry listed a set of expressions that have modal meanings. The list was far from complete. Here, some other types of expressions that may fall under the general category of modality or at least belong to adjacent categories will be added.

A closely related category, perhaps subsumable under modality, is evidentiality. Various languages regularly add markers, inflectional or otherwise, to sentences that indicate the nature of the evidence that the speaker has for the prejacent proposition. A typical evidential system might centrally distinguish between direct and indirect evidence. The latter concept might be further subdivided into indirect reasoning from direct evidence or conclusions based on hearsay or the like. The standard European languages do not have elaborate evidential systems but find other ways of expressing evidentiality when needed. The English adverb *apparently* seems to prefer indirect evidence:

(24) Kim has apparently been offered a new job.

The German modal *sollen* has a hearsay interpretation:

(25) Kim soll einen neuen Job angeboten bekommen haben.  
Kim soll a new job offered get have  
“Kim has supposedly been offered a new job.”

Another important category is mood, an inflectional marking on the main verb of a sentence, which expresses some kind of modal meaning. English has only a rudimentary mood system, if that. However, Romance languages, for example, productively use mood. In Italian, the complement clause of a verb like *say* occurs in the indicative mood, while the complement of *believe* appears in the subjunctive mood. There are attempts at analyzing the mood selection in such cases as depending on technical properties of the possible worlds semantics of the embedding verb. The research topic remains active and thriving.

Propositional attitude constructions are also related to modality. Consider the near equivalence of the following two sentences:

(26) Robin suspects that the butler is guilty.

(27) Given Robin's evidence, the butler might be guilty.

Jaako Hintikka (1969) proposed to analyze propositional attitudes with the same possible worlds machinery that was originally applied to modals, thus making the

relation between the two categories explicit in their semantics.

Expressions of illocutionary force are also within or close to the field of modality. Consider in particular attenuating speech act markers, as explored in pioneering work by J. O. Urmson (1952):

(28) The butler is, I suspect, guilty.

The difference between attenuated assertion of a proposition and categorical assertion of a modalized proposition is small, one suspects.

One particular kind of expression deserves attention: the modal particles that are rampant in some languages, such as German:

(29) Kim hat ja einen neuen Job.

Kim has JA a new job

“Kim has a new job, as you may know already”

The gloss here is only approximate, the meaning of the modal particles is elusive and under active investigation.

Modality is a pervasive feature of natural language and sometimes it clearly appears in the semantics of an expression without a clear syntactic or morphological exponent. Such hidden modality can be detected, for example, in infinitival relatives in English (for extensive discussion, see Bhatt 2005):

(30) When you have computer trouble, Sandy is the person to talk to. [= Sandy is the person one ought to talk to]

Sometimes the source for the modality can be identified but its etymology and nature remains opaque:

(31) What Arlo is cooking has garlic in it.

(32) Whatever Arlo is cooking has garlic in it. [epistemic modality triggered by *-ever*: speaker does not know what precisely Arlo is cooking]

The range of modal expressions is a rich domain for language-internal and cross-linguistic investigations.

### MODALITY WITHOUT CONTENT?

So far, this entry has assumed that modalized sentences express complex propositions with a possible worlds-based quantificational meaning built on top of a pre-jacent unmodalized proposition. While this is indeed the standard analysis in formal natural language semantics, it is not the standard assumption in descriptive and typological linguistics.

The most common analysis in descriptive work treats modality as an expression of the speaker’s attitude

toward the pre-jacent proposition, rather than giving rise to a complex proposition with its own distinct content. The prevalence of this conception can perhaps be traced back to the influence of Immanuel Kant, who wrote in his *Critique of Pure Reason* that “the modality of judgments is a very special function thereof, which has the distinguishing feature that it does not contribute to the content of the judgment” (1781, p. 74). This idea seems to have influenced both practicing linguists and a subset of logicians, including Gottlob Frege, who wrote in his *Begriffsschrift* that “[b]y saying that a proposition is necessary, I give a hint about the grounds for my judgment. But, since this does not affect the conceptual content of the judgment, the form of the apodictic judgment has no significance for us” (1879, p. 5).

It may be that scholars have typically adopted one of the two conceptions without much reflection. Within the descriptive literature, there is rarely any argumentation for the speaker’s comment analysis. And the formal semantic literature rarely addresses the issue either, basically ignoring the preponderance of the speaker’s comment analysis in the descriptive literature.

One rather straightforward prediction of the speaker’s comment analysis is that modalized sentences should not be easily embeddable. This prediction seems to be false for at least some standard modal expressions:

(33) It might be that visitors have to leave by six p.m.  
[epistemic modality embedding a deontic modality]

Such iterated modality is unexpected from the point of view of the speaker’s comment analysis. Better cases for a comment analysis come from speech act markers:

(34) #If yesterday, I suspect, was the worst day of the year, the market is in good shape.

The suspicion arises that some modal expressions have a comment-type meaning, while others contribute to the propositional content of the complex sentence. There is here, it seems, the opportunity for empirical and theoretical debate on this issue. It should be noted that the question here is related but not identical to the issue of whether a modal element expresses subjective or objective modality (these terms are discussed by Lyons 1977).

Independently of these ideas from descriptive linguistics, there are proposals that would give modals a meaning that goes beyond truth-conditions. In dynamic semantics, epistemic modals are treated as particular operations on an information state, see, for example, Veltman (1996). Finally, at least for deontic modals, it has

been suggested that they can be used with performative force, whether or not they also have propositional content. Kamp (1973, 1978) and Lewis (1979) explore the idea that deontic ‘may’ is used to grant permission, while Ninan (2005) explores the idea that deontic ‘must’ is used to issue commands.

## COMPOSITIONAL INTERACTIONS

As the examples of iterated modality in the previous section showed, at least some, if not most, modal expressions can compositionally interact with other expressions. Interactions with negation, quantifiers, and tense are particularly interesting.

The combination of modals with negation is a fountain of idiosyncratic facts. Consider that English *may* scopes under negation when read deontically, but scopes above negation when read epistemically:

(35) He may not have any cake. [deontic, “not allowed”]

(36) He may not be home. [epistemic, “possible that not”]

Or, consider that English *must* scopes above negation (in either reading) while German *müssen* scopes under negation:

(37) a. He must not have any cake. [“obligatory that not”]

b. He must not be home. [“evident that not”]

(38) Er muss nicht zuhause bleiben.

He must not at-home remain  
“He doesn’t have to stay home.”

Lastly, note that while *can* does not easily allow an epistemic reading, negated *cannot* does have an epistemic reading:

(39) a. Sandy can be home. [?]

b. Sandy cannot be home. [epistemic]

Most of these facts have resisted systematic explanation and remain mysterious.

Sentences containing both modals and quantificational noun phrases are often ambiguous:

(40) Most of our students must get outside funding ...

a. for the department budget to work out.

b. the others have already been given university fellowships.

In some of the literature, this ambiguity is assimilated to the distinction between *de dicto* and *de re* interpretations, probably inappropriately. In any case, it has been observed that not all sentences show this ambiguity. For example, epistemic modals seem to resist having quanti-

fiers scope over them (for an exploration, see von Stechow and Iatridou 2003):

(41) Most of our students must be home by now.

a. must > most of our students

b. \*most of our students > must

Again, this kind of fact remains mysterious, it may be an idiosyncratic syntactic fact without any grounding in semantics.

The interaction of modality and temporality is intricate and ill understood. One should first note that the aspectual nature of the prejacent sentence has a strong influence on what kind of meaning a modal sentence can carry. A nonstative prejacent typically gives rise to deontic readings, while a stative prejacent is compatible with both epistemic and deontic readings:

(42) He has to be in his office. [epistemic/deontic]

(43) He has to see his doctor this afternoon. [nonepistemic]

While modal auxiliaries do not inflect for tense (the fact that *might* may be a past-tense inflected form of *may* has reasons in the mist of history), other expressions do allow such inflection.

(44) He had to be in his office.

It is not always obvious whether what is happening here is that the modal sentence is located in the past or whether the modal has scope over a past-tense prejacent. The preceding sentence, when read epistemically, is plausibly ambiguous, reporting a past deduction about a simultaneous state of affairs or a present deduction about a past state of affairs. Finally, some modals in embedded positions seem not to express any modal meaning of their own but occur in “agreement” or “harmony” with a higher modal or mood. One relevant case is “I am convinced that it must be raining.” See Portner (1997) for discussion.

## CONDITIONALS

An interaction of modals with other expressions that is of paramount importance is their appearance in conditional constructions. It has been noticed again and again that for sentences of the form *if p, modal q* it is hard to find a compositional interpretation that treats the *if*-construction as expressing some kind of conditional meaning, while the modal in the consequent expresses its usual modal meaning.

Consider, for example, the following conditional:

(45) If Robin double parked her car, she must pay a fine.

A tempting idea is that the conditional construction introduces universal quantification over epistemically accessible worlds and says that the consequent is true in all epistemically accessible worlds where Robin double parked her car. The consequent in turn is true in an evaluation world if in all worlds circumstantially accessible from that world and favored by the deontic ordering source Robin pays a fine. However, now assume that one knows that Robin is invariably law abiding. She would never do anything that contravenes any law. So, among the epistemically accessible worlds there are none where she double parks against the law, so if she double parked, that must be consistent with the law. Hence, the above sentence would come out false. However, this seems wrong. The sentence does not make a claim about what the law must be like if Robin double parked her car. What it claims is that the actual law is such that double parking necessitates a fine.

The conclusion drawn from this and many parallel examples with other modal operators is that it is a mistake to analyze such structures as involving two-layered operators: a conditional construction embedding or embedded in a modal construction. Rather, the idea has been to say that in such sentences, the *if*-clause does not supply its own operator meaning but serves as a restriction on the modal base of the modal operator. The proper analysis of the previous sentence is that it says that among those circumstantially accessible worlds where Robin double parked her car, the ones favored by the law as it is in the actual world are all worlds where Robin pays a fine.

After surveying a number of such cases, Kratzer summarizes the thesis as follows, “[T]he history of the conditional is the story of a syntactic mistake. There is no two-place *if ... then* connective in the logical forms of natural languages. *If*-clauses are devices for restricting the domains of various operators” (1986).

What about bare conditionals such as *If Sandy’s light is on she is home*? Here, there is no modal operator for the *if*-clause to restrict. Should one revert to treating *if* as an operator on its own? Kratzer (1986) proposes that one should not and that such cases involve covert modal operators—in this case, possibly a covert epistemic modal. This entry has nothing to say about that here.

This entry has shown that the topic of modality is characterized by rich empirical detail, considerable cross-linguistic variation, and intriguing theoretical issues. The following bibliography can serve as a start for further reading and exploration.

## PHRONËSIS

Often translated as "practical wisdom," the Greek word *phronësis* derives from the verb *phronein*, meaning "to have understanding," or "to be wise or prudent." In its earliest uses the word is normative only in the sense that it signifies a correct cognitive grasp of some kind; only

gradually does it come to be used in ethical contexts for a correct grasp of what ought to be done. For Plato and the other Socratics, *phronësis* represents that aspect of our rational faculty that derives genuine knowledge about values and norms, that is, about the virtues (see especially *Protagoras*, *Gorgias*). The famous debate between the Socratics and their critics, such as the orator Isocrates, turned on the possibility of demonstrative knowledge in the sphere of virtue. Plato had attacked oratory on the grounds that its aim is not to discover what is morally right, but merely to persuade, and he offered in its place the Socratic method of dialectic, a cooperative search for the truth by means of hypothesis formation, critical examination and refutation, and hypothesis modification. Isocrates had characterized Socratic dialectic as mere eristic (*Against the Sophists* 1; *Antidosis* 261) or argument for argument's sake—probably for this reason, Plato is especially careful to distinguish the Socratic method from mere eristic in his *Euthydemus*—and referred to the Socratics as "disputers." But Plato devotes much argument to showing how the careful examination of various conceptions of the virtues can lead inexorably to a recovery of their essential nature, which resides in the soul of every person from birth.

Aristotle's treatment of *phronësis* (*Nicomachean Ethics* VI.5 1140a24–b30; cf. 1141b8–1143a5) is similar in many respects to Plato's, but in his account the knowledge that we obtain of virtue is not the equivalent of scientific (demonstrative) knowledge (*episteme*): unlike *episteme*, which is concerned with necessary truths, *phronësis* is always concerned with contingent truths. Aristotle defines *phronësis* by reference to something more concrete and familiar, namely, the practically wise person, *ho phronimos*, someone who has *phronësis*. It is the mark of the practically wise person, he says, to be able to deliberate well about what is good and advantageous for himself not merely in one area, such as health or strength, but as a means to human flourishing in general. The operation of *phronësis* in Aristotle's account of the rational faculties appears to hinge on the application of general rules for right conduct (the *orthos logos*) to the particular circumstances of a given situation so as to result in action that will generally tend toward human flourishing. The *phronimos* is the person whose life is characterized by such applications of *phronësis* and who, as a result, tends to flourish throughout his life. Such a person is said to be *eudaimôn* or "happy."

In contrast, the Stoics characterize *phronësis* as a kind of scientific knowledge (*episteme*), namely, of what should be done or not. Although they differ amongst

themselves about the precise relationship, the Stoics regard the other virtues as this sort of knowledge in more specific domains: justice concerns what should be done or not with regard to deserts, courage with regard to what should be endured, and moderation with regard to what should be chosen or avoided. But given the Stoics' conception of a good life as one lived in agreement with nature, knowledge of what should be done will depend on knowledge of both human nature and nature as a whole, and above all our role within the latter. *Phronêsis*, therefore, has a considerably larger scope for the Stoics than for Aristotle, and is possessed only by the Stoic ideal of the wise person.

For Epicurus, *phronêsis* has more to do with prudential reasoning. It is what enables us to assess the consequences of every choice and so calculate its overall value. It is thus crucial for leading a happy life—in fact, Epicurus regards it as even more precious than philosophy itself. In particular, he believes, it reveals that virtue and pleasure are inseparable: It is impossible to live pleasantly without living virtuously or, for that matter, to live virtuously without living pleasantly.

## QUANTIFIERS IN NATURAL LANGUAGE

Quantifiers in natural language correspond to words such as *every*, *some*, *most*, *few*, and many others.

## THE SEMANTICS OF DETERMINERS

What is the semantics of expressions like *every* and *most*? An answer to this question emerged in the early 1980s, in work of Jon Barwise and Robin Cooper (1981), James Higginbotham and Robert May (1981), Edward L. Keenan and Jonathan Stavi (1986), Johan van Benthem (1986), Dag Westerståhl (1985), and many others.

The basic idea of how to interpret quantified expressions comes from Gottlob Frege (1879). Frege observed that the familiar quantifiers  $\forall$  (*everything*) and  $\exists$  (*something*) can be thought of, in Frege's terms, as second-level concepts. Let us call whatever gives the interpretation of an expression its semantic value. Assuming an extensional and set-theoretic framework, we may assign predicates sets of individuals as their semantic values. Frege's idea can then be recast as saying that the semantic values of  $\forall$  and  $\exists$  are sets of sets.  $\exists xFx$  (*something is F*) is true if the semantic value of *F* is in the interpretation of  $\exists$ , which happens just in case the semantic value of *F* is nonempty. More generally, quantifiers have as semantic values sets of the values of predicates which result in true sentences when the quantifiers are applied.

In logic, this idea was later investigated by Andrzej Mostowski (1957) and then Per Lindström (1966). But it does not apply to natural language without an important modification. Consider:

- (1) Most students attended the party.

In this, *most* does not tell us something about a single predicate. Rather, it compares the students with the people attending the party. In particular, it compares the size of the set of students with the size of the set of people attending the party.

This binary or relational character of quantification in natural language is extremely widespread (as is demonstrated by the extensive list of examples in Keenan and Stavi 1986). It is also no accident. Rather, it reflects a fundamental feature of the syntax of natural languages. Simplifying somewhat, sentences break down into combinations of noun phrases (NPs) and verb phrases (VPs). Noun phrases also break down, into combinations of determiners (DETs) and common nouns (CNs) (or more complex construction with adjectival modifiers like *small brown dog*). Quantifier expressions occupy the determiner positions in noun phrases, as in:

- (2) [<sub>S</sub> [<sub>NP</sub> [<sub>DET</sub> most ] [<sub>CN</sub> students ] ] [<sub>VP</sub> attended the party] ]

(See any current syntax text for a more thorough presentation of this material, or the handbook discussions of

Bernstein [2001] and Longobardi [2001]. For some interesting cross-linguistic work, see Matthewson [2001] and the papers in Bach et al. [1995].)

Quantifier expressions, such as *every* and *most*, are determiners. Their semantic values must be relations between sets of individuals, representing the semantic values of CNs and VPs in simple syntactic configurations like (2). Using some set theory, we may give examples of the semantic values of determiners explicitly. For instance, for a universe of discourse  $M$  and sets of individuals  $X, Y \subseteq M$ :

- (3) a. **every** <sub>$M$</sub> ( $X, Y$ )  $\longleftrightarrow \Xi \subseteq Y$   
 b. **most** <sub>$M$</sub> ( $X, Y$ )  $\longleftrightarrow |X \cap Y| > |X \setminus Y|$

(Here the boldface **every** <sub>$M$</sub>  is the semantic value of the expression *every*.) This characterization of the semantic values of determiners as relations between sets is often called the relational theory of determiner denotations.

As the semantic values of determiners are relations between sets, the semantic values of noun phrases built out of determiners (or most determiners) are interpreted as sets of sets, along Fregean lines. For instance, the semantic value of *most boys* is **most** <sub>$M$</sub>  **boys** =  $\{Y \subseteq M: |\mathbf{boys} \cap Y| > |\mathbf{boys} \setminus Y|\}$ . We may use the term ‘quantifier’ for either sort of semantic value. The latter are often called unary or simple quantifiers. Quantifiers taking more than two arguments are well documented in natural language, and have been investigated by a number of authors, including Filippo Beghelli (1994) and Edward L. Keenan and Lawrence S. Moss (1984). Quantifiers taking as inputs relations rather than sets, called polyadic quantifiers, have also been investigated, by authors including Higginbotham and May (1981), May (1989) and van Benthem (1909), though their place in natural language remains controversial. The survey by Keenan and Westerståhl (1997) is a good place to look for an introduction to these issues.

## PROPERTIES OF QUANTIFIERS

The relational theory of determiner denotations has been applied to a number of issues in logic, philosophy of language, and linguistics. Many of these are discussed in the surveys by Keenan (2002), Keenan and Westerståhl (1997), and Westerståhl (1989). These applications rely on some important properties of quantifiers, of which two examples are given here.

**RESTRICTED QUANTIFIERS.** Quantifiers in natural language appear to be restricted quantifiers. Whereas  $\forall$  and  $\exists$  range over the entire universe, a quantifier like **most** <sub>$M$</sub>

ranges over its first input, corresponding to the CN position in an NP. *Most boys are happy* expresses **Most** <sub>$M$</sub> (**boys**, **happy**). Whether this holds or not depends on the properties of the **boys**, and not anything about the rest of the universe.

The mere presence of the CN argument is not enough to show that it functions as the domain of quantification. But the CN does play an important role, which is brought out by the following pattern:

- (4) a. i. Every student attended the party.  
 ii. Every student is a student who attended the party.  
 b. i. Most students attended the party.  
 ii. Most students are students who attended the party.

In each of these, (i) and (ii) are equivalent.

The pattern we see in (4) is called conservativity:

- (5) (CONS) **Q** <sub>$M$</sub> ( $X, Y$ ) is conservative if and only if for all  $X, Y \subseteq M$ , **Q** <sub>$M$</sub> ( $X, Y$ )  $\longleftrightarrow$  **Q** <sub>$M$</sub> ( $X, X \cap Y$ ).

Conservativity expresses the idea that the interpretation of a sentence with a quantified noun phrase only looks as far as the CN, so the CN restricts the domain of quantification.

One of the striking facts about natural languages, observed in Barwise and Cooper (1981) and Keenan and Stavi (1986), is that the semantic values of all natural language determiners satisfy CONS. This is a proposed linguistic universal: a non-trivial empirical restriction on natural languages.

Conservativity has proved an extremely important property. The space of conservative quantifiers is much more orderly than the full range of relations between sets. This is brought out most vividly by the conservativity theorem due initially to Keenan and Stavi (1986), further investigated by van Benthem (1983, 1986) and Keenan (1993). The key insight is that the class of conservative quantifiers can be built up inductively, from a base stock of quantifiers and some closure conditions. Let  $M$  be a fixed finite universe and let  $CONS_M$  be the collection of conservative quantifiers on  $M$ . We will build up a class of quantifiers  $D-GEN_M$  on  $M$  as follows.  $D-GEN_M$  contains **every** <sub>$M$</sub>  and **some** <sub>$M$</sub> . We also assume that each set of members of  $M$  is definable by a predicate, and that  $D-GEN_M$  is closed under Boolean combination and predicate restrictions. The latter assumes that if **Q** <sub>$M$</sub> ( $X, Y$ ) is in  $D-GEN_M$ , so is **Q** <sub>$M$</sub> ( $X \cap C, Y$ ) for  $C \subseteq M$ . This amounts to closure under (intersective) adjectival restriction in an NP.

The conservativity theorem says that for each  $M$ :

$$(6) \text{CONS}_M = D\text{-GEN}_M$$

This tells us that the domain of natural language determiners is far more orderly than it might have appeared. Some logical properties extending CONS have been studied, by van Benthem (1983, 1986) and Westerståhl (1985, 1989). These appear to strengthen the proposed universal as well.

**LOGICALITY.** Quantified NPs are often described as expressions of generality. One way to articulate the relevant notion of generality is that it requires the truth of a sentence to be independent of exactly which individuals are involved in interpreting a given quantifier. This can be captured formally by the constraint of permutation invariance. A permutation  $\pi$  of  $M$  is a 1-1 onto mapping of  $M$  to itself, which can be thought of as a rearranging of the elements of  $M$ . The constraint of permutation invariance then says:

$$(7) \text{(PERM)} \text{ Let } \pi \text{ be a permutation of } M. \text{ Then } \mathbf{Q}_M(X, Y) \longleftrightarrow \mathbf{Q}_M(\pi[X], \pi[Y]).$$

(Here  $\pi[X] = \{\pi(x) : x \in X\}$ .) PERM, or some strengthening of it, is commonly assumed in the mathematical literature, and is built into the definitions of quantifier in Lindström (1966) and Mostowski (1957). The semantic values of most natural language determiners satisfy PERM. (At least, the values of most syntactically simple determiners do.) There remain some hard cases, such as possessive constructions (as well as proper names, which can be interpreted as unary quantifiers not satisfying PERM). As these may not be examples of genuine determiners, the hypothesis that all natural language quantifiers satisfy both CONS and PERM is commonplace.

### SEMANTIC COMPOSITION

The relational theory of determiner denotations does not explain how quantifiers interact with the rest of syntax and semantics. The way the values of determiners combine with other semantic values provides an example of such interaction.

According to the relational theory, the semantic values of quantified NPs are sets of sets, while the values of VPs are sets. How do these combine? When we have a quantified NP in subject position, the semantics of composition is given by set membership. For a quantified NP value  $\alpha$ :

$$(8) [{}_S [{}_{NP} \alpha] [{}_{VP} \beta]] \text{ is true if and only if } \beta \in \alpha.$$

This simple story does not always work. Transitive verbs with quantified NPs in object position provide one sort of problem. A transitive verb will be interpreted as a relation between individuals. Now, consider an example like:

- (9) a. John offended every student.  
 b.  $[{}_S [{}_{NP} \text{John}] [{}_{VP} [{}_V \text{offended}] [{}_{NP} \text{every student}]]]$

The value of *offended* is a relation between individuals, while the value of *every student* is a set of sets. We have no way to combine these to give us a set of individuals, which the value of the VP must be.

The theory of determiner denotations does not help solve this problem. Instead, some more apparatus is needed, either in the semantics or in the syntax. One approach is to posit underlying logical forms for sentences which are in some ways closer to the ones used in the standard formalisms of logic.

The goal is to replace the quantified NP *every student* with a variable that can occupy the argument position of a VP, that is, a variable over individuals. This variable is then bound by the quantifier. We thus want a structure that looks something like:

$$(10) [ [{}_{NP} \text{every student}_x] [{}_S \text{John offended } x] ]$$

In fact, many theories (following May 1977, 1985) argue that a structure like (10) is the underlying logical form of a quantified sentence. This is a substantial empirical claim about natural language, which holds that syntactic structures like (10) provide the input to semantic interpretation. Typically, such theories also hold that a syntactic process of movement produces a syntactic structure with initial quantifiers, and variables in the argument positions those quantifiers originally occupied. (For a survey of ideas about logical form in syntactic theory, see Huang 1995.)

Providing a structure like (10) does not by itself explain the semantics of binding: It does not explain semantically how the quantified NP binds the variable in the VP. The theory of the semantic values of determiners does not explain this either. Some separate account is needed.

The semantic operation that corresponds to binding is one of forming the right set to be the input of the semantic value of the determiner. Hence, even though we think of the syntactic structure *John offended  $x$*  as sentence-like (with the variable functioning like a pronoun), its interpretation needs to wind up being  $\{x : \text{John offended } x\}$ . Once we have this, we can say the sentence is true if this set is in the semantic value of the quantified

NP *every student*. Hence, binding is carried out by the appropriate form of set abstraction (as in Barwise and Cooper 1981). Many current presentations are embedded in the framework of the typed lambda-calculus, which treat sets as functions from individuals to truth values. In such a framework (Büring 2005, Heim and Kratzer 1989), set abstraction is replaced by lambda-abstraction. Other approaches use similar syntactic structures to (10), but offer a more Tarskian account of binding (Higginbotham 1985; Larson and Segal 1995). Finally, there are approaches that avoid positing syntactic structures like we see in (10), including early work of Cooper (1983), and type shifting approaches (Hendriks 1993, Jacobson 1999, Steedman 2000, van Benthem 1991). There is also an approach that seeks to explain semantic composition via a generalized account of the semantic values of determiners (Keenan 1992).

Michael Glanzberg (2005)

## QUESTIONS

All too often when philosophers talk and write about sentences, they have in mind only indicative sentences, that is, sentences that are true or false and that are normally used in the performance of assertions. When interrogative sentences are mentioned at all, it is usually either in the form of a gesture toward some extension of the account of indicatives or an acknowledgment of the limitations of such an account. For example, in the final two sentences of his influential paper "Truth and Meaning" (1967), Donald Davidson remarks, "And finally, there are all the sentences that seem not to have truth values at all: the imperatives, optatives, interrogatives, and a host more. A comprehensive theory of meaning for a natural language must cope successfully with each of these problems." Nonindicatives are an embarrassment to Davidson's program of identifying meaning with truth conditions. They are equally an embarrassment for the old identification of meanings with verification conditions, as well as the newer identification of meanings with inferential roles. Nonindicatives in general, and interrogatives in particular, have neither truth conditions nor verification conditions, nor do they function naturally or principally as the premises or conclusions of inferences. Yet they are no less meaningful than indicatives. And they are certainly no less important. As Nuel Belnap has observed, following David Harrah, "[We] will not assert anything ever, nor profit from the assertions of others, without at least the traces of such interests as can be expressed by interrogatives" (1990, p. 16).

Why have philosophers felt comfortable in virtually ignoring interrogatives and the other nonindicatives? Probably because of the persistent yet rather inchoate idea that indicatives and assertion are somehow fundamental to language and meaning, and that the other forms of sentences and speech acts are secondary or derivative, perhaps even unnecessary. J. L. Austin railed

against this idea in *How to Do Things with Words* (1962). Austin's pioneering work gave birth to the field of speech-act theory, which found its fullest development in the work of his student John Searle. Speech-act theory is one of the few areas in philosophy that pays due attention to uses of language other than assertion. But even here one finds a residue of the tendency to subordinate the nonassertive to the assertive. We will return to this issue a bit later on.

Outside of speech-act theory, the idea that interrogatives and the other nonindicatives are secondary survives in a number of forms. The aforementioned identification of meaning with truth conditions is a primary example. One sometimes hears philosophers defend this idea by observing that everything that can be done with language can be done with just assertions. One can ask what time it is by asserting, "I wish to know what time it is"; one can command another to lower a weapon by asserting, "You will lower your weapon"; and so on. In the opposite direction, any assertion can be performed by way of a question or an order. For any  $p$ , one can assert that  $p$  by asking "Did you know that  $p$ ?" or by commanding "Be aware that  $p$ ." Just as questions and orders can be performed indirectly by way of assertions, assertions can be performed indirectly by way of questions and orders.

There is also the widespread view that the shared contents of all sentences and speech acts are propositions, which are nonlinguistic representations that are true or false and are the objects of belief and assertion. For example, it is thought that, in addition to its interrogative mood, the interrogative sentence "Did Martha shoot Henry?" expresses the proposition that Martha shot Henry, the same proposition expressed by the indicative sentence "Martha shot Henry." Similarly, in asking whether Martha shot Henry, a speaker expresses the very same proposition as when asserting that Martha shot Henry. The difference between these speech acts is located in what is called their illocutionary forces, not in their shared propositional content. The study of questions thus becomes a branch of the theory of force and not part of semantics proper, which is concerned with propositions and truth conditions. This provides some excuse for the philosophical focus on the truth-conditional areas of language at the expense of the vast non-truth-conditional areas.

## FREGE AND WITTGENSTEIN ON QUESTIONS

The distinction between the propositional content of a sentence or speech act and its mood or force is associated

with Gottlob Frege, for whom this distinction was a recurring theme. It is not often noticed, however, that Frege changed his mind about this distinction with regard to interrogatives. In his important paper “On Sense and Reference” (1970), Frege’s view was that interrogative sentences do *not* express propositions (Frege’s word for propositions was “thoughts”). Rather, interrogatives express what Frege called questions, where a question is not a proposition but something that “stands on the same level” as a proposition. In his later paper “Thoughts” (1984), he reversed himself, arguing, “An interrogative sentence and an assertoric one contain the same thought; but the assertoric sentence contains something else as well, namely assertion. The interrogative sentence contains something more too, namely a request” (p. 355). In other words, the sentences “Martha shot Henry” and “Did Martha shoot Henry?” express the same truth-conditional proposition. The difference is that the indicative sentence includes the force of assertion in the form of the indicative mood and the interrogative sentence contains the force of request in the form of the interrogative mood. (On imperatives, in contrast, Frege, in “Thoughts,” did not reverse his earlier position. He held throughout that these sentences express commands, that is, contents that are like thoughts yet lack truth-values. Also, it must be noted that in “On Sense and Reference” Frege was discussing embedded questions, e.g., the “whether” clause in “Nancy knows whether Martha shot Henry,” whereas in “Thoughts” he was concerned with stand-alone questions, e.g., “Did Martha shoot Henry?” If Frege held that the indirect reference of an embedded question should differ from the sense of its stand-alone counterpart, which seems unlikely, then we need not read him as having changed his mind.)

Ludwig Wittgenstein clearly rejected Frege’s later account in *Philosophical Investigations*:

Frege’s idea that every assertion contains an assumption, which is the thing that is asserted, really rests on the possibility found in our language of writing every statement in the form: “It is asserted that such-and-such is the case.” ... We might very well also write every statement in the form of a question followed by a “Yes”; for instance: “Is it raining? Yes!” Would this show that every statement contained a question? (Sec. 22)

One of the ideas in this passage is a criticism of Frege’s arbitrary identification of the contents of interrogatives with propositions. One could hold instead that the shared content of “Martha shot Henry” and “Did Martha shoot

Henry?” is an interrogative content, something akin to a proposition except that it has interrogative-satisfaction conditions, that is, conditions of being properly answered, instead of truth conditions. Then one could say that the indicative contains this interrogative content along with an element of affirmation (“Yes!”). Wittgenstein’s point is not that this alternative is preferable to Frege’s, but rather that both accounts are arbitrary and should be rejected. In other words, indicatives and interrogatives have distinct kinds of contents. Of course, this was the view that Frege held in his earlier work “On Sense and Reference.”

### QUESTIONS IN SPEECH-ACT THEORY

Despite Wittgenstein’s objections, many philosophers now accept Frege’s later view that propositions are the shared contents of indicatives and interrogatives. This idea is the foundation of Searle’s theory of speech acts. With a few exceptions (e.g., greetings), Searle analyzes speech acts on the basis of his schema  $F(p)$ , where “F” stands for force and “p” for propositional content. A consequence of this is that, aside from greetings and a few other speech acts, most speech acts have propositions as their contents (a circumstance that is a residue of subordinating the nonassertive to the assertive). The distinctive feature of questions is their interrogative force, which Searle takes to be a species of request. For Searle, asking a question is a request for an answer. Questions thus fall into Searle’s more general category of directives, the paradigms of which are orders and commands. The defining feature of directives is that they are attempts by speakers to get hearers to do something. So on Searle’s account, a question is essentially an attempt by a speaker to get the hearer to provide an answer.

Another important feature of directives is that they have what Searle calls “world-to-words” direction of fit (1979, p. 14). This means that for a directive speech act to be satisfied, the world must come to match the proposition expressed in the performance of the speech act. When I order Martha to shoot Henry, I express the proposition that Martha will shoot Henry with the force of an order. My order is satisfied just in case Martha acts to make this proposition true. This is the sense in which the order is satisfied if the world comes to fit the words used in the order. This position, however, leads to a problem when applied to questions. When I ask whether Martha shot Henry, my question is satisfied, that is, answered, just in case the hearer provides an answer. Yet the propositional content of my question is just that Martha shot Henry; it is not that the hearer will provide

an answer to the question of whether Martha shot Henry. There is no sense in which my question is satisfied when Martha shoots Henry. Another way to bring out this problem is to note that speech acts with world-to-words direction of fit require that their propositional contents describe future events or states of affairs. There is obviously no such restriction on the propositional contents of questions. The upshot of this is that questions do not fit neatly into Searle's category of directives. The fact that natural languages have a separate syntactic category of interrogative sentences, distinct from that of imperatives, further suggests that questions are not simply a variety of directives but rather constitute their own distinct category of speech acts.

### THE HAMBLIN POSTULATES

The growing interdisciplinary cooperation between philosophers of language and linguists provides reason for hope that the philosophical neglect of interrogatives is coming to an end. Interrogative expressions have always occupied a central place in linguistics. For example, the behavior of so-called "wh-" words, for example, "who" and "what," provided an important source of data for early work on Chomsky's theory of transformational grammar, and the phenomenon of "wh-" movement continues to be a rich topic for linguists working on the syntax of natural language.

Interrogatives have also received a great deal of attention from linguists working in semantics. Much of this work has been guided by a set of postulates about questions and answers first laid down by the philosopher and logician C. L. Hamblin in his paper "Questions" (1958):

1. To know the meaning of a question is to know what counts as an answer to that question.
2. An answer to a question is a complete sentence or proposition.
3. The possible answers to a question form an exhaustive set of mutually exclusive possibilities.

(Hamblin's ordering and wording of these postulates is slightly different.) The first postulate is the analog for interrogatives of the idea that to know the meaning of an indicative is to know what the world would be like if it were true, that is, that to know the meaning of an indicative is to know its truth conditions. This idea is the intuitive ground for the identification of the meaning of an indicative with its truth conditions. The first Hamblin postulate plays a similar role for interrogatives. It is the intuitive motivation for the identification of the meaning

of an interrogative with its answers. This first postulate is thus fundamental to semantic approaches to interrogatives.

Like the corresponding principle for indicatives, the first Hamblin postulate for interrogatives has been challenged. It seems possible to understand an interrogative without having any idea of what would count as an answer to it. The linguist Jonathan Ginzburg provides the example "What is the word for 'relaxation' in Chukotian?" (1996, p. 400). Working in the semantic framework known as situation theory, Ginzburg has developed a semantic account in which the contents of interrogatives are fine-grained structures that determine answers but are not identical with answers. This approach bears affinities to semantic accounts in which the contents of indicatives are structured propositions. Another range of counterexamples to Hamblin's first postulate derives from the work of the philosopher of science Sylvain Bromberger, who has argued that the search for answers to "why" questions for which we cannot formulate any answers is essential to the enterprise of science.

The first Hamblin postulate is also implicitly rejected by paraphrase theories of interrogatives, which analyze interrogatives by paraphrasing them into noninterrogative forms. In the theories of David Lewis and Max Cresswell, interrogatives are paraphrased as performatives. For example, "Did Martha shoot Henry?" is paraphrased as "I hereby ask you whether Martha shot Henry." A basic problem for these theories is that the interrogative reappears in the analysis in embedded form, in the example, "whether Martha shot Henry," which renders the analysis circular. In the epistemic-imperative approach of Lennart Åqvist and Jaakko Hintikka, "Did Martha shoot Henry?" is analyzed as the imperative "Bring it about that I know whether Martha shot Henry." The remaining embedded "whether" clause is then eliminated in terms of "that" clauses. "I know whether  $p$ ," for example, is analyzed as a conjunction of conditionals: "If  $p$ , then I know that  $p$ , and if not  $p$ , then I know that not  $p$ ." This account has some plausibility in this case, but as Lauri Karttunen has pointed out, it falls apart when applied to other uses of "whether" clauses. "I wonder whether  $p$ " is clearly not synonymous with the possibly ungrammatical "If  $p$ , then I wonder that  $p$ , and if not  $p$ , then I wonder that not  $p$ ." And it is not clear even how to apply this account to a sentence like "Martha's mental health depends on whether she takes her prescriptions."

The second and third Hamblin postulates concern the nature of answers. These two postulates combine to form a conception of answers that differs from what can

count as an answer in ordinary discourse. For example, the second postulate is in apparent conflict with the fact that one can often answer a question with something less than a complete sentence. For example, the proper name “Alexander Hamilton” seems like a perfectly good answer to the question “Who was the first U.S. Secretary of the Treasury?” The point of the second postulate is that, despite appearances, answers are always complete sentences or propositions, in this case, the sentence “Alexander Hamilton was the first U.S. Secretary of the Treasury” or the proposition expressed by this sentence. This postulate is motivated by the idea that a correct answer must be true, and being true is a property of sentences or propositions. Furthermore, answers always convey information, and information comes in sentences or propositions.

Despite these considerations, the second Hamblin postulate has not been universally accepted. So-called categorical theories, such as that of Roland Hausser, take seriously the surface grammatical forms of answers. On these approaches, answers can be of various categories, for example, names, common nouns, sentences, set designations, and predicates, which denote respectively individuals, objects, propositions, sets, and properties.

The third Hamblin postulate requires first that the set of answers to an interrogative be exhaustive. This is related to the fact that many interrogatives carry presuppositions. To use Hamblin’s example, consider the question “In which continent is Honolulu?” (1958, p. 163). This question falsely presupposes that Honolulu is in a continent. According to one position, for the set of answers to this question to be exhaustive, it must include an answer that denies the presupposition, that is, “Honolulu is in no continent.” Alternatively, one might hold that the presuppositions of a question restrict the range of possibilities to just those in which the presuppositions hold. A set of answers would then be exhaustive if it exhausts this restricted range of possibilities. On this alternative, the denial of the presupposition of a question is not an answer but rather a rejection of the question.

The third Hamblin postulate also requires that answers are mutually exclusive. This is intended to capture the idea that genuine answers are complete, in the following sense. Consider the question “Who ran the marathon?” where the candidate runners are Martha, Henry, George, and Nancy. A complete answer will indicate both who ran and who did not. For example, the proposition that only Martha and Henry ran and no one else ran is complete, whereas the proposition that Martha and Henry ran is not complete, since it leaves unspecified whether George or Nancy ran. A consequence of this is

that the proposition that Martha and Henry ran is at best a *partial* answer. The fact that answers can be merely partial is what motivates the requirement that answers be mutually exclusive. Allowing partial answers requires a contrasting criterion of completeness, which is provided by the notion that answers be mutually exclusive. (Incidentally, the above example illustrates how “wh-” words are context-sensitive, as are quantifier expressions. Intuitively, a speaker who asks “Who ran the marathon?” is not asking about everyone who has ever lived but rather about some contextually determined set of candidate runners. Parallel remarks apply to someone who asserts “Everyone ran the marathon.” In each case, a range of values for “who” and “everyone” is determined by features of the context of utterance. This is one of many similarities between “wh-” words and quantifiers.)

If answers are mutually exclusive, then there cannot be more than one complete and true answer to a question. This runs into problems with so-called mention-some questions. Suppose that Martha, who is new in town, asks Henry “Where can I buy an Italian newspaper?” (This example is due to Jeroen Groenendijk and Martin Stokhof.) On the most natural reading, Martha is only asking Henry to mention some place where she can buy an Italian newspaper. If so, Henry has available any number of complete and true answers, for example, “At the train station,” or “At the bookstore downtown.” Another sort of problem case, raised by Belnap, consists in choice questions, for example, “What are two cities that host marathons?” Intuitively, a complete answer mentions two cities that host marathons, and the choice of which two to mention is left up to the hearer. Thus, many complete and true answers are available, such as “Boston and New York host marathons,” “Chicago and Los Angeles host marathons,” and so on.

### THREE SEMANTIC APPROACHES TO INTERROGATIVES

This section sketches three prominent approaches to the semantics of interrogatives, all of which are set in the framework of Montague semantics, also variously known as intensional semantics, model-theoretic semantics, or possible-worlds semantics. In this framework, expressions are assigned both intensions and extensions. Intensions are functions from possible worlds to entities of various kinds. The extension of an expression at a possible world is the value of its intension with respect to that world. For example, the intension of a complete indicative sentence is a function from possible worlds to truth-values. The intensions of indicatives essentially divide the

set of possible worlds into two subsets: those possible worlds in which the indicative is true and those in which it is false. The proposition expressed by an indicative is normally identified either with its intension or, more simply, with the set of worlds in which the intension has the value true. This identification of propositions with sentence intensions or with sets of possible worlds is a notoriously problematic feature of the possible-worlds framework. It has the consequence that all necessarily true sentences express the same proposition. As we will see later on, a related problem arises for interrogatives.

On C. L. Hamblin's approach in his "Questions in Montague English" (1973), the intension of an interrogative is a function from possible worlds to sets of answers, where answers are propositions. The extension of an interrogative at a possible world is thus a set of propositions. This set is determined compositionally from the parts of the interrogative. For Hamblin, the extension of "who" at a possible world is a set of individuals. For example, suppose that the extension of "who" in a possible world  $w$  is the set {Martha, Henry, George, Nancy}. The extension of "Who runs?" in  $w$  is then the set of propositions {⟨Martha runs⟩, ⟨Henry runs⟩, ⟨George runs⟩, ⟨Nancy runs⟩}. (Remember that each of these propositions is itself an indicative sentence intension or a set of possible worlds.) Hamblin is aware that this approach is a departure from his own third postulate, since there is no requirement here that sets of answers be exhaustive nor that answers themselves be mutually exclusive. The extension of the yes/no interrogative "Is it the case that  $p$ ?" in a world  $w$  is the set consisting of the proposition that  $p$  and its negation. For example, the extension of "Does Martha run?" in  $w$  is {⟨Martha runs⟩, ⟨Martha does not run⟩}.

Perhaps the best-known approach to interrogatives is due to Lauri Karttunen. Karttunen's account is similar to Hamblin's except that Karttunen requires that each member of the extension of an interrogative be true. In other words, on Karttunen's approach, the intension of an interrogative is a function from possible worlds to sets of true answers. Suppose that in  $w$  only Martha and Henry run. For Karttunen, the extension of "Who runs?" in  $w$  is the set {⟨Martha runs⟩, ⟨Henry runs⟩}. Similarly, the extension of "Does Martha run?" is the singleton set {⟨Martha runs⟩}. Karttunen argues that the advantage of his approach over Hamblin's is that his approach provides a simpler account of the semantics of question-embedding verbs like "knows," as in sentences such as "Nancy knows who runs." It is widely assumed that the content of the embedded interrogative "who runs" is

identical with the content of its stand-alone counterpart "Who runs?" Very roughly, Karttunen's idea is that "Nancy knows who runs" is true in  $w$  just in case in  $w$  Nancy knows each of the propositions in the extension of "who runs." The advantage of Karttunen's approach is that this extension includes only true propositions, which accords with the fact that one cannot know something false.

A third prominent approach to interrogatives is due to Jeroen Groenendijk and Martin Stokhof (1997). Unlike Hamblin and Karttunen, Groenendijk and Stokhof accept the third Hamblin postulate. On their account, the sets of answers to interrogatives are exhaustive, and each answer is mutually exclusive. A consequence of this position is that, on their view, the intension of an interrogative is a function from possible worlds to single propositions, that is, the unique, complete answers in each world. Suppose that in  $w$  only Martha and Henry run. Then the extension of "Who runs?" in  $w$  is the single proposition that Martha runs and Henry runs and no one else runs. Groenendijk and Stokhof's approach is sometimes called a partition theory. This is because on their view the intension of an interrogative partitions the set of possible worlds into jointly exhaustive, nonoverlapping subsets, one for each possible complete answer. One advantage of this model is that it captures the apparent fact that if Nancy knows who runs, she knows both who runs and who does not run. For example, if George does not run, and Nancy does not know it, then it seems that Nancy does not know who runs, even if she knows that Martha and Henry run. For Groenendijk and Stokhof, this is captured by the fact that "Nancy knows who runs" is true just in case Nancy knows the complete answer to the question "Who runs?" For Karttunen, all that is required for the truth of "Nancy knows who runs" is that Nancy knows all the true propositions of the form ⟨ $X$  runs⟩. She need not know any of the true propositions of the form ⟨ $X$  does not run⟩.

A feature shared by all three approaches is that they assign contents to interrogatives that are distinct from those for indicatives. The content of an expression is its intension. This means that for Hamblin, Karttunen, and Groenendijk and Stokhof, the contents of interrogatives are *not* propositions. Rather, they are functions from possible worlds to sets of propositions (Hamblin, Karttunen) or single propositions (Groenendijk and Stokhof). These functions can be thought of as *properties* of propositions. Thus, for Hamblin, the content of an interrogative is the property of being an answer to that interrogative (where answers can be incomplete), for Karttunen it is the prop-

erty of being a true (possibly incomplete) answer, and for Groenendijk and Stokhof it is the property of being a complete and true answer.

As noted earlier, the framework of Montague semantics faces difficulties arising from its identification of propositions with sets of possible worlds. Because they are set within this framework, all three of these accounts of interrogatives face similar problems. For example, the contents of “Does  $5 + 7 = 12$ ?” and “Is first-order logic undecidable?” turn out to be identical on all three accounts. Philosophers have responded to the problems for possible-worlds accounts of propositions by searching for more fine-grained entities, such as structured propositions, to serve as the contents of indicatives. Whether or not similarly fine-grained interrogative contents can be found is a question that is currently being explored.

## REDUCTIONISM IN THE PHILOSOPHY OF MIND

Reduction can be understood in a loose or in a strict sense. In the loose sense, entities (or expressions) of a given type are reduced if they refer to “nothing over and above” other entities (expressions) that we consider well established. This is consistent with the conclusion that the reduced entities are among the posits of a mistaken world view and thus have no place in our ontology, and it is also consistent with the conclusion that the reduced entities are conserved among other accepted, better established or understood entities. In the first case we have *elimination*, and proposing this for entities of a given kind makes us eliminativists about those entities. In the second case we have *reduction in the strict sense*, and proposing this for a given kind makes us reductionists (sometimes called “conservative” or “retentive” reductionists). Reductionist projects can also be semantic or theoretical. A semantic reduction attempts to show that items belonging to a certain class of expressions are semantically equivalent to—that is, definable in terms of—another class of expressions. A theoretical reduction aims at showing that a given scientific theory can be fully subsumed under (that is, derivable from) another more basic theory.

## TYPES OF MIND-BODY REDUCTIONISM

In the philosophy of mind, reductionist projects come in all formats. A reductionist effort will typically be directed against the claim that the mental has some real, independent status. But this claim has a range of versions that go from the mind being a nonphysical/biological object, to mental properties constituting a level of *sui generis* properties of organisms that is in some sense autonomous vis-à-vis the physical/biological properties, to mental expressions possessing meanings that cannot be accounted for in purely behavioral/physical terminology.

The substance dualist assertion influential until the twentieth century—that the (human) mind is an immaterial object or substance—has faced widespread philosophical criticism of an eliminativist type: “Immaterial mind” or “soul,” like “*élan vital*,” “elf,” or “chupacabras,” are ghostly expressions that come from mistaken frameworks or conceptions and do not refer to anything. An influential formulation of this view is Gilbert Ryle’s claim that the immaterial entity posited by substance dualism is the result of a category mistake in which we reify our mental activities by placing a ghost in charge of our body. Another major reason for the eliminativist consensus about nonmaterial substances is the inability of a non-physical substance to causally interact with the physical world, because of conservation of energy considerations and because of the difficulty of making sense of bridging mechanisms between the two ontologically diverse realms. Absent causal interaction, the argument goes, postulating souls seems pointless if not absurd.

Eliminating mental substances, however, does not directly lead to a reductive view of the mental. In the twentieth century substance materialism or physicalism has been the orthodoxy in tune with modern science, but “the reducibility of mind” has remained as a philosophical issue of first importance. It is only that the focus of the debate has now shifted to the ontological or semantic autonomy of mental *properties* or *predicates*. The first systematic attempt to fully reduce the mental to the physical comes from logical behaviorism, a position championed by Rudolf Carnap, Carl Hempel, and Gilbert Ryle in the 1930s and 1940s. The view has doctrinal connections to methodological behaviorism, the dominant methodology of psychology in the first half of the twentieth century.

Based on the logical positivist’s verification criterion according to which the content of an expression is just the expressions’ verification conditions and on the assumption that these conditions have to be publicly observable, logical behaviorism argues that in order for sentences

including mental expressions to be meaningful they have to be translatable without loss of content into sentences including just behavioral and other physical expressions. This implies that mental expressions should be defined in terms of behavioral and other physical expressions. Following the model of definitions of dispositional properties in the natural sciences, these definitions standardly include conditional sentences showing dispositions to behave under given environmental circumstances including stimuli. So logical behaviorism is a form of semantic reduction of the mental.

Logical behaviorism has been largely abandoned for several reasons, one of them being its inability to meet the positivist standards in its own reductionist strategy. Most mental terms cannot be associated with a single behavioral disposition; there is no single behavioral manifestation of, say, “believing in God” or “loving one’s country.” If mental terms denote behavioral dispositions, these dispositions must be “multitracked,” and this would make behavioral definitions of mental terms enormously complex. This makes the behaviorist project of defining mental terms a highly dubious project.

Moreover, it has been convincingly argued that even in simple cases a purely behavioral definition just is not possible—unless one uses some mentalistic term in the definition, which of course undermines the behaviorist enterprise. The fall of behaviorism as the accepted reductive view led to a different reductionist approach. In the 1950s U. T. Place, J. C. C. Smart, and Herbert Feigl proposed the mind-body identity theory, a simple and appealing view in line with the surge of neural research. According to the view, while there is no meaning equivalence between mental and neural terminology (thus no semantic reduction) mental states are just states of the brain or the nervous system. The claim is one of numerical identity between types of states or properties and as such it involves ontological reduction in the strict sense.

A main line of argument for the identity theory is based on ontological simplicity, a standard strategy for ontological reduction. Once we have observed a pervasive set of systematic correlations between mental occurrences and neural events, the argument goes, we should conclude that the mental and the neural are identical. For while mind-brain correlations are compatible with a range of views about the mind, simplicity dictates that we should not multiply entities that are not going to enhance our explanatory power. The view is also supported by considerations of theoretical reduction. The history of science offers countless cases of predicates of everyday frameworks being reduced to predicates of explanatorily

richer scientific frameworks (a standard example is the reduction of temperature [of gases] to molecular kinetic energy). Given the advances in the neurosciences we have good reason to think a neural reduction of mentality is going to be one more item in a chain of successful theoretical reductions. This theoretical reduction would proceed by establishing “bridge laws” between mental and neural predicates and then reducing all generalizations involving the mental to the more encompassing laws of neuroscience.

Of the many attacks raised against the identity theory, two have aimed at the core of its reductive stance. Donald Davidson has argued against type-identification by claiming that there cannot be laws connecting the mental and the physical (this is called anomalism of the mental, an essential part of Davidson’s nonreductive view discussed below). Mental states, in particular intentional states such as beliefs and desires, are governed by principles of rationality without which attribution of mentality would be impossible. Laws connecting the physical and the mental would constrain the mental by the principles of physical theory and thereby undermine its own peculiar rationality constraints.

Another highly influential argument against the identity theory is the “multiple realization” argument initially developed by Hilary Putnam. The identity theory requires a single physical property be the reduction base for each mental state. But surely the same mental state can occur in organisms with diverse neurophysiological structures. Nonhuman animals can be in pain and we can conceive of noncarbon based species and perhaps even artificial creatures being in pain. Mental states, Putnam argues, can be implemented or “realized” in widely diverse physical/chemical structures and so there is no unifying reduction base or structure for them. (This multiple realization objection is also at the core of the nonreductive functionalist approach discussed below.)

An alternative, eliminativist stance was defended in the 1960s by Richard Rorty and Paul Feyerabend and has as more recent versions the views of Patricia Churchland, Paul Churchland, and Stephen Stich. Learning from the failure of the identity theory to establish type-type identities between mental and neuro-chemical properties, eliminativism claims that the mental expressions used in our everyday psychological talk have no more reality or significance than “phlogiston” and “caloric fluids,” terms of superseded and discarded scientific theories. It is highly unlikely that these concepts of vernacular psychology could be sharpened into concepts that will be useful to the sciences and do not correspond to the concepts of

the sciences (neuroscience or cognitive science) that have the task of explaining human behavior. This radical view proposes to eliminate mental terminology for the purposes of scientific theorizing and can go as far as predicting that a full replacement is possible even for everyday purposes. The analogy with concepts in the history of science that were found to be fully misguided and therefore replaced plays an important role in the argumentation in favor of eliminativism. This view has been found by most philosophers to be unacceptably extreme since it means that an essential component of our conceptual framework has to be given up. Also, some have argued that the view is incoherent since the view cannot be expressed without the very (mental) concepts it rejects (since in the very act of affirming their view, the eliminativist is expressing a *belief*, something that, according to their view, does not exist).

#### TYPES OF MIND-BODY ANTI-REDUCTIONISMS AND THE REDUCTIVISTS’ REACTIONS

Starting in the late 1960s, the problems plaguing reductive views led to the establishment of nonreductive physicalism as a reigning orthodoxy in the philosophy of mind. Its two most salient versions are anomalous monism and functionalism. Functionalism in fact has been the predominant view into the twenty-first century.

Davidson’s anomalous monism is a physicalist view that eschews reduction. From the principles that every singular causal relation needs to be backed by strict laws (nomological character of causation) and that there are no “strict” laws about mental properties (mental anomalism), together with the assumption that at least some mental events causally interact with physical events, Davidson concludes that mental events must be identical with physical events. According to Davidson, this provides causal efficacy to mental events, even though there are no strict psychological laws governing them, and it also leads to a nonreductive view of the mental because there are no laws connecting mental properties with physical properties.

Many critics have argued that Davidson’s view leaves the mental with no causal role to play. Davidson is entitled to affirm that a mental event causes a physical event (by being identical to a physical—probably neural—event). Now, an event instantiates a law—required for causation—in virtue of some of its properties, or, in other words, in virtue of falling under some event-type. Since anomalism entails that there are no laws involving mental properties or event-types, it is the physical (neural)

properties of the cause event that are efficacious in the production of the effect. The fact that the cause event falls under a mental type, or the fact that the event has mental properties, is completely irrelevant for the event's causing the effect. Thus, critics conclude, Davidson's anomalous monism renders the mental epiphenomenal, making it an easy target for elimination.

The functionalist view of the mental defended by Putnam and Jerry Fodor, among others, starts with the anti-reductivist stance included in the multiple realization argument. Its positive view includes the claim that mental properties are functional properties, rather than physical/neural properties as claimed by the identity theory. On the functionalist view, for something to have a mental property *M* is for it to instantiate some physical property *P* that has the right causal connections with inputs, behavioral outputs and other mental states. Thus, a mental property is a second-order property of having a (first-order) property that fulfills a certain specified causal specification. A first-order property meeting the causal specification is called a "realizer" or "realizing property" of the second-order functional property. For any given mental property there will likely be indefinitely many realizing properties satisfying its causal specification.

The reductionist can challenge the functionalist by suggesting that the mental property be identified with the disjunction of realizers. Settling this challenge would require a metaphysical discussion on the nature of disjunctive properties. A more powerful challenge raised by Kim is the claim that since having the functional mental property implies having one of its realizing properties and since the causal powers of the instance of a functional property must be considered to be inherited from the causal powers of the realizing property, mental properties have no autonomous causal powers and so are epiphenomenal. To the reply that it is the mental kind and not the instance that has its own causal powers Kim answers that the sheer heterogeneity and diversity of the realizers of a functionally conceived mental property deprives the property of the kind of causal-nomological unity required for nomological and causally efficacious properties.

All versions of nonreductive physicalism (including anomalous monism and traditional functionalism) are targets of the exclusion argument initially put forth by Norman Malcolm and developed by Jaegwon Kim. Physicalists, even those in the nonreductive camp, accept the primacy of the physical not only in terms of substance monism but also in terms of physical properties being primary vis-à-vis mental properties. This commitment includes, according to Kim, accepting the causal closure

of the physical and accepting a strong sense of dependence of the mental upon the physical. Thus, every physical event, including human behavior, has to have a complete physical cause. The mental event that is supposed to be the cause of behavior is preempted of its causal role by the physical state upon which it depends and which is the required physical cause of behavior. The upshot is that we cannot attribute a causal role to the mental unless it is identified with the physical, transforming nonreducible mental properties into epiphenomena. And epiphenomena, Kim thinks, should be cut from our ontology because they serve no purpose.

A common theme across several discussions so far has revolved around whether the mental, on one view or another, has autonomous causal powers. It is not obvious whether causal reduction or elimination implies full ontological reduction or elimination, that is, whether putative entities that are causally inefficacious or epiphenomenal can still be *bona fide* entities. To achieve full reduction we need the extra assumption that independent causal powers are necessary for the very reality of an entity. This view has been explicitly defended by Kim and Sidney Shoemaker, among others, and is largely the orthodox view. A negative answer (supported for instance by Elliott Sober and Marcelo Sabatés) makes room for epiphenomenalism as a nonreductive option about the mind.

In the first decade of the twenty-first century reductionism has gained some momentum. Kim has developed an influential functionalist view of reduction with ties to the version of functionalism defended by David Lewis in the 1970s. Kim's position, in agreement with his criticism of traditional functionalism à la Putnam, claims that "functionalizing" a property provides a form of theoretical reduction that does not require bridge laws and fully explains its reductive relationship on the base property. The view implies that on account of its multiple diverse realizability, no mental property has sufficient causal/nomological homogeneity to count as a genuine, projectible property useful in science. Instead, it proposes that we eschew talk of mental *properties* in favor of mental *predicates or concepts* that at most we get a pragmatically useful mental *predicate*. In making this move, functional reductionism appears to turn itself into a form of eliminativism with regard to mental properties.

## SOPHIA

The Greek word *sophia* properly refers to cleverness or skill in handicraft and the productive arts, such as carpentry, music, singing, poetry, chariot driving, medicine, and even divination. In short it tends to pick out the sort of excellence in a particular domain that derives from experience and expertise. In early applications of the term to "wise men," for example the Seven Sages, the term referred primarily to the sorts of skills that would make for expertise in matters of common life and so was virtually synonymous with practical wisdom or prudence (*phronêsis*). By the late fifth century BCE, however, the term was coming to have a more specialized meaning having to do with technical skill and the expertise derived from expert training and experience; that is, it encompassed both a knowledge base and an intimate familiarity with the applications of that knowledge base. The Sophists in particular claimed to have this sort of knowledgeable expertise in many different areas, from medicine to mathematics, oratory, and political science. Indeed, the name "sophistês" simply means someone who makes a profession of the practice and teaching of such sorts of knowledge.

In Plato, "sophia" clearly has more philosophical connotations. Already in the early, Socratic dialogues we find an attempt to draw a distinction between the kinds of "expertise" that Sophists had and the sort of genuine reflective wisdom modeled by Socrates. For Plato, the former is clearly mere logical chicanery used to generate linguistic puzzles for the purpose of winning debates (see, for example, Socrates' line of reasoning in the *Gorgias* 464b–465e). By the time Plato wrote the *Theaetetus*, he had clearly settled on an antisophistic conception of knowledge and expertise that takes the life and methodology of Socrates as its model, though even in that arguably late dialogue there is no clear line of demarcation drawn between *sophia* and *epistêmê* (knowledge). Since, for Plato, all knowledge, whether of mathematical objects or normative concepts such as the virtues, involves cognitive grasp of purely formal entities, there is less demand in his epistemology for a clear and concise differentiation between the two types of mental states and their proper objects.

Aristotle, by contrast, drew rather sharp distinctions not only between *epistêmê* and *sophia*, but also among those rational faculties and *phronêsis* (practical wisdom), *technê* (art, skill), and *nous* (intelligence, understanding). Yet the relation of *sophia* to the other rational faculties is somewhat specialized. In the *Nicomachean Ethics* (VI.7,

1141a9–b3), Aristotle began by noting the traditional use of the word “sophia” to denote those who have mastered their craft (*technē*) in a most exacting way, but added that it was also used to denote those who are “wise in general and not in one department,” and he gave this as his reason for thinking that *sophia* is the “most perfect of the modes of knowledge.” Thus *sophia* is associated with both *technē* and *epistēmē*, but it marks off a superlative kind of knowledge in which the knower not only fully understands the consequences of the principles of his craft but also fully understands the natures of the principles themselves. There is thus a sense in which *sophia* encompasses both the necessary truths that follow from demonstrations (the domain of *epistēmē*) and the necessary truths that are the first principles of the demonstrative sciences (the domain of *nous*). In the *Metaphysics* (981b28), this controlling wisdom is said to have the causes and first principles of all the other intellectual faculties as its proper objects, and so it is the highest form of wisdom.

The Stoics likewise took *sophia* as the perfection of human understanding (Seneca, *Epistulae* 89.4), and as consisting in a fully comprehensive and systematic grasp of the rational order in the universe. They characterized *sophia* as “knowledge of the divine and the human,” with some adding “and their causes” (von Arnim, 2.35; Seneca, *Epistulae* 89.5). They also regarded this understanding as the crucial underpinning for the goal of leading a moral life and hence considered it a virtue.

In later antiquity, *sophia* held an even more elevated place. In the early Christian theologies of Philo Judaeus and Origen, it is associated with *logos* (word) and thus with the daughter or son of God, respectively. A central feature of the various Gnostic movements was the personification of *sophia* as a salvation figure. In some systems there were two sorts of *sophia*, Wisdom from above and Wisdom from below, representing the female, or noumenal, world and the male, or material, world, respectively. This dualism of *sophia* came in varying degrees. In Marcionism, a heretical doctrine of the second through fifth centuries and the most dualistic system of all, salvation consisted of accepting the wisdom that comes from the Good God and rejecting whatever comes from the Demiurge.

## SÔPHROSUNĒ

*Sôphrosunē* is the Greek virtue of self-control, or temperance, a virtue that Aristotle says lies between self-indulgence (*akolasia*) on the one hand and insensibility (*anaisthēsia*) on the other. In its earliest uses (Homer) the word means “soundness of mind,” “prudence,” “discretion,” and is related to the verb *sôphronein*, combining *sôs*, safe, and *phronein*, to think, a verb related to *phrên*, an archaism for mind (literally, “midriff,” “heart,” “the seat of thought,” according to the Greeks).

Although Plato dedicated an entire dialogue (*Charmides*) to a discussion of the meaning of *sôphrosunē*, the notion of self-mastery is central to his ethical theory and he invokes it in many contexts, ranging from the *Gorgias* to the *Republic* to the *Laws*. Plato’s central claim is that self-mastery is more than the mere abstention from certain forms of physical pleasure—that was the popular and sophistic characterization of the virtue—he “exalts” it (*semmunôn*, *Laws* 710a5) by equating it with *phronēsis*, practical wisdom. Already in the so-called “early” or “Socratic” dialogues (among which the *Charmides* may be counted) Plato had spoken not only of self-control but of

all the virtues as reducible, in some way, to knowledge of one kind or another. Like the other “early” dialogues, the *Charmides* ends in *aporia*, puzzlement, about what *sôphrosunê* “really” is, but the suggestion is quite clear that it has to do with knowledge of what is the objectively best way for one to live. When, at *Gorgias* 491e, Callicles scorns self-control as a mere convention valued only by stupid, foolish people (*êlithious*), Socrates mounts an argument to show that those who cannot master their own desires and inclinations cannot master anything, a theme he takes up again in the *Republic*.

Aristotle regards temperance as moderation regarding pleasures and pains, and he loosely associates this virtue with courage as the two virtues of the non-rational (*alogon*) part of the soul (*Nicomachean Ethics* II.7, 1107b5–8; cf. III.10–12 1117b23–1119b10). Aristotle notes that temperance applies more to physical pleasures and pains than mental, and rather more to pleasure than to pain. On Aristotle’s account, the temperate person does not crave pleasures more than is right, nor does he crave the wrong sorts of pleasures. The self-indulgent, by contrast, will crave either greater quantities of physical satisfaction than is right, for example, more food than he needs for healthy sustenance, or else he will crave the wrong sorts of physical satisfaction. Aristotle maintains that the other vice opposed to temperance, insensibility, is not merely rare but quite unnatural in humans as well as other animals. The point of both temperance and self-indulgence is the satisfaction of desire, in the one case correctly achieved in the pursuit of human flourishing, in the other a disordered pursuit of pleasure for its own sake rather than for one’s natural end. Insensibility, by contrast, is an outright denial of one’s basic physical needs and, by extension, a contravention of one’s natural end.

Post-Aristotelian philosophy is quite heterogeneous in its treatment of ethical issues. The central conception of the virtue of self-control still has to do with controlling one’s desires, though in certain cases (see, for example, *SVF* 1.200–201) it is connected more directly to the foregoing of pleasures. For the Stoics, *sôphrosunê* was counted among the cardinal virtues along with courage, prudence, and justice. Since their highest good was a life lived in accordance with nature (*kata phusin*) the wise person is one whose understanding of nature and his place in it leads him to a kind of unity with nature, and they defined *sophrosynê* very generally as practical wisdom concerned with choice and avoidance (Plut. *Stoic. rep.* 1034ce). The Epicureans, according to Cicero (*De finibus* 1.14.47–8), associated self-control with peace of mind and harmony, by freeing us from the disruptions and consequences of

an unbridled pursuit of pleasure. This has value, according to them, not in itself, but because it secures greater pleasure over the long run.

## TENSE

Tense is a grammatical category by means of which some natural languages express the temporal location of the event described by the sentence in which the grammatical tense occurs. (This definition assumes a distinction between grammatical and lexical categories. For the technically inclined, lexical categories are part of the lexicon of a language and are open classes [classes that allow new vocabulary through compounding, derivation, coining, and borrowing]. They become inflected, and do not contract, affix, or cliticize. Examples of lexical categories are nouns, adjectives, adverbs, verbs. Grammatical categories are part of the grammatical system of a language and are closed classes [classes that do not allow additions]. They may contract, affix, or cliticize. Examples include inflectional and derivational morphemes and function words, such as prepositions, determiners, conjunctions, and pronouns.) An instance of a tensed language is English. In the English unembedded sentence “Bill called,” the grammatical tense “-ed” conveys the information that Bill’s call happened before the time of speech. Similarly, in the English sentence “Bill will call,” the grammatical tense “will” contributes the information that Bill’s call occurs after the time of speech. When a language does not have grammatical tenses, as in the case of Chinese, the temporal

information may be conveyed by lexical categories, such as adverbs.

The mapping between the grammatical tenses of a natural language and the expression of temporal location is very complex, and one of the goals of linguistic semantics is to investigate the relation between grammatical tenses and the expression of time. To achieve this goal, scholars in both linguistics and philosophy have proposed different theories of tense.

One type of theory, beginning with the work of the logician Arthur Prior, analyzes tenses as temporal operators. Prior (1957, 1967) treated the past and future tenses as sentential operators meaning “it was the case that” and “it will be the case that,” respectively. The sentence “Bill called” is translated into  $P(\wedge p)$  and is true in a world  $w$  at a time  $t$  if and only if “Bill calls” is true in  $w$  at a time  $t'$  ( $\wedge p$  is the intension of  $p$ , and “ $\langle$ ” means “earlier than”). In his intensional system, Montague (1974) adopted Prior’s tense logic by introducing tense operators for the past and future tenses, with the time parameter of the intensional expression embedded in the tense operator.

A different approach to the analysis of tense is that proposed by Reichenbach (1947). According to Reichenbach, tense is not a temporal operator but a complex structure built from a small set of primitives: the event time ( $E$ ), the speech time ( $S$ ), the reference time ( $R$ ), and two relations that can hold between these times, simultaneity (symbolized with a comma) and anteriority (symbolized with an underscore). One of these relations holds between  $S$  and  $R$ , and one relation holds between  $R$  and  $E$ . The relation between  $S$  and  $E$  is not represented but is inferred from the first two. With this small set of primitives, Reichenbach was able to define the set of possible English tenses. For example, the simple past, future, and present tenses have the structures  $[E, R\_S]$ ,  $[S\_R, E]$ ,  $[S, R, E]$ , respectively. The contribution of  $R$  becomes crucial in the analysis of complex tenses, such as the future and past perfect (which Reichenbach called “anterior future” and “anterior past”), where  $R$  overlaps neither  $E$  nor  $S$ . For example, the past perfect in “At 3:00 p.m., John had (already) called” has the structure  $[E\_R\_S]$ , where the calling time  $E$  precedes the reference time  $R$  (3:00 p.m.), which in turn is before  $S$ .

The case of the future perfect is a little more complex. Take the sentence “By 3:00 p.m., John will have called.” Our intuition is that, while 3:00 p.m. must follow the speech time, the time of John’s calling must be before 3:00 p.m. but does not have to follow the speech time. The availability of the reference time  $R$  allows Reichenbach to account for this intuition easily:  $R$  must be future

relative to  $S$ , and  $E$  must be past relative to  $R$ , but the relation between  $S$  and  $E$  is left unspecified, leaving open the following three possibilities:  $[S\_E\_R]$  or  $[S, E\_R]$  or  $[E\_S\_R]$ .

A third family of theories views tenses as temporal predicates expressing relations between times (or events). Zagana (1995), Stowell (1996), and Higginbotham (2002) are the main proponents of this view. According to these authors, tenses express temporal relations, such as anteriority, posteriority, and simultaneity, between two events (or times). However, unlike Reichenbach’s theory, events (or times) are not introduced by the tenses but by verbs and adjectives instead. This view is also different from the operator analysis of tense since tenses are not operators shifting evaluation parameters

The operator theory of tense has been very influential and has inspired semantic analyses where tense is an existential quantifier binding the time argument in the predicate. Versions of the quantificational theory of tense have been proposed by David Dowty (1979), Arnim von Stechow (1995), Toshi Ogihara (1996), and Dorit Abusch (1997), among others (see Kuhn and Portner 2002 for an overview on tense logics for natural languages). Barbara Partee (1973, 1984) has observed that existential-quantifier theories are problematic when we consider some occurrences of tense in natural language. Her famous example is

- (1) I didn’t turn off the stove

uttered as the speaker is driving down the freeway. According to the existential analysis of tense, the sentence can be interpreted either as “There is no past time at which I turned off the stove” or as “There is a past time at which I did not turn off the stove,” depending on the scope of negation with respect to the temporal quantifier. However, neither interpretation correctly captures the meaning of the sentence in the context we are considering. Clearly, the speaker did not mean to negate the existence of *any* time at which she turned off the stove, nor did she mean to assert the existence of *some* time at which she did not turn off the stove. She merely meant to assert that she did not turn off the stove at a *contextually salient past time*.

To solve this problem, Partee proposed a *referential* analysis of tense, in which tenses are linguistic devices by which we refer to times salient in the previous discourse. This analysis treats English tenses analogously to how Hans Kamp (1981) and Irene Heim (1988) treated pronouns and nominal anaphora. Variants of this idea have also been proposed by Enç (1986), Heim (1994), and

Kratzer (1998). However, there are occurrences of tenses that are not about particular times, as in the sentence

(2) Einstein visited Princeton

where a quantificational analysis of tense seems more apt. Both quantificational and referential theories of tense need to account for the occurrences of tense in (1) and (2). One possibility is to analyze the past tense as a restricted quantifier, just like ordinary nominal quantifiers. In this analysis, (1) would assert that there is no time within a contextually salient past interval at which the individual turned off the stove. The indeterminate reading of (2) would arise when the restriction of the quantifier is Einstein's entire life span.

The discussion so far has been about the meanings of the English tenses, and we have been silently assuming that there is a one-to-one correspondence between grammatical tenses and these meanings. While this is generally true in simple clauses, there are exceptions. For example, (3) illustrates a use of the grammatical present tense with the so-called *futurate* meaning.

(3) The 4:00 o'clock train leaves in five minutes.

Example (4) from Enç 1996 illustrates a mismatch between the future tense morpheme *will* and the semantics of the future, since Pat's sleeping is understood to be overlapping the speech time. Similarly, example (5) illustrates a mismatch between the past tense morpheme *was* and the semantics of the past, since the past tense is allowed to occur with the future adverb *tomorrow*.

(4) Pat will be sleeping now.

(5) Pat was leaving tomorrow.

The idea of a one-to-one correspondence between tense morphology and tense meanings turns out to be even more problematic when we consider subordinate clauses and the phenomenon of sequence of tense. Consider the following sentence, where the matrix verb and the embedded verb both occur in the past tense.

(6) Bill thought that Sue was pregnant.

There are two possible readings of (6). According to the first reading, the content of Bill's thought was that Sue was pregnant at some time before the time at which Bill was having the thought. This is the so-called *shifted* reading. According to the second reading, the content of Bill's thought is that Sue was pregnant at the time when Bill was having the thought. This is the so-called *simultaneous* reading. The possible simultaneous reading, where the embedded past morpheme is not interpreted as a past tense, seems problematic for a theory in which the mor-

pheme “-ed” is always interpreted as a semantic past. The simultaneity relation, generally expressed in English by the absence of either past or future morphemes, is expressed in sequence of tense with the past morpheme. Furthermore, notice that when we actually embed a grammatical present tense under a grammatical past tense, as in (7), we obtain not a simultaneous reading but yet a third reading, the so-called *double-access* reading. As pointed out by Enç (1987), in (7) Bill's thought is that Sue's pregnancy extends over a period of time including both the time at which Bill had the thought and the time at which (7) was uttered.

(7) Bill thought that Sue is pregnant.

Let us go back to (6). Operator theories of tense try to reconcile the occurrence of an embedded past-tense morpheme with the simultaneous reading by proposing accounts where, at the level of semantic interpretation, the embedded past tense is deleted (Ogihara 1989, 1995; von Stechow 1995) or is semantically bound by the matrix past tense (Abusch 1997) and its temporal features are deleted (von Stechow 2003).

Within the referential theories of tense, Enç (1987) proposed that the simultaneous reading of (6) is obtained when the embedded past tense is coindexed with the matrix past tense, and thus bound by it. Therefore, in her account, the embedded past tense refers to the past time referred to by the matrix past tense. Abusch (1988) points out that already in Kamp and Rohrer (1984) we can find some evidence against the claim that the morphological past tense in an embedded clause is interpreted as a semantic past tense. Abusch provides (8) as an example illustrating the fact that, the most embedded past tense, that associated with “were,” cannot refer to any past time since, in the intended reading, the event of having their last meal together is understood as overlapping John's saying event.

(8) John decided a week ago that in ten days at breakfast he would say to his mother that they were having their last meal together.

Among referential theories of tense, a slightly different approach has been taken by Kratzer (1998). Kratzer's proposal, while inheriting several elements from Abusch's (1997) analysis of sequence of tense, is based on Irene Heim's observation that in some occurrences, pronouns have features that are not interpreted. For example, the second occurrence of “I” in Heim's example (9) is interpreted not as an indexical but as a bound variable in the so-called strict reading.

(9) Only I got a question that I understood.

According to Kratzer, the simultaneous reading of (6) arises when the embedded past tense is interpreted as a bound variable, just as the second occurrence of the first-person pronoun in (9) is interpreted as a bound variable, rather than as an indexical. The features on both the embedded “I” in (9) and the embedded past tense in (6) are not “interpretable” (in the sense of Chomsky 1995), that is, they do not contribute to the LF (logical form) representations of these sentences. They are zero pronouns, or zero tenses, whose morphological and phonological features probably derive from agreement with their antecedents and do not carry any semantic information. Kratzer’s parallel between zero pronouns and sequence-of-tense tenses expands Partee’s original insight about an analogy between pronouns and tenses. The parallel between pronouns and tenses is also at the center of recent work by Schlenker (2003) and von Stechow (2003).

The discussion of sequence-of-tense phenomena above has been concerned with sequences of tenses where the matrix tense is a past. Hornstein (1990) claims that the availability of the simultaneous reading in sequence of tense is not restricted to the past tense but applies to all tenses. Enç (1996) challenges this claim on the basis of examples like (10), where, according to her judgment, only the shifted interpretation is possible:

(10) Mary will say that she will be tired.

Furthermore, Enç points out that the double-access reading is not forced by embedding the present tense under the future—a fact that thus sets the future tense apart from the past tense. In (11) the only reading is that Mary is upset at the time of John’s assertion.

(11) John will say that Mary is upset.

On the basis of these asymmetries between the future and the past and on the basis of the observation that future-oriented modals behave like “will” with respect to sequence of tense, as in (12), Enç suggests that the future morpheme “will” is not a tense but a modal.

(12) John must claim that he is sick.

This last point raises the question of the relation between tense and two other grammatical categories: aspect and mood. Tense, aspect, and mood are intimately related, since they all contribute some information about the event that a given sentence is about: Tense, as mentioned, conveys information about the time of the event; aspect conveys information about the beginning, duration, completion, or repetition of the event; finally, mood conveys information about whether the sentence is about a possible or actual event. It is common to assume, how-

ever, that these categories are distinct, even though their boundaries are not always clear. (An example is the debate over the semantics of the present perfect in English and other languages. For a general overview of the topic, see Alexiadou, Rathert, and von Stechow 2003 and the references cited there.) Further comparative studies across Indo-European and non-Indo-European languages will, it is hoped, shed light on these intricate issues.

## XENOPHON [ADDENDUM]

The central concern regarding Xenophon since the mid-1960s has been his place in the so-called Socratic problem, the question of to what extent our knowledge of the historical Socrates is accurate and on the basis of what sources we may have any confidence in the portrait of

him that has come down to us. Although Xenophon's Socratic writings have been criticized on the grounds that their philosophical acumen does not compare with that of Plato, scholarship since antiquity has tended to regard them as important sources of information about the life and character of the historical Socrates. But Xenophon's portrait of Socrates has received mixed reviews. Scholars continue to debate whether the Socrates that we encounter in the early, Socratic dialogues of Plato is the historical man himself, a Platonic fiction, or something in between, and the portrait of Socrates that we find in Aristophanes is clearly something of a caricature, in which Socrates appears to serve virtually as a stock character for the ridicule of philosophers generally.

This has prompted some to claim that Xenophon is our best hope for piecing together the real life of the man. Others, however, argue that Xenophon shows no real sophistication in his writings and hence cannot be relied upon to produce an accurate portrait of such a central figure in the history of philosophy, and that if we compare Xenophon's portrait of Socrates with those of other writers of *Sōkratikoī logoi* (stories about Socrates), a genre that grew up among the followers of Socrates shortly after his death in 399 BCE, we find that we have no compelling reason to prefer his portrait to any other, including Plato's. Plato himself mentions the views of Xenophon only once (*Laws* 694c), and only to criticize an element of the political education of Cyrus as portrayed in the *Cyropaedeia*. Plato has nothing to say about Xenophon's portrait of Socrates. The other writers of *Sōkratikoī logoi* (Antisthenes, Phaedo, Euclides, Aristippus, Aeschines, and Plato), were actively writing memoirs of Socrates as early as the 390s and 380s, but Xenophon did not begin to write his *Sōkratikoī logoi* until the 360s, and some scholars see in him a repository of recycled information, with at least one scholar suggesting that Xenophon's own youthful memories of Socrates were "filtered through the Socratic literature that had been published in the meantime" (Kahn 1996, p. 30).

Another area of scholarly attention since the mid-1960s has focused on Xenophon as comparative biographer. Even if we accept the view that his portrait of Socrates is as accurate than that of any other Socratic, some scholars maintain that we may nevertheless see in his accounts of Socrates and Cyrus an attempt at comparative biography that has value in its own right. This judgment must be weighed against the view of other scholars who argue that Xenophon's imagination is not on a par with those of the other Socratics, nor is his philosophical acumen up to the task of drawing and compar-

ing such lives with anything like the skill that one finds in, for example, the writings of Plutarch.

## *thematic outline of contents*

**T**he Thematic Outline of Contents has been constructed to assist readers who wish to explore a number of entries in a specific time period or in a distinct subfield of philosophy. Entries have, accordingly, been grouped under two general headings: “Historical Periods” and “Subfields of Philosophy.”

The personal entries and a few of the subject entries in the *Encyclopedia* can be placed in one of the following five historical time periods.

- (1) Ancient Philosophy—from Homer in the 8th century BCE to Augustine in the 4th–5th century CE
- (2) Medieval Philosophy—from Augustine to Thomas Aquinas in the 13th century CE
- (3) Modern Philosophy—from Thomas Aquinas to Georg W. F. Hegel in the 18th–19th century CE
- (4) Nineteenth Century
- (5) Twentieth Century

To group philosophers in this fashion may give the false impression that ancient philosophy began in the time of Homer and ended with Augustine and that medieval philosophy began in the time of Augustine and ended with Aquinas after whom we get modern philosophy. The developing story of philosophy does not lend itself to such rigidly defined temporal boundaries. Indeed, Augustine was importantly influenced by ancient Platonic thought even as Aquinas was significantly indebted

to ancient Aristotelian thought. Moreover, the philosophical traditions springing from Augustine and Aquinas—Augustinianism and Thomism—are very much alive in our world today. If we respect the insight that philosophical thinking develops throughout the centuries by virtue of philosophers engaging in dialogues not only with their contemporaries but also with their predecessors, then we will avoid such false notions as ancient philosophy ending at such and such a time, and we will be safe in talking about certain temporal periods of philosophy—which we are doing in this Thematic Outline of Contents.

Personal entries in the Nineteenth Century section have been divided into two groups: “major” to signify large entries containing more than 2,500 words and “minor” to indicate smaller entries. It must be noted, however, that a personal entry in the category of “minor” may discuss an enormously influential philosopher. The size of a personal entry is not always an indication of the importance of that person in a philosophical tradition. Indeed, in preparing personal entries for very influential philosophers from the current scene, our standard word allocation was between 1,000 and 1,500 words.

Personal entries in the Twentieth Century section are also divided into two groups: “early” referring to scholars whose major work was done in the first half of the twentieth century, and “recent” referring to scholars whose major work takes place in the last half of the twen-

tieth century continuing frequently into the twenty-first century.

Some of the subject entries can be placed within Ancient Philosophy (such as Aretē and Demiurge), Medieval Philosophy (such as Liber de Causis and Scotism) and Modern Philosophy (such as Atheismusstreit and Jansenism). Most subject entries, however, defy allocation to one time frame because they relate to questions that have engaged philosophers for many centuries. Accordingly, most of the subject entries have been grouped within the following twenty-one philosophical subfields that appear in the following order: Epistemology; Philosophy of Mind and Cognitive Science; Metaphysics; Philosophy of Science; Logic, Philosophy of Logic, and Philosophy of Mathematics; Philosophy of Language; Continental Philosophy; Feminist Philosophy; Ethics; Applied Ethics; Social and Political Philosophy; Philosophy of Law; Aesthetics and Philosophy of Art; Philosophy of Religion; Buddhist Philosophy; Chinese Philosophy; Indian Philosophy; Islamic Philosophy; Japanese Philosophy; Jewish Philosophy; and Russian Philosophy. Two additional categories—Philosophical Perspectives and Movements; and Special Topics—complete the Thematic Outline of Contents.

The list of philosophical subfields into which entries have been placed is not exhaustive. Indeed, there are many additional subfields that frequently bear the title “Philosophy of . . .” such as Philosophy of Education, Philosophy of Medicine, Philosophy of Sex, Philosophy of Technology, etc. Many of these subfields have entries dedicated to them in the *Encyclopedia* and they are listed in the Thematic Outline of Contents under Special Topics.

Because most personal entries describe scholars who make contributions in more than one subfield of philosophy (such as Plato, Aristotle, Augustine, Aquinas, Descartes, Hume, Kant, Hegel, Bertrand Russell, and Hilary Putnam to mention only a few), it would be overly cumbersome to list each of them in all the subfields in which they worked. Some persons, however, can be reasonably associated with one particular subfield, such as Monroe Beardsley with “Aesthetics and Philosophy of

Art,” Georg Cantor with “Logic, Philosophy of Logic, and Philosophy of Mathematics,” Confucius and Mencius with “Chinese Philosophy,” and Mohammed Arkoun and Seyyed Hossein Nasr with “Islamic Philosophy.” Such scholars are listed not only in one of the five historical periods but also within their distinctive subfields.

Clearly, the Historical Periods and the Philosophical Subfields of this Thematic Outline of Contents reflect the influence of the Western philosophical tradition originating with the ancient Greeks. Equally evident is the fact that the *Encyclopedia* contains articles devoted to non-Western philosophical traditions such as the African, Buddhist, Chinese, Indian, Japanese, and Korean. These traditions together represent a host of entries in the *Encyclopedia*. Inserting these entries into the Thematic Outline of Contents might suggest at first glance that the integrity of these traditions is being violated because they are being forced into a Procrustean Western mold. Yet it is important to remember that contemplative people from diverse cultural traditions have pondered some of the same perennial human questions for centuries. Philosophy begins with wonder, and the West has no monopoly on wonder. Human beings from diverse cultures have wondered about such things as truth, knowledge, logic, morality, and the nature of the human and also the transcendent. While the way questions are posed and answers are given may vary significantly from culture to culture, the topics of philosophy are truly multicultural. Admittedly, three of the Historical Periods used in this Thematic Outline of Contents—Ancient, Medieval, and Modern—have employed Western thinkers—Homer, Augustine, Aquinas, and Hegel—as temporal markers. Non-Western traditions would no doubt use other markers. Dividing human development into distinct periods has an element of unavoidable arbitrariness. The point to be emphasized by utilizing such divisions, however, is that philosophical thinking is a growing concern and that stages of growth are usually recognizable. The entries covering diverse philosophical traditions will, it is hoped, display that growth and also the commonality of human wonder.

*The First Edition of the Encyclopedia of Philosophy included bibliographical essays dealing with philosophy dictionaries and encyclopedias, philosophy journals, and philosophy bibliographies. To preserve and enhance these essays, they have been reproduced in this Second Edition along with detailed updates. The updates to the bibliographies cover material published between 1965 and mid-2005. All of the references appear in OCLC's WorldCat bibliographic database and are thus available either in mid- to large-size academic libraries, or through interlibrary loan. While the bibliographies are extensive, they are not exhaustive. This is especially true in the case of the journal bibliography, where less readily available non-English-language journals have been excluded, as have journals published for short periods of time. Accessibility was deemed to be more important than exhaustive coverage. The subject coverage includes both general philosophical works and works from the major sub-domains of philosophy. The bibliographic lists show that philosophy is a vital, worldwide discipline. A perusal of the journal bibliography will show that new journals are appearing every year, and the dictionary and encyclopedia bibliography identifies publications in fifty different languages. The constant stream of new journals and the accumulation of philosophical resources in so many languages are indicators of a truly vibrant discipline.*

## PHILOSOPHY BIBLIOGRAPHIES

Lists of philosophers and the titles of their works were for the most part provided only *en passant* by ancient and medieval writers and scholars, as in the brief citations scattered through the first book of Aristotle's *Metaphysics* and throughout Aquinas' *Summa Theologica*. It is true that Diogenes Laërtius' listing was somewhat more systematic, but philosophical bibliographies fully worthy of the name date from more recent times.

Modern philosophy has been well supplied with bibliographies in the general sense of the term, as will be noted in the present survey, but it has been weak in a special variety of bibliographical literature, namely, journals of abstracts. The two main journals containing abstracts of current work in philosophy—the *Bibliographie de la philosophie* and the *Bulletin signalétique: Philosophie, sci-*

*ences humaines*—have done and are doing a good job as far as they go, but the scope of each is limited: the first covers books only, and the two-line précis in the second are enough only to whet a desire for more.

Modern bibliographies of philosophy are of four kinds: general bibliographies; those covering a specific region or country; those covering a particular period, movement, or philosopher; and those covering a specific philosophical discipline.

### GENERAL BIBLIOGRAPHIES

**BIBLIOGRAPHICAL BOOKS AND PAMPHLETS.** One of the earliest of the general bibliographies of philosophy is the *Bibliotheca Philosophorum Classicorum Authorum Chronologica; in qua Veterum Philosophorum Origo, Successio, Aetas, & Doctrina Compendiosa, ab Origine Mundi, Usq. ad Nostram Aetatem, Proponitur; Quibus Accessit Patrum, Ecclesiae Christi Doctorum a Temporibus Apos-*

*tolorum, Usque ad Tempora Scholasticorum ad An. Usq. Do. 1140, Secundum Eandem Temporis Seriem, Enumeratio*, by Johann Jacob Fries (Zürich, 1592, 110 pages), with about 2,500 entries. Three of its significant successors in the next three hundred years are the *Bibliotheca Realis Philosophica*, by Martin Lipen (2 vols., Frankfurt, 1679), with about 40,000 entries, some on subjects no longer regarded as philosophical in a strict sense; the *Bibliotheca Philosophica*, by B. G. Struve (Jena, 1704; 5th ed., 2 vols., 1740), containing about 4,000 entries; and the *Systematisch-alphabetischer Hauptkatalog der Königlichen Universitätsbibliothek zu Tübingen; Erstes Heft; A. Philosophie* (Tübingen, 1854, 63 pages), with about 3,000 entries and with annual supplements to 1880.

Of the four pre-twentieth-century bibliographies mentioned, all are available at the Library of Congress in Washington and at the British Museum in London. The last-named item is also available at the New York Public Library and at the Library of the University of Illinois.

In the twentieth century four main general philosophical bibliographies have been compiled. The first is the *Bibliography of Philosophy, Psychology, and Cognate Subjects*, by Benjamin Rand (2 vols., New York, 1905), which has about 70,000 entries and is a major work of scholarship. It was published as the two-part Volume III of the *Dictionary of Philosophy and Psychology*, edited by James M. Baldwin (3 vols., New York, 1901–1905). Part I of the two-part *Bibliography* covers histories of philosophy and works by and about philosophers from Abel to Zwingli, and Part II is systematic.

Second among the main general bibliographies of the present century is the *Bibliographische Einführung in das Studium der Philosophie*, edited by I. M. Bocheński, which consists of 20 fascicles (24 to 85 pages each) published at Bern from 1948 to 1950 and which covers philosophy in certain periods (ancient and medieval philosophy), countries (modern Italian, French existentialist, and American philosophy), religious and ethnic groups (Buddhist, patristic, Jewish, and Arabic philosophy), systems and disciplines (philosophy as a whole, symbolic logic, and logical positivism), and individuals (Plato, Aristotle, Augustine, Aquinas, and Kierkegaard).

The third principal source of this kind is Gilbert Varet's *Manuel de bibliographie philosophique* (2 vols., Paris, 1956), which contains about 25,000 entries, Volume I being historical and Volume II systematic.

Finally, there is Wilhelm Totok's *Handbuch der Geschichte der Philosophie* (Frankfurt, 1964–), of which the first volume, *Altertum* (400 pages), covers works on

Indian, Chinese, Greek, and Roman philosophy, with an introduction listing works on the methodology of research in philosophy and on the general history of philosophy, dictionaries of philosophy, introductions to philosophy, and works on the philosophical disciplines. Articles from over 400 periodicals are cited.

**BIBLIOGRAPHICAL SERIALS.** Apparently the earliest general serial covering works in philosophy was the *Allgemeines Repertorium der Literatur; . . . philosophische Literatur*, by J. S. Ersch (Jena and Weimar, one volume each for 1785–1790, 1791–1795, and 1796–1800). Partly overlapping it in time was the *Lehrbuch der Geschichte der Philosophie und einer kritischen Literatur derselben*, by J. G. Buhle (Göttingen, one volume for each year from 1796 to 1804). After a gap of 87 years, the *Critical Review of Theological and Philosophical Literature*, edited by S. D. F. Salmond, was published at Edinburgh, covering the years 1891 to 1904. It was succeeded by the *Review of Theology and Philosophy*, edited by Allan Menzies, also at Edinburgh, which covered 1905/1906 to 1914/1915.

Meanwhile, in 1895 at Louvain a periodical was begun which was entitled the *Sommaire idéologique des ouvrages et des revues de philosophie*. After a number of changes (and with no volumes published from 1915 to 1933 and from 1941 to 1945), this periodical is now entitled the *Répertoire bibliographique de la philosophie*. It is issued four times a year and is one of the three general bibliographical serials now being published in the field of philosophy; it covers both books and periodical articles. (It is reproduced *in toto*, with Dutch headings replacing the French headings, in the *Tijdschrift voor Filosofie*, published quarterly at Louvain.) A second of the three leaders in this category is the *Bibliographie de la philosophie*, begun in 1937 as a semiannual by the International Institute of Philosophy, continued (with the omission of the years 1939 to 1945) until 1953, and issued since 1954 four times a year by the International Federation of Philosophical Societies; it covers books only, with a summary of each.

The third is the *Bulletin signalétique: Philosophie, sciences humaines* (entitled the *Bulletin analytique: Philosophie* from 1947 to 1955), published quarterly at Paris by the Centre de Documentation du Centre Nationale de la Recherche Scientifique; it is the only world-wide source of its kind which not only covers both books and periodicals but also contains a succinct abstract of each entry.

Remaining to be mentioned, as regards serial bibliographies of philosophy, are a number of sources which

are either limited in scope in one way or another or are no longer issued.

A general world-wide serial no longer issued but useful for works published in the period in which it appeared is *Philosophic Abstracts*, published for the most part quarterly at New York from 1939 to 1954, with an index covering 1939 to 1950. It contains abstracts of books and lists of periodical articles.

There are two important serials, of a quasi-bibliographical character, devoted exclusively to critical reviews of philosophical books: The *Philosophischer Literaturanzeiger*, published eight times a year at Meisenheim am Glan (begun in 1949 at Schlesdorf am Kochelsee), which contains about 15 reviews in each issue; and *Philosophical Books*, issued quarterly since 1960 at Leicester, England, which contains about a dozen reviews in each issue, written largely from the viewpoint of analytical philosophy. Also deserving of mention, as regards coverage of books only, is *Scripta Recenter Edita*, issued ten times a year since 1959 at Nijmegen, the Netherlands, which is a list of books on philosophy and theology (each issue containing about 400 entries with emphasis on theology), designed especially for use by acquisitions officers of libraries.

**Periodicals.** It may be added, as regards serial bibliographies, that selective lists or reviews (and, in a few cases, abstracts) of current philosophical books, plus lists of periodical articles in some cases, are published either in each issue or annually or from time to time in many philosophical periodicals, and the coverage is in some cases fairly comprehensive. (For the names of periodicals in this field, see *Philosophical Periodicals, An Annotated World List*, by David Baumgardt, Washington, 1952, 89 pages, 489 entries; the list, with 157 entries, which appears under the heading "Philosophy" in *Ulrich's Periodicals Directory*, 10th ed., New York, 1963, 667 pages; and the article "Philosophy Journals" in this volume.) Especially strong in book reviews and abstracts are the German philosophical periodicals.

Of the currently published annual bibliographies in philosophical periodicals, mention may be made of the one which appears in the *Deutsche Zeitschrift für Philosophie*, published in East Berlin. Although generally global in coverage, it emphasizes works on dialectical materialism written in Eastern Europe.

Finally, topical, regional, or other summaries and evaluations of current philosophical literature (as distinguished from lists, reviews, or abstracts) appear regularly or occasionally in *The Hibbert Journal* (world-wide), *Cross Currents* (world-wide), *Philosophy* (selected coun-

tries), the *Revue philosophique de la France et de l'étranger* (selected countries), and the *Revue des sciences philosophiques et théologiques* (world-wide).

**BIBLIOGRAPHICAL SECTIONS OF BOOKS.** Many of the standard histories of philosophy contain bibliographical sections. The most important source of this kind is the voluminous bibliographical material in the *Grundriss der Geschichte der Philosophie*, by Friedrich Ueberweg and others (12th ed., 5 vols., Berlin, 1923–1938). The handiest is the series of lists of philosophers preceding each main part of the *History of Philosophy*, by Wilhelm Windelband, translated by James H. Tufts (2 vols., New York, 1958, paperback reprint of the rev. ed. of 1901). Also useful for the history of philosophy are the bibliographical lists (usually divided into "Fonti" and "Studi") at the ends of the chapters of the *Guida storico-bibliografica allo studio della filosofia*, by Carmelo Ferro (Milan, 1949?).

In addition, many introductory works on philosophy contain bibliographical guides. An outstanding example is the discussion of philosophical books, periodicals and dictionaries in Louis de Raeymacker's *Introduction to Philosophy*, translated by Harry McNeill (New York, 1948, 297 pages), on pp. 196–258.

## NATIONAL OR REGIONAL BIBLIOGRAPHIES

**BIBLIOGRAPHICAL BOOKS AND PAMPHLETS.** A convenient list of the bibliographies of philosophy which are national in scope, covering some twenty countries or groups of countries, will be found in *A World Bibliography of Bibliographies*, by Theodore Besterman (4th ed., 4 vols., Lausanne, 1965–1966), Volume III, Columns 4809–4827. Outstanding among these country guides are the *Manuel de la recherche documentaire en France; . . . Philosophie*, by Raymond Bayer (Paris, 1950, 410 pages), with about 6,000 entries; the *Repertorium der Nederlandse Wijsbegeerte*, by J. J. Poortman (Amsterdam, 1948, 404 pages), with about 20,000 entries and a 168-page supplement published in 1958; the *Bibliografia filosofica italiana del 1900 al 1950* (4 vols., Rome, 1950–1957), with about 50,000 entries; the *Bibliografia filosófica española e hispanoamericana* (1940–1958), by Luis Martínez Gómez (Barcelona, 1961, 524 pages), 10,166 entries; and the anonymous *Philosophie und Grenzgebiete, 1945–1964* (Stuttgart, 1964, 434 pages), covering philosophical works in the German language, with a list of periodicals. Also deserving of mention, as regards French philosophy, are the fascicles entitled "Logique et philosophie des sciences," by Robert Blanché (1959, 54 pages), and "Morale

et philosophie politique,” by Georges Bastide (1961, 92 pages), in the *Bibliographie française établie à l'intention des lecteurs étrangers* (Paris).

Two volumes of a *Bibliografia Filozofii Polskiej*, covering 1750–1830 and 1831–1864, were published at Warsaw by the Polska Akademia Nauk in 1955 and 1960 (1,241 and 3,771 entries, respectively). The first volume of a *Bibliographie der sowjetischen Philosophie* (listing the articles which appeared in the Soviet periodical *Voprosy Filosofii* from 1947 to 1956; 906 entries) was compiled under the direction of I. M. Bocheński and published in 1959 by the Ost-Europa Institut at the University of Fribourg, Switzerland; four subsequent volumes, published from 1959 to 1964, covered books of 1947 to 1960 and articles of 1957 to 1960.

**BIBLIOGRAPHICAL SERIALS.** Serials (mostly annuals) devoted to philosophical works issued in particular countries include the following:

*Abstracts of Bulgarian Scientific Literature; Philosophy and Pedagogics* (Sofia; one volume for each year since 1958).

*Bibliografia filosofica italiana* (Milan; one volume for each year since 1949).

*Bibliography of Current Philosophical Works Published in North America*, issued as a supplement to certain issues of *The Modern Schoolman* (St. Louis, Mo.) and covering mainly the United States.

*Die deutschen Universitätschriften zur Philosophie und ihre Grenzgebieten*, edited by Kurt Gassen (published annually at Erfurt from 1924 to 1930).

*Literarische Berichte aus dem Gebiete der Philosophie*, edited by Arthur Hoffman (published semi-annually at Erfurt from 1923 to 1932), which covered current German periodical publications, with special retrospective bibliographies on Hegel, Nietzsche, and others.

“Thèses de doctorat concernant les sciences philosophiques et théologiques soutenues en France,” published each year since 1954 in a spring or summer issue of the *Revue des sciences philosophiques et théologiques* and covering the preceding year.

The annual *Handbook of Latin American Studies* (published since 1935, originally and now again at Gainesville, Fla.) regularly contains a chapter on philosophical studies. A “Scandinavian Bibliography,” covering philosophical works published in Denmark, Finland, Norway, and Sweden, appears once a year in *Theoria*

(Lund, Sweden). The *Heythrop Journal* (Oxford, quarterly) regularly contains a “select list of British books on philosophy and theology.”

**BIBLIOGRAPHICAL SECTIONS OF BOOKS.** Many of the standard historical, critical, or documentary treatments of philosophy in particular countries or regions (American, British, French, German, Indian, etc.; and Latin American, Anglo-American, European, Scandinavian, Western, Oriental, etc.) include extensive bibliographical sections, either at the end of the book or at the end of each chapter. Examples are the bibliographies in the introductions to the several parts of the anthology *The Development of American Philosophy*, edited by W. G. Muelder and others (2d ed., Cambridge, Mass., 1960), with about 500 entries, and the bibliography at the end of Chandradhar Sharma’s *Indian Philosophy* (New York, 1962, paperback reprint of the Benares edition of 1952), with about 300 entries.

## PERIOD OR MOVEMENT BIBLIOGRAPHIES

**BIBLIOGRAPHICAL BOOKS AND PAMPHLETS.** Noteworthy among the philosophical bibliographies which cover a particular period are one on antiquity, one on the Renaissance, one on an 11-year period of the twentieth century, and one on the twentieth century as a whole:

*Guía Bibliografía de la Filosofía Antigua*, by Rodolfo Mondolfo (Buenos Aires, 1959, 102 pages), which is a worthy extension of the author’s many substantive contributions to philosophical scholarship.

*A Catalogue of Renaissance Philosophers (1350–1650)*, by John O. Riedl and others (Milwaukee, 1940, 179 pages), dealing with about 2,000 philosophers, with lists of writings in some cases.

*Bibliographia Philosophica, 1934–1945*, by G. A. de Brie (2 vols., Brussels and Antwerp, 1950–1954), Volume I historical and Volume II systematic; 48,178 entries.

*Bibliografía filosofica del siglo XX.; Catalogo de la Exposición Bibliografica Internacional de la Filosofia del Siglo XX.* (Buenos Aires, 1952, 465 pages), with 4,011 entries.

A period bibliography which is specialized in two senses (limited with respect to the period when the items were published and to the period with which the items deal) is the *Thomistic Bibliography, 1920–1940*, by Vernon J. Bourke (St. Louis, Mo., 1945; supplement to Vol. 21 of

*The Modern Schoolman*), with about 5,700 entries. It lists a number of earlier bibliographies of scholastic philosophy.

Illustrative of bibliographies covering philosophical movements is the "Bibliographic der Geschichte der idealistischen Philosophie," in *Idealismus; Jahrbuch für die idealistische Philosophie* (Zurich), Vol. I (1934), pp. 217–256 (about 350 entries). Bibliographies covering philosophical movements in particular countries include V. E. Harlow's *Bibliographical and Genetic Study of American Realism* (Oklahoma City, Okla., 1931, 132 pages), with some 700 entries, and Vito A. Belleza's "Bibliografia italiana sull'esistenzialismo," in *Archivio di filosofia*, Vol. 15 (1946), 171–217, with over 700 entries. Works dealing with problems of philosophy and the history of philosophy from the standpoint of Marxism are listed in *O Marxistickej Filozofii a Vedeckom Komunizme*, compiled at the University of Bratislava (Bratislava, 1962, 146 pages), with over 400 entries.

Bibliographies covering individual philosophers are very numerous. They are listed in the appropriate sections of the general bibliographies mentioned earlier. For contemporary philosophers, the comprehensive bibliographies in the volumes of the Library of Living Philosophers, edited by Paul A. Schilpp (now published in La Salle, Ill.), are especially worthy of mention; the series covers C. D. Broad, Rudolf Carnap, Ernst Cassirer, John Dewey, Albert Einstein, Karl Jaspers, G. E. Moore, Sarvepalli Radhakrishnan, Bertrand Russell, George Santayana, and A. N. Whitehead, and volumes on others are in preparation.

**BIBLIOGRAPHICAL SERIALS.** The main bibliographical serial covering a specific period or movement in philosophy is the annual *Bibliographia Patristica; Internationale patristische Bibliographie*, by Wilhelm Schneemelcher (Berlin, begun with a volume for 1956 published in 1959), with about 1,000 entries in each volume.

**BIBLIOGRAPHICAL SECTIONS OF BOOKS.** Many of the standard works on the philosophy of a particular period or movement include extensive bibliographical sections either at the end of the volume or at the end of each chapter. As regards books on particular periods, mention may be made, for example, of Maurice de Wulf's *History of Mediaeval Philosophy*, 3d English ed., based on the 6th French ed., translated by E. C. Messenger (2 vols., London, 1935–1938; reprinted 1952); it contains (1) in Volume I an introductory chapter entitled "General Bibliography," with sections on research methods, auxiliary

sciences, dictionaries and encyclopedias, collections, monographs on problems, etc. (totaling over 500 entries), and (2) at the end of each major section in each chapter a bibliographical discussion (for example, about 25 entries on John Scotus Erigena).

As regards books on particular movements, mention may similarly be made, for purposes of illustration, of *Logical Positivism* (Glencoe, Ill., 1959), edited by A. J. Ayer, which contains on pp. 381–446 a section entitled "Bibliography of Logical Positivism" (over 2,000 entries), covering not only logical positivism strictly interpreted but also "all types of analytical philosophy." Ayer's book is part of the series entitled Library of Philosophical Movements; the other books in the series (on existentialism, Scholasticism, "realism and the background of phenomenology," etc.) also contain extensive bibliographies.

## BIBLIOGRAPHIES OF SPECIFIC DISCIPLINES

Among the bibliographies covering specific philosophic disciplines are the following:

I. M. Bocheński's bibliography of the history of formal logic in his *Formale Logik* (Fribourg, 1956), pp. 531–605 (over 2,000 entries), which was reproduced photographically in the English translation by Ivo Thomas, *A History of Formal Logic* (Notre Dame, Ind., 1961), on pp. 460–534, with English section headings substituted for the German headings and 34 additions to the bibliography given on p. 567.

Alonzo Church's "A Bibliography of Symbolic Logic," in *Journal of Symbolic Logic*, Vol. 1 (1936), 121–218 (about 1,800 entries), which is supplemented by abstracts of books and periodical articles on symbolic logic in each issue of the *Journal of Symbolic Logic*. Vol. 3 (1938), 178–212, contained the section "Additions and Corrections," applicable to the basic bibliography.

William A. Hammond's *A Bibliography of Aesthetics and of the Philosophy of the Fine Arts from 1900 to 1932* (rev. ed., New York, 1934, 205 pages, 2,191 entries), which also has a continuing supplement in the "Selective Current Bibliography for Aesthetics and Related Fields," now published annually in June in the *Journal of Aesthetics and Art Criticism* and originally published quarterly, under the title "Quarterly Bibliography of Aesthetic Theory, Criticism, and Psychology of Art," from the beginning of the issuance of the periodical in 1941.

Ethel M. Albert and Clyde Kluckhohn's *A Selected Bibliography on Values, Ethics, and Esthetics in the Behavioral Sciences and Philosophy, 1920–1958* (Glencoe, Ill., 1959, 342 pages), which contains 600 items in Chapter 6, "Philosophy."

John C. Rule's *Bibliography of Works in the Philosophy of History, 1945–1957* (The Hague, 1961, 87 pages, 1,307 entries), which excludes Marxist interpretations of history in the expectation of covering them separately later.

Amedeo G. Conte's "Bibliografia di logica giuridica (1936–1960)," in *Rivista internazionale di filosofia del diritto*, Vol. 38 (1961), 120–144 (about 250 entries). Addenda appeared in Vol. 39 (1962), 45–46.

For a discussion of some of the bibliographies mentioned in this article, from a librarian's standpoint, see Wilhelm Totok, "Die bibliographische Situation auf dem Gebiet der Philosophie," in *Zeitschrift für Bibliothekswesen und Bibliographie*, Vol. 5 (Frankfurt, 1958), 29–43; and his *Bibliographischer Wegweiser der philosophischen Literatur* (Frankfurt, 1959, 36 pages). See also the section on bibliographies of philosophy in Jean Hoffmans, *La Philosophie et les philosophes; ouvrages généraux* (Brussels, 1920, 395 pages).

**William Gerber (1967)**

## PHILOSOPHY BIBLIOGRAPHIES [ADDENDUM]

*The English- and non-English-language citations in this update are combined and are organized chronologically by year of publication. The citations appear within the individual year listings alphabetically by author's last name.*

1965

Chan, Wing-tsit. *An Outline and an Annotated Bibliography of Chinese Philosophy*. Supp. New Haven, CT: Far Eastern Publications, 1965.

Higgins, Charles L. *The Bibliography of Philosophy; A Descriptive Account*. Ann Arbor, MI: Campus Publishers, 1965.

1966

*Bibliography of Philosophy*. Paris: Cultural Center of the French Embassy, 1966.

Jessop, T. E. *A Bibliography of David Hume and of Scottish Philosophy from Francis Hutcheson to Lord Balfour*. New York: Russell & Russell, 1966.

1967

## PHILOSOPHY DICTIONARIES AND ENCYCLOPEDIAS

Aristotle compiled the first dictionary of philosophy. Other outstanding philosophers who either wrote such works or made slight beginnings in that direction include Avicenna, Leibniz, Voltaire, and Dewey. Kant lectured on *philosophische Enzyklopädie*, but his topic was really the encyclopedic scope of philosophy; Hegel wrote an “encyclopedia” of philosophy which was not an encyclopedia in the ordinary sense. Indeed, what constitutes a dictionary or encyclopedia of philosophy deserves discussion. First, it will be helpful to inspect early examples of such works as well as what might be called embedded dictionaries—the philosophical articles, alphabetically arranged but separated by nonphilosophical material, in general encyclopedias.

In Book V of Aristotle’s *Metaphysics* each section consists of a definition and discussion of a philosophical

concept. The various sections begin, for example, “Beginning means . . .,” “Cause means . . .,” “Element means . . .” He thus covered 29 topics in this first dictionary or quasi-dictionary of philosophy: beginning, cause, element, nature, necessity, one, being, substance, sameness and difference, limit, that in virtue of which (or reason why), disposition, priority and posterity, potency, quantum, quality, relation, completeness (or perfection), state, being affected, privation, possession, derivation, part, whole, mutilation, genus, falsity, and accident. The rationale for the order of topics can only be conjectured.

After Aristotle dictionary-type or encyclopedic compendiums were produced by Alexandrian, Roman, and Byzantine lexicographers and doxographers, covering, for the most part, philosophy among other domains of knowledge, not philosophy exclusively. Many of these compendiums were arranged in an order other than alphabetical. Thus, in his *Bibliotheca*, or *Myriobiblion*, Photius (c. 850) summarized, in no special order, some 280 philosophical and nonphilosophical books, including works by Philo Judaeus, Justin Martyr, Origen, and Gregory of Nyssa but none by Plato or Aristotle, although he mentions having read books by Timaeus, Boëthus, and Dorotheus on Plato’s use of words.

By contrast Suidas’ *Lexicon* (c. 950) is arranged alphabetically. It contains articles on Aristotle (about 150 words), Zeno of Elea (about 75 words), and numerous other philosophers, as well as many topical entries, such as those on *physis*, *physikos*, and related terms (about nine hundred words in this group). After Suidas, however, through the rest of the medieval period and the Renaissance, most of the summaries of knowledge reverted to the nonalphabetical arrangement.

In modern times the alphabetical arrangement has been dominant in general compendiums of knowledge, and useful philosophical articles have frequently been included in them. It will be instructive, before examining the separately published dictionaries of philosophy, to survey the embedded dictionaries of philosophy.

#### PHILOSOPHICAL ARTICLES IN GENERAL ENCYCLOPEDIAS

From the standpoint of embedded philosophical material four French, six English, and seven other encyclopedias are especially worthy of comment. In addition, readers may note (a) the interest of various prominent philosophers in general encyclopedias, as illustrated by Leibniz’ proposal to Louis XIV around 1675 that a group of learned persons “extract the quintessence of the best books, add the unwritten observations of experts, and

thus build systems of knowledge based upon experience and demonstrations”; (b) the role of the *philosophes* in the work on the *Encyclopédie*; and (c) Giovanni Gentile’s role in the Italian encyclopedia of 1929–1939.

FRENCH GENERAL ENCYCLOPEDIAS. Moreri, Bayle, Diderot, and Larousse are the key figures in the history of French encyclopedias. Of these four Louis Moreri and Pierre Bayle each produced an entire encyclopedia single-handedly.

**Moreri.** Moreri’s *Le Grand Dictionnaire historique* (1st ed., Lyon, 1674, 1,346 pages; 20th ed., 10 vols., 1759) was translated twice into English and at least once into German, Italian, and Spanish. Reprintings and supplements continued to be published until 1845. By contrast with many dictionaries of philosophy which cover only topics, not individual philosophers, Moreri, in his articles on philosophy, covered many of its practitioners but offered no separate treatments of philosophical domains, problems, schools, or technical terms. Moreover, his articles on the philosophers are so thoroughly oriented toward biography that little attention is paid to doctrines.

**Bayle.** Bayle’s *Dictionnaire historique et critique* (1st ed., 2 vols., Rotterdam, 1697; 5th ed., 5 vols., 1734; annotated ed., 16 vols., Paris, 1820–1824), two editions of which were translated or paraphrased into English, contains some basic facts plus philosophical or critical (usually impish and skeptical) comments for each entry. The comments on both the philosophical and the nonphilosophical topics support atheism, hedonism, and skepticism. As professor of philosophy at Sedan, France, and at Rotterdam, Bayle possessed the necessary technical equipment with which to support his trenchant skepticism. Acknowledging the roar of disapproval which greeted the first edition, Bayle made some revisions in the articles, but the second edition was no less outspoken than the first.

New English translations of selected articles from the *Dictionnaire* were published at Princeton in 1952, edited by E. A. Beller and M. du P. Lee, Jr., and at Indianapolis in 1965, edited by Richard H. Popkin.

“*Encyclopédie.*” The third French general encyclopedia with significant philosophical articles was the one called simply, by common consent, the *Encyclopédie*. Its full title was *Encyclopédie, ou Dictionnaire raisonné des sciences, des arts et des métiers, par une société de gens de lettres*, edited by Denis Diderot and Jean d’Alembert.

The *Encyclopédie* had a stormy history. It was originally conceived by André F. Le Breton as merely a translation of Ephraim Chambers’ *Cyclopaedia* of 1728

(described below), but the character of the project changed, especially after Diderot was put in charge. A corps of contributors was rapidly enlisted which included men of the caliber of Rousseau and Voltaire.

Among the vicissitudes which followed were the periodic banning of the work as irreligious or politically dangerous after the publication of the early volumes and the discouraged resignation of d'Alembert from the project. In 1764, while the manuscript for the final volumes was being edited, Diderot learned to his consternation that Le Breton was toning down the language in order to obviate further prosecution; some of Le Breton's most extensive changes were made in Diderot's own article "Pyrrhonienne ou sceptique philosophie," containing Diderot's most cherished ideas. The original proofs, showing Le Breton's changes and deletions, were discovered in 1933.

The *Encyclopédie* contains no articles on philosophers as such. Among its main articles dealing with philosophical schools or otherwise of philosophical interest are those on Socratic philosophy, Aristotelianism, Epicureanism, and skepticism. The spirit of the philosophical and ethical articles in the *Encyclopédie*, many of which were written by Diderot himself, was antidogmatic, but it was not atheistic or consistently skeptical. Voltaire's 40-odd articles, written in this vein, included 3 in the *E's* ("Élégance," "Éloquence," and "Esprit"), 21 in the *F's* ("Félicité," "Finesse," "Fornication," and so on), 11 in the *G's* ("Goût," "Grandeur," and so on), 5 in the *H's* ("Heureusement," "Histoire," and so on), "Idolatrie" in the *I's*, and "Messie" (Messiah) in the *M's*.

Rousseau wrote the articles on economics (in which he laid the groundwork for his *Contrat social*) and music. Baron de Montesquieu declined the invitation to write on democracy and despotism but promised an article on taste; the portion of it which he had finished before his death in 1755 at the age of 66 was published in Volume VII immediately after Voltaire's article on the same subject.

Eight articles from the *Encyclopédie* on ethical subjects (calumny, unhappiness, and the like) were translated by Ivan Vanslov into Russian and published in 1771 at St. Petersburg by the Imperial Academy of Science as a 21-page dictionary of ethics.

(For a full discussion of the purpose, influence, and philosophic content of the *Encyclopédie*, see the entry **Encyclopédie**.)

**Larousse.** The excitement aroused by Diderot's original *Encyclopédie* and by the revised editions which fol-

lowed it eventually subsided, and a calm period in this field ensued. The fourth main French encyclopedia, Larousse's, had its birth in the second half of the nineteenth century. Several encyclopedias bear the name Larousse, beginning with the 15-volume *Grand Dictionnaire universel du XIXe siècle* sponsored by Pierre Larousse (Paris, 1865–1876; 2-vol. supp., 1878–1890) and extending through *Larousse de XXe siècle*, compiled by Paul Augé and published in Paris by the Librairie Larousse (6 vols., 1928–1933; supp., 1953), and the *Grand Larousse encyclopédique*, also published by the Librairie Larousse (10 vols., 1960–1964).

In the *Grand Dictionnaire* the article on philosophy, which covers only the history of philosophy, is curiously followed (perhaps to compensate for the lack of topical discussion) by 51 extensive articles on books with *philosophie* as the first or principal word of the title, such as "Philosophie (Principes de)," by Descartes; "Philosophie morale (Principes de)," by Shaftesbury; "Philosophie première, ou Ontologie," by Wolff; "Philosophie de la vie," by Schlegel; and "Philosophie de l'art," by Taine. This is hardly the best way to cover philosophy in an encyclopedia.

The current *Grand Larousse encyclopédique* contains numerous philosophical articles, both topical and biographical, which, although pithy, are excessively brief; for example, Bergson is covered in eight hundred words and logic in nine hundred. The space devoted to the separate articles "Logique (Grande), ouvrage de Friedrich Hegel," "Logique déductive et inductive (Système de), par John Stuart Mill," and "Logique de Port-Royal ou Art de penser" (after the fashion of the nineteenth-century edition) could have been far better used in the article on logic.

**ENGLISH GENERAL ENCYCLOPEDIAS.** Of the numerous English-language encyclopedias mention may be made of Harris' and the two Chambers', which are mainly of historical interest, and the *Britannica*, the *Americana*, and *Collier's*, which are influential today.

**Harris.** The *Lexicon Technicum, or an Universal English Dictionary of Arts and Sciences*, by the clergyman John Harris (1st ed., London, 1704; 5th ed., 2 vols., 1736; supp. vol., 1744), is called by the *Encyclopedia Britannica* the first alphabetical encyclopedia in English, although there seem to be other claimants to this honor. Harris wrote in the Preface, "In Logick, Metaphysics, Ethicks, Grammar, Rhetorick, &c. I have been designedly short; giving usually the bare meaning only of the Words and Terms of

Art, with one or two instances to explain them, and illustrate them.”

The book contains no articles on individual philosophers, and the articles on philosophical topics show a popular rather than a technical understanding (or misunderstanding) of the subject. For example, the article “Logick” (32 lines, mainly laudatory and, curiously, ascribing to logic our ability to explain why we dislike a painting) refers the reader, for details, to the articles “Apprehension” (7 lines), “Discourse” (5 lines defining the term as if it were a synonym of “inference”), “Judgment” (12 lines), and “Method, or Disposition” (40 lines, outlining Descartes’s four methodological precepts, with condescending comment) but does not refer the reader to the articles “Conditional Propositions” (8 lines) or “Definition” (19 lines). There is no article on fallacy or syllogism.

*Chambers’ “Cyclopaedia.”* A quarter of a century after the appearance of the Harris volume Ephraim Chambers published the *Cyclopaedia, or an Universal Dictionary of Arts and Sciences* (1st ed., 2 vols., London, 1728; 5 other eds., 2 vols., London, 1739–1751/1752, and another 2-vol. ed., Dublin, 1742); supplements were published at various times from 1738 to 1753. Later editions were reportedly used in an unpublished French translation by the writers of the French *Encyclopédie*. Chambers was a freethinker, but many of his articles repeat superstitions and preposterous medical marvels as fact. The *Cyclopaedia* contains succinct articles on essence, ethics, God, knowledge, logic, metaphysics, philosophy, Sophists, truth, and will, as well as on Academic, Cartesian, Epicurean, Platonic, Pyrrhonian, Socratic, and Stoic philosophy, among others. It does not cover individual philosophers.

*“Chambers’s Encyclopaedia.”* The so-called *Chambers’s Encyclopaedia, a Dictionary of Universal Knowledge for the People* (10 vols., London and Edinburgh, W. & R. Chambers, 1860–1868; rev. eds. issued periodically to 1935) was not a new edition of Ephraim Chambers’ *Cyclopaedia* but a new work, written by over one hundred contributors and influenced greatly by the 15-volume tenth edition of the *Conversations-Lexikon* published from 1851 to 1855 by F. A. Brockhaus at Leipzig. The philosophical articles in *Chambers’s Encyclopaedia* are uneven. Anaximander is allotted ten times as much space as Anaximenes. The article on the Gnostics is scholarly (although the author wrongly says that they “feigned a naive surprise” at not being accepted as Christians), whereas other articles are more popular in style. The arti-

cle on Pascal is wholly biographical, but the one on Plotinus covers both his life and his teaching.

The current *Chambers’s Encyclopaedia* (15 vols., London, George Newnes, 1950; rev. ed., 1959) is a successor of the 1860–1868 work, not of Ephraim Chambers’. Its advisers on philosophy were John Laird and A. C. Ewing. The articles on Greek philosophy incorporate recent scholarship; the one on Antisthenes, for example, avoids the error, embodied in many earlier treatments, of calling him the first Cynic. It seems odd, however, to find the intellectual work of Mohandas Gandhi and Sarvepalli Radhakrishnan discussed in A. B. Keith’s article on Hinduism, which is concerned mainly with the Hindu religion, rather than in S. N. Dasgupta’s article on Indian philosophy. The index volume contains a useful classified list of the philosophical articles: 29 on philosophy, metaphysics, and epistemology; 32 on logic; 8 on ethics; 41 on systems and schools; and over 200 on individual thinkers.

*“Encyclopaedia Britannica.”* The last edition of Ephraim Chambers’ *Cyclopaedia* was published in the 1750s, and the French *Encyclopédie* had appeared in the 1750s and 1760s. In the middle or late 1760s William Smellie, a printer, historian, and naturalist, wrote most of the articles for a new compendium, the *Encyclopaedia Britannica, or Dictionary of Arts and Sciences* (1st ed., 3 vols., Edinburgh, A. Bell and C. Macfarquhar, 1768–1771). It was issued in installments beginning in December 1768, and subsequent editions, some with supplements, were issued by various publishers. The numbering of the editions was discontinued after the fourteenth edition, which appeared in 1929. The *Britannica* is now published, with continuous revisions, in Chicago by William Benton.

The most famous (and on some topics the most scholarly and comprehensive) edition of the *Britannica* is the eleventh (29 vols., London and New York, 1910–1911). It was sharply attacked by Willard H. Wright (better known by his pseudonym S. S. Van Dine, under which he wrote best-selling murder mysteries) in *Misinforming a Nation* (New York, B. W. Huebsch, 1917), which made several points in Chapter XI, “Philosophy.” The *Britannica* is provincial, he claimed, as in its description of Locke as “typically English in his reverence for facts”; dogmatic, as in the statements that Berkeley “once for all lifted the problem of metaphysics to a higher level” and that Hume “determined the form into which later metaphysical questions have been thrown”; and patronizing, as in the statement that Condillac’s thought “was by no means suited to English ways of thinking.” Wright also pointed out that the eleventh edition contained no arti-

cles on Bergson, Bradley, Dewey, Royce, or Santayana, and only 1 column on Nietzsche, as compared to 3 on Samuel Clarke, 5 on Spencer, 7 on Fichte, 11 on Cousin, 14 on Hume, 15 on Hegel, 15 on Locke, and 19 on Newton.

Edmund Husserl's article on phenomenology, first published in the 14th edition (1929), was included in the various printings through 1955. It was also reproduced in *Realism and the Background of Phenomenology* (Roderick M. Chisholm, ed., Glencoe, Ill., Free Press, 1961). In subsequent printings of the *Britannica* the article on phenomenology was written, at first, by J. N. Findlay and, currently, by Herbert Spiegelberg.

Many of the philosophical articles in the *Britannica* were rewritten around 1957. Some of the topical articles reflect the current Oxford philosophy. Of the current revision (1966), which for the most part reproduces the recently rewritten articles, the editors and advisers for articles on philosophy are Alonzo Church of Princeton, W. C. Kneale and W. H. Walsh of Oxford, and Sarvepalli Radhakrishnan, president of India. Contributors near the beginning of the alphabet include A. J. Ayer, Max Black, and Brand Blanshard and near the end I. A. Richards, Gilbert Ryle, A. E. Taylor, Wilbur M. Urban, and Abraham Wolf.

In a later revision Thomas E. Jessop is lively as well as scholarly on Hume. The article on Plato, by A. E. Taylor and Philip Merlan, is a comprehensive monograph of the highest value; the bibliography of over 125 items covers manuscripts, editions, commentaries, translations, and analyses. The article on aesthetics, by Thomas Munro, and "Aesthetics, History of," by Helmut Kuhn, which refer to each other, overlap somewhat; for historical data one should consult both. In his article on metaphysics Gilbert Ryle presents a penetrating survey of the status of metaphysics from the origin of the term through the twentieth-century attacks on the discipline; he predicts that the term may "come back into ordinary or pedagogic use" when the motives which generate synoptic world views swing once more into prominence.

"*Encyclopedia Americana*." Another major English-language encyclopedia, the *Encyclopedia Americana*, edited by Francis Lieber and Edward Wigglesworth (13 vols., Philadelphia, Carey, Lea and Carey, 1829–1833), was originally in large part a translation of the seventh edition (1827–1829) of the *Conversations-Lexikon* published by Brockhaus. Subsequent unnumbered editions, some with supplements, have been issued by various publishers.

The 1996 edition of the *Americana* has Morton G. White of Harvard University as the philosophy member of its editorial advisory board. Among the principal contributors are Brand Blanshard on idea and idealism, Richard B. Brandt on duty and ethics, Herbert Feigl on the Vienna circle, Carl G. Hempel on meaning, Walter Kaufmann on Nietzsche, C. I. Lewis on philosophy, Kingsley Price on fine arts, and Donald C. Williams on conceptualism, free will, innate ideas, mechanism, and pluralism. The article on logic, by Ernest Nagel; "Logic, Symbolic," by W. V. Quine; and the "Logic Glossary," by Arthur Danto, excel in covering a broad range of technical data briefly but comprehensibly. Some of the articles need updating; for example, the death of G. E. Moore, which is mentioned in Volume XIX, has not yet occurred in the article on common sense in Volume VII. The unsigned article on Santayana is philosophically weak.

"*Collier's Encyclopedia*." *Collier's Encyclopedia* (20 vols., New York, P. F. Collier & Son, 1950–1951; rev. ed., 24 vols., 1962), is published by Crowell Collier and Macmillan. It has T. V. Smith as its adviser on philosophy. Among its American contributors in the field of philosophy are Max Black, Brand Blanshard, George Boas, Roderick M. Chisholm, Raphael Demos, C. J. Ducasse, Marvin Farber, Carl Hempel, Sidney Hook, C. I. Lewis, Ernest Nagel, and Herbert W. Schneider. There are also philosophical articles by such eminent foreigners as T. M. P. Mahadevan and John Passmore. *Collier's* is stronger on the philosophical disciplines than on the schools. It contains first-class articles on aesthetics, by Van Meter Ames; epistemology, by Roderick M. Chisholm; history of ethics, by R. A. Tsanoff; logic, by I. M. Copi; metaphysics, by Blanshard; and philosophy, by a group including Blanshard, Demos, and C. W. Hendel. However, there is no article on realism, the one on naturalism has 1 paragraph, the one on monism 2 paragraphs, and the one on pragmatism 3 paragraphs. Existentialism, however, has 12 paragraphs. The bibliography of philosophy in the final volume lists over four hundred books.

OTHER GENERAL ENCYCLOPEDIAS. Of the numerous other modern encyclopedias, mention may be made of seven—three in German, one each in Italian and Spanish, and two in Russian—which are perhaps the most prominent.

*German.* The *Grosses vollständiges universal Lexicon*, edited by Johann Heinrich Zedler and Carl G. Ludovici (64 vols., Halle and Leipzig, 1732–1750; reprinted, 1959), was the first encyclopedia compiled on a cooperative basis. The number of its collaborators, nine, was meant to

correspond to the number of the Muses. The articles display an orthodox and partly medieval point of view, acknowledging the existence of the devil and of miracles, accepting astrology (“the influence of the planets must be conceded”), and stressing the scientific contributions of Roger Bacon and Albert the Great.

*Der grosse Brockhaus* (16th ed., 12 vols., Wiesbaden, F. A. Brockhaus, 1952–1957; supp. vol., 1958) is the current progeny of the Brockhaus-sponsored *Conversations-Lexikon*. It is especially strong on bibliography. The bibliographical sections of some of the philosophical articles, especially those on individual philosophers, constitute one-third or more of the entire text. The bibliographical section of the article on philosophy contains seven subsections, including one on dictionaries, which lists 12 items (9 German, 2 English, and 1 French).

Of the series of encyclopedias begun by Joseph Meyer as *Das grosse Conversations-Lexicon für die gebildeten Stände* (“The Great Encyclopedia for the Educated Classes,” 38 vols. in 46, Philadelphia and Hildburghausen, Germany, Bibliographisches Institut, 1840–1853; 6-vol. supp., 1853–1855) the various editions, most of which were published at Leipzig and Vienna, included, for the most part, very creditable articles on philosophers and philosophical topics. The eighth edition, called *Meyers Lexikon* (Leipzig, Bibliographisches Institut, begun 1936; Vol. XII, an atlas, published 1936), was abandoned in 1942 with the ninth volume, covering *R* and *S*. This edition showed decided Nazi influence, using, for example, the exclamation point of sarcasm in noting, in a discussion of Jewish thought, Spinoza’s doctrine that God and nature (and substance also, according to the author of the article) are “identisch(!)” and in referring, in the article on Salomon Maimon, “Philosoph, Ostjude,” to the baleful influence of his “Ghetto-Intellekt” on Neo-Kantianism.

**Italian.** Giovanni Gentile was a director and later a vice-president of the organization which produced the *Enciclopedia italiana di scienze, lettere ed arti* (36 vols., Milan and Rome, Istituto Giovanni Treccani, later the Istituto della Enciclopedia Italiana, 1929–1939; supp. vol., 1938; 2-vol. supp., 1938–1948). The philosophical articles often include special features. For example, the one on Socrates offers a detailed analysis and appraisal of the sources, the one on Aristotle contains a section on medieval legends about Aristotle and Alexander, the one on Bruno discusses *la libertà filosofica*, and the one on *filosofia* (almost 100,000 words) quotes from a large number of writers on the nature of philosophy. Mussolini was the author of the article on fascism.

**Spanish.** In the Spanish *Enciclopedia universal ilustrada europeo-americana* (70 vols., in 72, Bilbao, Spain, Espasa–Calpe, 1905–1930; 10-vol. appendix, 1930–1933; supp., usually biennially) many of the articles on philosophical schools or positions—materialism, utilitarianism, and so on—are usefully divided into two sections, exposition and criticism. In the article on pragmatism, for example, the sections on Anglo-American pragmatism and French pragmatism are each so divided.

**Russian.** The outstanding encyclopedia of prerevolutionary Russia was the *Entsiklopedichesky Slovar’* (“Encyclopedic Dictionary”), edited by Ivan E. Andreyevsky and others (43 vols. in 86, St. Petersburg and Leipzig, F. A. Brockhaus–I. A. Ephron, 1890–1907). Its philosophy articles were edited by Vladimir S. Solovyov, one of Russia’s greatest philosophers, until his death in 1900 and then by Ernest L. Radlov, author of a philosophical dictionary published in 1911 (mentioned below). Solovyov himself wrote the articles on actuality, Campanella, cause, Comte, Duns Scotus, eternity, freedom of the will, Gorgias, Hartmann, Hegel (22 columns), Indian philosophy, Kant, Lully, Maine de Biran, Malebranche, metaphysics, nature, optimism, pessimism, Plato (28 columns), Plotinus, space, time, Vedānta, world process, and others.

The first edition of the *Bol’shaya Sovetskaya Entsiklopediya* (“Great Soviet Encyclopedia”) was published in Moscow from 1926 to 1947 in 66 volumes. The second edition, whose chief editor was S. I. Vavilov, was published in Moscow by the Soviet Encyclopedia Publishing House from 1950 to 1958 in 53 volumes. Stalin’s death during the course of publication of the second edition led to a change in the tone in the later volumes, where, for example, the cult of personality is rejected. In 1964 *Pravda* announced plans for a third edition.

The philosophical articles in both editions of the “Great Soviet Encyclopedia” are characteristically Marxist in viewpoint. Thus, Rudolf Carnap’s philosophy is branded as “a typical example . . . of subjective idealism under the new labels adopted by the ideologists of the imperialist bourgeoisie in the struggle against the scientific materialist world view.” In the allocation of space Hegel gets 5 pages, Kant 4, Spinoza 2, Plato 1, and G. E. Moore none; dialectical materialism gets 19 pages, philosophy 17 pages, and pragmatism half a page.

Some of the philosophical articles of the “Great Soviet Encyclopedia” were translated into German and issued in separate brochures (one each on Aristotle, Hegel, Voltaire, and idealism; one covering Bacon, Berkeley, and Bruno; and one covering Helvétius, Heraclitus,

Hobbes, and Holbach) in a series entitled *Grosse Sowjet-Enzyklopädie: Reihe Geschichte und Philosophie* (Berlin, Aufbau-Verlag, 1953–1955).

ENCYCLOPEDIA DICTIONARY. Well deserving of mention is the fact that Charles S. Peirce wrote the definitions of terms in metaphysics, logic, mathematics, and other subjects and Lyman Abbott was responsible for those in theology in *The Century Dictionary; An Encyclopedic Lexicon of the English Language*, edited by William D. Whitney (8 vols., New York, Century, 1891; issued, together with *The Century Encyclopedia of Names* and an atlas, as a 10-vol. work entitled *The Century Dictionary and Encyclopedia* in various years, with revisions, to 1911; issued in condensed form as *The New Century Dictionary*, 2 vols., D. Appleton–Century, 1943 and later years). According to the Preface, “Though it has not been possible to state all the conflicting definitions of different philosophers and schools,” nevertheless, “. . . the philosophical wealth of the English language has, it is believed, never been so fully presented in any dictionary.” Peirce’s fine hand is evident not only in the choice of illustrative quotations but also in the breakdown of terms into subcategories; for example, the article on being includes definitions of actual being, accidental being, being in itself, connotative being, and so on.

SEMIGENERAL ENCYCLOPEDIAS. The following constitute bridges between the dictionaries of philosophy embedded in general encyclopedias and the separate dictionaries of philosophy.

“*Cyclopedia of Education.*” Articles on 114 philosophers or groups of philosophers “whose systems have educational significance” and on 29 “philosophic views bearing on the nature of education” (atomism, determinism, dualism, empiricism, and so forth) appear in *A Cyclopedia of Education*, edited by Paul Monroe (5 vols., New York, Macmillan, 1919). John Dewey was the departmental editor for philosophy of education, and he wrote the articles on determinism, positivism, and many others. Other contributors include John Burnet, Paul Carus, Morris R. Cohen, Arthur O. Lovejoy, I. Woodbridge Riley, Frank Thilly, and Frederick J. E. Woodbridge. Cohen’s article on philosophy is one of the best sources for the history of the teaching of philosophy; its bibliography contains 45 painstakingly assembled entries on philosophy in American, British, and Continental colleges, on philosophy in the secondary school, and so on.

“*Encyclopaedia of the Social Sciences.*” The *Encyclopaedia of the Social Sciences*, edited by Edwin R. A.

Seligman and Alvin Johnson (15 vols., New York, Macmillan, 1930–1935; reissued in part or in whole in various years), of which John Dewey was the advisory editor for philosophy, had over a dozen philosophers among its editorial consultants, including Morris R. Cohen, Benedetto Croce, Arthur O. Lovejoy, Ralph Barton Perry, Herbert W. Schneider, and T. V. Smith. This encyclopedia contains some extraordinarily illuminating articles on philosophical subjects.

Among the contributors of philosophical articles were George Boas on Berkeley; Léon Brunschvicg on Pascal and on Plato and Platonism; Ernst Cassirer on Kant; Cohen on atheism, belief, Bradley, Descartes, fictions, Hegel, and scientific method; Dewey on human nature, logic, and philosophy; Sidney Hook on Engels, Feuerbach, materialism, and violence; Hu Shih on Confucianism; Horace M. Kallen on behaviorism, James, modernism, morals, pragmatism, and radicalism; Lovejoy on academic freedom; Richard McKeon on Albert the Great, Anselm, Averroës, and Peter Lombard; C. R. Morris on Locke; M. C. Otto on hedonism; J. H. Randall, Jr., on Copernicus and on deism; F. C. S. Schiller on humanism; Herbert Schneider on Christian socialism, ethical culture, and transcendentalism; T. V. Smith on common sense, duty, ethics, and honor.

Dewey’s article on human nature (ten columns) sets forth with clarity and force the principal meanings of the term *human nature*, the basic questions which may be asked about human nature, and the history of the understanding of human nature; his 21-item bibliography begins appropriately with his own *Human Nature and Conduct* (1922). Cassirer’s article on Kant (eight columns) highlights Kant’s significance for social thought and succinctly traces his impact through Fichte, the Hegelians, and the socialists; the 39-item bibliography begins with Cassirer’s ten-volume edition of Kant’s *Werke*. McKeon’s article on Anselm brings out Anselm’s little-known contribution to the problem of church–state relations.

“*International Encyclopedia of the Social Sciences.*” The *International Encyclopedia of the Social Sciences*, a completely new encyclopedia, edited by David L. Sills, is a lineal descendant of the *Encyclopaedia of the Social Sciences*. This encyclopedia is devoted primarily to the fields of anthropology, economics, political science, psychology, sociology, and statistics. However, many of its articles are of direct relevance to philosophy; others describe the relevance of philosophical concepts to the social sciences. There are also many biographical articles on philosophers

who have made significant contributions to the social sciences.

## EARLY DICTIONARIES OF PHILOSOPHY

What is to count as a dictionary of philosophy and the difference between a dictionary of philosophy and an encyclopedia of philosophy are largely matters of definition. Two definitions seem most useful for the present purpose. First, a dictionary of philosophy is an expository work setting forth information about philosophical ideas in an arrangement which either is alphabetical (as in the embedded dictionaries of philosophy already mentioned and in most of those described below) or is based on key words or concepts (as in Aristotle's "dictionary" mentioned above and the first few of those mentioned below) rather than on a systematic division of philosophy into its disciplines or parts. Second, an encyclopedia of philosophy is a comprehensive dictionary of philosophy in which various articles are monographic in scope.

Dictionaries of philosophy range from those which are purely factual through those which are partly interpretive or evaluative to those, such as Voltaire's, which present rhapsodic or satirical reflections on key general topics. Divergences from this broad range of varieties also occur—for example, a "dictionary" which merely lists philosophical terms in one language with equivalents in other languages, a "dictionary" which presents for each important philosophical term a suggested usage rather than a statement of actual usage, and an anthology of philosophical quotations arranged alphabetically by topic. Over one hundred dictionaries of philosophy of one sort or another have been published. Most have been soon forgotten, but some have gone through multiple editions over many decades.

**MIDDLE AGES.** Of the medieval works which may be counted as dictionaries of philosophy perhaps those of Isaac Israeli and Avicenna are most worthy of note. Israeli (c. 855–c. 955), the first Jewish Neoplatonist, wrote, in Arabic, *Kitāb al-Hudūd wal Rusum* ("Book on Definitions and Descriptions"), later translated into Latin and Hebrew. This work contains definitions, with comments thereon, of topics grouped roughly as intellect, soul, vital spirit, and so on; reason, knowledge, opinion, memory, deliberation, and so on; division, syllogism, demonstration, truth, falsehood, necessary, impossible, and so on; imagination, estimation, and sense perception; love, passion, and desire; innovation, creation, coming to be, passing away, and so on; time, eternity, and perpetuity; and

other topics. The influence of al-Kindī in some 20 of the 56 sections has been noted by the latest editors of Israeli's work, A. Altmann and S. M. Stern.

Avicenna's *Kitāb al-Hudūd* ("Epistle on Definitions") contains, after an introduction on the pitfalls of the process of defining, definitions—extracted in part from Avicenna's other works—of accident, body, cause, continuous, creation, definition, form, individuality, intelligence, limit, motion, nonbeing, place, prime matter, priority, rest, soul, substance, time, universe, and other subjects. Terms having obvious mutual relations are grouped. The definitions are close to Aristotelianism in tenor.

An anonymous *Compendium Philosophiae*, based mainly on Aristotle and Albert the Great, written (probably in France) about 1327 and as yet only partly edited and published (Paris, 1936), was one of the last medieval dictionaries of philosophy. In topical groups it contains, in Books I to V, brief discussions of God, the physical features of the world, plants, animals, and man and, in Books VI to VIII, scholastic-type discussions of accident, actuality, art, becoming, being and nonbeing, cause, fate, free will, identity, language, law, motion, names, necessity, perfection, philosophy, place, potentiality, quality, quantity, relation, science, substance, time, truth and falsity, virtue and vice, and wisdom, as well as other subjects.

**SIXTEENTH CENTURY.** After the revival of learning and the invention of printing there appeared a number of compendiums of philosophical information. Apparently, the first formal dictionary of modern times devoted exclusively to philosophy was Giovanni Baptista Bernardo's *Seminarium Totius Philosophiae* (3 vols., Venice, Damian Zenarius, 1582–1585; 2nd ed., 3 vols. in 2, Geneva, Jacob Stoer and Franc. Faber, 1599–1605), later referred to as the *Lexicon Triplex*. In separate alphabetical dictionaries the three volumes cover, respectively, Aristotelian, Platonic, and Stoic philosophy in the writings not only of Aristotle, Plato, and the early Stoics but also of other philosophers, Greek, Roman, Christian, and Arabic. Thus, the first volume contains articles on Aristotelian philosophy from "Abstractio," "Accidens," "Actus," and other topics in the A's to "Zeuleucus," "Zephirus," "Zodiacus," and other topics in the Z's.

The article "Definitio" in Volume I contains 333 paragraphs summarizing or quoting specific passages on the subject in Aristotle, Ammonius, Alexander of Aphrodisias, Themistius, Simplicius, Boethius, Averroës, Alexander of Hales, Albert the Great, Thomas Aquinas, and others. A similar approach—abstracting specific pas-

sages—is used throughout the three volumes. Accordingly, the work is essentially useful as a thorough guide to the sources but not as a synthesis.

SEVENTEENTH CENTURY. The seventeenth century provided nine principal dictionaries of philosophy, all in Latin.

**1610—Nicolaus Burchardi.** Burchardi's *Repertorium Philosophicum, Quo Omnes in Universa Philosophia Subinde Occurrunt Termini Perspicue Traduntur* (Leipzig, 573 pages) appeared in 1610. It was also issued at Grimma in 1613 and at Gera in 1614, 1615, and 1616. Only two copies of this work are known to exist, having been located, after many fruitless searches elsewhere, in the Universitätsbibliothek in Marburg, West Germany (the 1614 printing), and in the Sächsische Landesbibliothek in Dresden, East Germany (the 1616 printing). A microfilm copy of the 1616 printing was procured and is filed in the Public Library of the District of Columbia.

The main part of the book is not arranged alphabetically. It treats exactly one hundred topics, from philosophy, logic, metaphysics, art, nature, and word, near the beginning, to infinite soul, theology, and God, at the end. The articles are superficial in their analysis but reflect wide reading in the classic sources. An alphabetical index of topics (*abstractum, ars*, and so on) appears at the beginning, and the book ends with an alphabetically arranged index of themes discussed in the articles—for example, *abstracta saepe ponuntur pro concretis* (“the abstract is often substituted for the concrete”) and *amicitia honesta cur rara* (“why true friendship is rare”).

**1612—Henri Louis Chasteigner.** Chasteigner's *Celebriorum Distinctionum turn Philosophicarum tum Theologicarum Synopsis* (Poitiers, A. Mesner, 1612, 71 pages; subsequent eds. or reprints, various places, 1616, 1617, 1619, 1623, 1635, 1645, 1651, 1653, 1657, 1658, 1659, and 1667) made a beginning in the provision of syntheses that Bernardo's work lacked. Thus, absolute is explained as in one sense opposite to relative; in another, to dependent; and in still another, to restricted. Abstraction is broken down into real (when the thing abstracted can exist separately) and rational; rational abstraction, into negative (or divisive) and precise (or simple); and precise abstraction, finally, into physical, mathematical, and so on. A prefatory alphabetical list names 48 authors—Alexander of Hales, Aristotle, Bonaventure, Buridan, Duns Scotus, Suárez, Thomas Aquinas, William of Ockham, and so on—whose writings were chiefly used in compiling the work.

**1613—Rudolf Goclenius the elder.** The *Lexicon Philosophicum* (Frankfurt, Matthias Becker, 1613, 1,143 pages; additional printings or eds., Marburg, 1613, 1615 and Frankfurt, 1633, 1634; Frankfurt 1613 ed. reissued in facsimile, Hildesheim, 1964) opens with four tributes to Goclenius (Rudolf Goeckel) in Latin verse. There follow articles on terms beginning with the vowels—*absolutum, existentia, idea, obligatio, unitas*, and the like—and then articles on terms beginning with the consonants—*beatitudo, causa*, and so on. The articles are informative, presenting standard scholastic breakdowns and definitions. As has been noted by José Ferrater Mora, Goclenius, although he was the first to use the term *ontologia* (in Greek letters), did not make significant use of the term. Goclenius is cited for support on a particular point in a work as late as Eisler's *Wörterbuch der Philosophie* (1899).

**1626—Johann H. Alsted.** Alsted's *Compendium Lexici Philosophici* (Herborn, Germany, Georg Corvin and J. G. Munderspach, 1626, 720 pages) is a group of dictionaries on about thirty separate disciplines—anatomy, arithmetic, astronomy, and so on in nonalphabetical order—including ten on philosophy covering ethics, logic, metaphysics, philosophical “archelogy” (basic terms), philosophical didactics (teaching of philosophy), philosophical “hexilogy” (mental faculties involved in philosophy), philosophical method, pneumatics (study of spiritual beings), poetics, and politics. Some parts of the dictionaries are alphabetical; others are not. Of the ten philosophical dictionaries, the one on logic, which is 26 pages long, is perhaps the best, but most of the material in it is not arranged alphabetically and is therefore difficult to follow.

**1629—George Reeb, S.J.** Reeb's *Distinctiones Philosophicae* (Ingolstadt, Germany, Gregory Haenlin, 1629, 167 pages; 2nd ed., Cologne, 1630) was reprinted in 1653, 1657, and 1658 in the same volume as Chasteigner's *Synopsis*. With Reeb's *Axiomata Philosophica* it was reissued under the editorship of J. M. Cornoldi, S.J. (Bressanone, Italy, 1871 and Paris, 1873, 1875, 1891), under the title *Thesaurus Philosophorum, seu Distinctiones et Axiomata Philosophica*. Reeb's work, written from a scholastic viewpoint, discusses, as philosophical topics, such adverbial opposites as absolutely and dependently, in act and in potency, artificially and naturally, collectively and distributively, concretely and abstractly, and so on.

**1653—Johann Micraelius.** The *Lexicon Philosophicum Terminorum Philosophis Usitatorum* of Johann Micraelius (Jena, Jeremiah Mamphras, 1653, 667 pages; 2nd printing, 1662) contains explanations of the terms used in philosophy, broadly understood; a 51-page

appended outline, by discipline, of the topics covered; a 30-page index of Greek terms; and 17 pages of illustrations, mostly geometric figures. Many articles begin with what Aristotle said on the subject and continue with the scholastic elaborations of what Aristotle said. The article “Deus,” however, begins by saying flatly that Aristotle was right in calling God the prime mover but was wrong in denying God’s creation of the world, God’s omniscience, and so on.

1658—*Johann Adam Scherzer (Schertzer) and others*. Scherzer and others’ *Vade Mecum, Sive Manuale Philosophicum Quadripartitum* (Leipzig, Christian Kirchner, 1658) has four parts separately paged but bound as one volume. Part I, by Scherzer, entitled *Definitiones Philosophicae*, is a scholastic-type alphabetical dictionary, with definitions, for example, under *necessarium*, of absolute, hypothetical, physical, moral, and logical kinds of necessary thing. Part II consists of Chasteigner’s *Synopsis* and Reeb’s *Distinctiones Philosophicae*. Part III, by Scherzer, entitled *Axiomata Resoluta*, presents a system of rules of thought (a thing cannot be and not be, a proposition must be true or false, and so on). Part IV, by Scherzer, entitled *Aurifodina Distinctionum* (“Gold Mine of Distinctions”), discusses selected distinctions in an alphabetical arrangement (for example, intrinsic and extrinsic accidents among the A’s and remote and proximate cause among the C’s). Scherzer’s project was ambitious, but the resulting complex was too cumbersome for convenience.

1675—*Heinrich Volckmar*. The *Dictionarium Philosophicum, Hoc Est Enodatio Terminorum ac Distinctionum* of Heinrich Volckmar (Frankfurt, Jacob Gottfried Seyler, 1675, 798 pages; 2nd printing, 1676) is in Latin, but the author sprinkles a little German here and there. Thus, in citing the tenet “Credo quod Deus creavit me” under “Creatio,” he translated it (as if it were difficult Latin) “Ich gläube dass mich Gott geschaffen hat.” In an epilogue he asked the reader to ascribe any omissions not to negligence but to the enormity of the field to be covered, and he named as predecessors Chasteigner, Goclenius, Reeb, Micraelius, and Scherzer but not Alsted.

1692—*Étienne Chauvin*. In Chauvin’s *Lexicon Rationale, Sive Thesaurus Philosophicus Ordine Alphabetico Digestus* (Rotterdam, P. van der Slaast, 1692, 756 pages; 2nd ed., entitled *Lexicon Philosophicum*, Leeuwarden, Netherlands, Franciscus Halma, 1713, 719 pages) philosophy includes natural science. Thus, there are articles, in their Latin equivalents, on acceleration, fire, meteors, and the stomach, as well as on Aristotle, Descartes (a particularly laudatory article), other philosophers, and

*cognitio, simplicitas, subsistentia*, and other philosophical concepts. Cartesian influence is apparent in many of the articles.

“*Nondictionaries*.” Mention may also be made of an unalphabetical “lexicon” of this period by Pierre Godart. The second edition of his *Totius Philosophiae Summa* (Paris, L. Billaine, 1666, 245 pages) was entitled *Lexicon Philosophicum* (2 vols. in 1, Paris, J. and R. I. B. de La Caille, 1675) although it was not really a dictionary. After an introduction on philosophy and its divisions, the philosophical schools, and some principles of philosophy the book discusses being, causes, properties, and species; physics, including matter, motion, soul, sensation, and so on, with an attack on Cartesian philosophy; economics and politics; and logic. The alphabetical index in the second edition is 47 pages long.

Wolter Schopen’s *Alphabetum Philosophicum* (Nissa, John Joseph Krembsl, 1696, 105 pages), although sometimes referred to as a dictionary of philosophy, is, like Godart’s *Lexicon*, not a dictionary. It is a straight exposition of twenty-odd philosophical topics, such as what a definition is, what conversion and opposition of propositions are, and how many kinds of syllogism there are, each topic being designated by a letter of the alphabet (A, B, C, and so on).

LEIBNIZ AND AFTER. Among the fragments of Leibniz edited in 1903 by Louis Couturat and assigned to the period 1670–1704 are two which show an interest in the Alsted work mentioned above and several which consist of lists of definitions of terms, as if Leibniz were thinking of compiling a dictionary of philosophy apart from the general encyclopedia which he had discussed with Louis XIV. One of these lists of definitions, for example, is headed “Introductio ad Encyclopaediam Arcanam.” It contains definitions of *conceptus clarus*, *conceptus distinctus*, *conceptus adaequatus*, *conceptus primitivus*, and the like. Another, untitled, contains definitions of *amor* (love), *sapientia* (wisdom), *laetitia* (joy), *perfectio* (perfection), and so on. Illustrative are his definitions of love, the emotion by which it happens that the good or evil of another is considered part of our own, and of wisdom, the science of happiness. If Leibniz had completed a dictionary of philosophy along these lines, it would probably have constituted a vade mecum to his own philosophy rather than an exposition of historical viewpoints in philosophy.

In 1716, the year of Leibniz’ death, there appeared the last Latin dictionary of philosophy before the first modern-language dictionaries. It was the *Lexicon Philo-*

*sophicum; Sive Index Latinorum Verborum Descriptionumque ad Philosophos & Dialecticos Maxime Pertinentium* (The Hague, Henri du Sauzet, 322 pages), of which the author is listed on the title page as Plexiacus (“Auctore Plexiaco”). Plexiacus has been identified as Charles Duplessis d’Argentre or Michèle Toussaint Chrétien Duplessis (or du Plessis), but the best scholars attribute the work to one Michel Brochard. Following an extended systematic treatment of argumentation, definition, words and things, distinctions, and so on, the author presents, in an alphabetical arrangement, numerous philosophical terms and their definitions. The systematic treatment in the first part of the book, which leans heavily on the writings of Cicero, is more interesting than the somewhat routine definitions in the lexicon proper.

A Latin quasi dictionary of philosophy that may deserve mention here is the book *Philosophia Definitiva, Hoc Est Definitiones Philosophicae*, by Frederick Christian Baumeister (Wittenberg, Germany, J. J. Ahlfeld, 1738, 252 pages; 7th ed., 1746; enlarged ed., 1767), which contains definitions, grouped according to subject, of 329 logical terms, 233 terms in ontology, 95 terms in cosmology, 264 in psychology, 53 in natural theology, 182 in ethics, 69 in political philosophy, and 35 in physics, with a consolidated alphabetical index. The definitions, based in large part on the philosophy of Christian Wolff, are useful but not profound.

#### FIRST MODERN-LANGUAGE DICTIONARIES

In 1715 there appeared a work by J. H. (Johann Hübner) entitled *Compendieuses Lexicon Philosophicum* (Frankfurt and Leipzig, B. P. C. Monath, 208 pages; 2nd ed., 1717). The title of the second edition, varying slightly from that of the first, was *Compendieuses Lexicon Metaphysicum, zum besondern Nutzen aller Studierenden, vornemlich abet der politischen Wissenschaften beflissenen zusammen getragen* (“Compendious Metaphysical Lexicon, for Special Uses by All Students, but Chiefly Those Specializing in Political Sciences Taken as a Whole”). Although the work is in German, it discusses only Latin philosophical terms in nonalphabetical order. It begins with *ens* (a being) and among other things points out, with German examples, the distinctions among *ens*, *res* (a thing), and *reale* (a real thing). Other terms discussed include *verum* and *bonum* (true and real), *ubi* and *quando* (where and when), and the four causes. An alphabetical index at the end contains over four hundred entries, including about fifty under *causa*—*efficiens*, *in sensu juridico*, *necessaria*, *proxima*, and so on. The treatment is elementary, the

analyses are not sharp, and the work has only historical interest today.

The first alphabetically arranged dictionary of philosophy in a modern European language appears to be Hubert Gautier’s *La Bibliothèque des philosophes, et des sçavans, tant anciens que modernes* (2 vols., Paris, André Cailleau, 1723). Chauvin had treated philosophy as including the natural sciences; Gautier treated it as including the natural sciences and the humanities. Thus, his book contains articles on Alexander the Great, Copernicus, and La Fontaine, as well as on Avicenna, Descartes, Porphyry, and many others, plus a smaller number of topical articles, such as those on the Académie Royale des Sciences, *homme* (man), and *terre* (earth). Each volume has a topical index. Today, the work has interest mainly as a curiosity rather than for the information it provides.

Strictly speaking, the first dictionary of philosophy in a modern language appears to be the *Philosophisches Lexikon*, by Johann Georg Walch (Leipzig, 1726, 3,048 cols.; 2nd ed., 1733; 3rd ed., 1740; 4th ed., 2 vols., 1775), which set a new standard of comprehensiveness and scholarship for works of this kind. It reflects in part the ideas of Leibniz and Wolff, quoting or citing them in various articles as authorities. Among the more intriguing articles in this *Lexikon* are those on atheism (16 cols.), discussing arguments derived from the existence of evil, the eternity of the world, the sufficiency of nature as an explanation of events, the anthropomorphic character of our idea of God, and so on; self-knowledge, knowledge of others, knowledge of nature, and knowledge of God; fate, with summaries of the views of Parmenides, Democritus, Plato, Aristotle, the Stoics, the Epicureans, the Chaldeans and other Oriental peoples, Sextus Empiricus, Leibniz, and others; and freedom of thought (25 cols.), discussing the ipse dixit principle, freedom of interpretation, freedom of belief, the role of reason, the fate of Spinoza, the right to know the truth, and other aspects of the topic.

An appendix covers philosophers from Abelard, Albinus, and others at the beginning to the two Zenos and Zoroaster at the end. These biographical sketches are of decidedly less interest than the vivid expositions in the topical articles. Many of the biographical sketches begin, repetitiously, “. . . one of the most famous philosophers of” such-and-such a country.

In 1963 the Stuttgart firm of Friedrich Frommann Verlag was planning to issue a facsimile reprint of the fourth edition of Walch’s *Philosophisches Lexikon*.

Walch’s work was followed by one which originated the exact title used shortly thereafter by Voltaire. This was

the *Dictionnaire philosophique portatif, ou Introduction à la connoissance de l'homme*, by Didier Pierre Chicaneau de Neuville (London, J. M. Bruyset, 1751, 381 pages; 2nd ed., Lyon, J. M. Bruyset, 1756; Italian translation of 2nd ed., Venice, 1756; 3rd ed., Paris, 1764). In de Neuville's pioneering French philosophical lexicon many of the articles are, or begin with, dictionary-type definitions, but the further explanatory material (including quotations from Boileau, Pope, Rousseau, and the early writings of Voltaire) is sometimes piquant.

## VOLTAIRE AND AFTER

On September 28, 1752, Voltaire and other intellectual companions of Frederick the Great were dining with the king at Potsdam. Someone, perhaps Frederick himself, mentioned the idea of producing a philosophical dictionary on which men of letters, including Frederick, would collaborate. Voltaire began work on the project the next day and soon showed the article "Abraham" to Frederick, who considered it good and asked Voltaire to set up a list of proposed articles for the work. Voltaire instead quickly produced articles on *âme* (soul), *athéisme*, *baptême*, and so on, and Frederick commented that the whole book would soon be finished. Voltaire, however, interrupted the project some months later, when he left Potsdam following his break with Frederick, and he presently became involved in preparing articles for Diderot's *Encyclopédie*.

Early in 1760 Voltaire resumed work on his own dictionary. He wrote to the marquise du Deffant on February 18, "I am absorbed in rendering an alphabetical account to myself of everything that I think about this world and the other, entirely for my own use, but (perhaps after my death) for that of honest people."

In the summer of 1764 the *Dictionnaire philosophique portatif*, which was 344 pages long and contained 73 articles, was printed anonymously at Geneva with London given as the place of publication. There was a second printing later in the year. The book was banned by the Parlement of Paris on March 19, 1765, and was placed on the Index of prohibited books by the pope on July 8, 1765. Voltaire denied authorship of the book in 68 letters between July 1764 and February 1768.

A second edition was published at London in 1765 in four printings (varying from 308 to 364 pages), with eight additional articles. Three of these four printings were subsequently counted as the second, third, and fourth editions. A printing which was counted as the fifth edition was issued at Amsterdam in 1765 in two volumes with 15 additional articles. An edition specifically labeled "Sixième Édition," with 34 additional articles, was pub-

lished at London in 1767 in two fascicles bound as one volume. Another edition, also called the "Sixième Édition," was printed at Geneva in 1769 under the title *La Raison par alphabet*, with further additions, in two volumes.

Subsequent editions continued to appear both during and after Voltaire's lifetime under various titles, sometimes including the articles prepared by Voltaire for the *Encyclopédie*; Voltaire's *Questions sur l'Encyclopédie*, an alphabetically arranged set of comments; *L'Opinion par alphabet*, a manuscript found after Voltaire's death; or a combination of the foregoing. One of the most useful editions was edited by Julien Benda (2 vols., Paris, Garnier Frères, 1936). Of the English versions, complete or abridged, the first appeared in 1765; a noteworthy successor appeared in 1824 (6 vols., London, J. and H. L. Hunt), comprising about three-fourths of the original, the remainder being, according to the anonymous translator, repetitive. In 1901 an "unabridged and unexpurgated" edition was translated by William F. Fleming (10 vols., London, E. R. DuMont); the latest edition, translated by Peter Gay with a preface by André Maurois, was published in 1962 (2 vols., New York, Basic Books).

Voltaire's dictionary covers primarily topics, almost totally excluding individual philosophers; among the few philosophers accorded separate treatment are Arius and "Julien le Philosophe." The topical articles are largely in the nature of discursive essays, occasionally in dialogue form, rather than directly informative expositions, but they nevertheless reflect extensive research and critical analysis. In the article on miracles Voltaire made such points as the following: if a miracle is an event to be marveled at, then everything is a miracle; if a miracle is a violation of an eternal (inviolable) law, then it is a contradiction in terms; it is a strange God who is so incapable of achieving his purposes through his own laws of nature that he must resort to changing his own "eternal" ways.

The topics covered are, for the most part, in the field of popular philosophy or religious controversy, such as Adam, apocalypse, *tout est bien* (all is good), confession, *enfer* (hell), inquisition, and so on. A few touch on technical philosophy; examples are those on *âme* (soul), *beauté* (beauty), *chain des êtres créés* ("great chain of being"), *destin* (fate), and *nécessaire* (necessary). Of the articles in his own dictionary Voltaire submitted only the one on idolatry intact to Diderot for inclusion in the *Encyclopédie*. It was reprinted there without change.

Various literary scholars have studied the sources of Voltaire's dictionary. Although Voltaire acknowledged his

indebtedness to Bayle's *Dictionnaire historique et critique* and the title of his dictionary is identical with that of the one de Neuville published in 1751, it appears that he owed more to the English deists and the early French deists. As André Maurois has observed, the ideas in Voltaire's dictionary "were clichés in its epoch. Gassendi, Fontenelle, Bayle, had said all that." But the form in which the ideas are clothed in Voltaire's dictionary is inimitably adroit, vivid, chatty, anecdotal, and essentially consistent in its rough humaneness and urbanity though inconsistent in details.

**REACTION TO VOLTAIRE.** Reacting with indignation to the religious skepticism of the *Dictionnaire philosophique portatif* and without knowing that Voltaire was the author of the work, Louis M. Chaudon published—also anonymously—the *Dictionnaire anti-philosophique, pour servir de commentaire & de correctif au Dictionnaire philosophique & aux autres livres qui ont paru de nos jours contre le christianisme* (Avignon, 1767, 451 pages; 4th ed., 2 vols. in 1, Avignon, La Veuve Girard, 1775). Among the approximately 150 articles in the first edition are those on soul, atheism, Bayle, *Encyclopédie*, faith, hell, miracles, natural law, and reason; new articles in subsequent editions include those on deists, Spinoza, suicide, theater; and tyrannicide. Some of the articles are in two sections, presenting the orthodox view of the subject and replying to the skeptics' objections. After the alphabetical part of the work is a summary headed "Résultat des réflexions répandues dans ce *Dictionnaire*." Chaudon's defense of religion in general and of Christianity in particular was spirited and literate.

**OTHER EIGHTEENTH-CENTURY DICTIONARIES.** Between Voltaire and Chaudon and the end of the eighteenth century six dictionaries of philosophy appeared—three in French, two in German, and one in English—plus a number of works which have promising titles but are not dictionaries of philosophy.

**French.** In 1772, eight years after the first appearance of Voltaire's dictionary, a work comparable in outline, *La Petite Encyclopédie, ou Dictionnaire des philosophes*, by Abraham J. de Chaumeix, a Frenchman, was published anonymously and posthumously (Antwerp, Jean Gasbeck, 136 pages). It contains only topical articles, none on philosophers, and the articles are popular rather than strictly philosophical in tenor. The motto at the end of the book is a misquotation from Virgil, "Heu! Ubi prisca fides?" ("Alas! Where now is your former faith?").

The other two of the three French dictionaries were parts of a 166-volume rearrangement, by disciplines, of the material in the Diderot *Encyclopédie*. The rearrangement, entitled *Encyclopédie méthodique* (Paris, C. J. Panckoucke and others, 1782–1832), consisted of about fifty separate dictionaries. One of these was *Logique, métaphysique et morale*, edited by Pierre L. Lacratelle (4 vols., 1786–1791). The Lacratelle work started out to cover only logic and metaphysics, and a complete alphabetical arrangement of topics in those two disciplines was presented, from absolute (in logic, 2 cols.) and abstraction (19 cols.) at the beginning of Volume I to sensation (230 cols.) and systems (41 cols.) near the end of Volume II; however, the scope was then changed to include ethics, and the remainder of Volume II and Volumes III and IV contain an alphabetical series of articles on ethics. Volume III was the first volume to include ethics on the title page.

Immediately adjacent to the Lacratelle work in the *Encyclopédie méthodique* is *Philosophie, ancienne et moderne*, edited by Jacques A. Naigeon, an atheist who considered himself Diderot's successor (3 vols., 1791–1793). The topics range from Academics (352 cols.) and Academy (2 cols.) in Volume I to Zend-Avesta (10 cols., Diderot's article on the subject transplanted intact from the *Encyclopédie*) in Volume III. The third volume also contains, on pages 767–945, articles omitted from the first two volumes.

**German.** Various giants in the history of philosophy—Aristotle, Leibniz, and Voltaire—have thus far entered this record as contributors to the development of dictionaries of philosophy. Another giant—Kant—enters the record by a quirk of terminology. Kant lectured on the subject *philosophische Enzyklopädie* ten times from 1767/1768 to 1781/1782 and advertised lectures on this subject for 1785/1786 and 1787, although these did not materialize. A set of his lecture notes on *philosophische Enzyklopädie*, probably dating from the winter semester of 1781/1782, was edited by the Deutsche Akademie der Wissenschaften zu Berlin and published for the first time in 1961 in East Berlin. But the work actually deals with what might suitably be called philosophy as an encyclopedic discipline rather than philosophy expounded in encyclopedic form. It presents a structured (not alphabetical) outline of philosophy in its broadest ramifications, based on J. H. Feder's *Grundrisz der philosophischen Wissenschaften* ("Foundation of the Philosophical Sciences," Coburg, Germany, J. C. Findeisen, 1767; 2nd ed., 1769).

Thus, Kant did not write a dictionary of philosophy. However, his admirer Salomon Maimon did. Maimon was the author of *Philosophisches Wörterbuch, oder Beleuchtung der wichtigsten Gegenstände der Philosophie, in alphabetischer Ordnung* ("Philosophical Dictionary, or Illumination of the Most Important Themes of Philosophy, in Alphabetical Order," Berlin, Johann F. Unger, 1791, 222 pages). This work is an impressionistic presentation of various philosophical topics, in substance less iconoclastic than Voltaire's dictionary but just as unconventional stylistically. One of the articles, for example, includes separate vehement apostrophes, each beginning "Meine Herren!," to "die Dogmatiker oder Antikantianer" ("dogmatic philosophers or anti-Kantians") and "die kritischen Skeptiker oder Kantianer" ("critical skeptics or Kantians").

Another German dictionary of philosophy in this period, also impressionistic, was Carl Ludwig Friedrich Rabe's *Gedanken und Urtheile über philosophische, moralische und politische Gegenstände, aus guten Schriften gezogen, alphabetisch geordnet* ("Thoughts and Judgments on Philosophical, Ethical and Political Themes, Deduced From Reliable Publications, Alphabetically Arranged," Stendal, Germany, D. C. Franzen and J. C. Grosse, 1789–1790, 2 vols.). This work is even rarer than the Burchardi book of 1610. The Royal Library at Copenhagen possesses what may be the sole extant copy of it, located after the trail had run dry in many other directions. A microfilm of the Copenhagen copy is now available at the Public Library of the District of Columbia.

Volume I of Rabe's *Gedanken* contains reflections on topics with initial letters from A to Z, and Volume II likewise begins at the beginning of the alphabet and goes through to Z. Among the topics discussed are antiquity, art, business, culture, death, despotism, freedom of the press, God, guilt, happiness, language, man, religion, republic, *Schmerz*, science, soul, and time. Articles range from one or two lines to three or four pages in length. The one on freedom of the press reads, in translation, "Without freedom of the press, the soul is crippled. Freedom to think, without freedom to say, is no better than being in a straitjacket." The article on *Held* (hero) reads, "Ein Held wird nicht geformt, er wird geboren" ("A hero is born, not made").

Toward the end of the eighteenth century, there appeared two other documents like Kant's with titles that sound relevant to the story of dictionaries of philosophy but which turn out to have no relevance to the subject. The first of these was Johann Georg Büsch's *Encyclopädie der historischen, philosophischen und mathematischen*

*Wissenschaften* (2 vols. in 1, Hamburg, Heroldsche Buchhandlung, 1775), which presents its material not in an alphabetical but in a systematic arrangement, Volume I covering history and philosophy and Volume II mathematics. The section on philosophy stresses the contributions of Descartes and Wolff and discusses philosophy in general, logic, theology, philosophical psychology, ethics, politics, economics, and related topics.

The second was the *Encyclopädische Einleitung in das Studium der Philosophie*, by Karl Heinrich Heydenricks (Leipzig, Weygandsche Buchhandlung, 1793, 249 pages), which is a systematic, nonalphabetical exposition of the nature of philosophy, systems of philosophy, the bearing of philosophy on other disciplines and on life, and the way to study philosophy.

**English.** In 1786, *The Philosophical Dictionary, or The Opinions of Modern Philosophers on Metaphysical, Moral, and Political Subjects*, by François Xavier Swediaur, was published (4 vols., London, G. G. J. and J. Robinson, 1786) with "F. S\*\*\*\*\*r, M.D." at the end of the Preface as the only indication of the author or compiler. Many of the articles bear at the end the name of an author (Gibbon, Helvétius, Hume, Locke, Rousseau, Voltaire, and others) from whose writings the article was adapted. Swediaur did not show much understanding of or sympathy for technical philosophy. His article "Ancient Greek Philosophy" mentions Hesiod and Theognis but not Socrates, Plato, or Aristotle.

## NINETEENTH CENTURY

Dictionaries of philosophy, or works purporting to be such, appeared in German, English, French, Italian, Latin, and Russian in the nineteenth century.

**GERMAN.** Initiating the contributions of the century to the library of dictionaries of philosophy, J. C. Lossius published *Neues philosophisches allgemeines Real-Lexikon* (4 vols., Erfurt, Germany, J. E. G. Rudolph, 1803–1805). It contains no articles on individual philosophers. Many of the articles are written from a Kantian point of view. The topics treated include not only such philosophical concepts as *angebörne Begriffe* (innate ideas) and *cogito ergo sum* but also concepts in anthropology, mathematics, and other disciplines.

Lossius' four-volume work was followed soon after by two other works, both of which were left incomplete.

The first of these, Georg S. A. Mellin's *Allgemeines Wörterbuch der Philosophie, zur Gebrauch für gebildete Leser* ("General Dictionary of Philosophy, for Use by

Educated Readers,” 2 vols., Magdeburg, Germany, Ferdinand Matthias, 1806–1807), covers the letters *A* and *B*; no more volumes were published. The work is thoroughly Kantian, as is evidenced particularly in such articles as those on apperception, on the various aspects of *Begriff* (concept), and on the various kinds of concepts.

The other, Gottfried Immanuel Wenzel’s *Neues vollständiges philosophisches Real-Lexikon* (“New Complete Philosophical Encyclopedia,” 2 vols., Linz, Austria, Akademische Buchhandlung, 1807–1808), was planned in four volumes, but the author died before the work was completed, and only two volumes (covering *A* to *H*) appeared. The quaint subtitle gives an adequate, if overstated, description of the work. Literally translated, the subtitle reads: “In Which the Materials and Technical Terms Appearing in All Parts of Recent and Most Recent Philosophy Are Explained, Being Developed From History Where Necessary; Disagreements of Philosophers Are Expounded and Analyzed, Many Propositions Thereof Being Corrected, Made Precise, or Expanded; Obscurities Are Lifted; New Contributions to the Stock of Philosophical Knowledge Are Presented; and Higher Pedagogy and the Science of Intellectual Excellence [*Klugheitslehre*] Are Similarly Treated.”

*Original works of encyclopedic scope.* Each of three German works published in the subsequent years of the nineteenth century, although denominated an encyclopedia of philosophy, presented its material nonalphabetically. The works are Gottlob E. Schulze’s *Enzyklopädie der philosophischen Wissenschaften, zum Gebrauche für seine Vorlesungen* (“Encyclopedia of the Philosophical Sciences, for Use With the Author’s Lectures,” Göttingen, Vandenhoeck und Ruprecht, 1814, 150 pages; 2nd ed., 1818; 3rd ed., 1823, 1824); Georg Friedrich Hegel’s *Enzyklopädie der philosophischen Wissenschaften zum Grundrisse* (“Encyclopedia of the Philosophical Sciences in Outline,” Heidelberg, A. Oswald, 1817, 288 pages; 2nd and 3rd eds., 1827, 1830; 4th ed., 3 vols., Berlin, issued by Hegel’s students with their lecture notes and other materials, 1840–1845); and Johann F. Herbart’s *Kurze Enzyklopädie der Philosophie aus praktischen Gesichtspuncten entworfen* (“Short Encyclopedia of Philosophy Designed From the Practical Standpoint,” Halle, Germany, C. A. Schwetschke und Sohn, 1831, 405 pages; 2nd ed., 1841), which is reprinted in the various editions of Herbart’s collected works.

*Other dictionaries.* German dictionaries of philosophy, more properly so designated, were written after the earliest years of the century by Krug, Furtmair, Hartsen, Noack, and Kirchner (as well as by Eisler, who wrote a

landmark work described in a section below). Of the works referred to the first four are of mainly historical interest.

The first is Wilhelm T. Krug’s *Allgemeines Handwörterbuch der philosophischen Wissenschaften, nebst ihrer Literatur und Geschichte, nach dem heutigen Standpuncte der Wissenschaft* (“General Concise Dictionary of the Philosophical Sciences, Including Their Literature and History, From the Present Standpoint of Science,” 4 vols., Leipzig, F. A. Brockhaus, 1827–1829, plus supp., 1829; 2nd ed., 4 vols., 1832–1833, plus supp., 1838). Krug succeeded Kant in the chair of philosophy at Königsberg. Among the more interesting and unusual articles of Krug’s book, all competently written, are “Aegyptische Weisheit” (Egyptian wisdom), “Baccalaureus der Philosophie” (Ph.B. degree), “Freund und Freundschaft” (friend and friendship), “Immoralität” (immorality), “Ontologischer Beweis für’s Dasein Gottes” (Ontological Proof of God’s existence), “Schöne Kunst” (fine art), and “Supernaturalismus” (supernaturalism). The collaborators who produced the Adolphe Franck dictionary of 1844–1852 mentioned below and Pierre Larousse of the French encyclopedia firm criticized Krug more sharply than seems warranted for working, as far as they could see, without plan or method, for giving more emphasis to the history of philosophy than to philosophy itself, and for showing, in their opinion, insufficient gravity in his style.

Another dictionary was Max Furtmair’s *Philosophisches Real-Lexikon* (4 fascicles in 1 vol., Augsburg, Karl Kollmanschen Buchhandlung, 1853–1855). The third and fourth fascicles were prepared with the collaboration of Johann N. Uschold. The author, inviting attention to his title, said that his aim was to clarify not words but things. What he presented, however, is indistinguishable from the contents of lexicons with more modest pretensions. His heavy indebtedness to Krug, which he acknowledged, is evidenced by, among other things, his inclusion of the articles “Aegyptische Weisheit,” “Baccalaureus der Philosophie,” “Freundschaft,” and others on topics suggested by Krug’s work.

In 1877 appeared Frederik A. Hartsen’s *Ein philosophisches Wörterbuch* (Heidelberg, Carl Winter, 45 pages). The terms defined in this work are generally philosophical expressions rather than single terms. An example is *Betrachten etwas (A) als etwas (B)* (“considering something [A] as something [B]”). In some cases the definitions are of the dictionary type, with little philosophical depth.

There is also Ludwig Noack’s *Philosophiegeschichtliches Lexikon* (Leipzig, Erich Koschny, 1879, 936

pages). This work emphasizes individual philosophers and is especially useful for little-known Renaissance and early modern thinkers. Although some topics—the Academy, eclectics, French philosophy, Cabala—are covered, there are no articles on the philosophical disciplines—ethics, logic, metaphysics, and so on. In 1963 the Stuttgart firm of Friedrich Frommann Verlag was planning to issue a facsimile reprint of this work.

Friedrich Kirchner, author of philosophical monographs and textbooks, including a history of philosophy which went into several editions and was translated into English, wrote a *Wörterbuch der philosophischen Grundbegriffe* (Heidelberg, G. Weiss, 1886, 459 pages), which also appeared in second and third editions (1890 and 1897), by Kirchner, and in fourth, fifth, and sixth editions (1903, 1907, 1911), revised by Carl Michaëlis. The first fascicle, 96 pages, of a projected Russian translation was published at St. Petersburg by Brockhaus–Ephron in 1913. Kirchner's work contains no articles on individual philosophers. The articles are scholarly but not penetrating; the one on logic, for example, is mainly historical and biographical.

ENGLISH. The four English dictionaries of philosophy published in the nineteenth century are now outmoded.

The first one, Isaac Taylor's *Elements of Thought, or First Lessons in the Knowledge of the Mind* (London, B. J. Holdsworth, 208 pages), appeared in 1822. With some changes in the subtitle this work went through 11 British editions (11th ed., 1866) and two American editions (2nd American ed., New York, 1851). Part II contains an exposition, in alphabetical order, of about ninety topics—analysis, argument, art, axiom, being, belief, cause, and so on—bearing upon “the nature and operation of the intellectual powers.”

In 1857 William Fleming's *The Vocabulary of Philosophy, Mental, Moral, and Metaphysical, With Quotations and References, for the Use of Students* (London and Glasgow, Richard Griffin, 560 pages) was published. Subsequent editions included the second (1858), an American edition, edited by Charles P. Krauth (Philadelphia, 1860; reissued 6 times, 1866–1873); a third, edited by Henry Calderwood (1876); another American edition edited and entitled *A Vocabulary of the Philosophical Sciences* by Krauth (1878; reissued, 1879); another American edition edited by Calderwood (New York, 1887, 1890); and a work by Calderwood entitled *Vocabulary of Philosophy and Student's Book of Reference, on the Basis of Fleming's Vocabulary* (1894). The illustrative quotations in the various articles are taken mainly from English writers such as

Berkeley, Hume, Jeremy Taylor, Sir William Hamilton, and J. S. Mill, but there are quotations from Kant (in English) in the article “A Priori,” from Cicero (in Latin) in “Faculty,” and from other foreign thinkers in other articles.

In *A Dictionary of English Philosophical Terms* (London, Rivington, 1878, 161 pages) Francis Garden undertook to present a more general and less technical account of philosophical topics than had appeared in Fleming's work. Like Fleming, however, he leaned heavily on Hamilton for arguments, illustrations, and even topics, including, for example, the article “Worse Relations” (that is, more distant relations) in logic, which is written chiefly according to Hamilton's views.

Edwin S. Metcalf's *Olio of Isms, Ologies and Kindred Matter, Defined and Classified* (Chicago, L'Ora Queta P. and J. Co., 1899, 158 pages) is an elementary and popular manual. In the section “Doctrinal and Sectarian Isms” it has articles on agnosticism, antinomianism, Arminianism, and the like; the section “Civic Isms” has articles on topics like anarchism and collectivism; “Ologies” deals with such topics as aetiology and cosmology. A section headed “Miscellany” treats altruism, analogy, art, and so forth, and “Divination” has articles on aruspicy (art or practice of divination), bibliomancy, and similar topics.

The work entitled *A Dictionary of Philosophy in the Words of Philosophers*, compiled by John R. Thomson (London, R. D. Dickinson, 1887, 479 pages; 2nd ed., 1892), is not a dictionary. Its material is arranged according to a strange outline the logic of which leaves much to be desired. In some cases it is not clear whether the material presented is in Thomson's words or in those of the philosopher who is under discussion.

FRENCH, ITALIAN, AND LATIN DICTIONARIES. Adolphe Franck, a disciple of Victor Cousin, and more than fifty collaborators, including A. A. Cournot, Paul Janet, and Ernest Renan, produced the *Dictionnaire des sciences philosophiques* (6 vols., Paris, Librairie Hachette, 1844–1852; 2nd ed., 1 vol., 1875; 3rd ed., 1 vol., 1885); the second and third editions had an analytical guide to the alphabetical articles. In matters touching on religion the authors of the articles, as pointed out by Pierre Larousse in 1865, showed restraint and circumspection; indeed, in the Preface they acknowledged reverence as one of their key principles. The work is still useful today for its extensive articles on less well-known philosophers. It contains, for example, individual articles on 12 Sophists, 11 Cyrenaics, 6 Pyrrhonists, 13 Greek Stoics, 15 Roman Stoics, and 21 members of the school of Leibniz and Wolff.

Of the other French-language dictionaries of philosophy published in the nineteenth century, one was a Belgian product, and three were Parisian.

The Belgian work, (Louis J. A.) de Potter's *Dictionnaire rationnel des mots les plus usités en sciences, en philosophie, en politique, en morale et en religion* (Brussels and Leipzig, August Sehnée, 1859, 348 pages), began as a glossary at the end of the author's *La Réalité déterminée par le raisonnement* (Brussels, 1848). The glossary was reprinted under the title *A, B, C de la science sociale* (Brussels, 1848) and was then extensively elaborated into the *Dictionnaire rationnel*. The author defended middle-class conservatism in religion, politics, morals, and economics. He decried the intellectual elite and the democratic masses, the philosophical skeptics and the radical innovators.

In 1877 Bernard Pérez wrote the 16-page *Petit dictionnaire philosophique* (Paris, A. Morant). This work, intended for baccalaureate candidates, contains mostly two-line to four-line definitions or explanations of technical terms (plus identifications of a few philosophers), from *acatalepsie*, *actuel*, and *animisme* to *vitalisme*, *Xenocrate*, and *zététique* (persistent skepticism). Pérez also produced a similar work, *Dictionnaire abrégé de philosophie* (Paris, Félix Alcan, 1893, 90 pages).

Pages 483–521 of Henri Marion's *Leçons de psychologie appliquées à l'éducation* (Paris, Armand Colin, 1882, 538 pages; 13th ed., 1908) contained a "Vocabulaire des noms propres et des expressions philosophiques." This vocabulary covers topics in philosophy and other fields, including art, religion, and science.

Alexis Bertrand's *Lexique de philosophie* (Paris, P. Delaplane, 1892, 220 pages) has had at least four printings. This work covers topics only, on an elementary level, but the explanations are not always clear.

There were one Italian and two Latin works of this kind published in the nineteenth century.

The first Latin work was J. A. Albrand's *Lexicon Philosophicum, Quo Verba Scholastica Explicantur*, a work 68 pages long printed on pages 557–624 of Volume IV of Albrand's edition of the *Theologia Dogmatica*, by Thomas ex Charmes (4 vols., Paris, Louis Vivès, 1856–1857). The articles, explicating *absolutum*, *beatitudo*, *esse*, and so on, provide, in prosy Latin, the standard scholastic definitions of the regular scholastic philosophical terms. The *Lexicon* was intended for the use of theological students, especially those trying to understand the system of the eighteenth-century theologian Thomas ex Charmes (also called Thomas a Charmes). Of the several reprints of

Albrand's edition of Thomas' *Theologia* (6, 7, or 8 vols.) some do and some do not include Albrand's *Lexicon Philosophicum*.

The Italian work was Luigi Stefanoni's *Dizionario filosofico* (2 vols, in 1, Milan, Natale Battezzati, 1873–1875). Some of the articles—for example, those on immaculate conception, matrimony, molecule, pope, and Shakers—are a bit unusual in dictionaries of philosophy, but the articles on technical philosophical subjects are useful and contain a significant amount of detail. A pro-Catholic bias is evident in the articles on theological subjects.

The second Latin work, Niceto A. Perujo's *Lexicon Philosophico-theologicum* (Valencia, Spain, Friedrich Domenech, 1883, 352 pages), had a scholastic orientation. It contains 1,364 articles, including explanations not only of terms but also of such common philosophical propositions as "Dato uno absurdo, sequitur aliud" ("If one absurdity is granted, another follows"). Some of the explanations are supported by extensive quotations from Aquinas, Bonaventure, and others.

RUSSIAN. A number of notable dictionaries of philosophy were written in Russia in the nineteenth century.

In 1819 appeared Alexander I. Galich's *Opyt Filosofskogo Slovaria* ("Toward a Philosophical Dictionary," St. Petersburg), the second fascicle of a larger work on the history of philosophical systems. This dictionary contains 217 articles, from "Absolute" to "Theurgy." The topic headings are given in the Latin alphabet—for instance, "Absolutum"—and the explanations in Russian. Special attention is paid to new philosophical terms.

Alexander I. Galich's *Leksikon Filosofskikh Predmetov* (Vol. I, No. 1, St. Petersburg, Tip. Imp. Akad. Nauk, 1845, 298 pages) is the first fascicle of a proposed set of nine (three volumes with three numbers in each). It covers about 170 terms beginning with *A* or *B* in aesthetics, ethics, logic, and metaphysics. The project was discontinued when the author's notes were destroyed in a fire.

S. S. Gogotsky's monumental work *Filosofsky Leksikon* (4 vols., Kiev, University of Kiev and other publishers, 1857–1873; 2nd ed., 1 vol., St. Petersburg, I. I. Glazunov, 1859) contains about twelve hundred articles. The articles on philosophical method, such as those on analogy, classification, dialectic, dogmatism, and method in general, are especially noteworthy. In 1876 Gogotsky produced *Filosofsky Slovar'* (Kiev, Tip. Red. "Kievsk Telegrafa," 146 pages), a one-volume condensation of his lexicon, containing approximately the same number of articles.

EISLER. Rudolf Eisler produced his *Wörterbuch der philosophischen Begriffe und Ausdrücke* ("Dictionary of Philosophical Concepts and Expressions," Berlin, E. S. Mittler und Sohn, 1899, 956 pages), which, following the setup of the *Wörterbuch* by Friedrich Kirchner, has no articles on individual philosophers. Of the three volumes of the fourth edition, whose title was shortened to *Wörterbuch der philosophischen Begriffe* (Berlin, E. S. Mittler und Sohn, published with the cooperation of the Kant-gesellschaft, 1927), the second and third were edited with the assistance of Karl Roretz, Eisler having died after the work on the first volume was completed.

This is perhaps the best technical dictionary of philosophy produced up to its time. Even now, it is probably one of the ten best available dictionaries of philosophy, ranking along with the better works of the twentieth century. Its articles contain terse definitions and are rich not only in relevant quotations in the original languages, including English, but also in bibliographical citations. On Oriental subjects the articles were weak in the first edition (Sāmkhya being dismissed with the statement that it is the system of the Indian thinker Kapila) but were strengthened somewhat in subsequent editions. The later editions, although expanded in coverage, contain fewer quotations in languages other than German.

In 1964 the Basel firm of Benno Schwabe had in preparation a new edition of the *Wörterbuch* under the editorship of Joachim Ritter.

For use by students Eisler summarized the main articles of his large dictionary in the *Handwörterbuch der Philosophie* (Berlin, E. S. Mittler und Sohn, 1913, 801 pages), of which a second edition, supervised by Richard Müller-Freienfels, was issued not only as a regular book in 1922 but also as a "microbook" (Düsseldorf, Microbuch- und Film Gesellschaft, 1922, 785 pages on 88 sides).

Eisler also produced the *Philosophen-Lexikon: Leben, Werke und Lehren der Denker* ("Dictionary of Philosophers: Lives, Works and Doctrines of the Thinkers," Berlin, E. S. Mittler und Sohn, 1912, 889 pages) to make up for the lack of treatment of individuals as such in his *Wörterbuch*. The *Philosophen-Lexikon* was the first modern biographical dictionary of philosophers. Although its articles are shorter, more numerous, and alphabetically arranged, it recalls the useful work of Diogenes Laërtius. From Anathon Aall of Norway to Ulrich Zwingli, the Reformation figure, some four thousand philosophers are identified and, when appropriate, discussed, with their main writings and writings about them listed. Eisler could perhaps be excused for according some emphasis to

German philosophers, and it is not strictly fair to criticize comparative comprehensiveness on the basis of lines of print, especially since most of Eisler's allocations of space seem right; nevertheless, one may perhaps with some warrant complain that Kant gets 33 pages, Wundt 16, Spinoza 11, Plato (as well as Hegel and Leibniz) 10, and Aristotle 9 and that Hermann Cohen gets more space than Augustine, Fichte more than Descartes, Herbart more than Hume, Lotze more than Locke, Maimon more than Maimonides, and Meinong more than Bentham.

## EARLY TWENTIETH CENTURY

In 1901 an important dictionary was published, and an important dictionary was begun. The early twentieth century also saw the publication of dictionary-type or supposedly encyclopedic treatments of philosophical topics by Lalande, Windelband, and less well-known writers.

GOBLOT. Edmond Goblot issued *Le Vocabulaire philosophique* (Paris, Librairie Armand Colin, 1901, 513 pages; 6th ed., 1924), in which he tried not only to record the actual meanings of terms but in part to correct confused usages by suggesting, for example, separate meanings for *général* and *universel*; for *particulier*, *individuel*, and *singulier*; and for *mémoire* and *souvenir*. But philosophers being the individualists that they are in the use of words, their degree of acceptance (if any) of his commendable suggestions is not perceptible. Spanish translations of this work were published at Barcelona in 1933 and at Buenos Aires in 1942 and 1945.

BALDWIN. The other important work of 1901 was Baldwin's. James M. Baldwin, a psychologist, edited, with the collaboration of an international board of advisers and contributors that included Bosanquet, Dewey, William James, Janet, Lloyd Morgan, Moore, Münsterberg, Peirce, Pringle-Pattison, Royce, Sidgwick, Stout, and Urban, the *Dictionary of Philosophy and Psychology* (3 vols. in 4, New York, Macmillan, 1901–1905; reprinted with corrections several times, in part or in entirety, by the same firm, in some cases with the designation "New Edition"; also reprinted by Peter Smith twice, partly at New York and partly at Gloucester, Mass., 1940s, 1950s). Volume III, in two parts, is a bibliography of philosophy and psychology, by Benjamin Rand, to which there were annual supplements in the *Psychological Index* from 1901 to 1908.

In the Preface the editor stated that a dictionary of terms used in Greek and scholastic philosophy "is much needed: but we have not attempted it." The dictionary does, however, include articles on Greek terminology (8

pages, by Royce) and Latin and scholastic terminology (11 pages, by Royce), as well as on analogy, nous (mind), and other special terms. Moreover, the editor aimed “to present science—physical, natural, moral—with a fullness and authority not before undertaken in a work of this character.” Thus, there are articles on anthropology, brain, case law, hybrid, money, peace, pupa, and others. Like Goblot, Baldwin futilely suggested that his readers follow the recommendations made in some of the articles for preferred philosophical usage. For many entries German, French, and Italian equivalents are recommended. In addition, at the end of Volume II there is an index of Greek, Latin, German, French, and Italian terms, including those covered by separate articles on the terms as such and those merely mentioned as recommended equivalents.

Philosophically, the articles in the Baldwin dictionary are of uneven value. Some, especially the biographical articles, are too short, and there are no articles at all on Maine de Biran, Renan, and Saint-Simon. Others are broken down too minutely into terms rarely encountered, including Peirce’s articles on particulate, *parva logicalia*, philosopheme, predesignate, and prosyllogism. In others there is cavalier treatment of the philosophical aspects of a subject, as in the psychologically oriented article on the self. Some articles, however, are excellent, especially the longer ones by Dewey—for example, those on nature, pluralism, and skepticism; those by Moore on cause and effect, change, nativism, quality, real, reason, relation, relativity of knowledge, spirit, substance, teleology, and truth; and the longer ones of the approximately 180 written by Peirce, including his 23 columns on syllogism, 10 columns on uniformity, and 10 on matter and form. Peirce’s articles (the preparation of which, from 1901 to 1905, constituted his last steady employment) were mainly fragments of a book on logic which he never finished; only about half of these articles were reprinted in the Harvard *Collected Papers* of Peirce. Moore’s 12 articles, which he later, with undue modesty, called crude, have not been reprinted.

LALANDE. With the collaboration of others André Lalande, a professor at the Sorbonne, issued the *Vocabulaire technique et critique de la philosophie* (21 fascicles, Paris, Félix Alcan, 1909–1922; revision of fascicle covering *A* in *Bulletin* of Société Française de Philosophie, 1923; 2nd ed., 2 vols., 1926; 3rd ed., 2 vols., 1928; 4th ed., 3 vols., 1931, reissued in 1932, Vols. I and II reissued, 1938; 5th–9th eds., 1 vol., 1947, 1950, 1956, 1960, 1962; 5th ed. translated into Spanish, Buenos Aires, 1953, with 2nd ed., Buenos Aires, 1964, 1,502 pages). Lalande was 95

years old when the ninth edition of the *Vocabulaire* was published. At the bottom of most of the pages appear the comments of members of the Société Française de Philosophie, including Peano and Russell among the foreign members, on the articles. The emphasis of the articles is on clarifying the meanings of terms and the usage of expressions rather than on the imparting of historical or technical information.

ORIGINAL WORKS OF ENCYCLOPEDIA SCOPE. Just as, early in the nineteenth century, the works of Schulze, Hegel, and Herbart were published as encyclopedias of the philosophical sciences, so early in the twentieth century three works of this kind were published or begun. The first “nonencyclopedia” was a series of works, edited by H. Renner and published at Charlottenburg, Germany, by O. Günther beginning in 1907, under the general title *Encyklopädie der Philosophie*. It included, for example, an introduction to philosophy and volumes on the philosophy of Rudolf Stammler and Rudolf Eucken.

Second of the three nonencyclopedias was August J. Dörner’s *Encyklopädie der Philosophie* (Leipzig, Verlag der Durr’schen Buchhandlung, 1910, 334 pages); in Kantian fashion it dealt with phenomenological investigations, the construction of empirical science, and similar topics.

The third was a proposed *Encyklopädie der philosophischen Wissenschaften*, of which the first volume, *Logik*, was published in 1912, edited by Wilhelm Windelband and Arnold Ruge (Tübingen, Germany, J. C. B. Mohr, 275 pages), containing expositions of the principles of logic by Windelband, Josiah Royce (translated from English), and Louis Couturat (translated from French); of the task of logic by Benedetto Croce (translated from Italian); of the problems of logic by Federigo Enriques (translated from Italian); and of the bearing of the concepts of consciousness on logic by Nicholas Lossky (translated by Lossky himself from the original Russian).

An English edition of the Windelband–Ruge encyclopedia was projected under the editorship of Sir Henry Jones, and the first volume, *Logic*, was published in 1913 (London, Macmillan, 269 pages). For the English edition Royce’s English version was available, Couturat’s article was done into English from the original French rather than from the published German version, and the German of Lossky’s article was his own; therefore, as the translator, B. Ethel Meyer, pointed out, only Croce’s and Enriques’ articles “suffered a double process of translation.”

The onset of war in 1914 and the death of Windelband in 1915 resulted in the abandonment of the project. Windelband's contribution to the first volume, issued separately in German in 1913, was republished in English years later as *Theories in Logic* (New York, Philosophical Library, 1961, 81 pages). Royce's contribution was also published separately, as *The Principles of Logic* (New York, Philosophical Library, 1961, 77 pages).

OTHER WORKS. The works of the early twentieth century by less well-known writers in Italian, French, German, English, Russian, and Japanese were numerous.

In Italian there was Cesare Ranzoli's *Dizionario di scienze filosofiche* (Milan, Ulrico Hoepli, 1905, 683 pages; 2nd ed., 1916, 1,252 pages; 3rd ed., 1926, 1,207 pages; 4th ed., Maria P. Ranzoli, ed., 1943, 1,360 pages; 5th ed., Maria Ranzoli, ed., 1952, 1,313 pages). Covering only topics, not individual philosophers, the book contains articles on Pyrrhonism and Pythagoreanism (and later editions cover existentialism), but there is none on Platonism. The articles are of high quality.

In 1906 appeared Élie Blanc's *Dictionnaire de philosophie ancienne, moderne et contemporaine* (Paris, P. Lethielleux, 1,248 cols.; supp., for 1906–1907 and 1906–1908; consolidated ed., 1909). Blanc also published a vocabulary of scholastic and contemporary philosophy, presented at the beginning of his *Traité de philosophie scolastique* (3 vols., Lyon, Emmanuel Vitte, 1889; 3rd ed., Paris, 1909), and the *Dictionnaire universel de la pensée, alphabétique, logique et encyclopédique* (2 vols., Lyon, Emmanuel Vitte, 1899), which was a thesaurus-type classification of words, ideas, and things. In the *Dictionnaire de philosophie* his Catholic viewpoint is evident in many places; indeed, his starting point, he said, is moderate dogmatism.

In Germany Rudolf Odebrecht produced the *Kleines philosophisches Wörterbuch; Erklärung der Grundbegriffe der Philosophie* (Berlin, Buchverlag der "Hilfe," 1908, 83 pages; 6th ed., Leipzig, Felix Meiner, 1929). The choice of topics in this highly condensed wordbook was in some cases injudicious. There are entries on *heliocentrisch* (heliocentric) and *Hypnose* (hypnosis) but none on the Academy, Epicureanism, or Taoism.

A pocket volume, about 2½ inches by 4 inches, one of a series of about fifty covering literary terms, commercial terms, art terms, and so on was edited by Arthur Butler, *A Dictionary of Philosophical Terms* (London, G. Routledge and Sons, and New York, E. P. Dutton, 1909, 114 pages). The *Dictionary of Philosophical Terms* depends heavily on Kant, who is cited in ten of the first fifty articles. Among

the topics treated are a number of German terms, such as *Anschauung* (outlook), *Begriff* (concept), and *Ding an sich* (thing-in-itself).

In 1909 also appeared Arturo Mateucci's *Vocabolario di termini filosofici* (Milan, Casa Editrice Sonzogno, 63 pages; 2nd ed., 1925). Intentionally elementary in its treatment, in many cases this work contains little more than dictionary definitions of the concepts covered. Some 75 percent of the articles consist of only one, two, or three lines.

Fritz Mauthner edited the *Wörterbuch der Philosophie* (2 vols., Munich, G. Muller, 1910–1911; 2nd ed., 3 vols., Leipzig, Felix Meiner, 1923). Mauthner was a literary critic and nonacademic philosopher who contributed pioneering insights on the question of what, if anything, ordinary language reveals about the world, whether the distinction between analytic and synthetic propositions is tenable, and so on. His *Wörterbuch*, after a rambling introduction of 96 pages, presents a mixture of very odd items and very useful, though informal, ones. The odd items include the articles "Babel," "Bacon's Ges'pensterlehre" (Bacon's study of ghosts), "Form" (40 cols., with only a passing reference to Aristotle), and "Graphologie." The more useful ones include "Geschichte" (history, 68 cols.), "Natur" (nature, 29 cols.), "Nichts" (nothing, 14 cols.), and "Spinoza's 'Deus'" (Spinoza's "God," 19 cols.); even these, however, should be used with caution, for they contain some questionable material.

Ernest L'vovich Radlov's *Filosofsky Slovar'* (St. Petersburg, Brockhaus–Ephron, 1911, 284 pages; 2nd ed., Moscow, G. A. Leman, 1913) covers aesthetics, ethics, logic, psychology, and the history of philosophy. It is of only limited usefulness.

Tetsujiro Inouye, Yujiro Motora, and Rikizo Nakashima edited the *Dictionary of English, German, and French Philosophical Terms, With Japanese Equivalents* (Tokyo, Maruzen Kabushiki–Kaisha, 1912, 205 pages), written in English. This is the definitive edition of the *Dictionary of Philosophical Terms* first brought out by Inouye and others in 1881 and issued in a second edition in 1884. For topical entries, including some in Arabic, Greek, and Latin besides the languages listed in the title, only the Japanese equivalents are given; the personal entries also provide identifying information.

Julius Reiner's *Philosophisches Wörterbuch* (Leipzig, Otto Tobies, 1912, 295 pages) is an elementary work in which, for example, the article on *Ambiguität* (ambiguity) consists of one word, *Zweideutigkeit* (having two meanings), and the article on *Intellekt* (intellect) consists of two

words, *Geist*, *Verstand* (spirit or mind, understanding). Other articles, however, such as those on *Darwinismus* and *Ethik* (Darwinism and ethics), go more deeply into the subject.

Another German work was Heinrich Schmidt's *Philosophisches Wörterbuch* (Leipzig, Alfred Kröner, 1912, 106 pages; 8th ed., 1930). This was republished in the United States in 1945 by authority of the alien property custodian and went through several editions; the tenth edition (1943) was reprinted in the United States without the authority of the alien property custodian; the sixteenth edition appeared in 1961. The editions which appeared after the death of the author in 1935 were supervised by various editors. The numerous editions of this work had a vast circulation in all German-language areas. Indeed, it is perhaps the most widely used philosophical dictionary in any language at any time, the Eisler work being its main rival for this distinction. In the ninth edition (1934), while Schmidt was still alive, some pro-Nazi and anti-Jewish comments were included, and in the tenth edition (1943) the desecration of scholarship was compounded with obsequious compliments to insignificant Nazis and truly monstrous articles on Bergson, Freud, Husserl, and others. Recent editions bend over backward to rectify these aberrations.

Paul Thormeyer's *Philosophisches Wörterbuch* (Leipzig, B. G. Teubner, 1916, 96 pages; 4th ed., 1930) is an uncommonly useful short reference work. It is well organized and was up-to-date at the time it was issued.

## THE NINETEEN-TWENTIES

**ANGLO-SAXON SILENCE.** In the 1920s 12 dictionaries of philosophy appeared or were begun—4 in German and 1 each in Hungarian, Swedish, Dutch, French, Spanish, Hebrew, Japanese, and Chinese. Not one was published in the United States or Great Britain. Indeed, the only English-language work deserving of mention here published between Butler's *Dictionary* of 1909 and Runes's *Dictionary* of 1942 was a quasi encyclopedia, the *International Encyclopedia of Unified Science*, begun in 1939. The Anglo-Saxon silence can only be recorded here. The explanation of it requires more data than are readily at hand.

**GERMAN.** Of the German works published in the 1920s three were published in 1923. The *Systematisches Wörterbuch der Philosophie*, by Karl W. Clauberg and Walter Dubislaw (Leipzig, Felix Meiner, 1923, 565 pages), is systematic to a fault, many of the articles being broken down into standard subdivisions—for example, definition,

statement, addition, and example—in a somewhat rigid fashion. Dubislaw, who was a professor of philosophy at the University of Berlin, had a continuing interest in the clarification of concepts. He was close to logical empiricism and wrote the comprehensive *Die Definition* (Leipzig, Felix Meiner, 1931, 160 pages); he also made notable contributions to the philosophy of method, mathematics, and science.

In Rudolf Wagner's *Philosophisches Wörterbuch* (Munich, Rösl, 1923, 148 pages) articles range in length from one-word or two-word definitions or identifications to the six-page article on the history of philosophy, which consists mainly of a five-page outline taken from Wilhelm Wundt's *Einleitung in die Philosophie* (1914); individual philosophers are not accorded separate treatment.

In most dictionaries of philosophy that cover both topics and persons, the articles on topics are far more numerous than those on people; in Alfred Sternbeck's *Führer durch die Philosophie; Philosophenlexikon und philosophisches Sachwörterbuch* (Berlin, Globus Verlag, 1923, 306 pages), however, those on people almost equal the topical articles in number. Moreover, whereas some of the topical articles are elementary, containing little more than dictionary definitions, the biographical articles are more substantial.

Two years later, there was published the last of the German works of the 1920s, *Klare Begriffe! Lexikon der gebräuchlicheren Fachausdrücke aus Philosophie und Theologie*, by Theodor Mönnichs, S.J. ("Clear Concepts! Dictionary of the Most Common Technical Terms of Philosophy and Theology," Berlin, Ferdinand Dümmlers Verlag, 1925, 170 pages; 2nd ed., 1929). This work was written, according to the author, from the standpoint of *philosophia perennis* and Catholic theology. The longest article is the sixty-line one on religion. The pervasive scholastic emphasis in the book is indicated by the fact that many articles begin with the Latin equivalent of the term being covered, and the second edition contains, as an appendix, a 20-page alphabetical list of Latin philosophical terms with their German equivalents.

**HUNGARIAN.** The Hungarian work of the 1920s was *Philosophiai Szótár*, by Enyvvári Jenő (family name Enyvvári), published at Budapest by Franklin-Társulat (1923, 187 pages). The articles in this work show a creditable familiarity with West European scholarship. The titles of many of the articles are in languages other than Hungarian—for example, "Élan vital," and "Moral Insanity." Appended are a list of philosophers and a competent discussion of philosophical bibliographies.

SWEDISH. Sweden contributed the *Filosofiskt Lexikon*, edited by Alf Ahlberg (Stockholm, Bokförlaget Natur och Kultur, 1925, 207 pages; 3rd ed., 1951). In this work Swedish philosophers were given fuller treatment than others—C. J. Boström, 15 cols.; E. G. Geijer, 10 cols.; Aristotle and Plato, 6 cols. each.

DUTCH. The Dutch work of the period was C. J. Wijnaendts Francken's *Koort Woordenboek van Wijsgeerige Kunststermen* ("Short Dictionary of Philosophical Terms," Haarlem, D. H. Tjeenk Willink & Zonen, 1925, 157 pages). It covers topics only, in a fairly popular style, and the choice of topics is liberal, making room for such terms as *kosmopolitisme*, *opportuniste*, and *sarcasme*, along with more technical philosophical terms.

FRENCH. In France appeared Armand Cuvillier's *Petit Vocabulaire de la langue philosophique* (Paris, Librairie Armand Colin, 1925, 109 pages; 13th ed., 1953). It was subsequently translated into Turkish (Ankara, 1944) and Portuguese (São Paulo, Brazil, 1961). This work was intended by its author to be at once *élémentaire* and *précis*. In large measure it succeeded in achieving both objectives.

SPANISH. Begun in Spain was the *Diccionario manual de filosofía* by Marcelino Arnáiz and B. Alcalde (Madrid, Talleres Voluntad, 1927–). Volume I, "Vocabulario Ideario" (659 pages), is rich in bibliography, and many of the articles contain sound historical data in addition to the conceptual explanations which the volume was essentially intended to provide. A projected second volume, covering the history of doctrines, biographies, and bibliography, was not published.

EASTERN LANGUAGES. In the 1920s dictionaries of philosophy appeared in three Eastern languages, apparently for the first time (aside from translations).

*Hebrew.* The Hebrew dictionary of philosophy begun in the 1920s was the *Otsar ha-Munahim ha-Filosofiyim ve-Antologiyah Filosofit* ("Thesaurus of Philosophical Terms and Philosophical Anthology"), by Jacob Klatzkin (4 vols., Leipzig, August Pries, 1928–1933); an introductory volume, published in Berlin by "Eschkol" Verlag in 1926, contains an anthology of Hebrew philosophy. Each of the four regular volumes has, as an added Latin title, *Thesaurus Philosophicus Linguae Hebraicae et Veteris et Recentioris*; Volumes III and IV had M. Zobel as coeditor. The dictionary articles are on topics only, not philosophers or schools of philosophy. Many of the articles contain the German or Latin equivalent of the title of

the article; indeed, the purpose usually seems to be to explain the use of terms rather than to convey historical information on the topic as a topic, although the usage of historical writers on the subject is often indicated.

*Japanese.* A 1,026-page work entitled *Tetsugaku dai-Jisho* ("Dictionary of Philosophy") was published at Tokyo in 1924 by Dai Nippon Hyakka Jisho (Japanese Encyclopedia). The eighth edition (1928) consists of three volumes of text, an index volume, and a supplement. In the text volumes and in the supplement each article begins with the title in Japanese, followed usually by English, German, and French equivalents of the title. Thus, the first article in the first volume is headed, after the Japanese title, "Love. Liebe. Amour." The next several articles deal with patriotism, agape (listed alone after the Japanese title), affection, love and hate (with the Greek equivalents, *φιλότης* and *ἄγαπη*), Aitareya Upanishad, idealism, vaguedualism, pity, and Augustine. Some of the articles, including the one on religion, are extensive, and many include references to European works.

The index volume of this Japanese dictionary has a title page in German ("Encyclopaedia Japonica, *Enzyklopädische Wörterbuch der Philosophie . . . Register . . .* Tokyo: Dobunkwan"). In addition to a Japanese index, it contains English, French, German, Latin, Pali, Sanskrit, and Chinese indexes and a *Namenregister* (index of names). In the English index approximately 35 of the first 100 entries are strictly philosophical—absolute, abstract, Academy, accident, actual, and so on; most of the others pertain to psychology. In the *Namenregister*, too, about 35 of the first 100 entries are standard names in philosophy—Abelard, Aenesidemus, Albert the Great, al-Fārābī, and so on.

*Chinese.* In *Chê Hsüeh Tz'ü Tien* ("Dictionary of Philosophy"), by Fan Ping-ch'ing (Shanghai, Commercial Press, 1926, 1,110 pages; 2nd ed., 1935; 3rd ed., 1961), the title of each article is given in Chinese, English, French, and German. The dictionary begins with an article on monism and continues with articles on monotheism, Monophysites, the seven liberal arts, the seven wise men, dualism, dilemma, antinomy, ethnology, subconscious, Albert the Great, major term, minor term, asymmetry, *credo quia absurdum*, medieval philosophy, Pascal, Parmenides, and so forth. The content is scholarly, but there are numerous errors in the Western languages. The work closes with an alphabetical index of names (in which Abelard has 8 references, Aristotle 45, Kant 28, and Marx 5) and an alphabetical index of topics from abiogenesis (1 reference) to *Zwecksystem* (1 reference).

## THE NINETEEN-THIRTIES

In the 1930s there appeared four Italian and two Russian works. During this period a number of works in other languages were also published.

**GERMAN.** Germany began the decade with Max Apel's *Philosophisches Wörterbuch* (Berlin and Leipzig, W. de Gruyter, 1930, 155 pages). The fifth edition, which was revised by Peter Ludz, appeared in 1958, and a Spanish translation was published at Mexico City in 1961. Editions of Apel's work published since World War II are pro-Soviet.

**DUTCH.** In the Netherlands appeared the *Encyclopaedisch Handboek van het Moderne Denken*, edited by Willem Banning and 41 collaborators (2 vols., Arnhem, Van Loghum Slaterus, 1930–1931; 2nd ed., 1 vol., 1942; 3rd ed., 1 vol., 1950). Although the third edition emphasizes such modern ideas as anarchism, Gestalt theory, phenomenology of worship, quantification of the predicate, and the United Nations, the work does not neglect such standard philosophical ideas as category, natural law, and thing.

**ENGLISH.** A United States contribution, a quasi encyclopedia, in the 1930s was the inauguration of the *International Encyclopedia of Unified Science*, by Otto Neurath, Rudolf Carnap, and Charles Morris in 1936/1937 at the University of Chicago. This work, carried on after Neurath's death in 1945 by the Institute for the Unity of Science in Boston under the joint editorship of Carnap and Morris, consists thus far of 15 fascicles, of which Volume I, Number 1 (1938), contained articles by Niels Bohr on analysis and synthesis in science, by Carnap on logical foundations of the unity of science, by John Dewey on unity of science as a social problem, by Morris on scientific empiricism, by Neurath on unified science as encyclopedic integration, and by Bertrand Russell on the importance of logical form. The other 14 are monographs by individual authors. To each of these a volume and a number are assigned. The latest numerically is Volume II, Number 9 (1951), a study by Jørgen Jørgensen on the development of logical empiricism. The latest chronologically, Volume II, Number 2 (1962), is a monograph by Thomas S. Kuhn on the structure of scientific revolutions.

Thus, this "encyclopedia," like Hegel's, Herbart's, Contri's (see below), Windelband–Ruge's and the *Nouvelle Encyclopédie philosophique*, is a compendium but it is not alphabetical. The announced topics of the volumes are foundations of the unity of science, Volumes I and II;

theories, induction, probability, and so on, Volume III; logic and mathematics, Volume IV; physics, Volume V; biology and psychology, Volume VI; social and humanistic science, Volume VII; and history of the scientific attitude, Volume VIII. This project, inspired by logical positivism and designed by Neurath to show that all the sciences speak the same language—essentially, physicalism—was overambitious.

**FRENCH.** France's contribution in the 1930s was Jean B. Domecq's *Vocabulaire de philosophie* (Tours, Alfred Cattet, 1931, 208 pages), which has separate alphabetical arrangements of topics for logic, ethics, and metaphysics and a consolidated index at the end. The author was an abbot, and the work has a Catholic orientation.

Mention may also be made of a series of monographs inaugurated in Paris in 1934 by the Presses Universitaires de France, *Nouvelle Encyclopédie philosophique*, which do not constitute an encyclopedia in the strict sense. Among the monographs published thus far are, for example, Louis Lavelle's *Introduction à l'ontologie* (No. 41, 1947) and Robert Blanché's *Les Attitudes idéalistes* (No. 45, 1949).

**ITALIAN.** Four Italian dictionaries of philosophy appeared or were begun in this period. The first was Giovanni Semprini's *Piccolo dizionario di cultura filosofica e scientifica* (Milan, Edizioni Athena, 1931, 502 pages). This was revised as *Nuovo dizionario di cultura filosofica e scientifica* (Turin, Società Editrice Internazionale, 1952, 470 pages). The work covers topics and individuals in philosophy, science, and education.

In 1933, Antonio Bettioli's *Il pensiero filosofico attraverso i secoli* (Urbino, Editoriale Urbinata, 234 pages) was published. The articles are grouped into schools and systems of philosophy—for example, the Academy, eclectics, idealism—and individual philosophers—113 names, including Dante, Feuerbach, Goethe, Leonardo, Swedenborg, and Tolstoy but not Bergson, Dewey, Husserl, Origen, Philo, or Proclus. The book is of limited value.

An elementary work with little penetration, Francesco Varvello's *Dizionario etimologico filosofico e teologico* (Turin, Società Editrice Internazionale, 406 pages), appeared in 1937, with a second edition in 1938. Fascism is lauded as the opposite of various false forms of government. According to the author, Marx (described as a Jew) rejected the idea that man does not live by bread alone. The articles on religion are pro-Catholic.

There was also Emilio Morselli's *Piccolo dizionario filosofico* (Milan, Carlo Signorelli, 1938, 104 pages). In

this book the author aimed to help young readers who encounter in the classics of thought special philosophical expressions, expressions whose meanings differ not only from what they are in ordinary discourse but also from period to period.

An Italian work of the 1930s which called itself an encyclopedia of philosophy but which was not arranged alphabetically was Siro Contri's *Piccola enciclopedia filosofica* (Bologna, Costantino Galleri, 1931), of which only the first volume, on logic and the philosophy of science, was published.

**PORTUGUESE.** In Brazil appeared Renato Kehl's *Bioperspectivas; dicionário filosófico* (Rio de Janeiro, Livraria Francisco Alves, 1938, 187 pages), which is a series of Voltairian musings on art, the categorical imperative, civilization, death, education, free will, God, history, intelligence, original sin, personality, philosophy, politics, progress, work, and other subjects.

**RUSSIAN.** The first of the two Soviet contributions of the 1930s was Timofei S. Ishchenko's *Kratky Filozofsky Slovar'* (Moscow, Moskofsky Rabochy, 1931, 200 pages), which gave more space to Stalin (four cols.) than to Plato, Aristotle, Kant, Hegel, or Marx. Other Marxist topics, such as dictatorship of the proletariat, were accorded correspondingly disproportionate treatment with the usual positive bias. The three items in the bibliography on Aristotle are by Marx, Engels, and Stalin, respectively.

The second was a work by Mark M. Rozental' and Pavel F. Yudin, likewise entitled *Kratky Filozofsky Slovar'* (Moscow, 1939; 2nd–4th eds., 1940, 1951, 1954, each of which was reprinted the following year). A new edition appeared in 1963 with the title modified by the omission of the first word, which means “short,” although the 1963 edition of 544 pages is actually shorter than the previous edition, which had 567 pages. The encyclopedia was translated into Spanish in 1945, Bulgarian in 1947, English in 1949, Ukrainian in 1952, Hebrew in 1954, and Chinese, French, Polish, and Rumanian in 1955. Reportedly, 2 million copies of the Russian original were sold in the first ten years after publication, and the press run of one of the printings in the 1950s was 500,000. The English version, adapted and translated by Howard Selsam (New York, International Publishers, 1949, 128 pages), stated in the Preface that the volume reflects Marxist partisanship (for materialism and for socialism) as contrasted with the lack of a “common approach” and the “alphabetic disorder” of other dictionaries of philosophy.

Illustrative of the topical entries in the English version are those in the *E*'s: “Eclecticism,” “Economic Bases of Society,” “Economic Determinism,” “Economics and Politics,” “Empiricism,” “Empirio-criticism,” “Energism (metaphysical),” “Epistemology,” “Equality,” and “Equilibrium, Theory of.” The men treated in the *S*'s are Saint-Simon, Schelling, Spencer, Spinoza, and Stalin, and the article on Stalin is the longest of these.

The article on Kant in the English version dutifully quotes from Lenin, and those on Campanella and dualism, among others, drag in quotations from Stalin. Many of the articles on individual philosophers vapidly make a point of recounting what Marx, Engels, Lenin, or Stalin thought of the philosopher or even reverently disinter a colorless quotation from Stalin summarizing what Marx or Lenin thought of the philosopher. The article “Partisanship of Philosophy” states that the class struggle is always behind the scenes in the open struggle of philosophical opinions.

According to Alexander Philipov, a former professor of philosophy at the University of Kharkov who later emigrated in the United States, for the English version Selsam watered down two features of the original—its invective and its extravagant praise of Lenin and Stalin—in order to make the edition less offensive to Western readers.

A significant feature of the original is the fact that the article on Stalin in the fourth edition (1954) ended with a sentence which may be translated “The immortal name of Joseph Stalin will live forever in the minds and hearts of the Russian people”; that sentence vanished without a trace in the 1955 printing of the same edition. In the 1963 edition, of which 400,000 copies were printed and which had about 160 collaborators (including most of the important figures in current Soviet philosophy), there is no article on Stalin, and the Preface acknowledges the “enormous harm” resulting from the cult of Stalin. The 1963 edition is stronger than its predecessors in coverage of linguistic philosophy, logical positivism, and logic.

**LITHUANIAN.** Lithuania's contribution to the history of philosophical dictionaries is a 97-page article entitled “Bendroji Filosofijos Terminija” (“General Terminology of Philosophy”), by Stasys Šalkauskis; it constituted an entire issue of the periodical *Logos; Filosofijos Žurnalas* (Kaunas), 1937. The article listed some fifteen hundred Lithuanian terms useful in philosophical discussions, with their equivalents in French, German, and Russian. The list was supplemented by a discussion of synonyms of various philosophical terms in Lithuanian. In a 1938 issue of the same periodical Šalkauskis presented a list of

over fifteen hundred German philosophical terms with their Lithuanian equivalents.

**HEBREW.** In Palestine, Zvi Hirsch Rudy produced the *Leksikon le-Filosofiyah* (Tel Aviv, Dvir, 1939, 816 cols.), with an added title page in Latin, *Philosophiae et Scientiarum Propinquareum Lexicon Hebraicum*. This work is generous with Latin terms, as the titles of articles—for example, “Actus purus,” in Hebrew transliteration; as the Latin equivalents of the Hebrew titles of topical articles—for example, “Natura Naturans” as the equivalent of “Teva Tovei”; and as the titles of works cited—for example, works by Abelard and Augustine cited in the articles on those thinkers. Contemporary writers, such as Dewey and Meyerson, and topics of current interest, such as absurd and *élan vital*, are also included. The articles lack penetration. The Bibliography at the end is erratic in including, along with students’ handbooks, a poorly balanced small selection of specialized monographs.

**CHINESE.** In 1934 appeared a new Chinese dictionary, not so strictly confined to philosophy as was the 1926 Chinese work. This was the *Ssu Hsiang Chia Ta Tz’ü Tien* (“Dictionary of Great Thinkers”), by P’an Nien-chih (Shanghai, Shih Chieh, 1,062 pages), which contains over five hundred articles on philosophers, writers, artists, musicians, and others. Mo Tzu quite properly is accorded 12 columns, but in the modern period Kant and Mill get only 5 columns each while Mussolini rates 6. Many names are misspelled.

#### THE NINETEEN-FORTIES

The 1940s saw six philosophical dictionaries in Spanish, five in English, five in German, two in Italian, two in French, and one each in Hungarian and Turkish.

**FERRATER MORA.** José Ferrater Mora began the decade by producing the *Diccionario de filosofía* (Mexico City, Editorial Atlante, 1941, 598 pages; 2nd ed., 1944; 3rd–4th eds., Buenos Aires, Editorial Sudamericana, 1951, 1958; 5th ed. in preparation). It is one of the most useful dictionaries published in the twentieth century. From the technical standpoint it may be mentioned that the author used a sensible system of cross references which eliminates the need for an index; he chose as topics for articles units which are neither too large nor too small. The bibliographical citations provided at the ends of some articles are judiciously selected.

The writing shows a philosophical understanding decidedly above the average for writers of philosophical

dictionaries. Ferrater Mora was equally strong in his knowledge of modern logic and positivism and in the more traditional philosophical trends and developments associated with Continental metaphysics. The comprehensiveness of his scholarship and the soundness of his judgment have combined to create a monumental one-man contribution to the library of dictionaries of philosophy.

**OTHER LATIN AMERICAN WORKS.** In the same year, 1941, two other dictionaries were published in Latin America. One was Martín T. Ruiz Moreno’s *Vocabulario filosófico* (Buenos Aires, Editorial Guillermo Kraft, 1941, 156 pages; 2nd ed., 1946, 302 pages). Among the articles of special interest in it are “Angustia” (anguish), which sets forth the viewpoints of Kierkegaard and Heidegger, and “Cosa” (thing), which distinguishes the philosophical, the (Argentine) juridical, and the economic uses of the term.

The other dictionary was César A. Guardia Mayorga’s *Léxico filosófico* (Arequipa, Peru, 1941, 138 pages). A second edition was published in Arequipa in 1949 under the title *Terminología filosófica*. This work allots more space to Oriental subjects than does Ruiz Moreno’s.

A work of the 1940s described as a dictionary of Argentine thought—Florencio J. Amaya’s *Diccionario político, sociológico y filosófico argentino* (Mendoza, Argentina, Editorial Cuyo, 1946, 520 pages)—is more general than its title indicates. The philosophical articles are mainly subjective reflections (in the manner of Voltaire but more conservative) with occasional references to historic positions. The author’s declared intention to produce sequels 6 and 12 years later (described on the title page of this book as Volumes II and III) was not carried out.

In 1947 appeared the anonymous *Pequeño diccionario de filosofía* (Buenos Aires, 156 pages), issued by Ediciones Centurión for use in conjunction with Emilio Gouiran’s *Historia de la filosofía* (Buenos Aires, 1947), published by the same house. The *Pequeño diccionario* consists of two parts, one on philosophers from Peter Abelard to Xavier Zubiri, with indications of their dates and their principal works, and the other on philosophical terms, from Academia (the Academy) to *univoco* (univocal), with explanations ranging from 1 to 29 lines.

**SPANISH—SPAIN.** In José M. Rubert Candau’s *Diccionario manual de filosofía* (Madrid, Editorial Bibliográfica Española, 1946, 658 pages) the main topics of philosophy are dealt with in extensive articles or groups

of articles, and the less important topics are given merely as entries with references to the main articles where they are treated. Thus, there are articles on being (5 cols.), supreme modes of being (21 cols.), and transcendental properties of being (27 cols.); the entry “Categorías supremas” refers the reader to the articles on supreme modes of being and on predicables and predicaments. This work deserves to be better known for its clear and systematic exposition of complex subject matter, especially on topics where its Catholic orientation is not a factor.

ITALIAN. Alfredo Galluccio’s *Dizionario dei principali vocaboli filosofici* (Cava de’ Tirreni, Italy, Editore Coda, 1942, 23 pages; 3rd ed., Naples, 1952) covers only topics. Most of the eight hundred articles in the third edition are only a few lines long and are intended to identify unfamiliar terms which students may encounter in their philosophical reading.

Another miniature dictionary is Paolo Rotta’s *Dizionario filosofico* (Milan, Carlo Marzorati, 1944, 125 pages; 5th ed., 1953), which likewise covers only topics, including concepts, problems, and movements. Many of the almost five hundred articles in the fifth edition present Kant’s ideas on the subject at hand.

FRENCH. Régis Jolivet, dean of the faculty of philosophy of the Catholic University of Lyon, produced the French contribution of the 1940s, *Vocabulaire de la philosophie* (Lyon, Emmanuel Vitte, 1942, 207 pages; 2nd–4th eds., 1946, 1951, 1957; Spanish translation, Buenos Aires, 1953). The articles are brief (4 lines for “Thomisme” but 53 for “Liberté” and 52 for “Nature”). A 17-page appendix presents a “tableau historique des écoles de philosophie,” showing, in conventional groupings, the dates and (in 1–11 lines) the “écoles et doctrines” of about 250 philosophers from Zoroaster to Wittgenstein.

A book described in its foreword as a “dictionnaire abrégé” is Georges Barbarin’s *L’Ami des heures difficiles; un consolateur et un guide* (Paris, Éditions Niclus, 1946, 173 pages). The author presents conventional advice, constituting a popular philosophy or a popular psychology, on more than 130 problems of life—adversity, anxiety, despair, humiliation, injustice, pain, remorse, scandal, and seduction, among others. A seduced and betrayed woman is advised to look inward and find the Divine Friend in her own soul. The friend (*Ami*) mentioned in the title is not the book but God.

ENGLISH. The *Dictionary of Philosophy* (343 pages), edited by Dagobert Runes, was published at New York by

the Philosophical Library in 1942. The list of 72 contributors included some outstanding American philosophers plus a few noted Europeans. When the work was published, 13 of the contributors—C. A. Baylis, A. C. Benjamin, E. S. Brightman, Rudolf Carnap, Alonzo Church, G. W. Cunningham, C. J. Ducasse, Irwin Edman, Hunter Guthrie, Julius Kraft, Glenn R. Morrow, Joseph Ratner, and J. R. Weinberg—declared their disapproval of it. Their statement, published in various periodicals including the *Philosophical Review* and *Mind*, read in part: “We objected to the publication of the work in its present form, and some of us made vigorous efforts to persuade Mr. Runes to delay publication until it had been very materially revised. These efforts were to no avail.” They added that their own articles had been altered without their consent and that although they were listed as associate or contributing editors, they “feel obliged to make a public disavowal of any editorial responsibility for it.”

Despite the important defects of this work, chiefly imbalance, there are many pithy, useful identifications, descriptions, and discussions in it, especially those by Church on topics in logic. Indeed, the collection of Church’s contributions to the dictionary and their issuance in a separate volume on issues and methods in logic would be a worth-while project.

A new edition of the Runes dictionary has been issued every few years (16th ed., 1960); these are, however, essentially reprints, containing only minor variations from the first edition. At least one edition, or reprint, was issued overseas (Bombay, Jaico Publishing House, 1957).

Runes also edited *Who’s Who in Philosophy*, Vol. I, *Anglo-American Philosophers* (New York, Philosophical Library, 1942, 193 pages), a biographical dictionary of over five hundred living thinkers, covering not only Americans and Britons but also Indians, Europeans who came to the United States or England during Hitler’s regime, and others. A contemplated second volume, for other parts of the world, was not issued. An unusual feature of the work is the listing of numerous periodical articles, as well as the major books, written by the philosophers included. Thus, the entry on Dewey runs to over 650 lines, listing over 50 books and over 250 articles.

In 1946, Father William D. Bruckmann published the third of the four American dictionaries of philosophy of this period, a volume entitled *Keystones & Theories of Philosophy* (New York, Benziger Brothers, 230 pages). This work includes comprehensive explanations—from the standpoint of Catholic philosophy—of concepts from *abstractio* (abstraction), to *voluntas* (will), of theories

from absolutism to voluntarism, and of technical terms from *ab intrinseco*–*ab extrinseco* (from the intrinsic–from the extrinsic) to *ut sic* (as such). It also lists chronologically 121 philosophers with very brief indications of their view-points. The bulk of the work is devoted to concepts, only 19 pages being given to the individual philosophers.

Finally, John Dewey and Arthur F. Bentley, in an article in the *Journal of Philosophy* (Vol. 44, 1947, 421–434), “Concerning a Vocabulary for Inquiry Into Knowledge,” presented what may, by a broad interpretation, be counted as a dictionary of philosophy. It is an array of ninety terms in alphabetical order, from *accurate*, *action*, *activity*, *actor*, *application*, and *aspect* near the beginning to *thing*, *trans* (as a prefix), *transaction*, *true*, *truth*, and *word* near the end. Although the entry for *mental* begins “This word is not used by us” and continues that the word usually “indicates a hypostatization arising from a primitively imperfect view of behavior,” the remainder of the entry sanctions the use of the word for “emphasizing an aspect of existence.” The entry for *real* reads: “Its use is to be completely avoided when not a recognized synonym for genuine as opposed to sham or counterfeit.” The other entries show a similar striving for clarity and rigor.

A British dictionary of philosophy published in the 1940s is *A Rationalist Encyclopaedia: A Book of Reference on Religion, Philosophy, Ethics, and Science* (London, Watts, 1948, 633 pages; 2nd ed., 1950), by Joseph McCabe, a former priest. McCabe debunks Aquinas as bracketing “serfs and animals,” Aristotle as having had almost no influence for several centuries and then a deleterious influence on science, Augustine as writing poor Latin, Avicenna as sensual and dissipated, Bacon as hypocritical, Bergson as using largely inaccurate scientific material, Buddha as unoriginal, and so on. He generally lauds philosophers who were agnostics or deists. Some of the topical articles, while equally tendentious, contain useful criticism.

GERMAN. The Kirchner work of 1886 as revised by Michaëlis in 1903 was the basis of the *Wörterbuch der philosophischen Begriffe*, by Johannes Hoffmeister (Leipzig, Felix Meiner, 1944, 776 pages; 2nd ed., 1955, 687 pages). The 1944 edition shows the influence of Adolf Hitler’s regime. For example, the article “Volk” (folk) in the 1944 edition includes a lyrical exposition of the meaning of membership in a tight ethnic group and cites Hitler’s *Mein Kampf* and Alfred Rosenberg’s *Der Mythus des 20. Jahrhunderts*, but in the 1955 edition that exposition and those citations have vanished. The 1944 article “Rassenbiologie” (racial biology) does not appear in the

later edition. The 1944 article “Demokratie” (democracy) says that pure democracy is impossible to achieve because it falsely assumes the equality of individuals; that statement is omitted in the 1955 edition. The article “Relativitätstheorie” in the 1944 edition refers to “der jüd. Gelehrte Einstein,” but in the 1955 edition it says simply “Einstein”; the articles “Marxismus,” “Spinozismus,” and others show the same difference in the two editions.

In 1945 the Zurich firm of Rudolf Schaltegger published the first of the new German-language dictionaries of the decade, the *Ruscha Fachwörterbuch der Philosophie* (“Ruscha Dictionary of Technical Terms in Philosophy,” 147 pages), in which the entries are, for the most part, a few lines long. The book would be of use to only the most elementary students.

Three years later Erwin Metzke published *Handlexikon der Philosophie* (Heidelberg, F. H. Kerle Verlag, 1948, 457 pages; 2nd ed., 1949). The wealth of topics it covers may be noted, for example, in the *L*’s, where one finds the articles “Leben” (life), with four meanings distinguished, three of them broken down into submeanings; “Lebensanschauung” (outlook on life), two meanings; “Lebensform” (form of life), two meanings; “Lebensgefühl” (feeling toward life), three meanings; “Lebenskraft” (vigor), two meanings, with cross references to “Vitalismus” (vitalism) and “Vitalität” (vitality); and “Lebensphilosophie” (philosophy of life), six meanings. A 138-page appendix consists of 1-line to 34-line identifications or brief accounts of almost two thousand philosophers, many of them living, with Americans well represented.

Walter Brugger, S.J., is the principal author of the *Philosophisches Wörterbuch*, prepared with the collaboration mainly of his colleagues at the Berchmans-Kolleg near Munich (Vienna, Herder Verlag, 1948, 532 pages). This work went into 11 editions published in various years to 1964; it was also translated into Italian (Turin, 1959) and Spanish (4th ed., Barcelona, 1964). Many of the more than two thousand articles contain bibliographical references, mostly to German works. The Catholic viewpoint from which the book was prepared is not conspicuous, and the topics are treated factually, with a minimum of controversial interpretation. An appendix of over one hundred pages (including an index of about two thousand names) presents an outline history of philosophy.

Six fascicles, covering *A* to *J*, of the *Philosophen-Lexikon* were issued in 1936–1937 by various publishers in Berlin, having been prepared under the editorship of Eugen Hauer, Werner Ziegenfuss, and Gertrud Jung. The

completed work was issued in 1949–1950 by Ziegenfuss, with the collaboration of Gertrud Jung, under the title *Philosophen-Lexikon: Handwörterbuch der Philosophie nach Personen* (2 vols., Berlin, Walter de Gruyter). Most of the articles contain biographical data about the individual covered, an indication of his contribution to philosophical thought, the titles (and years of publication) of his principal works or the principal collections of his works, and the titles of selected writings about him. Some articles, such as those on von Hartmann, Friedrich Schiller, and Unamuno, present significant quotations from their writings. For Karl Barth there are, atypically, only 3 lines of text, followed by a 24-line bibliography of his writings and a 12-line list of writings about him.

The two volumes of the Ziegenfuss work are remarkably comprehensive. They are also accurate and relatively cosmopolitan. Germans, it is true, get more space than others—for example, 5 pages for Benno Erdmann, who was Gertrud Jung's teacher, and 6 pages for Fechner, compared with 1 for Democritus and 3 for Socrates. A few Marxists also get disproportionate coverage—4 pages for Lenin and 5 for Marx—and contemporaries likewise are given some preference—for example, 6 pages for Berdyaev, compared with 1 for Bentham. One is surprised to see 5 pages devoted to the racist Houston Stewart Chamberlain. But Americans are given fairly good coverage—1 page for Peirce, 3 for Emerson, 3 for James, 2 for Dewey, and 1 for Royce.

A few of the articles in the Ziegenfuss work (for example, those on Nicolai Hartmann, 17 pages; P. A. Sorokin, 3 pages; and Erich Rothacker, 7 pages) were written by the subjects themselves.

**HUNGARIAN.** Volume I (“Aall” to “Avicebrón”) of Pal Sandor's *Filozofiai Lexikon* (Budapest, Faust Kiadás, 64 pages) appeared in 1941. No further volumes seem to have been published. This is a biographical dictionary of philosophers with some emphasis on nineteenth-century and twentieth-century thinkers—Erich Adickes, four men named Adler, Samuel Alexander, and so on—and with considerable space devoted to selected great figures of the past—Anselm, Antisthenes, Aquinas, Aristotle (32 cols.), and others.

**TURKISH.** The *Felsefe ve Gramer Terimleri* (“Dictionary of Philosophy and Grammar,” Istanbul, Cumhuriyet Basimevi, 1942, 318 pages), prepared by the Türk Dil Kurumu (Turkish Language Society), contains a series of alphabetical three-language lists of equivalent terms (Turkish, Osmanli, French; Osmanli, French, Turkish;

and French, Osmanli, Turkish) and three corresponding lists of grammatical terms. (Osmanli is a Turkish dialect.) The philosophical lists usefully include over one thousand terms in cosmology and metaphysics—*causality*, *demiurge*, and so on; ethics—*altruism*, *deontology*, and so on; logic—*amphibology*, *contraposition*, and so on; and other domains of philosophy, plus terms in psychology—*abulia*, *claustrophobia*, and so on.

## THE NINETEEN-FIFTIES

The flowering begun in the 1940s continued in the 1950s. Where the previous decade saw 22 new dictionaries of philosophy that have come to the writer's attention, 24 were published in the 1950s. Nine languages were represented: English, Gaelic, German, Dutch, French, Italian, Spanish, Portuguese, and Turkish. The great landmark of the 1950s is the monumental four-volume Italian encyclopedia of philosophy written by scholars at Gallarate.

**ENGLISH.** A philosophical dictionary vastly different from most is *The Great Ideas: A Syntopicon of Great Books of the Western World*, compiled under the direction of Mortimer J. Adler (Chicago, Encyclopaedia Britannica, 1952), comprising Volumes II and III of the publisher's 54-volume “Great Books of the Western World.” It covers 102 “great ideas,” including art, being, cause, chance, change, democracy, eternity, form, God, good and evil, idea, knowledge, logic, love, matter, metaphysics, mind, nature, necessity and contingency, one and many, reasoning, sense, sign and symbol, soul, space, time, truth, will, wisdom, and world.

For each idea the work presents an analytical and expository introduction, followed by a list of elements of the idea with a series of references to pertinent passages in the great books for each element. There is also a list of related great ideas and finally a list of additional readings on the subject in classics which are not included in the “Great Books” collection. At the end of the second volume of the *Syntopicon* there are a bibliography consolidating the lists of additional readings, a discussion of “syntopical construction” (which lists, among the ideas originally considered for inclusion but rejected, becoming, belief, deduction, doubt, essence, probability, purpose, reality, self, spirit, substance, value, and many others), and an “inventory” (index) of eighteen hundred terms.

A more self-conscious book could scarcely be imagined. Virtually every portion of the book is preceded by an explanation of why that portion was formed in the way in which it was formed and not otherwise. Critics are

answered before they have a chance to formulate criticisms. The reader is everywhere shown the scaffolding, and his attention is invited to a close inspection of its features.

Nevertheless, the book is highly useful. For the elements of the idea of form, for example, the reader is referred to specific passages in Plato, Aristotle, Lucretius, Augustine, Aquinas, Bacon, Descartes, Locke, Berkeley, Kant, Hegel, William James, and others. The analytical and expository introductions are for the most part general rather than technical, but they go as deeply into a subject as a thoughtful, educated reader may desire. All in all, this unique work was decidedly worth undertaking and was competently executed.

The only other English dictionary of philosophy published in the 1950s was Michael H. Briggs's *Handbook of Philosophy* (New York, Philosophical Library, 1959, 214 pages). It is difficult to see the usefulness of the article "Future," which reads, in its entirety, "Those events that will happen in time to come," or of the opening definition of the article "Change"—namely, "A constant alteration of states of the universe so that specific combinations of events do not persist." Several other articles in this handbook are equally unenlightening.

**Gaelic.** The *Foclóir Fealsaimh* ("Vocabulary of Philosophy"), by Colmán O Huallacháin, O.F.M. (Dublin, An Clóchomhar, 1958, 169 pages), begins with a preface in French by Monsignor Louis de Raeymaeker of the University of Louvain. The book presents brief Gaelic descriptions or explanations of about two thousand Gaelic terms in philosophy and related humanistic disciplines, with the equivalent terms in German, English, French, and Latin. At the end of the book are four reciprocal word lists—German, English, French, and Latin—with the Gaelic equivalent of each word. The English word list includes not only such specifically philosophical terms as *Absolute*, *actual*, *aesthetics*, *agnostic*, and *aseity* but also such terms as *abnormal*, *acoustics*, *agoraphobia*, *anthropology*, and *atavism*.

**GERMAN.** In Germany and Switzerland five works were produced or begun, not counting a nonalphabetical so-called encyclopedia published in 1959. First, Carl Decurtins produced the *Kleines Philosophen-Lexikon* (Affoltern am Albis, Switzerland, Aehren Verlag, 1952, 312 pages), containing biographical sketches of three hundred individuals, among whom are not only the main figures in the history of philosophy strictly conceived but also Helena P. Blavatsky, Karl von Clausewitz, Lenin,

Mussolini, the racists Chamberlain, Gobineau, and Alfred Rosenberg, as well as Jesus Christ, Dostoyevsky, Emerson, and Omar Khayyám. Chamberlain gets more space than Jesus Christ.

In 1954, Franz Austeda wrote the *Kleines Wörterbuch der Philosophie* (Frankfurt, Humboldt-Verlag, 188 pages; 2nd ed., entitled *Wörterbuch der Philosophie*, Berlin and Munich, Verlag Lebendiges Wissen, 1962, 270 pages). This work contains over eighteen hundred articles, including eight hundred which are biographical. It is a highly sensible and sound short reference work, with a reasonable proportion of space allotted to each of the standard topics in philosophy and the principal philosophers of the past and the present, as well as topics in less standard fields, such as Oriental philosophy, disciplines close to philosophy, and even old saws like Terence's "Homo sum; humani nihil a me alienum puto" ("A man am I; nothing human do I consider alien to me").

On behalf of the Kommission für Philosophie der Akademie der Wissenschaften und der Literatur zu Mainz, Erich Rothacker undertook a series of volumes under the general title *Archiv für Begriffsgeschichte; Bausteine zu einem historischen Wörterbuch der Philosophie* ("Archive for History of Concepts; Building Stones for a Historical Dictionary of Philosophy," Bonn, H. Bouvier, 1955–). Among the volumes which have appeared are Volume II (Part 2), *Kosmos* (1958, 168 pages), by Walther Kranz; Volume III, *Gewohnheit* ("Custom," 1958, 606 pages), by Gerhard Funke; Volume IV (1959, 239 pages), containing discussions by eight writers regarding various concepts or suggested texts of articles for the *Wörterbuch*; Volume V (1960, 718 pages), containing, under the headings "Absolut," "Abstrakt, Abstraktion," and "Aktivität, aktiv-passiv," the *Bibliographie deutscher Hochschulschriften von 1900–1955*, by Hans Flasche and Utta Wawrzinek; Volume VII (1962, 325 pages), containing discussions by a number of writers on such concepts as the Kantian *Analytik* and *Dialektik*; and Volume VIII (1963, 398 pages), by Karl Otto Apel, on the idea of language in the humanistic tradition from Dante to Vico. This is an ambitious and useful undertaking. Although it may not eventuate in an actual dictionary of philosophy, future writers of such dictionaries should feel obliged to utilize its findings.

In 1958, Max Müller and Alois Halder produced the paperback *Herders kleines philosophisches Wörterbuch* (Freiburg, Verlag Herder, 204 pages; 7th ed., 1965), with a bibliographical appendix citing various histories of philosophy and journals of philosophy and nine earlier dictionaries of philosophy. Portraits of Aristotle, Plato,

Augustine, Aquinas, Descartes, Leibniz, Kant, Hegel, Husserl, Bergson, Heidegger, and Jaspers appear on the back cover. The articles on medieval, modern, and contemporary thinkers are especially useful; Nicholas of Cusa is given 76 lines, Unamuno 34 lines, and Buber 28 lines.

The last of the German-language contributions of the decade is Volume II of *Das Fischer Lexikon, Enzyklopädie des Wissens*, a compilation entitled *Philosophie*, edited by Alwin Diemar and Ivo Frenzel (Frankfurt, Fischer Bucherei, 1958, 376 pages). This paperback book was reprinted in 1959 and 1960, and an English version translated by Salvatore Attanasio and prepared under the direction of James Gutmann was published as *Philosophy—A to Z* (New York, Grosset and Dunlap, 1963) in hardback and paperback editions. The collaborators consisted of 15 German authorities plus Paul K. Feyerabend of the United States. The work presents a small number of comprehensive articles—26—on such broad topics as anthropology, aesthetics, and Chinese and Japanese philosophy rather than a multitude of short ones. Historical information is given where necessary, but the emphasis is on concepts and problems. The articles show originality and penetration.

A nonalphabetical so-called encyclopedia was *Die Philosophie im XX. Jahrhundert: Eine Enzyklopädische Darstellung ihrer Geschichte, Disziplinen und Aufgaben*, edited by Frederick H. Heinemann (“Philosophy in the Twentieth Century; An Encyclopedic Presentation of Its History, Disciplines and Formulations,” Stuttgart, Ernst Klett Verlag, 1959, 600 pages; 2nd edition, 1963). Heinemann begins with a discussion of the term *encyclopedia* which de-emphasizes the alphabetical order of topics, and he continues with chapters, written by himself or others, on Oriental, ancient, medieval, and modern philosophy; on movements in twentieth-century philosophy; and on epistemology, logic, philosophy of mathematics, metaphysics, philosophy of nature, and other philosophical disciplines. The treatment of the topics is mainly interpretive and constructive, rather than purely expository, especially in the chapters on the philosophical disciplines.

DUTCH. The Dutch work of this decade was edited by Johan Grooten and G. Jo Steenbergen. It is *Filosofisch Lexicon* (Antwerp, Standaard-Boekhandel, 1958, 331 pages), written by 32 collaborators, of whom the best known are perhaps E. W. Beth and Louis de Raeymaeker. The book begins with an explanation of how the topics are broken down, what type of spelling is used, how to find medieval

names, and how the cross references are shown. The articles themselves are scholarly and well balanced.

FRENCH. Armand Cuvillier’s *Nouveau Vocabulaire philosophique* (Paris, Librairie Armand Colin, 1956, 203 pages; 3rd ed., 1958) is a worthy successor to his *Petit Vocabulaire*, which went through 13 editions from 1925 to 1953. The new work includes a number of terms borrowed from other languages, such as *Erlebnis* (experience), *Dasein* (existence), and *pattern*. A number of articles, à la Goblott and Baldwin, set forth more than one meaning and then discourage the use of the term in one of the senses. For example, under “Empirique” (Empirical), the third meaning is “fondé sur l’expérience en général . . .” (“founded on experience in general”), but the author comments, “impropre au sens 3; dire expérientiel” (“improper in sense 3; say experiential”). A Spanish translation, entitled *Diccionario de filosofía*, was published at Buenos Aires in 1961.

J. Claude Piguet’s *Le Vocabulaire intellectuel* (Paris, Centre de Documentation Universitaire et S.E.D.E.S. Réunis, 1957, 112 pages; reprinted, 1960, backstrip title, *Vocabulaire de philosophie*) disclaims being a dictionary in the sense of a list of pat definitions. It aims, instead, to stimulate students’ thinking, partly by provocative opposition. For many terms an antonym is given, or two or more “opposites” are cited; for example, the article on absolute contrasts absolute with relative, and the article on duty contrasts duty not only with moral indifference but also with right. The book is probably of use mainly to students specializing in subjects other than philosophy.

ITALIAN. Of the seven Italian works of the period, three were published in 1951. Eustachio P. Lamanna and Francesco Adorno produced the *Dizionario di termini filosofici* (Florence, Felice le Monnier, 1951, 104 pages; 9th ed., 1960), in which the articles are brief, ranging from 1 line for “Verbo, (il),” ending with a cross reference to “Logos,” to 47 lines for “Intelletto.”

Giovanni Semprini compiled the *Nuovo dizionario di coltura filosofica e scientifica* (Turin, Società Editrice Internazionale, 1951, 470 pages), which chiefly has articles on philosophical subjects, with errors in various articles on British and American philosophy, but also covers topics in the empirical sciences; for example, there are articles on anesthesia, clan, geology, and Mesmer.

Mario A. Boccalaro’s *Dizionario filosofico* (Bologna, Licinio Cappelli, 1951, 91 pages) covers topics only. Its articles, generally a few lines long, are carefully and accurately phrased.

In 1952, Vincenzo Miano and 12 Italian collaborators produced the *Dizionario filosofico* (Turin, Società Editrice Internazionale, 1952, 693 pages), written with a Thomistic approach. Only topics are treated, but the appended “Schema della storia della filosofia” shows the name of the article in which each important philosopher is discussed; over 150 thinkers are included in the list.

Umberto Cantoro’s *Vocabulario filosofico* (Bologna, Casa Editrice N. U. Gallo, 1955, 283 pages) began with an introduction on the philosophical disciplines and continued with an alphabetically arranged vocabulary which purportedly emphasized terms in common usage that have a special meaning in philosophy—for example, *absolute, concrete, and criticism*—but actually devoted most of its pages to the usual philosophical terms—*agnosticism, ambiguity, anguish, free will*, and the like. Psychology was taken by the author to be a philosophical discipline.

The *Dizionario di filosofia*, edited by Andrea Biraghi with contributions by 29 Italian collaborators (Milan, Edizioni di Comunità, 1957, 787 pages), is not strictly a dictionary since the materials in its two parts (on the history and problems of philosophy, respectively) are arranged in a nonalphabetical order, but it contains, as appendixes, three features which put it in the broad stream of dictionaries of philosophy: a dictionary of Greek terms, a dictionary of German terms, and a comprehensive alphabetical index.

**The Gallarate landmark.** In 1957 a group of Italian scholars in the Centro di Studi Filosofici di Gallarate, together with a few foreign collaborators, produced the *Enciclopedia filosofica* (4 vols., Venice and Rome, Istituto per la Collaborazione Culturale for the Ministry of Public Education and the Giorgio Cini and the Enrico Lossa foundations), which for the first time in half a century outshone the Baldwin work in comprehensiveness and up-to-date scholarship. The directing committee aimed to produce not “un mero *dizionario filosofico*” but a true encyclopedia of philosophy which would go beyond the dry explanation of the usages of terms and would present deeper analyses of the elements and implications both of individual problems and ideas and of more general points of view.

Each volume contains a number of full-page illustrations (mostly portraits of philosophers), and many of the articles contain bibliographical references at the end. This colossal work, totaling some 6 million words, is a basic landmark in the field of philosophical reference works, far outstripping its nearest competitors in magnitude. Physically, also, it is outstanding; the print and the 233

illustrations are not only tasteful but in some ways sumptuous. The work contains about twelve thousand articles, of which seven thousand are historical (on individual philosophers, movements, and the like) and five thousand are analytical (on concepts, problems, and the like). There are, for example, over 130 articles on past and present Russian philosophy, 82 on individual philosophical journals, over 80 on twentieth-century American philosophy, 74 on Indian philosophy, and 55 on subtopics of deduction and induction.

The contributors are mainly professors in Italian universities. Their contributions are factual, reliable, and broad in scope. The article on Aristotle (27 cols., with a full-page glossy reproduction of Raphael’s head of Aristotle in the “School of Athens”) is followed by articles on Pseudo-Aristotle (1 col.), Aristotle in Latin (2 cols.), and Aristotelianism (6 cols.), all of them rich in content and based on vast learning. There are worthwhile articles on neoclassicism, neocriticism, neo-empiricism, Neo-Guelphism, Neo-Hegelianism, Neo-Lutheranism, Neo-Malthusianism, Neo-Pythagoreanism, Neoplatonism, neopositivism (16 cols.), neorealism, Neo-Scholasticism, and neo-humanism.

There is some bias toward religious and idealistic positions in philosophy. Moreover, more Italian twentieth-century philosophers are treated in separate articles than either French or British. G. E. Moore gets only a column, which is less than the space assigned to Bernardo Varisco or Michele F. Sciacca, and a number of eminent American philosophers—Brand Blanshard, C. I. Lewis, Arthur O. Lovejoy, and R. W. Sellars—get less than a column.

The encyclopedia also goes far afield in including material on economics, pedagogy (with articles on *scoutismo*—the boy scouts—and on coeducation), and literary art (with articles on Joseph Addison, Sir Philip Sidney, and Jonathan Swift). Moreover, there are many minute articles which could profitably have been combined into more meaningful longer articles. However, weighing the encyclopedia’s many merits against its few shortcomings, one must conclude that the work represents a highly laudable achievement, destined to be useful over a prolonged period.

**SPANISH.** Of the two Spanish-language dictionaries of philosophy produced in the 1950s, the first was published in Argentina and the second in Spain. Julio Rey Pastor and Ismael Quiles directed five editors and ten collaborators in the production of the *Diccionario filosófico* (Buenos Aires, Espasa-Calpe Argentina, 1952, 1,114

pages), in which the material is arranged according to a systematic outline of topics in 18 chapters instead of in alphabetical order. The 18 chapters are headed “Introducción a la historia de la filosofía”; “Lógica”; “Teoría del conocimiento”; “Epistemología y teoría de la ciencia”; “Lógica, Lógica Simbólica o Lógica Matemática”; “Ontología,” with 19 subheads, including “Ser,” “Ente,” “Existencia,” and “Esencia”; “Metafísica general” (nature and structure of being and individuality); “Metafísica especial” (matter, life, mind, and spirit); “Filosofía de los valores”; “Filosofía de la religión”; “Ética”; “Estética”; “Filosofía del arte y poética”; “Psicología”; “Antropología filosófica”; “Concepción del mundo”; “Sociología”; and “Filosofía del derecho.” At the end are the 45-page “Vocabulario filosófico,” alphabetically arranged, and the 17-page “Equivalencias idiomáticas” (German–Spanish, English–Spanish, French–Spanish, and Italian–Spanish).

Juan Zaragüeta Bengoechea, director of the Luis Vives Institute of Philosophy in Madrid, is the author of the *Vocabulario filosófico* (Madrid, Espasa–Calpe, 1955, 571 pages), in which almost every article begins with the German, French, English, and Italian equivalents of the term being discussed. The terms are defined and explained from a scholastic point of view, generally without historical references. The articles are weak on contemporary philosophy, the one on *lógica*, for example, merely setting forth in 20 lines what symbolic logic is about.

PORTUGUESE. Three Portuguese-language dictionaries of philosophy were published or were begun and dropped in the decade of the 1950s. Volume I (A–D) of the *Dicionário de filosofia*, by Orris Soares, was published at Rio de Janeiro in 1952 by the Instituto Nacional do Livro of the Ministério da Educação e Saúde. No other volumes have appeared. At the beginning of many of the articles are the equivalents of the term being covered in one or more of the following languages—Greek, Latin, French, Italian, English, and German. The article on Aristotle runs to more than 25 columns, with subtopics arranged alphabetically (for instance, “Aristóteles e a alma” and “Aristóteles e a astronomia”). To take the *D*’s for an example, there are useful articles on Dalton, Dante, Darwin, Descartes (15 cols.), Diogenes (four persons so named), Driesch, Duhem, Dühring, Duns Scotus, Durkheim, and others but none on Dewey.

Published at São Paulo were the first fascicle, covering the letter A, of the *Dicionário de filosofia*, by Luís Washington Vita, reprinted from the *Revista do Arquivo Municipal* (1950, 48 pages), and the *Vocabulário filosófico*,

by Carlos Lopes de Mattos (Edições Leia, 1957, 387 pages). Both cover only topics but include among the topics the philosophy of some individuals, in the articles on Aristotelianism, Averroism, and so forth. Vita modestly ascribes any errors which may appear in his work (of which no more has been published) to the fact that his is the first dictionary of philosophy in the Portuguese language; thus, he does not count the Voltairian 1938 work of Renato Kehl as a true dictionary of philosophy. Vita includes and Mattos excludes fields akin to philosophy. For many of his terms Mattos gives the equivalents in Esperanto, French, German, Greek, Italian, Latin, and Spanish and enumerates in the Bibliography 17 earlier dictionaries of philosophy.

TURKISH. Of Cemil Sena’s *Büyük Filozoflar Ansiklopedisi* (Istanbul, Negioğlu Yayınevi, 1957–), only one volume, covering A to D, appeared. This work is a dictionary of philosophers which ranges from technical philosophers like Anaxagoras (12 cols.) to popular philosophers like Angelus Silesius and Will Durant, natural scientists like Ampère, and sociologists like Durkheim. The articles—some of them illustrated—are well balanced between biography and doctrine. Appended to Volume I are a glossary of Turkish philosophical terms with their French equivalents and an index of persons mentioned, showing, for example, 130 pages of the 642 pages in Volume I as containing references to Plato.

#### URMSON, ABBAGNANO, AND AFTER

ENGLISH. *The Concise Encyclopedia of Western Philosophy and Philosophers* (New York, Hawthorn Books, 1960, 431 pages), edited by James O. Urmson, contains over 150 articles on individual philosophers and about 65 articles on philosophical topics and schools. It also includes over one hundred full-page illustrations, mostly portraits of philosophers, of which eight are in color. It closes with an 11-page bibliography. Many outstanding contemporary British and American philosophers are among the 48 contributors. In the Preface the editor set forth his principles. Where it was difficult to summarize the views of a philosopher briefly, he was to be given enough space to make his position intelligible (six thousand words for Kant). More generally, it was deemed better to have fewer and longer articles than many short ones of doubtful utility. Philosophy was interpreted narrowly, excluding such popular topics as the philosophy of life. Eastern thinkers were excluded because, according to Urmson, they are philosophers in the popular, and not in the technical, sense. In recapitulation, however, he gives as the reason

for their omission the fact that “their achievement is not closely related to that of western philosophers.” Exception could be taken to the former of these justifications for the omission of Oriental philosophy, but the addition of the latter makes it hard to object.

Although the articles in the Urmson work are not signed, the authorship of some has become known—for instance, the article on epistemology is by Gilbert Ryle, on ethics by R. M. Hare, on Heidegger by Walter Kaufmann, and on logic by D. J. O’Connor. The articles on epistemology and ethics display a freshness seldom found in encyclopedias; they are readable, free of academicism, informative, and challenging. Many other articles are also both brilliant and original. However, the article on Heidegger not only, with some justification, makes much of his welcome of Hitlerism but also, with less warrant, dismisses the fabric of his thought as comparable to the nonexistent clothes of Hans Christian Andersen’s fairy-tale emperor.

Urmson’s choice of topics is questionable. Although topics outside technical philosophy were to be excluded, Karl Marx is covered in an article of fifty-three hundred words, of which the first sentence is “Marx was not primarily a philosopher.” Many of the contributors are themselves the subjects of articles, but one does not find any article on Gödel, Tarski, or, among thinkers of the past, Bayle or Voltaire. Among the topical articles one does not find any on belief, causation, error, existence, identity, necessity, philosophy of history, negation, self, or vitalism.

Another English work of the 1960s was Henry Thomas’ *Biographical Encyclopedia* (New York, Doubleday, 1965, 286 pages). This is a work for the general reader, not for the specialist in philosophy. For example, the more than four hundred thinkers covered include a generous selection of poets (Horace, Omar, Byron, Shakespeare), social commentators (Benjamin Franklin, Oliver Wendell Holmes, Jr.), and theosophists (Annie Besant, Helena P. Blavatsky) but not Ayer, Carnap, Jaspers, Lovejoy, Meinong, Moore, Reichenbach, Ryle, or Schlick. The expositions and evaluations are likewise on a popular level.

Another popular biographical work is Thomas Kierman’s *Who’s Who in the History of Philosophy* (New York, Philosophical Library, 1965, 185 pages). The expositions of the doctrines of some of the philosophers covered are naive. For example, Aquinas is said to have redirected Aristotelianism “towards truth and away from doubt,” and Mill’s inductive methods are said to be based on his “advocacy of the law of the uniformity of nature.”

RUSSIAN. The year 1960 saw the first volume (A to “Diderot”) of a new Russian dictionary of philosophy, the *Filosofskaya Entsiklopediya*, edited by F. V. Konstantinov and others (Moscow, “Soviet Encyclopedia” Publishing House). The second volume (covering “Disjunction” to “The Comic”) of the four projected volumes was published in 1962. Volume I includes four articles—“Democracy,” by L. Denisova; “Dialectics,” by P. Kopnin; “Humanism,” by L. Denisova; and “Dialectical Materialism,” by A. G. Spirkin—which are available in English, the first three having been translated by William Mandel in the quarterly *Soviet Studies in Philosophy* (Vol. I, Spring 1963) and the fourth having been translated for *Russian Philosophy: A Book of Readings*, edited by James M. Edie and others (3 vols., Chicago, Quadrangle Books, 1965).

The article on democracy attempts to show that bourgeois democracy is dictatorship of the capitalist class, with illusory freedoms, whereas socialist democracy is dictatorship of the proletarian class, with genuine freedom of speech, the press, assembly, and demonstration. The truth is also labeled elsewhere in the encyclopedia, as in the article on absolute idealism, which is described as based on “the false assumption of the existence of an absolute idea.” On the positive side may be mentioned the numerous good articles on logic, the broad coverage of both topics and persons (except that Bukharin and some other heretic Marxists are omitted), and the many halftone cuts. Such sociological topics as marriage are included.

Karl G. Ballestrem’s *Russian Philosophical Terminology* (Dordrecht, D. Reidel, 1964, 116 pages) contains a glossary of about one thousand philosophical terms in Russian, with English, French, and German equivalents. Emphasis is placed on terms having a special use in Soviet philosophy.

ITALIAN. Nicola Abbagnano published the *Dizionario di Filosofia* (Turin, Unione Tipografica, 1961, 905 pages; Spanish translation, Mexico City and Buenos Aires, 1963) with the collaboration of Giulio Preti on topics in the field of logic. Abbagnano is a distinguished figure in contemporary philosophy and philosophical scholarship. His dictionary, covering only topics, shows vast erudition and commendable acumen in appraising tendencies and movements in philosophy. It gives, for example, a fair and thoroughly knowledgeable treatment to contemporary Anglo-American and positivistic philosophy. In the admiring words of Urmson, who noted a few inaccuracies in the Abbagnano work in a review in *Mind* (Vol. 71,

1962, 425), Abbagnano “refers as readily to the latest numbers of American journals as to the works of Plato.”

Topics for which the standard name is in a language other than Italian—for example, *Erlebnis* (living experience), *Gegenstandstheorie* (object theory), and *Weltanschauung* (world outlook)—are treated by Abbagnano or cross-referenced in their regular alphabetical order. For many of the Italian words he also gives equivalents in Greek, Latin, English, French, and German. This work is one of the outstanding dictionaries of philosophy of our time. An English translation is scheduled to be published by the University of Chicago Press.

DUTCH. K. Kuypers is the editor of a Dutch work, *Elseviers Kleine Filosofische en Psychologische Encyclopedie* (Amsterdam, Elsevier, 272 pages), that appeared in 1960. Short but useful articles are presented on obscure as well as prominent thinkers and topics. Some topics—for instance, the Gifford lectures—are not often found in dictionaries of philosophy. Appended are a 15-page historical outline showing the schools or other groupings of over five hundred philosophers; a bibliography; and a selected list of philosophical journals and organizations.

DANISH. A work of this period is Henrik Thomsen’s *Hvem Taenkte Hvad; Filosofiens Hvem-Hvad-Hvor* (Copenhagen, Politikens Forlag, 1961, 390 pages), with an introductory note by Justus Hartnack. The book contains a thumbnail history of philosophy from the pre-Socratics to Husserl, Wittgenstein, and Russell; numerous illustrations and two maps; a who’s who of philosophy with illustrations of Augustine reading and Heidegger hiking; a dictionary of technical terms; and a bibliography.

GERMAN. Joseph Münzhuber wrote the *Kleines Wörterbuch der Philosophie, zum Gebrauch an Schulen* (Düsseldorf, Pädagogischer Verlag Schwann, 1962, 45 pages). This work contains about 135 articles ranging from the 2-line “Transintelligibel” to the 48-line “Existenzphilosophie.” Among the more unusual articles are “In-der-Welt-Sein” (being-in-the-world) and “Unschärferelation” (Heisenberg’s uncertainty relation).

Anton Neuhäusler wrote *Grundbegriffe der philosophischen Sprache: Begriffe viersprachig* (Munich, Ehrenwirth Verlag, 1963, 276 pages). The length of the article on any topic covered by Neuhäusler is based not on the topic’s importance but on its “Klärungs-bedürftigkeit und schwierigkeit” (“need and difficulty of explanation”). Each entry includes the English, French, and Italian equivalent of the term; an indication of the origin of the term (if this is relevant); a sophisticated but clear discus-

sion of the use of the term; and a brief bibliography. An appendix presents a decimal classification of philosophical concepts—for example, 1 for philosophy itself; 11 for metaphysics; 11.1 for ontology; 111.11 for existence, *Dasein*, and reality; 19 for history of philosophy; 2 for theology.

In 1964 there appeared another *Philosophisches Wörterbuch* (Leipzig, VEB Bibliographisches Institut, 650 pages; reprinted 1965), edited by Georg Klaus and Manfred Buhr. It was a joint project of the Institute for Philosophy of the German Academy of Sciences in Berlin and the professorial chair for philosophy of the Institute for Economics of the Central Committee of the German Socialist Unity party. The Marxist–Leninist slant is sometimes blatant, as in the article “Demokratie,” where bourgeois democracy is characterized as a form of government in which everything is subordinated to profit. Among the examples presented to illustrate the use of “is” in the article “Kopula” are (in translation): “Marx is the author of *Capital*” and “Marx is one of the greatest thinkers of mankind.”

FRENCH. In 1962, Paul Foulquié, with the collaboration of Raymond Saint-Jean, produced the *Dictionnaire de la langue philosophique* (Paris, Presses Universitaires de France, 1962, 776 pages), which, as the Preface states, is heavily indebted to Lalande’s work. Since Foulquié’s is a dictionary of concepts, there are no articles on schools or viewpoints, such as Aristotelianism and Eleaticism. Although the basic arrangement is alphabetical, related concepts are in some cases grouped around a generic term—for example, *étant*, *entité*, *essence*, *exister*, and *existentialisme* around *être*. Many of the articles quote texts to support the definitions presented.

The anonymous *Dictionnaire des philosophes* (Paris, Collection Seghers, 1962, 383 pages; binder’s title, *Dictionnaire illustré des philosophes*) contains biographical statements regarding approximately six hundred standard Western philosophers and philosophic thinkers, such as Ruth Benedict, Karen Horney, and Kurt Lewin, in allied fields. There follow references to about thirty Oriental thinkers and a vocabulary of some five hundred terms, most of them defined in a few lines. Scattered in the book are 64 portraits.

According to Didier Julia, the purpose of his *Dictionnaire de la philosophie* (Paris, Librairie Larousse, 1964, 320 pages) is the disclosure of eternal truths as being applicable to daily life. In keeping with that purpose, the illustrations are popular: an abstract painting, a scene in Paris after the explosion of a plastic bomb, a child peer-

ing through curtains (illustrating “Attention”), a Buddhist immolating himself at Saigon, and others. Marx gets more space than anyone else, and Trotsky gets more than Aristotle. Maimonides and Peirce are among the omissions. It is doubtful that the announced purpose of the work was achieved.

**SPANISH.** Paul Henri Boyer’s *Diccionario breve de filosofía* (Buenos Aires, Club de Lectores, 1962, 187 pages) has some material of questionable validity. There is only one article on Oriental philosophy, on nirvana, which is wrongly defined as negation of the will to live. The spelling of non-Spanish names in the work is not reliable.

**ORIENTAL LANGUAGES.** Three Asian countries—nationalist China, Japan, and, most notably, Korea—have made significant contributions in the 1960s.

**Chinese.** The Chinese dictionary is *Chê Hsüeh Ta Tz’ü Tien* (“Comprehensive Dictionary of Philosophy,” Taipei, Ch’i Ming Shu Chû, 1960, 464 pages), containing about one thousand five hundred articles, each printed with the equivalent of the term in at least one Western language. The first entry is on monism, and the last is on “ideal-realism.” The rest cover the standard philosophical and psychological topics and personalities plus such unusual topics as dilemmatic proposition and “sum-mists” (authors of works entitled *Summa*). Two indexes in Western languages (and roman type) list topics and personal names.

**Japanese.** Naomichi Takama’s *Tetsugaku Yogo No Kiso Chishiki* (“Philosophical Terminology,” Tokyo, Seisun Shuppan Sha, 242 pages), a Japanese work, was published in 1961. The title of each article is given with English and German equivalents. There are articles on patriotism, happiness, justice, human nature, freedom of the will, suicide, space, time, dialectical materialism, scholastic philosophy, and many other popular and technical topics. Some of the articles show an undue influence of Marxism.

Another Japanese work was edited by Yasumasa Oshima—*Shin Rinri Jiten* (“Dictionary of Ethics,” Tokyo, Sobun Sha, 1961, 472 pages). The scope of this work is broader than its title indicates. Some of the articles are on ethical subjects, including agape, evil, ataraxia, will, Epicureanism, and human rights, but others transcend the domain of ethics, including those on atman, Aristotle, either-or, a priori, causality, Eleatics, entelechy, and *Dasein*. In general, this is the more scholarly of the Japanese works.

**Korean.** One hundred and four Korean scholars worked on the *Dictionary of Philosophy: Ch’örhak Tæ-sajôn* (Seoul, Hagwönsa, 1963, 1,376 pages). A monumental job of scholarship and printing, this work contains, for many entries, the Korean expression followed by equivalents in other pertinent languages, the article in Korean with romanized transliterations where needed, and a bibliography. The field covered includes philosophy, psychology, and sociology, and the articles are of exceptionally high quality. Among the added features are about four hundred pictures of philosophers; other illustrations, including Wittgenstein’s duck-rabbit and four full-page maps; a uniquely rich year-by-year chronology of philosophy, showing, for example, 1905 as the year of the inauguration or publication of specific works by 22 philosophers; and an index of about five thousand terms in Western languages.

A “NONENCYCLOPEDIA.” From time to time we have paused to poke a curious finger into works which are called dictionaries or encyclopedias of philosophy but which are not arranged alphabetically. The latest of these is Ramón Conde Obregón’s *Enciclopedia de la filosofía* (Barcelona, De Gassó Hernanos, 1961, 363 pages). The first four parts of the book are on philosophy in general, prephilosophy, Western philosophy, and Oriental philosophy; the fifth is headed “Conclusion.” Conde’s work will probably not be the last, in the march of philosophical exposition, to exploit the perennial intellectual magnetism of the term *dictionary or encyclopedia*.

## DICTIONARIES OF SPECIAL PHILOSOPHICAL TOPICS

There are dictionaries which cover one or more philosophical disciplines, periods, and schools, as well as individual philosophers. The listings presented here are merely illustrative; complete coverage is not attempted.

**DISCIPLINES.** Some dictionaries cover a single discipline, such as aesthetics, ethics, logic, or theology; others cover a combination, such as ethics and theology or logic and philosophy of science.

**Aesthetics.** Among the dictionaries of aesthetics is Ignaz Jeittele’s *Aesthetisches Lexikon: Ein alphabetisches Handbuch zur Theorie der Philosophie des Schönen und der Schönen Künste* (“Dictionary of Aesthetics: An Alphabetical Handbook of the Theory of the Philosophy of Beauty and the Fine Arts,” 2 vols., Vienna, Carl Gerold, 1835–1837). This is a capably written reference work, covering numerous topics in architecture, the dance,

drama, drawing, music, painting, poetry, rhetoric, sculpture, and other arts, as well as topics applicable to natural beauty or to more than one of the arts. An 84-page appendix reviews the classic literature on aesthetics.

In 1946 Roger Caillois produced the *Vocabulaire esthétique* (Paris, Éditions de la Revue Fontaine, 141 pages). In addition to whole chapters on nature and art, this work contains articles on art for art's sake, authority, image, order, originality, sincerity, and other topics in nonalphabetical order. Each article is a discursive essay rather than a systematic treatment.

A curiosity among dictionaries of aesthetics is Paolo Mantegazza's *Dizionario delle cose belle* (Milan, Fratelli Treves, 1891, 346 pages; German translation, 2 vols., Jena, 1891–1892). After an introduction on elements of beauty (color, symmetry, and so on) constituting about a third of the book, the author presents over one hundred articles in alphabetical order on “beautiful things”—alabaster, eagle, gazelle, jasmine, lark, lion, moon, snow, stars—with rhapsodic comments on each.

*Ethics.* Among the dictionaries of ethics, mention may be made of two in particular. The first is *Dictionnaire des passions, des vertus, et des vices* (2 vols., Paris, Chez Vincent, 1769), published anonymously by Antonio F. Sticotti and Antoine Sabbatier. Discussing such topics as abasement, abominable, admiration, and adultery near the beginning of the alphabet and urbanity, utility, vivacity, and volition near the end of the alphabet, the authors epitomized the comments of famous writers—Aristotle, Bacon, Confucius, Diderot, Locke, Pascal, Voltaire, and others—on these topics.

In 1956 Vergilius Ferm's *Encyclopedia of Morals* (New York, Philosophical Library, 682 pages) appeared. The contributors to this scholarly and well-balanced volume include Lewis White Beck on Nicolai Hartmann; William K. Frankena on Ross, Sidgwick, and moral philosophy in America; Lucius Garvin on major ethical viewpoints; Walter Kaufmann on Freud, Goethe, Hammurabi, and Nietzsche; George L. Kline on current Soviet morality; Clyde Kluckhohn on Navaho morals; Swami Nikhilananda on Hindu ethics, and Frederick Sontag on Socrates, Plato, and Aristotle. Most of the articles are of substantial length and rich in content; some are a bit pedestrian.

*Logic.* In logic there is a Spanish *Vocabulario de Lógica*, by Baldomero Diez y Lozano (Murcia, Spain, Imp. Lourdes, 1925, 198 pages; 2nd ed., 1928), which contains about five hundred articles covering not only topics in traditional logic, such as absurd, affirmation, a fortiori,

but also topics in related philosophical fields, such as change, causality, phenomena, tree of Porphyry. Given the brevity of the articles, the treatment is necessarily superficial, but the identifications of the more obscure terms are useful.

*Theology.* Dictionaries of theology are fairly numerous. Among them, some warrant special mention.

From 1908 to 1914 was published a work edited by Samuel M. Jackson and others, *The New Schaff–Herzog Encyclopedia of Religious Knowledge* (13 vols., New York and London, Funk and Wagnalls; reprinted, Grand Rapids, Mich., Baker Book House, 1949–1950). This work was based on the nineteenth-century works in this field edited by Philip Schaff and Johann J. Herzog. The Preface lists numerous preceding Catholic, Protestant, Anglican, Jewish, Muslim, and other theological dictionaries. More of the articles are on individuals—prophets, religious leaders, and theologians—than on topics. Most articles of philosophical interest, such as those on dualism, duty, ethics, freedom of the will, gnosticism, philosophy of religion, positivism, probabilism, Stoicism, utilitarianism, and others, as well as on individual philosophers, were written by specialists in religion; a few, however, such as those by Troeltsch on British moralists, deism, the Enlightenment, idealism, and so on, are philosophically penetrating. The 13-volume work was condensed and brought up to date in the *Twentieth Century Encyclopedia of Religious Knowledge*, edited by Lefferts A. Loetcher (2 vols., Grand Rapids, Mich., Baker Book House, 1955).

Joseph Bricout edited the *Dictionnaire pratique des connaissances religieuses* (7 vols., Paris, Letouzey et Ané, 1925–1933). In this Catholic-sponsored work the articles of philosophic interest—prepared mostly by professors at the Séminaire des Missions located at Vals in southern France—include those on aesthetic sense, agnosticism, atheism, belief, categories, criteria of truth, deism, doubt, efficient cause, empiricism, and others, plus about 230 articles on philosophers, theologians, and schools of thought. The articles on non-Catholic viewpoints are factual and fair.

Joseph Höfer and Karl Rahner edited the *Lexikon für Theologie und Kirche* (10 vols., Freiburg, Verlag Herder, 1957–1965), a revision of the work of the same title, edited by Michael Buchberger (10 vols., 1930–1938), which was itself referred to as the second edition of Buchberger's two-volume *Kirchliches Handlexikon* (Munich, Allgemeines Verlags-Gesellschaft, 1907–1912).

The work on the philosophical articles was coordinated by Bernhard Welte of Freiburg. The Catholic view-

point is supported throughout, but the presentation of other viewpoints is informative.

The dictionary edited by Everett F. Harrison, *Baker's Dictionary of Theology* (Grand Rapids, Mich., Baker Book House, 1960, 566 pages), includes articles on movements of theological thought—for example, Calvinism, Lutheranism, and Thomism—but none on individual thinkers as such. Only those philosophical topics which are theological in a strict sense are dealt with. The orientation is that of sophisticated fundamentalism.

In 1962 was begun *A Catholic Dictionary of Theology* (Edinburgh, Thomas Nelson and Sons), edited by Monsignor H. Francis Davis and others. One volume of the four projected volumes has been issued thus far. Very Reverend Ivo Thomas is among the editors, and Father F. C. Copleston is among the better-known contributors. Instead of the usual prosaic and often uninspired articles on individual thinkers, Volume I contains articles on special features, such as Augustine and his influence, Berkeley and Catholicism, and the system of Boscovich. The writing is lively, and the authors do not hesitate to propound new theories.

Dictionaries or encyclopedias of specific religions and denominations are also available and contain articles on theological and even general philosophical topics. Several of these sectarian dictionaries of philosophy are outstanding.

*The Jewish Encyclopedia*, edited by Cyrus Adler and others (12 vols., New York and London, Funk and Wagnalls, 1901–1906; reprinted in various years), contains rewarding articles on Aristotle in Jewish literature, the influence of Arabic philosophy on Judaism, Maimonides (21 cols.), Spinoza (17 cols.), ethics, theology, and numerous other topics of philosophical relevance.

*The Universal Jewish Encyclopedia*, edited by Isaac Landman (10 vols., New York, Universal Jewish Encyclopedia, 1939–1943), had significant contributions by Isaac Husik, perhaps the greatest historian of medieval Jewish philosophy. This encyclopedia is a worthy successor to *The Jewish Encyclopedia*.

*The Catholic Encyclopedia*, edited by Charles G. Herbermann and others (16 vols., New York, Robert Appleton, 1907–1912; reprinted, 1913; supp., 1917, 1922, 1954), contains over five hundred articles on cosmology, theology, metaphysics, epistemology, logic, ethics, and individual philosophers. The articles expound these topics with clarity and vigor. Noteworthy contributors include Émile Bréhier, Pierre Duhem, and Maurice de Wulf. Comparable works exist in French, German, and Italian.

Of projected works the *New Catholic Encyclopedia* being edited at the Catholic University of America, Washington, D.C., will devote about 1 million of the total of 14 million words to subjects pertinent to philosophy. *Je sais, je crois: Encyclopédie du catholique au XXème siècle*, edited by Henri Daniel-Rops (Paris, Librairie A. Fayard, 1956–), is scheduled to comprise 150 volumes (more than 130 have been published as of 1965); it is being translated into English as *The Twentieth Century Encyclopedia of Catholicism* (New York, Hawthorn Books). It is arranged by topic rather than alphabetically. Among the volumes of philosophical interest are Claude Tresmontant's *Les Origines de la philosophie chrétienne*, Vol. XI (1962), Philippe Delhay's *La Philosophie chrétienne au moyen âge*, Vol. XII (1959), and Régis Jolivet's *L'Homme métaphysique*, Vol. XXXV (1958).

*Theology and ethics.* Of the dictionaries that cover two philosophical disciplines, chief among those covering theology and ethics is the *Encyclopedia of Religion and Ethics*, edited by James Hastings and others (13 vols., Edinburgh and New York, T. and T. Clark and Charles Scribner's Sons, 1908–1926; reprinted in whole or in part in various years). This is one of the great encyclopedias of all time. In conception it is original and imaginative; in execution, apt. The choice of topics is sagacious; the research has weathered the test of time; the analyses are thorough and penetrating. Among the philosophical contributors are John Burnet on the Academy, skeptics, and Socrates; C. D. Broad on reality and time; A. F. R. Hoernlé on solipsism; the Reverend William R. Inge on logos and Neoplatonism; Rufus M. Jones on mysticism; John Laird on will; J. M. E. McTaggart on personality; John H. Muirhead on ethics and rights; Josiah Royce on axiom, error and truth, mind, monotheism, negation, and order; F. C. S. Schiller on humanism, pragmatism, spiritualism, and values; A. E. Taylor on identity and theism; Erust Troeltsch on idealism and Kant; Frederick J. E. Woodbridge on Hobbes, Hume, and pluralism; and Maurice de Wulf on aesthetics and beauty. The orientation in the articles on religion is generally that of liberal Protestantism, but opposing points of view are presented fairly. The bibliographies are compact and useful.

Also deserving of mention as covering both theology and ethics is *A Dictionary of Religion and Ethics*, edited by Shailer Mathews and Gerald B. Smith (New York, Macmillan, 1921, 513 pages), which had as contributors Franz Boas, Edgar J. Goodspeed, Rufus Jones, Eugene Lyman, George Herbert Mead, Roscoe Pound, James B. Pratt, James H. Tufts, and others. For less important topics the articles present dictionary-type definitions or

identifications and little more. Imbalance in some of the articles may be illustrated by the fact that the 800-word article on Aristotle presents only one sentence on his ethics. There is a bibliography at the end, containing almost two thousand items.

*Logic and philosophy of science.* Major topics of another pair of philosophical disciplines—logic and the philosophy of science—are covered, though inadequately, in the *Harper Encyclopedia of Science*, edited by James R. Newman (4 vols., New York, Harper and Row, 1963), which had Ernest Nagel as its consultant on the philosophy and history of science. Among the contributors to the Newman work besides Nagel were Max Black, Irving M. Copi, Arthur C. Danto, and Milton K. Munitz. However, the philosophical articles are for the most part excessively brief. Exceptions include those on logic (four thousand words) and logical empiricism (almost five hundred words).

PERIODS. There are dictionaries covering the philosophy of specific periods, including, for example, the *Lexicon Philosophicum Graecum*, by Rudolf Goelenius the elder (Marburg, Rudolf Hutwelcker, 1615, 390 pages; 2nd ed., Frankfurt and Paris, S. Celerius, 1634), in which the terms defined are in Greek and the definitions and explanations are in Latin. Sources used by the author include the Greek philosophical classics, the New Testament, and the writings of the Greek Fathers of the Church.

The *Index zu philosophischen Problemen in der klassischen griechischen Literatur*, by Georg T. Schwarz (Bern, Francke Verlag, 1956, 109 pages), is a list of about 280 topics, such as being, definition, democracy, good, idea, life, love, philosophy, and reason, with an indication of where and how each one is discussed in pre-Aristotelian Greek literature and philosophy. Its limited objective is well carried out.

*The Dictionnaire de philosophie et de théologie scolastique, ou Études sur l'enseignement philosophique et théologique au moyen âge*, by Frédéric Morin, is included in the *Encyclopédie théologique*, edited by J. P. Migne (168 vols. in 170 in 3 series, Paris, 1844–1866), as Volumes XXI and XXII (1856–1857) of the third series. This dictionary covers adequately the medieval Scholastics, the main Arabic thinkers (but no Jewish philosophers), and the more important topics, problems, and movements of medieval philosophy. (The Migne encyclopedia is an unsystematic collection of dictionaries of aspects of religion—the Bible, church history, liturgy, saints, and so on.)

SCHOOLS. Movements or schools in philosophy are covered by various works. Among these is *A Biographical Dictionary of Modern Rationalists*, by Joseph McCabe (London, Watts, 1920, 934 pages). Rationalists are defined here as those who “uphold the right of reason against the authority of Church or tradition.” Included are biographies of philosophers—for example, Bergson, Bradley, Lovejoy, and Moore; statesmen—for example, John Adams and Clemenceau; writers—for example, Balzac and Keats; musicians, artists, scientists, inventors, historians, sociologists, and so on.

Another school is covered in the *Dictionary of Scholastic Philosophy*, by Bernard Wuellner (Milwaukee, Wis., Bruce Publishing Co., 1956, 138 pages). Many of the articles are merely definitions. For example, the article on belief consists simply of the synonym *faith* and the article on faith gives only dictionary-type definitions of *faith* and *divine faith*, with references to two works of Aquinas. However, the book contains 33 interesting diagrams and charts, which show the subdivisions of act and potency, the categories of being, the kinds of evil, and the like.

*A Concise Dictionary of Existentialism*, edited by Ralph B. Winn (New York, Philosophical Library, 1960, 122 pages), contains quotations from six thinkers—Kierkegaard, Heidegger, Jaspers, Marcel, Sartre, and de Beauvoir—on anguish, being, boredom, choice, encounter, and other topics. Some of the quotations are epigrammatic; others are more extensive.

PHILOSOPHERS. Dictionaries devoted to the thought of individual philosophers are numerous. Aquinas, Aristotle, Bonaventure, Kant, Hegel, Maimonides, Plato, Russell, Schopenhauer, Spinoza, Teilhard de Chardin, and Wolff are among the main figures having special dictionaries devoted to their work. Aristotle, for example, is covered by four works.

First was Hermann Bonitz' *Index Aristotelicus* (Berlin, G. Reimer, 1870, 878 pages), which was reprinted from Volume V of the Academia Regia Borussica edition of Aristotle (5 vols., Berlin, G. Reimer, 1831–1870), with Greek texts edited by Immanuel Bekker. The index was reprinted in 1955 by the Akademie-Verlag in East Berlin. It is a complete concordance, indispensable to Aristotle scholars working with the original Greek.

Matthias Kappes' *Aristoteles-Lexikon* (Paderborn, Germany, Ferdinand Schöningh, 1894, 70 pages) contains a discussion in German of about four hundred Greek words used by Aristotle, with references to the main passages where those words play a part in his philosophy. On the basis of the 11-volume Oxford translation of Aristo-

tle, Troy W. Organ's *An Index to Aristotle in English Translation* (Princeton, N.J., Princeton University Press, 1949, 181 pages) covers about four thousand English words, from Abdera, abdomen, and abortions to Zeno, Zeus, and zodiac, with references to the passages where they significantly occur.

In 1962 there appeared the *Aristotle Dictionary*, edited by Thomas P. Kiernan (New York, Philosophical Library, 524 pages), which has passages from Aristotle's writings, translated by H. E. Wedeck and others. It begins with a 161-page summary of the individual writings of Aristotle and continues with quotations under alphabetically arranged topic headings. The quotations chosen are not always apt; for example, the five sentences quoted under "Form" do not represent Aristotle's philosophy of form.

Plato, Aquinas, and Kant are similarly covered by three or more dictionaries each; one of the Kant dictionaries is in Russian.

## CONCLUSION

In the past it was possible for a scholar to encompass in a lifetime of learning the whole of a broad domain of human interest, such as philosophy. It was possible for one person to read all the important sources, major interpretations, and critiques of the sources. One could then write a thorough, well-balanced, and accurate dictionary of philosophy for his less knowledgeable colleagues.

However, with the democratization of education and the spread of intellectual activity the philosophical sources and the critical works have become too voluminous for a single individual to master. The truly comprehensive study of what philosophers have thought and said has therefore necessarily become a cooperative venture. Although some commendable dictionaries of philosophy have been produced by great scholars singlehandedly in the twentieth century, the scholarship of a single individual is, after all, limited.

Periodically, therefore, the need arises for expert summaries and appraisals of the philosophical books and articles that rush from the presses. Thus, cooperative summings up have appeared with some regularity. This *Encyclopedia of Philosophy* is intended to provide a new, more inclusive treatment of a wide variety of philosophical topics and to be a repository of up-to-date, detailed scholarship for the use of researchers and creative philosophers alike.

## Bibliography

### ON GENERAL ENCYCLOPEDIAS

Especially useful are the articles on encyclopedias which appear in the *Encyclopaedia Britannica*, 11th ed., 29 vols. (Cambridge and New York, 1910–1911); in the *Encyclopedia Americana*, 30 vols. (New York, 1966); and in *Chambers's Encyclopaedia*, 15 vols. (London, 1959).

### OLDER LISTS

Some 20 dictionaries of philosophy, of ethics, or of individual philosophers are listed in Johann A. Fabricius, *Abriss einer allgemeinen Historie der Gelehrsamkeit*, 3 vols. (Leipzig, 1752–1754), Vol. I, p. 422. Shorter, evaluative lists of dictionaries of philosophy appear in the Preface to the first edition of Franck's *Dictionnaire des sciences philosophiques*, 6 vols. (Paris, 1844–1852), and in the Preface to Larousse's *Grand Dictionnaire universel du XIXe siècle*, 15 vols. (Paris, 1865–1876), Vol. I, pp. xli–xlii.

### TWENTIETH-CENTURY LISTS

The section "Dictionnaires de philosophic" in Jean Hoffmans, *La Philosophie et les philosophes: Ouvrages généraux* (Brussels, 1920), pp. 1–4, lists, along with 11 general dictionaries of philosophy, about 80 specialized dictionaries, on topics like ethics and aesthetics. See also the lists of philosophical dictionaries in the Alcalde *Diccionario* (Madrid, 1927), Vol. I, pp. 12–15; the section on dictionaries in the *Allgemeine philosophische Bibliographie*, by I. M. Bocheński and Florenzo Monteleone (Bern, 1948), pp. 32–33; the section on dictionaries in Carmelo Ferro's *Guida storico-bibliografica allo studio della filosofia* (Milan, 1949), pp. 187 ff.; and the section "Philosophie" in the *Index Lexicorum*, by Gert A. Zischka (Vienna, 1959), pp. 40–43.

### DISCUSSIONS

André Lalande, in "Les Récents Dictionnaires de philosophie," *Revue philosophique de la France et de l'étranger*, Vol. 56 (1903), 628–648, and Frederick H. Heinemann, in "Die Aufgabe einer Enzyklopädie des XX. Jahrhunderts," pp. 1–22 of his compilation *Die Philosophie im XX. Jahrhundert*, 2nd ed. (Stuttgart, 1963), provide thoughtful comments. Also provocative is Benedetto Croce's "Un Vocabolario della lingua filosofica italiana," *La Voce*, Vol. 1 (1909), 42; in it he urged the need for historical and analytical work on philosophical terminology which would not be a mere "dizionario filosofico," with its dismembered alphabetical order; he suggested, rather, a work like "una enciclopedia filosofica," having some of the attributes of Hegel's *Encyklopädie*. The editors of the Gallarate encyclopedia, in offering more than "un mero dizionario filosofico" may have had Croce specifically in mind.

William Gerber (1967)

## PHILOSOPHY DICTIONARIES AND ENCYCLOPEDIAS [ADDENDUM]

The English-language citations in this update are organized alphabetically by book title. The non-English language citations are grouped initially as either Asian or European, and are listed within those two categories by specific language; the citations appear alphabetically by book title within each specific language's listing.

## PHILOSOPHY JOURNALS

The learned journal was one of the major cultural innovations of the seventeenth century. Of the pioneering scholarly journals inaugurated during that century, the earliest one that regularly presented philosophical material is, remarkably, still being published, but, unhappily for our story, it now deals mainly with philology and related fields. This patriarch of professional periodicals, 300 years old and still lively, is the *Journal des savants* (Paris, 1665–), issued quarterly, with variations. The title was *Journal des sçavans* from 1665 to 1792. Publication was suspended from 1797 to 1816. The journal was devoted originally to book reviews, bibliographies, and news notes on philosophy, science, and literature.

In the same century similar learned journals, commenting on new books in philosophy and other fields, were issued for various periods in a number of cultural centers besides Paris. Indeed, on October 22, 1668, Leibniz wrote to Emperor Leopold I, taking note of the fact that the rival French nation had inaugurated the *Journal des sçavans* and declaring that Germany needed a similar medium of intellectual communication; Leibniz asked for a license to issue such a periodical, and the issuance of *Acta Eruditorum* beginning some 14 years later (see below) may have been the result. Prominent among the early learned journals issued outside of France which covered philosophy among other subjects were:

1668–1690. *Giornale de'letterati* (Parma), monthly. Suspended 1679–1686. Periodicals with the same

title were also published in other Italian cities, including Rome, for various periods.

1681–1683. *Weekly Memorials for the Ingenious* (London), weekly.

1684–1718. *Nouvelles de la république des lettres* (Amsterdam), originally issued monthly, later issued six times a year. Founded by Pierre Bayle during his exile from France and edited by him from 1684 to 1687. Suspended 1689–1698 and 1711–1715.

1688–1690. *Freymüthige lustige und ernsthaffte Monats-Gespräche* (Halle), monthly.

In Latin, philosophical and other material appeared in *Acta Eruditorum* (Leipzig, 1682–1776), issued monthly. The title was *Nova Acta Eruditorum* from 1732 to 1776. This periodical, founded by Otto Mencke, Leibniz' friend, contained many contributions by and about Leibniz, and some authorities even say it was founded by Leibniz; he probably at least had a hand in Mencke's establishment of it. In this vehicle Leibniz first gave the world his notions respecting the differential calculus, and in it raged the controversy, beginning in 1699, over whether Leibniz or Newton first discovered the principles of the calculus.

Beginning in the eighteenth century a number of learned journals were devoted exclusively or largely to philosophy. These were the earliest instances of philosophical journals in a strict sense.

**DEFINITION OF A PHILOSOPHICAL JOURNAL.** A philosophical journal, for the purposes of this article, is a publication that fulfills the following criteria:

(1) It is devoted to the whole field of philosophy (and nothing else) or, more narrowly, to a part of the field of philosophy (for example, symbolic logic or Thomism) or, more broadly, to the whole field of philosophy plus one or two other fields of interest (philosophy and psychology, philosophy and theology, and so forth). The specification "part of the field of philosophy" is taken strictly, thereby excluding philosophy of education and pure theosophy, but it includes political and social philosophy. Magazines of popular philosophy or popular morals—such as Addison and Steele's *Spectator* (founded 1710), *Der Leipziger Diogenes* (founded 1723), and *Der Dresdnische Philosoph* (founded 1737)—are excluded. Student journals, such as the *Graduate Review of Philosophy* (Minneapolis), are also excluded. One theosophical journal, however, *The Aryan Path*, which contains many strictly philosophical articles, is included here.

(2) It is issued at stipulated intervals of less than a year. Thus, the intent reader will notice that this account

does not mention bibliographical yearbooks, annual collections of studies, annual proceedings of philosophical societies, or irregular collections of articles (such as the quasi journal *Polemic*, of which eight issues were published at London at irregular intervals, from 1945 to 1947). In a few cases, however, a publication which, although it had no stipulated frequency, was actually issued (say) four times a year for a period of years, is counted as a regular journal.

(3) It has survived longer than a year. This requirement leads to the exclusion of, for example, *Symposion; Philosophische Zeitschrift für Forschung und Aussprache* (Erlangen), edited by Ernst Cassirer, Hans Driesch, and others, since only four issues were published, in 1926. In the case of periodicals inaugurated just prior to the completion of this article, however, the requirement of more than a year's duration is relaxed.

Strict adherence to the second criterion listed above has led to the exclusion of at least one vitally important medium of philosophical discussion—*Proceedings of the Aristotelian Society* (London), issued annually (referred to in this Encyclopedia as *PAS*). Since its founding in 1891 this periodical has presented numerous important articles, including papers by Bertrand Russell, Gilbert Ryle, J. L. Austin, Ludwig Wittgenstein, G. E. Moore, and many others.

In our account of significant journals devoted to the whole of philosophy, we have attempted to be comprehensive. It is probable, however, that a considerable number of obscure, though worthy, journals have slipped through the net and that on these strict criteria a few borderline semiprofessional journals are omitted which may have merited inclusion. Therefore, the statistics offered from time to time in this article (for example, that so many journals originated in a certain period) are based on its author's particular standards and should be taken as approximate. For fairly complete details about philosophical journals devoted to the whole of philosophy which are still being issued, the reader is referred to the *International Directory of Philosophy and Philosophers*, edited by Gilbert Varet and Paul Kurtz (New York, 1966).

For journals devoted to a part of philosophy or to philosophy and other disciplines, the present list is definitely incomplete. For example, there have been over a hundred theological journals, past and present, but only some fifty are mentioned as outstanding examples.

Regarding each journal mentioned in this article, four facts are ordinarily presented: the year it began publication (and, if it is no longer issued, its last year of pub-

lication), its title, its place of publication, and the frequency of its issuance. Other facts, such as historic figures who were editors, periods of suspension, and changes of title, are sometimes noted, but these additions are illustrative rather than complete.

In the case of journals that have changed their titles, the latest title is usually given as the main entry, and earlier titles are noted. Where one journal has succeeded another with some definite contact or relationship between them, they are considered as a single journal with a changed title. Thus, *Ratio* is considered as continuous with its earlier incarnation and appears below as one of the two oldest living philosophical journals.

In several instances some outstanding articles that the periodicals have published or striking facts about their influence in the philosophical world are set forth. Other periodicals, such as *Philosophy* (1926–), *Voprosy Filosofii* (1947–), and some German and Italian periodicals, could also have been appropriately singled out for such an exposition, had space permitted.

STATISTICAL CONSPECTUS. From the eighteenth century to the present, approximately 70 philosophical journals have been born with more or less fanfare, have survived for a period, and have given up the ghost. About 180 others, however, are still alive, some flourishing, some bravely keeping their heads above water, some pitifully gasping for breath.

Of the philosophical journals published today, two are more than a century old, and four others are over 90 years old; their average life span, however, is about 28 years. Of those which no longer exist, the longest-lived at the time of its death was 81 years old: the *Zeitschrift für Philosophie und philosophische Kritik*, founded by the younger Fichte in 1837 and discontinued in 1918.

More births of philosophical journals occurred in the 1950s (55) and the 1940s (49) than in any other decades, but likewise more deaths of philosophical journals occurred in the 1950s (19) and the 1940s (17) than in any other decades. During World War I about 12 per cent of the philosophical journals in existence in 1914 ended their lives; during World War II about 15 per cent of those in existence in 1939 were terminated.

## EARLY JOURNALS

EARLY QUASI JOURNALS. Publications devoted to philosophy that were intended to be issued from time to time (more than once a year) but not at uniform intervals may be denominated “quasi journals of philosophy” since they

do not conform to the requirement of a set frequency of issuance. A number of these quasi journals came into being from about 1715 on, especially in Germany, and lasted for varying periods. The following may serve as examples:

1715–1726. *Acta Philosophorum* (Halle). In German. Covered books on the history of philosophy. Probably the earliest quasi journal of philosophy.

1741–1744. *Philosophische Büchersaal* (Leipzig). Eight issues were published.

1789–1790. *Neues philosophisches Magazin; Erläuterungen und Anwendungen des Kantischen Systems bestimmt* (Leipzig). Two volumes, each with four issues, appeared.

1790–1850. Of seven genuine philosophical journals that saw the light before 1850, two—the *Theologische Quartalschrift* and *Ratio*—still survive, but the continuity of *Ratio* with its origin is tenuous. Chronologically, the seven pre-1850 journals fall into two groups. Those in the first group are:

1794–1807. *Revue philosophique, littéraire et politique* (Paris), issued three times a month, with variations. Title was *Décade philosophique, littéraire et politique* from 1794 to 1804 and became *Revue, ou Décade philosophique* late in 1804. Merged in 1808 with the *Mercure de France* (Paris, 1672–1820) and at that point may be considered to have lost its standing as a philosophical journal.

1795–1800. *Philosophisches Journal einer Gesellschaft teutscher Gelehrten* (Neustrelitz, 1795–1796; Jena and Leipzig, 1797–1800), monthly. J. G. Fichte was coeditor from 1797 to 1800. An article that Fichte published in the *Journal* in 1798 regarding the grounds of our belief in a divine government of the universe (defining God as the moral order of the universe) caused a cry of atheism to be raised and led to the suppression of the *Journal* in all the German states except Prussia, as well as to Fichte's resignation in 1799 from his teaching position at the University of Jena (see Atheismusstreit).

1802–1803. *Kritisches Journal der Philosophie* (Tübingen), issued five times in 1802 and once in 1803. Editors, F. W. J. von Schelling and G. W. F. Hegel. Included a number of articles by Hegel.

1819–. *Theologische Quartalschrift* (Tübingen; later Ravensburg; now Stuttgart), quarterly. Suspended 1945.

The following journals belong to the second pre-1850 group:

1832–1852. *Zeitschrift für Philosophie und katholische Theologie* (Cologne, 1832–1836; Coblenz, 1836–1839; Cologne, 1840–1841; Bonn, 1842–1852), quarterly, with variations.

1837–1918. *Zeitschrift für Philosophie und philosophische Kritik; Vormals Fichte-Ulricische Zeitschrift* (Bonn, 1837–1842; Tübingen, 1843–1846; Halle, 1847–1890; Leipzig, 1891–1918), quarterly, with variations. Title was *Zeitschrift für Philosophie und spekulative Theologie*, from 1837 to 1846; subtitle varied. Founded by I. H. von Fichte (son of J. G. Fichte); later edited by him and Hermann Ulrici. Supported Christian and Hegelian views.

1847–. *Ratio* (Oxford and Frankfurt; formerly Göttingen), semiannual, with variations. Title was *Abhandlungen der Fries'schen Schule* from 1847 to 1936. Suspended 1850–1903, 1915–1917, 1919–1928, and 1937–1956. Now issued in English and German editions.

1850–1900. Of the decades from 1850 to 1899, the first produced 1 new journal of philosophy, the second and third a total of 11, and the fourth and fifth a total of 19. The lone philosophical journal born in the 1850s was *La Revue philosophique et religieuse* (Paris, 1850–1858), issued monthly.

*The 1860s.* In the 1860s seven philosophical journals were begun—three in Germany and one each in Belgium, France, Switzerland, and the United States. The first four journals to appear in this decade, including the first English-language journal of philosophy, are now defunct.

1861–1914. *Zeitschrift für Philosophie und Pädagogik* (Leipzig; later Langensalza), monthly, with variations. Title was *Zeitschrift für exakte Philosophie im Sinne des neuern philosophischen Realismus* (and the journal was, for the most part, a quarterly) from 1861 to 1896; suspended 1876–1882. Merged in 1896 with the *Zeitschrift für Philosophie und Pädagogik*, which had been issued since 1894; the combined publication took the title of the latter *Zeitschrift*.

1862–1864. *Athenäum; Philosophische Zeitschrift* (Munich), quarterly.

1867–1913. *L'Année philosophique* (Paris), issued annually and therefore not a “periodical” in the required sense, from 1867 to 1869 and again from 1890 to 1913, but it was a weekly (with variations)

from 1872 to 1885 and a monthly from 1885 to 1889. Title was *La Critique philosophique* when the publication was issued weekly or monthly, from 1872 to 1889. C. B. Renouvier was a coeditor from 1890 to 1900.

1867–1893. *Journal of Speculative Philosophy* (St. Louis, Mo., 1867–1880; New York, 1880–1893), quarterly, with variations. Apparently the first philosophical journal in the English language. Founded by William T. Harris. Organ of the St. Louis Philosophical Society. Served as the vehicle for the first published writings of James, Royce, and Dewey. Its motto was “Philosophy can bake no bread, but she can procure for us God, freedom, and immortality.”

The three philosophical journals of this period which have survived are German, Swiss, and Belgian, respectively:

1868–. *Archiv für Geschichte der Philosophie* (Berlin; previously Leipzig and Heidelberg), quarterly, with variations. Title was *Philosophische Monatshefte* from 1868 to 1887, *Archiv für Geschichte der Philosophie* from 1888 to 1894, *Archiv für Philosophie* from 1895 to 1926 (in this period the periodical was issued in two parts, *Archiv für Geschichte der Philosophie* and *Archiv für systematische Philosophie*), title was *Archiv für Philosophie und Soziologie* from 1927 to 1930 (again issued in two parts, *Archiv für Geschichte der Philosophie und Soziologie* and *Archiv für systematische Philosophie und Soziologie*), title reverted to *Archiv für Geschichte der Philosophie* in 1931; suspended 1933–1959. Original editor was Ludwig Stein, with the collaboration of Hermann Diels, Wilhelm Dilthey, Benno Erdmann, and Eduard Zeller. Paul Natorp became coeditor of the combined publication in 1895 and editor of the systematic part. Has contained articles in English, French, German, and Italian since 1895.

1868–. *Revue de théologie et de philosophie* (Lausanne), issued six times a year from 1868 to 1920, quarterly since 1921. Title has varied.

1869–. *Nouvelle Revue théologique* (Louvain, Belgium), monthly. A Jesuit organ.

THE 1870S. The 1870s are remembered as the decade which produced the *Revue philosophique de la France et de l'étranger* and *Mind*. However, two other journals were inaugurated during the decade:

1870–. *Rivista di filosofia* (Turin; previously Bologna-Modena, Florence, Forli, Genoa, Pavia, Rome, and

Milan), quarterly, with variations. Title was *La filosofia delle scuole italiane* (Florence; then Rome), 1870–1885; title was *Rivista italiana di filosofia* (Rome) from 1886 to 1898; became two separate periodicals, *Rivista di filosofia e scienze affini* (Bologna), 1899–1908, and *Rivista filosofica* (Pavia), 1899–1908; combined under the title *Rivista di filosofia* in 1909. Suspended 1922. In 1963 it absorbed *Il pensiero critico*, a quarterly published at Milan since 1950.

1877–1916. *Vierteljahrsschrift für wissenschaftliche Philosophie und Soziologie* (Leipzig), quarterly. Title was *Vierteljahrsschrift für wissenschaftliche Philosophie* from 1877 to 1901. Coeditors at various times included Richard Avenarius, Ernst Mach, and Wilhelm Wundt.

“*Revue Philosophique.*” The *Revue philosophique de la France et de l'étranger* (Paris, 1876–) was originally issued monthly and later issued six times a year; it is now issued quarterly. The *Revue's* first editor, Théodule Ribot, served for 40 years, until his death in 1916. Under his direction the *Revue* gave primary emphasis to articles on psychology. Philosophy began to gain predominance under Ribot's successor, Lucien Lévy-Bruhl, who was also a long-lived editor, conducting the periodical for 23 years until his death in 1939. The editors in succeeding years, when philosophy was fully established as the main arena of discussion in the *Revue*, were Émile Bréhier and Paul Masson-Oursel (1940–1952), Masson-Oursel and Pierre-Maxime Schuhl (1952–1956), and Schuhl alone (since 1956).

Even now the *Revue's* strongest contribution is represented not so much by publication of original hypotheses as by careful analysis and criticism of old and new viewpoints. Useful articles, for example, have been published on Leibniz, Hume, and English linguistic philosophy. An entire issue was devoted to Lévy-Bruhl in 1957 on the one hundredth anniversary of his birth. The coverage of philosophy “de l'étranger” has consisted in large part of some translations from English and German, extensive critical reviews of books, and summaries of periodical articles.

Among the more original contributions in the *Revue* have been C. S. Peirce's “La Logique de la science” (1878–1879), Étienne Gilson's “Essai sur la vie intérieure” (1920), Raymond Ruyer's “Ce qui est vivant et ce qui est mort dans la matérialisme” (1933), and Georges Gurvich's “Le Problème de la sociologie de la connaissance” (1957–1958). Famous contributors have included Rudolf

Hermann Lotze, Herbert Spencer, J. S. Mill, Wilhelm Wundt, Henri Bergson, and Georges Sorel.

*"Mind."* *Mind; A Quarterly Review of Psychology and Philosophy* (originally London, later Edinburgh, now Oxford, 1876–), is issued quarterly.

In 1874 Alexander Bain broached the idea of establishing the first British philosophical journal to his pupil George C. Robertson, who suggested the title *Mind*. Bain appointed Robertson editor and supported the journal financially, sinking almost £3,000 into it in 15 years, until Robertson resigned in 1891.

Robertson, on laying down his mantle as editor, lamented that the journal had attracted more attention from "the lay student" than from those "whose regular business is with Philosophy." G. F. Stout, when he succeeded Robertson in 1892, wrote that "what is of prime importance is that our pages shall be filled with genuine work to the exclusion of merely dilettante productions." The implication here is curious when one considers that among the contributors to *Mind* during Robertson's stewardship were philosophers of the caliber of Samuel Alexander, A. W. Benn, Bernard Bosanquet, F. H. Bradley, T. H. Green, William James, C. Lloyd Morgan, Hastings Rashdall, Josiah Royce, Henry Sidgwick, and John Venn.

Sidgwick, who succeeded Bain as the financial "angel" of *Mind*, died in 1900. It was then that, pursuant to a suggestion made by Sidgwick in 1899, the Mind Association was formed (with Edward Caird as the first president) to support the journal. Meanwhile, G. E. Moore and Bertrand Russell had published their earliest contributions in *Mind* in the 1890s, and the periodical was well on its way to becoming what it is now, one of the dozen most influential journals of philosophy in the world. Stout relinquished the editorship in 1920; his successors were Moore, 1921–1947, and Gilbert Ryle since 1948.

Over the decades *Mind* has published many highly influential articles, such as Moore's "The Refutation of Idealism" (1903), Russell's "On Denoting" (1905), and H. A. Prichard's "Does Moral Philosophy Rest on a Mistake?" (1912). During Moore's editorship the journal set a particularly high standard, publishing such papers as W. T. Stace's "The Refutation of Realism" (1934), A. J. Ayer's "Demonstration of the Impossibility of Metaphysics" (1934), C. L. Stevenson's "Persuasive Definitions" (1938), Norman Malcolm's "Are Necessary Propositions Really Verbal?" (1940), John Wisdom's eight articles entitled "Other Minds" (1940–1943), and Frederick Will's "Will the Future Be Like the Past?" (1947). More recently (under Ryle's editorship), *Mind* has presented such

important articles as J. N. Findlay's "Can God's Existence Be Disproved?" (1948), R. M. Hare's "Imperative Sentences" (1949), Paul Edwards' "Bertrand Russell's Doubts About Induction" (1949), P. F. Strawson's "On Referring" (1950), A. J. Ayer's "Individuals" (1952), G. E. M. Anscombe's "Aristotle and the Sea Battle" (1956), Nelson Goodman's "About" (1961), and many papers—written by Wittgenstein's disciples—that helped to establish Wittgenstein's reputation before the posthumous publication of his books.

A public controversy occurred when *Mind* declined to publish a review of Ernest Gellner's *Words and Things* (London, 1959), which was critical of the ordinary-language school. Bertrand Russell, in a letter to the *London Times*, on November 5, 1959, protested against *Mind's* decision.

Ryle's policy as editor has been to give some preference to philosophers who have not previously appeared in print. This policy, while testifying to the kindness of the editor and his concern for providing needed encouragement to tomorrow's leading spirits, has made it difficult to maintain the Olympian level of quality to which readers became accustomed during Moore's period as editor.

**THE 1880S.** Of the nine journals of philosophy generated in the 1880s, five are still functioning, *The Monist* being perhaps the best known. One of the nine, among the oldest Italian philosophical journals, is *Divus Thomas*; another, a Swiss product, has had *Divus Thomas* as its subtitle or (for a time) as its main title. Japan and Russia gave birth to journals of philosophy in this decade, and the Japanese entry is still in the field.

**American and British.** Paul Carus was associated with two of the three English-language journals begun in this decade.

1886–1915. *Review of Theology and Philosophy* (Edinburgh), quarterly. Title was *Theological Review and Free Church College Quarterly* from 1886 to 1890 and *Critical Review of Theological and Philosophical Literature* from 1890 to 1904.

1887–1936. *The Open Court* (Chicago), issued every other week from 1887 to 1888; weekly from 1888 to 1896; monthly from 1897 to 1933; quarterly from 1934 to 1936. Successor to *The Index* (published weekly at Toledo, Ohio, and later at Boston, 1870–1886), organ of the Free Religious Association. *The Open Court* was founded by Paul Carus. Devoted to the establishment of ethics and religion on a sci-

entific basis, it was more clearly a philosophical journal than was *The Index*.

1888–. *The Monist; An International Journal of General Philosophical Inquiry* (La Salle, Ill.; previously Chicago), quarterly. Suspended 1937–1963. International editorial board. Each issue now devoted to a specific topic. Edited by Paul Carus from 1888 to his death in 1919. Contributors have included Peirce, Dewey, Bosanquet, and Russell.

**European.** Two of the journals first issued in the 1880s are products of Italy and two are German-language publications.

1880–. *Divus Thomas; Commentarium de Philosophia et Theologia* (Piacenza), issued six times a year. Articles in English, French, Italian, and Latin. Suspended 1906–1923.

1881–1900. *Rivista speciale di opere di filosofia scientifica* (Milan), monthly. Title was *Rivista di filosofia scientifica* from 1881 to 1891.

1886–. *Freiburger Zeitschrift für Philosophie und Theologie* (Fribourg, Switzerland), quarterly, with variations. Title was *Jahrbuch für Philosophie und spekulative Theologie* (Paderborn; later Vienna) from 1886 to 1922, with the subtitle *Divus Thomas* from 1914 to 1922; title was *Divus Thomas* from 1923 to 1953.

1888–. *Philosophisches Jahrbuch* (Munich; previously Fulda), semiannual, with variations. Title has varied. Catholic-oriented.

**Japanese and Russian.** The Japanese journal begun in the 1880s is still being issued. The Russian journal, *Voprosy Filosofii i Psikhologii*, died in 1917, but a new *Voprosy Filosofii*, as will be noted later, arose from its ashes 30 years later, in 1947.

1887–. *Tetsugaku Zasshi; Journal of Philosophy* (Tokyo), quarterly, with variations. Journal of the Philosophical Society of Tokyo University. Titles of articles in English.

1889–1917. *Voprosy Filosofii i Psikhologii* (Moscow), issued six times a year by the Moskovskoe Psikhologicheskoe Obshchestvo.

**THE 1890S.** The 1890s constituted the fertile decade of *Ethics* and *The Philosophical Review*, of the *Revue de métaphysique et de morale*, of the *Revue philosophique de Louvain*, and of *Kant-Studien*, all of which are on the scene today, plus the oldest Indian and Polish philosophical journals, which also continue to appear.

Louvain was the parent of a pair of French-language journals, both flourishing today:

1894–. *Revue philosophique de Louvain* (Louvain), quarterly. Founded by Cardinal Mercier. Published by the Société Philosophique de Louvain. Neo-Scholastic. Suspended 1915–1918 and 1941–1944. Title was *Revue néo-scholastique* from 1894 to 1910, *Revue néo-scholastique de philosophie* from 1910 to 1933, and *Revue néoscholastique de philosophie* from 1934 to 1945. A *Répertoire bibliographique* has been published as an adjunct of the *Revue* since 1895; since 1938 it has been published separately, and since 1949 it has been administratively separate. Some articles in English; others in French with English summaries.

1895–. *Répertoire bibliographique de la philosophie* (Louvain), quarterly. Title was *Sommaire idéologique des ouvrages et des revues de philosophie* (with variations) from 1895 to 1914. Suspended 1915–1933 and 1941–1945. Reproduced *in toto*, with Dutch headings, in the *Tijdschrift voor Filosofie* (Louvain, 1939–).

Two of the journals that started publication in the 1890s have ethics as their subject matter, ethics alone in one case and ethics plus metaphysics in the other:

1890–. *Ethics; An International Journal of Social, Political and Legal Philosophy* (Chicago), quarterly. Established, under the title *The International Journal of Ethics*, as an outgrowth of *The Ethical Record*, organ of the Ethical Societies; responsibility assumed by the University of Chicago in 1923; name changed to *Ethics* in 1938.

“*Revue de métaphysique et de morale.*” The *Revue de métaphysique et de morale* (Paris, 1893–) has been issued quarterly since 1920 (previously issued six times a year). This *Revue*, now the principal French philosophical journal, was established by Xavier Léon, with the collaboration of Élie Halévy. The title of the publication reflected not only a reaction against positivism but also, affirmatively, a belief that the conclusions of speculative philosophy could have a practical value. Léon (who also founded the Société Française de Philosophie in 1901 and organized various international congresses of philosophy) served as editor of the *Revue* until his death in 1935, when he was succeeded by Dominique Parodi. Parodi died in 1955, and Jean Wahl (who had assisted Parodi on the *Revue*) took over.

Until World War II special numbers of the *Revue* were occasionally devoted to a single topic. For example,

issues were devoted to Kant (1904, the centennial of his death), Rousseau (1912, the bicentennial of his birth), American philosophy (1922, with articles by John Dewey, W. E. Hocking, C. I. Lewis, R. B. Perry, and others), Pascal (1923, the tercentenary of his birth), Hegel (1931, the centennial of his death), and Descartes (1937, the tercentenary of the *Discourse on Method*).

The journal's contributors have included all French philosophers of note as well as many eminent foreigners, such as Bertrand Russell, A. N. Whitehead, and Bernard Bosanquet; Benedetto Croce and Giovanni Gentile; Miguel de Unamuno; and Edmund Husserl. Among the articles of more than ordinary interest which have appeared in the journal are Henri Poincaré's "La Logique de l'infini" (1909), Henri Bergson's "L'Intuition philosophique" (1911), Étienne Gilson's "Art et métaphysique" (1916), Gabriel Marcel's "Existence et objectivité" (1925), Léon Brunschvicg's "Religion et philosophie" (1935), José Ferrater Mora's "Philosophie et architecture" (1955), and Wahl's "Physique atomique et connaissance humaine" (1962).

"*The Philosophical Review*." Two of the major philosophical journals now on the scene had their origin in the *fin de siècle* decade. One of these was American, *The Philosophical Review* (Ithaca, N.Y., 1892–), which is now issued quarterly. It was previously issued six times a year. It is published by the Sage School of Philosophy at Cornell University.

*The Philosophical Review* was relatively undistinguished until the late 1940s. Among the few important articles that preceded the late flowering of the journal were C. I. Lewis' "Experience and Meaning" (1934) and Moritz Schlick's reply, "Meaning and Verification" (1936), which is commonly regarded as Schlick's most telling contribution to contemporary philosophy.

The *Review*'s recent burgeoning took place under the guidance of Max Black and his colleagues on the philosophy staff at Cornell. Significant contributions in this period include W. V. Quine's "Two Dogmas of Empiricism" (1951), Black's "Definition, Presupposition, and Assertion" (1952), Gilbert Ryle's "Ordinary Language" (1953), H. P. Grice and P. F. Strawson's "In Defense of a Dogma" (1956), Stuart Hampshire's "On Referring and Intending" (1956), various articles by John Rawls on justice (1958–1963), J. J. C. Smart's "Sensations and Brain Processes" (1959), Norman Malcolm's "Anselm's Ontological Arguments" (1960), and Richard Taylor's "Fatalism" (1962).

Other prominent philosophers whose work has appeared in *The Philosophical Review* include George Boas, R. M. Chisholm, P. T. Geach, Nelson Goodman, Arthur E. Murphy, Ernest Nagel, and J. A. Passmore.

"*Kant-Studien*." The other famous journal founded in the last decade of the nineteenth century was German: *Kant-Studien; philosophische Zeitschrift* (Hamburg and Leipzig; later Berlin; now Cologne, 1896– —), issued quarterly, with variations. The title was originally spelled *Kantstudien*. This journal has been the organ of the Kant-Gesellschaft since 1904. It was suspended twice, from 1937 to 1942 and from 1945 through 1953.

Hans Vaihinger founded *Kant-Studien* and was its editor, alone or with one or two coeditors, until 1922; Max Scheler was coeditor in 1902/1903. The periodical has published articles in English, French, German, and Italian by outstanding scholars and philosophers, including Erich Adickes, Émile Boutroux, Edward Caird, Ernst Cassirer, Rudolf Eucken, and Norman Kemp Smith. Although the periodical is specifically oriented toward Kant, it includes in its purview current thought on questions raised by Kant, pre-Kantian philosophy as part of the background of Kantianism, and other liberal extensions of the frame of reference.

For many years *Kant-Studien* published abstracts of new books in philosophy on a unique basis: the abstracts were written by the authors themselves. As another special feature, 86 separate monographs have been issued under the auspices of the journal.

During the short-lived revival of *Kant-Studien* in 1942–1944, the journal was not uninfluenced by Nazism. In 1954, however, on the 150th anniversary of Kant's death, the periodical was reborn in a new setting (Cologne), and since then it has regained its international reputation.

*Other journals.* Additional journals which arose in the 1890s were the following:

1893–. *Revue thomiste; Revue doctrinale de théologie et de philosophie* (originally Brussels; now Toulouse), quarterly. Founded by the Dominican order.

1895–. *The Vedanta Kesari* (Madras), monthly, with variations. Title was *The Brahmavadin; A Fortnightly Religious and Philosophical Journal* from 1895 to 1914. Organ of the world-wide Ramakrishna order.

1896–1915. *Neue metaphysische Rundschau* (Berlin), monthly. Title was *Metaphysische Rundschau* from 1896 to 1897.

1897–1949. *Przegląd Filozoficzny* (Warsaw), quarterly. English summaries of articles in some issues; table of contents also printed in French. Suspended 1940–1946. Issuance stopped by the government at the beginning of the period of militant Marxist domination of Polish philosophy (first half of the 1950s). Replaced (not succeeded) by the periodical now called *Studia Filozoficzne; Kwartalnik* (1951– —).

#### PREWAR PERIOD

The vital statistics for the period from 1900 to 1914 show 19 journals born, 12 of which have survived. This is the period of *The Hibbert Journal*, *The Journal of Philosophy*, *The Harvard Theological Review*, and the first of various journals called *Logos*. Czechoslovakia, Ireland, the Netherlands, and Spain are represented for the first time in this period.

**THEOLOGY.** The prewar period was exceptionally rich in journals which emphasized theology or the philosophy of religion:

1900–1939. *Revue de philosophie* (Paris), issued six times a year. Thomist-oriented.

1902–. *The Hibbert Journal; A Quarterly Review of Religion, Theology and Philosophy* (London), quarterly; originally issued monthly. Treats religious and humanistic questions from a philosophical or cultural point of view. Contributors have included Henri Bergson, Sarvepalli Radhakrishnan, Bertrand Russell, Rabindranath Tagore, and Leo Tolstoy.

1905–1910. *Rivista storico critica delle scienze teologiche* (Rome), monthly.

1907–. *Revue des sciences philosophiques et théologiques* (Étiolles, Soisy-sur-Seine), quarterly, with variations. Founded by the French Dominicans of the Facultés de Philosophie et de Théologie du Saulchoir. Suspended 1915–1919 and 1943–1946.

1908–. *The Harvard Theological Review* (Cambridge, Mass.), quarterly.

1909–. *Rivista di filosofia neo-scolastica* (Milan), issued six times a year, with variations. Organ of the Istituto de Filosofia, Università Cattolica del Sacro Cuore.

1910–. *La ciencia tomista* (originally Madrid; now Salamanca), issued six times a year from 1910 to 1949, quarterly since 1950. Edited by the Spanish Dominicans.

**SOCIAL PHILOSOPHY AND AESTHETICS.** Journals of ethics, social philosophy, philosophy of culture, and aesthetics were fostered in the prewar period in Germany and Italy:

1906–1926. *Zeitschrift für Ästhetik und allgemeine Kunstwissenschaft* (Stuttgart), quarterly. Max Dessoir, editor.

1907–. *Archiv für Rechts- und Sozialphilosophie* (Neuwied; previously Munich), quarterly. Title has varied. Contains articles mainly in German and English.

1906–. *Rivista rosminiana di filosofia e di cultura* (Milan; formerly published at Pallanza and other Italian cities), quarterly, with variations. Edited by Giuseppe Morando from 1906 to his death in 1914; edited by his son Dante since 1937. Combats positivism and subjectivism.

1910–1941. *Zeitschrift für deutsche Kulturphilosophie; Neue Folge des Logos* (Tübingen), issued three times a year. Title was *Logos; Internationale Zeitschrift für Philosophie der Kultur* from 1910 to 1933. In 1934, when the journal was completely Nazified, Richard Kroner was replaced as editor in chief (a post which he had held since 1910) and Ernst Cassirer, Edmund Husserl, Friedrich Meinecke, and Rudolf Otto were summarily removed from the roll of collaborating editors.

**GENERAL PHILOSOPHY.** Several of the prewar journals were general in their philosophical coverage. Two were Italian:

1903–1951. *Quaderni della critica* (Naples), issued six times a year, with variations. Founded by Benedetto Croce. Title was *La critica; Rivista di letteratura, storia e filosofia* from 1903 to 1944. Contained many articles by Croce and by Gentile.

1908–1925. *Bollettino filosofico; Organo della Biblioteca Filosofica di Firenze* (Florence), monthly, with variations. Suspended 1910, 1913–1915, and 1917–1923.

France and the Netherlands gave rise to two others:

1900–. *Bulletin de la Société Française de Philosophie* (Paris), quarterly. Contributors have included Bergson, Louis de Broglie, Brunschvicg, Croce, Einstein, and Russell.

1907–. *Algemeen Nederlands Tijdschrift voor Wijsbegeerte en Psychologie* (Assen; formerly Amsterdam), issued five times a year. Organ of the

Algemene Nederlandse Vereniging voor Wijsbegeerte. Title was *Tijdschrift voor Wijsbegeerte* from 1907 to 1934. From 1934 to 1938 this periodical included, as a separate section, *Annalen der Critische Philosophie* (Assen, 1931–1938), which was also published separately and was succeeded by *Annalen van het Genootschap voor Wetenschappelijke Philosophie* (Assen, 1939–1959), which was likewise published separately in addition to being included in this periodical. Suspended 1944–1946.

One periodical begun in this period originated in what is now Czechoslovakia, and one in what is now Poland:

1902–1937. *Česká Mysl; Casopis Filosofický* (Prague), quarterly, with variations.

1911–. *Ruch Filozoficzny* (Torun; previously Lvov), originally monthly; now quarterly. Was a supplement to *Przegląd Filozoficzny* (Warsaw, 1897–1949) from 1911 to 1914. Suspended 1915–1919, 1939–1947, and 1951–1957 (the third period being one of militant Marxist domination of Polish philosophy). Organ of the Polskie Towarzystwo Filozoficzne.

Two of the general prewar products were English-language journals. One was an Irish intellectual quarterly:

1912–. *Studies; An Irish Quarterly Review of Letters, Philosophy & Science* (Dublin), quarterly. Title on individual issues is now *Studies; An Irish Quarterly Review*, but the annual title page for bound volumes continues to use the full title.

The other English-language philosophical periodical of a general character has been associated from the start with Columbia University.

“*The Journal of Philosophy.*” *The Journal of Philosophy* (New York, 1904–), issued fortnightly, was founded by Frederick J. E. Woodbridge and Wendell T. Bush. The title was *Journal of Philosophy, Psychology, and Scientific Methods* from 1904 to 1920. Provocative articles by William James, Arthur O. Lovejoy’s “The Thirteen Pragmatisms” (1908), the “First Platform and Program of the New Realists” (1910), and numerous other notable articles have appeared in its pages. Dewey was a frequent contributor, and his philosophy has been analyzed and appraised in the *Journal* from many angles.

A few of the other important articles, on a variety of subjects, that have appeared in the *Journal* are C. I. Lewis’ “A Pragmatic Conception of the A Priori” (1923), Herbert Feigl and Albert Blumberg’s “Logical Positivism, A New Movement in European Philosophy” (1931), which intro-

duced the term “logical positivism,” Ernest Nagel’s “Impressions and Appraisals of Analytic Philosophy in Europe” (1936), W. V. Quine’s “Designation and Existence” (1939), C. G. Hempel’s “The Function of General Laws in History” (1942), Nelson Goodman’s “The Problem of Counterfactual Conditionals” (1947), and Norman Malcolm’s “Knowledge of Other Minds” (1958). Also noteworthy are Nagel’s penetrating reviews, which were frequently featured in the *Journal* in the 1930s and 1940s.

From 1933 to 1936 the *Journal* published annual world-wide bibliographies of philosophy. In more recent years it has carried texts of papers presented at the annual meetings of the Eastern Division of the American Philosophical Association. In 1963/1964 the *Journal* was involved in a minor *cause célèbre* when, after publishing an article by one of its editors on the discussion between non-Soviet and Soviet philosophers at the Thirteenth International Congress of Philosophy (Mexico City, 1963), it declined to provide equal space, although it offered some space, for an article giving a contrary view of the same discussion.

## WORLD WAR I TO 1928

During World War I two new philosophical journals were begun in Europe and one each in Argentina and Japan. Only the Japanese journal is still being published. One of the European journals was a new *Logos*.

1914–1943. *Logos; Rivista trimestrale di filosofia e di storia della filosofia* (Perugia; later Naples and Florence; then Rome), quarterly. International board of editors. Suspended 1916–1919. Title was *Logos*, without the subtitle, from 1914 to 1938.

1915–1929. *Revista de filosofía, cultura, ciencias, educación* (Buenos Aires), issued six times a year, with variations.

1916–. *Tetsugaku Kenkyu; Journal of Philosophical Studies* (Kyoto), monthly. Organ of the Philosophical Society of Kyoto University. Contributors have included Heidegger and Jaspers.

1918–1943. *Blätter für deutschen Philosophie; Zeitschrift der Deutschen Philosophischen Gesellschaft* (Erfurt; later Berlin), quarterly. Title was *Beiträge zur Philosophie des deutschen Idealismus* from 1918 to 1927.

The years from 1919 to 1928 saw 32 new journals of philosophy roll off the presses, the largest quota in any ten-year period up to that time. Included were *The Per-*

sonalist, the first Chinese philosophical journals, another *Logos*, *The Australasian Journal of Philosophy*, *Philosophy*, and *The New Scholasticism*. Of the total of 32, 7 were Italian (5 survive), 5 German (2 survive), 5 French (all survive), and 4 American (all survive); the rest were scattered among China (3, none surviving), Czechoslovakia (2, none surviving), and Australia, Great Britain, India, Lithuania, the Netherlands, and Poland.

ITALIAN. Three of the Italian journals of the postwar decade have Latin names and concern theological matters chiefly:

1920–. *Gregorianum* (Rome), quarterly. Published by the Università Gregoriana di Roma. Articles in English, French, German, Italian, Latin, and Spanish.

1924–. *Angelicum* (Rome), quarterly. Journal of the Faculty of Theology, Canon Law, and Philosophy, Pontificium Athenaeum Angelicum. Articles in French, German, Italian, and Latin.

1926–. *Antonianum; Periodicum Philosophico-theologicum Trimestre* (Rome), quarterly. Published by the Athenaeum Antonianum de Urbe. Articles mainly in Latin; those in other languages are summarized in Latin

The other Italian philosophical journals of the period cover various fields:

1920–1923. *Rivista trimestrale di studi filosofici e religiosi* (Perugia), quarterly.

1920–. *Giornale critico della filosofia italiana* (Florence; previously Messina, Milan, Rome, and elsewhere), quarterly, with variations. Founded by Giovanni Gentile and edited by him until his assassination in 1944.

1921–. *Rivista internazionale di filosofia del diritto* (Milan), issued six times a year, with variations.

1924–1945. *L'idealismo realistico; Rivista di filosofia mazziniana* (Rome), monthly.

GERMAN. *Erkenntnis* (see below) was the most important journal of the postwar decade, but four other German journals also merit attention.

1919–1924. *Grundwissenschaft; Philosophische Zeitschrift der Johannes-Rehmke-Gesellschaft* (Leipzig), quarterly. Subtitle varied.

1923–1932. *Literarische Berichte aus dem Gebiete der Philosophie* (Erfurt), semiannual, with variations.

Title was *Literarische Berichte der Deutschen Philosophischen Gesellschaft* from 1923 to 1924.

The two German journals begun in this period that are still on earth are concerned with heavenly matters:

1923–. *Neue Zeitschrift für systematische Theologie und Religionsphilosophie* (Berlin; originally Gütersloh), issued three times a year; formerly quarterly (irregular 1956–1959). Title was *Zeitschrift für systematische Theologie* from 1923 to 1958, and *Neue Zeitschrift für systematische Theologie* from 1959 to 1962. Suspended 1944–1949.

1926–. *Scholastik; Vierteljahresschrift für Theologie und Philosophie* (Frankfurt; previously Freiburg im Breisgau), quarterly. Published by the Jesuits of the faculties of philosophy and theology, Hochschule St. Georg, Frankfurt, and Berchmanskolleg, Pullach-am-Main. Suspended 1941–1943; combined with the *Theologische Quartalschrift* (1819–) for one year, 1944; suspended 1945–1948.

“*Erkenntnis*.” *The Journal of Unified Science (Erkenntnis)* (Leipzig; later The Hague and Chicago, 1919–1940) was issued six times a year, with variations. Its title was *Annalen der Philosophie, mit besonderer Rücksicht auf die Probleme der als ob Betrachtung* from 1919 to 1923, *Annalen der Philosophie und philosophischen Kritik* from 1924 to 1930, and *Erkenntnis, zugleich Annalen der Philosophie* from 1930 to 1939. Hans Vaihinger was coeditor from 1919 to 1930. From 1930 to 1940 the editors were Rudolf Carnap and Hans Reichenbach (but Carnap alone in 1937/1938).

In the 1930s *Erkenntnis* was perhaps the most influential philosophical periodical ever published. The Vienna circle of logical positivists took over the journal, then entitled *Annalen*, in 1930 (Vaihinger, its coeditor, was then 78 years old), renamed it *Erkenntnis*, and transformed it into a medium—which struck sparks of fire in the philosophical world—for the discussion and propagation of the circle’s theses. The first issue of *Erkenntnis* contained Moritz Schlick’s “Die Wende der Philosophie” (“The Turning Point in Philosophy”) as the opening article and also Carnap’s “Die alte und die neue Logik” (“The Old and the New Logic”). In quick succession, in the early 1930s, the periodical published Carnap’s “Überwindung der Metaphysik durch logische Analyse der Sprache” (“Elimination of Metaphysics Through Logical Analysis of Language”), probably his most famous paper; Schlick’s “Positivismus und Realismus” (“Positivism and Realism”) and “Über das Fundament der Erkenntnis” (“On the Foundation of Knowledge”); Otto Neurath’s “Pro-

tokollsätze” (“Protocol Sentences”); and Ernest Nagel’s “Measurement.”

Other notable articles which appeared in *Erkenntnis* are Hans Reichenbach’s “Wahrscheinlichkeitslogik” (“Logic of Probability,” 1935) and others by him on probability theory, Max Black’s “Relations Between Logical Positivism and the Cambridge School of Analysis” (1939), and articles by Niels Bohr and other famous scientists and mathematicians, not all of whom were logical positivists. Various issues of *Erkenntnis* contained the proceedings of the Tagung für Erkenntnislehre der Exakten Wissenschaften (1929–1930), and of the International Congress for the Unity of Science (1934–1938).

Many of the articles published in *Erkenntnis* were translated into English and other languages and published in collections of the foundation papers of the logical positivist movement. Indeed, the journal had its greatest impact on philosophers in England and the United States rather than on those in continental Europe, many of whom had fallen under the spell of Martin Heidegger’s *Dasein*.

**FRENCH.** Two of the French periodicals of the first post-war decade are religiously oriented.

1921–. *Revue d’histoire et de philosophie religieuse* (Strasbourg), quarterly. Published by the Faculté de Théologie Protestante de l’Université de Strasbourg.

1924–. *Bulletin thomiste* (Étiolles, Soisy-sur-Seine), quarterly, with variations. Organ of the Société Thomiste.

The other three are secular and humanistic.

1923–. *Archives de philosophie* (Paris), quarterly, with variations. Suspended 1953–1954.

1926–. *Les Études philosophiques* (Paris), quarterly, with variations. Founded by Gaston Berger.

1927–. *Revue des sciences humaines* (Lille and elsewhere), quarterly, with variations. Title was *Revue d’histoire de la philosophie* from 1927 to 1931 and *Revue d’histoire de la philosophie et d’histoire générale de la civilisation* from 1933 to 1946. Suspended 1932, 1940–1941, and 1945.

**EASTERN EUROPEAN.** During the 1920s Prague was the birthplace of two philosophical journals and Kaunas and Cracow of one each (including another *Logos*):

1920–1939. *Ruch Filozoficzny* (Prague), issued six times a year, with variations.

1921–1938. *Logos; Filosofijos Laikraštis* (Kaunas), semiannual.

1922–1950. *Kwartalnik Filozoficzny* (Cracow), quarterly. Published by the Polskiej Nakładem Akademii Umiejętności. Suspended 1934 and 1940–1945. Editor in the last years of the periodical was Roman Ingarden. Emphasis on phenomenology and conceptual analysis.

1927–1929. *Filosofie* (Prague), issued ten times a year. Published under the auspices of the Ministerstvo Školství a Národní Osvěty of Czechoslovakia.

**AMERICAN.** In the United States a personalistic magazine and three religious journals were founded and are still being issued:

1920–. *The Personalist* (Los Angeles), quarterly. Issued by the University of Southern California.

1923–. *The Modern Schoolman* (St. Louis, Mo.), quarterly.

1926–. *Thought; A Review of Culture and Idea* (New York), quarterly. Founded by the Jesuit periodical *America*; directed since 1940 by Fordham University. Subtitle was *A Quarterly of the Sciences and Letters* from 1926 to 1939.

1927–. *The New Scholasticism* (Washington), quarterly. Organ of the American Catholic Philosophical Association. This periodical is one of the two best sources of philosophical news (teaching appointments, publication projects, congresses, etc.), the other being the *Revue philosophique de Louvain* (1894–).

**ASIAN AND AUSTRALASIAN.** The three Chinese journals of philosophy that were introduced in the 1920s are:

1921–1927. *Chê Hsüeh* [“Philosophy”] (Peking), issued six times a year, with variations. Generally referred to as *Chê Hsüeh Tsa Chih* (“Philosophical Journal”).

1926–1930. *Chê Hsüeh Yüeh K’an* [“Philosophical Monthly”] (Peking), monthly, with variations.

1927–1944. *Chê Hsüeh P’ing Lun* [“Philosophical Review”] (Peking), issued six times a year, with variations.

A journal published in India continues to be active:

1925–. *Philosophical Quarterly* (Calcutta; later Amalner), quarterly. Organ of the Indian Institute of Philosophy and the Indian Philosophical Congress.

“*The Australasian Journal.*” One journal published in Australia merits a pause for special comment: *The Australasian Journal of Philosophy* (Glebe, New South Wales, Australia, 1923–), issued quarterly from 1923 to 1937 and three times a year since 1938. It is the organ of the Australasian Association of Psychology and Philosophy. The title was *The Australasian Journal of Psychology and Philosophy* from 1923 to 1946.

The *Journal* announced in its first issue that some of its articles would be technical and addressed to a few experts, whereas others would treat of “topics of universal interest, ranging from the high metaphysical quest of the secret of the Absolute, to concrete problems of social and political ethics.” It undertook not to “scorn the old fogey in Philosophy, or disdain the new faddist.” Bertrand Russell helped the *Journal* get off to a flourishing start by publishing in its first volume (second issue) a little-known but important article of his, “Vagueness.”

In 1935 John Anderson, a controversial philosopher of Scottish origin, became the editor of the *Journal*. He thereafter exerted a strong influence not only on the *Journal* but also on the thinking of philosophers in his part of the world. The legislators of New South Wales, shocked by Anderson’s militant atheism, unsuccessfully demanded his removal from his teaching post at the University of Sydney.

The current editor of *The Australasian Journal of Philosophy* is A. K. Stout, son of G. F. Stout, former editor of *Mind*. This is the third notable case in which a son followed his father’s trade as editor of a philosophical journal, the other such families being the Fichtes, who respectively edited the *Philosophisches Journal*, 1795 ff., and the *Zeitschrift für Philosophie*, 1837 ff.; and the Morandos, who were editors at different times of the *Rivista rosminiana*, 1906 ff.

Among the challenging and widely discussed papers that Anderson on his pluralistic, positivistic realism; the last pieces by the elder Stout; some of the most celebrated articles by J. N. Findlay and others in the early 1940s on the philosophy of Wittgenstein; J. A. Passmore’s three articles entitled “Logical Positivism” (1943, 1944, and 1948) and his “Christianity and Positivism” (1957); J. J. C. Smart’s “The Reality of Theoretical Entities” (1956); A. N. Prior’s “The Autonomy of Ethics” (1960); and Keith Lehrer’s “Doing the Impossible” (1964). The *Journal*’s influence reached a particularly high level in the period beginning about 1955.

BRITISH AND DUTCH. The remaining examples of journals begun in the first postwar decade have had London and Hilversum as their headquarters:

1926–. *Philosophy* (London), quarterly. Organ of the British Institute of Philosophy. Title was *Journal of Philosophical Studies* from 1926 to 1931. Contributors have included Samuel Alexander, George Dawes Hicks, and Bertrand Russell.

1926–1944. *Denken en Leven; Wijsgeerig Tijdschrift* (Hilversum), issued six times a year.

### 1929–1938

From 1929 to 1938, 25 new journals of philosophy sought subscribers. Of these, 8 have fallen by the wayside, 6 being casualties of World War II. Among the new journals of this period were a Yugoslav quarterly, the first journals covering the philosophy of science and symbolic logic, and *Analysis*. Italy produced the most new philosophical journals (10); Germany produced none.

IDEALISTIC, RELIGIOUS, AND MYSTIC. Two publications on nonworldly philosophy were established in India:

1930–1935. *Review of Philosophy and Religion* (Poona), semiannual. Organ of the Academy of Philosophy and Religion.

1930–. *The Aryan Path* (Bombay), monthly. Popular ethics and mysticism, with emphasis on Indian philosophy.

The remaining examples of this kind of journal had their homes in Belgium, Italy, the Netherlands, and the United States, respectively:

1929–. *Recherches de théologie ancienne et médiévale* (Louvain), quarterly.

1934–. *Doctor Communis; Acta et Commentationes Pontificiae Accademiae Sanctae Thomae Aquinatis* (Rome; previously Turin), issued three times a year. Title was *Acta Pontificiae Accademiae Sanctae Thomae Aquinatis* from 1934 to 1947. Articles mainly in Latin; those in other languages are summarized in Latin.

1938–. *Bijdragen van de Philosophische en Theologische Faculteiten der Nederlandsche Jezuiten* (Maastricht), issued three times a year, with variations. Title has varied.

1938–. *Vedanta and the West* (Hollywood, Calif.), issued six times a year. Emphasis on mysticism.

Sponsored by the Vedanta Society of Southern California.

**LOGIC AND RELATED DISCIPLINES.** Balancing the inaugurations of religious periodicals were those of periodicals on logic, philosophy of science, and language analysis. The two most influential were *Analysis* and the *Journal of Symbolic Logic*.

**“Analysis.”** *Analysis* (Oxford, 1933–) is issued six times a year, with variations. The journal was suspended from 1940 to 1947. This periodical was founded by a number of younger philosophers under the influence of G. E. Moore, Bertrand Russell, and Ludwig Wittgenstein. It was intended mainly as a medium for short analyses and discussions. A group of supporters pledged to pay £5 each if the venture should so require, but the journal paid its way. In 1936 an Analysis Society was formed, also aimed at guaranteeing the financial stability of the journal, but it went out of existence a few years later; some of the papers read at its meetings were published in *Analysis*.

Max Black, in America, was closely associated with the journal from its foundation, and Rudolf Carnap, Carl Hempel, and Moritz Schlick, of the Vienna circle, contributed articles to early issues. Among the memorable articles that *Analysis* has published are A. J. Ayer’s “The Genesis of Metaphysics” (1934), Schlick’s “Facts and Propositions” (1935), Margaret Macdonald’s “Necessary Propositions” (1940), Black’s “The Semantic Definition of Truth” (1948), Friedrich Waismann’s six articles entitled “Analytic–Synthetic” (1949–1953), P. T. Geach’s “Russell’s Theory of Descriptions” (1950), Alonzo Church’s “On Carnap’s Analysis of Statements of Assertion and Belief” (1950), Gilbert Ryle’s “Heterologicality” (1951), Karl R. Popper’s “A Note on the Body–Mind Problem” (1955), Yehoshuah Bar-Hillel’s “New Light on the Liar” (1957), Peter Achinstein’s “The Circularity of a Self-supporting Inductive Argument” (1962), and Keith Gunderson’s “Interview With a Robot” (1963).

Many highlights from the journal were reprinted in *Philosophy and Analysis* (New York, 1954), edited by Margaret Macdonald, who was editor of *Analysis* from 1948 to her death in January 1956. For a time in the 1950s, *Analysis* conducted “competitions” and published the best short answers to such questions as “Does it make sense to say that death is survived?”

Especially in the early years of *Analysis*, its pages crackled with iconoclasm, terseness, and wit. Currently, some of the articles are longer than the average of the

early years, and a supplement containing extended articles is now issued annually.

**“Journal of Symbolic Logic.”** The *Journal of Symbolic Logic* (Providence, R.I.; previously Menasha, Wis., and Baltimore, Md., 1936–), issued quarterly, publishes articles in English, French, and German. It is the organ of the Association for Symbolic Logic.

This journal was the first one to be devoted exclusively to its field. In April 1934, Paul Weiss called attention to the fact that papers on logic were scattered in heterogeneous periodicals, and (without specifically proposing a new periodical) he suggested the formation of a logic association. Later in the year, C. J. Ducasse and C. A. Baylis explicitly urged the establishment of a journal of symbolic logic, to be supported by an association for symbolic logic. The response was encouraging, and the venture was undertaken.

Financing the *Journal* was a problem in the early years, and it was uncertain, after the publication of the third issue, whether the publication could continue. Happily, subventions were obtained from a number of universities, and dues payments accumulated sufficiently to enable the *Journal* to meet its bills.

Aside from the high quality of many of the articles, the *Journal* is noted for an exceptionally useful section devoted to reviews and abstracts of current literature. These reviews and abstracts purport to cover all pertinent books and articles which have come to the attention of the editors; the frame of reference of publications pertinent to symbolic logic is interpreted broadly. The reviews and abstracts constitute a continuation of Alonzo Church’s nonpareil bibliography of symbolic logic from 1666 to 1935 which appeared in the issue of December 1936, with a supplement in the issue of December 1938.

The well-deserved international reputation of the *Journal* derives in large part from the vast knowledge and logical acumen of Church, who is the principal editor. Among the many articles of enduring worth which have appeared in the *Journal* are Church’s “A Note on the *Entscheidungs-problem*” (1936), Barkley Rosser’s “Extensions of Some Theorems of Gödel” (1936), W. V. Quine’s “On the Theory of Types” (1938) and his “On Universals” (1947), Carl G. Hempel’s “A Purely Syntactical Definition of Confirmation” (1943), Rudolf Carnap’s “Modalities and Quantification” (1946), Wilhelm Ackermann’s “Begründung einer strengen Implikation” (1956), Gordon Matheson’s “The Semantics of Singular Terms” (1962), and Frederic B. Fitch’s “A Logical Analysis of Some Value Concepts” (1964).

**Other journals.** Other journals on logic, analysis, and so forth, were published in Poland, the United States, and the Netherlands:

1934–. *Studia Logica* (Warsaw), semiannual, with variations; formerly an annual. Suspended 1937–1952. Sponsored since 1953 by the Komitet Filozoficzny, Polska Akademia Nauk. Articles in English, French, German, Polish, and Russian, each with summaries in two other languages. In 1953 it absorbed the irregularly published *Studia Philosophica* (Warsaw, 1935–1951, four volumes).

1934–. *Philosophy of Science* (East Lansing, Mich.), quarterly. Organ of the Philosophy of Science Association.

1936–. *Synthese; An International Quarterly for the Logical and the Psychological Study of the Foundations of Science* (Dordrecht; previously Utrecht), quarterly, with variations. Subtitle has varied. Suspended 1940–1945 and 1964–1965. Articles in English, French, and German (originally, mainly in Dutch). Various issues have included a section (sometimes separately paged) entitled “Communications of the Institute for the Unity of Science” or “Unity of Science Forum.”

**SOCIAL AND MORAL PHILOSOPHY.** Italy produced three, and the United States one, of the social and moral periodicals that started in this prewar period:

1932–1943. *Archivio della cultura italiana* (Rome), quarterly. Title was *Archivio di storia della filosofia italiana* from 1932 to 1938.

1935–1941. *Rassegna di morale e di diritto* (Rome), quarterly.

1935–1942. *Journal of Social Philosophy & Jurisprudence; A Quarterly Devoted to a Philosophic Synthesis of the Social Sciences* (New York), quarterly. Title was *Journal of Social Philosophy* (with the same subtitle as later) from 1935 to 1941.

1935–. *Rivista internazionale di filosofia politica e sociale* (Genoa; formerly Padua), quarterly. Suspended 1944–1963.

**PHILOSOPHY, HISTORY, AND LETTERS.** Italy fathered three journals linking history and literature with philosophy:

1929–1943. *Civiltà moderna; Rassegna bimestrale di critica storica, letteraria, filosofica* (Florence), issued six times a year.

1929–. *Convivium; Rivista di lettere, filosofia e storia* (Turin), issued six times a year. Suspended 1944–1946. Subtitle has varied.

1931–. *Ricerche filosofiche; Rivista di filosofia, storia e letteratura* (Messina), semiannual, with variations. Since 1948 it has been the organ of the Società Filosofica Calabrese, founded in that year.

**GENERAL.** Seven regular academic or professional periodicals devoted to philosophy in general were begun in this period:

1931–1959. *Annalen van het Genootschap voor Wetenschappelijke Philosophie* (Assen), issued five times a year. Title was *Annalen der critische Philosophie* from 1931 to 1938. In 1959 absorbed into *Algemeen Nederlands Tijdschrift voor Wijsbegeerte en Psychologie* (Amsterdam and later Assen, 1907–), after having been published both separately and as a section of that periodical from 1934 to 1959.

1931–. *Archivio di filosofia* (Rome), issued three times a year, with variations. Originally the organ of the Società Filosofica Italiana; more recently the organ of the Istituto di Studi Filosofici and the Associazione Filosofica Italiana. Suspended 1943–1945.

1933–. *Sophia; Rassegna critica di filosofia e storia della filosofia* (Rome; formerly Palermo, Naples, and Padua), quarterly. Became international in 1935. Subtitle has varied. Contains articles in English, French, German, Italian, and Spanish, with subtitles in these languages.

1935–1940. *Bollettino filosofico* (Rome), quarterly.

1935–. *Theoria* (Lund, Goteborg, and Copenhagen; previously Goteborg), issued three times a year. Contains articles in English, French, and German (before 1937, in Danish, Norwegian, and Swedish).

1936–1940. *Philosophia; Philosophorum Nostri Temporis Vox Universa* (Belgrade), quarterly, with variations. Contained articles in English, French, and German.

1938–. *Revue internationale de philosophie* (Brussels), quarterly, with variations. Suspended 1939–1948. Each issue is devoted to a movement, problem, or philosopher, with a comprehensive bibliography.

## WORLD WAR II

In the seven years from 1939 to 1945, 21 journals of philosophy came into being. Fully 16 of these have survived,

and they include a number of today's outstanding philosophical journals.

**NORTH AMERICAN.** Canada, the United States, and Mexico produced a total of eight philosophical journals during World War II. Canada provided a new medium for discussions of theology and philosophy, *Laval théologique et philosophique* (Quebec, 1945–), issued semiannually. This journal is published by the Facultés de Théologie et Philosophie de l'Université Laval de Québec.

In Mexico, for 17 years, a university review of philosophy and letters was published: *Filosofía y letras* (Mexico City, 1941–1957), issued quarterly, with variations. It was the organ of the Facultad de Filosofía y Letras, Universidad Nacional Autónoma.

In the United States six periodicals, varying widely in their character and in their topical focus, began in the period from 1939 to 1945. Five of these were:

1939–1954. *Philosophic Abstracts* (New York), quarterly, with variations.

1939–. *The Thomist; A Speculative Quarterly Review* (Washington; formerly New York), quarterly. Edited by the Dominican Fathers of the Province of St. Joseph.

1940–. *Journal of the History of Ideas* (New York), quarterly.

1941–. *Journal of Aesthetics and Art Criticism* (Baltimore Md.), quarterly. Organ, since 1945, of the American Society for Aesthetics. Contributors have included Croce, Dewey, and Santayana.

1943–. *Etc.: A Review of General Semantics* (San Francisco; formerly Bloomington, Ill.), quarterly. Organ of the International Society for General Semantics. Anthology volumes, consisting of selections from *Etc.*, were published in 1954 and 1959.

**"Philosophy and Phenomenological Research."** The most influential journal begun during World War II was *Philosophy and Phenomenological Research* (Buffalo; then Philadelphia; now Buffalo again, 1940–), which is issued quarterly. This journal is an outgrowth of the *Jahrbuch für Philosophie und phänomenologische Forschung* (Halle, 1913–1930), which was founded by Edmund Husserl.

Husserl died in 1938. In the following year the International Phenomenological Society was formed in New York City to further the understanding, development, and application of phenomenological inquiry as inaugurated by Husserl. The Society's journal, *Philosophy and Phenomenological Research*, although taking Husserl's

philosophy as "the point of departure," announced at the outset that it would represent "no special school or sect." Its editor for a quarter of a century, Marvin Farber, has kept the journal's pages open to diverse points of view.

*Philosophy and Phenomenological Research* published the proceedings of the First Inter-American Conference of Philosophy (held at Yale University in 1943) and several stimulating symposia. The symposia dealt with meaning and truth, with articles by C. A. Baylis, C. J. Ducasse, Felix Kaufmann, C. I. Lewis, Ernest Nagel, R. W. Sellars, Alfred Tarski, W. M. Urban, A. Ushenko, and John Wild (1943–1945); probability, with articles by Gustav Bergmann, Rudolf Carnap, Kaufmann, Richard von Mises, Nagel, Hans Reichenbach, and Donald Williams (1945–1946); Russian philosophy and psychology, educational philosophy, "philosophy of freedom," and the philosophy of Arthur O. Lovejoy (various years in the 1940s and 1963); and "logical subjects and physical objects," with articles by Wilfrid Sellars and P. F. Strawson (1957).

Among the memorable individual articles in the journal were three little-known papers by Husserl entitled "Notizien zur Raumkonstitution" (Nos. 1 and 2, 1940), "Phänomenologie und Anthropologie" (1941), and "Persönliche Aufzeichnungen" (1956). Others include Paul Weiss's "The Meaning of Existence" (1940), Ernst Cassirer's "The Concept of Group and the Theory of Perception" (1944), Arthur Pap's "Logical Nonsense" (1948), Richard Mc-Keon's "Dialogue and Controversy in Philosophy" (1956), Lewis S. Feuer's "The Bearing of Psychoanalysis Upon Philosophy" (1959), Nagel's "Determinism in History" (1960), and Nicholas Rescher's "On the Logic of Presupposition" (1961). The journal publishes Spanish abstracts of its articles.

**SOUTH AMERICAN.** In 1944 two philosophical periodicals were established in Argentina:

1944–. *Stromata: Ciencia y fé* (Buenos Aires), issued quarterly by the Facultades de Filosofía y Teología, Colegio Máximo de San José, San Miguel. Title was *Ciencia y fé* from 1944 to 1964. Considered to be the successor to *Fascículos de biblioteca* (1937–1943) and *Stromata* (1938–1943).

1944–. *Philosophia* (Mendoza, Argentina), semiannual. Issued by the Instituto de Filosofía y Disciplinas Auxiliares, Universidad Nacional de Cuyo.

**WESTERN EUROPEAN.** Despite the atmosphere of war or preparations for war, new journals for philosophical discussion were begun in Belgium and France and in Spain and Portugal:

1939–. *Tijdschrift voor Filosofie* (Louvain), quarterly. Articles in English, Dutch, French, and German, with English, French, or German summaries of the articles in Dutch. Editors are chosen from Netherlands universities and Dutch-language universities of Belgium.

1942–. *Revista de filosofía* (Madrid), issued three times in 1942, quarterly since 1943. Organ of the Instituto de Filosofía Luis Vives. Scholastic. Some foreign contributors.

1945–. *Pensamiento; Revista de investigación e información filosófica* (Madrid), quarterly. Organ of the Facultades de Filosofía, Compañía de Jesús en España. Strong on the bibliography of Spanish and Latin American philosophy.

1945–. *Revista portuguesa de filosofía* (Braga; formerly Lisbon), quarterly. Organ of the Faculdade Pontifícia de Filosofia of Braga, a branch of the Society of Jesus.

1945–1955. *Dieu vivant; Perspectives religieuses et philosophiques* (Paris), quarterly, with variations.

CENTRAL AND SOUTHERN EUROPEAN. Contributions of Italy and neutral Switzerland were:

1940–1943. *Bollettino dell'Istituto di Filosofia del Diritto dell'Università di Roma* (Rome), issued six times a year.

1940–1949. *Studi filosofici; Problemi di vita contemporanea* (Milan), quarterly. Pro-Marxist from 1946 to 1949. Subtitle varied.

1945–. *Methodos; Linguaggio e cibernetica* (Milan; previously Rome), quarterly, with variations. Title was *Analisi; Rassegna di critica della scienza* from 1945 to 1947 and *Sigma; Conoscenza unitaria* from 1947 to 1948. Subtitle has varied. Contains articles in various languages. International editorial board. Organ, since 1959, of the Centro di Cibernetica e di Attività Linguistiche, Università di Milano, and of the Consiglio Nazionale delle Ricerche.

1945–. *Theologische Zeitschrift* (Basel), issued six times a year.

BULGARIAN AND ISRAELI. In Bulgaria and Israel the following journals came into being:

1945–. *Filosofska Mis'l* (Sofia), issued six times a year. Table of contents also in English, French, German, and Russian; summaries in English and Russian.

Issued since 1952 by the Institut po Filosofia, Bulgarska Akademiia na Naukite.

1945–. *Iyyun* (Jerusalem), quarterly. Irregular 1945–1948; suspended 1949–1950. Contains English summaries.

## POSTWAR PERIOD

In the early postwar years philosophical journals were founded at an unprecedented pace. They numbered 11 in 1946 (of which 9 have survived); 8 in 1947 (6 still alive); 5 in 1948 (4 still alive); and 7 in 1949 (3 still alive). Among them was another *Logos*.

1946. Three products of the first postwar year had humanistic titles:

1946–. *Teoresi; Rivista di cultura filosofica* (Catania; formerly Messina), quarterly, with variations. Emphasizes the synthesis of idealism and realism.

1946–. *Sapientia* (Buenos Aires), quarterly. Organ of the Facultad de Filosofía, Universidad Católica Argentina. Thomist. International contributors.

1946–. *Humanitas* (Brescia, Italy), monthly. In four parts, of which the part on philosophy is edited by Michele Federico Sciacca.

Four journals, including two from Japan, had standard, traditional titles:

1946–1949. *Tetsugaku Hyōron; Philosophical Review* (Tokyo), monthly.

1946–1949. *Tetsugaku Kikan* ["Quarterly Review of Philosophy"] (Kyoto), quarterly.

1946–. *Giornale di metafisica* (Turin), issued six times a year. Founded and edited by M. F. Sciacca. From 1946 to 1948 published by the University of Pavia; since then, by the University of Genoa. Has been described as following the Plato–Augustine–Rosmini tradition. Contributors include Maurice Blondel, Gabriel Marcel, and Jacques Maritain.

1946–. *Zeitschrift für philosophische Forschung* (Meisenheim am Glan, Germany; formerly Würzach), quarterly.

The others cover a variety of fields:

1946–. *Otázky Marxistickej Filozofie* (Bratislava, Czechoslovakia; formerly Prague), issued six times a year, with variations. Title was *Philosophica Slovaca* from 1946 to 1949 (issued annually); *Filozofický Sborník* from 1950 to 1952 (issued annually); *Filo-*

zofický *Časopis* from 1953 to 1955 (quarterly); and *Slovenský Filozofický Časopis* from 1956 to 1960 (quarterly). Issued by the Slovenská Akadémia Vied. Table of contents also in English, German, and Russian. Emphasis on historical materialism.

1946–. *Rassegna di scienze filosofiche* (Naples; previously Bari and Rome), quarterly. Title was *Noesis*; *Rassegna internazionale di scienze filosofiche e morali* in 1946. Suspended 1947. Neo-Scholastic.

1946–. *Rivista critica di storia della filosofia* (Milan), quarterly. Title was *Rivista di storia della filosofia* from 1946 to 1949.

1946–. *Nederlands Theologisch Tijdschrift* (Wageningen), issued six times a year.

1947. Two of the 1947 products expired within 3 to 11 years:

1947–1949. *Tetsugaku* [“Philosophy”] (Tokyo), quarterly.

1947–1958. *Wiener Zeitschrift für Philosophie, Psychologie, Pädagogik* (Vienna), semiannual.

The ones that are still alive include two that are general in their scope:

1947–. *Archiv für Philosophie* (Stuttgart), quarterly. Not to be confused with the *Archiv für Geschichte der Philosophie* (Berlin, 1868–), which was entitled *Archiv für Philosophie* from 1895 to 1926. Some issues of the Stuttgart periodical, beginning in the late 1940s, incorporated issues of the irregularly published *Archiv für mathematische Logik und Grundlagenforschung*.

1947–. *Voprosy Filosofii* (Moscow), monthly, with variations. Issued by the Institut Filosofii, Akademiia Nauk SSR. Contains summaries in English and titles in English, French, German, and Spanish.

“*Review of Metaphysics.*” The *Review of Metaphysics* (New Haven, 1947–), published quarterly, is one of the major media of discussion of the perennial problems of metaphysics. In addition, it publishes annual lists of doctoral dissertations accepted by philosophy departments in the United States and Canada, of professors who have become emeritus in philosophy, and of visiting philosophy professors from abroad. Beginning with December 1964, each issue contains abstracts of articles in certain philosophical periodicals, written (as in the case of the book abstracts formerly published in *Kant-Studien*) by the authors of the articles themselves. In earlier years the *Review* conducted competitions, comparable to those in

*Analysis* (1933–), for the best short answers to piquant questions, such as why there has never been a great woman philosopher.

Outstanding among the many important articles that have appeared in the *Review* are Paul Weiss’s “Being, Essence and Existence” (1947), W. V. Quine’s “On What There Is” (1948), Charles Hartshorne’s “The Immortality of the Past” (1953), Nathan Rotenstreich’s “The Genesis of Mind” (1962), and Wilfrid Sellars’ “Abstract Entities” (1963). The discussion section of the *Review* has also provided a large number of valuable contributions to current thought.

Two of the 1947 periodicals concern the philosophy of science or the unity of the sciences, and one is bibliographical:

1947–. *Dialectica; International Review of Philosophy of Knowledge* (Neuchâtel, Switzerland; and Paris), quarterly. Emphasis on philosophy of science.

1947–. *Studium Generale; Zeitschrift für die Einheit der Wissenschaften im Zusammenhang ihrer Begriffsbildungen und Forschungsmethoden* (Berlin), monthly. Articles in English, French, and German.

1947–. *Bulletin signalétique: Philosophie, sciences humaines* (Paris), quarterly. Title was *Bulletin analytique: Philosophie* from 1947 to 1955. Contains abstracts of books and articles on philosophical subjects. Published by the Centre de Documentation du Centre Nationale de la Recherche Scientifique.

1948. Three journals begun in 1948 were founded on the European continent:

1948–. *Revue d’esthétique* (Paris), quarterly.

1948–. *Sapienza; Rivista di filosofia e di teologia dei Domenicani d’Italia* (Naples), issued six times a year. Since 1956 the organ of the Centro Italiano di Studi Scientifici, Filosofici e Teologici. Subtitle has varied.

1948–. *Roczniki Filozoficzne* (Lublin), quarterly.

The others were issued in South America:

1948–1950. *Revista colombiana de filosofía* (Bogotá), issued six times a year. Emphasis on Thomism and phenomenology.

1948–. *Filosofía, letras y ciencias de la educación* (Quito), semiannual. Published by the Facultad de Filosofía, Letras y Ciencias de la Educación, Universidad Central, Quito. Title has varied.

1949. Another *Logos* appeared in 1949, along with two periodicals called “philosophical studies” (in German and in English), and four other journals:

1949–1951. *Logos* (Mexico City), quarterly. Published by the Mesa Redonda de Filosofía, Facultad de Filosofía y Letras, Universidad Nacional Autónoma de México.

1949–1952. *Philosophische Studien* (Berlin), quarterly, with variations.

1949–. *Philosophical Studies* (Minneapolis), issued six times a year. Brief articles. Many distinguished contributors.

1949–1953. *Revista de filosofía* (Santiago, Chile), quarterly. Organ of the Sociedad Chilena de Filosofía and the Universidad de Chile.

1949–1954. *Notas y estudios de filosofía* (Tucumán, Argentina), quarterly.

1949–. *Philosophischer Literaturanzeiger* (Stuttgart; formerly Schlesdorf am Kochelsee, then Stuttgart, then Meisenheim am Glan), issued eight times a year.

1949–. *Analele româno-sovietice; Filozofie* (Bucharest), quarterly, with variations. Table of contents also in Russian. From 1949 to 1951 it was a part of *Analele româno-sovietice; Seria istorie-filozofie* (quarterly; issued six times in 1951; title also in Russian), which itself had been a part, from 1946 to 1949, of *Analele româno-sovietice* (issued irregularly; title also in Russian).

## THE NINETEEN-FIFTIES

The decade of the 1950s saw 11 new English-language journals, 13 Spanish-language journals, 11 Italian, 4 Portuguese, 4 French, 3 German, 2 Dutch, and 1 each in Hungarian, Rumanian, Polish, Serbo-Croat, Russian, Chinese, and Japanese. As in two earlier periods, Italy was the leading or a leading producer of new philosophical journals.

ENGLISH. In continental United States and Hawaii the following journals were introduced:

1951–. *Philosophy East and West* (Honolulu), quarterly. Emphasizes Oriental and comparative thought. Suspended from 1964 to 1966.

1957–. *Philosophy Today* (Celina, Ohio), quarterly. Mainly contains reprints or translations of articles appearing elsewhere. Religious emphasis.

In Scotland are published a journal for the philosophy of science and a quarterly which has the same title as a living Indian journal begun in 1925:

1950–. *British Journal for the Philosophy of Science* (Edinburgh), quarterly.

1950–. *The Philosophical Quarterly* (St. Andrews, Scotland), quarterly. Published for the Scots Philosophical Club.

The Commonwealth countries of Canada, India, and Pakistan produced the following periodicals:

1953–. *Diogenes; An International Journal for Philosophy and Humanistic Studies* (Montreal; formerly New York), quarterly. Published under the auspices of the International Council for Philosophy and Humanistic Studies with the assistance of UNESCO.

1953–. *Journal of the Philosophical Association* (Amraoti, India; later Nagpur), quarterly. Organ of the Indian Philosophical Association. Contributors outside India have included P. T. Geach, Elizabeth Anscombe, and A. N. Prior.

1956–. *Indian Philosophy and Culture* (Vrindaban, India), quarterly. Issued by the Vaishnava Research Institute.

1957–. *Pakistan Philosophical Journal* (Lahore), quarterly.

1959–. *The Indian Journal of Philosophy* (Bombay), quarterly; formerly issued three times a year. Published for the Association for Philosophical Research.

From the Netherlands and Norway come the following:

1956–. *Phronesis; A Journal for Ancient Philosophy* (Assen), semiannual.

1958–. *Inquiry; An Interdisciplinary Journal of Philosophy and the Social Sciences* (Oslo), quarterly. Emphasis on analytic philosophy.

SPANISH. In South America five periodicals sprang to life, including one which repeated the title (*Humanitas*) of an Italian journal begun in 1946:

1950–1954. *Revista de filosofía* (La Plata, Argentina), quarterly. Issued by the Instituto de Filosofía, Universidad Nacional de La Plata.

1951–1954. *Ideas y valores* (Bogotá), quarterly. Issued by the Facultad de Filosofía y Letras de la Universidad Nacional. Title varied slightly.

1952–. *Arkhé Revista americana de filosofía sistemática y de historia de la filosofía* (Córdoba, Argentina), semiannual (formerly issued three times a year). Suspended 1955 to mid-1964. Title was originally *Arqué* subtitle varied.

1953–. *Filosofía; Revista semestral* (Quito), semiannual. Organ of the Sección de Ciencias Filosóficas y de la Educación de la Casa de la Cultura Ecuatoriana.

1953–. *Humanitas; Revista de la Facultad de Filosofía y Letras, Universidad Nacional de Tucumán* (San Miguel de Tucumán), issued three times a year, with variations.

In Central America and the Caribbean, two university *Revistas* appeared:

1956–1958. *Revista dominicana de filosofía* (Ciudad Trujillo, now called Santo Domingo), semiannual, with variations. Organ of the Facultad de Filosofía of the Universidad de Santo Domingo.

1957–. *Revista de filosofía de la Universidad de Costa Rica* (San José), semiannual.

In Spain itself six periodicals arose, including one which repeated the title (*Convivium*) of a journal begun at Turin in 1929:

1951–. *Estudios filosóficos; Revista de investigación y crítica* (Las Caldas de Besaya, Spain), issued three times a year. Organ of the Spanish Dominicans.

1951–. *Archivum; Revista de la Facultad de Filosofía y Letras, Universidad de Oviedo* (Oviedo), semiannual, with variations.

1952–. *Espíritu; Cuadernos del Instituto Filosófico de “Balmesiana”* (Barcelona), semiannual, with variations.

1954–. *Crisis; Revista española de filosofía* (Madrid), quarterly. Emphasizes Christian existentialism.

1956–1957. *Convivium; Estudios filosóficos* (Barcelona), semiannual. Issued by the Facultad de Filosofía y Letras, Universidad de Barcelona.

1956–. *Augustinus* (Madrid), quarterly. Many foreign contributors.

ITALIAN. Three of the births of Italian philosophical journals took place at Milan: one each in 1950, 1951, and 1952.

1950–1962. *Il pensiero critico* (Milan), quarterly. In 1963 absorbed into the *Rivista di filosofia* (Milan, 1870–).

1951–. *Aut Aut; Rivista di filosofia e di cultura* (Milan), issued six times a year. Title is based on the Kierkegaardian *Either/Or*

1952–. *Bollettino della Società Filosofica Italiana* (Milan), quarterly.

Three births also occurred at Rome, including that of a journal with a Latin title which contains articles in Italian and other languages:

1952–. *Rassegna di filosofia* (Rome), quarterly. Organ of the Istituto di Filosofia, Università di Roma.

1955–. *La nuova critica; Studi e rivista di filosofia delle scienze* (Rome; formerly Florence), semiannual. Articles mostly in Italian, but with some in English and French. International board of editors. The title may reflect a desire for association with Croce’s Naples journal *La critica* (1903 ff.), which, under a slightly different title, had died in 1951.

1958–. *Aquinas; Ephemerides Thomisticae* (Rome), issued three times a year, with variations. Subtitle has varied. Now issued by the Faculty of Philosophy, and the Patristic–Medieval Institute “*Joannes XXIII*,” of the Pontificia Universitas Lateranensis. Articles in English, French, Italian, Latin, and Spanish.

The locale of two births was Turin; of two others, Padua; and of one, Bologna:

1950–. *Filosofia* (Turin), quarterly.

1951–. *Il saggiatore; Rivista di cultura filosofica e pedagogica* (Turin), quarterly.

1954–. *Studia patavina; Rivista di filosofia e teologia* (Padua), issued three times a year; formerly a quarterly.

1956–. *Rivista di estetica* (Turin; formerly Padua), issued three times a year.

1957–. *Il dialogo* (Bologna), quarterly, with variations.

PORTUGUESE. The Portuguese-language journals which were brought into being in the 1950s were:

1951–1959. *Revista filosófica* (Coimbra, Portugal), issued three times a year, with variations.

1951–. *Revista brasileira de filosofia* (São Paulo), quarterly. Organ of the Instituto Brasileiro de Filosofia. Chiefly in Portuguese, with some articles in English, French, Italian, Spanish, and other languages.

1954–. *Filosofia; Revista do Gabinete de Estudos Filosóficos* (Lisbon), quarterly. Subtitle has varied.

1959–. *Organon; Revista da Faculdade de Filosofia da Universidade do Rio Grande do Sul* (Pôrto Alegre), quarterly, with variations.

FRENCH. Four new journals of philosophy in the French language appeared in the 1950s, including two published in Belgium (one with articles in English, French, and German) and one published in the Saar (with articles in French and German), which are included here among the French journals, since the titles of two are in French, and the title of the third is in Latin and French:

1951–. *Morale et enseignement* (Brussels), quarterly, with variations. Published by the Institut de Philosophic, Université de Bruxelles.

1951–. *Revue de l'enseignement philosophique* (Paris), issued six times a year, with variations. Organ of the Association des Professeurs de Philosophie de l'Enseignement Public.

1952–. *Annales Universitatis Saraviensis; Philosophie–lettres* (Saarbrücken), quarterly, with variations. Published since 1957 by the Philosophische Fakultät, Universität des Saarlandes. Articles in English, French, and German.

1954–. *Logique et analyse* (Louvain), quarterly, with variations. Articles in English, French, and German. Organ of the Centre National (Beige) de Recherches de Logique; issued only to members from 1954 to 1957 under the title *Bulletin intérieure*.

GERMAN AND DUTCH. Three new journals of philosophy in the German language appeared during the 1950s:

1950–. *Philosophia Naturalis; Archiv für Naturphilosophie und die philosophischen Grenzgebiete der exakten Wissenschaften und Wissenschaftsgeschichte* (Meisenheim am Glan), quarterly, with variations.

1953–. *Philosophische Rundschau* (Heidelberg), quarterly, with variations. Reviews of current books. Concerned largely, in its early years, with surveys of new philosophical literature, this became a general philosophical journal. Contains occasional articles in English.

1953–. *Deutsche Zeitschrift für Philosophie* (East Berlin), monthly, with variations (quarterly, 1953–1954; issued six times a year, 1955–1959). Table of contents also in English, French, Russian, and Spanish.

The Dutch-language journals of the 1950s include one with a Dutch title and one with a Latin title:

1959–. *Dialogo; Tijdschrift voor Wijsbegeerte* (Antwerp), quarterly.

1959–. *Scripta Recenter Edita* (Nijmegen), issued ten times a year. Contains a list of books on philosophy and theology, with emphasis on theology.

RUMANIAN, HUNGARIAN, AND SLAVIC. The period produced one Rumanian and one Hungarian organ, each issued for the most part four times a year:

1954–. *Cercetări filozofice* (Bucharest), quarterly, with variations. Table of contents also in French and Russian; summaries in French or German and in Russian.

1957–. *Magyar Filozófiai Szemle* (Budapest), quarterly, with variations. Table of contents, and summaries, in English, German, and Russian. Organ of the Magyar Tudományos Akadémia Filozófiai Intézetének Folyóirata.

Of the Slavic languages, Polish, Serbo-Croatian, and Russian are represented once each in the new philosophical journals of the 1950s.

1951–. *Studia Filozoficzne; Kwartalnik* (Warsaw), quarterly, with variations. Title was *Mysł Filozoficzna* from 1951 to 1955 (issued six times a year). Sponsored from 1952 to 1955 by the Komitet Filozoficzny, Polska Akademia Nauk. Suspended 1956. Published by the Instytut Filozofii i Socjologii, Polska Akademia Nauk. Table of contents and summaries of articles in English and Russian. This periodical replaced *Przegląd Filozoficzny* (1897–1949) at the beginning of the period of militant Marxist domination. According to an article in a 1963 issue of *Studia Filozoficzne*, it was Lenin who first solved Zeno's antinomy of the arrow in flight.

1953–1958. *Filozofski Pregled* (Belgrade), issued three times a year, with variations.

1958–. *Nauchnye Doklady Vysshoi Shkoly; Filosofskie Nauki* (Moscow), issued six times a year; originally issued quarterly. Often cited as *Filosofskie Nauki*, without the series title (“Scientific Reports of the Higher School”) represented by the first four words.

JAPANESE AND CHINESE. Also begun in the 1950s were *Bigaku; Aesthetics* (Tokyo, 1950–), issued quarterly, and *Ché Hsüeh Yen Chiu* [“Philosophical Research”] (Peking, 1955–), issued six times a year; formerly quarterly.

## THE NINETEEN-SIXTIES

The early years of the 1960s were fruitful in the production of new journals of philosophy, but not as fruitful as the record year of 1946 (11 journals). The year 1960 brought forward 9; 1961, 4; 1962, 6; 1963, 5; 1964, 3; 1965, 6; and 1966, 1 (as of the time of the completion of this article).

1960. Three philosophical journals which were started in 1960 had their origin in England:

1960–. *The Heythrop Journal; A Quarterly Review of Philosophy and Theology* (Oxford), quarterly. Issued by the Jesuit Faculties of Philosophy and Theology, Heythrop College, Oxford.

1960–. *The British Journal of Aesthetics* (London), quarterly. Published for the British Society of Aesthetics.

1960–. *Philosophical Books* (Leicester, England), originally a quarterly; now issued three times a year.

Three had their origin in the United States:

1960–. *Notre Dame Journal of Formal Logic* (Notre Dame, Ind.), quarterly.

1960–. *Studies in Philosophy and Education* (Toledo, Ohio; previously New Brunswick, N.J.), quarterly, with variations.

1960–. *Journal of Existentialism* (New York), quarterly. Title was *Journal of Existential Psychiatry* from 1960 to 1964.

Amsterdam, Madrid, and Rome fathered one philosophical journal each in 1960:

1960–. *Wijsgerig Perspectief op Maatschappij en Wetenschap* (Amsterdam), issued six times a year. Each issue devoted to a specific topic.

1960–. *Noesis; Revista de filosofía y arte* (Madrid), quarterly. Suspended 1962–1963. *Noesis* had previously been the title of a philosophical journal in Italy in 1946.

1960–. *Filosofia e vita; Quaderni trimestrali de orientamento formativo* (Turin; previously Rome), quarterly.

1961. Two journals of philosophy were inaugurated in the United States, and one each in India and the Netherlands, in 1961:

1961–. *Journal for the Scientific Study of Religion* (New Haven), semiannual.

1961–. *International Philosophical Quarterly* (New York and Heverlee–Louvain), quarterly. Edited by the department of philosophy of Fordham University and the professors of philosophy, Berchmans Philosophicum, Heverlee, Belgium.

1961–. *Darshana* (Moradabad, India), quarterly. International board of consultants.

1961–. *Studies in Soviet Thought* (Dordrecht), quarterly. Published by the Institute of East-European Studies, University of Fribourg, Switzerland. Articles in English, French, and German.

1962. Two more journals were inaugurated in the United States, and one each in Argentina, Canada, Italy, and Australia, in 1962:

1962–. *Pacific Philosophical Forum* (Stockton, Calif.), quarterly. Each issue devoted to a specific subject, with a set format (thesis and countertheses).

1962–. *Soviet Studies in Philosophy* (New York), quarterly. Contains translations from Soviet publications, mainly Soviet periodicals.

1962–. *Cuestiones de filosofía* (Buenos Aires), quarterly.

1962–. *Dialogue; Canadian Philosophical Review; Revue canadienne de philosophie* (Montreal), quarterly. Articles in English and French. Sponsored by the Canadian Philosophical Association.

1962–. *De Homine* (Rome), quarterly. Issued by the Centro di Ricerca per le Scienze Morali e Sociali, Istituto di Filosofia, Università di Roma.

1962–. *Sophia; A Journal for Discussion in Philosophical Theology* (Melbourne), issued three times a year. An Italian *Sophia* began publication in 1933.

1963. As in 1961 and 1962, two journals of philosophy were inaugurated in the United States in 1963; in addition, two were inaugurated in India and one in the Netherlands:

1963–. *Southern Journal of Philosophy* (Memphis, Tenn.), quarterly.

1963–. *Journal of the History of Philosophy* (Berkeley), semiannual.

1963–. *Indian Journal of Philosophic Studies* (Hyderabad), semiannual. Published for the Andhra Pradesh Philosophical Society by the department of philosophy of Osmanian University, Hyderabad.

1963–. *Research Journal of Philosophy and Social Sciences* (Meerut, Uttar Pradesh, India), semiannual, with variations. International editorial board. Each issue contains about 200 pages on a particular subject.

1963–. *Vivarium; A Journal for Mediaeval Philosophy and the Intellectual Life of the Middle Ages* (Assen), semiannual.

1964. Three new contributions appeared in the year 1964:

1964–. *American Philosophical Quarterly* (Pittsburgh, Pa.), quarterly. International board of consultants. Articles only; no book reviews.

1964–. *The Philosophical Journal* (Edinburgh), semiannual. Issued by the Royal Philosophical Society of Glasgow. Although mainly concerned with scientific matters, the *Journal* also contains some valuable philosophical articles.

1964–. *Documentación crítica iberoamericana de filosofía y ciencias afines* (Seville), quarterly.

1965. The following journals began publication in 1965:

1965–. *Concilium; An International Review of Theology* (London), issued ten times a year.

1965–. *Foundations of Language; International Journal of Language and Philosophy* (Dordrecht, Netherlands), issued quarterly.

1965–. *Information aus dem philosophischen Leben der Deutschen Demokratischen Republik* (East Berlin), issued quarterly.

1965–. *Religious Studies* (London), semiannual. Articles on philosophy of religion and history of religion.

1965–. *Transactions of the Charles S. Peirce Society* (Amherst, Mass.), semiannual.

1965–. *Revue universitaire de science morale* (Geneva), issued three times a year.

1966. One philosophical journal began publication in 1966 before the present article was completed:

1966–. *The Bulletin of Philosophy* (Washington), issued eight times a year. Contains news of interest to philosophers.

The expansion in the twentieth century of the number of currently published journals of philosophy has roughly paralleled the growing interest in philosophy as an academic discipline.

## Bibliography

Four authors have studied philosophical journals in general. In chronological order, their reports on this field are Friedrich Medebach, "Die philosophische Fachzeitschrift," in *Zeitungswissenschaft*, Vol. II (Berlin, 1936), 210–214; David Baumgart, *Philosophical Periodicals; An Annotated World List* (Washington, 1952); Augusto da Silva, *Revistas de filosofia* (Braga, Portugal, 1955); and Tóth Ilona Kovácsné, "A Magyar Közkönyvtarakban Megtalálható Kurrens Filozófia Periodikák" ("Current Philosophical Periodicals Available in Public Libraries in Hungary"), in *Magyar Filozófiai Szemle*, Vol. 8 (Budapest, 1964), 574–601.

Three sources cover philosophical journals in particular countries: Paul Feldskeller, "Das philosophische Journal in Deutschland," in *Reichs philosophischer Almanach* (Darmstadt, 1924), pp. 302–458; Enrico Zampetti, *Bibliografia ragionata delle riviste filosofiche italiana del 1900* (Rome, 1956), and the highly knowledgeable passages on periodicals in Max Rieser, "Polish Philosophy Today," in *Journal of the History of Ideas*, Vol. 24 (1963), 423–432.

Short articles on 83 periodicals appear in the *Enciclopedia filosofica*, 4 vols. (Venice and Rome, 1957). Other pertinent sources are the list, published annually in the *Répertoire bibliographique de la philosophie*, of periodicals covered by the *Répertoire*, and the list headed "Philosophy" in *Ulrich's Periodicals Directory* (New York, 1932; 10th ed., 1963).

The titles appearing in the philosophy category in the monthly *New Serial Titles; Classed Subject Arrangement* (Washington, 1955–) are useful, as is also the record of births and deaths of periodicals (as well as of libraries which possess complete or partial sets of the periodicals) in the *Union List of Serials in Libraries of the United States and Canada*, edited by Edna Brown Titus, 3rd ed., 5 vols. (New York, 1965), continued as *New Serial Titles*, which was begun by the Library of Congress in 1953 and is published monthly.

William Gerber (1967)

## PHILOSOPHY JOURNALS [ADDENDUM]

The English-language journal citations in this update are organized chronologically by year of first publication, and appear within the individual year listings alphabetically by journal title. The non-English-language journal citations directly follow the English-language list; they too are organized chronologically by year of first publication, and appear within individual year listings alphabetically by journal title.

ENGLISH LANGUAGE

1965

*Foundations of Language*. Dordrecht, The Netherlands; Boston: D. Reidel. 1965–1976 bimonthly (formerly quarterly).

*International Directory of Philosophy and Philosophers*. Bowling Green, OH: Bowling Green State University, Philosophy Documentation Center. 1965–.

*Transactions of the Charles S. Peirce Society*. Amherst, MA: University of Massachusetts Press. 1965– quarterly.

1966

*Apeiron*. University of Alberta, Dept. of Classics and Monash University, Dept. of Classical Studies. Edmonton: Academic Print. & Pub. 1966–.

*The Teilhard Review*. Pierre Teilhard de Chardin Association of Great Britain and Ireland (London). Teilhard Centre for the Future of Man. 1966–1981.

1967

*Conceptus*. Innsbruck: J. Zelger. 1967–.

*Noûs*. Wayne State University, Dept. of Philosophy. Detroit: Wayne State University Press. 1967– quarterly.

*The Philosopher's Index*. Bowling Green, OH: Bowling Green State University, Philosophy Documentation Center. 1967– quarterly.

*Royal Institute of Philosophy Lectures*. Royal Institute of Philosophy. London: Macmillan. New York: St. Martin's. 1967–1990; semiannual, 1987–1990.

1968

*American Philosophical Quarterly*. Monograph Series. University of Pittsburgh, Dept. of Philosophy. Oxford: Basil Blackwell. 1968–1978 irregular.

*Kinesis*. Carbondale, IL: Southern Illinois University, Dept. of Philosophy. 1968– semiannual.

*Man and World*. State College, PA: I.P.R. Associates. 1968–1997 quarterly.

*The Philosopher's Index*. Richard H. Lineback. Bowling Green, OH: Philosopher's Information Center. 1968–cumulative ed.

*Philosophy and History*. Tübingen, Germany: Institut für wissenschaftliche Zusammenarbeit. 1968–1991 semiannual.

*Philosophy and Rhetoric*. University Park, PA: Pennsylvania State University Press. 1968– quarterly.

*The Philosophy Forum*. DeKalb, IL: Northern Illinois University. 1968–1980 quarterly.

1969

*Chinese Studies in Philosophy*. White Plains, NY: International Arts and Sciences Press, M. E. Sharpe, Inc. 1969–1997.

*The Journal of Critical Analysis*. Bemidji, MN: National Council of Teachers for Critical Analysis. 1969– quarterly.

*The Owl of Minerva: Quarterly Journal of the Hegel Society of America*. Villanova, PA: Hegel Society of America. Villanova University, Philosophy Dept., and Florida State University. 1969– semiannual.

*Studies in Philosophical Linguistics*. William L. Todd. Evanston, IL: Great Expectations. 1969.

*The Undergraduate Journal of Philosophy*. Oberlin, OH: Oberlin College, Philosophy Dept. 1969–1977.

1970

*Auslegung*. Lawrence, KS: Dept. of Philosophy, University of Kansas. 1970s– semiannual.

*International Journal for Philosophy of Religion*. Dordrecht, The Netherlands; Boston: Martinus Nijhoff. 1970– four issues per year; 1983– six issues per year.

*The Journal of Philosophical Linguistics*. William Todd. Evanston, IL: Great Expectations. 1970–1971.

*Metaphilosophy*. Oxford: Basil Blackwell for the Metaphilosophy Foundation. 1970–1999; 2000– five issues per year.

*Philosophic Exchange*. Brockport, NY: State University of New York College at Brockport, Center for Philosophic Exchange, College of Arts and Science. 1970–.

*PSA; Proceedings of the Biennial Meeting of the Philosophy of Science Association*. East Lansing, MI: Philosophy of Science Association. 1970–1994 biennial.

*The Southwestern Journal of Philosophy*. Norman, OK: Southwestern Philosophical Society. 1970–1980.

*philosophy journals [addendum]*

*Studies in History and Philosophy of Science.* Oxford; New York: Pergamon Press. 1970– quarterly since 1995.

*Theory and Decision.* Dordrecht, The Netherlands: D. Reidel. 1970– eight issues per year.

1971

*Canadian Journal of Philosophy.* Edmonton: Canadian Association for Publishing in Philosophy. 1971–.

*Graduate Faculty Philosophy Journal.* New York: New School for Social Research, Philosophy Dept. 1971– semi-annual.

*Idealistic Studies.* Worcester, MA: Clark University Press. 1971– three issues per year.

1972

*Aitia.* Farmingdale, NY: State University of New York at Farmingdale. 1972– 1992 three issues per year.

*Journal of Philosophical Logic.* Association for Symbolic Logic. Dordrecht, The Netherlands; Boston: Kluwer Academic. 1972– bimonthly.

*Paideia.* Buffalo, NY: State University College at Buffalo; University of New York College at Brockport. 1972.

*Philosophical Linguistics.* William Todd. Evanston, IL: Great Expectations. 1972–1973.

*Philosophical Papers.* Dept. of Philosophy, Rhodes University, and University of the Witwatersrand. 1972– three issues per year.

*Philosophy in Context.* Cleveland, OH: Cleveland State University, Dept. of Philosophy. 1972–1990 annual.

*Radical Philosophy.* Radical Philosophy Group (Great Britain). Canterbury: Radical Philosophy Group. 1972– bimonthly.

*Second Order.* Ile-Ife, Nigeria: University of Ife Press. 1972— semiannual.

*Thêta-pi.* Leiden, The Netherlands: E. J. Brill. 1972–1974 semiannual.

1973

*CIRPHO.* Montreal: International Society for Computer Research in Philosophy. 1973–1976.

*Gnosis.* Montreal: Sir George Williams University, Dept. of Philosophy. 1973–.

*Indian Philosophical Quarterly.* Pratap Centre of Philosophy. Amalner, India: University of Poona, Dept. of Philosophy. 1973– quarterly.

*Radical Philosophers' Newsjournal.* Somerville, MA: Radical Philosophers' Newsjournal. 1973–1990s.

*Revolutionary World.* Amsterdam: B. R. Grüner Pub. Co. 1973–1982 five issues per year.

1974

*Indian Journal of Philosophic Studies.* Osmania University, Dept. of Philosophy. Hyderabad: Osmania University 1974–.

*International Studies in Philosophy.* State University of New York at Binghamton. Torino, Italy: Filosofia. 1974–1979 annual, 1980–1981 semiannual, 1982– three issues per year.

*Journal of the Philosophy of Sport.* Philosophic Society for the Study of Sport, and the International Association for the Philosophy of Sport. Champaign, IL: Human Kinetics Publishers. 1974–2000 annual, 2001– semiannual.

*Lias.* Amsterdam: Holland University Press. 1974– two issues per year.

1975

*Canadian Journal of Philosophy.* Supp. vol. Guelph, ON: Canadian Association for Pub. in Philosophy. 1975–.

*Journal of the Department of Philosophy.* University of Calcutta, Dept. of Philosophy. Calcutta: University of Calcutta. 1975–.

*Philosophy and Medicine.* Spicker, Stuart F., and H. Tristram Engelhardt. Dordrecht, The Netherlands; Boston: Reidel. 1975–.

*Philosophy Research Archives.* American Philosophical Association, and Canadian Philosophical Association. Bowling Green, OH: Bowling Green State University, Philosophy Documentation Center. 1975–1981 annual.

*Poznan Studies in the Philosophy of the Sciences and the Humanities.* Amsterdam: Rodopi. 1975– quarterly.

*Teaching Philosophy.* Cincinnati, OH: [s.n.]. 1975– quarterly, formerly semiannual.

1976

*Midwest Studies in Philosophy*. Morris, MN: University of Minnesota, Morris. 1976– annual.

*Philosophical Studies in Education*. Ohio Valley Philosophy of Education Society. Terre Haute, IN: School of Education, Indiana State University. 1976– annual.

*Philosophy and Literature*. University of Michigan, Dearborn; Whitman College. Baltimore, MD: Johns Hopkins University Press. 1976–.

*Southwest Philosophical Studies*. Lubbock, TX: Texas Tech Press. 1976 annual, 1982 Spring, 1988 three issues per year, 1988– annual.

1977

*Aletheia*. Irving, TX: International Academy of Philosophy Press. 1977– irregular.

*A Directory of Women in Philosophy*. Bowling Green, OH: Bowling Green State University, Philosophy Documentation Center. 1977–1982.

*The Independent Journal of Philosophy*. Vienna: G. E. Tucker. 1977–.

*Linguistics and Philosophy*. Dordrecht, The Netherlands: Kluwer Academic. 1977– bimonthly.

*Reports on Philosophy*. Uniwersytet Jagiellonski. Warsaw: Polish Scientific Publishers. 1977–.

*Review Journal of Philosophy & Social Science*. Meerut, India: Anu Prakashan. 1977–.

*Towards*. Northridge, CA: C. Monks. 1977– semiannual.

1978
