**RAPHAEL HYTHLODAEUS.** The unconscious pull of Platonism and Stoicism, not to mention Christianity, is too great to allow a full-fledged Epicureanism in *Utopia*. This is perfectly consistent, however, with the engrossing character of the main narrator, Raphael Hythlodæus, who is a philosopher by nature and profession and interjects mild expressions of disapproval of Utopian hedonism. He is unattached: His only commitment is to freedom, truth, and justice. Negligent in dress, he has divested himself of the cares of riches by giving his patrimony to his relatives. He now lives as he pleases (according to Cicero's definition of freedom), and he must speak his mind openly. In spite of being accused of too great speculativeness and idealism by Thomas More, he travels and searches for something quite practical: the good state and the good citizen. In this emphasis on the useful, and in his return to the sources (especially the Greek), Hythlodæus is at one with the early English, as well as the northern, Renaissance. In his chosen field of philosophy, he finds nothing of value in Latin except Seneca and Cicero. But he is far from being narrow. The great books in Greek that he carries with him include Plato and Plutarch, as well as Aristotle and Theophrastus, dramatists, poets, historians—and Lucian. Devotion to Lucian undoubtedly helped to mark More's philosophical character as his friends saw him—as “another laughing Democritus.” More's emphasis upon the Greek sources in medicine (Galen and Hippocrates) and science (Aristotle's *Meteorology*) makes him, in a sense, an unwitting scientific reactionary.

**PLATO'S INFLUENCE.** Of all the Greek authors, Plato is cited most frequently in the *Utopia* proper and in its preliminary materials. This is hardly surprising, since its true title may be translated as *The Best Order of Society* (*De Optimo Reipublicae Statu*). More is indebted, however, as much to Plato's *Laws* as to his *Republic*. His obvious but modified borrowings from Plato are dialogic form, but with a monologue in Book II; communism, which he broadens to embrace a whole nation, not merely an elite class; preeminence of learning, with transformation of the philosopher-king into the scholar-governor; the almost complete equality of men and women; and the connections between goodness and religion. The differences are radical: *Utopia* is a casteless democracy, not an aristocracy; and the family, not a ruling class with common wives and children, is the basic social and political

unit. It is significant that More also briefly introduces the Aristotelian objections to communism of property.

**PLEASURE AND THE BEST SOCIETY.** It is a tribute to More's rhetoric (not philosophy) that the unwary reader is left under the impression that the Utopians espouse thoroughgoing hedonism. But this does not involve merely a humanistic *jeu d'esprit* or even a literary tour de force, for pleasure is related intimately to the main subject of the *Utopia*, the best society. The best society is one whose aim is the temporal well-being or happiness—or pleasure, as defined and described in Utopian terms—of all the citizens, not only of the rich or of the well-born. All are to share equally and equitably in all the good things—or pleasures—of this life and this world: food, clothes, houses, work, play, sleep, and education. More bridges the gap between Utopian philosophy and Utopian communism by the use of the basically Aristotelian phrase “the matter of pleasure” (*materia voluptatis*). Vital commodities (food, clothing, housing) constitute the pleasurable *matter*, which must be determined by a *form* (either private ownership or common possession). The Utopians have chosen communism, not private property, to bring the greatest pleasure to the whole nation. Only in this way will justice be introduced into an unjust society. In this at least theoretical espousal of communism, More agreed with Erasmus and many fellow humanists.

**WEAKNESSES.** On the debit side of the *Utopia* might be listed the deliberately static nature of this ideal society and the failure to recognize the individual person and his basic instincts, liberties, and even imperfections. The removal of all struggle and all insecurity would logically and psychologically lead to the prayer: “Give me something to desire.”

**INFLUENCE.** The major influence of the *Utopia* lies not in its philosophic hedonism, with its concomitant communism, but in its establishment of a pattern for ideal commonwealths. Historically the type proliferated into a thousand different forms that can be found discussed in bibliographies and commentaries. In particular, the *Utopia* itself set an example for what might be termed the philosophical utopia that continued well into the eighteenth century. The most notable productions are Francis Bacon's *New Atlantis*, Tommaso Campanella's *City of the Sun*, and Samuel Johnson's *Rasselas*.

### Bibliography

The best modern edition of More's Latin and English writings is the Yale edition: *The Complete Works of St. Thomas More*, R. S. Sylvester, executive ed. (New Haven, CT, 1963–1997), 21 volumes. Vol. IV, *Utopia* (New Haven, CT: Yale University Press, 1965), is edited by Edward Surtz and J. H. Hexter. Also see the Selected Works edition (New Haven: Yale University Press, 1961–), planned in seven volumes, of which two have appeared: *Selected Letters*, E. F. Rogers, ed. (1961), and *Utopia*, Edward Surtz, ed. (1964). E. F. Rogers had previously edited More's *Correspondence* (Princeton, NJ: Princeton University Press, 1947). Only the first two volumes of a contemplated seven-volume modern version of More's *English Works* (1557), edited by W. E. Campbell, were issued (London: Eyre and Spottiswoode, 1927–1931).

More's best biographers are the earliest: William Roper, *The Lyfe of Sir Thomas Moore*, edited by E. V. Hitchcock (London: Oxford University Press, H. Milford, 1935); and Nicholas Harpsfield, *The Life and Death of St. Thomas Moore*, edited by E. V. Hitchcock and R. W. Chambers (London: Oxford University Press, H. Milford, 1932). The best modern life is still R. W. Chambers, *Thomas More* (London, 1935), to be supplemented by E. E. Reynolds, *Saint Thomas More* (London: Burns and Oates, 1953).

Bibliographical data can be found in *St. Thomas More: A Preliminary Bibliography ... to the Year 1750*, compiled by R. W. Gibson, with a bibliography of Utopiana compiled by R. W. Gibson and J. M. Patrick (New Haven, CT: Yale University Press, 1961). Also see F. and M. P. Sullivan, *Moreana, 1478–1945* (Kansas City, MO: Rockhurst College, 1945). In 1963, the international Amici Thomae Mori began publication of *Moreana: Bulletin Thomas More* (Angers).

Illuminating studies of the background can be found in W. E. Campbell, *Erasmus, Tyndale, and More* (London: Eyre and Spottiswoode, 1949); Fritz Caspari, *Humanism and the Social Order in Tudor England* (Chicago: University of Chicago Press, 1954); Pearl Hogrefe, *The Sir Thomas More Circle* (Urbana: University of Illinois Press, 1959); R. P. Adams, *The Better Part of Valor: More, Erasmus, Colet, and Vives on Humanism, War, and Peace* (Seattle: University of Washington Press, 1962); and especially G. Marc'hadour, *L'univers de Thomas More* (Paris: Vrin, 1963), corrected and supplemented currently in *Moreana*.

The principal interpretations of *Utopia* are those by Karl Kautsky, *Thomas More and His Utopia* (1888), translated by H. J. Stenning (reprinted, New York: Russell and Russell, 1959); H. W. Donner, *Introduction to Utopia* (London: Sidgwick and Jackson, 1945); Russell Ames, *Citizen Thomas More and His Utopia* (Princeton, NJ: Princeton University

Press, 1949); J. H. Hexter, *More's "Utopia": The Biography of an Idea* (Princeton, NJ: Princeton University Press, 1952); Edward Surtz, *The Praise of Pleasure: Philosophy, Education, and Communism in More's "Utopia"* (Cambridge, MA: Harvard University Press, 1957); and Edward Surtz, *The Praise of Wisdom: A Commentary on the Religious and Moral Problems and Backgrounds of St. Thomas More's "Utopia"* (Chicago: Loyola University Press, 1957).

The fate of the utopia as a literary form can be followed in Richard Gerber, *Utopian Fantasy* (London: Routledge and Kegan Paul, 1955); J. O. Hertzler, *The History of Utopian Thought* (New York: Macmillan, 1923); and G. R. Negley and J. M. Patrick, eds., *The Quest for Utopia* (New York: Schuman, 1952).

## MORGAN, C. LLOYD

(1852–1936)

C. Lloyd Morgan, an English biologist and philosopher, was born in London. His early education "was almost exclusively literary," but he later became attracted to scientific studies, attended the Royal School of Mines, and received a diploma in metallurgy. His deepest interest, however, was in the bearing of science on philosophical issues. This interest was given encouragement and direction by T. H. Huxley, under whom he studied biology. Henceforth, Morgan's vocation was to be that of an investigator of "borderland problems of life and mind" and the expositor of a philosophy of "emergent evolution." After teaching for five years at a small college near Cape Town, South Africa, he was appointed in 1884 to the chair of geology and zoology at University College, Bristol. When the college received a university charter in 1909, Morgan agreed to serve temporarily as its first vice-chancellor. At his own request, however, he resigned the next year and resumed his chair, now designated the chair of psychology and ethics. He retired in 1919. During his career at Bristol, Morgan devoted himself to the study of animal psychology and published such books as *Animal Life and Intelligence*, *Habit and Instinct*, *Animal Behavior*, and *Instinct and Experience*.

When he was elected a fellow of the Royal Society in 1899, he became the first person to be thus honored for scientific work in psychology. After his retirement he was invited to deliver the Gifford Lectures and used the occasion to expound his philosophical ideas, which subsequently appeared in *Emergent Evolution* and *Life, Mind, and Spirit*. Two other works, *Mind at the Crossways* and *The Emergence of Novelty*, contain elaborations of his position.

Morgan's psychological studies had a Darwinian background. Accepting the view that evolution is a continuous process, he sought to trace the development of mental characteristics in the world of living things. The focal point of his investigations was the behavior of those organisms that showed some capacity to learn from experience. He contended that the rudiments of intelligence are to be found wherever learning results from "the method of trial and error"—a phrase that he coined in 1894. Much of his experimental work was designed to show how this method is employed, even by relatively simple forms of life. Unlike his predecessors in animal psychology, Morgan was alert to the dangers of using casual reports of animal behavior, especially reports from untrained observers. He urged the importance of a methodological "law of parsimony," according to which we should never interpret what an animal does as the outcome of a higher psychical power if the action "can be interpreted as the outcome of the exercise of a power which stands lower in the psychological scale." Morgan's experiments usually were not strictly laboratory ones but involved artificially produced situations in the natural habitat of animals. His accurate and detailed observations of their behavior in these situations, however, gave comparative psychology a new scientific status.

The conceptual background of Morgan's work was neither mechanistic nor finalistic. He rejected the view that biological processes are to be understood in physico-chemical terms and that physiology can give an adequate account of animal behavior. Radical behaviorism was likewise unacceptable to him. On the other hand, he rejected the view that teleology is operative throughout the living world and that even reflex action and instinctive responses must be explained teleologically.

In *Instinct and Experience* Morgan criticized Henri Bergson's teleological speculations. Morgan's own position, which he described as "naturalism," was that in all behavior there occurs an "unrestricted concomitance" of physical and psychical events. Hence, each behavior episode is susceptible of interpretation in both physiological and psychological terms. There are two stories to be

told, each throwing light on the other, "but neither story as such *makes* the other what it is."

Philosophically, Morgan adopted the hypothesis that the twofold story was really about *one* natural order of events. Moreover, that one order of events has a progressive natural history designated by the word *evolution*. An adequate description of this process requires us to recognize that evolution has not been uniformly continuous, as Charles Darwin believed, but has involved from time to time major discontinuities or "critical turning points." These turning points are marked by the abrupt appearance of certain phenomena that Morgan called *emergents*, a term used by G. H. Lewes in 1874. An emergent (1) supervenes upon what already exists, (2) arises out of what already exists, (3) is something genuinely new in the history of the universe, (4) occurs in a manner that is unpredictable in principle since it conforms to no general laws, and (5) cannot be naturalistically explained but must be accepted "with natural piety." The successive emergents in the panorama of evolution mark stages of progress from lower to higher. Hence, Morgan followed Samuel Alexander in picturing the totality of nature as "a pyramidal scheme."

The full significance of emergent evolution cannot be grasped, however, as long as one remains at the level of "a philosophy based on the procedure sanctioned by the progress of scientific thought." It was essential, Morgan thought, to construct a metaphysical system within which the naturalistic version of evolution could be set. This system would formulate certain fundamental concepts and presuppositions by whose aid an "ultimate explanation" of the evolutionary process could be given. Nothing affirmed in this constructive scheme was to be at variance with science, but it would "complete the otherwise incomplete delivery of strictly scientific thought."

A necessary basic presupposition of the system Morgan proposed was the existence of a physical world that "is nowise dependent on being perceived or thought of by any human or sub-human mind." Since no conclusive proof of this contention had ever been given, it was simply "accepted under acknowledgment." Morgan then elaborated a psychophysiological oriented theory of how organisms perceive the external world. Physical events exert an "advenient influence" on the sense receptors of organisms. By virtue of their psychical power, the organisms respond by referring the signs arising within the psychophysical system to regions of physical space in a process Morgan called "projicient reference." The result is an emergent object correlated with the external event in such a way as to be biologically useful to the organism.

Morgan's second presupposition was that the pyramid of emergent evolution is a hierarchy of kinds of relatedness. Four basic concepts are needed to unfold its consequences—stuff, substance, quality, and property. The ultimate stuff consists of psychophysical events, and the mode of their relatedness in a given system is that system's substance. Each system has intrinsic qualities grounded in its substance and extrinsic properties grounded in its relation to other systems. Besides the emergents there are *resultants*, or phenomena that are repetitive, predictable, and the source of quantitative continuity. Emergence generates progress in continuity, but through resultants there is continuity in progress.

The third presupposition that Morgan acknowledged was the universal correlation of physical and psychical events. He recognized a similarity between his system and that of Benedict de Spinoza in this respect, yet Morgan's view that "mind" is "a quality emergent at a high level of evolutionary advance" would have been quite unacceptable, or possibly unintelligible, to Spinoza. Even that from which mind in this sense emerges—the pervasive psychical correlate—is scarcely to be compared with a Spinozistic attribute.

The last presupposition introduced by Morgan affirmed that a directing activity, otherwise called "spirit" or "God," is manifested everywhere. Thus, "the whole course of events subsumed under evolution is the expression of God's purpose," which embraces all that has been and all that will be brought about in the course of evolutionary advance. This postulate can be neither proved nor disproved but only adopted to satisfy the need for an ultimate explanation of things.

Morgan's philosophy of evolution gave wide currency to the idea of emergence. Yet when compared with later discussions, his treatment of the idea lacks precision. He was not a close reasoner, and his speculative scheme was much less carefully worked out than that of Alexander, to whom he was indebted. A hostile critic might well question Morgan's policy of "acknowledging," rather than arguing for, important principles in his system. And, although he opposed Darwinism by insisting that evolution is "jumpy" and not continuous, each jump is, in Morgan's view of evolution, a mystery, unexplained and inexplicable except, perhaps, to God.

## MORGAN, LEWIS HENRY

(1818–1881)

Lewis Henry Morgan was an American anthropologist and social philosopher. After graduating from Union College in 1840, he practiced law in Rochester, New York, from 1844 to 1864, but he devoted much of his time to anthropological research, which eventually became his exclusive interest. One of the most celebrated American scholars of his time, Morgan was elected a member of the National Academy of Sciences in 1875 and president of the American Association for the Advancement of Science in 1879. The results of his investigations into the life of various Indian tribes appeared in his *League of the Ho-dé-no-sau-nee or Iroquois* (Rochester, NY, 1851) and his later work, *Systems of Consanguinity and Affinity* (Washington, DC, 1871); these two books were hailed as pioneering achievements of the first order in the study of kinship systems by even the most outspoken of his critics.

Morgan's aim was not merely to describe how different civilizations had evolved; he wished to elicit from their history a general pattern of institutional progress. In his most ambitious work, *Ancient Society* (New York, 1877), Morgan sought to establish that human history falls into three main stages—savagery, barbarism, and civilization—and that each stage reflects a close correlation between economic and cultural achievements. Savagery was the period before pottery; barbarism was the ceramic era; civilization began with writing and the pho-

netic alphabet. The first two periods are further subdivided, and each subperiod is defined in terms of its characteristic technological innovations. The discovery of fire and the beginning of fishing, for example, are characteristic of the second subperiod of savagery, the invention of the bow and arrow of its third subperiod.

Although Morgan shared the view of his Swiss contemporary and fellow anthropologist Johann Jakob Bachofen that society had emerged from a state of primitive communism, and also accepted the Bachofen hypothesis of matrilineal descent, he had little interest in ancient myths and religions. His principal attention was focused on technological factors, kinship systems, and property systems, and their relations to social and political institutions. In spite of gaps and distortions, Morgan's account of the growth of civilization has been considered by so severe a critic of his ethnological theories as Robert H. Lowie to be a comprehensive scheme of cultural wholes far beyond anything attempted up to that time. Lowie has written, "Morgan's *Ancient Society* was a synthesis of sociological material that for the first time brought together material on Australian and American natives, on ancient Greece and Rome; and all this in an orderly arrangement prescribed by an evolutionary doctrine" (*The History of Ethnological Theory*, London, 1937, p. 56).

Moreover, *Ancient Society* speaks for a distinct social philosophy and philosophy of history. The collation and comparison of human institutions, inventions, and discoveries convinced Morgan of humankind's unity of origin, of the similarity of human wants in different societies at comparable stages of advancement, and of the uniformity in the operations of the human mind in similar conditions of society. He formed the view that the human race was "one in source, one in experience and one in progress" (*Ancient Society*, p. vi). The problem that preoccupied Morgan in his historical researches was the existence of social and economic inequality. He could not conceive that "a mere property career" was the final destiny of humankind. Man's obsession with private property, he felt, was only a transient stage of human civilization. For if it was not, it was bound to lead to society's self-destruction. If progress was to be the law of the future as it had been of the past, property would have to be diffused and if necessary controlled, so that "democracy in government, brotherhood in society, equality in rights and privileges, and universal education" would foreshadow the next higher plane of society, "to which experience, intelligence and knowledge are steadily tending" (*Ancient Society*, p. 552).

Morgan recognized that civilization could be aggressive as well as progressive. But his theory of social evolution has nothing in common with such imperialist notions as Rudyard Kipling's concept of the white man's burden. Progress, Morgan insisted, echoing Herder, is inherent in all cultures, civilized or not, and each has to advance along its own lines. Culture is a process, not an administrative imposition.

Although Morgan's theories were invoked by Karl Marx and by Friedrich Engels (notably in his *Origin of the Family, Private Property and the State*) in support of their interpretation of history, Morgan's social message bears only superficial similarities with Marxist doctrines. Nonetheless, the optimistic flavor of his evolutionism had a powerful appeal to social reformers. At the same time this very quality made it suspect to the uncommitted social scientist.

## MORGAN, THOMAS

(d. 1743)

Thomas Morgan, the Welsh deist, dissenting minister, doctor of medicine, freethinker, and religious controversialist, was born of a poor family but received a free education from the Reverend John Moore, a dissenter. Morgan was ordained in 1714 and became minister of Burton two years later and subsequently of Marlborough; in 1720 he was dismissed from this last post for his growing unorthodoxy. He then took up the study of medicine and produced several books on that subject—*Philosophical Principles of Medicine* (1725), *The Mechanical Practice of Physic* (1735), *Letter to Dr. Cheyne in defence of the “Mechanical Practice”* (1738).

Morgan is chiefly remembered, however, for his deistical tracts, or “Christian deistical,” as he preferred to call them, in which he described himself as “M.D. and Moral Philosopher.” *The Moral Philosopher, in a Dialogue between Philalethes, a Christian Deist, and Theophanes, a Christian Jew* (1737) is his major work. Controversy produced two further works under the same title, the second of 1739, subtitled “Being a farther Vindication of Moral Truth and Reason,” and the third of 1740, subtitled “Superstition inconsistent with Theocracy.” In 1741 he published *A Vindication of the Moral Philosopher; Against the False Accusations, Insults, and Personal Abuses, of Samuel Chandler, Late Bookseller and Minister of the Gospel*.

In general, Morgan was a rationalist espousing the five Common Notions of Lord Herbert of Cherbury. He was also one of the pioneers of historical criticism of the Bible, particularly of the Pentateuch, and was considerably influenced by John Toland and to some extent by Thomas Chubb. The latter’s advocacy of free will, however, he strongly attacked in 1727 in *A Letter to Mr. Thomas Chubb, occasioned by his “Vindication of Human Nature”* and in 1728 in *A Defence of Natural and Revealed Religion*.

Morgan believed in the corruption of human nature and defended suicide for the “weary or satiated with living.” His criticism of the Scriptures centered on the fact that so many different interpretations are possible and are accepted by so many different and sincere believers. Traditional religion, therefore, is not infallible but only probable, as is all history. Priestcraft, which instituted superstition, enthusiasm, and finally persecution, is the culprit for the erroneous notion of the infallibility of a catholic church. Reason and tolerance are the only cures.

*See also* Deism.

**Bibliography**

Additional works by Morgan include *A Collection of Tracts ... occasioned by the late Trinitarian Controversy* (1725); *A Philosophical Dissertation upon Death. Composed for the Consolation of the Unhappy* (1732); *The History of Joseph Considered ... by Philalethes* (1744). See also Sir Leslie Stephen’s *History of English Thought in the Eighteenth Century* (London: Putnam, 1876; the paperback edition, 2 vols., New York: Harcourt Brace, 1963, follows the revised edition of 1902), and the general bibliography under the Deism entry.

## MORITZ, KARL PHILIPP

(1756–1793)

Karl Philipp Moritz, German novelist, man of letters, and aesthetician, was born to poor and radically Quietist (Protestant) parents. Moritz started his career as an apprentice hatmaker at the age of twelve and ended up as an intimate of Johann von Goethe, Friederich Schiller, and Johann Georg Herder, and as professor of archaeology and aesthetics at the Berlin academy of art as well as a member of the Prussian Academy of Sciences. A prolific writer, his works include the psychological novel *Anton Reiser* (1785–1790), a fictionalized account of his own passage from his narrow religious origins to the center of the German Enlightenment; the satirical novel *Andreas Hartknopf* (1786); a widely read account of *The Travels of a German in England in 1782* (1783); an *Essay toward a Practical Logic for Children* (1786); an English grammar for Germans (1784); as well as a work on German prosody (1786) and much more; and he edited the *Magazine for Empirical Psychology* from 1783 to 1793 as well as the *Monthly of the Academy of Arts and Sciences* in 1789 and 1790. But among philosophers, he is best known for the brief “Essay on the Unification of all Fine Arts and Sciences under the Concept of *That Which Is Perfect in Itself*” (1785) and the longer essay *On the Imaginative [bildende] Imitation of the Beautiful* (1788).

The first of these essays offers an early defense of the idea of *art for art’s sake*. Moritz argues that an object is beautiful neither because it gratifies us nor because it is useful to us but because it possesses an entirely internal purposiveness that is so perfect that contemplation of it causes us to leave all our ordinary concerns behind: In such a moment of contemplation, “we sacrifice all of our individually limited existence to a kind of higher exist-

tence" (Moritz 1989, p. 11; Moritz 1993, vol. 2, p. 545). This position leads Moritz to the extreme conclusion that when one feels bad at seeing a play performed before an empty house, one shares the disappointment not of the playwright, actors, and producers but of the work of art itself.

Moritz's longer essay on the imitation of the beautiful is less radical and more deeply entrenched in long-standing traditions in aesthetics: Here the influence of neo-Platonism, Leibniz-Wolffian aestheticians such as Alexander Gottlieb Baumgarten and Moses Mendelssohn (in spite of his criticism of Mendelssohn in the essay on the perfection of art), and Herder all become clear. Moritz argues that in properly imitating a beautiful work of art, one does not ape its outward appearance but, rather, strives to exercise one's own active powers in a way analogous to the exercise of the artist's powers that produced the object. At the same time, however, one seeks contemplation and repose in the experience of such an object. The apparent contradiction between these claims is resolved in Moritz's view that in contemplating the beauty of an object as a self-contained whole, one both experiences an intimation of the perfection of the cosmos as a whole and is also led to strive to transcend the limits of individuality and thereby to make one's own contribution to the perfection of that whole. Both passive and active relation to a beautiful work of art is thus a mirror of both passive and active relations to the perfection of the cosmos as a whole.

Although Moritz's name was not much mentioned by leading philosophers, his influence is clear. Kant surely knew Moritz's 1785 essay (it appeared in a number of the *Berlin Monthly* in which Kant also published an article), and his own concept of the *subjective purposiveness* of the experience of beauty may well have been intended as a corrective to Moritz's conception of the internal perfection of the work of art itself. There is no direct evidence that Kant knew Moritz's 1788 essay, but Kant's own distinction between being moved by the originality of a work of genius and merely aping its outward manner could certainly have come from Moritz. Moritz's analysis of one's both passive and active relation to beauty surely influenced Schiller's analysis of one's diverse drives with regard to beauty in his *Letters on the Aesthetic Education of Mankind*. And Moritz's idea that the contemplation of beauty allows one to transcend the limits of one's own individuality also anticipates a central theme of Schopenhauer's aesthetics. Moritz thus represents an important transition between the aesthetics of the mid-eighteenth century and classical German aesthetics.

## MOSCA, GAETANO

(1858–1941)

Gaetano Mosca, an Italian legal and political theorist and statesman, was born in Palermo. He was one of several social theorists, including Vilfredo Pareto and Robert Michels, who gave currency to the conception of ruling elites and their circulation as being the basic characteristic of politically organized societies. Mosca outlined his conception in *Sulla teorica dei governi e sul governo parlamentare* and elaborated it in his major work, *Elementi di scienza politica*, first published in 1895 and considerably expanded in the third edition, which appeared in 1923 (translated as *The Ruling Class*).

The *Elementi* ranges over a large number of problems in the philosophy of history and in the analysis of political organization and development. Mosca speculated about the stages of political and social development, the types of political and social systems, the role of moral forces and religions in political organization and change, the function of international and civil wars, the causes and types of revolutions, race and nationality, and the causal significance of economic factors. However, the

notion of the “political class,” or “ruling class,” is central to the *Elementi*.

Mosca asserted that every politically organized society of any degree of complexity is characterized by the existence of an organized minority that rules and a majority that is ruled. He rejected the Marxist position that the ruling class always derives from the organization of the economy. He held that in different types of societies, different qualities and functions characterize the members of the ruling class. In certain societies, warriors occupy a central role within the ruling class; in others, economic functions are important in determining membership; and still other societies have been characterized by a hereditary ruling class. In modern societies an important section of the ruling class is always the bureaucracy, the body of salaried officials professionally entrusted with the administration of the machinery of political, economic, and social life. (Mosca was particularly interested in the emergence of modern bureaucratic states and treated bureaucratic societies as one of the chief social types.)

It appears that Mosca loosely identified the ruling class with those who occupy the controlling or governing positions within the political organization of society. At times, however, he spoke as if the ruling class were a multiplicity of political, social, and economic elites, as when he wrote, for example, that “below the highest stratum of the ruling class there is, even in autocratic systems, another that is much more numerous and comprises all the capacities for leadership in the country.” Without a ruling class, Mosca claimed, all forms of social organization would be impossible. He added that the democratic tendency—the tendency to replenish ruling classes from below—“is constantly at work with greater or less intensity in all human societies.” Mosca, unlike Karl Marx, did not think of classes as necessarily conflicting social forces; nor did he think of the ruling class as always imposing its will on, and maintaining its distinctive class interests against, the rest of society.

He said that every organized political society has its “political formula,” a doctrine or body of belief that legitimizes the political structure and the authority of the ruling class; there are, for example, the doctrines of divine right, and of democracy. It may often be the case that the power of the ruling class requires the use of force or violence; but Mosca thought that in stable, progressive, and flourishing societies the position of the ruling class may be founded on its intellectual and moral preeminence as well as on its care for the collective interests of the nation; the political formula that legitimizes the authority of the

ruling class may be accepted by all members of the society.

In fact, in arguing that all developed societies are governed by a ruling class (and that the idea of democracy in the literal sense of government by the majority is an illusion) Mosca did not wish to imply that all societies are authoritarian or autocratic. Throughout the *Elementi* he argued strongly in support of a society marked by a high measure of what he called “juridical defence”—a society in which members of the ruling class are limited in their exercise of authority and power by moral codes that protect individual rights and liberties; a society that is pluralistic, or “open,” in the sense that power is widely diffused throughout the community, and hence many different interests or social forces are able to express themselves within the political framework. Mosca was critical of parliamentary government in his early work, but later, especially in the material added to the 1923 edition of the *Elementi*, he spoke strongly of its merits; he saw it as the one form of organization able “to utilise almost all human values in the political and administrative departments of government, ... [in which] the door has been left open to all elements in the governed classes to make their way into the ruling classes” (*The Ruling Class*, p. 389). Thus, although Mosca thought that recognition of the inevitable existence of the ruling class in any society was sufficient to destroy the illusions of democratic ideologies, his conclusions are not easy to distinguish from the standard doctrines of liberal-democratic political philosophy.

## MOTION

The nature of motion and the philosophical problems surrounding it have been perennial issues in Western philosophy. Motion is a special case of change, and much discussion relevant to motion extends naturally to change in general (see Mortensen 2002).

Notable among the problems of motion are those provided by Zeno's paradoxes. Perhaps the hardest of these is the Arrow paradox. Consider an object in motion. At any instant of that motion, since it is an instant, the object makes no advance on its journey. But if it makes no advance in any instant of its journey, how can it make advance in all of them? The sum of a collection of nothings—even an infinite collection—is nothing. It would seem that it cannot move at all.

### MOTION AND THE CALCULUS

Substantial progress concerning the topic of motion was made with the development of the calculus by Isaac Newton and Gottfried Wilhelm Leibniz in the seventeenth century. The velocity of an object at time  $t$ ,  $v(t)$  (with respect to a frame of reference), is given by the derivative of its spatial location,  $x(t)$ , with respect to time. That is,  $v(t_0)$  is  $dx(t)/dt$ , evaluated at  $t_0$ . An object is in motion at an instant if its velocity at that instant is nonzero; it is at rest if its velocity is zero.

The understanding of motion thus provided is, of course, parasitic on an understanding of the calculus itself and specifically on the notion of a derivative. In the eighteenth and early nineteenth centuries this depended on the notion of an infinitesimal; and infinitesimals behaved in a notoriously inconsistent fashion. Specifically, they were assumed to be nonzero (sometimes) and zero (sometimes).

### HEGEL ON MOTION

Georg Wilhelm Friedrich Hegel, writing at the start of the nineteenth century, put the contradictory properties of the infinitesimal to the service of his dialectic. The con-

tinuous and the discrete are contradictory notions. There is, therefore, something that is their synthesis. This is a variable point: the infinitesimal. It has the property of being a point, so having zero extension, and being extended, so having nonzero extension.

This understanding allows him a particular view of the account of motion provided by the calculus. To be in motion at an instant is precisely to move an infinitesimal amount. Thus,

[when a body is moving] there are three different places: the present place, the place about to be occupied and the place which has just been vacated; the vanishing of the dimension of time is paralyzed. But at the same time there is only *one* place, a universal of these places, which remains unchanged throughout all the changes [i.e., the variable point]; it is duration existing immediately in accordance with its notion, and as such it is motion. (Hegel 1970, p. 43)

That is, "Something moves not because at one moment of time it is here and at another there, but because at one and the same moment it is here and not here, because in this 'here' it at once is and is not" (Hegel 1969, p. 440). This provides Hegel with a simple solution to the Arrow paradox. The object advances on its journey because it does advance at each instant: It moves a tiny amount at each instant.

### RUSSELL ON MOTION

Within fifty years Hegel's analysis of motion was rendered obsolete by new mathematical developments. Toward the end of the nineteenth century the notion of an infinitesimal disappeared from standard mathematics. This was because, through the work of Baron Augustin-Louis Cauchy, and particularly Karl Weierstrass, a different understanding of the derivative was developed. A derivative came to be understood simply as the limit of a certain ratio as some variable approaches a value. In particular, the velocity  $v(t_0)$ , that is,  $dx(t)/dt$  as evaluated at  $t_0$ , came to be understood as the limit of  $(x(t_0+\epsilon)-x(t_0))/\epsilon$  as  $\epsilon$  approaches 0.

Therefore, the new interpretation of the calculus provided a different understanding of motion. This was spelled out by Bertrand Russell in *The Principles of Mathematics* as follows:

[I]n consequence of the denial of the infinitesimal, and in consequence of the allied purely technical view of the derivative of a function, we must entirely reject the notion of a *state* of

motion. Motion consists *merely* in the occupation of different places at different times.... There is no transition from place to place ... no such thing as velocity except in the sense of a real number which is the limit of a certain set of quotients. (1938, p. 473)

The paradox of the Arrow can then be dismissed: In the case of motion, [Zeno's Arrow paradox] denies that there is such a thing as the *state* of motion. In the general case of a continuous variable, it may be taken as denying actual infinitesimals. For infinitesimals are an attempt to extend to the *values* of a variable the variability which belongs to it alone.... [The modern account of the variable has clarified this confusion, but] its absence in Zeno's day led him to suppose that continuous change was impossible without a state of change, which involves infinitesimals and the contradiction of a body's being where it is not. (Russell 1938, pp. 350–351)

#### PROBLEMS WITH THE ORTHODOX ACCOUNT

The view concerning motion expressed by Russell became the orthodox view of motion in the twentieth century. It is not without its problems, however. As Russell makes clear, according to this account there is no such thing as an intrinsic state of motion. That is, the instantaneous states of two objects, one in motion and one at rest at that instant, but at the same place, would be identical. Whether the object is in motion or at rest at that instant depends entirely on its states at neighboring instants. This is highly counterintuitive: Motion turns out to be a sequence (albeit a continuous one) of states that are indistinguishable from rest-states. There is no genuine flux. Motion occurs in much the same way as it appears to when successive stills in a cinema film are shown so fast that something seems to move. Indeed, one might call this the cinematic view of change. One way to bring home its oddity is as follows. Suppose that there is a particle that behaves as follows: At any time it exists simply at some place, but at any time it may disappear and reappear at some other place. Suppose that, by an accidental string of occurrences, the positions of the particle over a short period just happen to be a continuous function of time with a nonzero derivative. One would not, on this account, be inclined to say that the particle is in motion at each instant.

The cinematic account of change is not just counterintuitive. It has a number of other untoward conse-

quences, as Russell himself notes (1938, p. 482). It is natural to take laws of nature to state causal relations between various quantities, such as velocity and its derivative, acceleration. Indeed, one normally takes it that the states of these quantities at a time are causal determinants of later states. If, in nature, there are no such things as these quantities, all this must be foregone—including the possibility of Laplacean determinism: the view that the intrinsic state of a system at any time determines its future states.

Further problems arise when one considers discontinuities of various kinds. Thus, suppose that an object is at rest before time  $t$ , and then starts to move with velocity  $1$ . That is,  $x(t) = 0$  if  $t < 0$  and  $x(t) = t$  if  $t \geq 0$ . The object has no velocity at  $t = 0$  (since  $x(t)$  has no derivative there), and a fortiori no acceleration. Still, it would seem that it ought to, if the motion is the result of an impulse applied to the object at  $t = 0$ . Worse: suppose that the object moves instantaneously at  $t = 0$  to some other position where it is at rest; so  $x(t) = 0$  if  $t < 0$  and  $x(t) = 1$  if  $t \geq 0$ . If  $t \neq 0$ , the velocity of the particle is 0; and if  $t = 0$ , the velocity is undefined. Hence, the particle has changed places at  $t = 0$ , yet it has never been in motion!

Finally, and Russell's protestations to the contrary notwithstanding, it would appear that he has not so much solved the Arrow paradox as ignored it. He accepts that no progress is made on the journey in an instant, but simply insists that, nonetheless, progress is made in the whole journey. This is not a solution, it is what must be explained.

#### TOOLEY'S ACCOUNT

These and other objections were leveled against the Russellian account by Graham Priest (1985, 1987) and Michael Tooley (1988), each of whom offers an account of motion according to which velocity (relative to a frame of reference) is an instantaneous property of an object.

According to Tooley velocity is a theoretical (i.e., unobservable) property of an object that is causally efficacious in determining its behavior. Specifically, it is a quantity,  $v(t)$ , satisfying the equations:

$$x(t_1) = x(t_0) + \int_0^1 v(t) dt$$

$$m(t_1) \cdot v(t_1) = m(t_0) \cdot v(t_0) + \int_0^1 F(t) dt$$

where  $m(t)$  is the inertial mass of the object at  $t$  and  $F(t)$  is the force acting on it at that time. These, note, are the two key laws in (relativistic) kinematics involving velocity. The first relates velocity to position; the second to the forces acting. The crucial point is that, on Tooley's view,

these equations should be interpreted as stating relations between (instantaneous) physical quantities.

### PRIEST'S ACCOUNT

Priest's account draws on Hegel. It does not resurrect Hegel's account of the categories; nor does it rehabilitate the notion of the infinitesimal. What it does do is take seriously the possibility that, at an instant, the position of a moving object may be spread out over a short (but non-infinitesimal) region. Because the object is in motion it may be impossible to localize it to any one position. This is called the spread hypothesis.

More specifically, let  $x(t)$  be the locus of motion of an object, as it occurs in the laws of motion cited in the previous section. One can write  $r_t$  for the value of this function at  $t$ . For Russell, the state of the object at time  $t$  is characterized by the set of statements  $S_t = \{\text{"The object is at } r_t\} \cup \{\text{"The object is not at } r'; \text{ where } r \neq r_t\}$ . Given the spread hypothesis, one must suppose that there is an interval of times containing  $t$ ,  $\theta_t$ , such that the object is equally at  $x(t')$  for all  $t' \in \theta_t$ . The state of the object at  $t$  is therefore characterized by the set of all those statements in  $S_t$  for  $t' \in \theta_t$ . (What, exactly,  $\theta_t$  is, is a matter to be determined by other consideration; possibly by nature itself. But it is not unnatural to suppose that the width of  $\theta_t$  is proportional to  $dx(t)/dt$  if this is defined.)

If  $x(t')$  is constant for  $t' \in \theta_t$  (and, in particular, if  $\theta_t$  contains just  $t$ ), the state-description is identical to the Russellian state-description; in particular, it is consistent. But if  $x(t')$  takes different values,  $r_1$  and  $r_2$ , for  $t' \in \theta_t$ , then it will be inconsistent: it will contain the statements that the object both is and is not at  $r_1$  (and  $r_2$ ).

To be in motion at an instant, then, according to this account, is to have an inconsistent state description at that instant. Objects in motion are at one place at one time, and another at another. But this is not sufficient. This would be equally true of an object at rest at each of these places. To be in motion at a time, an object must both be and not be at a place at that time.

### THE ARROW AGAIN

If one is to have a theory according to which motion is an intrinsic property of an object, then the accounts of Tooley and Priest may not be the only ones; but they are the only two presently on offer. Therefore, it is natural to compare their relative merits.

One feature of Tooley's account, unlike Priest's, is that it is consistent. Priest's account (and Hegel's) presupposes that one can make sense of the possibility that the

truth about a situation can be contradictory (dialetheism). It requires the use of a logic that is such that contradictions do not imply everything. One may take this to be a strong mark in Tooley's favor. Other objections against Priest can be found by consulting Tooley (1988). It appears that there are perfectly natural replies to these objections, but this is not the place to go into the matter.

On the other side, it is clear that Priest's account solves the Arrow paradox essentially as does Hegel's. The object, by occupying more than one point at an instant, does make progress during each instant, and so in the whole comprising them. Tooley's account would not appear to solve the paradox. It still leaves one with the fact that the object makes no progress during an instant of its journey. Russell, whether rightly or wrongly, took the problem to be solved by rejecting instantaneous states of motion. Even this step is not open to Tooley.

Doubtless, there is more to be said on these matters. Regardless, one thing is clear: Even after the development of the calculus, the theory of the limit, the understanding that it is possible to postulate unobservables in science, and even of paraconsistency, Zeno's paradox of the Arrow still haunts us.

## MOTION, A HISTORICAL SURVEY

"Motion," or "movement," in its modern meaning, is change—or more precisely, change of the relative positions of bodies. The concept of motion thus involves the ideas of space and time. Kinematics, in the nineteenth century usually called "kinetics" or "phoronomics," is the science that deals exclusively with the geometrical and chronometrical aspects of motion, in contrast to dynamics, which considers force and mass in relation to motion. In medieval terminology, following Aristotelian tradition, "motion" (*motus* or *kinesis*) had a much wider significance, denoting any continuous change in quality, quantity, or place.

### EARLY CONCEPTS OF MOTION

Ever since the beginning of philosophical speculation and scientific analysis, the concept of motion has played a predominant role in Western thought. Anaximander of Miletus (sixth century BCE) saw in motion an eternal agent of the cosmos. For Heraclitus motion was a cosmological principle underlying all physical reality (*panta rhei*, "everything is in perpetual flow"). Yet in spite of their insistence on the universality of motion, neither Anaximander nor Heraclitus seems to have inquired into the nature of motion itself. The Eleatics were probably the first to do so, when they discovered the contradiction inherent in the idea of motion and consequently denied the reality of motion, relegating its appearance to the realm of illusions and deceptions. A body, they argued, can move neither where it is nor where it is not; hence, reality is motionless and unchanging. Zeno's famous antinomies (Aristotle, *Physics* 239), such as the "Arrow" and "Achilles," seem to have been aimed, at least in part, at a refutation of the possibility of motion. On the other hand, for the atomists, such as Democritus and Leucippus, motion was a fundamental property of the atoms. All changes in nature were reduced to the movements of atoms in the void, and with the eternity and uncreatedness of the atoms their motion was eternal and uncreated; this motion itself, in the atomists' view, was not further analyzable. It remained a primary concept until Epicurus

searched for a causal explanation. This (according to Lucretius) he thought to have found in weight, the cause of the downward movements of atoms, and in their little "swerves," by which he explained the otherwise incomprehensible collisions and redistributions of atoms without which physical processes could not be accounted for.

ARISTOTLE. In Aristotle's natural philosophy the concept of motion played a decisive role, since for him nature was the principle of movement or change: "We must understand what motion is; for, if we do not know this, neither do we understand what nature is" (*Physics* 200b12), a statement recurrent in Peripatetic philosophy under the motto *Ignato motu, ignatur natura* ("To be ignorant of motion is to be ignorant of nature"). For Aristotle, in contrast to his predecessors, motion raised a profound problem—not merely from the logical point of view. Expressing the deeply rooted metaphysical conviction of Western thought that motion is neither logically nor ontologically self-sufficient but requires an explanation, Aristotle contended that motion is neither in the causal, or genetic, nor in the ontological sense a primary concept. Causally, every motion originates in another motion; only animate organisms possess an inherent power to move. Hence his famous dictum *Omne quod movetur ab aliquo movetur* ("All things that move are moved by something else"). To avoid infinite regression and to find a satisfactory explanation of the existence of motion, Aristotle reduced the ultimate origin of all movements to an eternal mover who is himself unmoved. (*Physics* 258b). Ontologically, Aristotle derived motion from the basic notions of his metaphysics of substance and form by defining it as "the progress of the realizing of a potentiality *qua* potentiality" (*Physics* 201a10). Motion as the actualization of that which exists in potentiality may produce a substantial form (*generatio*), may change qualities (*alteratio*) and quantities (*augmentatio* or *diminutio*), or, finally, may be a change of place (*motus localis*). Although Aristotle did not reduce qualitative differences to quantitative relations of size and position, as did the atomists, his physics is essentially a physics of qualities. He did regard local motion as of a more fundamental character than the other kinds of motion (*Physics* 208a31); it is "the primary and most general case of passage and prior to all other categories of change" (*Physics* 260b22). Yet in spite of this preferential status, local motion for Aristotle is only a necessary concomitant of change, not, as the mechanistic physicists of the post-Newtonian era maintained, the essential and exclusive constituent of change.

In kinematics Aristotle distinguished between circular and rectilinear motion (*De Caelo* 268b17), the former, the more perfect, being the motion of the celestial bodies (*De Generatione et Corruptione* 338a18). Dynamically, motion is either natural or violate. Natural motion is circular for celestial and rectilinear for terrestrial objects; violate motion is the removal of a body from its natural place (*locus naturalis*) through the action of an external force.

**ANCIENT AND MEDIEVAL CONCEPTS.** Aristotle's kinematics, like his physics in general, was a qualitative science, incapable of providing a precise definition of such notions as velocity and acceleration. In fact, Greek mathematics, with its insistence on the illegitimacy of proportions or ratios between heterogeneous quantities, did not provide even the formal means of defining velocity as the ratio between distance and time; only topological, not metrical, determinations of motion could be formulated. Thus, Aristotle said that a body is quicker than another if it traverses equal spaces in less time or greater spaces in equal time (*Physics* 215a26). As related by Simplicius, Strato of Lampsacus, in a lost treatise "On Motion" (*De Motu*), was apparently the first to analyze in great detail these kinematic notions, in particular the concept of acceleration, although without trespassing the boundaries imposed by the Aristotelian conceptual scheme. The kinematics of uniform motion could be fully developed and rigorously formulated at least *in abstracto*, as exemplified by the treatise "The Motion of the Sphere" (300 BCE), written by the astronomer Autolycus of Pitane. Nevertheless, as far as is known, the earliest kinematicist to associate concrete numerical designations with velocities was Gerard of Brussels, in the thirteenth century (*Liber de Motu*).

The formulations of the basic concepts in the science of motion did not, however, evolve out of practical necessities, the study of simple machines, or other scientific or technical considerations; they were, rather, the outcome of a curious development that originated in connection with a purely philosophical, ontological, and even theological problem. The point of departure was the much discussed problem of the increase and decrease of qualities (*intensio et remissio formarum*), the question of how such qualities as warmth or blackness could vary in their intensities. Aristotle explicitly admitted (*Categories* 10b26) such alterations, but he also described such qualities as numbers (*Metaphysics* 1044a9) as immutable and unchangeable. One of the solutions, as listed by Simplicius, is that of Archytas, who suggested that every quality

possesses a certain range of indeterminacy, or margin of variability (*platos*).

In Peter Lombard's "Books on the Sentences" (*Libri Quatuor Sententiarum*, c. 1150 CE) the same problem reappears in the realm of theology when it is asked, with reference to Scripture, how an intensification or diminution of the Holy Spirit or of the *caritas* is possible in man. Until well into the thirteenth century the Christian concept of *caritas* was par excellence the subject of discussions on the intension and remission of qualities and served as the standard example for intricate analyses of the notions of change and motion. One solution, advanced by Henry of Ghent in one of his *Quodlibeta*, referred in this connection explicitly to Archytas's previously mentioned conception of margin of variability, now termed the "latitude" (*latitudo*) of quality or change, a notion that was destined to play an important role in the foundation of classical kinematics.

## GROWTH OF THE SCIENCE OF KINEMATICS

In order to understand the subsequent development of the concept of motion another problem that engaged the thirteenth century to a great extent must be mentioned, the question of what category change, or motion, belongs to. Aristotle was usually interpreted as having advocated an identification of *motus* with *terminus motus*—that is, viewing motion as an evolving process in the same category as the terminal, or the perfection, of this process. According to this view motion is a *forma fluens*, to use the terminology of Albert the Great, whereas the opposing view, which relates motion and its terminus to different categories, is the *fluxus formae* conception of motion. In the special case of local motion the *forma fluens* interpretation regards the process of motion as merely the continuous and gradual acquisition of the final *terminus motus*, just as the qualitative change of *nigrescere* (to become black) is merely the gradual acquisition of the *nigredo* (blackness). The concept of motion obtained its final and most radical formulation along these lines in the nominalistic statement of William of Ockham that motion is merely a name for the set of successive positions occupied by the mobile.

The nominalistic interpretation, often epitomized as *motus est mobile quod movetur*, met with considerable opposition, curiously enough among the Parisian terministic philosophers, such as Jean Buridan. One of the arguments for its rejection was undoubtedly its logical inapplicability to the motion of the outermost sphere, which, not further surrounded by any object, possessed

neither place nor space, according to the Aristotelian-scholastic theory of space; thus its motion clearly could not be interpreted as a set of successive positions. No wonder, then, that the *fluxus formae* interpretation of motion, which distinguished between the process, on the one hand, and the terminus or position (*locus*), on the other, and regarded motion as a specific quality inherent in the mobile, became predominant. Buridan, for example, defined motion, or *moveri*, as an inherent property in the mobile—*intrinsice aliter et aliter se habere*—and Blasius of Parma characterized local motion as a quality that is capable of gradual intensification or remission and is inherent in the moving object (*motus localis est qualitas gradualis intensibilis et remissibilis, mobili inhaerens subjective*).

Meanwhile the notorious *calculatores* of Merton College at Oxford, including Thomas Bradwardine, Richard Swineshead, and William Heytesbury, established their famous formalism of subjecting qualities of all kinds, but primarily the quality of *caritas*, to mathematical analysis and quantification. It was there, at Merton College, that the different trends converged. For motion, itself a quality according to the *fluxus formae* conception, soon became the favorite subject of mathematical description and took the place of *caritas* in these discussions. Employing the notion of latitude, the calculators analyzed the various possibilities of changes of motion and illustrated their theorems by graphical representations. Thus, through the conflux of various conceptual trends the foundations of modern kinematics were laid at Oxford: The concept of velocity was clarified by the introduction of the notion of instantaneous velocity, uniformly accelerated motion was unambiguously defined, the distance traversed by a body in uniformly accelerated motion was calculated, and, finally, a clear distinction between kinematics and dynamics was drawn. The results thus obtained seem, however, never to have been applied to any motions encountered in nature; they were, rather, a theory for the classification of possible motions.

The new knowledge soon spread to France, Germany, and Italy. Only Galileo Galilei, and possibly Dominic de Soto, applied these results to the study of specific natural phenomena, such as free fall. Since kinematic investigations formed the point of departure for the subsequent development of mechanics and physics in general, the analysis and clarification of the concept of motion may rightfully be regarded as of primary importance for the rise of modern science as a whole. With the establishment of a scientific kinematics the notion of motion also became purified from certain connotations

that it carried from ancient times. Thus, according to the Aristotelian theory of motion the movement of any object presupposes the existence of an immobile body. Themistius, Averroes, and other commentators interpreted this statement as a proof of the immobility of Earth. In fact, for Averroes the immobility of the center was a necessary prerequisite not only for the motion of the spheres but also for the very spatiality of the outermost sphere (*caelum est in loco per centrum*). Not only was Earth unique as being the abode of man; its distinction was due also to the fact that it served as the basis for the localizability of the celestial spheres.

However, as soon as the *fluxus formae* conception characterized motion as a property inherent solely in the mobile, the Aristotelian presupposition of an immobile correlate lost its logical legitimacy. Celestial motions no longer needed to be conceived of as dependent on the immobility of Earth, and a severe obstacle to the Copernican doctrine could easily be removed.

## RELATIVITY OF MOTION

It is a curious fact that the modern conception of motion, though historically and conceptually connected most intimately with the Copernican revolution, led to a partial reinstatement of the Aristotelian presupposition. Not the immobility but the existence of a correlate is the indispensable requirement for any physical significance of the concept of motion. For the relativization of the notion demands a body of reference. The question whether absolute motion, motion without reference to a physical object extraneous to the mobile, is a scientifically or philosophically meaningful conception or whether motion is only relative—that is, whether the statement “A moves” makes sense only if it means “A moves relative to B”—is the problem of the relativity of motion and has a long history of its own.

Aristotle’s distinction between ordinary motion and motion *per accidens* may be regarded as the first implicit differentiation between absolute and relative rest, an idea further developed by Sextus Empiricus (*Adversus Mathematicos* 2, 55). The dynamical equivalence, under certain conditions, between relative rest and absolute rest was essential to the acceptance of the Copernican theory and, in fact, was explicitly stated by Nicolas Copernicus himself: *Inter motu ad eadem, non percipitur motus* (*De Revolutionibus Orbium Coelestium*, Nuremberg, 1583, Bk. 1, Ch. 3). It was further elaborated by Galileo (*Dialogo sopra i due massimi sistemi del monde*, second day) into what is now called the Galilean principle of relativity. René Descartes, fully aware of the implications of the relativity

of motion for the Copernican controversy, adopted a compromise position by distinguishing between “the common and vulgar conception of motion” as the passing of a body from one place to another and the “true or scientific conception” of motion as the transfer of matter from the vicinity of those bodies with which it was in immediate contact into the vicinity of other bodies (*Principia Philosophiae*, Part 2, Section 24). He thereby associated the relativity of true, or scientific, motion with the Aristotelian contiguity as the determinant of localization. Descartes is often credited with having been the first to enunciate explicitly the relativity of motion, and Gottfried Wilhelm Leibniz is cited as one of its most enthusiastic proponents.

For Isaac Newton and his doctrine of absolute space the notion of absolute motion was, of course, of physical significance, being “the translation of a body from one absolute place into another” (*Principles*). He defined relative motion, corresponding to the concept of relative space, as “the translation from one relative place into another.” In spite of his professed adherence to Galileo’s principle of relativity, Newton maintained the possibility of distinguishing absolute from relative motion by their “properties, causes and effects.” His belief in the reality of absolute motion was based on his thesis that real forces create real motion. The reality of absolute motion, he argued, is manifested by the effects that such motions produce, for example, the appearance of centrifugal forces or effects. For Newton forces are metaphysical entities, and the motions they produce are therefore more than merely geometricotemporal or kinematic phenomena. Thus, rotation is an absolute motion, as he thought to have proved by an analysis of his famous pail experiment.

Apart from Christian Huygens, who from 1688 maintained the relativity of circular motion on physical grounds, and Leibniz, who rejected the Newtonian conception on philosophical grounds, it was primarily George Berkeley who treated the epistemological aspects of the problem (*Treatise concerning the Principles of Human Knowledge; De Motu*). He concluded:

It does not appear to me, that there can be any motion other than *relative*: so that to conceive motion, there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. Hence if there was one only body in being, it could not possibly be moved. This seems evident, in that the idea I have of motion doth necessarily include relation.

However, in the eighteenth and early nineteenth centuries, primarily as a result of Leonhard Euler’s justification of absolute motion on the basis of the principle of inertia (*Mechanica; Theoria Motus*, Secs. 84, 99) and Immanuel Kant’s argumentations in his “Metaphysical Foundations of Natural Science” (*Metaphysische Anfangsgründe der Naturwissenschaft*, 1786), absolute motion was regarded by the majority of philosophers as a meaningful concept, not only in physics but also in philosophy. Toward the middle of the nineteenth century the situation changed. At first it was admitted that rotational motion is absolute but translational motion is relative (James Clerk Maxwell, P. G. Tait, H. Streinitz, L. Lange), and later all motion was regarded as relative. One of the most ardent proponents of the universal relativity of motion was Ernst Mach (*Die Mechanik in ihrer Entwicklung*, Leipzig, 1883); he refuted Newton’s argument concerning the rise of centrifugal forces as evidence of the absolute nature of motion and explained it as an induction effect produced by the motion relative to the fixed stars. Whether Mach’s conjecture can be corroborated rigorously is still a problem that engages modern research, especially in the theory of general relativity.

The question of the relativity of motion, initiated, as we have seen, by Descartes, gained increased importance, owing to the fact that the concept of motion became the basic element of physical explanation. In fact, it was Descartes’s insistence on the exclusive admissibility of local motion that was decisive in this development. As is suggested in the *Principles of Philosophy* (Pt. 2, Sec. 23) and expounded in a letter to Marin Mersenne (1643), Descartes refused to attribute any reality to the so-called qualities of substances. The conception of such qualities, he contended, complicates and confuses rather than simplifies the explanation of physical phenomena in natural philosophy. In concluding such deliberations, Descartes declared local motion to be the only admissible element for physical explication. Descartes’s rejection of the Aristotelian physics of qualities had a great appeal to philosophers (see, for example, Thomas Hobbes, *Elementorum Philosophiae Sectio Prima*, 1655; *De Corpore*, Sec. 8, Ch. 9) and was instrumental in the development of the mechanistic orientation of modern classical physics, which tried to reduce all natural phenomena to motions of masses in space.

Characteristic of this conception of classical physics is a statement by Maxwell: “When a physical phenomenon can be completely described as a change in the configuration and motion of a material system, the dynamical explanation of that phenomenon is said to be

complete" (*Scientific Papers*, Cambridge, U.K., 1890, Vol. 2, p. 418). The predominant role of the concept of motion in physical science poses a problem of great importance to philosophy. Why is it that all processes, laws, and formulas of physics—and modern physics is no exception—ultimately refer to motion, and why is it that even problems in statics, the science of equilibrium and absence of motion, are solved in terms of fictitious motions and virtual velocities? Is the answer to be found only in the historical circumstances, namely that kinematic investigations were the earliest successful approach to the establishment of a physical theory and that consequently forces were regarded as manifesting themselves only through motions? The answer probably lies in a vestige of ancient Eleatic philosophy that seems still to motivate our mode of thinking: A physical explanation of a natural phenomenon becomes more satisfactory the nearer it approaches the statement that nothing has happened. Motion, as Wilhelm Wundt pointed out, is the only conceivable process in which an object, so to speak, both changes and remains the same: It changes by assuming a different position relative to other objects; it remains the same by preserving its complete identity.

## MOUNIER, EMMANUEL

(1905–1950)

Emmanuel Mounier, the French personalist philosopher, was born in Grenoble. He studied philosophy from 1924 to 1927 in Grenoble and in Paris, where he was successful in the *agrégation* examination of 1928. After teaching philosophy in schools during 1931 and 1932, he collaborated with others in bringing out a work on the thought of Charles Péguy, whom Mounier as a Roman Catholic greatly admired. This collaboration was extended to plans for a review to carry on Péguy's work, and *Esprit* was launched in October 1932. Mounier continued to edit the review in the face of difficulties, not least of which was the feeling of some Catholics that his position was virtually Marxist. He taught at the French *lycée* in Brussels from 1933 to 1939. He was called up for military service on the outbreak of war and was demobilized shortly after the fall of France in 1940. Mounier contrived to continue the production of *Esprit* until August 1941, when the Vichy government banned it.

Suspected of subversive connections, he spent some months in prison in 1942, but was eventually acquitted and settled with his family, incognito, near Montélimar.

Mounier returned to Paris in 1945, and until his death he continued to produce books and a resuscitated *Esprit*, inspired by the times and his personalist response to them.

Mounier is the chief representative of the movement known as personalism. It is closely related, in the ideas it propounds, to existentialism. Personalism, however, is distinctively Christian and sees the personal "vocation" as seeking communication between unique persons, whereas existentialism is often divorced from religious belief, rejects the possibility of shared values, and is often strongly pessimistic concerning human relationships.

Mounier held that the person is entirely distinct from the political individual, who is "an abstract, legal, self-seeking entity, asserting his rights and presenting a mere caricature of the person." The person is "a spiritual being ... subsisting by his adherence to a hierarchy of values freely adopted, assimilated, and lived through, thanks to a responsible commitment and a constant process of conversion."

The "unique vocation" of the person has little more specifiable content than Jean-Paul Sartre's "original project." Mounier, however, insisted on the distinctive character of legitimate commitment, which is both personalist and *communautaire*, or directed toward a fellowship of other persons. Man's chief task, Mounier wrote in *Qu'est-ce que le personalisme?*, is not to master nature but increasingly to bring about communication leading to universal understanding.

Personalism is a natural product of the kind of French philosophy that has, since Maine de Biran, stressed the notion of a self that in some measure owes its being to an external reality which it apprehends or upon which it acts. Such thinking led Mounier to say that "as the philosopher who first shuts himself up within thought will never find a door leading to being, so he who first shuts himself up in the self will never find a path to others." Mounier criticized René Descartes, despite his modernity, for first adumbrating the solipsism that has since hung over modern man. In the economic field, bourgeois values "exalt the isolated individual and strengthen that economic and spiritual individualism" that still bedevils us. Mounier pointed the way from spiritually sterile self-absorption to the apprehension of reality in the form of not-self, particularly in the form of the other person with whom we communicate. The primitive experience of the person is the experience of the second person. The thou, including the we, precedes the I, or at least accompanies it. Mounier's objection to egoism was not only to economic individualism but also to its subtler

forms, such as a fastidious withdrawal from modern vulgarity into the purity of the self. All true living is a transaction with the reality of the world and others in a process of mutual enrichment. There is no true inwardness that is not nourished by its interaction with an outer reality. "We must find our way out of our inwardness in order to sustain that inwardness."

## MOZI

(c. 470–c. 391 BCE)

Mozi, also called Mo Di, was the founder of one of the classical systems of Chinese philosophy, Mohism, as well as of a religious community. After serving for a brief period as a civil servant, Mozi spent a number of years as a traveling counselor to feudal lords and princes, and, having never been given the opportunity to put his teachings into practice or the world in order, he had eventually to be contented with conducting a school and preparing his disciples for public office. He left a work consisting of seventy-one chapters, known as *The Mozi*. It is said that Mozi was at first a follower of Confucianism but later renounced it to found a system of thought of his own. He was critical of Confucianism for its emphasis on the codes of rituals and social elegance, which were to him burdensome and wasteful.

The rigoristic temperament of Mozi made him also a man who practiced what he preached. A chief concern for Mozi, for instance, was to reduce the recurrent military conflicts among the feudal states. There are records of his taking distant journeys to prevent the outbreak of impending wars. On one of his journeys, according to the record, he had to walk ten days and ten nights and tear off pieces of cloth from his garments to wrap up his sore feet.

A distinctive characteristic of Mozi's thought was his stress on methodology. He declared: "Some standard of judgment must be established. To make a proposition without regard for standard is similar to determining the directions of sunrise and sunset on a revolving potter's wheel." He attached great importance to the threefold test and the fourfold standard. The threefold test refers to the basis, the verifiability, and the applicability of a proposition. Explained in present-day language, this test is employed to examine a proposition for its compatibility with the best of the established conceptions, its consistency with experience, and its conduciveness to desirable ends when put into operation. The benefits resulting from the application of a proposition, the last part of the threefold test, are conceived in terms of the fourfold standard, namely, enrichment of the poor, increase of the population, removal of danger, and regulation of disorder. Mozi evidently would employ these tests and standards on all propositions without exception, and contemporary scholars have sometimes called him a pragmatist, and sometimes a utilitarian. There is a section of six chapters in *The Mozi* that has come to be spoken of as the section on Mohist logic. Most of the material contained therein has little utilitarian application, but it must

have been written in Mozi's tradition, if not by his hand. This logical development is an outgrowth of Mozi's insistence on "standard of judgment" but is generally regarded as constituting a neo-Mohist movement.

A common problem that confronted all the thinkers of the classical age was how to bring order out of chaos. The system of feudalistic hierarchy instituted at the beginning of the Zhou dynasty had crumbled, the Period of Warring States (403–222 BCE) was setting in, and the people were living in suffering and bewilderment. By Mozi's diagnosis, the chaotic condition was brought about by selfishness and partiality. And the cure? "Partiality should be replaced by universality." Universal love is the keystone of Mozi's teaching. Mozi was dissatisfied with Confucianism for its gradation in benevolence, and he exhorted everyone to regard the welfare of others as he regarded his own. He was convinced that the practice of universal love would bring peace to the world and happiness to man, and he took pains to demonstrate that the principle of universal love was grounded simultaneously in its practicability on earth and its divine sanction from Heaven. Universal love for Mozi was at once the way of man and the way of God.

In contrast to most Chinese philosophers, Mozi spoke of Heaven with feeling and conviction; his conception of it was similar to the Western conception of God. The will of Heaven was to be obeyed by man and was to be the standard of human thought and action. Heaven loved all men, and it was the will of Heaven that men should love one another. Soon after Mozi's death the teacher's system became embodied in an organized church with a succession of elder masters and a considerable following.

As a religious congregation Mohism did not last long, but as a system of thought and teaching Mohism ranked with Confucianism for some two centuries as one of "the eminent schools of the day." Mohism was pushed into the background if not into complete oblivion by the ascendancy of Confucianism for the next two thousand years and was rediscovered only in the mid-twentieth century.

## MUKAMMAŞ, DAVID BEN MERWAN AL-

See *Muqammiş, David ben Merwan al-*

## MULLĀ ŞADRĀ (1571/1572–1640)

Mullā Şadrā is the name usually given to Muḥammad ibn Ibrāhīm Şadr al-Dīn Shīrāzī, the most outstanding of the later Muslim philosophers. (*Mulla* means teacher.) He is also known by the honorific title *Sadr al-muta'allihin*, "the foremost among the theosophers." Born in Shiraz into an aristocratic family, he received his early education in that city and his advanced training in Ispahan, the Safavid capital, where he studied with Mīr Dāmād and Bahā' al-Dīn 'Amīlī. After completing his formal education he retired to a village near Qum, where he spent ten years in asceticism and self-purification. Then, upon the demand of the Persian king, he returned to Shiraz as a professor in the school of Allāhwirdī Khān, where he taught and wrote for the rest of his life. He died in Basra on the return journey from his seventh pilgrimage to Mecca.

Mullā Şadrā wrote over fifty books, most of them after leaving his spiritual retreat. All his books are in Arabic except his "spiritual defense," the *Siḥ aṣl* (Three principles) and a few poems and letters, which are in Persian. His works can be classified into those dealing primarily with religion, such as his commentaries on the Qur'an and the *Uṣūl al-Kāfi* (Principles of Kāfi) of Kulainī, and those which deal mostly with philosophy and theosophy.

In the latter category the most important is *Al-Ḥikmat al-muta'aliyah fi'l-asfār al-arba'ah* (The exalted wisdom concerning the four journeys of the spirit), or simply *Asfār* (The journeys), a work of monumental proportions and the most advanced work on Islamic philosophy. Mullā Şadrā also wrote a large number of shorter treatises, such as *Al-Mashā'ir* (The book of metaphysical penetrations), *Al-Shawāhid al-rubūbiyah* (Divine witnesses), and *Al-Ḥikmat al-'arshiyah* (The book of theophany inspired by the throne), which treat specific metaphysical and philosophical questions.

In Mullā Şadrā's work Muslim Peripatetic philosophy, especially that of Avicenna, the illuminationist theosophy of Shihāb al-Dīn Yahyā Suhrawardī, the gnostic doctrines of Muhyī al-Dīn ibn al-'Arabī and certain themes of Muslim theology (*Kalām*) became unified in the background of Shī'ism and the teachings of the Shī'ite imams. The philosophy of Mullā Şadrā, however, is synthetic rather than eclectic, because out of these various threads he created a new intellectual perspective in which reason, revelation, and mystic vision are harmonized into a total, unified view of things.

Mullā Şadrā brought to fruition the attempt of Muslim thinkers from the beginning of the Middle Ages to harmonize religion and philosophy. In his thought the tenets of revelation, the dicta of reason, and the verities of gnosis discovered through illumination are all considered possible sources of knowledge and are blended together. His writings bridge discursive and intuitive knowledge by making the discoveries of reason the necessary background of spiritual knowledge, which is above reason without being irrational. Mullā Şadrā also revised many of the tenets of Peripatetic and illuminationist philosophy and established philosophy upon a set of principles, many of which were derived from Sufism, that had not been demonstrated as such and had not existed in philosophy before.

These principles include the unity, gradation, and principality of being, by which is meant that it is being rather than the quiddity or essence of things that is ultimately real. Moreover, being is inwardly unified as a single reality that possesses states and gradations. It is upon this principle that Mullā Şadrā built his "metaphysics of being." Another principle of his philosophy is the unity of the intellect, or intelligence, and the intelligible, of the knower and the known. At the moment of intellection the intellect becomes identified with the intelligible form of the object perceived. Thus, knowledge is intimately connected with being and affects the ontological state of the knower.

Mullā Ṣadrā also posited the principle of substantial motion. According to the previous Muslim philosophers and going back to Aristotle, motion is possibly only in the accidents of things, not in their substance. Mullā Ṣadrā thought that, on the contrary, motion implies an inner becoming within the substance of things and therefore a continuous development toward higher states of being (without in any way implying the modern theory of evolution).

Another important principle asserted by Mullā Ṣadrā is the catharsis and independence of the imaginative faculty from the body. There is an intermediate “imaginal world” (*mundus imaginālis*) not to be confused with the “imagination” of current usage. The human imagination is a microcosmic aspect of this cosmic imagination and it is precisely in this domain possessing a reality of its own that eschatological problems whose solution escaped earlier philosophers take place and can be understood. These and many other principles, some of whose roots are to be found in the writings of the earlier Sufis and philosophers, Mullā Ṣadrā systematized and developed to their full conclusion.

Mullā Ṣadrā had many students, of whom the most famous are Mullā Muhsin Faiḍ Kāshānī and ‘Abd al-Razāq Lāhijī, who were among the leading Shī‘ite thinkers. His disciples propagated his works and teachings in both Persia and India, and in fact he founded a school that has dominated the intellectual life of Persia for the past four centuries. It is, however, against his worldview that the founder of the Shaikhī movement, Shaikh Aḥmad Ahsā‘ī, wrote his criticisms. The Bāb, the founder of Babism, also belongs to the current against Mullā Ṣadrā and should by no means be considered as a product of his school. The school of Mullā Ṣadrā is still alive in Iran today and is the most important traditional school of philosophy and theosophy there.

## MULLĀ ṢADRĀ [ADDENDUM]

In developing his concept of existence Mullā Ṣadrā works against the backdrop of Shihāb al-Dīn Yaḥyā Suhrawardī’s essentialist metaphysics on the one hand, and Avicenna’s rather incomplete and occasionally imprecise remarks on being on the other. Suhrawardī had defended essence (*māhiyya*) as the sole reality and as the

proper subject matter of metaphysics. For him, existence (*wujūd*) is a common term and a secondary intelligible, shared by a multitude of objects without corresponding to any particular being. Suhrawardī proposed two objections against the primacy of existence. First, if existence is to be the real attribute of an essence in the extramental world, then this essence will have to have an existence of its own before receiving existence as an attribute. In this case existence will be the attribute of something that already exists. Second, if existence is to be the basis of reality, then it will have to exist before being such a basis. In this case this second existence will have to exist before serving as a basis for the first existence, and so on ad infinitum. Therefore, existence is a secondary intelligible posited by the mind, adding nothing to the concrete existence of quiddities.

Ṣadrā's response to this is based on a position he calls the primacy of existence (*aṣālat al-wujūd*). Instead of defining existence as a generic term and attribute, which things take on *a posteriori*, Ṣadrā construes it as that by which things are what they are. According to Ṣadrā one cannot say "existence exists" just as one cannot logically say "whiteness is white." When one talks about beings that exist, what one means is that things exist or simply are rather than they have existence. This means that the existence of something is its reality. According to Ṣadrā Suhrawardī's essentialism results from his failure to make a distinction between the concept and reality of existence. While existence as a concept is a secondary intelligible applicable to a multitude of objects, the reality of existence is such that it leaves no distance between the existence of something and its reality. Furthermore, Ṣadrā posits existence as the principle of both unity and difference. On the one hand, existence is that which makes things exist and, on the other, it is that which makes them what they are as a specific quiddity. Existence becomes delimited and multiplied by itself alone, displaying various modes of intensification and diminution. Ṣadrā explains this process with his central concept of the gradation of existence (*tashkīk al-wujūd*). In this gradational ontology essences are nothing but mental constructions produced by the human mind to denote the different particularizations of existence, which ultimately remain one and the same.

Ṣadrā's insistence on existence as the sole reality has far-reaching consequences for his epistemology. He defines knowledge as a mode of existence and relegates all cognition to the immediate perception of existence. In this view, to know something is to know its intelligible form. But since Ṣadrā takes intelligible forms to be vari-

ous manifestations and self-delimitations of existence, one's epistemic access to things ought to be through the existence of what one knows. Furthermore, Ṣadrā's realist ontology considers intelligible forms ontologically more real and epistemologically more reliable than their material existence. The climax that one reaches through the unification of the intellect, the intelligible and the intellect is thus a mode of existential intensification and not a simple process of conceptual augmentation. These considerations lead Ṣadrā to develop a mystical theory of knowledge without totally jettisoning the traditional peripatetic noetics.

## Bibliography

### WORKS BY ṢADRĀ

- The Metaphysics of Mulla Ṣadrā*. Translated by Parviz Morewedge. New York: Society for the Study of Islamic Philosophy and Science, 1992. Originally published under the title *Kitab al-Masha'ir*.
- Tafsir al-qur'an al-karim*. Qum: Bidar Press, 1366–1369/1987–1990. 7 vols. edited by Muhammad Khwajawi. Ṣadrā's incomplete commentary on the Qur'an written from a philosophical and mystical point of view.
- Ma'ani al-alfaz al-mufradah min al-qur'an* (The meanings of Qur'anic terms). A short exposition of certain Qur'anic terms and expressions.
- Mutashabihat al-qur'an* (Allegorical verses of the Qur'an). Ṣadrā's explanation of the Qur'anic verses that are called allegorical or metaphorical (*mutashabih*) by the Qur'an (Al-i 'Imran, 3:7) such as 'God's hand.' Published in Sayyid Jalal al-Din Ashtiyani, *Sih Risalah* (Mashhad: Mashhad University Press, 1352 (A. H. Lunar)).
- Sharh usul al-kafi* (Commentary on the *Usul al-kafi*). A commentary on the famous Shi'ite book of Hadith compiled by Abu Ja'far Muhammad ibn Ya'qub Kulayni (d. 329/940). Edited by Muhammad Khwajawi in 3 Vols. (Tehran: Mu'assasa-yi Mutala'at wa Tahqiqat-i Farhanghi, 1366 (A. H. Solar)).
- Risalat al-Hashr* (The treatise of resurrection). Muhammad Khwajawi has published a critical edition with Persian translation under the title *Risalat al-hashr ya kitab-i rastakhiz-i jahan* (Tehran: Intisharat-i Mawla, 1377 (A. H. Lunar; second edition)).
- Huduth al-'alam* (Temporal origination of the world). Ṣadrā's most important work on the temporal origination of the world. Printed in the *Rasa'il* (Qom: Maktab al-Mustafawi, 1302 (A. H. Lunar)) (first treatise).
- Iksir al-'arifin fi ma'rifat tariq al-haqq wa'l-yaqin* (The elixir of the gnostics for knowing the path of the truth and certainty). One of Ṣadrā's mystical works; Translated by William C. Chittick as *The Elixir of the Gnostics: A Parallel English-Arabic Text*. Provo, UT: Brigham Young University Press, 2003.

*Kasr al-asnam al-jahiliyyah fi dhamm al-mutasawwifin* (The demolition of the idols of ignorance in blaming those who pretend to be Sufis). Şadrâ's attack on those who pretended to be Sufis and held excessive views during the Safawid period; edited by M. T. Danechepazuh (Tehran: 1340 (A. H. Solar)).

*Kitab al-Masha'ir*. Translated by P. Morewedge as *The Metaphysics of Mulla Şadrâ*. Texas: Global Publications Associations, 1992. A summary of some key issues of Sadrean metaphysics.

*Al-Mazahir al-ilahiyyah fi asrar al-'ulum al-kamaliyyah* (Divine manifestations concerning the secrets of the sciences of perfection). One of Şadrâ's major theological works synthesizing philosophical arguments with quotations from the Qur'an; edited with an introduction by Sayyid Muhammad Khamanei. Tehran: Bunyad-i Hikmat-i Islami-yi Şadrâ, 1378.

*Zad al-musafir* (Provisions of the traveler) also known as *Zad al-salik* and *Ma'ad al-jismani*. A short treatise summarizing Şadrâ's views on eschatology. Edited by S. J. Ashtiyani. Tehran: Mu'assa-yi Intisharat-i Amir Kabir, 1379 (A. H. Lunar).

*Majmu'a-yi rasa'il-i falsafi-yi Sadr al-Muta'allihin*, edited by Hamid Naji Isfahani. Tehran: Intisharat-i Hikmat, 1375 (A. H. Lunar). Contains a number of Şadrâ's short treatises.

## MULTICULTURALISM

In many academic fields in the United States after 1970, multiculturalism has meant that members of historically disadvantaged nonwhite or minority racial and ethnic groups have distinctive knowledge and ways of knowing that ought to be incorporated into curricula and recognized in research. This idea has led to area studies programs and departments that concentrate on cultures from specific geographical locations, such as Africana or African American studies, Latino/a studies, Asian American studies, Native American studies, and more generally, American studies and ethnic studies. As well, new texts and different cultural perspectives have been incorporated into traditional fields in the humanities and social sciences.

Multiculturalists have advocated greater diversity and representation in the academic community, by increasing members of historically disadvantaged groups among faculty, staff, and students, and recognizing and addressing their distinctive intellectual and socially relevant interests. Multiculturalism has often been associated with identity politics, or advocacy of the interests of minority groups, by their members, in both national and local politics and representations of ideas and persons in specific institutional contexts. Multiculturalism has been opposed in academia, because it is believed to weaken traditional subject matter by minimizing the established canon and neglecting universal knowledge. This opposition has been largely from conservative white intellectuals, but not exclusively so. For example, sociologist Yehudi Webster has argued that multiculturalism deprives students of the opportunity to develop critical thinking skills, and philosopher Jason Hill has argued that in emphasizing the value of racial and ethnic identities, multiculturalism stifles individual creativity and shared cosmopolitanism.

## MULTICULTURALISM IN THE U.S. PROFESSION OF PHILOSOPHY

The practice of academic philosophy in the United States has tended to be restricted to the work of English, French, German, and ancient Greek philosophers, with varied recognition of American philosophy or pragmatism. Advocates of multicultural inclusion have argued that philosophical inquiry has not been limited to the United States, Europe, and ancient Greece, but exists in intellectual traditions in China, India, Africa, and South America, as well as in the cultures of groups worldwide. Multicultural advocates therefore conclude that the canon of American academic philosophy ought to reflect more geographical diversity. Also, when Western European philosophy has presented itself as universal, the incorporation of multicultural philosophical perspectives would seem to imply that Western European philosophy itself is as local as philosophies from other parts of the world.

Such intellectual multiculturalism has been undertaken by a number of American philosophers since the end of the twentieth century; James Sterba (2002) has argued that there is a Western bias in ethics that can be corrected. In *Native Pragmatism* (2002), Scott Pratt identifies Native American perspectives in nineteenth and early twentieth century American philosophy, and tracks their transmission. Also, introductory anthologies have become more inclusive of African, Asian, and East Indian traditions—Max Hallman's (2003) collection, *Traversing Philosophical Boundaries*, is one example.

American philosophers have also addressed demographic multiculturalism, which aims to increase the racial and ethnic diversity of philosophers and resembles the kinds of multiculturalism in other fields that has been associated with identity politics. In 2003 the American Philosophical Association's (APA) Committee on Inclusiveness proposed that the APA Board consider, for possible approval by all APA members, the following statement on inclusiveness:

The American Philosophical Association is committed to expanding and enhancing the inclusiveness of the profession by: (A) Increasing the numbers and respected presence of persons from groups that have historically been subjected to invidious discrimination. These groups include, but are not limited to, disabled persons; persons of African descent; American Indians; Asians and Asian Americans; Hispanics and Latinos/as; Jews; persons of Middle Eastern descent; multiracial persons; lesbian, gay, bisexual,

and transgendered persons; women. (B) Recognizing and supporting the development of scholarly philosophical research, teaching, service, and professional activity pertaining to the concerns of these groups.

The APA Board and the profession of U.S. academic philosophers are likely to approve the statement on inclusiveness, although as the profession develops over the twenty-first century, both intellectual and demographic multiculturalism, and external political and social changes will probably result in its augmentation and revision. Still, many traditional philosophers have opposed multiculturalism, on the grounds that its distinctive knowledge and epistemologies are not contributions to the field of academic philosophy, but rather applications of philosophical methods to new subjects, or else simply not philosophical at all. There are also concerns about time constraints on courses resulting in superficial instruction of a variety of traditions, in place of more thorough investigation of one or two.

Nonetheless, the APA, which is the primary professional organization of U.S. academic philosophers, publishes biannual newsletters on: American Indians in philosophy; Asian and Asian American philosophers and philosophies; the black experience; and Hispanic/Latino issues in philosophy. Also, the APA Committee on Inclusiveness is a standing committee that includes APA special committees on: American Indians, Asian and Asian American philosophers and philosophies, blacks in philosophy, and Hispanics. All of these committees were formed to address the relatively small numbers of nonwhite philosophers, and the absence of strong professional support of multicultural writing and teaching in the field. In 2002, the number of nonwhite academic philosophers was lower than the 10 percent of nonwhites in the U.S. professoriate overall, a figure that had not changed since 1989, and the percentage of African American philosophers was less than the national 4.4 percent of the U.S. professoriate, half of whom were employed in traditional black colleges (see Wilson [2002] for the national figures).

As of 2005, multicultural scholarly work in philosophy has mainly focused on African American concerns, although in the late 1990s, Asian American, Native American, and Hispanic concerns began to appear in philosophy courses and publications. In addition, since the late 1970s, feminist philosophers have attempted to address issues raised by nonwhite women, partly in response to criticism by bell hooks, Elizabeth Spelman, and others,

that academic feminists were overly preoccupied with the problems of white middle class women.

This growing body of multicultural philosophical work is to some extent independent of the intellectual multiculturalism already mentioned, because it tends to be motivated by concerns about demographic inclusiveness and past oppression. It should be noted that the adjective *multicultural* does not always appear in multicultural scholarly work by philosophers, who are instead likely to use the terms *race* or *racial*, *black*, *African American*, *Asian American*, *Hispanic* or *Latino/a*, or *Native American* in their titles and within their work.

Still, the multicultural work of philosophers has often been multidisciplinary, with forays into anthropology, literature, sociology, law, the history of ideas, economics, and social theory. At the same time, multicultural philosophy has made use of traditionally analytic, continental (phenomenological and existentialist), and post-modern philosophical methodologies, sometimes combining different methodologies in the same texts. Much of the multicultural philosophical work is about race in U.S. society, and much of it is centered on social and individual problems or questions: Can affirmative action be morally justified? What is racism and how can it be remedied? What is racial identity? Are reparations for past oppression, such as slavery and the appropriation of indigenist lands, morally imperative? Does biology support ideas of human racial divisions in society?

Writings of historical figures have also been reexamined, for instance: David Hume and Immanuel Kant for their belief in the existence of hierarchies of human races; W. E. B. DuBois and Alain Locke for their ideas about racial identity; Frederick Douglass and Julia Ann Cooper for their contributions to theories of liberation; Frantz Fanon and Jean-Paul Sartre for ideas on individual freedom and authenticity and group emancipation. Overall, the subject of race in U.S. multicultural philosophy unifies into a set of logically connected concepts and subjects that scholars analyze from diverse starting premises, with considerable disagreement, albeit a common goal of increasing social justice for disadvantaged groups. At least three of these subjects merit closer examination in this context of multiculturalism in philosophy: the existence of biological race, racism, and affirmative action.

## THE EXISTENCE OF BIOLOGICAL RACE

Whether or not human races exist as biological divisions of humankind has philosophical implications: If races are biologically real, then the social problems concerning race are matters of race relations; if races are not biologi-

cally real, then many social problems as well as much of the discourse about race must be understood by philosophers in terms of false beliefs that participants hold. That is, if biological races exist, then the philosophical discussion about race is in part a direct discussion about the world, whereas if biological races are fictional, then the philosophical discussion becomes a second-order discourse about what people believe. David Hume, Immanuel Kant, and other Enlightenment thinkers thought that the existence of human races was self-evident. During the time they wrote, the new sciences of biology and anthropology had begun to produce systems of classification that appeared to explain those physical differences among human groups, which were apparent in common sense.

By the mid-nineteenth century, human races were believed to be biological groups with common inherited physical, cultural, and psychic traits. American anthropologists were prominent proponents of natural human hierarchies, based on race and ultimately caused by racial essences, believed to be inherited in the blood. However, during the early twentieth century, anthropologist Franz Boas and his students Claude Lévi-Strauss, Margaret Meade, and Melville J. Herskovits established that history and culture were the causes of nonphysical racial differences. Subsequently, biological anthropologists came to agree that there were no general physical essences or even stable sets of particular traits shared by every member of any race. Blood types do not correspond to social racial groups. Mitochondrial DNA, used to track existing populations to ancestral groups in Asia, Africa, and Europe, has no relation to genes that determine inherited traits considered racial in society. And there is greater variation within races of those inherited racial traits than between any two races. In short, while biology confirms the existence of inherited physical traits that are considered to be racial in society, biology, according to some scholars, offers no support for a taxonomy of human races.

In the early 1990s, Kwame Anthony Appiah was the first U.S. philosopher to examine the lack of a scientific biological foundation for human races and he then argued that racial identities ought to be reconsidered. His work was taken up through controversial justifications for mixed race identity and more extensive philosophy of science analyses of how ideas of race are precluded by the findings and methodologies of biological anthropology, Mendelian heredity, and population genetics as of the late twentieth-century (Zack 1993 and 2002).

Yet, by 2005, most Americans continued to believe that human races are real physical divisions and that the

social taxonomy of three (or four or five) races can be verified within the biological sciences. Multicultural scholars in all fields and philosophers who begin their inquiries on the basis of common sense or received opinion, tend to concur with the public, although often for avowedly political motivations. Thus, Lucius Outlaw, writing in the tradition of W. E. B. Dubois and Alain Locke, advocates a conservation of ordinary ideas of race, with their biological connotations, for the sake of continued self-esteem and social justice for African Americans. Amy Gutman claims that retention of ideas of race is essential for identifying those groups who have been oppressed or discriminated against on the basis of their purported race, so that their members may be assisted toward equality of opportunity for success in society.

Furthermore, scholars of Latino philosophy such as Linda Alcoff, Jorge Gracia, Eduardo Mendieta, and Ophelia Schutte have included discussions of racism in their analyses of Hispanic and Latino ethnicity. This suggests that members of dominant white Northern European groups have sometimes viewed Hispanics and Latinos as a distinct race and that addressing discrimination associated with that view could include the construction of positive distinctive racial identities for Hispanics and Latinos. And even in a purely conceptual analysis, Michael O. Hardimon (2003) dismisses disputes about the scientific standing of race and their relation to the ordinary concept of race. Hardimon then asserts, "The ordinary concept of race is our concept. It is part of our discourses, our practices, our conceptual repertoire" (Hardimon 2003, p.438).

Similarly, in an Op-Ed piece in the *New York Times* on March 14, 2005, Armand Mare Leroi, an evolutionary developmental biologist, called upon scientists to resurrect notions of biological race in light of its cultural significance, citing the importance of the preservation of the Negritos, an ancient tribe on the Andaman Islands in the Indian Ocean. It is a paradox that while philosophical multiculturalism enables analysis of the biological foundations for race, multiculturalist beliefs about how to attain social justice are held to be incompatible with the results of such conceptual analyses, even though everything of social value that used to be called race can be captured by ideas of family heredity and culture.

## RACISM

The term *racism* came into broad usage in the United States during the late 1960s and there has since been both implied and explicit disagreement about what racism is. The concept of racism is broader than its predecessors,

bigotry, discrimination, intolerance, and prejudice, because it can refer to social conditions as well as intentions and attitudes of individuals. By the late twentieth century, there was a consensus in business, academia, politics, and public life generally that racism in individuals is morally wrong and that the practice of racism by representatives of institutions and organizations is unjust, as well as in violation of Title VII of the Civil Rights Act of 1964, which prohibits employment discrimination based on race, sex, national origin, or religion. (Title VI prohibits public access discrimination, which was relevant to the implementation of school desegregation and Title VIII was the first federal fair housing law).

Moral philosophers have traditionally posited justice as a cardinal social and individual virtue. Given the premise that racism is a kind of injustice against human beings based on their racial identities, the main philosophical argument has focused on whether the causes of racism and remedies for it are confined to individuals or can be understood as institutional. Because racism, as a wrong, requires remedies where it exists, the individual view focuses on psychological and educational remedies, whereas the institutional view supports progressive legal action and public policy. Both views are motivated by concepts of responsibility in the sense that both individuals and societies are believed to be accountable and subject to blame for wrongs they commit.

Some proponents of individual views of racism have worked within a Kantian moral tradition. J. L. A. Garcia (1997) has argued that racism is a kind of ill will or contempt in the hearts and minds of individuals, a lack of benevolence for which they are morally responsible. Racism in this sense may be present when others are not harmed by it and it may not be present when others are harmed in ways associated with their race.

Philosophers who study racism with a multidisciplinary approach are inclined to define racism institutionally, because historians, sociologists, and political scientists have provided many extended examples of behavior, traditions, and laws that explicitly or implicitly disadvantage members of nonwhite groups in comparison to whites. Slavery, segregation, and the status of African Americans according to many measures of demographic well-being are one set of examples; the failure of the U.S. government to honor its treaty obligations to Native Americans is a second; restrictions on nonwhite immigration are a third.

For all minority groups, evidence of institutional racism against them includes disproportionately higher rates of incarceration, poverty, and unemployment, and

disproportionately lower rates of income, family assets, advanced educational degrees, and presence in the political leadership class. Whereas most scholars in philosophy and other fields focus on institutional racism as a modern and postmodern phenomenon, several have drawn wider connections. Berel Lang (1997) claims that racism is historically prior to modern ideas of race and that metaphysical racism is a set of ideas and practices that can be attached to varied specific notions of race; Charles Mills (1997) argues that modern Western history has developed on the basis of a racial contract that places Europeans and Americans at the top of a hierarchy in which indigenist Americans, Africans, and Asians are oppressed and exploited.

In the context of American history, critical race theorists such as Derek Bell and Patricia Williams have argued that the American legal system is structurally racist, from the acceptance of slavery in the U.S. Constitution to the neglect of race-based disadvantage in laws presumed to be color blind. Finally, there is disagreement among philosophers about who the most disadvantaged or paradigm victims of racism are: Lewis Gordon (1995) has claimed that antiblack racism is more extreme than other forms, because of the historical association of darkness with sin in the Christian tradition; Native American philosophers refer to European conquest as a holocaust; Asian Americans claim group histories of exclusion in immigration law and exploitation as cheap labor.

There are also issues of whether nonwhites can be racist against whites and whether racism can be practiced by some members of the same race against others. Nonwhites can be individually racist against whites, although not institutionally because they do not have sufficient influence within major social institutions. Preferences for lighter skin color within nonwhite groups, as well as self-hatred on the grounds of nonwhite race would be examples of same-race racism.

## AFFIRMATIVE ACTION

In 1965, according to U.S. Executive Order 11246, President Lyndon Johnson required that government officials take affirmative action (AA) to address the ongoing disproportionately low numbers of minorities directly and indirectly employed by the federal government. At that time, the concept of institutional racism was not widely accepted, but it was assumed that AA would override individual racism that could not otherwise be proved in hiring decisions. Arguments in favor of AA have been based on the value of minority role models, the justice of compensation and reparations for past wrongs, and the

presumption that U.S. society has not ceased to disadvantage minorities on the grounds of race. Arguments against AA often proceed from the premise that minorities have gained formal and legal equality in the United States, to the claim that AA is unnecessary, and unjust because it penalizes otherwise deserving and innocent whites who are not responsible for past injustice.

In 2003 the U.S. Supreme Court's rulings in two University of Michigan cases offered a practical resolution of these disputes. In both *Grutter v. Bollinger* and *Gratz v. Bollinger*, the Court recognized the value of a diverse student body but used strict scrutiny in its rulings, determining whether two different forms of AA constituted a compelling government interest and were narrowly tailored to advance that interest. In *Grutter v. Bollinger*, the Court ruled in favor of the University of Michigan Law School's policy of considering the race of applicants holistically, as one factor among many; in *Gratz v. Bollinger*, the Court ruled against the University of Michigan's undergraduate admissions policy of uniformly giving the same number of points for minority racial identities. In its rulings in these and previous cases, the Court declared as unconstitutional, role model and compensation/reparation justifications for AA. However, in *Grutter v. Bollinger* the Court upheld the value of a critical mass of minority students, as opposed to tokenism. The Court's main justification for AA was the value of a racially integrated leadership class, which would in time make AA unnecessary.

Philosophers of race and racism are unlikely to accept judicial decisions on AA as the last word, because courts may revise or overturn previous rulings and legal reasoning has distinctive constraints, one of which is to assume that existing laws are effective. In the Michigan cases, the Supreme Court appeared to assume that formal legal equality guarantees equal opportunity. It therefore seemed to view AA as a strategy for achieving diversity, on the assumption of unequal ability, rather than a strategy for social justice. That is, the Court seemed to accept the fairness of admissions criteria that nonwhites disproportionately fail to meet and did not address the possibility of racism in the face of official race neutrality.

## FURTHER ASPECTS OF MULTICULTURAL PHILOSOPHY

Whether multicultural academic philosophy will remain a distinct range of specializations or become part of the core curriculum is an open question. Africana Philosophy, which includes studies of race and racism, did become a recognized philosophical subfield by the 1990s.

Native American philosophers Anne Waters (2000) and V.P. Cordova (2000) have argued that Western philosophy has Christian religious foundations that are inimical to indigenist world views, a perspective that undermines beliefs in the universalism of traditional philosophy. Hispanic and Latin American philosophy has never been part of the recognized philosophical canon, although by 2000 it was clearly part of multicultural philosophy. Although Asian or Eastern philosophy has a long history as a distinctive body of knowledge, often addressed within comparative philosophy, the status and concerns of Asian Americans would be a new subject.

By 2005, the existence of philosophical multicultural research, published by academic book presses and journals, constituted a tradition capable of supporting graduate research and further professional scholarship, as well as the curricula of multicultural courses. Where studies of race have been limited to U.S. society, further work is likely to include international and world perspectives. Multidisciplinary approaches are likely to continue, drawing on studies in law, political science, sociology, public policy, and economics. Philosophy of science analyses of ideas of race in biological anthropology and population genetics could expand into ideas of race in the social sciences (for example, psychologist Roy Freedle [2003] has presented statistical data on standardized test scores, which indicate that minority students score higher than traditional white students on difficult questions). Feminist interest in racial differences among women adds a multicultural dimension to existing feminist philosophy. And finally, analyses of racism and its remedies are relevant to established work in the philosophy of education, as well as moral theory, ethics, and applied ethics.

In considering future directions for both intellectual and demographic multiculturalism in philosophy, and assessing progress at any given time, the subject itself suggests cross-national comparisons. In general, the extent of multiculturalism in philosophy seems to be more sensitive to external political, social, and demographic factors, than to purely intellectual interests in inclusion or exclusion. For example, as university subjects in the Soviet Union, *philosophy* referred to the work of Karl Marx and Vladimir Lenin, whereas Western philosophy, which was what Western Europeans and Americans called *philosophy*, was taught as a distinct and subsidiary subfield.

There have been two models of political and social pluralism that are relevant to multicultural philosophy, considered as an international subject. The assimilationist model encourages subordinate groups to achieve inclusion through their contributions to the common

culture of dominant groups. The autonomous or diversity model advocates that subordinate groups participate in a shared but diverse common culture. American academic philosophy is becoming multicultural according to the diversity model.

In contrast, the trend in Great Britain has been to assimilate white women and minorities within the existing academic field of philosophy. Julian Baggini, editor of *The Philosophers' Magazine*, who interviewed sixteen leading British philosophers about their profession, observed in 2003 that participants in the main British philosophy conference were often all white, with a very small minority of women. Since the 1970s, Canada has had a strong multicultural political movement that has been reflected in its intellectual life. James Tully (1995) has examined how constitutionalism can coexist with diversity in *Strange Multiplicity*. And in *Multicultural Citizenship* (1995), Will Kymlicka argues that immigrant and indigenous groups in a multicultural society have disparate needs.

Developing parts of the world have perhaps been more interested in examining and constructing their own national and cultural intellectual perspectives, in a post-colonial era. Their work may be included in multicultural studies for Northern and Western audiences—for example, V. Y. Mudimbe's *Nations, Identities, Cultures*. But, multiculturalism for postcolonial critics is more likely to be a matter of deconstruction than inclusion. For example, in *Dislocating Cultures* (1997), Uma Narayan examines how British representations are an integral part of what is accepted as Indian culture and its products. Nevertheless, it is increasingly difficult to generalize about scholarly trends in multiculturalism. Chinese academics have launched *The Journal of Multicultural Discourses*, a forum for multicultural approaches to language, communities of discourse, cultural and literary criticism, and comparative studies, which will aim to be multidisciplinary across the social sciences and humanities, including philosophy.

## MULTIPLE REALIZABILITY

Multiple realizability is a key issue in debates over the nature of mind and reduction in the sciences. The subject consists of two parts: multiplicity and realizability. "Multiplicity" designates variability in the mechanism and materials from which a particular type of thing can be made. "Realizability" designates a specific relation that exists when there is the stated variability.

## REALIZABILITY

Apart from the broad folk notion of realization meaning that a thing is made real, philosophers apply several technical notions of realization to paradigm cases such as computational states realized by engineering states, minds realized by brains, and persons realized by their bodies. The technical notions fall into three broad traditions: mathematical, logico-semantic, and metaphysical.

The mathematical tradition equates realization with a form of mapping between objects. Generally speaking,  $x$  (mathematically) realizes  $y$  because elements of  $y$  map onto elements of  $x$ . The notion is useful for many purposes, for example, when constructing a formal model of a particular domain. However, since mapping extends to models as well as reality, it fails to distinguish between simulated versus genuine realizations. Heavenly stars can be mapped onto grains of sand, but grains of sand do not realize heavenly stars in any genuine sense. Similarly, the mental states described by a cognitive program can be mapped onto unthinking groups of things, but unthinking groups of things do not realize mental states in any genuine sense (Block 1978). Hence, to capture what is essential to genuine realization, William Lycan (1987) adds ideas about evolutionary function, while David Chalmers (1994) emphasizes facts about the causal structure of a system. To present Chalmers's idea and cast in terms of a computational model that informs the literature cited, a set of mental properties that constitute the cognitive program of a system is realized by a set of engineering properties possessed by that system if and only if (a) there is a one-to-one mapping between instances of the two sets of properties, and (b) the engineering involved has the causal structure to satisfy the computational state transitions required by the program.

The logico-semantic tradition translates realization into an interpretation of symbolic objects. Generally speaking,  $x$  (semantically) realizes  $y$  because  $x$  can be interpreted to meet the conditions for satisfying the term " $y$ ." Thus, logicians say that a set of objects is the realization of a formal language when the objects satisfy the predicates of that language (Tarski 1936/1956). Being a matter of semantic interpretation, might appear irrelevant to paradigm cases of realization whereby one thing (engineering or brains) generates or produces another thing (computation or minds). Yet Daniel Dennett (1978) addresses such cases by employing a method of agent interpretation, in effect turning the interpretation of symbols into an interpretation of rational symbol systems. Roughly, a set of mental properties that constitutes a system's cognitive program is realized by a set of engi-

neering properties possessed by that system if and only if (a) the system's behavior supports an interpretation according to which instances of the computational properties are internal symbols involved in the operations of the system, and (b) it is rational for the system to possess those symbols and operations under the stated interpretation.

Finally, the metaphysical tradition views realization as a species of determination between objects. Generally speaking,  $x$  (metaphysically) realizes  $y$  because the properties of  $x$  determine the properties of  $y$ . Unlike other forms of determination, philosophers see a very close connection in paradigm cases of metaphysical realization. Regarding the particulars, some philosophers add that instances of realized and realizing properties occur at the same time, with the former composed out of the latter (Tye 1995). Regarding the properties, Stephen Yablo (1992) applies the notion of determinables and determinates by maintaining that a realized property stands to a realizing property as the determinable color red stands to its more determinate color scarlet. So human neurophysiology is a way of being a mind, like scarlet is a way of being red. In a different vein, Sydney Shoemaker (2001) employs metaphysical and set-theoretic notions by viewing the causal powers of a realized property as a subset of the causal powers of its realizing property. So mental abilities are a mere portion of the causal capacities of the appropriate engineering systems.

Many philosophers explain realization in terms of functionalism, the leading doctrine in the philosophy of mind. On this view, mental processes are understood by the functions they perform and not by the materials that realize the processes. On one popular version, each mental property is a higher-order property whose nature is defined as the possession of a lower-order physical property that plays an associated functional role. To present this idea in computational format, a set of mental properties that constitutes a system's cognitive program is realized by a set of engineering properties possessed by that system if and only if (a) the mental properties are higher-order properties that require lower-order physical properties to play their associated functional roles, and (b) the physical engineering properties of the system play the required functional roles.

## MULTIPLE REALIZABILITY

Multiple realizability is a kind of variability in materials that philosophers call "property variability" or "compositional plasticity." Functionalists have this variability in mind when they observe that different physical properties

can play the same functional role in different individuals. Indeed, this observation is commonplace in computer science. Thus Alan Turing judged that the specific physical properties of an engineering system are unimportant for a theory of computation because the same computational function can be performed by systems with different engineering:

Importance is often attached to the fact that modern digital computers are electrical, and that the nervous system is also electrical. Since Babbage's machine was not electrical, and since all digital computers are in a sense equivalent, we see that this use of electricity cannot be of theoretical importance. ... If we wish to find [computational] similarities we should look rather for mathematical analogies of function. (Turing 1950, p. 439)

That is, while an instance of a given physical property may be sufficient to realize a computational property, as when the human brain computes addition, nevertheless that same physical property is not necessary. Other systems with quite different physical properties can compute addition: someone with a different neurophysiology, an artificial machine with a microprocessor, and so on. So the key to property variability is that sufficient conditions for the realization of higher-level properties are not necessary conditions.

More formally, property *G* is lawfully sufficient for property *F* if, as a matter of physical law, *F* is realized when *G* is realized. But *G* is not a necessary condition for *F* if *F* can be realized without *G*. For example, *G* is sufficient but not necessary for *F* if *F* is a computational function that can be realized on some occasion without the property *G* of having a human neural assembly but with the property *H* having an artificial microprocessor. To incorporate this idea into a formal definition in which *A* is a set of realized properties and *B* its realizing base:

Property *F* in set *A* has variability with respect to set *B* if and only if there exist properties *G* and *H* in *B* such that

- (i) it is possible that *G* and *F* but not *H* are realized, and, as a matter of physical law, if *G* is realized then so is *F*;
- (ii) it is possible that *H* and *F* but not *G* are realized, and, as a matter of physical law, if *H* is realized then so is *F*; and
- (iii) there is no property *K* in set *B* such that, as a matter of physical law, *F* is realized if and only if *K* is realized. (Endicott 1994)

Clauses (i) and (ii) jointly express a minimal form of property variability, while the addition of clause (iii) expresses a form of deep property variability by guaranteeing that the variability of *F* with respect to *G* and *H* is not a superficial fact that masks an underlying common property, that is, ruling out any property in *B* that is lawfully coextensive with *F*.

Property variability also comes in degrees. Being a planet has many physico-chemical realizations (all possible minerals constituting large dense bodies in orbit), while being jade has only two such realizations (jadeite and nephrite). Accordingly, there is the project of explaining how variability arises and why. Dennett (1991) appeals to the forces of evolution, claiming that the brain developed variability in how it realizes cognitive functions to enhance the organism's ability to adapt to a changing environment. Robert Batterman (2000) offers a more general explanation based upon the notion of universality in physics, which concerns the procedure of finding similarities in behavior among physically diverse systems.

But however property variability is explained, it appears widespread. Neural plasticity is well documented (Johnson 1993). In particular, the brain is capable of compensatory plasticity, in which areas in the brain formerly dedicated to one cognitive task can, after injury or disease, become dedicated to another cognitive task (Rauschecker 1995). The brain is also capable of experience-dependent plasticity, in which the basic wiring of the brain is refined by an individual's sensory experience, creating individual differences in how the brain realizes mental functions (King 1999). At a more abstract level, functional properties are variable with respect to different physical properties, shapes can be shared by different kinds of matter, and the same spatial patterns can be discerned among physically distinct structures.

## SUBSEQUENT DEBATE OVER IDENTITY AND REDUCTION

Hilary Putnam (1967/1975) and Jerry Fodor (1974/1981) developed an argument concerning special sciences such as psychology that was then extended by David Hull (1974) to the biological sciences. As a result of this argument, it became the dominant opinion among philosophers in the late-twentieth century that property variability supplies adequate evidence against type identity and physical reduction. Type identity is the theory that mental properties are identical with physical properties. And physical reductionism is the doctrine that all sci-

entific theories reduce to basic physical theories. Below is an outline of Putnam's and Fodor's multiple-realizability argument:

(1) If a mental property  $F$  is identical with or reducible to a physical property  $G$ , then, as a matter of physical law,  $F$  is realized if and only if  $G$  is realized (they must be lawfully coextensive).

Yet (2) this requirement that identical properties be lawfully coextensive is not met in cases where property variability applies, because  $F$  can be realized without  $G$ .

So (3) mental property  $F$  is not identical with or reducible to physical property  $G$ .

Yet the issue is not settled. There are several responses, which divide into three main areas of discussion: variability, the notion of a property, and reduction versus identity.

**VARIABILITY REEXAMINED.** Jaegwon Kim (1972) challenges premise (2) by observing that physical differences between individuals who share the same psychology does not imply that no physical property is realized when and only when a given mental property is realized. In other words, the minimal form of property variability expressed by clauses (i) and (ii) does not imply the deep property variability captured by clause (iii) that rules out mental-physical identities. Moreover, Kim believes that the world reveals interlevel identities along with minimal property variability. For example, temperature is identical with mean kinetic energy in ideal gases, yet two aggregates of molecules with the same temperature will differ physically by having constituent molecules with different positions and directions. Accordingly, reductionists are optimistic that neuroscience will discover mental-physical identities, like the specialized Hubel-Wiesel cells, which detect edges in a visual field, or the identification of visual awareness with 40–70 Hz oscillations in the cortical system (Crick and Koch 1990/1997). Indeed, Patricia Churchland (1986) foresees that portions of psychology and neuroscience will coevolve to a point where they reductively converge because their methodologies are interdependent, as when neuroscientists employ psychofunctional criteria to identify brain structures, thereby establishing mental-physical correlations.

Antireductionists counter that, while mere physical differences do not guarantee that each mental property is not coextensive with some physical property, deep variability remains extremely plausible, given the functional nature of mental phenomenon and the actual record of

how cognitive systems are built in a physically variable way. Consider again the case of computation. Having devised computational mechanisms that exhibit quite different engineering properties—from electrical charges passing through silicon pathways to light signals flashing across optical channels—scientists cannot point to a single necessary and sufficient physical condition for any computational function. So it seems unlikely that computation is like temperature in ideal gases, whose necessary and sufficient physical condition is mean kinetic energy. Moreover, antireductionists claim that neuroscientific discoveries only establish mental-physical correlations, not the coextensions that support property identity. Thus, various systems of computer vision carry out algorithms for edge detection, which shows that the activity of Hubel-Wiesel cells is sufficient but not necessary for that function. Furthermore, even if artificial systems are discounted and psychological theory is restricted to biological systems such as mammals, and even if neuroscience employs psychofunctional criteria to identify mammalian brain structures, those identifications must be compatible with compensatory and experience-dependent plasticity as well as any other physical variations that arise from evolution (Rosenberg 2001). This makes the identification of particular types of mental functioning with coextensive physical functioning unlikely.

**RECONCEPTUALIZED PROPERTIES.** Many reductionists challenge premise (2) in Putnam's and Fodor's argument by reconceptualizing the pertinent properties. On the side of the mental, David Lewis (1969) suggests that mental properties are lawfully coextensive with physical properties when the former are narrowly conceived species-specific properties. Thus, unlike pain *per se*, which might be realized in physically different ways across various species, pain *in human beings* may be lawfully coextensive with a human neurophysical property (see also Kim 1972, 1992/1993). On the side of the physical, Kim (1998) suggests that mental properties are lawfully coextensive with physical properties when the latter are broadly conceived disjunctive properties. Thus, the property of having pain is lawfully coextensive with the disjunctive property of having a particular human neural assembly *or* a particular extraterrestrial neural assembly *or*, and so on. Here the disjunctive property includes every possible realization of pain.

Yet, regarding species-specific mental properties, antireductionists counter that psychological theory also requires more general properties to explain cross-species generalizations. Moreover, they argue that even if theories

are restricted to species-specific properties, there remains the fact that variability occurs within a species and even the same individual over time (Horgan 2001). As for disjunctive physical properties, some critics deny that they exist, because they do not guarantee meaningful statements of similarity among objects or plausible statements about the causal powers of objects (Teller 1983). Others argue that disjunctive predicates do not always express natural kinds, yet projectible natural-kind predicates are needed for scientific prediction and explanation (Block 1997).

**REDUCTION VERSUS IDENTITY.** Finally, rather than cast doubt upon premise (2) in Putnam's and Fodor's argument, some philosophers promote views of reduction that do not require the identities at issue in premise (1). Granted, on the traditional account of scientific reduction associated with Ernest Nagel, one theory reduces to a more basic theory when the former can be deduced from the latter by means of connecting principles that express property identities. But there are other accounts that advertise no requirement concerning lawful coextensions which support intertheoretic property identities, including variations on approximate reduction (Paul Churchland 1979, Bickle 1998) and physicalist interpretations of functionalism (Kim 1998).

Critics counter that, among other problems, traditional connecting principles resurface within these alternatives (Endicott 1998, Marras 2002). Critics also add that, to the extent that any account avoids property identities, it is best understood as a model of scientific replacement, not reduction. In the end, philosophers have proposed many notions of reduction. But the fundamental metaphysical question remains: whether the properties of special sciences and physical sciences are identical or whether, because of multiple realizability, they fail to be identical.

**Ronald Endicott (1996, 2005)**

## MUQAMMIŞ, DAVID BEN MERWAN AL-

David ben Merwan al-Muqammiş was one of the first medieval Jews to respond to the philosophical challenge of Muslim rationalism. Nothing about his life is known with any certainty, but he probably flourished in the early years of the tenth century. According to the account given by the tenth-century Karaite historian Kirkisani, David al-Muqammiş was a native of Raqqa, in Mesopotamia.

Born into the Jewish faith, Kirkisani stated, al-Muqammiş became a Christian and then studied philosophy and theology at the well-known school of Nisibis, in Syria. Later, as reported by Kirkisani, he returned to Judaism but is supposed to have made good use of his Christian learning in his commentaries on Genesis and Ecclesiastes, which have been lost. In the latter part of the nineteenth century some quoted fragments of al-Muqammiş's philosophical work were discovered in Judah ben Barzilai's Hebrew "Commentary on the *Sefer Yezirah*" (early twelfth century). In addition, a substantial section of al-Muqammiş's major work, *'Ishrūn maqālāt* (Twenty Chapters), in the original Arabic, was found by Abraham Harkavy in 1898 in the Russian Imperial Library at St. Petersburg, but it was never published.

This fragmentary and incomplete knowledge enables us to assert that al-Muqammiş's thought was deeply rationalistic, influenced in this direction by the Mu'tazilites (Arab theologians). His philosophy was, like theirs, generally cast in an Aristotelian mold, modified by some Neoplatonic elements. He shared with all Muslim philosophers a rigorous view of the divine unity; possibly it was the crystallization of this conviction that led to his rejection of Christianity and his return to Judaism. His discussion of the nature of the concept of unity as applied to God led him to distinguish between several ways of speaking about unity in ordinary language and to realize that none of these ways suggests what we mean in speaking of the unity of God, which is unique. More generally, al-Muqammiş argued, whenever we use the language of description we imply comparison and classification; however, God is incomparable and unclassifiable. Strictly, then, whether we speak of God in the language of the Bible or in that of philosophy, our language cannot be understood in any ordinary sense. If God is One, then each expression we use in speaking of him must be synonymous with every other expression. To use a variety of different expressions adds nothing, therefore, to our description of God. Al-Muqammiş suggested, however—anticipating Moses Maimonides in this suggestion—that although the different attributions add nothing positive, they do have the value of denying their antonyms.

In al-Muqammiş, then, we have the first suggestion in medieval Jewish philosophy of the theory of negative attributes. On other matters, such as the doctrine of rewards and punishments, al-Muqammiş seems to have had no difficulty in blending the traditional thought of the rabbis into his rational system.

## MURDOCH, IRIS

(1919–1999)

Iris Murdoch is best known to the world as a novelist—she wrote twenty-six—but she was a tutor in philosophy at Oxford University from 1948 until 1963 and wrote several influential essays on moral philosophy in the 1950s and 1960s. Her collection of three such essays, *The Sovereignty of Good* (1970), remains her most influential work. Her most sustained philosophical work is *Metaphysics as a Guide to Morals* (1993), a sprawling work ranging over an extraordinary range of topics and also a difficult work not enjoying the impact on philosophy of her earlier work. Murdoch also wrote on literature, religion, and art. Her thought is a unique appropriation of Platonic, Freudian, and existentialist themes.

Murdoch’s thought emerged from, and against, British moral philosophy of the 1950s and 1960s (which she calls “linguistic philosophy”), perhaps best represented by Richard Hare’s *Language of Morals* (though Murdoch does not mention Hare by name). This school of thought held that the techniques of linguistic analysis could illuminate moral concepts while remaining neutral regarding substantive moral views.

In “Sovereignty of Good over Other Concepts,” Murdoch rejects this distinction. “Moral philosophy can not avoid taking sides and would-be neutral philosophers merely take sides surreptitiously” (Murdoch 1970, p. 78). British philosophy, Murdoch says, suggests that the moral life does not present us with moral concerns of great depth or urgency. Its behaviorist proclivity, implying that morality resides only in outer behavior, does away with the substantial inner life of the mind and, by implication, any notion of moral vision.

Murdoch was initially attracted to Jean-Paul Sartre’s existentialism (she had met Sartre briefly in 1945) as a philosophy that one could actually live by and also as a philosophy that subjects individual consciousness to philosophical scrutiny. (In 1953 she published the critical but appreciative study *Sartre: Romantic Rationalist*.) Yet she came to feel that Sartre’s moral philosophy was quite similar to linguistic philosophy in its faulty conception of moral agency and the moral life, despite the enormous differences in aspiration and mood in the two schools of philosophy. The “existentialist/behaviorist” view, as she frequently refers to the two views, sees the self as a solitary will and sees the core of moral agency as lying in the exertion of the will at the moment of choice. This solitary moral agency operates in a shared world of evaluatively neutral facts, with freedom as a central value, and confers value through choices.

Murdoch regards this conception of moral agency as entirely faulty. The moral agent perceives the world as saturated with value, and one’s choosings arise almost automatically from how one antecedently perceives situations. Moral activity is not confined to outward behavior; seeing other persons in a just and accurate manner is moral activity, even if one never performs actions affecting such persons. Therefore, moral life does not sporadically occur only at moments of choice, but is pervades throughout the agent’s existence, shaping the perceptions that issue in action. We erect structures of value around us, generally without recognizing that we are doing so.

Murdoch also chastises British moral philosophy for failing to focus centrally on how agents can morally improve—a task that she understood primarily as gaining a clear grasp of the moral reality outside themselves. To characterize the psychic process by which this is accomplished, Murdoch appropriates the term “attention” from Simone Weil, a French philosopher of the 1930s and 1940s who exerted a strong influence on her. By attending to the outer world, the moral agent becomes open and receptive to a reality other than oneself in a way uncontaminated by personal needs, fantasies, illusions, and the

like. Murdoch sometimes speaks of attention as a kind of love and is critical of contemporary moral philosophy for leaving no room for love as a central moral notion.

Murdoch's conception of moral reality takes two somewhat distinct directions. The first is Platonic. (Plato is the philosopher Murdoch embraces most unambivalently.) On her Platonic conception, the ultimate moral reality is a transcendent Good, as she says in "On 'God' and 'Good,'" a "single perfect transcendent non-representable and necessarily real object of attention"—a description that Murdoch draws partly from religion, though she explicitly rejects traditional theism (Murdoch 1970, p. 55). Murdoch thinks of the Good as something that can be contemplated, that exerts a kind of magnetic pull, and from which moral agents can draw a moral energy to overcome selfishness. She faults linguistic philosophy for discrediting metaphysics, which she sees as required for rendering the idea of the Good intelligible, an idea she develops further in *Metaphysics as a Guide to Morals*.

The second strand in Murdoch's conception of moral reality is particular other persons, especially those emotionally close to us, Murdoch's favored context for moral attention in her novels as well as her philosophy. "The fat, relentless ego" revealed by Freud, with its self-serving fantasies and illusions, presents daunting obstacles to apprehending moral reality. Murdoch is also pessimistic that by turning one's attention inward, one can identify and perhaps dispel one's particular psychic obstacles. Self-knowledge, she thinks, is largely a delusion.

Murdoch offers no systematic account of how to attain a state of attention, how to know the morally real, but she offers a few examples of things that can take us out of ourselves toward a reality external to us: art, natural beauty, prayer, a foreign language with its own logic, which cannot be distorted by personal wishes or fantasies. Her central example is art, especially literature. Good literature portrays human situations and human truth in an accessible form that provides readers a way to get outside themselves to a moral reality. Indeed, Murdoch sees the production of literature too as a moral task, a task in which authors must keep their own fantasies and illusions from distorting the creation of their characters. Murdoch's philosophy of art, inseparable from her moral philosophy, is developed in *The Fire and the Sun: Why Plato Banished the Artists* and in several essays.

Murdoch contributed to moral philosophy's greater attention to moral psychology (especially moral perception) since the 1970s, and she occasionally speaks of virtue. On the whole, however, Murdoch's work does not

readily fit within any of the familiar schools of contemporary moral thought, and her insights and perspective remain a largely untapped resource and a formidable challenge to moral philosophy.

## MURO KYŪSŌ

(1658–1734)

Muro Kyūsō was a Japanese Confucianist who was instrumental in defending the Zhu Xi school of Neo-Confucianism as the official learning of the Tokugawa government. Born in Edo (Tokyo), he was a pupil of Kinoshita Junan (1621–1698) in Kyoto. In 1711 he became, through the recommendation of the scholar-statesman Arai Hakuseki (1657–1725), the official scholar of the Tokugawa government. He was commissioned to compile the *Rikuyu engi-tai* (Outline of principles of Confucianism) that in 1724 became the standard textbook on Zhu Xi's doctrine for all official schools. Muro in

his early years was not a follower of the Zhu Xi school; as he tells us in his *Shundai zatsuwa* (Conversations at Surugadai), it was only at the age of forty, after a long period of doubt, that he embraced Zhu Xi's thought. The doctrine was then under heavy attack by such of the "ancient learning" scholars as Yamaga Sokō, Itō Jinsai, and Ogyū Sorai. Muro believed he had been chosen to defend the teaching of Zhu Xi, and to this task he dedicated the rest of his life with unsparing zeal.

Muro's ideas are not strikingly original, but they have the power of sincerity and conviction. Typical are his denunciations of hypocrisy, a trait not so uncommon among formalist Confucians, and his insistence upon virtue as springing from the inner self; two of his favorite maxims were "Be true to the self" and "The root of evil lies in the innermost recesses of the mind." His ideas on the Godhead bear a similarity to the Christian conception of the attributes of God. The deity (or deities) is omnipresent and omniscient. He stressed self-vigilance and the realization of heavenly reason in human life. The heavenly order was to be reflected in the social one, thus consolidating the immutability of Tokugawa society. His sense of the indebtedness (*gi*) and the gratitude (*on*) man owes to Heaven, the earthly lord, the parent, and the teacher was bound to foster obedience rather than self-assertiveness. Muro opposed the scholars of the "ancient learning" school, who, with others, supported the emperor; Muro stood solidly for the Tokugawa government. He was also critical of Buddhism and Shinto. But the tide was against him; especially in vain was his effort to preserve the ancient spirit of the samurai who more and more assimilated into the merchant class.

## MURPHY, ARTHUR EDWARD

(1901–1962)

Arthur Edward Murphy, an American philosopher, was the creator of the phrase "objective relativism." Murphy was born in Ithaca, New York, and received his training in philosophy at the University of California (A.B. in 1923, Ph.D. in 1926). He taught successively at California, Chicago, Brown, Illinois, Cornell, Washington, and Texas; at the last four he was department chairman.

Murphy attracted attention at an early age with his article "Objective Relativism in Dewey and Whitehead" (1927). He argued that the writings of these two influential philosophers exhibited a convergence on a common doctrine, which reversed a tradition of treating "objects as primary, as substantives, and events as characters of objects." In contrast, for John Dewey and Alfred North Whitehead "the event is substantive and objects are characters of events. Thus relatedness, in all its complexity and interconnections, is made basic for the objective world." Murphy, himself, supported this doctrine, which had a vogue for a time.

In 1930, however, Murphy attacked Whitehead's *Process and Reality* in his article "The Development of Whitehead's Philosophy." In later writings he repeatedly charged both Dewey and Whitehead, among other metaphysicians, with attempting to prove by speculative metaphysics what would better be offered as sheer speculation, to be tested in appropriate contexts. Commenting on Dewey, he wrote: "What Mr. Dewey says about cognition is true of it as he defines it and false of it as more ordinarily understood" ("Dewey's Epistemology and Metaphysics," in *The Philosophy of John Dewey*, edited by P. A. Schilpp, p. 210, Evanston and Chicago, 1939).

Throughout his career Murphy maintained an acquaintance with philosophers of varied opinions. As a graduate student on a traveling fellowship, he explored the philosophical currents of Europe in 1924–1925, when realism was at its height. During the 1930s his work as book editor of the *Journal of Philosophy* gave him occasion to examine and to pass judgment on the purpose and achievements of his generation and the previous one.

Murphy spent the year 1937–1938 in England, and from his remarks it is apparent that he was directly influenced by Ludwig Wittgenstein through reading the *Blue Book*, as well as indirectly through Wittgenstein's colleagues in England. He grew increasingly dissatisfied with speculative metaphysics, as may be seen in his contribu-

tions to the Dewey, G. E. Moore, and Whitehead volumes of the Library of Living Philosophers. His disillusionment with his own creation, objective relativism, is reported in "What Happened to Objective Relativism." Yet, to the end, it was his opinion that the speculative philosophers had opened roads to "a better understanding of the values that are basic to human life" than had most of the so-called analytic philosophers.

Murphy's strong convictions on the importance of philosophy in a liberal education led him to expend a great deal of time on the work of the Commission on Philosophy in American Education of the American Philosophical Association. His opinions on this subject are to be found in the chapters that he contributed to *Philosophy in American Education* (1945) and in his own essays.

Much of his work illustrates his expressed intent "to write philosophy ... with explicit reference to contemporary issues" (*The Uses of Reason*, p. 5). His early concern with epistemology and metaphysics changed to a dominating preoccupation with the uses of reason in ethical and social enterprises. His last twenty years were directed toward the working out of a systematic account of ethics. Sketches of this attempt appear in the chapter, "The Context of Moral Judgment," in *The Uses of Reason*, and in his essays. Murphy made good use of his powers of assimilation and criticism in examining the great moralists with a view to extracting and identifying points that must be taken account of in any subsequently defensible ethical theory. At his death, he left a long manuscript, *The Theory of Practical Reason*, which elaborates his Carus Lectures of 1955, originally known as "An Enquiry concerning Moral Understanding."

## MUSIC, PHILOSOPHY OF

Since the veritable renaissance of aesthetics and philosophy of art in the 1960s, there has been a clear tendency to deal with the individual arts as presenting philosophical problems peculiar to themselves. This is not to say that philosophy of art in general has not also been pursued. Ambitious theories of art, attempting to encompass all of the fine arts in synoptic definitions, have occupied some of the best philosophical minds of the period, and brought much needed clarity and rigor to the discipline. But alongside of this more traditional, Socratic project there has flourished a busy community of philosophers exercising their analytic skills on the individual problems of arts such as literature, painting, dance, photography, cinema, drama, architecture, and, of course, music, the topic here.

### MUSIC AND THE EMOTIONS

The oldest and most persistently scrutinized philosophical question with regard to music is the question of its emotive character. Plato expressed the view that music has the power to engender emotive states in the listener. Aristotle made the intriguing, though puzzling, suggestion that music "imitates" or represents the emotions. But we know little, if anything, about what their music sounded like. And without that knowledge we are at a loss to know what these philosophers were talking about, and consequently what they were really saying about it.

Modern speculation on this matter began at the beginning of the seventeenth century, when the inventors of opera began to speculate about music as the source of emotive expression in the newly minted dramatic form. But the problem did not take on the form in which contemporary aesthetics deals with it until, in the late eighteenth century, instrumental music emerged as a major musical genre and *the* major genre in the philosophy of music.

In the past seventy years, the question has taken a schematic form: What are we saying when we say "The music is *sad*"? Some answers have been that the music makes us sad; that the music expresses the composer's sadness; that the music somehow symbolizes or represents sadness; that the music possesses sadness as a perceptual quality, just as an apple possesses redness; some combination of the above; and finally, that the music just is *not* sad and it is nonsense to say that it is. The majority view, at the turn of the century, is that the emotive properties of music are perceived properties of it, although opinion is divided about whether it also *arouses* the emo-

tions it is expressive of. Those who argue against arousal (Peter Kivy, for example), argue that emotions are aroused in ordinary life by beliefs formed about states of affairs, which the appropriate emotions then take as intentional objects, and that music cannot provide the necessary conditions for such arousal, nor is there evidence that listeners are so aroused. In contrast, those who argue for arousal (Stephen Davies and Jerrold Levinson) maintain that because the emotions aroused by music are not full-blooded emotions, but close enough to be taken for them, music does indeed have the power to arouse emotions, though these emotions do not give rise to the normal behavioral responses of real-life emotions.

### FORMALISM

While the topic of music and the emotions has perhaps been the most talked about in music aesthetics since time out of mind, it is arguable that the vital center of philosophy of music has been, since the end of the eighteenth century, the debate over musical formalism. Immanuel Kant seemed to entertain no doubt that pure instrumental music, “absolute music,” as it came to be called, was a purely formal art (although he acknowledged its emotive aspect), and because it lacked ideational content, he was reluctant to consider it one of the fine arts at all.

Arthur Schopenhauer pretty much settled the issue in favor of absolute music as a fine art. He did so by considering music a *representational* art form, and thus an art form conforming to the eighteenth-century dogma of *mimesis* (imitation). But the cost was heavy, for the cumbersome metaphysical underpinnings of his theory would hardly be countenanced by philosophers with modern philosophical sensibilities.

The first full-blown formalist account of absolute music, that of Eduard Hanslick (1825–1904), followed not too long after. In musical aesthetics, formalism, as Hanslick construed it and as it continued to be construed until the 1980s, is the doctrine that absolute music, as an art object, must be considered a purely formal structure in sound, with no emotive significance at all. But when some writers came to see that the emotive properties of music could themselves be construed as perceptual properties of music, they saw that a formalism with emotive properties as part of the formal structure is, in spirit, a formalism as well. This view has come to be called “enhanced formalism.”

As things stand at the beginning of the twenty-first century, there are those, particularly in historical musicology, who find even enhanced formalism too pallid, and views of absolute music as a “narrative without

words” are surfacing in great profusion. What had seemed to many to be an issue firmly settled in favor of formalism has now become an issue very much in doubt.

### MUSICAL UNDERSTANDING

Closely related to the concept of musical form is that of musical understanding. Whether or not one is a formalist, one has to assume that understanding the pure musical fabric is a prerequisite for understanding anything beyond the pure fabric—narrative content, for example. In other words, one must hear what one is listening to *as music* before one can hear it as a story *in* music.

It is generally agreed that understanding music is a matter of hearing it as a *connected* series of events that makes musical sense to the listener. How this basic musical understanding is to be recognized and construed are contentious questions. Furthermore, there is substantial disagreement about whether or not musical understanding requires knowing and attending to the large structural elements of musical compositions and the musical techniques that may govern the connections between events. This disagreement extends to whether or not knowledge of what is known in the trade as music theory has any relevance to the appreciation and enjoyment of absolute music. In the 1990s these questions were hotly disputed. In *Music in the Moment*, Jerrold Levinson maintained that normal listening requires attention merely to the connections between short segments of musical texture present to immediate perception, in what he calls “quasi-hearing.” In the opposite camp, Peter Kivy, in *Music Alone* and elsewhere, has argued that music-theoretical knowledge, though not essential to minimal musical understanding, enlarges the intentional object of musical understanding, thus increasing by orders of magnitude the satisfaction of the musical experience.

### REPRESENTATION

The question of whether instrumental music is capable of anything like pictorial representation is not high on the list of questions that philosophers of music at the beginning of the twenty-first century concern themselves with, although in the heyday of nineteenth-century Romanticism it was much discussed as a matter of “practical” music aesthetics and was closely associated with the issue of absolute versus program music. There are those who claim that music in principle cannot pictorially represent but can only imitate sounds, which is obviously a very different matter. Others maintain that there are instances of pictorial representation in music, although of a very minimal kind. Those committed to more or less elaborate

narrative interpretations of the canon of absolute music are committed, at least implicitly, to some more liberal view of music's representational capacities, although little philosophical light on the issue has been forthcoming from that quarter.

## WORDS AND MUSIC

As questions in musical practice, how words are set to music and what role words and music play in this give-and-take enterprise have been argued vigorously, sometimes acrimoniously, since the last half of the sixteenth century, with opera as the major motivating force. Whether these are philosophical questions is debatable. Nonetheless, in the literature after 1990 those who *do* think of themselves as philosophers have shown an increase in interest in opera as an art form worthy of separate scrutiny. Among the issues raised have been whether opera is basically a musical form or a literary form with music, how we are rationally to understand a drama with characters who sing rather than speak, how drama can accommodate itself to musical form, how we are to understand, on rational grounds, the ubiquitous orchestral presence in the sung drama, and what capacity the music in opera has of "saying" things, beyond the capacity of the libretto to do so. These debates have blurred, in an intellectually healthy way, the boundaries between philosophy and various musical disciplines. At the same time, those outside both the philosophical and musical academic communities have made substantial contributions to the philosophical discourse.

Perhaps the central philosophical issue in the words-music debate is best revealed by the title that Joseph Kerman, a musicologist by trade, gave to his groundbreaking, widely admired book *Opera as Drama*. On Kerman's view, opera is to be viewed, at its best, as principally a form of drama, *dramma per musica*, in the venerable Latin phrase. Taking the opposite view, Peter Kivy, in *Osmín's Rage*, has put the emphasis, not on opera as *drama*, but rather on opera as *music*, drama-made-music, as he terms it.

## THE WORK

Whatever one may think about the philosophical credentials of some of the questions that philosophers of music interest themselves in, the question of the ontological status of the musical work seems unequivocally philosophical. Who *else* but a philosopher, it might well be asked, would raise such a question, or be interested in the answer?

Musical ontology emerged in the 1960s in the form of two opposing answers to the question, What is a musical work? The term "art object" clearly suggests the kind of artwork that can, at least on first reflection, be identified with a physical object, locatable in space and time. But if the "object" in question is a musical work, it seems clear that it is not located anywhere. The *Mona Lisa* is in the Louvre. Where is Beethoven's *Fifth Symphony*?

Nevertheless, there are physical objects, broadly speaking, associated with musical works, namely their performances. One direction in which musical ontology went was the Platonic direction, taking musical works as universals or types, performances as their instances or tokens. The other direction, eschewing the specter of timeless, nonphysical Platonic entities, identified the musical work with the class of its performances. Both directions have problems, but the Platonic model, somewhat surprisingly, has been the one most exploited.

The major problem of musical Platonism has been the apparent conflict between two basic intuitions. Platonic entities are timeless, and hence cannot have come into being, whereas musical works do indeed come into being, are created, through the labor and inspiration of their composers. Platonists of the more doctrinaire kind have tried to argue that we can preserve our notion of composers as inspired, "creative" artists, in some sense or other, while biting the Platonic bullet and affirming that musical works are discovered rather than brought into being. Other, more moderate Platonists have opted for a kind of universal or type that comes into being in the composer's creative act but, in other respects, preserves the character of a Platonic universal or type so as to make the universal/particular or type/token distinction suitable for what they want to say about the relation between works and their performances. The latter approach seems to be more popular at the beginning of the twenty-first century, while the attempt to identify works with classes of their performances seems just about dead in the water.

## THE PERFORMANCE

Since the most popular analyses of the musical work construe it as some kind of universal, with performances as the particulars, one would expect a substantial literature on musical performance. But until the late 1990s, this had not been so, it being assumed that performers and performances are philosophically transparent, presenting no conceptual puzzles. Then in the 1990s a movement in the *practical* world of performer and performance, the movement for so-called "historically authentic performances," began to generate considerable interest among philoso-

phers in the relation between performance and work, performer and composer. The historicist project in musicology, so long directed at establishing musical texts that are historically authentic, became, in the 1990s, directed as well at the historical authenticity of the musical performance of that authenticated text, the practical result being that more and more performances of music composed prior to the nineteenth century are attempts to reproduce, both physically and in interpretation, the kind of performance that the composer himself had in mind when he composed it.

After the turn of the century, philosophers began to cast an analytic eye on the concept of the historically authentic performance and on the aesthetic imperative that supposedly drives it. What is a historically authentic performance? One that reproduces a physical object or an intentional one? Does the integrity of the musical text require a historically authentic performance, or does the text survive an unabashedly modern one? Is the performer an artist in his own right, as tradition would have it, or is he the composer's machine? Is there an ideal performance of a work, and is it the historically authentic one? These questions have begun to generate articles and books of interest not only to the philosophical community but also to the musical community as well. Moreover, what the musical community has written about performance is now undergoing philosophical scrutiny. The results are not yet in.

### THE REWARDS OF LISTENING

Finally, what contribution of value does the art of absolute music make to the human experience. What kind of satisfaction does it provide? Schopenhauer argued that since absolute music satisfies in the same manner as the other fine arts, which are unquestionably representational arts, absolute music too must be a representational art. He then cast about for an object that absolute music might represent, fixing on the metaphysical will—a result that few today would find plausible. Be that as it may, those who interpret the absolute-music canon in narrative terms are implicitly committed to Schopenhauer's general argument, if not to his conclusion about music's relation to the will. For the quest for stories in symphonies assumes that the satisfaction provided by such music requires an account, and since the satisfaction of temporal art forms lies in their storytelling capacity, the same must be true for the temporal art of absolute music. (Schopenhauer himself, however, does not carry his argument to this extreme.)

Formalists, of course, must find other sources for the value and satisfaction of absolute music. One answer, distinctly in the spirit of Schopenhauer, is that absolute music provides a kind of escape, a liberation from the world, from this veil of tears, into a world of pure sonic forms. The narrative and representational arts, anchored in this world as they are, cannot provide this liberation. Another answer simply rejects the question. There is no mystery about the satisfactions of absolute music. They lie simply in all the components of absolute music that music critics, analysts, and theorists talk about. It is obvious why these components please us. No further answer, it is claimed, is either needed or available.

Is the satisfaction of absolute music a mystery or a pseudomystery? Whatever the answer, absolute music, since the mid-1950s, has become a topic of intense interest in the philosophy of art, and the philosophy of music has become a recognized subdiscipline of the field. The interest shows no signs of abating.

## MUSONIUS RUFUS

(30–100 CE?)

Musonius Rufus belongs to a group of Roman Stoic thinkers that also includes Seneca and Marcus Aurelius. He was Epictetus's teacher. Only fragmentary accounts of his views, recorded by others, have survived (English translation in the edition by Cora Lutz).

Like other Stoics, Musonius rejects the distinction between theoretical and practical wisdom: philosophy is nothing else but to practice and put in good deeds what Stoic doctrine prescribes. All human beings have the potential to strive towards virtue. This view is anchored in a radically embedded concept of human nature: a human is a composite of soul and body and a member of the universe's community of gods and men, the so-called cosmopolis. Musonius reinforces this ontological embeddedness by emphasizing social responsibility in general, in existing communities of human beings.

Musonius is perhaps best known for his positive views on women (fragments 3 and 4): Both men and women have the same intellectual and moral capacities, and hence women should be educated in philosophy just as men are. But it is equally important that this stance has a social corollary in Musonius's highly positive assessment of marriage as a symmetrical and fully reciprocal relationship among equals that entails a union of soul as well as of body (fragments 12, 13 A and B, 14). Thus

Musonius represents a Stoicism that upgrades traditional relationships such as marriage to the level of philosophically inspired friendship between men.

The importance of social responsibility is also evident in Musonius's views on suicide. As fragment 29 states, "One who by living is of use to many has not the right to choose to die unless by dying he may be of use to more" (tr. Lutz). Hence the concern for others ought to be central in one's decision-making process.

Other themes in the preserved fragments reflect on the need for a king to be a philosopher, on the duties of parenthood, on curtailing one's bodily and material wants, and on patience with and forgiveness of people who have wronged one. Rudolf Hirzel (1895, 2: 239) dubbed Musonius "the Roman Socrates."

## MYSTICISM, HISTORY OF

Mystical experience is a major form of religious experience, but it is hard to delineate by a simple definition for two main reasons. First, mystics often describe their experiences partly in terms of doctrines presupposed to be true, and there is no one set of doctrines invariably associated with mysticism. Some of the definitions of mysticism advanced by Western writers are quoted by W. R. Inge in his *Mysticism in Religion* (p. 25): "Mysticism is the immediate feeling of the unity of the self with God" (Otto Pflieger); "Mysticism is that attitude of mind in which all relations are swallowed up in the relation of the soul to God" (Edward Caird); "True mysticism is the conscious-

ness that everything that we experience is an element and only an element in fact, i.e. that in being what it is, it is symbolic of something else" (Richard Nettlehip). Quite clearly, such definitions import a religious and philosophical interpretation to the phenomenon of mysticism that would not be shared by all contemplatives. For instance, the Buddhist mystic, not believing in a personal God, would reject the first two of these definitions; and he might well be skeptical about the third—in what sense is the experience of nirvāṇa symbolic of something else?

Second, there is quite a difference between mystical experience and prophetic and, more generally, numinous experience, but it is not easy to bring out this phenomenological fact in a short definition. (A numinous experience is an experience of a dynamic external presence—described classically in Rudolf Otto's *The Idea of the Holy* as that of a *mysterium tremendum et fascinans*, an awe-inspiring and fascinating mystery.) Sidney Spencer says, for instance, "What is characteristic of the mystics is the claim which they make to an immediate contact with the Transcendent" (*Mysticism in World Religion*, p. 9). Such a definition includes under mysticism the experiences of the Old Testament prophets, those of Muḥammad, and the theophany described in the *Bhagavad-Gītā*. However, these differ so markedly from the interior illumination of such figures as Meister Eckhart, Teresa of Ávila, Śankara, and the Buddha that it is misleading to bracket the two kinds of experience. This article will explicitly exclude the prophetic and numinous experience, save where it becomes relevant to the experiences and doctrines of those properly called mystics. It is thus best to indicate what is meant by "mysticism" by referring to examples, such as Eckhart and the others cited above, and by sketching some of the important features of the type of experience in question without interpreting it doctrinally.

Generally, mystics as typified by Eckhart, Teresa of Ávila, Śankara, and the Buddha feel that their experience is somehow timeless, that it involves an apprehension of the transcendent (of some thing, state, or person lying beyond the realm of things), that it gives them bliss or serenity, and that it normally accrues upon a course of self-mastery and contemplation. These are certainly features of what has been called introvertive mysticism by W. T. Stace (*Mysticism and Philosophy*, p. 60). There are other experiences, however; those of extrovertive mysticism, where, according to R. C. Zaehner, one gains a kind of rapport with the world, or "panenhenic" feeling (*Mysticism Sacred and Profane*, Ch. 1). These neither coincide with prophetic experiences nor strictly with those of

introvertive mysticism, but since they sometimes occur in conjunction with the latter, it is convenient to treat them as mystical. Various abnormal mental states, such as those induced by mescaline, lysergic acid, and alcohol are sometimes considered mystical, but they are far enough removed from mainstream mysticism for it to be reasonable to neglect them here.

In the light of all this, we can distinguish various aspects of mysticism: The experiences themselves, the paths or systems of contemplative techniques often associated with them, and the doctrines that arise from mysticism or are affected by it. Also, such paranormal phenomena as levitation are sometimes ascribed to mystics, although they usually regard these as of secondary significance.

There is no single history of mysticism because some of the major religious traditions have been largely independent of one another. Further, there is no way of knowing the real origins of mysticism, since for such an intimate type of experience we must rely chiefly on written records and thus have no access to prehistoric mysticism. Studies of contemporary nonliterate cultures—in Africa, for instance—do not reveal the presence of much or any mysticism proper; for example, the religious experiences of the Nuer in the Sudan are more akin to those of Old Testament prophecy. It is thus convenient to confine attention to the main literate religious traditions: Indian religions (Hinduism, Buddhism, Jainism, Sikhism); Chinese and Japanese religions; and the Semitic faiths (Judaism, Christianity, and Islam). It may be noted that early Christian mysticism was influenced by Greek, notably Platonist, ideas.

## THE INDIAN TRADITION

The mainstream of Indian mysticism centers on the practice of yoga, which in its general sense involves techniques of pacifying the mind and of attaining interior insight. Evidence from the pre-Aryan Indus Valley civilization indicates that it may have been practiced in the second millennium BCE or earlier. By contrast, the religion of the Aryans who settled in north India centered on sacrifice set in a polytheistic framework. As this ritual religion became more complex, questions arose concerning the inner meaning of the sacrificial rites. The *Upaniṣads* (the chief of which date from about 800 BCE to about 500 BCE) were in part concerned with extending and deepening sacrificial ideas in the quest for *vidyā*, or knowledge of sacred reality. Quasi-magical ideas surrounded this notion—for instance, that knowledge gives power over the thing known and that one can become identified with

the thing known. At the same time, mystical ideas began to permeate religious thinking, notably the idea that through austerity and self-control one could attain a realization of one's eternal self. A confluence of these streams of religious thought resulted in the famous central identification expressed in the *Upaniṣads*, "That art thou"; the sacred reality embracing and sustaining the cosmos ("That") and the eternal self ("thou") are one. In brief, inner mystical knowledge brings a union with the Divine.

This union is described in various ways: "Just as a man embraced by his dear wife knows nothing at all, outside or inside, so does the eternal life-monad [*puruṣa*], embraced by the supreme spiritual Self, know nothing at all, outside or inside" (*Bṛhadāraṇyaka Upaniṣad*, IV. 3.21); "As rivers flow to their rest in the ocean and there leave behind them name and form, so the knower, liberated from name and form, reaches that divine Person beyond the beyond" (*Chāndogya Upaniṣad*, 6). Sometimes the lack of duality between the divine Being and the soul is stressed: "Where there is a duality, as it were, one sees another, tastes another, speaks to another.... But when everything has become one's own self then whom and how would one see? ... The Self is not this, not that" (*Bṛhadāraṇyaka Upaniṣad*, IV. 5.15). Mystical consciousness is also said to be like a state beyond dreamless sleep. These passages hint at what is virtually universal throughout Indian yoga, the fact that the contemplative state in its highest form involves going beyond ordinary perceptions, mental images, and thoughts. It is thus not describable by the ordinary expressions for mental states. It is no doubt partly for this reason that the distinction between perceiver and perceived is not regarded as applicable, and so the contemplative who conceives himself as "seeing" *Brahman* (the divine Being) thinks of this as a kind of union with *Brahman*. By contrast, in atheistic systems of Indian religion, where there is nothing for the self to be identified *with*, the contemplative state is conceived in a rather different way.

Although identification between the self and *Brahman* is a central theme in Upaniṣadic religion, some of the writings, notably the *Kaṭha* and the *Śvetāśvatara Upaniṣads*, are more theistic in spirit and less inclined to speak in terms of identification. These differences of emphasis are partly the reason for the divergences in interpretation found in different types of Vedānta in the medieval period.

**JAINISM AND YOGA.** Jainism, Buddhism, and the tradition later formulated as classical yoga involved an atheistic or agnostic interpretation of mystical experience.

Jainism and classical yoga (the long-extinct Ājīvika school) were monadistic: They believed in an infinity of eternal life monads or souls, and the aim of the ascetic was to bring about the isolation of the soul from its material environment. Such an isolation would involve the cessation of reincarnation and thus final deliverance from suffering. Jainism, because it held that karma, the force determining people's situations as a result of their previous deeds, is a subtle form of matter, considered extreme *tapas* (austerity), which had the effect of annihilating this material force, the central means of liberation. Nevertheless, it seems that the Jain teacher Vardhamāna (known also as Mahāvīra), a contemporary of the Buddha, and his disciples claimed to attain a certain kind of higher state analogous to the experience of nirvāṇa in Buddhism. Thus, in Jain doctrine the life monad in its emancipated state gains omniscience, a concept reflecting the intense sense of insight accruing upon the contemplative experience.

**BUDDHISM.** The accounts of the Buddha's enlightenment—a crucial event in the history of Indian religion and likewise centrally important in the history of Indian mysticism—are elaborate and circumstantial. During the first night, the Buddha, seated under the bo tree, remembered the series of his former births; during the second, he acquired the “heavenly eye,” which enabled him to view the entire world and the whole cyclical process of rebirth; during the third, he saw how the latter depended upon grasping and ignorance—if living beings were liberated from these, they would escape rebirth; and in the fourth, he attained supreme insight after going through the various stages of meditation (Sanskrit, *dhyāna*; Pāli, *jhāna*). In all this he gained supreme peace. No doubt the scriptural records are a formalized account, hardly based on the Buddha's autobiographical report, but they certainly point to the type of inner experience early Buddhism prized. Something can be learned from the *Theragāthā* and *Therīgāthā*, verses composed by monks and nuns and expressing the flavor of early Buddhist contemplative experience. These poems often show the sensitivity of the recluse to the beauty of nature:

The peacocks shriek. Ah, the lovely crests  
and tails  
And the sweet sound of the blue-throated  
peacocks.  
The great grassy plain with water now  
Beneath the thunder-clouded sky.  
Your body is fresh; you are vigorous now and fit  
To test the teaching. Reach now for that  
saintly rapture,

So bright, so pure, so hard to fathom,  
The highest, the eternal place.

(*THERAGĀTHĀ* CLXVI)

The eternal place is, of course, nirvāṇa.

The achievement of inner peace and insight, as opposed to the use of complex psychological categories in explaining human nature, was given comparatively little doctrinal elaboration in early Buddhism because the Buddha apparently felt that the concepts of the transcendent state (nirvāṇa) and the cessation of rebirth through the perception or attainment of nirvāṇa were sufficient means of interpreting mystical experience. Certainly, he did not give the more elaborate type of interpretation found in the *Upaniṣads* and in theistic mysticism. It is clear, however, that the experience or experiences involved both the attainment of a marvelous serenity and a kind of knowledge or insight (something regarded as knowledge, given the presuppositions of the Buddhist mystical quest). Grasping and ignorance are dispelled by this peace and knowledge.

Buddhism rejected the doctrine of a plurality of eternal souls, but in a sense it can be seen as a transcendence of monadism, with the concept of the eternal soul replaced by that of the capacity to attain release. Thus early Indian mysticism is typically monadistic, except in the *Upaniṣads*, where the interior experience is related to the *Brahman* and where, therefore, the *Brahman-ātman* (self) equation is formulated. Only because the eternal self of the mystic is identified with the presupposedly single divine Being is the plurality of souls denied. The numinous religion of Brahmanism overlays that of the contemplative mysticism of yoga, and the mystical experience is interpreted in terms of union with the unitary divine Principle.

Mahāyāna Buddhism, from the first century BCE on, moved toward a more elaborate interpretation of the contemplative path. Nirvāṇa was identified with the Absolute, variously named Suchness (*tathatā*) and the void (*śūnya*). These terms served to bring out the ineffability and undifferentiated nature of ultimate reality, which in turn corresponded to the undifferentiated and “void” nature of the contemplative experience itself. The Absolute was also identified, from the standpoint of the ordinary worshipers, with the Truth Body of the Buddhas—the transcendent and essential aspect of buddhahood—and thus the mystical path involved being a bodhisattva (buddha-to-be). The distinctionless, non-dual experience of ultimate reality, the goal of the path, was the achievement of identity with the Absolute, which

was equated with buddhahood. This is why the Mahāyāna path of contemplation was thought of as the path of bodhisattvahood, so that on his enlightenment the mystic would himself become a buddha.

As a preliminary, the aspirant practices individual worship (*pūjā*) of the celestial buddhas and bodhisattvas and can gain assurance from a living buddha that his aspiration to buddhahood will be fulfilled. He practices the perfections of the path, culminating in supreme wisdom or insight (*prajñā*).

There are three chief differences between Mahāyāna and Hīnayāna, now represented by the Theravāda (in Myanmar, Sri Lanka, and parts of Southeast Asia). First, the Mahāyāna stresses self-giving more strongly, so that the aspirant continually looks to the welfare of others; second, it is a path accessible to laymen as well as to monks; third, contemplation is supplemented by the use of sacramental and ritual practices, at least in certain phases of the Mahāyāna. Some of these practices, known as tantra, became well developed in the middle of the first millennium CE in both Hinduism and Buddhism and deeply affected the Buddhism of Tibet. It sometimes involved the ritual breaking of taboos (against meat-eating and against sexual intercourse outside marriage): Such a breaking of taboos was regarded as a means of testing and developing detachment. Coordinate with this type of Buddhism was a highly ritualistic use of sacred texts and recitations. The most outstanding figure of Tibetan mysticism was the poet and yogi Milarepa (1040–1123).

**HINDUISM.** The theistic religion implicit in some of the *Upaniṣads*, reinforced by popular cults and by an emphasis on *bhakti*, or loving adoration of God, led to a different valuation of mysticism in the *Bhagavad-Gītā*. The poem speaks of three paths to salvation: the way of knowledge (primarily contemplative knowledge), the way of works, and the way of devotion (*bhakti*). The three paths are stressed in different parts of the *Gītā*, but two significant lessons emerge. First, the pursuit of works (religious and moral duties) need not bind one to the world if they are performed in a spirit of self-surrender to God; the way of works should be seen in the light of the way of devotion. Second, the yogi who pursues knowledge (*jñāna*) can become *Brahman* (VI.27). Elsewhere, however, *Brahman* is spoken of as part of God; the personal aspect of God is more important than his impersonal aspect. Thus the yogi, in pursuing a strictly contemplative path, can only unite himself with the lower, rather than the more important, aspect of the

Lord's nature. This doctrine represented a higher evaluation of *bhakti* than of contemplative yoga. (It must be pointed out that traditional Indian commentators are divided on the question of what is the correct interpretation of the *Gītā*. However, there is little doubt that extraneous theological and philosophical presuppositions have played a large part in determining interpretations.)

The continued growth of devotional or *bhakti* religion led to a similar interpretation of mysticism during the medieval period. Thus, in the twelfth century Rāmānuja reversed the doctrinal priorities of Śankara (ninth century). Śankara's monism represented the most radical interpretation of the Upaniṣadic identity texts, asserting a numerical identity between the soul and the divine Being. While for Śankara the personal Lord was a lower manifestation of the Absolute, so that worship and devotion could be transcended when one had attained the apprehension of identity with Brahman, Rāmānuja, although recognizing identity as one religious goal, conceived it as an inferior form of release. The higher form was the vision of the personal God, in which the soul was in a state of loving dependence on the Lord. Both Madhva (thirteenth century) and the theistic Śaivite schools of Indian philosophy interpreted mystical experience in terms of union with God, but not a union involving the numerical identity of the soul and God. Thus, mystical experience was interpreted by reference to the duality of the soul and God implicit in the religion of *bhakti*: The worshiper has a strong sense of the majesty and glory of God, and thus of the difference between himself and the object of worship. Various analogies were used, including that of the marriage of the soul and God, since sexual love symbolizes the intimate union between the lover and the beloved while presupposing the difference between the two. This analogy tied in with the cult of Krishna: The legend of Krishna's amorous dalliance with the milkmaids was seen as an allegory of the relation between God and men's souls.

The interiorization of religion involved in both devotionalism and contemplation influenced Nānak (1469–1538), founder of the Sikh religion, who preached doctrines combining the anti-idolatrous monotheism of Islam and such characteristic Hindu ideas as reincarnation and karma.

There have been a number of outstanding contemplatives in modern Hinduism. Chief among them was Ramakrishna Paramahansa (1834–1886), whose disciple Vivekananda (1862–1902) did much to popularize his teachings in both the East and the West; Vivekananda's organizing ability was chiefly responsible for the flourish-

ing state of the Ramakrishna movement, in which the contemplative life is geared to social service and also provides a pattern of living that can, according to the teachings of the movement, transcend the differences between the great living faiths. A twentieth-century mystic who tried to adapt traditional teachings to modern thought was Aurobindo. Contemplation and yoga, through the activities of numerous recluses, holy men, and gurus, continue to play a prominent role in Indian religion.

## CHINA AND JAPAN

Chinese mysticism has two main sources, Daoism and Buddhism. A product of their interaction was Ch'an, better known under its Japanese name, Zen. The teachings of Confucius were not much concerned with the contemplative quest for inner illumination, although certain mystical ideas were expressed in the *Book of Mencius* of the Confucian tradition. On the whole, however, early Confucianism was indifferent to the contemplative ideal.

**DAOISM.** The chief early mystical writing in China was the *Dao-de-jing*, traditionally ascribed to Laozi, who is thought to have been an older contemporary of Confucius. It is likely, however, not only that the book was later but also that it was the work of several men. The anthology expresses a roughly consistent viewpoint, one that, on the most natural account of it, has its roots in contemplation (although some commentators give it a nonmystical interpretation).

The Way, or Dao, referred to in the *Dao-de-jing* is both a principle underlying natural processes and a mode of life whereby the sage can gain identity or harmony with nature. Since nature acts spontaneously and effortlessly, the book claims that the sage likewise can be effective through inaction (*wu-wei*) and effortlessness. Thus, the pattern of life suggested is one of withdrawal and passivity. In these themes the *Dao-de-jing* reflects some of those found elsewhere in mystical literature: The sense of identification with the Principle (*li*) underlying the world and the need for an unworldly mode of existence. Because the attainment of harmony with Dao was seen as living in accord with nature, the Daoists reacted against what they considered the artificialities of social life and etiquette as practiced by the Confucians, and from the doctrine of *wu-wei* they derived political views not far from anarchism.

In practice the effortlessness of the Daoist contemplative was modified by the use of techniques of meditation, such as controlled breathing, analogous to those employed in Indian yoga. The Daoist aim of an immedi-

ate, intuitive, inner illumination was sufficiently close to the aim of Buddhist meditation for it to be natural that the two streams of religion should influence each other in the period after Buddhism's arrival in China, in the first century CE. In particular, it was during the sixth and following centuries that this interplay was most marked.

**NEO-CONFUCIANISM.** The success of Buddhism, which in part resulted, at least among intellectuals, from the subtlety of its metaphysical doctrines, was a factor in stimulating the so-called neo-Confucian revival, in which a metaphysics was elaborated to underpin the Confucian ethic.

One main phase of this revival was the growth of philosophical idealism, which owed something to mystical ideas. Thus, Lu Xiangshan (1139–1193) argued that there is a single underlying principle, *li*, that explains all things and is spiritual. Thus, he claimed, his mind and the universe were one. It followed that one can discover the truth by introspection.

Such an idealism was further developed by Wang Yangming (1472–1529), about whom a significant story is told. He and a friend were concerned about the method by which one should purify the mind, for Zhu Xi (1130–1200) had said that one should investigate the nature of things. Wang and his friend decided to contemplate a bamboo in the front courtyard but gave up after several days. It is notable that this attempt corresponds to one of the preliminary methods of Buddhist contemplation. Although unconvinced by such "external" contemplation, Wang nevertheless considered the interior quest—the purification of consciousness—important. He believed that through looking inward at one's own nature one could gain an intuitive knowledge of the whole of reality. It is said that while in banishment and living under poor and menial conditions, Wang had a mystical experience in which he realized this doctrine existentially. However, Wang was far from abandoning the traditional Confucian emphasis on ethical behavior; he did not advocate quietism and passivity but saw in mysticism a way of enhancing moral goodness. Inner illumination would shine through in active concern for others. However, in such neo-Confucianism the influence of Ch'an Buddhism can be detected.

**BUDDHISM.** Ch'an, or Zen, Buddhism embodies the most distinctive feature of both Chinese and Japanese mysticism, since it incorporated Daoist ideas into Buddhist mysticism. Other schools of Far Eastern Buddhism in varying ways carried on and developed the Buddhist

tradition and therefore incorporated Buddhist contemplative ideals. A powerful aspect of Far Eastern Buddhism was the success of the Pure Land school, which centered its teachings on the faith and devotion whereby the ordinary person could receive supernatural aid from the Buddha Amitābha and gain rebirth in the paradise of the Pure Land. With its stress on devotion and the efficacy of the Buddha's grace, this school tended to bypass contemplative mysticism and to focus religion upon worship.

## JUDAISM

Although the Hebrew Bible contains virtually no expression of contemplative religion, mysticism developed within Judaism by the first century BCE. It centered mainly on the imagery of the *merkabah* (chariot), described in Ezekiel as a complex vision of the manifestation of divine power in the shape of supernatural beings riding on a mysterious four-wheeled chariot (Ezekiel 1). The Talmud indicates that some of the early rabbis practiced asceticism and self-purification as a preparation for a mystical "ascent into heaven." Philo Judaeus (fl. 20 BCE–40 CE) mentioned a community of Therapeutae near Alexandria who practiced a form of contemplative monasticism, and likewise mysticism may have been part of the Essene way of life. Philo himself was the greatest figure in these early phases of contemplative Judaism, although he was so deeply affected by Greek ideas that he is outside the mainstream of Jewish thought and piety. According to Philo, man, through his intellect, has an affinity with God; and through the contemplative life he can in principle attain a state where he can see God's essence. In accordance with Platonist and mystical ideas, Philo expounded a negative theology: God eludes the affirmations we try to make about him. Consequently, Philo's interpretation of Scripture was not at all literalistic, and he made lavish use of the allegorical method. He attempted, moreover, to show that the experiences of the prophets were mystical.

The most important period of Jewish mysticism was the Middle Ages. Beginning in the twelfth century there developed Hasidism, which made a lasting imprint on central European Judaism, and Kabbalism, mainly in Spain and southern France. The former takes its name from the term *Hasidim* ("devout ones"), a name originally applied to a movement of the second century BCE that was a forerunner of Pharisaism. Medieval Hasidism concentrated on the cultivation of the sense of divine presence. Modern Hasidism, dating from the eighteenth century, is more directly contemplative and is indebted to Kabbalism.

**KABBALISM.** Kabbalism centered on the esoteric teachings known as the Kabbalah, which found their chief expression in the *Zohar* ("splendor"), a work traditionally ascribed to the second century but actually dating from the thirteenth century or a little earlier, that conceives of God as the En-Sof, the "Endless" or "Infinite." In itself the En-Sof is qualityless, but there are ten ideal qualities, known as the *Sefirot*, that emanate from the Infinite—wisdom and power, for instance. These are used to explain the creation of the world. The cosmos that man inhabits, however, is the lowest sphere in which the *Sefirot* operate—a doctrine that expresses the way in which the perfect Infinite is far removed from the imperfect world we inhabit. The hierarchy of stages between God and the material world is reminiscent of Gnosticism. Nevertheless, the En-Sof, being infinite, does in some sense embrace lower forms of existence; and every entity in the universe reflects and interpenetrates everything else.

How is all this related to traditional Jewish teachings? According to the Kabbalah, the doctrine of interpenetration implies that lower events will stimulate corresponding activity from on high. The fall of Adam brought about a rupture in the cosmos; the Shekinah, or Divine Presence, became exiled from the En-Sof. No longer does the Presence pervade the whole world; it appears intermittently here and there—for instance, in ancient Israel—and has continued to be especially associated with the Jewish people. The aim of the pious should be to bring about a reunion of the En-Sof with the Shekinah. Since the human soul contains some of the *Sefirot*, the individual experience of such a reunion will have its cosmic effects and help to restore universal harmony. Consequently, the mystical life was given a dramatic and central place in the operations of the universe.

It will be apparent that some of these ideas, such as the ineffability of the En-Sof and the rather impersonal description of God, echo similar notions in Neoplatonism and other forms of mystical theology. Despite the unorthodoxy of much of their speculation, the Kabbalists continued the detailed observance of Jewish law, ascribing to it a mystical significance.

**Isaac Luria.** An important figure in the development of Kabbalism was Isaac Luria (1534–1572), of a Spanish Jewish family living in Palestine. He believed in reincarnation, which would give men ever fresh chances of living the pure life and would provide a framework for the punishment of those who had transgressed. Luria conceived of Adam as a universal being who before the Fall embraced the universe, then in an ideal state. With his fall, the material world was created, and the light of his

divine nature was fragmented into the sparks that illuminate the myriads of living souls. In the final consummation, all will be reunited. Asceticism and the practice of *kavannah*—concentrated devotion in all one’s acts—were the means of purifying the soul. Social conditions may have helped the growth of such doctrines, for the emphasis on meekness, love, and a quiet interior life were well adapted to the unhappy outer circumstances of the Jewish people, and the Kabbalistic reinterpretation of the Messianic hope gave the contemplative a cosmic role.

**MODERN HASIDISM.** The founder of modern Hasidism was Israel Baal Shem-Tov (c. 1700–1760), who lived in Carpathia in eastern Europe. He gathered round him disciples who were devoted to the mystical life. His successor, Baer of Meseritz (1710–1772), was an energetic organizer and missionary who spread the movement among Jews throughout eastern Europe and the Ukraine. Stress was laid on the concept of the *zaddik*, or perfectly righteous man, through whom the favor of God is channeled. Only he can attain union with the divine Being; less perfect folk must find their spiritual development through his guidance. This doctrine is reminiscent of Hindu ideas about the guru as conveyor of illumination. In any event, Hasidism implied that the *zaddik*, rather than the rabbi or learned person, was the immediate source of authority. This gave Hasidic mysticism a popular following and organization, and the essential simplicity of its message—that salvation can be attained through prayer and pious acts—made it adaptable to the experience of people of no great sophistication or learning.

As elsewhere in the history of mysticism, antinomian tendencies made their appearance. Thus Sabbatianism, named after Sabbatai Zevi (1626–1676), a self-styled Messiah who preached apostasy from Judaism, made use of Kabbalistic ideas in order to justify the concept of the God-man who is “beyond good and evil,” as in the teachings of Jacob Frank (c. 1726–1791).

Although the Hasidim often attacked official rabbinical teaching, the revival of Jewish learning in the nineteenth century paved the way for a reconciliation between orthodoxy and Hasidic piety, so that the latter still remains a force within the fabric of Jewish religion.

## CHRISTIANITY

**ORIGINS.** As has been mentioned, there was little mysticism in the traditions of Judaism until the time of Christ, and there also seems to have been little in the experience of the earliest church. It is true that Paul underwent a powerful experience of being “caught up to the third

heaven,” which could have had a mystical character, although it is also reminiscent of certain prophetic experiences, such as those of Muḥammad. The origins of Christian mysticism can more plausibly be sought elsewhere, in the rise of monasticism and the influence of Neoplatonism. Some stimulus to such a development may also have been given by the existence of Gnostic sects both within and outside Christianity, from the end of the first century CE.

**Gnosticism.** Gnosticism—a term derived from the word *gnosis*, meaning knowledge, particularly the immediate inner knowledge of the divine Being—tended to be ascetic and esoteric. Its asceticism was expressed by the doctrine that matter is evil, so that liberation of the soul is achieved through withdrawal from the world. Because of the evil nature of the world, Gnostics frequently postulated a hierarchy of beings below God and concerned with the creation of the world. Thus God himself was not contaminated, so to speak, by direct contact with matter. Such a doctrine was heretical, for it did not square with the Christian doctrine of creation or with Christian attitudes to the world, but it was one factor in stimulating an orthodox asceticism and mysticism within Christianity.

**Monasticism.** Monasticism grew out of eremitic practices, mainly in Egypt. Famous among early hermits was Anthony the Great, whose asceticism became almost legendary. Early in the fourth century monasticism proper was established in Egypt, the key figure being Pachomius. Thereafter the movement spread rapidly in Egypt and the Eastern church. It was further organized by Basil the Great (c. 330–379), whose rule formed the basis of Orthodox monasticism. John Cassian (c. 360–c. 434) brought Egyptian-style monasticism to the West, founding two monasteries in the south of France. His rule underlay that of St. Benedict, who lived in the following century. The connection of monasticism with mysticism was a straightforward one, for a main rationale of monasticism was the cultivation of the spiritual life, whereby a foretaste of the beatitude of the blessed in heaven could be gained. Thus the ultimate destiny of man was seen in contemplative terms, and it was thought possible to anticipate this destiny by a regulated life withdrawn from the world.

**Neoplatonism.** Neoplatonism, which expressed a view of the world in part stemming from, and in part providing a rationale for, mystical experience, made a lasting imprint upon Christian contemplation. A sign of this was the composition of the Pseudo-Dionysian writings, which were ascribed to Dionysius the Areopagite, a convert of St. Paul, but really date from approximately the

beginning of the sixth century. These writings had a wide impact upon medieval mysticism. The negative theology expounded in them was not merely the result of logical difficulties involved in the ascription of ordinary predicates to God but, more importantly, was geared to the expression of the contemplative's inner experience of a "darkness clearer than light." Thus the mystical experience, being different from, and not expressible in terms of, perceptual and related forms of experience, seemed to imply that its object was likewise indescribable and therefore better conveyed by negations than by positive affirmations.

Neoplatonism also, of course, deeply influenced St. Augustine, and he has been a principal source of the notion, enshrined in monastic practice, that introverted contemplation can give a foretaste of the heavenly life. Thus the highest state of Christian blessedness was increasingly identified with contemplation, and mysticism became the pattern after which eternal life was conceived.

**EASTERN ORTHODOX MYSTICISM.** The Pseudo-Dionysian writings also formed an important part of the fabric of Eastern Orthodox mysticism, for there were also features of the general theology of Orthodoxy that favored the contemplative ideal. John of Damascus, who in the eighth century summed up the work of the Cappadocian Fathers (fourth century), expressed in his writings a doctrine of deification that was both typical of and formative of Eastern Orthodox theology. Man was considered the connecting link between the visible and invisible worlds. He was created perfect but through the Fall lost his immortal, incorruptible, and passionless nature. A certain scope for free will remained, however. The image of God, although defaced, was not entirely lost. The restoration of man to the true end for which he was made—the contemplation of God—was effected through Christ's incarnation. Christ, by uniting the Godhead to human nature, restored that nature to its perfection; and by sharing in his perfect humanity, men also can be raised up and deified. In terms of Dionysian mysticism, this deification takes place through the illumination of the soul; its divinization, through the divine Light. Virtually throughout Eastern mysticism this imagery of light was to play a central part, and thus St. Simeon (949–1022), perhaps the most important of Eastern Orthodox mystics, identified the inner light with the glory emanating from God.

*Hesychasm.* Simeon was also a forerunner of the significant contemplative movement known as Hesychasm

(from the Greek word *hesychos*, "quiet"), whose methods of training had some analogy to those found in Indian yoga.

The Hesychasts (eleventh–fourteenth centuries) held that their methods were conducive to the inner vision of the uncreated Light, identified with that which suffused Christ at the Transfiguration on Mount Tabor. This Light was conceived as emanating from God and was not to be identified with his essence, which is unknowable (this was a means of retaining orthodox teaching, by safeguarding mysticism from a full doctrine of union with, or knowledge of, God). Among the training methods used were breathing exercises and the continued repetition of the Jesus Prayer—"O Lord Jesus, Son of God, have mercy on me, a sinner." In a mysterious manner, the very repetition of the sacred name of Jesus was supposed to contain the divine power.

Gregorius Palamas (c. 1296–1359), the most noted and controversial exponent of Hesychasm, considered the Jesus Prayer as the central act of piety; and although the use of breathing techniques, which persisted until the eighteenth century, has been discontinued, the Jesus Prayer has survived as a characteristic part of Orthodox religion. Palamas and the Hesychasts were not, however, unopposed. Some opponents thought that the doctrine of the uncreated Light made a division within the Godhead—Palamas had even spoken of "divinities." Thus the attempt to soften the idea of mystical union by regarding it as identification not with the divine essence but with the divine illuminative energy, was criticized on the ground that it transferred the difficulty to another locus by introducing something like polytheism. Nevertheless, Hesychastic teaching came to be recognized officially, and the movement was the mainspring of medieval Orthodox contemplation.

**ROMAN CATHOLICISM.** The mystical life served to counterbalance the worldly tendencies that had permeated the early medieval church in the West. Pope Gregory the Great (c. 540–604) discovered in his own experience something that could be expressed in terms of the irradiation of the divine Light; and Gregory VII, elected pope in 1073, undertook extensive ecclesiastical and monastic reforms that were partly inspired by the intense cultivation of the personal and contemplative life he had discovered in the Cluniac movement—a monasticism whose rules and ideals emanated from the monastic center at Cluny in Burgundy.

The most important figure in monastic reform was Bernard of Clairvaux (1090–1153). Although he was

influenced by Augustine, his concerns were not primarily expressed in metaphysical language. He believed that in the mystical experience the soul is emptied and wholly lost in God, but he did not conceive this as an actual union with the Godhead. The soul and God remain distinct in substance, although they are joined by the “glue of love.” Through man’s love flowing up to God and through the downward movement of God’s grace, the two become united. Bernard combined this intense mysticism with great powers of leadership and played a large part in the forward movement of the Cistercian order.

Other important mystics were Hugh and Richard of St. Victor, an Augustinian abbey in Paris in the twelfth century, and St. Bonaventure (c. 1217–1274) in the following century. St. Bonaventure evolved a theory of mysticism that set forth the three ways of the spiritual life: purgative, illuminative, and unitive. In the first stage, the individual purifies himself through meditation; in the second, he is illuminated by the divine mercy; in the third, he gains a continuing union with God through love. This love is nourished by concentrating upon God, to the exclusion of mutable things. Thus, Bonaventure’s path typically followed that of introversion, while his theological doctrines leaned upon Augustine and Pseudo-Dionysius.

There were ways, however, in which mystical teachings, especially where they strongly emphasized the negative theology of Pseudo-Dionysius, could seem unorthodox. The work of Thomas Aquinas (1224?–1274), in excogitating a novel synthesis between Christian theology and Aristotelianism, accentuated differences of emphasis between some of the mystics and orthodox doctrine. Thus Meister Eckhart (c. 1260–1327/1328), a Dominican and therefore versed in Thomism, fell under condemnation.

The greatest of the German contemplatives, Eckhart spoke in ways that suggested not merely that there is an ontological distinction between the Godhead, which is beyond description, and the Trinity of describable Persons but also that it is possible for the contemplative to go “beyond God” in achieving identity with the Godhead. Despite his unorthodox language, Eckhart inspired a strong following, and the mysticism of Johannes Tauler (c. 1300–1361), Heinrich Suso (1295/1300–1366), Jan van Ruysbroeck (1293–1381), and the partly lay group known as the Friends of God in Germany, the Low Countries, and Switzerland owed much to him.

It was out of the Friends of God that the anonymous but famous mystical treatise, the *Theologia Germanica*, originated, stressing the abandonment of the soul to God.

The corruption of the church and the disillusioning events of the Great Western Schism were motives for the Friends of God to attempt to revitalize faith through the inner life, and this sometimes involved a highly critical attitude toward ecclesiastical authority. It is worth noting, however, that the rather sudden flowering of mysticism in Germany during the fourteenth century owed much to the fact that in 1267 the Dominican friars had been charged by Pope Clement IV with the spiritual direction of the nuns in the numerous convents in the Rhineland. Hitherto they had frequently been without proper religious supervision.

Mysticism could lead in directions that seemed to be the reverse of Christian piety. The sect known as the Brethren of the Free Spirit, which dated from the early thirteenth century, believed that men are of the same substance as God: Every man is capable of becoming divine. It followed that when this divinization was achieved, a person could no longer sin, for God is sinless. Thus, whatever one did, it would not be a sin. Commandments and conventional tests of morality could no longer apply, and mysticism was therefore interpreted as justifying antinomianism. (Thus, it was not surprising that some of Eckhart’s language, although not intended in this sense, could be regarded as dangerous—as when he said that God is beyond good.) Despite the efforts of the Inquisition, the Brethren of the Free Spirit spread, partly because they were able to organize themselves into a secret society.

The asceticism often associated with mystical religion may also be seen in another heretical movement of the twelfth and thirteenth centuries—the Albigensians or Cathari, found in southern France, northern Italy, and parts of Spain, who held doctrines close to those of Manichaeism.

The fourteenth century also saw a marked development of mysticism in England, as exemplified by the writings of Richard Rolle de Hampole (c. 1290–1349), who led the life of a hermit; the anonymous author of the famous *Cloud of Unknowing*, which was influenced by Pseudo-Dionysius; Julian of Norwich (c. 1340–1415); Walter Hilton (d. 1396), and others. On the whole, the temper of their mysticism was nonspeculative, and they emphasized the practical means of developing the inner life.

A movement closely related to the Friends of God was that of the Brethren of the Common Life, which was deeply influenced by Ruysbroeck. Its best-known fruit was the widely read *Imitation of Christ*, attributed to Thomas à Kempis. With its stress on practical love, it was well adapted to the needs of those who did not necessar-

ily feel the call to the cloister and was a means of giving mysticism a wider social impact. Similarly, Catherine of Siena (1347–1380) exhibited a dynamic concern for social and ecclesiastical service. She ministered to victims of the Black Death and played a part in the attempt to strengthen the ailing papacy, persuading Gregory XI to return from Avignon to Rome.

Catherine of Siena spoke vividly of mystical experience in terms of spiritual marriage, paralleling the symbolism whereby the church was looked on as the bride of Christ. Another woman mystic, Teresa of Ávila (1515–1582), gave further expression to this imagery. Her accounts of her own experiences in pursuing the contemplative life, in such works as *The Interior Castle* and in her autobiography, are valuable and sensitive sources for understanding the inner phenomena of mysticism.

Another important mystic who used the imagery of marriage was a younger contemporary of St. Teresa, John of the Cross (1542–1591). He gave detailed expression to the experience of the “dark night of the soul,” an experience also recorded by Ruysbroeck and others. The mystic has, according to St. John, periods of despair in which he feels deserted by God. This he interprets as a means of purgation sent by God. The experience probably reflects the contrast between the bliss of union and the condition of striving for that bliss. It is not much written about in nontheistic mysticism, although Buddhist meditation involves the attempt to repress the feeling of bliss accruing on the attainment of higher states of consciousness, in order to obviate the depression liable to occur upon their cessation.

**PROTESTANTISM.** In one way, Protestantism provided a favorable milieu for mysticism, but in another and ultimately more important way, it provided an unfavorable one. The Protestant emphasis on personal experience of God could easily link up with the ideals of the contemplative life. Thus, the writings of the most famous Protestant mystic, Jakob Boehme (1575–1624), were widely diffused. Groups of followers known as the Behmenists flourished in England and were later absorbed in the Quaker movement, whose doctrine of the “inner light” was characteristically mystical. However, the type of experience that figured so centrally in early Protestantism and that has continued to be stressed in evangelical Christianity was that which gives the individual certitude of salvation. Such a “conversion” experience differs from the imageless rapture that is at the center of mystical religion. Moreover, Protestantism was organizationally unfavorable to the contemplative life, since this had flourished

principally in monasteries and indeed had provided a main rationale for their existence. Protestantism could be puritanical, but it did not favor withdrawal from the world.

The antinomian tendencies exhibited by the Brethren of the Free Spirit in the thirteenth and fourteenth centuries were reproduced in various offshoots of Protestant mysticism, as in the movement known as the Ranters, who were strong in seventeenth-century England. Their doctrines were held by opponents to be pantheistic, but more correctly they believed in the essential divinity of all human beings. Since God cannot sin, neither can divinized men, however wrong their actions may look from the standpoint of conventional morality. This was another instance in the history of religion where mystical teachings, normally nurtured in the context of asceticism and unworldliness, were interpreted to justify the opposite. Other important mystics in the Protestant tradition were George Fox (1624–1691), the founder of Quakerism; William Law (1686–1761); and the eccentric poet William Blake (1757–1827).

Although contemplative writings have been less prominent in more recent times, there have been a number of striking mystics since 1850, among them the pseudonymous Lucie-Christine (1844–1908), whose experiences are recorded in her *Spiritual Journal*; the converted French army officer Charles de Foucauld (1858–1916), and the Indian Christian Sadhu Sundar Singh (1889–1929).

Moreover, there has been a renewed scholarly interest in mysticism, as seen in the writings of William James, Evelyn Underhill (1875–1941), and William Inge (1860–1954). Further stimulus to the study of mysticism has been provided by the increased interaction between Eastern religions and Christianity.

## ISLAM

Early Islam was not especially conducive to mysticism, since its main spirit was that of the prophetic dynamism of Muḥammad’s numinous experiences. Nevertheless, by the eighth century mysticism was developing within Islam. Greek philosophy had already made its impact on the Arabs and thus had opened the way to speculation about God that was partly contemplative. More important, the ex-Christians who had been absorbed into the faith in many Middle Eastern areas carried with them a respect for the ascetic life. Further, the culture of the Arabian desert had encountered the rich and sophisticated standard of living of the conquered, and this confrontation had induced tensions within Islam. Those who held to the older tradition were moved to accentuate the puri-

tanism of early Islam, and such asceticism accorded with the practice of contemplation. Moreover, it was possible for Muslims to interpret Muḥammad's prophetic experience in a mystical sense.

Muslim mysticism is generally known as Sufism. The word *Ṣūfī* is probably derived from the term *Ṣūf*, "undyed wool," which was the material of a garment worn as a sign of simplicity and austerity. Although complete world denial was scarcely in accord with Muḥammad's teachings, the world acceptance expressed in the struggle for power among his successors brought conformity with mere orthodoxy into disrepute among the pious. This represented an opportunity for the growth of an ascetic otherworldliness. Those who adopted the contemplative life could withdraw from politics and could harness self-mortification to the task of concentrating solely upon Allah.

The general structure of Islamic faith was adapted to the service of the inner life. The repetition of prayers enjoined by Islam could be extended from that normally required of the faithful until every moment could be spent in remembrance of God and adoration of him. Almsgiving, one of the seven "pillars of Islam," could be interpreted in terms of thoroughgoing self-denial. The whole of life could be seen as a pilgrimage to a spiritual Mecca. Although the earliest teachings of Islam had laid duties on the individual as a member of the community—conceived as a brotherhood—tendencies later developed that made religion essentially a matter for the individual alone.

The new asceticism was regarded primarily as a means toward inner illumination. Fear and obedience of God melted into a burning interior love of him that carried with it the hope that union with him might be gained through negation of the self. This interior knowledge was described in terms of light, and an important passage in the Qur'an (Koran), the so-called Light Verse, was quoted as a backing for mysticism: "God is the light of the heavens and of the earth; His light is like a niche wherein there is a lamp, a lamp encased in glass, the glass as it were a glistening star." Also, the Sufis came to use the imagery of love as some Christian mystics did. An early example of this is to be found in the life and teachings of Dhū'l-Nūn (d. 861), an Egyptian influenced by Greek speculation.

**HERETICAL ASPECTS.** The knowledge prized by the Sufis was not the rational knowledge developed by the scholastic theologians (in Islam this meant mainly those who had come into contact with Greek philosophy); rather, it was the direct knowledge of Allah, or *ma'rifa*.

This *ma'rifa* or gnosis was the crown of the Sufi path. However, the idea of direct acquaintance with God could have consequences that were scandalous to the orthodox.

Thus, Abū Yazīd of Bistam (d. 875) was so convinced of his identity with God in the experience of *ma'rifa* that he could say "Glory to me—how great is my majesty." This seemed like claiming divinity, which was blasphemous and strictly contrary to the orthodox opposition to any doctrine of incarnation. Abū Yazīd also put forth an idea destined to play a large part in subsequent Islamic mysticism—that of *fanā'*, the passing away and extinction of the empirical self, which follows self-control through asceticism and contemplative techniques. The "passing away" involved the loss of the consciousness of one's own individuality and helps to explain why the Sufis sometimes spoke in terms that suggested that they became merged or identified with God. As has been seen, similar ideas were expressed on occasion by Christian mystics such as Eckhart and are found in Hindu and Buddhist mysticism.

The most notable example of this trend was the experience of al-Hallāj (854–922) of Baghdad, who spoke as though he were an incarnation of the divine Being through mystical experience and consciously and overtly modeled himself upon Jesus. Such ideas were intolerable to the orthodox and he was (appropriately) crucified.

Although at first the Sufis operated individually, they later associated in loose groups. The elaboration of contemplative techniques and the trend toward celibacy (scarcely in accord with the spirit of the revealed law contained in the Qur'an) brought about the creation of orders of Sufis who could work, and often live, together. It was common for such a group to be under the spiritual direction of a *shaykh* or *pīr*, and very often his residence would turn into a monastic community. The prestige of such holy men became great, and miraculous powers were ascribed to them. This prestige, combined with concepts clustering around *ma'rifa*, brought the ideal of the divine human and the cult of saints into Islam.

Persecution, as in the case of al-Hallāj, was no lasting answer to threats to orthodoxy; what was required was a synthesis between the new ideas and traditional theology that could harness Sufi piety to Qur'anic ends. Al-Ghazālī (1058–1111) provided the most acceptable and influential solution to the problem. In his *The Revival of the Religious Sciences* he dealt with the question of how *fanā'* could most properly be interpreted. He held that the mystic, in experiencing the vision of God, is so overwhelmed that he imagines he is united with him. However, this is a sort of illusion, analogous to the belief of a person who

sees wine in a transparent glass and thinks that wine and glass are a single object. When the contemplative returns from the state of ecstasy (“drunkenness,” as Ghazālī called it—metaphors of drinking were common in Sufi writings), he recognizes that there is a distinction between the soul and God. In such ways, Ghazālī tried to do justice both to the actual experience of the contemplative and to a religion’s requirements of worship, which presupposes a dualism between the worshiper and the object of worship. Ghazālī stressed the way in which self-purification, as part of the Sufi path, follows penitence, which in turn depends on the recognition of the awe-inspiring majesty and holiness of Allah. Thus he tried to show that contemplation and orthodox religion go hand in hand. Hence, he also did not believe in a mysticism that involved withdrawal from the world. The mystic returns to ordinary life, revitalized by the dazzling vision of the divine Reality. Ghazālī’s synthesis meant that henceforth Sufism had an accepted place within orthodox Islam, but contemplative and philosophical thought were not restricted.

**PANTHEIST TENDENCIES.** Notable among those who expressed a poetical and metaphysical Sufism was Ibn al-‘Arabī (1165–1240) of Spain. He influenced Dante Alighieri, who adopted the outline of Ibn al-‘Arabī’s description of the ascent into heaven (combining astronomical theory and the story of Muḥammad’s journey to heaven). His doctrines were pantheistic, and he considered human beings as offshoots of the divine essence that exist because of God’s desire to be known; and in the realization of the divine Being, the contemplative reflects in his own person the structure of the universe. He also made use of the logos idea: The logos as the creative principle in the universe was identified with the spirit of Muḥammad. However, there are hints in Ibn al-‘Arabī’s work that he considered himself superior to Muḥammad, having realized identity not with the logos but with the Godhead.

His voluminous writings, although regarded with distaste by the orthodox, were influential, especially in Persia, among such mystical poets as Jalāl ad-Din Rūmī (1207–1273) and Mawlana Nur ad-Din Jāmī (1414–1492). Rūmī, who founded one of the *darwish* orders (*darwish* literally means “mendicant,” and is commonly transliterated *dervish*), also wrote poetry expressing the longing of the soul for its return to God. However, he was also keenly appreciative of the beauties of nature, and he saw in the ritual of the Mevlevi order, which he founded, with its solemn swirling dance to the sound of drum and pipe, a reflection of the movements of the planets and of nature in general.

It may be noted that some of the orders experimented with various external means of inducing ecstatic experiences, and the dance was one. (The term *dervish* should properly apply to all mendicant orders, and not just to the Mevlevi “dancing dervishes.”)

Certain features of Sufi teaching are reminiscent of Indian mysticism, and it has been argued, although not conclusively, that there were borrowings from India. (See R. C. Zaehner, *Hindu and Muslim Mysticism*, on this question.) For instance, Abū Yazīd’s language is similar to that of the *Upaniṣads*; and Ibn al-‘Arabī argued, with a logic like that of Śankara, that it is inappropriate to speak of *becoming* God through mystical experience, since one is already essentially identical with God—mystical realization involves no change of ontological status. Again, like nearly all Hindu theologians, Ibn al-‘Arabī treated hell as a purgatory, rather than as a place of everlasting punishment. Various similarities of this kind can probably best be explained not so much as borrowings but rather as reflections of similar patterns of experience and speculation.

**MODERN SUFISM.** In the modern period, Sufism has undergone a considerable decline, and the revitalization of Islam has come about through other forces—the puritanism of the Wahhābī, Pan-Arabism, and political advance. Sir Muhammad Iqbal (1877–1938), however, an important figure in Muslim modernism, was influenced by Sufi thought. Since he wished to distinguish sharply between religion and science—the former having to do with personal life—he found the interior quest of Sufism attractive.

## MYSTICISM, NATURE AND ASSESSMENT OF

Attempts to define mystical experience have been as diversified and as conflicting as attempts to interpret and assess its significance. This is not surprising, for the language used to express and describe mystical experience is richly paradoxical, figurative, and poetical. Even if at times a mystic chooses what look like austere and precise metaphysical terms, this may be only an apparent concession to logic, for he will employ these terms in senses far from normal. Mystics have called the Godhead a sheer “Nothing” and yet the ground of all. They have affirmed simultaneously that the world is identical with God and that the world is not identical with God.

Some discriminations are possible, even if exact definition is not. Mystical experience is religious experience, in a broad but meaningful sense of “religious.” It is sensed as revealing something about the totality of things, something of immense human importance at all times and places, and something upon which one's ultimate well-being or salvation wholly depends. More specifically, a mystical experience is not the act of acquiring religious or theological information but is often taken to be a confrontation or encounter with the divine source of the world's being and man's salvation. An experience is not held to be mystical if the divine power is apprehended as simply “over-against” one—wholly distinct and “other.”

There must be a unifying vision, a sense that somehow all things are one and share a holy, divine, and single life, or that one's individual being merges into a "Universal Self," to be identified with God or the mystical One. Mystical experience then typically involves the intense and joyous realization of oneness with, or in, the divine, the sense that this divine One is comprehensive, all-embracing, in its being. Yet a mystical experience may be given much less theological interpretation than this description suggests. A mystic may have no belief whatever in a divine being and still experience a sense of overwhelming beatitude, of salvation, or of lost or transcended individuality.

Some mystical experiences occur only at the end of a lengthy, arduous religious discipline, an ascetic path; others occur spontaneously (like much nature-mystical experience); others are induced by drugs such as mescaline or take place during the course of mental illness.

An important distinction can be made between the extrovertive (outward-looking) and introvertive (inward-looking) types of mystical experience. In the first of these, the subject looks out upon the multiplicity of objects in the world and sees them transfigured into a living, numinous unity, their distinctness somehow obliterated. In nature mysticism, a form of extrovertive experience, the items of nature are not lost to consciousness; rather they are seen with unusual vividness and all as "workings of one mind, the features/Of the same face, blossoms upon one tree" (William Wordsworth, *The Prelude*, Book 6). In the introvertive type, the mystic becomes progressively less aware of his environment and of himself as a separate individual. He speaks of being merged in, identified with, dissolved into, the One. The subject-object distinction vanishes altogether. Some of the best-known mystics testify to experiences of both types, but the introvertive, being at the furthest remove from ordinary experience, is usually held to be the more developed of the two.

Although we can call mystical experience a kind of religious experience, we do not discover agreement among mystics about the nature and status of the mystical goal. Christian and Islamic mysticism, for example, interpret the experience theistically, although not with complete consistency; the Upanishads and Theravāda Buddhism are not theistic. Pantheist, monist, and agnostic interpretations have been offered, all with some *prima facie* plausibility.

## ALTERNATIVE RELIGIOUS INTERPRETATIONS

The pantheist argues that mystical experience compels us to strip away anthropomorphic conceptions of deity and

that although theism begins this work of refining, it stops long before it should. The theistic notion of God remains that of an infinite, supernatural individual. But apart from being intellectually unsatisfactory (infinity and individuality go awkwardly together), this picture contradicts the mystic's own experience, which is one not of an external face-to-face meeting with a deity but rather of merging with, and realizing one's own basic identity with, the mystical One. The theist has to set a great gulf between himself and his God; the mystic's experience testifies both to the existence of this gulf and, paradoxically, to its elimination. Brahman is both far and near.

Why have so many of the greatest Christian mystics used theistic language to describe their obviously intense mystical experiences? The pantheist will say that either they have simple-mindedly used the only religious terms they had been taught—despite their unsuitability—or else that the desire to conform to orthodox Christian dogma about God's transcendence has led them to muffle those parts of their individual experience that were opposed to it.

A pantheist interpretation claims that it alone does full justice to God's infinity and that its theology eliminates the last primitive remnants of deism. Since a mystical experience is a discovery, a realization, of what is eternally true, there need be no perplexing doctrines about special divine self-revelations and self-communications nor any interference with natural law. Accordingly, a mystical experience induced by drug or disease does not have to be judged illusory or demonic. In the determination of whether it is authentic or not, its causal circumstances are simply beside the point.

The theist, however, is not without a reply. He will reject the pantheist's conception of religious development. There has not been any general historical trend toward pantheism or monism in religion; and although early theisms were crudely anthropomorphic, this does not by itself entail that all personal language about God is equally false and crude. The doctrine of the Incarnation should teach the contrary—at least within Christendom.

Pantheism and monism, argues the theist, map only the lower slopes of the mystic's ascent. They are concerned with the preliminary purging of the senses and intellect; their raptures do not testify to an achieved union with God but only to what is perhaps an unusually fresh, innocent, and aesthetically intense awareness of the created world and its beauty. The mescaline-user and the temporarily psychotic, who make extravagant claims for their own identity with the mystical One, ought to—often do—think more humbly of their experiences once

normality returns. To the theist, the *unio mystica* is an objective that cannot be taken by assault; in the end, it is only the initiative, the grace, of God that bestows it. Causation does matter in this interpretation, and the inner, felt nature of the mystical experience cannot alone determine its authenticity.

## PARADOXES OF RELIGIOUS INTERPRETATIONS

Short decisive arguments can hardly be invoked to settle the dispute between these interpretations of mystical experience. The experiences themselves seem able to bear either interpretation; the choice between pantheism and theism is a choice between two massive conceptual systems. Neither account can claim the merit of being free from internal difficulties both conceptual and religious. Theism has somehow to combine the notions that God is immeasurably “other” to man and, yet, that mystical union is possible. Pantheism identifies world and God while maintaining their distinctness; it denies that “God” is simply another way of saying “world.”

Still more perplexingly, some mystics of great eminence speak the languages of both pantheism and theism. Meister Eckhart’s writings give full-blooded examples of each, as do those of the Indian mystic Śankara. Even in the Upanishads, although Brahman is said to be beyond relation, featureless, unthinkable, it (or he) is acknowledged to have personal aspects.

No precise or determinate idea, no particularized image, is allowed to be adequate to the mystical One. Although the ontological status of God seems at times to be that of a numinous individual being, at other times all hints of such a status are repudiated. “Simple people,” said Eckhart, “imagine that they should see God, as if He stood there and they here. That is not so.” The Divine is a “desert,” a “void,” an “abyss,” a “wheel rolling out of itself,” a “stream flowing into itself.”

Mystics will not always allow one even to say unequivocally that God exists. The pseudo-Dionysius, for example, denied that either the category of existence or of nonexistence applied to the Divine. These tensions and this indeterminateness—God is, or is not, a particular being, he is, or is not, an existent—can also be found in nonmystical theologies, but mysticism can enormously magnify them. Even Theravāda Buddhism contains deep-running paradox, despite its comparative reluctance to speculate at all. Attaining nirvāṇa, for instance, is like the extinguishing of a flame, yet nirvāṇa is not sheer simple extinction.

What attitude is it reasonable to adopt toward this display of tensions and antinomies? Four possibilities are worthy of serious discussion. (1) The paradoxes cannot be eliminated; they are to be taken literally and at their face value. Without paradox, we cannot speak of the mystic’s experiences or of his God, but this is no argument against the truth of the mystic’s claims. (2) The paradoxes are necessary in the same way that distortions of grammar and syntax are necessary to a poet attempting to say something that cannot be encompassed by ordinary language. They are not to be taken literally but are to be construed as analogies, hyperboles, metaphors, or oxymorons. (3) Since no logically coherent account of mystical vision seems attainable, it is more sensible to admit this fact and to believe the mystic’s claim that his experience is ineffable and that all language falsifies it. We would now have a mysticism without a theology. A very high value could still be set upon mystical experience, but we should be reverently agnostic on all questions of interpretation. (4) The appearance of paradox in a piece of discourse is very often taken by philosophers as a *reductio ad absurdum* of its claims. (Compare the logician’s story of the barber who shaves only those who do not shave themselves. When paradox arises over the question “Does the barber shave himself?” it is reasonable to infer that there logically cannot be a barber, so described.) Because the mystic says so many contradictory things about God, this demonstrates the logical impossibility of God’s existence, so described. Criticisms charging illogicality can be supported by attempts to explain in naturalistic terms the mystical experiences themselves.

## EVALUATION OF RESPONSES TO PARADOXES

Whether or not the paradoxes are finally to be judged literal and irreducible, we must clearly reject some of the speculations that are aimed at reducing their offense. For example, how God can be, but not by being an individual entity, is profoundly obscure. The mystery is not removed if we say that God is Being Itself or Being as such. Even if our ontology allowed such universals as “courage itself” or “blueness itself,” we still could not meaningfully include Being Itself among their number; there is no characteristic named “being” that is common to all actual entities and that should figure in their complete description. “Being Itself” cannot logically refer to anything either particular or universal, divine or nondivine.

Similarly, if we are offended by the claim that God neither exists nor does not exist, we might try a familiar palliative and say that he is above being. Our concepts fail

to grasp him precisely for that reason. “Above being” carries echoes of “above the turmoil,” “above suspicion,” “above praise,” with “above” indicating distance from and superiority to something. But in order to be “above,” one must first of all be—and continue to be. “God is above being” really fails to satisfy the conditions under which any “above” sentence of this kind can have meaning. It can, of course, be given a sense if “being” here means finite and dependent being. But if God is superior to this sort of being, if he is infinite and independent, then that is a superiority of his nature, and to learn this about him gives us no help with the original paradox.

**LITERAL VERSUS FIGURATIVE LANGUAGE.** The paradoxes and enigmas may have to stand, but why not take them as poetical, metaphorical, or symbolic language? Against that suggestion, it may be argued that if the paradoxes are metaphors, it should be possible to translate them—at least roughly—into direct, nonmetaphorical language. The only language available to the mystic, however, seems to be a language of irreducible paradox.

This argument is not very powerful. There are non-mystical topics about which it is impossible to speak without metaphor, such as important topics within the philosophy of mind. The history of conceptions of the mind is, in many of its facets, the history of changing metaphors, myths, and analogies. To defend a parallel account of mystical discourse would be less of a scandal to reason and logic than to insist on the literal view.

The literalist will reply that there is, in fact, no scandal to reason. The laws of logic work admirably for every situation where multiplicity is present. In the mystic’s unique case, all multiplicity has vanished and with it, therefore, the applicability of those laws. The mystic’s discourse is about the One that has no other; it lies beyond the province of logic.

This leaves us with a discomfiting worry. If logic is inapplicable to the mystic’s discourse, does that not come very close to saying that discriminations cannot be made in this field between sense and nonsense, the sound and the unsound?

The literal approach must be, for a philosopher, a desperate measure, a last resort only. To treat it as anything else would be methodologically perverse. Apart from the difficulties of discrimination, where logic is inoperative, the approach demands an unshakable prior conviction that the mystic’s paradoxes are to be taken at their face value as reports of veridical insights. Here there is much that can be challenged.

We refused to dismiss the figurative account for not being able to translate its metaphors, or to give literal equivalents for its symbols and analogies. Yet that inability is nonetheless an embarrassment to it. When the mystic says, “God is a desert”; “God is a blinding light”; “God is, and is not, identical with the world”; or “The mystical enlightenment is an absolute emptiness which is absolute fullness”; we are compelled to accept these metaphors and paradoxes on the faith—if we accept them at all—that they can be true in some inscrutable way of one and the same deity. This cannot be shown, although the mystic *feels* intensely that it is so. The skeptic complains that he cannot begin to see how such wildly incompatible predicates can refer to any one being, whereas he can understand with relative ease how they might, in fact, be the expression of some ecstatic inner experience of a quite noncognitive kind. He does not deny that some apparently incompatible predicates may be revealed as ultimately compatible. A psychoanalytic story can reveal how love and hate, desire and fear, can be harbored simultaneously by a person for a single object; the same can be true with conflicting analogies and metaphors. The last word of the mystic, however, is “ineffable”; he does not profess to have a reconciling story.

An objector might now suggest that it is easy enough to see how we could choose senses for the words *abyss*, *desert*, *light*, that would give us at least a glimmer of insight into their metaphorical reference to the same divine being. The words are rich enough in their connotations and implications, both near and remote. This is true, but it cannot be a key to all the paradoxes. Certain ones (like that of identity and difference between God and world) offer no scope at all for such imaginative siftings and surmisings—unless we paraphrase the mystic’s claim so freely that he will disown our translation. “The world is, and is not, identical with God” does not mean to the pantheistic mystic that the world is godlike in some respects and not in others.

If a city were referred to as a desert, a trap, or a furnace, the selection of appropriate meanings for these words in their metaphorical use would be possible because of the knowledge of the given fixed point of reference: a city. However, the concept of city is ontologically stable and intelligible in a way that the concept of God is not. The mystic’s paradoxical discourse is related ultimately to his basic assertions about God’s metaphysical status; this makes his semantic situation enormously more complex and precarious. Once again, these reflections do not attempt to disprove the mystic’s statements or even to show that they cannot be figurative as well as

semantically sound. If the mystic had independent grounds for believing in God, then one could readily accept the claim that he could speak about this God only in oblique language. Some mystics would say that they do have such independent grounds, but for others the mystical experiences themselves, reported in the language of paradox, furnish the grounds of belief. Here the risk of delusion is higher.

**MYSTICAL EXPERIENCE AND AGNOSTICISM.** “According to our scale of values,” Rudolf Otto wrote, we shall consider the mystic’s intuition “either a strange fantasy or a glimpse into the eternal relationships of things” (*Mysticism East and West*, p. 42). Need these be the only options? Might it not be possible to reject all the traditional interpretations of mystical experience but yet accord it very high intrinsic value? If the mystic cannot interpret his experience theologically without talking nonsense, it is then better for him not to attempt theology or metaphysics at all, lest he bring his experience itself into needless disrepute.

An approach of this kind would have strong sympathy with the agnostic elements of early Buddhism. Buddha taught the path to nirvāṇa but turned away any question about deities or the nature of a life hereafter. His emphasis was upon the moral quality of a life and upon attitudes toward life, death, suffering, and release from suffering. Mystical experience was attained in the course of a personal, practical discipline. It was understood as the culmination of such a discipline and given only the minimal theoretical interpretation. The lack of speculation did not, however, make the mystical experience unavailable to one who followed the Buddha’s prescription for attaining it.

To insist that mysticism is possible without interpretation has the merit of avoiding unnecessary intellectual offense; it also allows us to admit as mystical the experiences of people outside both the theistic and monistic traditions but whose testimony, at the phenomenological level, shows great affinities with the mysticism of both traditions. Nevertheless, the mystical experiences of an agnostic are surely bound to differ in important respects from those of a Christian, a Buddhist, or a Muslim. The concepts used in interpretation help to determine the mystic’s expectations of future experiences and to determine his map of the mystical path and the plotting of his position upon it. They shape the actual quality of his experience itself in a most intimate way. This does not imply that, but for the interpretative concepts, no experience could occur.

It may be feared that the theologically uninterpreted experience would tend to become a mere psychological curiosity, a luxury or consolation, isolated from all other parts of the subject’s life. This can happen, but need not. Mystical experience basically involves a powerful urge toward the reconciliation, unification, and harmony of all with all, a feature that can readily be integrated with a moral outlook in which primacy is given to love. “Integrated,” in fact, is really too weak a term; that moral ideal may receive its fullest and most splendid development in the mystical vision, and the moral agent gains a source of energy for the pursuit of the moral life.

These reflections may show, at least, that we cannot fairly assess the importance of mystical experience solely in terms of the interpretations that may be offered of it, whether speculatively pretentious or modest. An equally relevant question is what the mystic does with his experience, that is, what place he gives it in his total personal and moral existence. Evaluations based on this issue may often be at variance with those based upon a comparison of theories. A mystic may interpret elaborately and use his mystical experience as a mere refuge from responsibility, or he may be quite at a loss for interpretation, while recognizing in his experience the center and spring of a morally dedicated life.

#### OTHER PHILOSOPHICAL CRITICISMS

Our fourth type of response to the phenomena of mysticism was that offered by the radical philosophical critic, determined to call nonsense by its name, who takes the mystic’s antinomies as a *reductio ad absurdum* of his claims. To those logical objections philosophers have added various epistemological and psychological difficulties.

**THE PROBLEM OF OBJECTIVITY.** The mystic (and we are no longer thinking of the agnostic mystic) normally claims that his experience is not only a way of being inwardly, subjectively moved, but also that it discloses the nature of reality, that it is a cognitive, objective experience. To support this he may appeal to the impressive convergences of testimony on fundamentals among mystics of different periods and parts of the world. The critic may contest this. In reports upon perceptual illusions, for instance, even unanimity does not remove their illusoriness.

That the experiences are disclosures about the entire universe in its ultimate nature may be an almost irresistible conclusion for the mystic. Nonetheless, it must involve interpretation of a demonstrably fallible kind. To

feel that the experience is revelatory is one thing; to judge confidently that it is so is quite another. A dream under nitrous oxide may strike the dreamer with the force of a satanic revelation, but on awakening and correlating the nightmare with the shock of tooth extraction, he may have little temptation to judge the experience as a genuine disclosure. The feeling of revealedness can attach itself with equal intensity to incompatible contents.

W. T. Stace has argued that mystical experience is neither objective nor subjective but that it transcends this distinction and is best classified as transsubjective. To be objective, an experience must be orderly and law governed; the criteria of subjective experience are disorderliness and incoherence. Mystical experience fits neither category. It is an experience of unity, untouched by plurality; and without plurality there can be neither order nor disorder.

This is an ingenious treatment, but it seems open to criticism at least on two points. First, the criterion of objectivity may be questioned. We may be quite properly convinced that certain phenomena are objective before we have assured ourselves of their orderliness, and they may indeed remain anomalous. The subjective events of dreams and fantasies are not disorderly, although the laws governing dreams are very different from those governing events in the public world. Second, we may wish to deny that mystical experience is, in fact, experience of a totally undifferentiated unity. There is, no doubt, a stage in which the mystic not only apprehends the world of plurality as issuing from a single divine source but sees that source and the world as a unity. Mystical experiences, however, cannot usefully be restricted to this one type. Perception of multiplicity does play a role, even if it is a subordinate one, in many other types. This is obviously so with extrovertive mystical experience in general, which is an experience not simply of oneness but of oneness in multiplicity. It is also apparent in the statement from Sri Aurobindo that “those who have ... possessed the calm within can perceive always welling out from its silence the perennial supply of the energies which work in the universe” (*The Life Divine*, 1949, p. 28). The most favorable verdict we can pass upon claims to objectivity is “not proven.”

**EPISTEMOLOGICAL PROBLEMS.** When we ask more particularly what sort of apprehension, what modes of knowing are involved in mysticism, the answers swell our fund of paradoxes. If one mystic claims to perceive the cosmic energies welling forth from the One, another denies that anything like perception takes place. St. John

of the Cross speaks of a “supernatural knowledge and light” that is so completely “detached and removed from all intelligible forms, which are objects of the understanding, that it is neither perceived nor observed” (*The Ascent of Mount Carmel*, Vol. I, p. 123). Nor is mystical insight a purely intellectual act, for “the higher and more sublime the Divine light, the darker is it to our understanding.” Union with God “transcends all knowledge.” The difficulty is increased by the doctrine that in mystical experience the subject-object distinction breaks down, and with it, naturally enough, go all our thought models for cognitive activities. Faced with the risk of a complete failure in communication, the mystic usually resorts to a characteristic complex use of language. This works in part by negations (“not ordinary perception,” “not simply emotion”) and in part by descriptions of his religious situation as he interprets it in metaphysical and theological terms, enhanced with poetical imagery; God now dwells in him, or has “absorbed” him “in the embrace and abyss of His sweetness.” It is easy to see why the mystic resorts to these forms of discourse and also why they offer little comfort to the epistemologist. For the interpretations assume precisely what is at issue: that mystical experiences are objective and reliably cognitive in nature.

Some critics maintain that the mystic’s claim to “know” must at least be suspected of being spurious. When such expressions as “objectivity,” “discovery,” and “vision” are used in senses so radically far from normal and applied with obscure and idiosyncratic criteria, it is legitimate to ask whether some quite different (and noncognitive) thought model might give a more intelligible clue to what is being described.

For example, it is sometimes suggested that the mystic’s language might be best understood not as a description of reality but as the expression of a state of mind. Certainly, some of the mystic’s language is clearly emotive, and even when it seems to describe his “situation,” as we have been using the word, this may still be an indirect expression of his state of mind. Instead of saying, “I have an oppressive, worried feeling,” one may say, “I feel as if there were something terribly wrong.” Instead of “I feel uneasy, insecure,” he may say, “There is no sure footing; everything and everybody is working against me.” Instead of “I have a feeling of unreality,” he may say, “I am not real anymore.” The use of such examples does not imply that the mystic is psychotic. Some psychotic experiences are mystical experiences, but it hardly follows that all mysticism is psychosis. The critic could confine himself to pointing out this disturbing parallel in the use of language: Both mystics and psychotics use situation-descrip-

tive language for what, in the latter case at any rate, is a serious misperception of one's situation, a projection of inner disturbances upon the outer world. Furthermore, the projection occurs, partly at least, because the disturbances are not understood for what they are, and there is a failure of insight.

In the mystic's defense, it must be pointed out that to analyze his experience as a state of mind is not necessarily to discredit it. States of mind can be—and normally are—elicited by objective states of affairs, properly interpreted. People do, on occasion, fall victim to real persecution; their fears and anxieties can be very well founded.

But decisiveness, either in criticism or defense, is once more not to be had. Of course one's fears can be well-founded, but a person who says he does not really exist any more *must* be deluded. Significantly, as soon as such remarks verge on the paradoxical, we cease to take them at their face value and treat them as certain signs of disorder.

**CONTENT AND QUALITY OF MYSTICAL EXPERIENCE.** We have been considering some epistemological and linguistic problems set by mysticism and some ways in which a philosophical critic can assault, although probably not overthrow, the mystic's claims. Of the central mystical experience, characterized by loss of individuality and dissolution in a limitless divine totality, little or nothing has been said from a philosophical or psychological viewpoint. How far could a naturalistic account of mystical experience cope with these central features? Or could justice be done to them only in a thoroughgoing mystical philosophy, reared upon the paradoxes themselves? Here a suggestion or two must suffice.

In the first place, the mystical experience is a vision of the world that is free, to a very unusual extent, from the interposition of concepts. Normal perception is closely linked to practical projects; we see the world in terms of our needs and desires and our intentions to manipulate it in various ways. Aesthetic experience provides a sharp contrast. One may succeed briefly in contemplating a pastoral landscape not in terms of land utilization or of the practical problems of traveling across it, but simply as colors, shapes, or volumes. Seen in this way, the landscape can be excitingly and startlingly different from its everyday utilitarian appearance. Mystical experience is even more disturbingly strange because it suspends the application of still more basic concepts and categories. "As long as a man has time and place and number and quantity and multiplicity, he is on the wrong track and God is far from him" (Meister Eckhart, *Sermons*, p. 202).

When concepts are withdrawn and fundamental distinctions obliterated, it is understandable that our ordinary sense of the limits and boundaries between thing and thing, person and person, should also temporarily disappear. In this we may have an important clue to the mystic's claims about the overcoming of finite individuality, the cessation of the subject-object relation, and mergings and meltings into the infinite. Because our normal sense of our powers and their limits is fostered by the utilitarian and practical view of the world, when that view is suppressed, there can come the sense of exhilarating expansion or liberation that is often described in the mystical literature.

Similarly, if the practical orientation is suspended and, with it, the related conceptual framework of normal experience, we may lose awareness of the passage of time. We are not demarcating event from event in the normal time-articulating manner. In introvertive mystical experience the awareness of space is also obliterated, for there is a still more thoroughgoing withdrawal from perception and even from sensation. The intensity and strangeness of mystical experience reinforce the effect of timelessness; the experience is dramatically discontinuous with the flow of events before and after and hence is felt as not belonging to it.

The mystic himself can afford to be sympathetic to many such naturalistic explanations. He can refuse to admit that they discredit his experience. They are simply (he will say "necessarily") incomplete, for they cannot account for the qualitatively unique tone of mystical feeling, and they do not disprove his claim that the object of mystical vision itself must elude the categories of naturalistic philosophy.

Mysticism can be upgraded or downgraded with bewildering ease through the choice of a metaphor or a simile; its paradoxes are unutterable truths or blatant contradictions; its clearest affinities are with trustworthy modes of knowing or with psychotic, delusory states of mind; of all human experience it is the most valuable or it is a psychological curiosity, fashioned by the unconscious from infantile materials. The excesses of these opposite poles are avoided in our remarks about an "agnostic" or "noninterpreting" mysticism, although this is perhaps more of a practical compromise than the germ of a full-fledged theory. It tries at least to stress the potential human importance of mystical experience—when yoked to moral vision—and it expresses the wishful thought that the paradoxes of mystical interpretation should not be altogether allowed to mask that importance.

Perhaps it is more advisable to reflect on the meaning of ineffability claims made by mystics within their contexts, and the complex ways of interaction between mystical experiences and mystical traditions (Katz 1992).

### THE DEBATE OVER THEISTIC MYSTICISM

How we should classify different types of mysticism continues to be controversial. Some scholars do not regard theistic mysticism as a separate type. They argue that all mystical experiences have basically the same phenomenological content—the pure consciousness. Theistic mysticism is just the imposition of theistic interpretation on this core mystical experience.

However, R. C. Zaehner, William Wainwright, Stephen Payne, and Nelson Pike vigorously defend the distinctiveness of theistic mysticism. They appeal to the phenomenological data of Christian mysticism: God and the soul are said to be close, or in mutual embrace. The “language is radically dualistic” (Pike 1992, p. 108). Furthermore, the same mystic sometimes offers a theistic description and sometimes a monistic description. They seem to reflect differences in the content of the experiences. Moreover, the phenomenon of “spiritual sensations” can hardly be explained as the imposition of the Christian tradition.

Pike also argues that even if the theistic mystic may experience a monistic interval, the meaning of this experience should be determined with respect to the phenomenological context, which is a series of dualistic experiences of God. So it is legitimate to think that during a “monistic” interval, the spirit is simply “deluded by love into not noticing the difference between itself and God” (p. 156).

### DRUG-INDUCED MYSTICISM

Mysticism can be induced by drugs. This kind of chemical mysticism has been made popular by Aldous Huxley, and confirmed by some empirical studies (Tisdale 1980, chap. 15). However, its philosophical significance is unclear. Some regard the drug-induced alternative states of consciousness as gateways to extra-mundane reality. Others think that chemical mysticism demonstrates that reductive explanations of mysticism are available. Both interpretations can be resisted. On the one hand, the skeptics argue that we cannot distinguish alternative states of consciousness from hallucinations.

On the other hand, some scholars contend that it has not been really established that drugs are sufficient to

produce genuine mystical experiences. The experimental evidence only suggests that it can raise the likelihood and enhance the intensity of the experiences (Davis 1989, p. 220; Heaney 1973, p. 116; Vergote 1997, pp. 197ff). Even if drugs are causally sufficient to produce mystical experiences, it does not follow that they are unveridical. God may have laid down some psychophysical laws to the effect that whenever certain brain states are produced, a certain perception of the divine would be produced. There is no reason why those brain states cannot be caused by taking drugs. It has been argued that as long as the whole process is set up and upheld by God, such perception of God should be counted as veridical.

In any case, even if drug-induced mystical experiences are unveridical, it does not follow that non-drug-induced mystical experiences are also unveridical. What is shown is that on the experiential level, mystical experience can be faked. This is neither surprising nor uniquely true of mystical experience. Sense experiences can also be faked.

### NEURAL SCIENCES AND MYSTICISM

Eugene d’Aquili, Andrew Newberg, and Vince Rause (2001) have proposed a neurophysiological theory of mysticism. They explain mystical states as the effect of “deafferentation”—the cutting off of neural input into various structures of the nervous system. As a result, an experience of “absolute unitary being” occurs. In similar ways, the theory proposes explanations of a continuum of mystical experiences, both theistic and non-theistic.

The theory of d’Aquili and Newberg is by no means proven at this stage. Moreover, they point out that “tracing spiritual experience to neurological behavior does not disprove its realness ... both spiritual experiences and experiences of a more ordinary material nature are made real to the mind in the very same way—through the processing powers of the brain and the cognitive functions of the mind” (Newberg, d’Aquili, and Rause 2001, p. 37).

They also ask, “Why should the human brain, which evolved for the very pragmatic purpose of helping us survive, possess such an apparently impractical talent?” (Newberg, d’Aquili, and Rause 2001, p. 123). They in fact tend to think their biology of transcendence is congenial to religion. The neurophysiological theory by itself does not disprove the mystical experiences, just as psychophysical laws governing sense experiences would not disprove those experiences (Jerome Gellman 2001, p. 99). Of course, there are deep questions about naturalistic explanations of mysticism that deserve further exploration (Wainwright 1973; Yandell 1993, chaps. 6–7).

## MYSTICISM, NATURE AND ASSESSMENT OF [ADDENDUM]

Since the 1960s, philosophical controversies concerning the nature of mysticism mainly surround the relationship between mysticism and language, and the typology of mysticism. Moreover, as standard empiricist epistemologies no longer dominate the scene, new types of epistemology, which grant mystical experiences much more evidential force, have been formulated.

### MYSTICISM AND LANGUAGE

Concerning the relationship between mysticism and language, some believe that mysticism transcends language, as reflected in the claim that mysticism is essentially ineffable. Taken literally, this claim generates many paradoxes, and Keith Yandell (1993, chaps. 3–5) has made sharp criticisms of various versions of the ineffability thesis (Alston 1992, Matilal 1992).

At the other end of the spectrum, Steven Katz claims that mystical experiences are largely constructed out of the language provided by the mystics's conceptual framework and practice. His work has been largely responsible for the contextualist turn in the study of mysticism in the 1980s (Katz 1978, 1983). This kind of mystical constructivism has been fiercely contested, especially by Robert Forman (1990, 1998, 1999). He argues for the universality of the "Pure Consciousness Event," which is a purely nonconceptual state of consciousness without any intentional object, and that mystical constructivism cannot adequately explain mysticism's unpredicted and novel nature. Jess Hollenback (1996) provides cases of paranormal mystical experiences that "shatter the recipient's previous expectations" (p. 15). William Wainwright (1981) contends that while mystical experiences are shaped to some extent by the mystics's traditions, it does not follow that those experiences are entirely determined or created by those traditions.

It seems hazardous to make universal statements about the relationship between mysticism and language.

## THE ASSESSMENT OF MYSTICISM AND THE DEMISE OF FOUNDATIONALISM

Since the 1980s, there is a revival of the argument from mystical experience. Richard Swinburne (1979) defends the “Principle of Credulity,” which says we should trust our experiences unless there are special considerations to the contrary. William Alston has defended the rationality of mystical perception by propounding his “doxastic practice” approach. By “doxastic practice” Alston means a system of belief-forming mechanisms. His *Perceiving God* (1991) is an impressive work which argues that it is practically rational to regard all socially established doxastic practices as *prima facie* reliable. It is important to note that Alston requires those doxastic practices to have a significant degree of self-support, and an internal over-rider system.

Alston’s sophisticated argument has attracted a lot of criticisms (Fales 2004). Space does not permit detailed discussions of the debate. It is important to appreciate the significance of Alston’s work (together with Swinburne, Yandell, and Gellman) as a new research project in epistemology. They are not only reviving natural theology, but also proposing a new approach that navigates between strong foundationalism and postmodern relativism. They admit our epistemic base is fallible but they advocate an attitude of *prima facie* trust to replace Cartesian doubt. While “trust without infallible proof” was formerly treated as irrational, they suggest that the spirit of rationality should instead be construed as “trust until shown otherwise by criticisms.”

They maintain the emphasis on experience but try to break loose of the straightjacket of traditional empiricism by broadening the evidential base of experience. The basic rationale is that in the end we need to adopt an attitude of *basic trust* (i.e., a trust that cannot be non-circularly justified) toward our perceptual experiences. It would be unfair to grant this kind of basic trust to sense experiences alone while adopting skepticism toward other kinds of perceptual experiences. In the end, the epistemic assessment of mysticism will probably depend on the ability of this radically new epistemology to withstand objections. The controversy is still raging.

## MYTH

The relation between philosophy and mythology can be usefully set out under three main headings. There is first the period in Greek philosophy when philosophers wanted to discard and to criticize mythological modes of thought but when they were still so close to those modes of thought that mythology recurred in philosophical contexts. Then in modern thought there is the period from Giambattista Vico to Auguste Comte, when mythology was taken seriously as a clue to the primitive history of thought, and from the nineteenth century on, when there was a variety of systematic attempts at a science of mythology. Finally, there is the role of myth in modern irrationalisms.

To this scheme three objections may be made. The first is that in discussing the Greeks what is said will inevitably be conditioned by the writer's beliefs about what modern scientific approaches to mythology have yielded. Thus, the second section should precede the first. To this objection everything can be conceded except the conclusion, for it would be equally difficult to discuss the growth of the science of mythology before anything had been said about mythology itself.

A second objection might be that no initial definition of mythology has been offered. But here the danger is that by delineating the field of mythology too sharply, one biases one's account in favor of one sort of theory. And any definition broad enough to escape this charge would be either vague or a mere catalog.

The third objection would be that the Christian era until the time of Vico appears to be neglected by this schematism. For this there is good reason, however. In that era mythologies were predominantly treated as false theological accounts, rivals to the one true theological account, the Christian.

### GREEK PHILOSOPHY

Greek myths, like those of other Mediterranean and Near Eastern cultures, include cosmogonies and accounts of great discoveries and inventions, such as that of fire; of the founding of cities; and of the ancestry of kings, in which relationships between gods and men are codified. In different stages of the mythology, such as in the distinction between the Olympian gods and the dark, chthonic deities, one can distinguish different social origins. From the time of Émile Durkheim and Jane Harrison anthropologists have stressed the function of myths as explanations of rituals that express the social consciousness of a group. In Greek society the public ritual

continued to express the life of the community long after belief in gods had become questionable.

Greek philosophy only gradually separated itself from mythology. Personification, for example, was common in pre-Socratic philosophy, but at the same time rationalist criticism of mythology originated with writers like Xenophanes, who attacked anthropomorphic representation of the gods, and Euhemerus, who argued that myths were to be explained as stories about men who had been deified. Heraclitus attacked Homer and Hesiod for their dependence on myth.

PLATO. Plato used myths and allegories for a variety of purposes. Perceval Frutiger draws a distinction between myths properly so called and allegories, which, for example, lack the element of story; among allegories he would include the account of the Cave in the *Republic* or the noble lie about precious and base metals in the souls of different types of men. He divides myths in the full sense into those that function as allegories, those that function as genetic explanations, and those that function as other types of parascientific explanations. An example of allegorical myth is Diotima's account of the birth of Eros in the *Symposium*; among genetic explanations is the account of the creation in the *Timaeus*; and typical examples of what Frutiger calls parascientific are the accounts of a future life and of rewards and punishments for virtue and vice given in the *Republic*, *Gorgias*, *Phaedo*, and *Phaedrus*. Frutiger sees three features of Platonic myth as outstanding: the use of symbols, the freedom exhibited in the handling of the narrative, and what he pleasantly calls a prudent imprecision. The last is important. Plato uses myth where he wishes the precise extent of his own intellectual commitment to remain unclear. Thus, Plato's use of myth helps us to understand how the break with mythological thought forms involves the raising of sharp questions about truth and falsity which the mythological forms themselves are able to evade. This throws light on certain characteristics of mythology.

The subject matter of mythological narratives is no different from that of later philosophy and science; what differentiates myth from these is not merely its narrative form or its use of personification. It is, rather, that a myth is living or dead, not true or false. You cannot refute a myth because as soon as you treat it as refutable, you do not treat it as a myth but as a hypothesis or history. Myths that could not easily coexist if they were hypotheses or histories, as, for example, rival accounts of creation, can comfortably belong to the same body of mythology. There are often gradual processes of reconciliation and of

integration into a single narrative, but the discrepancies that give so much pleasure to the anthropologist are not discrepancies at all from the standpoint of the narrator.

Thus Plato, by falling back into myth, may be deliberately avoiding too direct an encounter not only with certain philosophical difficulties but also with rival religious traditions. For myth is not theology any more than it is hypothesis or history. Indeed, the dominance of theology in later religious thought and the insistence in the mystery religions and in Christianity on treating myth as theology are as responsible for the death of mythology as is any philosophical rationalism bred by the pre-Socratics and Plato. Of course, it was not only Greek mythology that was treated by Christianity in this way. Both Norse and Celtic mythology met the same fate, although they both survived in medieval literature as beliefs and not just as a source for tale telling.

### MODERN THOUGHT

The first serious modern treatment of mythology occurs in Vico's *Scienza nuova*. In Vico's theory of history each period has its own unity and character, and periods succeed one another in a determinate order. The beginnings of civilization occur in "the age of the gods," when men live in families and center their lives around religion, marriage, and the burial of the dead; this period is followed by the "age of heroes," in which aristocratic states arise. Only then comes the "age of men," the age of democratic republics. By the third stage rational inquiry is established, but in the early stages poetry and myth express the vulgar wisdom of a people. Only from mythology can we discover the religion, morals, law, and social life of early society. Myths are not false narratives, nor are they allegories. They express the collective mentality of a given age.

Vico's treatment of myth is far closer to that of modern anthropology than is that of his immediate successors. The Enlightenment's belief in progress and attack on superstition produced an unsympathetic climate for such interests. Even Johann Gottfried Herder, whose sympathy was awakened by seeing in primitive poetry and song the spirit of the folk, was inclined to treat myths as pardonably false beliefs. In the nineteenth century this assumption underlay the first systematic attempts at a science of mythology, but there was also a new consciousness of the widespread prevalence of mythology and a wish to apply comparative methods.

In 1856 F. Max Müller published his *Comparative Mythology*, in which he tried to interpret mythologies by means of principles derived from philology. All Aryan

languages are derived from Sanskrit, in which originally there were certain words named sun, sky, clouds, rain, and dawn. But language became diseased, the original meanings were lost, the words became treated as the names of divine beings, and what had been accounts of the sun ushering in the dawn and ending the reign of night were transformed into myths about battles between gods, heroic quests for gold, and the like. To understand a myth, asserted Müller, discover the etymology of the names.

Andrew Lang pointed out that rival philologists would give different etymological explanations of the same myth with apparently equal plausibility. Lang himself regarded myths as survivals of earlier social norms. The classical Greeks recount myths in which cannibalism and human sacrifice occur, although they practiced neither; however, among Polynesian and African peoples, of whom Lang's contemporaries were newly aware, just such customs and accompanying myths are found. In classical Greece the custom had vanished, but the myth remained. Or a nature myth may be found with its meaning plain in its Maori form today, whereas in its Greek version the story has been so changed that the original meaning has been lost. The anthropology Lang and his school used was that of E. B. Tylor, who himself criticized Müller's theorizing by showing how convincingly the nursery rhyme "Sing a Song of Sixpence" could be explained as a solar myth in Müller's terms.

RECURRENT THEMES AND COMPARATIVE METHODS. Lang took it for granted that the "same" myth could turn up both in Greece and in New Zealand. The modern collection of mythologies has emphasized nothing so much as the strikingly similar themes and stories that recur in widely different places and times. Myths of the creation of the world are widespread; myths of the creation of humankind occur everywhere. But even in detail myths resemble one another. Clyde Kluckhohn has written that he knows of no culture lacking myths of witchcraft in which were-animals move about at night; poisons can be magically introduced into the victim, causing illness and death; and there is some connection between incest and witchcraft. Rank has discussed the common myth pattern of a hero, born of noble parents, against whose birth an oracle warns his father, so that the child is left to die of exposure; the child is saved by shepherds or animals, grows up to return, perform great deeds, avenge himself, and finally be recognized. In the Far East, among the Navajo, and in Greece, as well as in many other places, we find this pattern. What is the explanation of its recur-

rence? We can distinguish three main types of explanation.

The first is psychoanalytic. Otto Rank, a Freudian, explains the hero as the ego of the child who rebels against his parents. His father, on whom the child's hate is projected, is pictured as exposing the child in a box on water. The box symbolizes the womb; the water, birth. The order of the story follows a sequence analogous to that of dreams in which natural events and symbols are combined in a single fantasy. The myth is the expression of all paranoid characters who hate the father who ousted them from the maternal love and care. Because such a character is widespread, the myth that expresses it is widespread, too; in general, it is the common biological, and, consequently, psychological, inheritance of humankind that underlies the common stock of mythology.

By contrast, the Jungian approach to mythology rests upon belief in a common human access to the collective unconscious. The individual continually finds himself giving expression to an archetypal symbolism that dominates not only the mythology but also much of the sophisticated literature of the world. The same myths recur in different times and places because all mythology has a common source. Modern man, who has overdeveloped the rational side of his nature, encounters in his dreams the same figures that appear in ancient and primitive mythology.

The difficulties in the Jungian account of mythology are difficulties that confront all Jungian theory. If the existence of the collective unconscious is a hypothesis designed to explain the recurrence of certain themes and symbols in myths and dreams, then it must be formulable in a way that is testable. But if such a hypothesis is to be testable, we must be able to deduce from it predictable consequences over and above the data it was originally formulated to explain. Yet no such consequences seem to follow from the hypothesis of the collective unconscious. It seems to be untestable; it certainly remains untested. As an explanation of the recurrence of mythological themes and symbols, it is also unnecessary, for there are simpler and less incoherent explanations.

Joseph Campbell has used the Jungian theory of archetypes to interpret the story *The Frog King*, one of the myths collected by the brothers Grimm. He sees the frog as a small-scale dragon whose outward ugliness conceals the depths of the unconscious, in which unrecognized and unknown treasure is to be found. The frog king summons the child to attain maturity and self-knowledge by exploration of the unconscious. Fortunately, we also have

a Freudian interpretation of *The Frog King* by Ernest Jones according to which the frog is a symbol for the penis and the myth represents the child's overcoming disgust in approaching the sexual act. Müller had, of course, long before interpreted *The Frog King* as one more solar myth.

In the face of these rival interpretations the need for a criterion of correct interpretation is clearly urgent, and with this need goes the need for a criterion for deciding when two myths are and are not versions of the "same" myth. The first step toward providing such criteria is the collection and tentative classification of as many bodies of mythology as possible. The most interesting work here has been done by Kluckhohn, who has systematically established not only the recurrence of plots and characters but also the existence of constant tendencies within this recurrence. For example, we can discover cases where a myth is reinterpreted to fit a new cultural or social situation. Clearly, where we can distinguish the original from the reinterpreted version, we are in a stronger position to compare a myth with similar myths for other cultures. We can study and compare not merely one version of a myth with another but the development of one myth through a series of versions with the development of another; from this it is clear that even if we wish to stress certain psychological functions of myth (Kluckhohn has thrown light on Navajo mythmaking by showing how it exemplifies mechanisms of ego defense), it is only when we put myth into a social context that we are likely to understand what the nature of mythmaking and recounting is.

**ANTHROPOLOGY.** The work of Claude Lévi-Strauss is important not only because its treatment of myth does not abstract myths from the social and economic relationships of those who tell and hear them but also because by invoking a wider context he has been able to pick out hitherto unnoticed features of mythology. In *Totemism*, for example, Lévi-Strauss shows how a myth of the North American Ojibwa and a myth from Polynesian Tikopia both express relationships between nature and culture, between the species that provide food and the kinship system. In each case the myth helps to express both continuity and discontinuity in these relationships; both myths also stress that no direct and simple connection between the one type of relationship and the other is possible. The myths, as it were, warn anthropologists not to oversimplify.

If one did not notice the connection of these myths with foodstuffs and with kinship but simply abstracted the "story," one would certainly not necessarily conclude

that the Ojibwa myth and the Tikopia myth were the same myth. The resemblances between them appear fully only because Lévi-Strauss poses certain questions about the myths. These questions are formulated in the light of his general theory of kinship systems and invoke the notion of relationships that are specified in purely formal terms. Lévi-Strauss elsewhere has analyzed other myths with a view to showing that in their structure formal properties are both exhibited and implicitly commented upon. Perhaps not surprisingly, these formal properties parallel the formal properties exhibited by kinship systems and also parallel to some extent, much more surprisingly, the formal properties of certain linguistic structures.

What emerges from these studies is the thesis that myths incorporate and exhibit binary oppositions that are present in the structure of the society in which the myth was born. In the myth these oppositions are reconciled and overcome. The function of the myth is to render intellectually and socially tolerable what would otherwise be experienced as incoherence. The myth is a form in which society both understands and misunderstands its own structure. Thus, Lévi-Strauss gives a precise meaning to Vico's contention that "The fables of the gods are true histories of customs."

This judgment is perhaps inverted in the work of Lévi-Strauss's most important rival, Mircea Eliade. The customs of men, in Eliade's view, often turn out to be the expression of their beliefs about the gods. Thus, the behavior of shamans, who in a state of trance imitate animal sounds (birds' song, for example, among many peoples) is a reenactment and an attempt to restore man's primitive, paradisaical, unfallen state in which he not only did not die or have to work but also communicated with the animals and lived in peace with them. Hence, Eliade concludes both that shamanism is part of the central religious tradition of humankind, stretching from primitive African myths to Christian theology, and that it is therefore not, as it first appears to be, an irrational phenomenon. Eliade distinguishes sharply between the particular cultural and social trappings that may surround a myth and what he calls the ideology behind the trappings that is exhibited in the myth itself. Thus, where Lévi-Strauss analyzes the content of a myth in terms of what is local and particular to a given society, Eliade wishes to relate the content to general human religious interests and as far as possible divorce it from the local and particular.

**IRRATIONALISM.** "Myths must be judged as a means of acting upon the present," said Georges Sorel in 1908.

Sorel distinguishes those beliefs that it is appropriate to characterize in terms of truth and falsity and those it is appropriate to characterize in terms of effectiveness and ineffectiveness. A myth is essentially a belief about the future that embodies the deepest inclinations of some particular social group. The myth that Sorel himself wanted to propagate was the syndicalist project of a general strike. Other socialists treated their beliefs about the future as predictions; Sorel regards this as for the most part irrelevant. The only predicates in which he is interested are self-fulfilling ones.

Yet to regard beliefs about the future in this way is paradoxical. For example, when I try to propagate a myth, I am inviting people to believe. But insofar as I do this, I invite them to treat it as true rather than false and as susceptible to truth or falsity. It is difficult to resist the conclusion that anyone who holds a view like Sorel's will fall into a form of doublethink, treating the myth as true or false in certain situations but retreating into the assertion that questions of its truth or falsity are inappropriate in other situations. Certainly, just this kind of doublethink characterizes modern irrationalist mythmakers after Sorel. They wish to avoid hard questions that philosophers or social scientists might raise about their myths, but they also wish to claim some kind of truth for their utterances. Thus, we also get a concomitant doctrine of special kinds of truth or special criteria for truth—for example, in works as different as Alfred Rosenberg's *Myth of the Twentieth Century* and D. H. Lawrence's *The Plumed Serpent*. Rosenberg's version of Houston Stewart Chamberlain's amalgam of anti-Semitism, racism, and authoritarian German nationalism is, of course, utterly different in content and implications from Lawrence's appeal to "the dark gods" and his attempt to restore an imagination violated by the wrong kind of arid rationalism. However, the difficulty with all irrationalism is that the abandonment of the criteria of rationality leaves us defenseless before the most morally outrageous appeals to emotion. In such appeals the revival of myth has a key place.

## MYTH [ADDENDUM]

As Alasdair MacIntyre says, some philosophers have treated myth, disparagingly, as the opposite of logos, as a nonrational form of understanding the world that either has been or should be displaced by science and reason. Others have agreed that myth is the opposite of logos but have consequently valorized it as a fruit of the primordial mind, a product of an archaic form of experience or mystical consciousness that the modern scientific mind, to its detriment, has lost. There is then a range of philosophical views of the relative value of myth, but philosophers have largely agreed with Ernst Cassirer in seeing myth as a quintessential product of pretheoretical consciousness and therefore as a foil for the scientific mentality of modern European civilization. Since 1967, however, this assumption has been problematized. The concept of myth has been deconstructed, and this deconstruction represents a double obstacle for any philosopher who wants to see in myths truths about the human condition.

The first obstacle arises as scholars realize the extent to which mythical accounts of the origins of the cosmos, of the gods, or of a people have been intimately tied to the social and historical context in which they are told. Far

from being the ahistorical products of the unconscious or whimsical flights of speculation—“the wonderful song of the soul’s high adventure,” to quote Joseph Campbell—myths have typically served to legitimate a particular social order. A clear example is the story of Purusha in the Rig Veda, a story that inscribes the divisions of the caste system as a cosmic reality rather than as a human and hence contingent arrangement. Myths are therefore partisan, not apolitical. In Bruce Lincoln’s (1999) slogan myths are “ideology in narrative form.” A culture will typically have more than one cosmogony, some mythical accounts of origins will seek to justify the status quo, and rival accounts will seek to undermine it. In short myths typically have a legitimating function, and this fact is concealed by traditional philosophical approaches that ignore the myths’ social and historical roots.

The second obstacle arises as scholars realize the extent to which the category of myth reflects the interests of those who employ it. To identify a particular story as a myth—identifying it as the product, for example, of pretheoretical consciousness—has operated to illustrate the superiority of certain ways of thinking over other ways of thinking and, sometimes explicitly, the superiority of certain cultures over other cultures. Thus, one can see that the category of myth is ideological. From this perspective the traditional account of the emergence of *mythos* and its struggle with and eventual defeat by *logos* is itself a myth, that is, a partisan, legitimating story that modern European philosophers tell of their own origins. *Myth* is in this sense therefore a construction of the scholar: myths are not discovered, they are invented, and philosophers who claim to find in myths *la pensée sauvage* tell us more about their own worldviews than they tell us about *les sauvages*.

A few Continental philosophers, such as Cassirer and Hans Blumenberg, explored the idea that myths play a role in the development of consciousness, but Anglophone philosophers were not especially interested. Modern philosophers of religion (who one might think would have a natural interest in myths) have tended to focus on religious “beliefs” deracinated from the oral and literary contexts from which they were drawn. They have also tended to avoid the study of any religion that is not monotheistic. When deconstructive arguments like those mentioned earlier are added to this aversion to the concrete, the result has been that myths have been left for social scientists to study. At the beginning of the twenty-first century there is almost no philosophical work being done on myth.

## A FUTURE FOR THE PHILOSOPHICAL STUDY OF MYTHS

But this result is not inevitable. Two observations may point to a future for the philosophical study of myths. In the first place, even when it is not a philosopher studying the myth, philosophy is still present, because answers to philosophical questions are always already embedded in the theories of myth. Social scientific approaches to myths are not philosophically neutral. They inevitably embody a particular set of normative assumptions about what is real and not real, knowable and not knowable, and good and not good, and in this way theories of myth carry certain metaphysical, epistemological, and axiological presuppositions. That the study of myths is unavoidably “philosophy-laden” is perhaps seen most easily when one looks at how the theorist answers questions about rationality, for every theory of myth assumes a judgment regarding what is and is not rational to say. For example, when the Victorian anthropologist Edward Tylor proposed that myths were rational insofar as they originated in observations about natural phenomena, his empiricism was showing.

In the second place, that some scholars pursue questions about the social or political dimensions of myths does not preclude others from asking philosophical questions about the existential, phenomenological, metaphysical, or ethical dimensions of those same narratives. That a story serves ideological ends does not rule out the possibility that it might also house truths about the human condition. To argue otherwise is to collapse the questions of provenance with those of truth, the genetic fallacy. And granting that philosophers’ use of the term *myth* has itself been ideological, the solution is not simply to switch the focus of reflection away from the narratives and onto the way that philosophers construct categories, but to practice philosophy self-consciously, self-reflexively, and without naïveté. Philosophers who work on culture should therefore become comfortable with working with histori-

ans, anthropologists, and others who deal with the contexts in which the myths have their sense, but they need not abandon the idea that philosophy has its own contribution to make.

In short, then, a philosophical contribution to the study of myths, though now moribund, waits on an appreciation, first, of the ways in which philosophical issues are woven into the theories at work in the social sciences and, second, of the ways in which philosophers of religion or of culture might broaden their studies to include narratives. The fact is that communities often tell stories that explain how the different forms of existence were established; stories that sanction a particular interpretation of history; stories that identify paradigmatic forms of proper behavior. Such stories can provide models of the lived world and of how best to operate within it, and philosophers can analyze and evaluate the truth and the rationality of these models. It can be expected that such stories will typically have an ideological function, but coming to terms with the interpretive and explanatory work of social scientists should strengthen and not eliminate a philosophy of myths.

## NĀGĀRJUNA

(c. 150–250 CE)

Nāgārjuna is the first and most important philosopher of the Mahāyāna Buddhist tradition. His work is fundamental to all Mahāyāna philosophy and is widely discussed in the subsequent Buddhist literature of India, Tibet, and East Asia. His work has also attracted considerable attention in Europe and North America.

### LIFE AND CONTEXT

Canonical hagiographies of Nāgārjuna report that he was born a Brahman in South India, became a Buddhist monk, and later adviser to a king of the Sātavāhana dynasty. He is credited with retrieving the *Prajñāpāramitā sūtras* from the undersea world of the *nāgās* to whom, according to legend, the Buddha had entrusted them for safekeeping. Given that Nāgārjuna probably lived at about the time that some of these texts were composed, it is possible that he was associated with their composition or dissemination. Nāgārjuna's philosophical work is grounded in the views articulated in these sūtras, and he develops a thorough exposition and defense of the central doctrine they articulate—that all phenomena are empty of essence. While Nāgārjuna's philosophical program,

including his interpretation of emptiness and his doctrine of the two truths, is in many respects highly original, it is also in other respects continuous with early Buddhist accounts of the impermanence, interdependence, and selflessness of the person and of phenomena (Vélez 2005).

While there is disagreement regarding Nāgārjuna's dates and regarding the area of India in which he lived, a confluence of evidence, including Kumārajīva's biography and Joseph Walser's [(2004)] (2005) analysis of the context of the composition of *Ratnāvalī* (Jeweled Garland of Advice to the King) indicates that Nāgārjuna probably lived in the late second and early third centuries in the lower Krishna River Valley. If this is correct, Nāgārjuna was writing at a time when the Mahāyāna was a nascent movement, and his texts provide both the philosophical foundations for that movement and polemical defense of its doctrinal probity.

### MAJOR WORKS

A large number of works are attributed to Nāgārjuna, including not only the philosophical works noted here, but also hymns, devotional poetry, and letters to royal patrons, as well as tantric and alchemical texts. It is likely that these latter were composed by another figure of the

same name, and that at least some of the devotional material ascribed to Nāgārjuna was not composed by the author of the philosophical texts that constitute the core of his corpus. The core texts, which are almost certainly composed by the same author, are *Mūlamadhyamakakārikā* (*Fundamental Verses on the Middle Way*), *Īṅyatāsaptati* (*Seventy Verses on Emptiness*), *Yuktiśaśṭika* (*Sixty Verses of Reasoning*), *Vigrahavyāvartanī* (*Replies to Objections*), *Ratnāvalī* (*Jeweled Garland of Advice to the King*), and *Vaidalyasūtra* (*Devastating Discourse*).

Of these, *Mūlamadhyamakakārikā* is the most important. The text comprises four hundred forty verses organized by Candrakīrti (c. 600–650 CE), in his commentary *Prasannapadā* (*Lucid Exposition*) into twenty-seven chapters. Nāgārjuna addresses a wide range of fundamental Buddhist categories and phenomena, arguing that each of them lacks essence. The text is terse and is difficult to interpret without a commentary, often considering opposing positions from non-Mahāyāna Buddhist schools and refuting them. Nāgārjuna relies almost exclusively on *reductio ad absurdum* arguments, arguing that any account of the essence of a phenomenon, or any account according to which something exists permanently, substantially, or independently, collapses into absurdity. As a consequence, he argues, all phenomena exist only interdependently, impermanently, and conventionally. Most importantly, the text identifies two truths: an ultimate truth—the emptiness of phenomena of any essence or substance; and a conventional truth—the empirical reality and interdependence of things, and argues that these two truths are mutually implicative.

*Vigrahavyāvartanī* is a reply to objections to *Mūlamadhyamakakārikā*, principally those of Nyāya philosophers. The first half of the text develops a series of objections, each to the effect that the doctrine that all phenomena are empty is self-refuting, on epistemological, logical or metaphysical grounds. In the second half, Nāgārjuna confronts each of these objections, demonstrating that each rests on a misunderstanding of emptiness—taking emptiness to be not essencelessness, but nonexistence. When emptiness is understood as interdependence, he argues, not only are none of these objections sound, but the alternative each proposes collapses into absurdity. This text is accompanied by a detailed and closely argued autocommentary.

*Īṅyatāsaptati* and *Yuktiśaśṭika* are each detailed verse explorations of specific themes raised in *Mūlamadhyamakakārikā*. *Īṅyatāsaptati* addresses the relationship between the ultimate emptiness of phenomena and their

conventional existence, arguing that the emptiness of phenomena does not undermine, but instead underwrites, their empirical reality. *Yuktiśaśṭika* explores the sense in which Nāgārjuna's position constitutes a middle path, and characterizes the extremes between which it is a midpoint. One extreme is that of reification—the view that anything that exists does so in virtue of having some essence, that things remain in existence over time, and that anything that exists can in principle exist independently; the other is the extreme of nihilism—the view that because there is no essence, because all phenomena are impermanent and independent, nothing really exists at all. These extremes, Nāgārjuna argues, share the erroneous view that to exist is to exist substantially, independently and continuously, and that once this view is rejected the moderate view that things exist conventionally, dependently and impermanently is the only coherent metaphysical position. *Vaidalyasūtra* is a refutation of the foundationalist Nyāya epistemology, arguing that none of the kinds of foundations that school proposes for knowledge is in fact appropriately self-justifying and that none of their ontological categories is in fact basic.

Each of these texts is written in a technical vocabulary, in an academic style and involves arguments intended to be read by scholars. Each focuses on issues in metaphysics and epistemology. *Ratnāvalī*, while a closely argued philosophical text, is different. It is aimed at a lay audience, and is addressed to a royal patron. While it surveys Madhyamaka metaphysics, it also addresses topics in ethics, political philosophy and statecraft. Indeed, it is probably the first scholarly text on Mahāyāna ethics and the only Mahāyāna text on political philosophy. In *Ratnāvalī* Nāgārjuna explicitly grounds the Mahāyāna ethic that takes compassion as its foundation in the doctrine of emptiness, and defends a theory of statecraft according to which the ruler's obligations include a wide range of social welfare programs. The text is also sectarian, arguing in favor of the legitimacy of the Mahāyāna at a time when this movement and its texts would have been marginal and controversial, and appealing to the king for support for the monasteries.

## PHILOSOPHICAL CONTRIBUTIONS

Nāgārjuna extends certain fundamental Buddhist doctrines to develop the metaphysics and epistemology distinctive of Madhyamaka. Five ideas deserve special attention: (1) the doctrine that all phenomena, including emptiness, are empty; (2) the doctrine of the two truths and the account of their relation to one another; (3) the deployment of both positive and negative tetrallemmas;

(4) the claim that madhyamaka is not a philosophical position on a par with others, in that it is not an account of the nature of reality, but a refusal of all such accounts; and (5) the attack on epistemological foundationalism.

Nāgārjuna argues that all phenomena are empty of essence, of independence, of substance, in virtue of the fact that essence, independent existence and substance are incoherent. He argues that emptiness is not another essence, but rather is the complete absence of anything that could be an essence. Emptiness itself is just as empty, in just the same sense, as anything else. The emptiness of phenomena is, for Nāgārjuna, the ultimate truth about things—the truth found when the analysis of a thing is complete; this amounts to the fact that things are impermanent, interdependent, and have merely conventional, nominal identity conditions, but no basic nature. The conventional truth about things is the truth about them delivered by our ordinary faculties when used appropriately. But this is just the fact that things are impermanent, interdependent, and have conventional identity conditions. Hence the two truths, according to Nāgārjuna, are, from an ontological point of view, identical. Ultimate truth is therefore not a separate reality; conventional truth is not a veil of illusion. Rather, they are two aspects of one reality.

Nāgārjuna makes extensive use of the Buddhist tetralemma—the partition of logical space into affirmation, negation, both affirmation and negation and neither affirmation nor negation. His deployment is distinctive in that he presents both positive and negative forms of the tetralemma. From the perspective of conventional truth he argues, on the one hand, that we can say that there is a self (conventionally); that there is no self (ultimately); that there both is (conventionally) and is not (ultimately) a self; and that there neither is (ultimately) nor is not (conventionally) a self. On the other hand, from the ultimate point of view none of these can be asserted, as from that point of view there is only emptiness, which cannot be grasped discursively as it is, because discursive thought always involves reification and the mediation by universals. Hence, from the ultimate view there is neither a self, nor not a self, nor both nor neither.

Nāgārjuna asserts that he rejects all views, and that Madhyamaka is not a view. This assertion is variously interpreted by subsequent commentators. Candrakīrti's reading is the most straightforward: Many metaphysical positions are views about the fundamental nature of reality. Metaphysical disagreements are predicated on the view that there is a fundamental nature of reality, and reflect divergent views of what that nature is. Madhya-

maka, Nāgārjuna argues, is the rejection of the coherence of the idea of a fundamental nature of reality. Hence it is not a metaphysical view in the sense that its rivals are.

According to many Indian philosophers, there are foundations of knowledge. Some argue that these are objects of knowledge; others that they are our means of gaining knowledge, such as perception or inference. Nāgārjuna argues that neither of these positions can be maintained: that objects of knowledge are only known in virtue of the employment of warranted means of obtaining knowledge, and that in turn these warranted means are only validated by the objects they deliver. Knowledge, such as the reality toward which it is directed, is hence groundless, interdependent, and conventionally constituted.

## CANONICAL COMMENTARIES

*Mūlamadhyamakakārikā* is the subject of many commentaries in India, China and Tibet. The earliest is the *Akuto bhayā*, whose authorship is not known. Some traditions regard it as Nāgārjuna's autocommentary, but because it cites the work of his immediate disciple ōryadeva casts doubt on this attribution. Pingala's commentary (c. fourth century) exists only in a Chinese translation. Buddhapālita (fifth to sixth centuries) composed an important commentary, the *Buddhapālita*. Bhāvaviveka (sixth century) composed an extensive commentary *Prajñāpradīpa* (*Lamp of Wisdom*) and subcommentary *Tarkajvāla* (*Blaze of Argument*). Bhāvaviveka offers extensive reconstructions of Nāgārjuna's arguments in line with the developments in Nyāya and Buddhist logic and takes issue with Buddhapālita's interpretation of the role of reductio argument in Madhyamaka methodology. Candrakīrti (seventh century) in *Prasannapadā* defends Buddhapālita's reading against Bhāvaviveka's critique. His distinction between their respective understandings of Nāgārjuna's methodology and his account of the metaphysical implications of those understandings form the basis for the Tibetan distinction between the *svātantrika* (Tib: *rang rgyud pa*) and *prāsaṅgika* (Tib: *thal 'gyur ba*) schools of Indian *madhyamaka* that has come subsequently to systematize much understanding of the diverse developments of Nāgārjuna's philosophy in India and Tibet. Candrakīrti also composed an extensive commentary on *Yuktiśāstīka*. Many commentaries on *Mūlamadhyamakakārikā* were composed in Tibet. The most extensive and influential is Tsongkhapa's *rTsa she tik chen rigs p'ai rgya mtsho* (*Ocean of Reasoning: An Extensive Commentary on Mūlamadhyamakakārikā*) which com-

parens the Indian commentaries, defending Candrakīrti's reading.

## TWENTIETH-CENTURY SCHOLARSHIP

The diversity of Western readings of Nāgārjuna's philosophical program is even greater than the diversity of Asian readings. Andrew Tuck (1994) notes that readings of Nāgārjuna in the West often follow fashions in Western philosophy and religious studies. He has been read as a mystic (Streng 1967), as a nihilist (Wood 1994), as a pragmatist (Kalupahana 1986), as an antirealist (Siderits 1988) and as a skeptic (Garfield 1995). There is also considerable debate concerning the degree to which Nāgārjuna argues cogently, and regarding whether his logic should be understood as akin to a European bivalent classical logic or as akin to a four-valued or paraconsistent logic (Robinson 1957, Hayes 1994, Garfield and Priest 2003).

## NAGEL, ERNEST

(1901–1985)

Ernest Nagel, the American philosopher of science, was born at Nove Mesto, Czechoslovakia and came to the United States at the age of ten, becoming naturalized in 1919. He was graduated from City College in 1923 and received an MA in mathematics from Columbia in 1925 and a PhD in philosophy in 1930. He served as the John Dewey professor of philosophy at Columbia University from 1955 to 1966, then took the position of university professor there until 1970, becoming emeritus in 1970. He expressed indebtedness to the teachings of Morris R. Cohen, John Dewey, and Frederick J. E. Woodbridge and to the writings of Charles S. Peirce, Bertrand Russell, and George Santayana.

## PHILOSOPHY OF SCIENCE

Nagel belonged to the naturalist and logical empiricist movements, and he is primarily noted for his contributions to the philosophy of science. In 1934 he published, with Morris R. Cohen, *An Introduction to Logic and Scientific Method*. This noted text has been praised for its high level of rigor and for its enrichment of the traditional dry fare of logic with illustrations of the functions of logical principles in scientific method, in the natural and social sciences, and in law and history.

Nagel's book *The Structure of Science* is a unified and comprehensive distillation of many years of teaching and of his many publications on special aspects of scientific thought. It is the most complete exposition of Nagel's analysis of the nature of explanation, the logic of scientific inquiry, and the logical structure of the organization of scientific knowledge, and it illuminates the cardinal issues concerning the formation and the assessment of

explanation in physics and in the biological and social sciences.

Two other contributions by Nagel to logic and the philosophy of science are *Principles of the Theory of Probability* (1939) and *Gödel's Proof* (1958), written in collaboration with James R. Newman. These studies range over many issues, from the logic of probable inference to the basic conditions of the structure of formal systems.

## GENERAL PHILOSOPHY

Two philosophical essays of a general scope by Nagel have been widely acclaimed. In "Logic without Ontology" Nagel defended a naturalistic interpretation of logic. He argued that logico-mathematical principles must be understood according to their functions in specific contexts, namely, in inquiries, and he criticized attempts to adduce an ontological ground or transcendent authority for the meaning, warrant, and necessary character of logical laws. Nagel had already repudiated his early view that logical principles "are inherently applicable because they are concerned with ontological traits of utmost generality" (*An Introduction to Logic and Scientific Method*, p. v). In "Logic without Ontology" he showed that the view that logic is ontologically determined or entails ontological commitments arises primarily from a failure to heed certain contextual and operational qualifications of the sense in which logical principles are supposed to possess "necessary truth."

In "Sovereign Reason" Nagel presented a penetrating critique, focused on the doctrine of internal relations, of Brand Blanshard's rational idealism. This critique exemplifies one of Nagel's strongest philosophical convictions and a main theme of "Logic without Ontology": Logical principles (and even pure Reason), just because they are analytic, are necessary but not sufficient instruments for acquiring knowledge or discovering truths about reality. The task of logic, according to Nagel, is to disclose the assumptions and clarify the methods on which responsible claims to knowledge are based and by which they are critically assessed. All claims to knowledge, even those most impressively supported by evidence and experiment, are subject to revision or rejection in the light of new advances in knowledge. This empiricist tenet led Nagel to accept contingency as a real trait of nature and fallibility as an inescapable feature of human inquiry.

## SCIENCE AND SOCIETY

Nagel's technical interest in the logic and history of scientific knowledge did not prevent him from appreciating the social consequences and problems of science and

technology in a democratic society. Much of his critical activity as a speaker, reviewer, and essayist was devoted to imparting a clearer understanding of the nature of science and to dispelling philosophical vagaries and bizarre notions concerning such matters as causality and indeterminism in physics; the alleged paradoxical character of abstract science or its utter disparity with common sense; the frequent claims that science is value-free, or metaphysically inspired, or mere codified sense data; and the revulsion or despair and the impassioned remedies that science has occasioned in some literary and theological circles.

## MATERIALISM, DETERMINISM, AND ATHEISM

Nagel's philosophical naturalism led him to take a decisive stand on certain broad philosophical issues, notably materialism, determinism, and atheism. It has been charged that naturalists, being materialists, are unable to account for mental phenomena. Nagel replied, fully aware of the many senses of the word *materialism*, that naturalists are not materialists if materialism is taken to mean that such psychological predicates as "fear" or "feeling of beauty" logically entail or are reducible to physical terms such as *weight*, *length*, or *molecule*. Although he repudiated reductive materialism, Nagel held that mental events are aspects of and contingent on the organization of human bodies. Events, qualities, and processes are dependent on the organization of spatially and temporally located bodies. In this sense, naturalism is committed to materialism: Organized matter has a causal primacy in the order of nature. It follows that there can be no occult forces or disembodied spirits directing natural events and no personal immortality when bodily organizations disintegrate.

To assess the role of determinism in history and in ethical theory, Nagel formulated the meaning of *determinism* in natural science. A scientific theory is deterministic with respect to a set of properties when, given a specification of the set at any initial time, a unique set of the properties for any other time can be deduced by means of the theory. The theory might be a mechanical theory, and the sets of properties mechanical states. This theory might conceivably be of use in calculating the mechanical states of a human organism, but only its mechanical states. Whether other properties of the organism and its history were deterministic would remain an open empirical question. Nor would determinism in human history, if it were established, automatically empty moral endeavor and responsibility of significance. Which

modes of human experience and behavior, if any, are subject to deterministic theory remains an empirical question; and the sense in which these conditions might be characterized as “deterministic” remains an issue of analysis.

In several places, including his influential paper “The Causal Character of Modern Physical Theory,” Nagel concerned himself with the philosophical implications of quantum theory. Like Albert Einstein and Max Planck, but unlike the majority of writers on the subject, Nagel denied that quantum theory has indeterministic consequences. He also showed in some detail how intellectual confusion thrives when distinctions of context and the relevance of theoretical language to specific contexts are ignored; for example, when “particle” in the context of Newtonian theory is transported into discussions of the uncertainty principle in modern physics. In another well-known essay, “Russell’s Philosophy of Science,” Nagel argued that the physical and physiological facts of perception do not require the abandonment of common sense in favor of the strange conclusions held by Russell and Arthur Stanley Eddington.

Nagel was one of the few naturalists to present a forthright statement of the naturalist critique of theism. His formulation of atheism is not couched as a sheer negation of theism but proceeds from a positive moral position according to which, while it is granted that there are inevitable tragic aspects of life, knowledge of life and nature is to be preferred to illusions. On matters of such supreme moment, the truth rather than fiction is the more fitting ideal of rational men.

Nagel did not, however, deny the value and authenticity of other than purely cognitive pursuits. He never argued that aesthetic qualities, ideals, suffering, and enjoyments are not genuine aspects of experience. On the contrary, he urged that naturalism, although obliged to render a competent account of scientific knowledge, also include in its scope a place for imagination, liberal values, and human wisdom.

## NAGEL, THOMAS

(1937–)

Thomas Nagel has contributed to a wide spectrum of philosophical topics in ethical theory, moral psychology, applied ethics, and political theory, as well as to metaphysics and epistemology. His work is distinguished by its breadth, clarity, and acumen.

While there is not a single, narrowly defined theme running through all his work, Nagel has persistently engaged the problem of reconciling an objective view of reality with one’s subjective, individual experience as a person. In his magisterial work, *The View from Nowhere*, Nagel writes: “This book is about a single problem: how to combine the perspective of a particular person inside the world with an objective view of that same world, the

person and his viewpoint included. It is a problem that faces every creature with the impulse and the capacity to transcend its particular point of view and to conceive of the world as a whole" (1986, p. 3). Nagel's defense of the legitimacy of both one's subjective perspective and an objective, nonindividual point of view, has been part of Nagel's resistance to philosophies that do away with either. So, in several books and many articles, Nagel has authored an influential critique of forms of physicalism that eliminate or do not take seriously the reality of subjective experience, and he has also been highly critical of philosophies that give way to skepticism because they grant excessive authority to subjectivity.

*The Possibility of Altruism*, his first book, argues that in an individual's recognition of goods and ills for him- or herself over time, there is an implicit recognition of the goods and ills that face other individuals. "In accepting goals or reasons myself I attach objective value to certain circumstances, not just value for myself" (1970, p. 85). In later work, Nagel refines the conviction that ethical and political theory needs to be comprehensively impartial and only comprised of agent-neutral reasons; these reasons are comprised of "what everyone ought to value, independently of its relation to himself" (1991, p. 40). Nagel allows that there is some tension between such an agent-neutral perspective and some of the values that have their place in specific, personal contexts. Nagel advocates an egalitarian social ideal (1991), while also recognizing that some goods are private and should be concealed from public surveillance and control (2002). Nagel's concern for the integrity of the individual pits him against overriding social engineering.

In philosophy of mind, Nagel is widely known for his essay "What Is It Like to Be a Bat?" (first published in *Philosophical Review* 1974, pp. 435–450, reprinted in *Mortal Questions* and widely anthologized). In this essay, Nagel identifies subjective, phenomenal experience as the central problem facing contemporary physicalism. He contends that a fully developed neurobiological, functional, materialist account of the human body would still leave out subjective experience (what it is like experientially to be conscious and undergo experiences), just as a fully developed neurobiological, functional, materialist account of a bat would still leave out what it is like to be a bat. In *What Does It All Mean?* Nagel employs the thought experiment of an inverted spectrum and other inverted sensations to exhibit the apparent contingency of the relationship between conscious, experiential states and functionalist, materialist ones. These are cases when the physicalist account of seeing some color or experienc-

ing some taste is inverted, so that while the physicalist would conclude that one is having some taste, when it turns out one is having a quite different one. In *The View from Nowhere*, *Other Minds*, and elsewhere, Nagel opposes all philosophies of mind that fail to recognize the reality of subjective, lived experience.

Although Nagel's defense of the reality of phenomenal experiences and the apparent contingency of the mental-physical relation has seemed to some to lend credence to at least a modified form of dualism, Nagel himself holds that dualism can be avoided by developing a conceptual revision of one's current concept of the physical world and subjective experience. While philosophers do not yet possess this new world view, Nagel urges that future philosophical work be focused on conceiving of a single natural world that incorporates what one now sees as objective physical states and one's internal, mental subjectivity.

In his short book, *The Last Word*, Nagel offers an impassioned defense of reason as a reliable mode of inquiry, not subject to the objections of relativists, post-modernists, or contemporary pragmatists like Richard Rorty:

Reason ... can serve as a court of appeal not only against the received opinions and habits of our community but also against the peculiarities of our personal perspective. It is something each individual can find within himself, but at the same time it has universal authority. Reason provides, mysteriously, a way of distancing oneself from common opinion and received practices. ... Whoever appeals to reason purports to discover a source of authority within himself that is not merely personal, or societal, but universal—and that should also persuade others who are willing to listen to it.

(1997, pp. 2–3)

Nagel acknowledges the many ways in which one's reasoning may be impaired, but he nonetheless maintains the necessity of making recourse to reason in order to correct, however gradually, such impairments.

Nagel received a BA from Cornell University in 1958, a PhD from Oxford in 1960, and his PhD from Harvard in 1963. He has held academic appointments at the University of California at Berkeley, Princeton University, and New York University where he was appointed as University Professor in 2002. In addition to his specialized philosophical writing, Nagel has written on practical political and moral problems. For example, he has argued for a

highly restricted account of when and how a just war may be engaged.

## NAIGEON, JACQUES-ANDRÉ (1738–1810)

Jacques-André Naigeon, a French writer, was an associate of Denis Diderot. Naigeon was not an original thinker; he became an editor, compiler, and commentator after having tried painting and sculpture, but he considered himself a philosopher and was proud of his classical erudition. A bibliophile, too, he accumulated one of the great collections of Greek and Latin classics of his time. Having been accepted into the group of Encyclopedists surrounding Baron d'Holbach, he became an aggressive atheist. He attached himself to Diderot as a disciple and tried to imitate his tone, his manner, and his ideas. Diderot in turn enjoyed Naigeon's wit and tolerated his bad temper, stiffness, and pedantry; Naigeon helped Diderot with the *salons* and the *Encyclopédie*. Naigeon later persuaded Diderot to make him his literary executor. He preserved and edited many of Diderot's manuscripts but did not publish others. He put out an incomplete edition of Diderot's works in 1798 and wrote a valuable but

unfinished commentary on his life and writings, *Mémoires historiques et philosophiques sur la vie et les ouvrages de Diderot* (Paris, 1821). He also arranged the clandestine printing of several of Holbach's works in the Netherlands, and in 1770 published *Mélange de pièces sur la religion et la morale*, which contained some minor pieces by Holbach and other writers.

Naigeon edited the works of Seneca, completing the translation begun by N. La Grange and adding notes; he published it with Diderot's defense of Seneca, *Essai sur les régnes de Claude et de Néron* (Paris, 1778). A one-act musical comedy, *Les Chinois* (1756), is sometimes attributed to him, perhaps in collaboration with Charles-Nicolas Favart. His only "original" work was *Le militaire philosophe, ou Difficultés sur la religion, proposées au P. Mallebranche* (London and Amsterdam, 1768), which is based on an earlier anonymous manuscript and has a final chapter by Holbach. This dull work is of minor value as an example of dogmatic atheism and materialism, but it merely repeats the same ideas and arguments that had run throughout the radical writings of the entire century. Naigeon supports hatred of priests and the church with the doctrine of materialism and a naturalistic utilitarian morality. He denounces Christian ethics (asceticism, humility, etc.), demanding fulfillment of legitimate natural demands and a moral code based on social well-being. He points out contradictions in Christian ethics and doctrine, stressing its cruelty and its failure. He argues that Christian ethics leads to an inversion of the natural order of values, hence to intolerance, inhumanity, and crimes. Earth would be peaceful and happy if the idea of God were eliminated.

Naigeon continued this attack in his contributions to C. J. Panckoucke's *Encyclopédie méthodique*. This work consisted of separate dictionaries, and Naigeon edited the *Dictionnaire de la philosophie ancienne et moderne* (3 vols., Paris, 1791–1793), which was largely a compilation. In *Adresse à l'Assemblée nationale sur la liberté des opinions* (1790) he demanded absolute freedom of the press and again gave vent to his hatred of priests.

There are no studies on Naigeon, except in relation to his publication of Diderot's manuscripts, nor is any needed.

## NAIVE REALISM

See *Realism*

## NAKAE TŌJU

(1608–1648)

Nakae Tōju, “the sage of Ōmi” (his native town in Shiga prefecture), the most respected Confucianist in the Tokugawa era, was an advocate of the Wang Yangming school. The ideas of Wang Yangming (in Japanese, Ōyōmei) were made known in Japan by the Zhu Xi scholar Fujiwara Seika (1561–1619), but only with Nakae did the Wang Yangming doctrine become a school of thought. The importance of this school lies in its impact on Japanese thinking and the nonconformists it produced. Its stress on *ryōchi* (literally, “good conscience”; more exactly, the innate knowledge that every man has from Heaven) favored the formation of strong individualists guided by the inner light of conscience without the formalistic restraints of Zhu Xi Confucianism. The cultivation of the mind combined with a stress on deeds rather than formal learning was another aspect of Nakae’s teaching. His upright character showed in practice what it meant to be a Confucian sage, that is, almost a saint.

Nakae’s intuitive and practical morality centering on filial piety had a great attraction for his pupils as well as for many later followers who for different reasons claimed him as their master. His outstanding followers were Kumazawa Banzan (1619–1691) and such men prominent in the nineteenth-century movement to restore the emperor as Ōshio Heihachirō, Yoshida Shōin, and Saigō Takamori. Kumazawa tried to persuade his master to leave the obscure village of Ogawa and enter the service of the lord of Okayama, but the humble Nakae shunned the proposal. In addition, Nakae’s inclinations were ethico-religious rather than politico-economic, the characteristic of many of his followers. Nor was he a radical, although some of his admirers were.

Nakae strove for a middle way, mildly criticizing other points of view. He spoke of *ri*, the “principle,” and *ki*, Zhu Xi’s material force (which Nakae interpreted as matter-life), as two aspects of the “supreme ultimate.” Nakae’s terminology recalls the ancient Chinese sages and suggests Christian influence; *Jōtei*, the “Supreme Lord Above,” he called “the absolute truth and the absolute spirit,” and he ascribed almost personal attributes to this Being. Nakae also had pantheistic leanings, however, and he used anthropomorphic expressions to ally his *Jōtei*

with Shinto deities. His moral ideas, though, are much more important than his cosmological views. Filial piety (*kō*) is the pivotal virtue, for him both the universe’s moral power and its reason for being. Everyone, from the emperor to the most despised woman—Nakae being quite an equalitarian—was affected by filial piety, the creative force descending by degrees from Heaven. This virtue became in his late followers patriotism toward the emperor. Still, for Nakae, it was a cosmic and religious force not limited to one family or nation.

## NAŞİR AL-DİN AL-ṬŪSĪ

(1201–1274)

Naşir al-Dīn al-Ṭūsī (1201–1274) is a Shi‘a Iranian author of some two hundred treatises in a number of disciplines, including philosophy, mathematics, astronomy, mysticism, and theology.

### LIFE AND TIMES

Naşir al-Dīn was born in the city of Tus in the province of Khurasan in northwestern Iran, the first area to be devastated by the Mongolian invasion of the Middle East by Helagu Khan (1217–1265), grandson of Genghis Khan (1167?–1227). After completing his formal studies, al-Ṭūsī carried out research and publications under the patronage of various Ismaili rulers from 1227 until 1256, when he assisted the Ismaili ruler to surrender to Helegu

Khan, who employed al-Ṭūsī as his adviser until Helagu’s death and then joined Abaq (1265–1282) until his own death. Al-Ṭūsī accompanied Helagu Khan in the Mongol attack on the last Sunni caliph in Baghdad, after which he built an observatory at Maragha in Azarbayijan in northwest Iran. There he spent the rest of his life in supervising innovations in astronomy and mathematics; in addition, he attracted the patronage of the Mongol ruler toward scientists, Shi’a theologians, and writers on mysticism.

### COSMOGONY AND ITS ETHICS

In formulating his views on the existence of God, al-Ṭūsī appeals to the Avicennan doctrine that God has no (external) cause; because entities are known by their causes, there cannot be any affirmative scientific type of knowledge (*‘ilm*) of God. In this light, one needs to note the Qur’anic indication that the divine expresses creation in the language of command (*amr*) and in the logos of be/make (*kun*), which express the good intention of the creator as the paradigm of action. Here al-Ṭūsī proffers an Isma‘ili doctrine that the Imam is a physical incarnation, or an earthly instantiation of the divine goodwill. As a self-caused entity God must be a unity; and as a unity he can only create one entity, namely the Necessary Existent (*al-wajib al-wujud*), which has been equated with the First Intelligence (*nous*), from which the rest of the universe emanates in a series that has been represented by Neoplatonists as follows: After the Universal Soul emanates, the Individual Souls come forth and finally matter. Whereas Ibn Sīnā does not equate his Necessary Existent with the God of Islam, the major Isma‘ili theologian prior to al-Ṭūsī, Nāṣir Khosrow, explicitly states that God creates the Necessary Existent, from whom the rest of the universe then emanates. A Zoroastrian and a Nietzschean type of ethics is implied in al-Ṭūsī’s cosmogony, where the good is associated with the good intention of the agent in the context of imitating the Imam.

### THE THEODICY OF SOFT DETERMINISM

Al-Ṭūsī held that *free will*, *determinism*, and *indeterminism* are metalinguistic terms for explaining actions. A system is determined if the future can be predicted from a knowledge of all events and laws. When people are unaware of causes of behavior, free will is attributed to an agent, whose will corresponds with necessity—for example, a pregnant mother who wills the birth of her child. Having free will does not imply that the will is free and

indeterminism is true. Total freedom is an intentional state of an agent that is achieved through knowledge of causes of events and one’s “love”-receptivity to accept one’s fate-role in the best of all possible worlds, as is exemplified by parents who graciously accept the facts of aging and welcome their children’s well-deserved authority. In this tenor, al-Ṭūsī’s system resembles Gottfried Leibniz’s view of the best of all possible worlds. H. A. Wolfson notes that such a resemblance is due to Leibniz’s copying Spinoza’s theodicy, which in turn can be traced to the influence of Avicennan thought on Maimonides. Following Tolstoy’s view that “free will is the essence of life, but it is an illusion,” al-Ṭūsī holds that free will is an intentional concept. “Will per se,” he states, “cannot be cause of any action in a mind-independent world” (pm: see *Metaphysics of Tusi*, p. 39–40). Al-Ṭūsī holds that to God, who is a unity, neither free will nor determinism applies, because an agent is free, if his or her will agrees with necessity (which implies a duality in the agent).

### REFUTATION OF MATTER

Through a number of proofs al-Ṭūsī points out the incompatibility of the notion of the ultimate indivisible material substance of early Sunni theologians. Consider, for example, the following 4 by 4 arrangement of material substances:

```

A 0 0 0 0 B
      0 0 0 0
      0 0 0 0
      0 0 0 0
C 0 0 0 0 D
    
```

Imagine a triangle, where hypotenuse is BC, the base is CD, and a side is BD. According to the atomic theory of homogeneous indivisible matters with no space between them, the base CD would equal the hypotenuse, which is BC. But this conclusion contradicts the Euclidean rule that a hypotenuse (BC) is longer than the base CD. Upholding the absoluteness of the Euclidean geometry, al-Ṭūsī uses this and seven other proofs to refute the material theory of substance.

### THE APPLICATION OF PHILOSOPHICAL ANALYSIS TO DIFFERENT SENSES OF INFINITY

Al-Ṭūsī faces the following dilemma: As a philosopher he has to agree with Aristotle and Ibn Sīnā in holding that the “actual infinite” is not a legitimate notion, yet as a mathematician he needs to employ “infinity” in the the-

ory of numbers. Moreover, as a phenomenologist he had to use a continuum to explain perception and a continuum is often expressed by real numbers. In a clever manner that resembles R. Carnap's celebrated method of reconstructionism and fits into the tradition of philosophical analysis, al-Ṭūsī proffers the following solution. He begins by distinguishing different senses of infinity in their application to various domains such as the "syntactical" realm, the actual world, the phenomenology of experiences such as perception, and the like.

### INTENTIONAL MYSTICAL VIRTUES

Al-Ṭūsī wrote several texts on intentional analyses of the moral psychology of mystical experience. A number of investigators, such as Wilfred Madelung, hold that al-Ṭūsī's main purpose was to propose a practical experiential praxis of mysticism of the Shi'a kind that was an alternative to the Sunni school of Ibn 'Arabi that had been advocated by Al-Qunawi.

## NASR, SEYYED HOSSEIN (1933–)

Seyyed Hossein Nasr is a Persian Islamic scholar and traditionalist philosopher. After receiving his primary school education in Iran, he was sent to the United States at the age of twelve and graduated from the Peddie School in

New Jersey in 1950. He studied physics and mathematics at Massachusetts Institute of Technology (MIT) and received his doctorate from Harvard University in 1958 with specialization in Islamic cosmology and science. From 1958 until 1979, Nasr was professor of the history of science and philosophy at Tehran University where he became dean of the Faculty of Letters for some years. He also served as president of Aryamehr University in Iran. It was during these years in Iran that Nasr studied with such traditional philosophers as S. M. Kazim 'Assar and S. M. Hossein Tabataba'i.

After the Iranian Revolution of 1979, Nasr migrated to the United States and taught at Temple University before joining the George Washington University in 1984. In 1981, Nasr gave the Gifford Lectures at the University of Edinburgh, which was published the same year as *Knowledge and the Sacred*. In 1999 he was chosen to be the first Muslim scholar to receive the Templeton Religion and Science Course Award. Most recently, a volume in the *Library of Living Philosophers Series* has been dedicated to him and his work.

As a prolific scholar and philosopher, Nasr has written extensively on topics as diverse as metaphysics and cosmology, tradition and modernity, Islamic science, comparative mysticism, Islamic art, interfaith dialogue, Sufism, and the environmental crisis. He is a prominent member of the traditionalist school of thought that includes such names as René Guénon, Ananda Coomoraswamy, and Frithjof Schuon. Nasr has played a key role in formulating and disseminating the ideas of the traditionalists on traditional metaphysics, sacred view of nature, and the critique of modern science. His *Knowledge and the Sacred*, his magnum opus in the field of philosophy and comparative religion, attempts to reconstruct traditional philosophy as an alternative to the modern worldview that Nasr describes as metaphysically blind and reductionist. Like the other traditionalists, Nasr places religion—or what Schuon calls *religio perennis*—at the heart of human history. A closely related term that permeates his work is perennial philosophy, which again points to the universality of tradition. In this view, tradition does not mean customs but signifies that primordial truth of divine origin that lies at the center of all cultures and religious traditions. Tradition is thus closely related to revelation and its articulation in philosophy, theology, mysticism, and sacred art.

Nasr's concept of traditional metaphysics is centered around a holistic and hierarchic view of reality. Saturated with traditional theocentrism, Nasr's view of metaphysics posits God or the One as the source, center, and end of all

there is. This principle takes on many different forms and formulations in different traditions but remains essentially the same. In keeping with the spirit of premodern philosophy, the spiritual has a higher ontological status over the material because the former is taken to reveal the divine and the latter to conceal it. The imagery of the great chain of being defines a good part of Nasr's metaphysical works. Nasr also attempts to create a holistic view of reality by showing the interrelatedness of the various levels and states of being.

Because every level of reality has its own meaning and place in the total economy of divine creation, none of them can be reduced to a lower order of reality nor the whole to one single element. According to Nasr, it is this teleological and hierarchic view of the universe that has prevented the premodern sciences of nature from slipping into reductionism and materialism. In addition to *Knowledge and the Sacred*, Nasr has provided a detailed analysis of these issues in his other works including *The Need for a Sacred Science* (1993) and *An Introduction to Islamic Cosmological Doctrines* (1964). In his major works on traditional metaphysics and cosmology, Nasr's main concern has been to revive *scientia sacra* (sacred science) by showing the underlying unity and interrelatedness of the transmitted, intellectual, and physical sciences under the umbrella of metaphysics.

Nasr sees all cultures and civilizations emanating from an essentially religious vision of the universe. This has led him to author a number of works on what he calls the "sacred view of the universe." From an ethical point of view, nature is seen as a sacred trust from God and from a metaphysical and theological point of view as *vestigia Dei* (signs of God; *ayāt Allah* in Arabic). This suggests that the order of nature has an essential telos, which makes it teleological, sacred, and intrinsically intelligible all at once. Nasr's lifelong interest in traditional and modern science can thus be seen as an extension of his view of metaphysics. In a number of works on *Islamic science*, a term Nasr has introduced to the field, he discussed the meaning of science within the context of the Islamic religious worldview and analyzed the achievements of Islamic scientific tradition in such fields as medicine, astronomy, mathematics, algebra, chemistry, physics, geography, and natural history.

Nasr's works on the relationship between religion, science, and the environmental crisis have had a long-standing impact in both the Islamic and European intellectual circles. His early work *The Encounter of Man and Nature: The Spiritual Crisis of Modern Man*, first appeared in 1968 and was one of the first books to predict the envi-

ronmental crisis. The book is a philosophical critique of the modern conception of nature as inert matter. This is also the first book in which Nasr takes up the challenge of modern science and its secular outlook. The second important book to appear in this line of writings is *Religion and the Order of Nature* (1996) in which he gives an account of the rise of modern science, criticizes the secular and reductionist philosophies of nature, and presents the traditional religious view of cosmos and the human body as a viable alternative to modern scientism and reductionism.

An overall concern of Nasr's thought has been to define the fault lines of tradition and modernity. As a traditionalist philosopher, Nasr defines modernity as a distinct worldview based on the denial of the transcendent, and rejects it. He considers the environmental crisis, the modern culture of nihilism and skepticism, and the rise of scientific positivism and materialism a direct result of the various forms of modernism. Against the proponents of modernism in both the European and the Islamic world, Nasr calls for a revival of the Islamic intellectual tradition in particular and traditional thought in general to address the challenges of the modern world. His work on Islamic philosophy and Sufism has been instrumental in showing the relevance of this tradition for questions of immediate concern to the contemporary Muslim world.

## NATIONALISM

In defining the word *nationalism*, at least five senses can be identified: (1) a sentiment of loyalty to a nation (a variety of patriotism); (2) a propensity, as applied to policies, to consider exclusively the interests of one's own nation, especially in cases where these compete with the interests of other nations; (3) an attitude that attaches high importance to the distinctive characteristics of a nation and, therefore, (4) a doctrine that maintains that national culture should be preserved; and (5) a political and an anthropological theory that asserts that humankind is naturally divided into nations, that there are determinate criteria for identifying a nation and for recognizing its members, that each nation is entitled to an independent government of its own, that states are legitimate only if constituted in accordance with this principle, and that the world would be rightly organized, politically speaking, only if every nation formed a single state and every state consisted exclusively of the whole of one nation.

### NATURE AND CRITERIA OF NATIONALITY

Nationalist doctrines and theories of the kinds referred to in (4) and (5) date from the end of the eighteenth century. Attachment to one's nation and the belief that, for instance, all Englishmen constitute an English nation are, no doubt, much older. Men have always had this kind of attachment to an in-group—whether tribe, city, or nation—and a corresponding awareness of (and perhaps hostility toward) nonmembers as foreigners. But what characterizes nations, distinguishing them from groups of other kinds?

**THE NATION DEFINED BY THE STATE.** A nation, wrote the French revolutionary ideologist the Abbé Sieyès in 1789, is “a union of individuals governed by *one* law, and represented by the same law-giving assembly.” Thus conceived, a nation's unity and identity derive from political organization, and the state would thus be logically prior to the nation. This view was consistent with the individualist or atomistic interpretation of group phenomena of which John Locke was a typical exponent and

which was characteristic of much of the social theorizing of the eighteenth-century Enlightenment. Writers like Denis Diderot and Marquis de Condorcet considered that individuals must be taken to concur in the setting up of a political order because (or insofar as) it is in their interests, several and collective. A public interest, thus created, is the ground of a duty to preserve and defend the order, and the state, as the subject of this interest, becomes a proper object of loyalty. Those sharing in such a common interest would constitute one people, or nation. This view of nationality is supported by the way in which, in ordinary speech, citizenship and nationality are interchangeable in many contexts. (This was once true of legal usage, too; however, many states now distinguish the rights and duties of a citizen from those of a national.) If, however, we do distinguish nationality from citizenship in ordinary speech, it is principally by narrowing citizenship to matters of political and legal status, whereas to determine nationality we take into account criteria like place of birth, parentage, language, and cultural tradition.

**THE NATION DEFINED BY LANGUAGE AND CULTURE.** The conception of nationality as language and culture became articulate, as an element in nationalist ideology, at the end of the eighteenth century, mainly through the work of German writers such as Johann Gottfried Herder, Novalis, Friedrich Schleiermacher, and Johann Gottlieb Fichte. Whereas for the French revolutionaries a nation was a group of individuals subject to a single political order, for the Germans nations were distinguished from one another by God and nature. Each had its peculiar character closely related to its common language. Since language is the vehicle of a tradition, preserving and transmitting sentiments, symbols, emotional associations, and myths, to share a native language is to share a common culture. “Every language,” wrote Schleiermacher, “is a particular mode of thought, and what is cogitated in one language can never be repeated in the same way in another.” This concept of nationality tended to be associated with a metaphysical doctrine that saw every nation as the expression of a spirit or idea, which in turn expressed a particular aspect of the divine image. The diversity of nations was a reflection of the diversity of reality, and each nation made its necessary contribution to the progress of humankind. Its members therefore had a moral duty to preserve and foster it. Thus, in reacting against the Francophile cosmopolitanism of the *Aufklärung* (German Enlightenment), the German cultural nationalist nevertheless continued to see the nations against the backcloth of humanity, each with a

role to play in what, in the end, was a drama of humankind.

As these writers saw it, a nation's existence did not depend on its members' choice or recognition; or, rather, because it formed their consciousness, they could hardly choose not to be members. If the German nation was a natural fact, it was because men reared in a German tradition would be essentially different from Englishmen or Frenchmen. Thus, a German who tried to ape the French inhibited the expression of his own nature and made do with what for him were artificial second bests.

#### THE NATION DEFINED BY COMMON HERITAGE.

The conception of nationality as language and culture was challenged by Ernest Renan in the famous lecture *Qu'est-ce qu'une nation?* of 1882. It is a mistake, says Renan, to confuse nations with ethnographic and linguistic groups. Common racial origin, language, or religion, common economic interests, or the facts of geography are not sufficient to constitute a nation. There are nations like the Swiss, who do not share such characteristics, and there are linguistic groups like the English-speaking peoples, who do but who do not form a single nation. According to Renan, what constitutes a nation is the possession, first, of a common history, particularly of sufferings—of a store, that is, of common memories that are a source of common sympathy and pride. But it is important that some things be forgotten, too, for until old wounds have healed, the sense of sharing a common heroic tradition will be lacking. Thus, the second condition of nationality is a will to live together and to keep the common heritage alive. “To have done great things together, and the will to do more, these are the essential conditions for a people. ... The existence of a nation is ... a daily plebiscite.”

Granted the importance of personal identification with a common tradition in the life of a nation, the metaphor of common memories does little, perhaps, to elucidate what gives a national tradition its unity and continuity. In the sense in which memory is important for individual self-knowledge and identity, individuals cannot remember what happened before they were born. Nor need their heroic ancestors stand in any generative relation to them. It is only in a figurative sense that a Frenchman could claim Joan of Arc for an ancestor. It is only because he is already a participant in a national tradition that he knows whom to call ancestor. Different situations call out different loyalties, and the ancestors a man acknowledges may differ accordingly. An American Jew of German descent might identify himself now with

Thomas Jefferson, now with Judas Maccabaeus, now with Frederick the Great. Again, although men may share memories simply by having been present at the same event, to share a common history is not just to know the same historical facts; it is to identify with the same historic symbols, feel vicarious pride in the same achievements, and feel indignation at the same affronts. A Frenchman may *know* as much about Frederick as about Joan; it is because Joan is *his* and Frederick *theirs* that he is a Frenchman. A nation exists, then, where there is a group of individuals, attached in this way to a common body of symbols, who recognize one another as fellow members sharing similar attitudes to these symbols and who, because of this, feel a loyalty and concern for one another that they would not extend to outsiders. Linguistic, religious, or physiognomic features may have a part in determining who is so recognized, and the importance of any one of them may be different in different situations.

**THE NATION DEFINED BY TERRITORY.** A characteristic of nationality distinguishing it from most other kinds of group attachment is its relation to territory. For a group to have no special territorial affinity would not prevent one from calling it a sect, a family, or a social class. The idea of a homeland, however, seems essential to the idea of a nation. The true cosmopolitan has no place where he belongs. This illumines the close conceptual relation between nation and state, for a state is also territorially based and will admit nonmembers only on its own terms.

Where an area has a history of conflict among religious, linguistic, or racial groups each concentrated in a particular territory, the members of each will be conscious of themselves as a separate group with a history of supremacy or suffering associated with that territory; the characteristics that significantly differentiate the group from those around it will come to be thought of as those of people who belong to that territory, even when they are also found outside it. Any such group excluded from political power may be expected to aspire to independence and to want to settle in its own territory the terms on which power and prestige are enjoyed. There is, then, a wide range of features by which a national group might identify itself and its members. Which of them becomes the focus of nationality in any given case will depend on how the group has come to self-consciousness; that feature will very often correspond to the criterion by which it has been singled out as an object of oppression. Its homeland will be the territory in which the group so defined now predominates or predominated in some earlier period to which its common recollections go back.

THE NATION DEFINED BY COMMON AIM. However, because nationalism is so often a form of protest, the concept of the nation to which it is tied may depend as much on the definition of the out-group against which it is aimed as on the positive delineation of the in-group. In the twentieth century African and Asian nationalisms, for instance, relied heavily on the repudiation of white colonialism and on an aspiration to count as the white man's equal. However, on its own this cannot be enough to constitute a nation, for though the same sentiments are found throughout Black Africa, only a few Africans see themselves as a single nation aspiring to unity in a single state. Nationalism, in fact, can exist before the nation, as the aspiration of a European-trained elite aiming at native independence in a territory defined by an imperial power for administrative convenience, not by any native tradition or symbolic attachment. Having transformed a colony into a state, nationalists in countries such as Ghana must then create a nation. That states can be as important in making nations as nations can be in making states is borne out by the success of the United States. The failure of the Austro-Hungarian Empire to create a nation was the cause of its disintegration.

#### NATURE SELF-DETERMINATION

The twin sources of modern nationalist doctrine are the French conception of popular sovereignty and German romantic anthropological nationalism. In eighteenth-century political theory the attribution of sovereignty to the people instead of the monarch gave the people the right to determine its own mode of government. This implied no threat to the existing order of states and gave rise to no irredentisms in France and England, where the territorial boundaries of the self-conscious nation corresponded more or less with the established frontiers of the state and where the state itself was already a national symbol. In Germany and Italy, however, nationality spilled across frontiers. If the people, being sovereign, might choose the political order it wished and if "the people" was defined by nationality irrespective of existing states, then a national will to unity and independence was self-justifying even though it dismembered existing states, upset dynastic legitimacy, and sanctioned the invasion of one sovereign state by another in the interest of national liberation. The Italian nationalist Giuseppe Mazzini put the case in extreme terms, professing the belief that the political unity and independence of every nation within its natural boundaries was ordained by God. A characteristically more moderate view was stated by J. S. Mill in *Representative Government* (1861):

Where the sentiment of nationality exists in any force, there is a *prima facie* case for uniting all the members of the nationality under the same government, and a government to themselves apart. This is merely saying that the question of government ought to be decided by the governed. One hardly knows what any division of the human race would be free to do if not to determine with which of the various collective bodies of human beings they would choose to associate themselves.

There are very great difficulties, however, in the notion of a right to self-determination, whether individual or collective. The idea of a state as an organization exercising authority over everyone within its boundaries is not compatible with the idea of conceding to each man a right to choose whether to give it his allegiance. Of course, everyone may have a right to some influence on how and by whom he will be governed. But this amounts to a right to participate in certain constitutional decision procedures that take the political framework for granted, not to a right to take or leave it as one likes. Nor is a collective right any easier. On the practical level no amount of fragmentation or partition could put every individual in an area like the Balkans into the right state.

A more fundamental problem, however, is to decide what constitutes a national group for the purpose of self-determination. In the name of national unity Ghanaian nationalists deny self-determination to the Ashanti as the Congolese denied it to Katanga. If Germans claim that all German-speaking people, as members of the German nation, ought to be included in Germany, would the principle of national self-determination leave so-called Germans abroad any choice in the matter? And if they demurred, would it be as Germans or as non-Germans? If as Germans, would this be compatible with the self-determination of the whole German people? Clearly, if nationality is to be judged by objective criteria like language, the principle of national self-determination would support irredentist expansion policies irrespective of the wishes of the subgroup concerned since the nation's will would presumably be more authoritatively expressed by the greater part than by the lesser. But if nationality is judged by subjective criteria, like a will to live under one government, repudiation by the subgroup would appear to be ground enough for saying that it was not part of the same nation after all. But a dissentient minority within that subgroup could then equally well claim a separate national identity and so on. If one accepts subjective cri-

teria for group self-determination, there is no reason for stopping short of individual self-determination.

The objective criteria, though often difficult to apply in actual cases, do provide clear principles for the proper constitution of states. However, they can claim no support from the individualist doctrine that political obligation must rest on consent. This principle has played its part in the history of nationalist doctrine. Immanuel Kant maintained that the principle of moral freedom and autonomy implied that men, as self-legislating members of the kingdom of ends, must impose political obligation upon themselves and that authority must derive from and be subject to the general will as expressed in law. Nationalists like the German political economist Adam Müller transformed the argument, however, by identifying the individual with the nation, insisting that the individual's permanent will was more truly expressed in the *Volksgeist*, or national spirit, than in any particular individual preference. Thus, the general will, which for Jean-Jacques Rousseau and Kant reconciled individual moral autonomy with political authority and obligation, became a way of denying the relevance of personal choice when it ran counter to the national spirit.

Early nineteenth-century nationalism was nevertheless liberal and humane in intention. Fichte and Mazzini would have argued that unless a nation was united in an independent sovereign state, its members, unable to command the respect of others as equals, would be lacking in dignity and self-respect. Much of the persuasive charm of nationalism in Africa and Asia has a similar source. Men of color repudiating white superiority feel that for their own self-respect they must be ruled by men of their own color and kind with whom they can identify and who will be received on equal footing by the leaders of other sovereign states.

However, the moral uncertainty out of which nationalism is born and which is perhaps its main justification, readily turns, once unity and independence has been won, into an aggressive assertiveness and national egoism, akin to what in France Charles Maurras called "integral nationalism," "the exclusive pursuit of national policies, the absolute maintenance of national integrity, and the steady increase of national power." The nation-state is no longer set in the context of a larger humanity; it is its own sufficient justification. Nationalism in this key is frankly irrationalist, delighting in the symbolic rhetoric of "blood and soil." Enormously important as it is for the historian and sociologist, it would be absurd to treat it as if it invited serious rational criticism.

## NATIONALISM [ADDENDUM]

However it is characterized, nationalism is a phenomenon of central importance in the modern world because it reflects the special moral significance that most people in fact attach to their ties as members of a particular nation. All forms of nationalism share the view that it is right and good for some particular people, or all peoples, to promote a common national identity through appropriate institutions. Contemporary philosophers are increasingly concerned to evaluate the claims of nationalism. Are ties of nationality desirable? Do they generate special obligations among conationals that do not extend to others? Is national identity compatible with the rights of national minorities in a larger nation-state, and duties of global justice that are owed to distant peoples? Is nationalism compatible with standard liberal assumptions concerning the equal worth of all persons, and the impartiality required for justice? If liberalism, nationalism, and global justice come into conflict, which should give way to better accommodate the prior claims of the other? What separates a morality of nationalism from a politics of tribalism?

Such issues have come to the fore in the work of contemporary liberals, communitarians, multiculturalists, and cosmopolitans. They advance rival normative models of nationalism and justice within and without borders. Many liberals are drawn to a thin civic paradigm of nationality. Communitarians favor a thicker cultural paradigm closer to the historical experience of shared nationality. On the civic paradigm, the demands of impartial justice within and between nation-states are most secure when ties of nationality consist in nothing more than individuals' relations as equal citizens of one and the same political society. This paradigm grows out of republican traditions of thought that identify the nation or people, the sole legitimate source of sovereignty, with members of the state—individuals born and living within its political borders. The civic paradigm is exemplified by Rawls's seminal reinvention of contractarian liberalism in *A Theory of Justice* (1971). In this framework, political society is a system of social cooperation for mutual advantage, which can be ordered entirely on

the basis of principles of justice and political ideals of freedom, equality, and fairness. Political society is just when it conforms to principles that free and equal persons would agree to under conditions that are impartial. Rawls's principles (equal civil and political liberties, equality of opportunity, and economic arrangements that either ensure material equality or use inequality to raise the material well-being of all) are embodied in his model of a just liberal-democratic welfare state.

Rawls argues that this model provides a stable, well-ordered nation-state on its own terms. It sustains the very sense of justice and mutual respect among persons as citizens that are necessary and sufficient to motivate them to support their political obligations, independently of any thicker ties of history, culture, religion, ethnicity, family, class, gender, and so on. For Rawls, justice is the primary virtue of human life in society. To this end, the civic paradigm of nationality constructs ties of nationality as the relations of equal citizens who recognize one another in a common allegiance to their shared political ideals and institutions. These ties are precisely what justice requires and all that justice requires by way of community. Of course the civic paradigm leaves ample room for the many cultural, ethnic, or religious attachments people may embrace. But for the Rawlsian liberal, the requirements of justice do not derive from any of these more particular ties. Furthermore, the requirements of social justice operate as background constraints on the permissible structure of all such ties, conforming them to persons' equal rights and duties as citizens. A civic nationalism justifies the politics of building just institutions and peoples bound together as citizens by their allegiance to shared political ideals.

### COSMOPOLITAN LIBERALS

For cosmopolitan liberals such as C. R. Beitz, Thomas W. Pogge, and Brian M. Barry, John Rawls's contractarianism and the civic paradigm have a great advantage in that they lay the basis for impartial and egalitarian principles of global justice. On their cosmopolitan argument, ignoring particular ties of nationality, as well as other contingencies such as race or gender, is a natural extension of Rawlsian liberalism. It justifies a choice of principles of global justice that do for the poorest persons in the world what Rawls's principles are supposed to do for the worst off in any particular nation-state. The civic paradigm of nationality as political citizenship seems well suited to allow each person to be a citizen of a just world because it rests on political ideals that are supposed to be universal and impartial in scope. Cosmopolitan justice redistributes the

wealth and resources of the world and reconstructs international arrangements with the aim of gaining rough equality in all persons' individual liberties, standards of living, and political rights. These arrangements provide a background justice, which constrains the conduct of nation-states and reconciles individuals' rights and duties as citizens of a particular nation with their rights and duties as cosmopolitan citizens of the world. Whether or not cosmopolitan liberalism leaves room for any recognizable ties of nationality comes into question by communitarian nationalists.

## COMMUNITARIANS

Communitarians such as Michael Sandel, Michael Walzer, Will Kymlicka, David Miller, and Charles Taylor provide the bases for an alternative cultural paradigm of nationality and nationalism. Communitarians argue that the civic paradigm is too thin to capture the bonds between persons that are both necessary and desirable for the robust experience of nationality. The ties of nationality are and ought to be the rich bonds of membership in a historic community marked by a shared societal culture and way of life. Such a culture involves a common language, time-honored customs, shared traditions, inherited institutions, agreed-on social meanings and values, and the exercise or aspirations of political autonomy in a certain geographic area. Nationalism is the process through which a societal culture of this sort is built up, enters into the identity of its members, and finds expression in political acts through which its members seek to create and preserve it as an independent entity. As such, national identity is not reducible to political ties of citizenship, or shared political ideals. Rather, a shared societal culture actively preserved by its members constitutes a people or nationality and this is precisely what a political society ought to recognize and protect. For communitarians, the existence of a nation in this rich culture and historical sense justifies rights of national self-determination, whether it is the right of a people to independent statehood (Walzer 1977) or more limited rights of self-determination within a multinational confederated state (Kymlicka 1989). The violation of these rights is taken to ground just war theory (Walzer 1977) and the right of a national minority to secede and form its own sovereign state (Buchanan 1991).

This paradigm of nationality as shared historical culture may be justified, and by implication challenged, in various ways. Some communitarians defend it on the basis of a philosophical conception of the self that holds that the self always gains its identity, purposes, and obli-

gations from the particular community(ies) in which it is embedded (Sandel 1982). Aspects of this conception motivate the nationalist argument that the very rights and duties of citizenship, stressed by the civic paradigm, depend on the fact that citizens are already bound together by a common nationality and thick cultural ties to their compatriots (Kymlicka 1989, Miller 1995). Others argue that any knowledge of justice and framework of moral deliberation always depend on the intersubjective meanings and values shared by a particular political community (Walzer 1977). The cultural framework provided by national identity can be justified by the argument that such a framework is necessary to provide persons with their meaningful options in life. Without such options, people lack any genuine individual freedom and liberal equality (Kymlicka 1989). A shared national identity is also defended on the grounds that it provides the only appropriate basis of reciprocal recognition among peoples, encompassing both a respect for cultural difference and human commonality (Taylor 1994). The ties of national culture are defended as intrinsically valuable because of the special human virtues and goods they make possible, such as loyalty, courage, love of country among compatriots (Miller 1995). National identities provide persons with rich cultural self-images that probably cannot, and should not, be replaced by a bare image of oneself as part of humanity, a citizen of the world, or a disembodied impartial deliberator; so the communitarian argument goes.

The import of the cultural paradigm of nationality, and communitarian nationalism, critically depends on what kinds of national community one has in mind. In modern history, nationalism in its cultural communitarian form has often implied tribalism, and a virulent hostility, intolerance, or indifference to other peoples (Arendt 1948). More generally, what of illiberal or oppressive national communities that violate the rights or stigmatize the identities of some of their own members, or of nonmembers, outsiders, foreign peoples (Doppelt 1998, 1999, 2002)? In liberal theory, the moral right of national self-determination universally applies to all peoples and implies duties of every people to respect or even defend the rights of other peoples. In practice, what sort of national cultures and nationalism are compatible with the rights of all individuals and peoples? These concerns inspire recent debates among communitarian nationalists and liberals concerning the possibility of a liberal nationalism based on a cultural paradigm of national identity.

## LIBERAL NATIONALISTS

Liberal nationalists seek to harness the special value of national belonging to liberal ideals so that each informs and constrains the other. For Kymlicka, one central problem for liberal nationalism arises because most nation-states contain several nationalities, involving majority and minority cultures. His multicultural liberalism employs the culture paradigm of nationality to justify group rights for national minorities in a larger nation-state, as a requirement of domestic justice. Such group rights to a limited measure of self-government, territorial sovereignty, and cultural autonomy empowers a national minority (French Canadians in Quebec; Native American bands on their tribal homelands) to preserve its historical community and national identity from assimilation to the dominant culture. The liberal nation-state should foster multinational cultures and institutions, as Canada, the United States, and other states in fact do. This multinationalism is supposed to be a liberal nationalism for two reasons. First, group rights are justified as necessary means to the fulfillment of liberal individualist ideals of freedom and equality for members of national minorities. Secondly, group rights to cultural autonomy are supposed to be fully compatible with the individual rights people possess as citizens of a liberal state. By this route, multiculturalism reconciles the cultural paradigm of nationality with the civic paradigm, and thus nationalism with liberalism. The citizen of a multinational state is supposed to combine a nationalist attachment to his or her own cultural community with a political attachment to the general rights and duties of citizenship.

## NATIONALISM VS. LIBERALISM IN THE MULTICULTURAL MODEL

Tensions arise between nationalism and liberalism in the multicultural model if group rights protect minority cultures with some illiberal or oppressive practices, or these group rights are embraced by minorities to shield them from oppression by an illiberal majority culture. The societal cultures protected by group rights are not supposed to define national identities in essentialist terms that exclude people or discriminate against them, on the basis of alleged racial characteristics, blood, descent, and the like (Kymlicka 1989). The model may also be unstable to the extent that multiple national identities in one and the same nation-state may fail to sustain sufficient unity for domestic liberal justice (Doppelt 1998, 1999, 2001). Such instability can motivate the descent of multiculturalism into either secession, assimilation, or domination. Miller's model of liberal nationalism suggests that

a weak or fragmented nation-state can be countered by providing unifying ties of national identity among all groups of citizens. It can do so by building a pluralistic national culture and identity, which is continually reshaped to include groups that have been oppressed, excluded, or marginalized. From this standpoint, the best liberal response to the existence of diverse ethnic and national minorities is not necessarily either group rights or cultural assimilation. To some extent, a liberal nationalism may require a democratic expansion of national culture and identity such that all groups can express and recognize themselves in it. All states engage in the construction of nationality through their activities in the spheres of law and public policy, immigration practices, public schooling, military service, political rhetoric, public ceremonies, and holidays, and so on. Criteria of liberal nation-building should be based on the extent to which a nation employs means that are consistent with democratic rights, and achieves results that embody an inclusive nationality (Kymlicka 1989).

## FURTHER APPROACHES TO LIBERAL NATIONALISM

Rawls's turn in his later work to political liberalism and the law of peoples provides yet another approach to liberal nationalism. He develops a conception of political society with communitarian components that moves his liberalism from a civic to a more cultural paradigm of the nation, though not as thick as other communitarian nationalists. Rawls now grounds the liberal ideals underlying contractarian justice in our particular historical tradition of legal and political institutions and ideas. Our political tradition is expressed in canonical texts such as the Declaration of Independence, the U.S. Constitution, the Bill of Rights, and landmark legislation. It lives in all the ways their basic principles enter into our democratic institutions and political practices. Rawls's political liberalism responds to the perennial worry of liberal nations that agreement on the fundamentals of justice is blocked by the divergent comprehensive views of life held by people of different religions, ethical outlooks, national or ethnic identities, and so on. Yet by public reflection on the meaning of our shared political culture, people with divergent views of life can attain an overlapping consensus on the most basic ideals of American democratic citizenship, and thus on political justice. With this focus on building democratic institutions and a national political identity, Rawls appropriates the cultural paradigm of nationality to vindicate his account of domestic justice and civic nationalism. This challenges the liberal nation-

alists who require much thicker cultural ties of nationality to explain why the conception of free and equal persons built into democratic culture is not sufficient for national identity.

### CHALLENGES TO LIBERAL NATIONALISM

The sharpest challenge to liberal nationalism is posed by cosmopolitan liberals who apply Rawls's principles of justice to generate the global egalitarian justice described above (Beitz 1983, Pogge 1994, and Barry 1999). Strong ties of nationality of the sort stressed by communitarians (liberal or not) support special obligations and affinities among conationals that either directly contradict their duties of cosmopolitan justice or weaken their motivation to comply with them. For example, the right of a people to national self-determination defended by communitarian nationalists is typically taken to include a right to control the national resources, wealth, and capital possessed by that people. But from the cosmopolitan standpoint, the distribution of wealth among nations may reflect a legacy of injustice or bad luck, and is, in any case, incompatible with the demands of global egalitarian justice. Nations have little or no independent moral standing except in the degree that their internal and external relations conform to the (Rawlsian) principles of justice that every person in the world could reasonably accept.

Liberal nationalists respond to this challenge by arguing either against the cosmopolitan conception of global justice or in favor of its compatibility with liberal nationalism. Walzer and Miller reject egalitarian cosmopolitanism because it fails to make sense of the ways persons' obligations to one another are typically rooted in a particular nation-state and not understood to extend to all humanity. Some philosophers underscore the ways common sense morality supports the dependence of persons' duties on the special associative ties of family, friendship, membership in a particular nationality, and the like (Scheffler 2001). Indeed, Rawls's turn to a conception of justice grounded in a people's own political traditions supports a nation-based account of international justice (his law of peoples) at odds with egalitarian cosmopolitanism. This tradition-based view of domestic justice allows that other peoples or nations with different, indeed illiberal political traditions can be just and decent; provided that they are well-ordered societies that respect the most basic rights of their own members (e.g., to physical security, the material means of life, etc.) and the rights of other just or decent peoples to self-

determination. Liberal and illiberal but decent nations can reasonably agree to principles of international justice that imply some mutual rights and duties among peoples. These include duties of material assistance to burdened nations that need it to become well-ordered, decent, and just, but not duties of egalitarian global redistribution.

From this standpoint, cosmopolitan justice is unreasonable because it ignores that peoples with different cultural traditions, exercising their rights of national self-determination, can be expected to have different levels of economic development, standards of living, and criteria of domestic justice. As such, nations bear some responsibility for their standards of living and thus differences between them do not in themselves imply global injustice. So while both Miller and Rawls support duties of distributive global justice and the rights of all persons to the basic means of life, health, and subsistence, both argue that cosmopolitan egalitarian principles come at the price of people's national identities, responsibilities, and rights of self-determination. By this route, liberal nationalism is reconciled with a much less demanding account of global justice, and one more in tune with the communitarian view of the independent moral standing of nations.

Other liberal nationalists such as Kok-Chor Tan defend cosmopolitan egalitarianism and argue that properly understood, it is compatible with a limited form of nationalism. The debate between nationalists and cosmopolitans often lump together different claims concerning what is supposed to make them incompatible: conflicting institutional requirements, nation-state versus global state; conflicting identities or attachments, national identity versus citizen of the world; conflicting moralities, nationalist partiality versus liberal impartiality; and conflicting views of justice, special duties of justice among conationals versus duties to all humanity in cosmopolitan justice. Liberal nationalists who defend egalitarian cosmopolitanism take the issue of justice to be the one that is fundamental to their reconciliation. The basic strategy is to limit or circumscribe the special rights and duties individuals have as conationals, the right of nations to self-determination, and the imperatives of domestic justice, so that they conform to the morally prior requirements of global egalitarian justice. The thought is that even so, the rigorous constraints imposed by cosmopolitan justice leave some room for associative ties of nationality and special duties arising from them. Cosmopolitan justice constrains domestic justice, and how nations may exercise rights of national self-determination, but does not destroy the important space

they occupy. Such a vision of liberal justice is in principle neutral concerning institutional, cultural, and identity issues that are used to drive a wedge between nationalism and cosmopolitanism (Tan 2004). For example, cosmopolitan equality does not necessarily require one global government in place of national political institutions. Nor does people's acceptance of duties to support egalitarian global arrangements imply the abandonment of any national identity or partiality to one's compatriots in some respects.

For these reasons, a liberal nationalism may be compatible with cosmopolitan justice, at least in principle. In practice the dynamics of human motivation might raise anew the tensions between nationalism and cosmopolitanism, as conflicting attachments and identities. In any case, these debates enrich political philosophy by bringing issues of political culture, national identity, nationalism, and global justice into the heart of contemporary liberalism.

## NATORP, PAUL

(1854–1924)

Paul Natorp was born in Düsseldorf and died in Marburg. Along with Hermann Cohen, he is known as one of the founders of the Marburg School of Neo-Kantianism. He studied history, philology, mathematics, and philosophy in Berlin, Bonn, and Strassburg. After completing his doctorate in history at the University of Strassburg in 1876, he went to Marburg where Cohen was working on the restoration of Kant's critical philosophy. In 1881 Natorp obtained his postdoctoral qualification with a thesis on the prehistory of criticism titled *Descartes' Erkenntnistheorie* (Descartes's theory of knowledge). He became an associate professor at the University of Marburg in 1885 and eventually a full professor of philosophy and pedagogy. In spite of being offered several chairs at other universities, Natorp remained in Marburg throughout his lifetime.

Despite their close relationship, Natorp cannot be seen as a genuine follower of Cohen, especially because of the explicitly historical foundation of his philosophy. Beside his interests in epistemology and the theory of science, both orientated on Cohen's logic, Natorp worked on problems in ethics, the philosophy of religion, philosophical psychology, and the philosophical foundations of pedagogy.

Three main periods of Natorp's philosophical work can be distinguished. During the earliest period, Natorp developed a methodical idealism that takes Kant and Cohen as its point of departure and is presented in *Die logischen Grundlagen der exakten Wissenschaften* (The logical foundations of the exact sciences, 1910) as well as in *Die Philosophie. Ihr Problem und ihre Probleme* (Philosophy. Its problem and its problems, 1911). Both books focus on the problem of definition in the natural sciences from an epistemological perspective. They take the mathematical approach as a paradigm for the object-creating function of consciousness. Natorp reduces the transcendental-logical analysis of the constitution of objects to the categories of scientific definition. Science, in this context, stands for the transcendental subject. This is the main characteristic of Natorp's philosophy: The sciences as *facts of reason* are taken as the only legitimate starting points of the *transcendental method* so that epistemology is understood as a theory of science.

Natorp attempted to find a basis for his methodical idealism not only through systematic thought but also through studies in the history of philosophy. His studies of Plato, as recorded in an extensive work on *Platons*

*Ideenlehre* (Plato's theory of ideas, 1903), are a good example of his historically orientated method. The book is still discussed as an example of a strictly systematic view on the history of philosophy.

The second period in Natorp's work is introduced by the *Allgemeine Psychologie nach kritischer Methode* (General psychology according to a critical method, 1912). In this book, Natorp proposes philosophical psychology as a discipline that should be able to examine the transcendental constitution of objects through reference to the subject's concrete nexus of experiences. Natorp hereby added a genetic aspect to epistemology, which was adopted by several philosophers of his time and had a significant influence on Edmund Husserl's foundation of phenomenology. At the same time Natorp abandons the restriction of the transcendental analysis to the *fact of science* by enlarging the *factum* to a *fieri*, the *what is* to the *what is to be*, so that cognition is no longer taken as a mere fact but rather as a process within the subject.

The psychological method is *reconstructive* insofar as the psychologist analyses the cognitive *process* and goes back to the very origin of cognition in a step-by-step analysis. The subject's experience is taken as the original source of cognition, but it is not intuitively given (as the phenomenologist would put it). According to Natorp the experience of the subject can only be reconstructed in a genetically oriented epistemological process. Concrete experience inevitably has to be transformed into an abstract definition of experience. The correlative of the object—the subject—is *reconstructed* post hoc. However, the reconstruction itself is a cognitive act and, as such, bound to definition and the interruption of cognition in process. Reconstruction, like any other cognitive process, is an approximative approach to and a concretization of the object, except that it does not lead back to the natural object but to its correlate, namely, the subject. The individual subject is correlated to an individual object, and every individual *case* of definition corresponds to an individual *case* of cognition. Natorp's concept of subject here is still a very restrictive one.

In his later philosophy Natorp connected logic and psychology by transforming his understanding of cognition as a concretization of being into a *general logic* concerning the relation of objects that is integrated into an extensive metaphysical conception. In his *Vorlesungen über praktische Philosophie* (Lectures on practical philosophy, edited in 1925) as well as in the *Philosophische Systematik* (Philosophical systematics, edited in 1958). Natorp attempted to preserve the guiding themes from of his early thought in a transformed way that now incorpo-

rates an ontological perspective. Instead of analyzing the object in terms of a theory of knowledge or pursuing a psychological analysis of the subject, Natorp turns his attention to the correlation between subject and object. The unity of the object depends on the basic condition that there *is* something (“it is”—*estin*—whereby the “it” remains undefined). On the other hand the specific unity of the individual subject is the correlate of the defined object’s unity (the specific “this one”—*tode ti*). Both parts of the correlation are connected by the process of categorical–ontological definition. This dialectic approach is elucidated in detail in Natorp’s *Philosophische Systematik* and extended to a theory of categories, which is only faintly reminiscent of Kant. In contrast to the older type of logic (à la Cohen) in Neo-Kantianism, Natorp outlines the *it is* as the epitome of being, which is prior to any logical definition. In the end, Natorp argued for an ontological interpretation of the *origin* in transcendental philosophy.

Overall, Natorp’s impact on the history of philosophy has been primarily indirect. His ideas were carried on above all by the youngest representative of the Marburg School, Ernst Cassirer. The logical motif of Natorp’s earliest period had a great influence on Cassirer’s philosophy of culture, which did influence the broader philosophical discussion. The early phenomenologists also referred to Natorp, even if these references were primarily critical, as when Husserl and Martin Heidegger, for example, tried to avoid Natorp’s one-sided emphasis on transcendental logic. At present the general philosophical audience is becoming increasingly aware of the close relationship between Natorp’s later thought and Heidegger’s thinking of being. In some ways Natorp’s philosophical development even illustrates the general development of transcendentalism during the twentieth century, which starts with a logic of pure cognition and ends with the problem of thinking, which is already and inevitably related to being.

## NATURALISM

Put most succinctly, metaphysical naturalism affirms that the natural world is the only real one, and that the human race is not separate from it, but belongs to it as a part. The term *naturalism* refers also to an aesthetic style in literature, drama, and painting, and in ethics, to the theory that the full meaning of value concepts such as good and evil can be spelled out using only terms from a natural, or factual vocabulary. These are not of concern here. What follows is a discussion of naturalism in metaphysics and epistemology.

Everyone has a rough working notion of what can happen in the course of nature, and is familiar with the idea that perhaps a transcendent or supernatural realm lies beyond nature, another world that may occasionally make contact with the everyday world by, for example, miraculous interventions. Yet the distinction between what is natural and what is not needs to be made with some care. As St. Thomas Aquinas pointed out, everything that happens is in some way natural. Thus, according to classical philosophical theology, God must always, of necessity, act in accordance with his own nature. So from the divine point of view, special miraculous intervention, or general providential guidance, lies entirely within the realm of what happens according to nature.

What is needed is the conception of a world all of whose normal workings count as natural, while whatever lies outside this limit does not. The space-time world, with its material constituents working according to the laws of cause and effect, seems a good place to start. The natural world is the world of space, time, matter, energy, and causality, and naturalism affirms that this natural world is the only one there is. Yet even here care is needed: In some modern interpretations of quantum theory, the so-called Many Worlds interpretations, this particular space-time world is not by any means the only one. What lies beyond this world are other spatio-temporal realms, inaccessible from this one, perhaps evolving under different laws, but equally a part of nature in its entirety. So naturalists must allow that nature comprises this spatio-temporal world together with all other realms required by the best scientific explanations of this one.

### NATURALISM AS METHOD AND AS ONTOLOGY

Because specifying what nature is brings in reference to scientific explanation in this way, naturalism is sometimes regarded as a rule of method rather than a metaphysical doctrine. There is a natural method of inquiry,

which consists in setting out to explain and understand the world by finding the natural causal processes by which natural objects come into being, produce their effects, and pass away. All genuine knowledge is of this natural, experimental kind; human beings, themselves part of the natural order, have no special insight or intuition that could provide a more direct path to knowledge. And the methods of the natural sciences, which are so successful, are these natural methods refined and made more systematic.

If naturalism is in this way a matter of method in inquiry, the natural world is the world revealed by the methods of the natural sciences. This does not, in itself, place many constraints on what sort of world that might be: One cannot tell in advance what the scientific method might reveal. Maybe it will uncover not just familiar items—ships and shoes and sealing wax, for instance—but fire-breathing dragons, the Fountain of Youth, or the Philosopher's Stone. Naturalism regarded as a method maintains that ontology should be developed a posteriori—whatever is vindicated by the sciences is acceptable, whatever is not, is not.

The attempts made during the twentieth century to establish the existence of the paranormal phenomena (telepathy, precognition, and telekinesis) illustrate this approach. The methods adopted were naturalistic methods, which in themselves set no limits to what can exist.

A more affirmative naturalism goes rather further: It claims not only that the scientific method provides the only sound basis for knowledge of reality, but also that it has already established that all nature has a physical basis. The fundamental causal network consists in chains of physical cause and physical effect, produced by the operation of physical forces. All realities have at least a physical nature of this kind, whatever else may prove to be true of them. This leaning toward a physical basis for everything has been encouraged by the development of more and more sophisticated instruments for probing the observable, tangible, and manipulable world of matter, and of increasingly successful physical theories to account for what is discovered.

Yet this tendency to regard physics and chemistry as the basic and comprehensive sciences does not in itself require a materialistic ontology. Physicalism is a particularly stringent version of naturalism. A physical basis for everything does not rule out other characteristics. It is possible to affirm naturalism while insisting that the higher faculties in humans and other animals cannot be given a physicalistic reduction, and nonmaterialistic naturalism avoids the difficulties that materialism has, for

example, in accounting for the intensional characteristics, such as linguistic meaning and psychological understanding.

### THE CASE FOR NATURALISM

Bertrand Russell was once charged, as Hamlet had charged Horatio, that there are more things in heaven and earth than were dreamt of in his philosophy. He retorted that he preferred it to be that way, rather than the other way around. He thus expressed the naturalist attitude, which is imbued with the spirit of Ockham's Razor: Extravagance in ontology is to be avoided. We must recognize the reality of what most plainly exists, the familiar natural world in which we live and move, and have our being. Beyond that, one should be cautious. There is no compelling evidence, of any kind, that there is more to reality than the nature revealed by scientific investigation. So the rational position to adopt is the economical, minimalist one that there are no further realms.

**THE ELEATIC ARGUMENT.** The Eleatic Stranger in Plato's *Sophist* proposes that "Power is the mark of Being"—that the true test of reality is to be efficacious. That which is real makes a difference, changes things, has effects. The outcome of a serious and sustained inquiry into what actually passes this test, is naturalism. For whatever operates in such a way as to alter the course of nature belongs by that very fact to the causal network of the natural world. And whatever has no such impact has no claim to reality.

The Eleatic argument is perhaps even more powerful as a methodological one: The only way in which anything can call attention to itself, and so stake a claim to reality, is by having an effect, either directly, in perception, or indirectly, through the traces it leaves in instruments. Without any such impact, there can be no reason to suppose that the thing in question exists. And that which there is no reason to think exists, should have no place in any ontology.

This argument needs to be elaborated to cover purely theoretical reasons for admitting other realms—parallel universes, for example, or sets to underpin mathematics. It is then not so straightforward to exclude higher realms, with unmoved movers, divine providences, or guardian angels. Here the argument must be that, unlike the extra worlds of quantum theory, these other worlds have no essential link to the natural explanation of what occurs in this one.

**THE SELF-CORRECTING VINDICATION.** Naturalism should be adopted as the proper stance in philosophy, just because it is open to development. Wherever the current conception of the world of nature is inadequate, this deficiency is likely, sooner or later, to be revealed, for there will be unaccountable phenomena that need to be accounted for. Current explanatory resources having proved inadequate, they must be expanded. New entities, properties, or forces must be recognized. The ontology of naturalism will grow to whatever extent the facts require, no more, but no less. So naturalism will always be the best philosophical stance. To maintain this position, a naturalist must show that explanatory reasoning does not advance in this way from the natural to the supernatural.

These three lines of support for naturalism all rest on a negative base: the claim that there is no valid method of discovery beyond those used in the natural sciences. So a thorough naturalism must explore, and reject, a priori reasoning in natural theology, and the claims of religious experience to provide knowledge of a transcendent divinity. It must also argue that the hermeneutic method of some social sciences, and the empathy by which humans reach a commonsense understanding of one another, does not involve entities or processes beyond those revealed by naturalistic methods.

### THE IMPLICATIONS OF NATURALISM

In general, naturalism and religion are at odds with one another. Most religions posit powerful and purposeful supernatural forces, responsible for creating the natural world, for shaping its progress, and for determining the destinies of its inhabitants. These beliefs are not compatible with the naturalistic outlook. This does not, however, preclude a religious attitude accompanying naturalism, involving feelings of awe and wonder toward the natural realm, and impulses to value and care for it. Nor does it rule out a pantheism such as Benedict de Spinoza's. Spinoza identified God with Nature, insisting, as naturalists do, that there is nothing beyond this law-governed world. The atheistic varieties of Buddhism, in which this world is the only one, and where law governs the world's unfolding, would also be naturalistic religions if they were to accord independent reality to the material realm.

Naturalism requires that religious experience, and in particular mystical experience, be given a reductionist interpretation. Such experiences are regarded as unusual states of mind that have their own causes and consequences within the natural world, but do not provide any contact with, or insight into, a supernatural realm.

**METAPHYSICAL IDEALISM.** Naturalism takes its cue from the natural sciences, and with the exception of some more fanciful interpretations of the measurement paradoxes in quantum theory, the sciences are resolutely realist about the material world. Realism maintains that the world of nature is as it is, irrespective of any human opinions about it. The natural world is not dependent on, or brought into being by human mind, will, or experience. As this is the working philosophy of the natural sciences, it is difficult to combine naturalism with metaphysical idealism, which implies that matter is in some way a function or aspect of mind.

A thorough-going phenomenalism, such as an atheistic version of George Berkeley's philosophy, might be thought to count as an idealistic naturalism in which every object of experience does indeed belong to a law-governed spatio-temporal world, but where to be spatio-temporal is to have a derivative status, with perceptual experiences as the basic elements out of which it is constructed.

However, such a view places the experiencing mind outside the world of nature, and this puts it in conflict with one of the most profound aspects of naturalism, the view that the human species enjoys no specially privileged position in the scheme of things. Naturalism implies that human beings share with all other beings a common status, as contingent, temporary configurations in the law-governed natural world. The human world is a part of the natural realm, not a distinct cultural sphere to be contrasted with it.

Realist naturalism takes the Earth and its living inhabitants as genuine independent realities, and by locating the human race within the natural world, can make progress toward explaining how it came into being, and how humans came to have the epistemic and cognitive capacities that they do. Not even the more objective post-Hegelian metaphysical idealisms can provide any basis for an explanation of how humans came to be as they are.

**THE PROBLEM OF UNIVERSALS.** Realists about universals—properties and relations—divide into the Platonists, who allow the real existence of properties even where there is nothing in this world that instantiates them, and Aristotelians, who admit the reality of instantiated universals only. Plato's heaven, a higher realm containing perfect patterns for the properties imperfectly realized here below, is clearly incompatible with naturalism, and it seems probable that unless they can be vindicated as being required for explanations of what happens in this

world, no system that admits uninstantiated universals can be naturalistic. Nominalist accounts of properties do not face any problem so far as naturalism is concerned.

**DETERMINISM.** Although naturalism stresses that it is by natural processes, involving natural causes only, that anything at all occurs, it is not committed to an absolute determinism. If there are causes at work, they are natural ones, but there may not be a cause in every case. There has to be at least enough general order in the world for it to provide an environment suitable for life and consciousness, but that admits of exceptions, here and there, to every rule. Quantum theory is not fully deterministic, as its causal relations are probabilistic. Naturalism requires there to be at least as much causality and law in the world as the development of natural sciences calls for, but it does not require any more than that.

**MATHEMATICS AND LOGIC.** Naturalism is almost bound to take a reductionist view of the so-called abstract objects of mathematics and logic—their numbers, functions, and relations. For the number twenty-seven, or the square root of negative one, or the relation of contrariety seem to fail both the spatio-temporal location test, and the Eleatic causal power test for natural reality. W.V.O. Quine, who was very much of a naturalistic bent, found himself forced to accept the reality of sets as a foundation for mathematics, something essential for physics, which provides the best description of the world. So sets, although not themselves naturalistic beings, have a place in the best ontology. This is a departure from pure naturalism. Hartry Field (1980), among others, has attempted to develop a philosophy of mathematics that dispenses with numbers or other mathematical objects.

The situation with the objects of geometry seems less problematic. If space-time is taken realistically (not, as with G.W. Leibniz, as a mere system of relations among physical objects), then the objects of geometry (points, lines, shapes, and geometrical solids) can be given a naturalistic home as aspects or parts of space-time.

## MODALITY

The natural world comprises not only objects and the properties they actually possess. It includes what might be, yet is not (natural possibility), and what not only is but must, in the course of nature, come to pass (natural necessity). To meet this situation, the properties that things now actually possess (categorical properties) must be distinguished from those that provide the basis on which things will change and develop (dispositional

properties or powers). Aristotle and the medieval Aristotelians such as Thomas Aquinas introduced potentiality (in contrast with *act*) to specify what an object is capable of—its range of possibilities. The modern version of this is the specification of an object's powers. The power to become *F* is a different property from being *F*, but it is itself a real categorical property, perhaps some feature of the underlying fine structure of the object that possesses it.

The powers that there are in the world determine and explain what is naturally possible, should they be exercised. And where they are exercised, the powers are bound to act as they do and produce their effects. This situation is therefore one of natural necessity.

Beyond natural possibility and necessity, however, lie that which is logically possible, even though ruled out by the laws of nature (such as a ball thrown into the air and just remaining there), and that which is, not just naturally, but logically necessary or impossible. Some philosophers treat possibility and necessity by introducing possible worlds, worlds in some way additional to the one actual world. This at least seems to be a departure from naturalism because additional, merely possible worlds do not belong in the same causal network with this world, and thus fail the Eleatic test on which naturalism insists.

Naturalism therefore seems to be committed to providing an account of the logical modalities that does not involve any special ontological commitments. The proposal that logical necessity is a reflection of language, of meaning and use, was an attempt to provide such an account. The linguistic theory has fallen out of favor; more recent accounts attempt to construct possible worlds from appropriately selected sets—sets of descriptions, or unactualized recombinations of elements from the actual world. These are accounts in terms of ersatz possible worlds. Provided a naturalistic account of sets can be given, such proposals would be naturalistic theories of necessity.

## OBJECTIVE MORALITY

Morality is another problematic area for naturalism. The standard naturalistic characteristics are the contingent factual actualities, and these do not include in any straightforward way the values that objects or situations may have. The size and shape of an object enters into the natural causal nexus, but its goodness does not seem to. A naturalistic account of morality must find a place for good and evil, but not in the inherent structure of the world, as a fully objective moral realism does. Nor can naturalism ground moral law in the commands of a deity.

It must explain right and wrong, good and evil, as arising in the nature, preferences, or reactions of people, and in the structure of the societies within which people live out their lives. Whether an account of morality along these lines can satisfactorily explain the authority and impersonal binding force that moral imperatives seem to possess, is perhaps the most difficult issue for naturalist theories of morality.

## NATURALIZED EPISTEMOLOGY

Naturalized epistemology is the proposal that the theory of knowledge bears a close relation to empirical studies of cognition. The proposal was first made by W. V. O. Quine in his influential article, "Epistemology Naturalized" (1969). Quine is usually interpreted as subscribing to *replacement naturalism*: epistemology is to be replaced with empirical psychology. But his proposal may well fall short of full replacement.

In his article, Quine distinguishes conceptual studies, which seek to clarify concepts by defining some of them in terms of others, from doctrinal studies, which attempt to establish laws by proving them. The conceptual studies, were they successful, would facilitate the doctrinal ones because clarifying concepts increases the chance that truths that would otherwise go unrecognized will come to be obvious or come to be perceived as "derivable from obvious truths" (p. 70). Quine allows that progress was made in conceptual studies when Jeremy Bentham suggested paraphrasing sentences about bodies in terms of sentences about sensory experience.

Unfortunately, the project of reducing talk of bodies to talk of sensory experience together with set theory, pursued by Rudolf Carnap in *The Logical Structure of the World* (1928/1967), did not come to fruition. Carnap's later attempts at a rational reconstruction of science abandoned the aim of providing equivalences that would enable us to eliminate the terms of science in favor of sensory terms, and so they did not legitimate science. Carnap's reduction failed, according to Quine, because scientific theories do not have observational consequences except in the presence of collateral scientific theories. In view of the failure of the reduction, Quine proposes that conceptual studies seeking to clarify terms be replaced by an empirical psychology that describes how science is related to experience: "If all we hope for is a reconstruction that links science to experience in explicit ways short of translation, then it would seem more sensible to settle for psychology" (p. 78). This is the first part of Quine's proposal that empirical psychology is

to enter into epistemology: Empirical studies of the cognitive development of science are to succeed the earlier reductive conceptual studies.

Regarding the doctrinal studies, Quine notes that it has been clear since Hume's treatment of induction (1739/1978) that we cannot derive scientific theories from sensory observations. Moreover, Quine claims that scientific theories have consequences for sensory experience only in the presence of collateral science (the Duhem-Quine Thesis). So scientific theories are not supported by observation alone. Since support for any scientific theory depends in this sense on further science, there is no reason to persist in the Cartesian stricture that any reliance on empirical science to understand how science is related to observation is circular. And so, for Quine, there is no point in excluding empirical psychology from such an understanding. This is the second part of Quine's proposal that empirical psychology is to enter into epistemology.

But Quine's reasoning here can be challenged on two grounds. He infers from the permissibility of relying on collateral scientific theories to support a given scientific theory that it is permissible to rely on a specific scientific theory, psychology, to understand how the given scientific theory is related to observation. But psychology is generally not the collateral scientific theory on which, according to the Duhem-Quine Thesis, we are allowed to rely for support of a given scientific theory; and the argument from the permissibility of relying on a collateral theory to *support* a given scientific theory to the permissibility of relying on psychology to *understand* how the theory is related to observation is not clearly valid. The latter challenge raises the worry that, in moving from the issue of the support of the theory by observation to the issue of understanding how the theory is related to observation, Quine makes room for psychology, but only by changing the subject from the support of the theory to understanding the relation between theory and observation. This challenge does not, however, undermine Quine's argument if he does not propose a full replacement thesis but rather the idea that empirical psychology is to figure in the project of supporting scientific theory.

The naturalized epistemology that results from Quine's proposals thus has two parts. The conceptual studies that attempted to clarify concepts by reduction are to be replaced by a psychology that understands how science is related to observations. The doctrinal studies are also to be altered. Regarding the latter, most commentators have assumed that Quine intends that we replace normative epistemology with a descriptive psy-

chology of the cognitive development of theories. Quine's summary, however, leaves room for a normative as well as a descriptive enterprise:

Epistemology, or something like it, simply falls into place as a chapter of psychology and hence of natural science. It studies a natural phenomenon, viz., a physical human subject. This human subject is accorded a certain experimentally controlled input—certain patterns of irradiation in assorted frequencies, for instance—and in the fullness of time the subject delivers as output a description of the three-dimensional external world and its history. The relation between the meager input and the torrential output is a relation that we are prompted to study for somewhat the same reasons that always prompted epistemology; namely, in order to see how evidence relates to theory, and in what ways one's theory of nature transcends any available evidence. (p. 83)

This passage could be taken to propose the replacement of epistemology with psychology: "evidence" could have the descriptive meaning of observation rather than a normative meaning, and seeing how theory transcends evidence might be a descriptive enterprise.

But there are other interpretations that make better sense of Quine's argument in "Epistemology Naturalized." He might mean that we are to use psychology to judge the amount of support the observations provide for given scientific theories, but only in light of an assumed epistemology (that is, an account of what support amounts to) distinct from psychology. On this interpretation, the epistemology tells us how far beyond the observations a scientific theory may go before the observations no longer support the theory; the psychology measures how far beyond our observations the theory actually goes; and the epistemology and psychology combine to tell us whether the theory enjoys support. Alternatively, Quine might mean that we are to use psychology to judge how any suggested epistemology fares in light of whether our actual achievement meets its demands. On this alternative interpretation, the results of psychology constrain epistemology. The psychology measures how far beyond our observations our scientific theories go; and a suggested epistemology is rejected if the measured distance between our scientific theories and our observations exceeds the distance the epistemology sets as the threshold for support.

This second interpretation makes the best sense of the text. Psychology contributes to an account not merely

of the causal but also of the support relation between observation and theory. Thus, there is continuity between the old task of supporting science by observations and the new task of accounting for the support relation between observation and theory. The interpretation responds to the charge that Quine's argument from the Duhem-Quine Thesis to the permissibility of relying on psychology changes the subject. And the interpretation is suggested by the fact that Quine assumes that the failure of the conceptual reduction of science to observations, or of the doctrinal derivation of science from observations, does not count decisively against a positive epistemic status for science. Without this assumption, Quine would have no reason to propose that epistemology should abandon reduction and derivation for psychology, rather than that we should terminate epistemology with the judgment that science lacks support because reductions and derivations fail despite being necessary for support. On the preferred interpretation, psychology enters after the failed conceptual reductions and doctrinal derivations, but the use of psychology is warranted only by the separate epistemological claim that the success of science is jeopardized by overshooting the observations, though the jeopardy is not so rigid that the failure of reduction and derivation entails skepticism.

Quine's "Epistemology Naturalized" led many philosophers to take seriously the relevance of psychology to epistemology. Although almost all interpreters read Quine as proposing to replace epistemology with psychology, few epistemologists follow Quine in embracing replacement. Many endorse instead a *conceptual naturalism*: our everyday epistemic concepts of knowledge, justified belief, or rational belief can be defined or clarified in naturalistic terms, where naturalistic terms are usually taken to be the terms of some respectable science, notably psychology. (On a more liberal view, naturalistic terms are simply those not patently normative.)

Most proponents of conceptual naturalism hold that our epistemic concepts are both normative and naturalistic. The motivations for conceptual naturalism are not often articulated, but they presumably include these: the concepts employed by our respectable sciences are our best-understood concepts and thus the best candidates for definitions in terms we can understand and also the best candidates for clarifying definitions; these are concepts with which we cannot now dispense in our intellectual lives, so for now these concepts are clearly available to provide definitions; and these are the concepts we have the best reason to believe succeed in referring to properties that are actually exemplified, so that knowledge

defined in terms of them does not turn out inadvertently to fail to obtain.

Perhaps the most popular version of conceptual naturalism has been *reliabilism*, according to which knowledge is true belief that results from a reliable belief-forming process—a process that tends to yield true beliefs (and similarly, justified belief is belief that results from a reliable process). Whether reliabilism is fully naturalistic depends on whether the notion of truth is naturalistic. Reliabilism has been most extensively developed by Alvin Goldman. In *Epistemology and Cognition* (1986), Goldman divides his epistemology into two parts. The first part is an analysis of epistemic concepts. Both knowledge and justified belief are defined in terms of reliability. Justified beliefs are (roughly) beliefs permitted by some right J-rule system. J-rules license certain cognitive processes, and “A J-rule system R is right if and only if R permits certain (basic) psychological processes, and the instantiation of these processes would result in a truth ratio of beliefs that meets some specified high threshold (greater than .50)” (p. 106).

This analysis is supported by intuitions in narrow reflective equilibrium. The second part of Goldman’s enterprise is an attempt to discover which sorts of beliefs are justified given his analysis of justified belief. This would ideally lead to discovering a right system of J-rules, but Goldman regards such an effort as premature, since “Cognitive science is still groping its way toward the identification of basic processes” (p. 181). Instead, Goldman considers candidates for basic processes individually and attempts to discern their reliability or contribution to a high truth ratio. He examines perception, memory, deduction, probability judgments, judgments under uncertainty, and belief revision in light of the findings of cognitive science. It is fair to say that his review of the reliability of cognitive processes is the most detailed and comprehensive yet undertaken. This second part of Goldman’s enterprise exemplifies *methodological naturalism*: that a significant part of epistemology is an inquiry into whether conditions of epistemic status are satisfied in light of empirical cognitive science. Quine, on the interpretation of his views suggested above, is a methodological naturalist in this sense.

Reliabilism is not the only proposed version of conceptual naturalism. Alvin Plantinga (1993) offers a *proper function theory* of knowledge that is conditionally naturalistic. According to the theory, knowledge is belief that results from the proper functioning of our cognitive faculties. This theory is naturalistic if proper functioning is naturalistic, although Plantinga denies that it is. More

than one writer has noted, however, that most analyses of knowledge and justified belief that eschew the label “naturalism” nevertheless meet the requirements of conceptual naturalism just as well as reliabilism does (Foley 1994, Goldman 1994). For example, some coherence theories define justified belief in nonnormative and even naturalistic terms, such as consistency, mutual entailment, and the like. Despite this, versions of reliabilism differ from coherence theories in usually resulting from an inquiry motivated by the desire to define knowledge and justified belief in natural terms. Coherence theories do not usually result from a naturalistically motivated inquiry.

A view consistent with conceptual naturalism is *property naturalism*: the property of knowledge or justified belief is *identical* with certain natural properties—properties to which respectable science refers. Ruth Millikan (1984) offers a proper function account of knowledge along these lines, for which the relevant science is evolutionary biology. A view entailed by both conceptual and property naturalism is *supervenience naturalism*: epistemic properties *supervene* on natural properties. However, it has been noted (Foley 1994) that few epistemologists have wished to deny supervenience naturalism: Roderick Chisholm (1989) allows that justified belief supervenes on nonnormative properties, despite defining it in normative terms. Keith Lehrer (1997) is rare among epistemologists in denying that justified belief supervenes on nonnormative properties.

Within the category of conceptual and property naturalism, certain views are versions of what Goldman (1994) calls *substantive naturalism*, according to which the defining terms refer to natural processes or to relations between the subject’s belief and the environment. Reliabilism would fit this label. But so would John Pollock’s (1989) internalist version of naturalism based on classical artificial intelligence, and Paul Thagard’s (1992) coherence theory, which understands the acceptability of a scientific theory as involving a connectionist mechanism. In an influential article, Philip Kitcher (1992) emphasizes a version of *psychologism* as central to naturalism: knowledge turns on the character of psychological belief-forming processes, as opposed to logical or statistical relations between evidence and belief.

Accounts of knowledge as involving or constituted by psychological processes like intuition and demonstration, and of justified belief as involving causal inference, were common in early modern philosophy. Louis Loeb (2002) argues that, in *A Treatise of Human Nature* (1739/1978), David Hume held a stability theory of justi-

fication: justified belief is the result of a belief-forming operation that tends to produce stable beliefs. C. S. Peirce is also commonly regarded as holding a stability theory in “The Fixation of Belief” (Schmitt 2002). But this psychologism was rejected in the late nineteenth and early twentieth centuries in tandem with the rejection of psychologism in semantical theory by Gottlob Frege. Recent naturalism, such as reliabilism and proper function theory, has brought psychological processes back to the fore in accounts of knowledge and justified belief. The chief ground for giving psychological processes a role in justification has been an attack on the “arguments on paper” thesis, which sees justification as turning merely on an evidential relation between the proposition believed and the evidence possessed by the subject (Goldman 1986, Kaplan 1994).

Related to the role of psychological processes is naturalist opposition to idealized epistemology, which derives norms or standards of justification from logic, probability theory, utility theory, or statistics, without attention to human limitations. For example, epistemologists have endorsed norms of rational belief-revision such as the following: we are to avoid contradictory beliefs, and we are to believe the proposition favored by the total evidence available to us. Hilary Kornblith (2002) cites reasons for doubting that we are generally able to guarantee that our beliefs are consistent. Goldman (1986) criticizes the claim that there must be a failure of rationality if one’s belief fails to conform to the total available evidence; the fault may lie in one’s access to memory rather than in one’s reasoning, which is the focus of the evaluation of rationality.

Of course, the norm of avoiding contradiction or of conforming to the total available evidence could be understood as the qualified requirement that we are to avoid contradiction or conform to the total available evidence when we are able to do so. But if it turns out that we are rarely if ever able to satisfy to these norms, there is little plausibility to the view that rational belief-revision requires satisfying, or even being guided by, such norms. Again, the norm of avoiding contradiction could be understood as the requirement that we are to approximate as nearly as feasible (or as cost-effective) to avoiding contradiction. But if it turns out that we are far short of being able to approximate the goal, then it seems there is no such norm. The question concerns the content of epistemic norms and an associated issue of the methodology of identifying norms: Can we formulate norms in ignorance of contingent facts about our cognitive powers, protecting the norm from empirical disconfirmation by

making it merely a requirement to approximate a goal, or must we craft norms under assumptions about human limitations that would best be empirically informed (Schmitt 2004)? The naturalistic methodology finds support in the theoretical point that the approximate idealizing view has no means of suppressing epistemic ideals that are intuitively plausible but so demanding that no norm should require approximating them to any degree.

A final issue within naturalism is methodological. Should we conduct epistemology by defining knowledge so as to explain the functions (biological, social, or cognitive) served by our *concept* of knowledge and *practices* of epistemic evaluation? Or should we instead identify knowledge with the real properties involved in states we label “knowledge,” studying knowledge on the model of a natural kind like aluminum or frog, opening the possibility that knowledge diverges from the properties represented in our concept, and that it serves primary functions quite different from any suggested by the functions of our use of the concept?

An account of the first sort is offered by Edward Craig (1990), who defines knowledge so as to explain the functions served by our applications of the concept. He proposes that our concept has its content in virtue of serving the social-cognitive function of picking out good informants. Craig rests his conditions of knowledge on everyday observations of the function of our concept, but it would be possible to rely on scientific sociology in such a study. An account of the second sort is offered by Hilary Kornblith (2002). He argues, by appeal to studies of animal cognition, that animals possess knowledge, and he defends the view that human knowledge is no different in kind from animal knowledge. In effect he proposes that we infer the conditions of knowledge from the biological functions of the states we label “knowledge.” As it happens, Craig’s conditions of knowledge roughly coincide with Kornblith’s: both are versions of reliabilism about knowledge. But Craig’s methodology is incompatible with Kornblith’s. For conditions of knowledge inferred from the social-cognitive functions of applying the concept of knowledge need not be coextensive with conditions inferred from the biological functions of knowledge itself. Nothing guarantees that the properties that humans ascribe in order to pick out good informants must be the properties that enable animals to survive in their habitats.

It is a further question whether, given Kornblith’s approach and findings, knowledge turns out to be a natural kind—for example, in the sense of a homeostatic property cluster or a cluster of self-maintaining proper-

ties. If instances of knowledge are to be instances of a natural kind and knowledge is to be reliable belief, then every instance of knowledge must be a state of a cognitive system in which a variety of reliable processes (perhaps perceptual, memorial, and inferential processes) routinely support one another in producing knowledge. This would seem to be the weakest sense in which the properties essential to an instance of knowledge could be said to be self-maintaining. If so, the claim that knowledge is a natural kind entails two key assertions: that knowledge requires not merely a reliable process yielding the given belief but also that instances of knowledge are embedded in a nexus of reliable processes. We may wonder, however, whether there is any informative condition of embedding in such a nexus that holds for all instances of knowledge across species; if not, there is no general natural kind of knowledge.

## NATURALIZED PHILOSOPHY OF SCIENCE

Naturalization in the philosophy of science is related to projects for naturalization in other areas of philosophy, including ethics, the philosophy of language and mind, and, especially, epistemology. So there are some general features of naturalism shared by these different philosophical projects. Still, in each of these areas the impulse to naturalization has had different motivations and a distinctive history. Projects for naturalizing the philosophy

of science were advanced independently within the Vienna Circle by Otto Neurath and in the United States by John Dewey from roughly 1925 to 1945. A decade later a philosopher of science, Ernest Nagel, familiar with both Neurath and Dewey, defended a general philosophical naturalism in his presidential address to the American Philosophical Association. And in 1969 Willard Van Orman Quine published his influential article “Epistemology Naturalized.” Nevertheless, interest in naturalization in the philosophy of science dates only from the 1980s. Three influences stand out. First, a growing dissatisfaction with logical empiricism and, more generally, with any philosophy of science conceived of as the logical or conceptual analysis of scientific and methodological concepts. Second, this dissatisfaction was in part sparked by a growing interest in the history of science, particularly as employed in Thomas S. Kuhn’s 1962 book *The Structure of Scientific Revolutions*. Finally, beginning in the 1970s there was a challenge from a newly militant sociology of science claiming to provide the whole story of how science works.

In thinking about science, it is usual to distinguish between the process of doing science, scientific practice, and the product of that process, usually understood as scientific knowledge. The project of naturalization applies to both processes and products. The naturalist project for examining knowledge in various special fields rejects claims to special forms of logical and philosophical analysis, preferring to employ fundamentally the same tools used by the relevant scientists themselves. But philosophers may ask different questions than those that typically concern working scientists. For example, a philosopher of science may ask how the concept of causality in quantum mechanics differs from that in classical mechanics, or how the theories and methods of classical genetics differ from those of molecular genetics. The answers will be framed in terms that can be understood by both scientists and educated laypersons. No peculiarly philosophical concepts are required. This entry will focus on the naturalizing project for understanding the process of science, including methods for certifying particular knowledge claims.

## BASIC FEATURES OF NATURALIZED PHILOSOPHY OF SCIENCE

In advancing a naturalized philosophy of science, one immediately rules out any philosophy of science invoking supernatural factors, which, however, occurs only in limited contexts. More generally, a naturalized philosophy of science rules out appeal to a priori principles, including

the results of logical or conceptual analysis. Positively, a naturalized philosophy of science restricts its resources to those provided by the sciences themselves. So a naturalized philosophy of science becomes a kind of theoretical science of science. Even this minimal general characterization of naturalized philosophy of science raises several problems.

First, how could one justify ruling out the imposition of a priori principles, or even appeals to the supernatural, in the philosophy of science? This would seem itself to require an a priori argument, thus violating naturalism’s own prohibition against the use of a priori principles. Second, given that the content of the sciences is continually changing, how can one specify just what counts as a resource for a naturalized philosophy of science? More simply, what counts as natural in either the philosophy of science or in the sciences themselves?

Both of these problems presume that naturalism is a thesis, indeed, a metaphysical thesis. Both problems vanish if, rather, naturalism is taken primarily as a methodological stance, a determination to employ only well-established scientific findings and methods, whatever they might be. Methodological naturalism, unlike metaphysical naturalism, can be defended simply in terms of past successes, first in physics and chemistry, but also especially in biology. Evolutionary theory and modern molecular genetics have pretty much demystified the phenomena of life. This provides a scientific reason for expecting that mental phenomena and even consciousness will some day be similarly demystified. Of course, this appeal to past scientific success to justify methodological naturalism strikes most nonnaturalistic philosophers of science as circular or regressive.

## NATURALISM AND NORMATIVITY

The most common objection to the whole project of naturalized philosophy of science is that, based only on scientific findings, it can at most describe actual scientific practice; it cannot provide a normative basis for distinguishing good science from pseudoscience. Naturalism, it is often argued, leads straight to relativism. Naturalists point out that this objection assumes that there exists an extrascientific criterion for demarcating good science from pseudoscience. They argue, naturalistically, that the failure to find an agreed on criterion is good evidence that no such criterion exists. Still, it is a fact that scientists and others claim to distinguish good science from pretenders to that status. Naturalists need an account of the bases for such judgments.

The usual naturalist account is that the norms operative in science are all conditional norms of the general form: If the goal is G, use method M. The justification for such norms is itself empirical, consisting of evidence that employing M is a relatively reliable means of obtaining G. This reply itself raises several problems. One is the specification of the goal, or goals, of scientific inquiry. A second problem is the threatened regress of methods, since taking the determination of whether M is a reliable means to G as itself a goal of inquiry seems to require another method of inquiry whose reliability itself must be investigated.

### REALISM VERSUS EMPIRICISM

Both naturalists and nonnaturalists argue that there is a single overarching goal to scientific inquiry throughout the history of modern science. Some make similar claims for scientific method. Proposed general goals include knowledge and truth, while proposed methods include “making use of evidence.” These goals and methods are, however, so general as to be nearly vacuous. Surely one must ask: Knowledge (or truths) about what? What kind of evidence? How is evidence to be used?

Historians of science and historically oriented philosophers of science have identified at least two divergent general goals that have been pursued, often explicitly, by scientists since the seventeenth century. One is broadly empiricist while the other is broadly realist. Isaac Newton’s professed refusal to “feign hypotheses” and injunctions only to make inductions from the phenomena are identified with empiricism. The nineteenth-century invocation of an aether to support electromagnetic radiation was an example of scientific realism. The later nineteenth-century debate between supporters of thermodynamics and supporters of statistical mechanics is seen as a dispute between empiricists and realists regarding the existence of atoms. In the twentieth century the weirdness of quantum physics (relative to classical physics) invited empiricist responses while molecular biology seemed uninhibitedly realist. Although most naturalists tended to argue for either an exclusively empiricist or realist understanding of science, the proper naturalist response seemed to reject the demand for a single goal for all of science as objectionably essentialist and to accept the historical diversity of goals as a natural part of science as a whole. Both empiricists and realists can be said to be seeking knowledge of the natural world rather than, say, spiritual enlightenment.

Returning to the threatened regress of methods, one question is whether or not avoiding an unacceptable rel-

ativism requires a method that can be justified a priori. Naturalists again argue that the failure of philosophers of science to agree on any such method is good evidence that no such method exists. More positively, it can be argued that the general pattern of inductive reasoning is fundamentally the same for higher-level claims about the effectiveness of various methods to deliver correct judgments at the object level as it is for object-level empirical claims themselves. There need be no regress of fundamentally different methods.

Nevertheless, naturalists tend to agree that, whatever the details of various methods for certifying scientific claims, there are no methods that can be employed without assuming that some empirical conditions obtain. There are no foundational methods any more than there are foundational empirical truths that can be known with certainty. To the extent that naturalists think this stance requires philosophical justification, that justification is usually sought in an appeal to some form of pragmatism.

### NATURALISM AND PRAGMATISM

It is no accident that prominent naturalists of earlier generations embraced pragmatism. Naturalism needs a philosophical orientation that makes sense of its rejection of a priori metaphysical and epistemological principles. Pragmatism provides that orientation. The relevant pragmatist doctrine begins with the rejection of any view of knowledge that requires either deduction from a priori truths or induction from incorrigible sense experience. The positive doctrine is that one always begins from the current state of what is taken to be known. From that point, anything can be questioned and subjected to experimental tests, provided that there is some basis for doubt. But not everything can be questioned at once. Universal Cartesian doubt is ruled out. Thus, in place of a foundationist picture of knowledge of either rationalist or empiricist persuasion, one has claims to knowledge regulated by a method of motivated doubt and empirical investigation. It is this general method, not any particular claims, that matters for science.

A pragmatist orientation also fits well with a typical naturalist appeal to the evolutionary history of humans as providing an understanding of the origins of human knowledge. Evolutionary survival requires early humans to have had a serviceable understanding of the world around them, including other humans. Survival did not require having beliefs that one would now regard as true. Rather, it only required beliefs that made it possible to perform appropriate actions at appropriate times. Later, humans could develop methods for questioning and

improving earlier beliefs apart from their immediate application to particular courses of action.

Some naturalist philosophers of science argue that the development of modern science itself follows an evolutionary pattern and maybe even involves evolutionary-like mechanisms. Others disagree. This dispute takes place within a naturalistic framework and the answer does follow from that framework alone. It remains an empirical question within a naturalistic approach to the philosophy of science.

## RESOURCES FOR A NATURALISTIC PHILOSOPHY OF SCIENCE

The purest statement of the logical empiricist approach to the philosophy of science was that the philosophy of science is the study of the logic of the language of science. This stance automatically put the focus of the philosophical study of science on the products of scientific activity rather than on the process of doing science. The naturalist project for the philosophy of science places greater emphasis on the practice of science. A programmatic formulation would be that a naturalized philosophy of science focuses on scientists as embodied agents practicing in a particular scientific culture. The question is what broadly scientific resources are to be employed in this study. Here, there is a diversity of opinion among those pursuing a naturalist program.

Following Kuhn and others, many philosophers of science study the activity of science using primarily historical concepts and methods. Sociologists of science, including historical sociologists partly inspired by Kuhn, invoke primarily historical and sociological categories, but differ among themselves as to which historical and sociological categories to employ. They mostly agree, however, on the desirability of there being a single unified sociological account. Some philosophers of science and cognitive scientists pursue the study of scientific practice as primarily a cognitive activity, borrowing concepts and methods from the cognitive sciences. A few philosophers and economists employ concepts from economics in their studies of science practice. Finally, feminist philosophers of science, for whom the idea of scientists as embodied and socially embedded is central, introduce concepts from feminist theory into the naturalized study of science.

Here again, the proper naturalistic response to this plurality of approaches would seem not to insist on a single unified approach, but to embrace a diversity of complementary approaches as appropriate for understanding a complex phenomenon such as science.

## NATURAL KINDS

Whether engaged in high-level scientific activity or in the ordinary business of living, we spend a great deal of our time sorting the objects we come across into kinds. Philosophers are concerned with the *kinds of kinds* into which we sort these objects, and with the principles that

distinguish one kind of kinds from another. One kind of kinds that has loomed large in recent philosophical discussions is that of so-called *natural kinds*. And one conception of natural kinds has dominated discussion in the contemporary philosophies of science, language, and mind, and this conception will concern us here. But first, some background.

Historical discussions of natural kinds (Ayers 1981) usually start with Aristotle and his conception of the *individuals* that are members of a kind of *substance* in virtue of the fact that they share a certain property (an *essence*) with all and only the other members of that kind. This essence can be specified in a *real definition* in terms of two of the five *predicables*: genus, species, difference, properties, and accidents. To give the most famous example, the *species* human being is part of the *genus* animal, and is distinguished from other animals by the *difference* rational; thus the essence of human beings is that they are rational animals. This essence determines the *properties* human beings possess (language, for example), although some members of the kind will also possess further properties that are not so determined, and these are the *accidents* (high intelligence, say, or lustrous skin).

In reaction against this Aristotelian vision, John Locke offered the distinction between real and nominal essences. Locke distinguished between the real essence (“the being of anything whereby it is what it is”) and the nominal essence (“the abstract idea which the general, or sortal ... name stands for”) (1975 [1689]). He argued that when we use general terms, we refer to kinds whose definition can be given entirely in terms of their nominal essence. He maintained, first, that the members of a kind share a real essence in virtue of sharing some property concerning their microstructure, and, second, that because we lack “microscopical eyes,” we can never know if an entity has this property or not. He then claimed that the features constitutive of the nominal essence of an entity are nonproblematically open to our view, and that as a result only these features are capable of ensuring that our use of a term refers to the kind in question.

This view rests upon some questionable assumptions. First, it is not obvious that our reference to an entity must be secured by features that are unproblematically open to our view. Second, it is not obvious that we cannot know that an entity possesses some microstructural feature simply because that feature is not observable. The modern view of natural kinds rejects both of these assumptions.

This modern view was inspired by the writings of Saul Kripke (1980) and Hilary Putnam (1975). The

numerous advances in natural-scientific knowledge since Locke’s time have greatly increased our sense that we are able to know about the microstructures of things, and these advances helped lead Kripke and Putnam to reject the second of Locke’s epistemological assumptions. Far more radical, however, was their rejection of his first assumption. They insisted that the reference of a natural-kind term is secured by the real essence of the kind, even if no one has any idea what this essence is. A connection with the mental lives of those who use the relevant natural-kind term remains, but is secured instead by the requirement that they use the term with the *intention* of referring to entities of the relevant kind. More specifically, when people learn the meaning of a natural-kind term, they are presented with a sample of the kind, and their competent use of the term is then (partly) a matter of their using it with the intention of referring to anything whose nature is the same as the relevant sample. This idea of a nature has clear Aristotelian resonances, and like Aristotle, Kripke and Putnam took the nature of an entity to be identical to its real essence.

Putnam analyzed the meaning of a natural-kind term into the following four components: a *syntactic marker* (the part of speech to which it belongs, obviously “noun”), a *semantic marker* (in the case of “water,” this would be “liquid”), a *stereotype* (in effect, the nominal essence, the range of observable features commonly associated with the term; in this case, “colorless, tasteless liquid,” for instance), and an *extension* (the things in the world determined by the real essence of the kind, whatever that may be). In the Kripke and Putnam picture, the stereotype provides guidelines for the use of the term, but it does not fix the reference of the term in a sentence containing it. Nonetheless, use of a term that is guided by the stereotype is still genuine use—partly in virtue of the intention to refer, and partly in virtue of what Putnam called “the division of linguistic labor” (the idea that a competent user of the term would defer to relevant experts on the matter of whether something actually is a member of the relevant kind).

This account of natural-kind terms has numerous advantages. It seems to provide an easy solution to the apparent problem of incommensurability, for example. Formulations of this problem start from an assumption characteristic of logical-empiricist accounts of scientific terms, namely, that the reference of a natural-kind term is fixed by the theoretically informed general beliefs of those who use that term. Consequently, when those beliefs change to a certain degree, so does the reference of the term. In the light of Thomas Kuhn’s idea that science

undergoes massive revolutions in the theoretical beliefs of scientists, it seems, once this assumption is granted, that past scientists who used the term “electrons” were not speaking about the same things that present-day scientists speak about when they use this term. By insisting that reference is fixed by the real nature of kinds and not the transitory beliefs of scientists, the theory of Kripke and Putnam allows scientific terms to refer to the same entities over time even though the relevant beliefs of scientists change massively.

In more recent years, some philosophers have started to become suspicious of attempts to extend this account to all natural-kind terms (Dupré 1993). It is questionable how far the theory is capable of handling the kinds that biologists appear to speak of, for instance. Terms of ordinary language such as “frog,” “toad,” “rabbit,” “hare,” “onion,” “garlic”—terms that one might assume are both natural kind terms and of relevance to biologists—are deployed by the latter in ways that radically diverge from how they are deployed by ordinary speakers. When ordinary speakers use these terms, it seems that their intention is not to refer to the putative real essence of, say, “garlic,” but rather to something that serves a certain *function* (“garlic” refers to that which serves a certain culinary purpose, for instance). One obvious response at this point is to say that these terms refer not to natural kinds but to functional kinds (Wiggins 2001), and that their reference is fixed by some description available to the users of the term. This possibility of diverging intentions suggests that one kind term might be a natural-kind term among a group of scientists (given how they use it) and a functional-kind term among a group of lay persons (given how they use it).

There are interesting questions as to whether this account of natural-kind terms contravenes or accords with a Fregean view of meaning (Evans 1973). There are also questions about the exact role that an appeal to natural-kind terms should play in arguments for an externalist account of mental content (that the content of a mental state is determined by suitably ‘external’ features). In addition, if the arguments for externalism that rely on the Kripke and Putnam account of natural-kind terms are sound and if a term such as “garlic” denotes a natural kind on the lips of a scientist but a functional kind on the lips of a layperson, and if the reference of functional kind terms is fixed by a description, then we seem to be saddled with the idea that scientists have a greater number of broad, externally determined mental states than laypersons.

## NATURAL LAW

Natural Law is a long-standing and widely influential theory in ethics and legal philosophy. Because of its long and varied history, and the diversity of definitions of the term “natural,” it is somewhat difficult to summarize exactly what makes a position or methodology one of natural law—at least in such a way as to neatly include all the positions and methodologies that have gone by that name. In attempting to establish a broad set of characteristics such a theory would have to possess in order to be considered natural law, it is useful then to look at the historical development of paradigmatic theories, paying attention to David Hume’s advice that when trying to understand a discourse that employs the concept of “nature,” we must consider what the concept is contextually being opposed to, and “the opposition will always discover the sense, in which it is taken” (Hume 2000, p. 305, n.).

In general, we can say that the traditional notion of natural law has held to the following four propositions: (1) morality is ultimately real and objective and is not relative in its primary truths to culture, subjective taste, or social agreement; (2) morality is somehow grounded in human nature, which is a specific part of the general

order of nature, and is crucial for human happiness and flourishing; (3) the normative force and obligatoriness of morality is somehow the result of this grounding and may be understood using the terminology associated with a legal code; (4) the application of reason in examining human nature, and to some extent general nature, provides evidence for the specific content of our moral obligations.

Some theories, especially contemporary ones, may not clearly fit the pattern of this list. However, this speaks to a criticism that some recent “natural law” theories are not really natural law theories at all. It is in reference to the sort of positions specified above that such criticisms are made. There is also a problem in producing such a list as to whether reference should be made to God as a divine legislator of natural law. While the original and most traditional theories of natural law do rely on a theological foundation, it is characteristic of modern and contemporary versions that they do not, and therefore theism has not been listed as a basic proposition.

## ANCIENT SOURCES

It is generally held that the first complete formulation of a natural law theory was a product of Stoic philosophers. It is also generally held, however, that classical Greek philosophers made significant conceptual contributions to what became natural law. Plato suggests the first, moral realist, tenet of traditional natural law theory in proposing his division of the Forms and appearances. In taking such a strong realist position, Plato provides material for the claim that goodness, or at least good order, is fundamentally real and our knowledge of it can be directly produced through reason. In dialogues such as *Gorgias*, *Protagoras*, and *Phaedrus*, Socrates defends a notion of objective truth and knowledge over the relativistic claims of sophists, which fits the natural law emphasis on moral realism. In the *Republic*, he analogizes the virtuous person to a healthy body and state, which fits the second proposition that morality is self-rewarding, tends toward happiness, and is the proper state of being. In the *Laws*, Plato touches upon the fourth proposition by referring to a law of nature forbidding homosexual sex as unnatural, appealing to animal behavior as evidence (836c–e).

Aristotle has an even stronger claim on influencing natural law, though his contribution is contested. One writer considers natural law his “principal legacy to Christian thought” (Hastings 2000, p. 465), whereas another believes that he “figures as a natural law thinker only ambiguously and not very helpfully” (Haakonssen 1992, p. 890). Howard P. Kainz (2004) points out that the

passages in Aristotle commonly used to indicate support of natural law—“Universal law is the law of nature. For there really is, as every one to some extent divines, a natural justice and injustice that is binding on all men, even on those who have no association or covenant with each other” (pp. 6–8)—come from the *Rhetoric* (1373b5–1373b15), and are embedded in a section giving advice to lawyers on how to argue cases. Aristotle suggests using the rhetoric of natural law when “the written law tells against our case” but suggests that when “the written law supports our case” it is better to argue that “trying to be cleverer than the law is just what is forbidden by those codes of law that are accounted best” (*Rhetoric*, 1375a25–1375b25). But though Aristotle may not be as clearly a natural lawyer as some have thought, he does bequeath three important ideas that get taken up by natural law later on. First, in the *Physics*, Aristotle speaks at length concerning teleology—the notion that all natural objects have an end they are internally driven to fulfill (their telos) and that to understand a thing we must understand the end toward which it aims (194b15–199b30). Second, in the *Nicomachean Ethics*, Aristotle applies this principle to discover the end of human beings, arguing that humans, as natural, aim at some specific highest good for humans, which he defines as happiness—virtuous, rational, satisfactory activity (1097a15–1098a15). The teleology of natural objects and a complex virtuous happiness as the end of human beings will figure prominently in later natural law formulations, particularly those of Aquinas. Third, in the *Politics*, Aristotle argues that living in a political organization is entirely natural for humans. In fact, nature implants in us a social instinct and we can tell by the fact that humans are not individually self-sufficient that the purpose of the state is to produce well-being (1253a25–1253a35). States that work for this common well-being are genuine; states that do not are “perversions” (1279a25–1279b10).

It is commonly considered, however, that the first full-fledged description of natural law arises in Stoic philosophy. In general, Stoic philosophers were drawn to the idea that the universe is controlled by a perfectly rational and fateful principle called the logos, a concept prominent in Heraclitus’s thought. The logos, as a rational principle that is creative, pervades all nature, and is reflected in human beings’ ability to consciously reason and express logical relations in language, unites the metaphysical, the epistemological, and the ethical. As A. A. Long (1986) writes: “[I]t is clear that logos is something which can be heard, which serves to explain things, which is common to all” (p. 145). This unity is important for a view of reason as a law that connects nature, thought, and

morality. In ethics, Zeno of Citium and other Stoics advise us to accept the logos-determined activity of the universe as right and unchangeable. It is our moral obligation to live in accordance with nature and our nature includes the instinct for self-preservation and the possession of reason (Diogenes Laertius 1925, pp. 193–197). The mostly widely cited statement of Stoic natural law, however, comes from Cicero, who wrote:

True law is right reason in agreement with nature; it is of universal application, unchanging and everlasting; it summons to duty by its commands, and averts from wrongdoing by its prohibitions. . . . It is a sin to try to alter this law, nor is it allowable to attempt to repeal any part of it, and it is impossible to abolish it entirely. We cannot be freed from its obligations by senate or people, and we need not look outside ourselves for an expounder or interpreter of it. And there will not be different laws at Rome and at Athens, or different laws now and in the future, but one eternal and unchangeable law will be valid for all nations and all times, and there will be one master and ruler, that is, God, over us all, for he is the author of this law, its promulgator, and its enforcing judge. Whoever is disobedient is fleeing from himself and denying his human nature, and by reason of this very fact he will suffer the worst penalties. (1928, p. 211)

In this passage, many of the traditional characteristics of natural law theory are asserted—the appeal to reason, natural ends, and universality, the lawlike features of obligation, commandment and punishment, the connection to human nature, our internal ability to determine natural law obligations through intuition, conscience, or acknowledgement of impulses, and the reliance on God as legislator. These aspects of natural law were subject to refinements and modifications at the hands of later thinkers including Roman jurists, such as Gaius, who focused on understanding natural law as the rational underpinning of positive law; Ulpian, who applied the natural law to all animals; and Gratian, who focused on natural law being spelled out as biblical commands (Kainz 2004).

## MEDIEVAL SOURCES

With St. Thomas Aquinas (1225–1274), natural law reached a summary moment and was systematized and incorporated into the dominant Christian theological tradition of the West. Aquinas is so influential on the natural law tradition that his position is often seen as para-

digmatic—a response that both limits the tradition and over-theologizes it.

Aquinas begins his discussion of the nature of law in the *Summa Theologiae* by defining law in general as “a rule and measure of acts, whereby man is induced to act or is restrained from acting” (Summa, Part 2, Part 1, Question 90, Answer 1), which is immediately “nothing else but a dictate of practical reason emanating from the ruler who governs a perfect community” (2.1.91.1). Proper laws always aim toward the general good and, following Aristotle, the goal of human life and thus the common good, is happiness (2.1.90.2). Aquinas then distinguishes between four types of law. Eternal law is the very idea of how things should be and has been intended in God’s mind. This idea of how things should be according to God has “the nature of a law” (2.1.91.1). The natural law is essentially the way in which human beings, as rational beings, are positioned within this divinely designed order of things, directed toward fulfilling their nature in that order. Aquinas says:

Wherefore, since all things subject to Divine providence are ruled and measured by the eternal law . . . it is evident that all things partake somewhat of the eternal law, in so far as, namely, from its being imprinted on them, they derive their respective inclinations to their proper acts and ends. Now, among all others, the rational creature is subject to Divine providence in the most excellent way. . . . Wherefore it has a share of the Eternal Reason, whereby it has a natural inclination to its proper act and end: and this participation of the eternal law in the rational creature is called the natural law. . . . It is therefore evident that the natural law is nothing else than the rational creature’s participation of the eternal law. (2.1.91.2)

Aquinas adds the categories of human law (specific determinations of practical regulations) and divine law (scriptural revelations of certain specifics). It is the relationship between natural law and eternal law that is most important here, however. As Aquinas sees it, the natural law is the way in which humans participate in the eternal law, by fulfilling our natural ends in the created order which is itself the expression of the eternal idea of God. The natural law is “imprinted” on us so that we have certain inclinations toward our ends but we also have reason, which allows us to perceive and choose to follow the imprinted inclinations in the proper way. In this sense, Aquinas frames natural law as objective, grounded in human nature, dependent ultimately on God as the cre-

ator of its content, understood through reason and through observation of our own innate tendencies and capacities.

When it comes to laying out the actual rules that the natural law prescribes, the first general principle is “good is to be done and pursued, and evil is to be avoided” which is coupled with the principle that “good has the nature of an end, and evil, the nature of a contrary, hence it is that all those things to which man has a natural inclination, are naturally apprehended by reason as being good, and ... their contraries as evil” (2.1.94.2). Aquinas then develops from these two principles other precepts, including the duty of self-preservation, procreation and education of offspring, seeking knowledge of God, living in society, and avoiding offending others. It is here that Aquinas begins a popular tradition among natural law theorists of laying out a set of necessary and basic human goods.

Aquinas goes on elsewhere to develop more specific rules dictated by the natural law, for example, famously outlawing masturbation, noncoital sex, and homosexual intercourse as “contrary to the natural order of the venereal act as becoming to the human race” (2.2.154.11). It is also largely on the basis of natural law reasoning that the teaching of the Roman Catholic Church rules out contraception as ever morally permissible (Hastings 2000, *Catechism of the Catholic Church* 1994).

It is important to realize, however that there is no simplistic equation of the natural with the moral in Aquinas. In addressing the question of whether the natural law can be changed, he distinguishes between adding to and subtracting from the requirements of the natural law and also between primary and secondary principles of the natural law. Adding to what the natural law requires is not by itself any problem “since many things for the benefit of human life have been added over and above the natural law, both by Divine law and by human laws” (2.1.94.5). Subtracting from what the natural law requires, however, depends on what level of principle we are considering. The primary principles, such as the first precept of pursuing good and avoiding evil and the immediately derivative precepts of self-preservation, and so on, cannot be changed at all. The secondary principles, however, which are “certain detailed proximate conclusions drawn from the first principles” may be changed “in some particular cases of rare occurrence, through some special cause hindering the observance of such precepts” (2.1.94.5).

With this added layer of complexity, it is incumbent upon people to use their reason and to attend to circum-

stances in order to determine what is and is not permissible according to the secondary principles. For example, in the pursuit of procreation, it might seem eminently natural for men to have multiple wives, yet the tradition of the church is for monogamy. How to decide this question? Aquinas argues that marriage has a primary end of producing and raising children, but also a secondary end of a social function within a community:

Accordingly plurality of wives neither wholly destroys nor in any way hinders the first end of marriage, since one man is sufficient to get children of several wives. ... But though it does not destroy the second end, it hinders it considerably for there cannot be peace in a family where several wives are joined to one husband, since one husband cannot suffice to satisfy the requisitions of several wives.... (3.suppl.65.1)

Thus according to a Thomistic reading of natural law, noncoital sex to the point of climax may never be permitted but a plurality of wives might be permitted if the material resources of the husband and culture made it workable.

Finally, for understanding the immense influence of Thomistic natural law, it is important to note that human law relies on natural law for its justification and authority. While human law may add various requirements in specifics (tax codes, civil regulations, etc.) it may not subtract from primary principles. Therefore, human laws are subject to a comparative test for their justification and authority. If they conflict with the natural law, they are not just, and not true law. Aquinas says:

Now in human affairs a thing is said to be just, from being right, according to the rule of reason. But the first rule of reason is the law of nature, as is clear from what has been stated above. ... Consequently every human law has just so much of the nature of law, as it is derived from the law of nature. But if in any point it deflects from the law of nature, it is no longer a law but a perversion of law (2.1.95.2).

As with Cicero years before, this idea makes it possible to judge human laws as unjust and nonobligatory, and opens the way for the possibility of just revolutions against unjust states and human laws.

Aquinas’s analysis of natural law set the stage for an ongoing debate over the nature of the relationship between morality, God’s will, and God’s intellect. For Aquinas, the eternal law, which was expressed in material creation, was found in God’s intellect, God’s perfect rea-

son. As such, natural law was not simply an edict of God's will, as divine command theorists would argue, but rather was the automatic rational relationship between a created, purposeful order and the rational beings within that order. Presumably, if God had created a different type of purposeful world than he did, there would still automatically be a derived natural law that applied to that world as a function of reason, though its specific content would be different than the existing world. In this sense, God is bound by reason, and the natural law is the immediate rational product of created order. As Aquinas writes: "the natural law is something appointed by reason, just as a proposition is a work of reason" (*Summa*, Part 2, Part 1, Question 94, Answer 1).

One position, credited to Gregory of Rimini, took from this view that the natural law simply illuminated which actions and goals were intrinsically good and which were intrinsically evil. As such, the natural law "demonstrates" but is not literally a law in the sense of being legislated. As Francisco Suárez (1548–1617) encapsulates it in his influential *De legibus*, Gregory's position is "that the natural law is not a preceptive law ... since it is not the indication of the will of some superior; but that, on the contrary, it is a law indicating what should be done, and what should be avoided, what of its own nature is intrinsically good and necessary, and what is intrinsically evil" (1944, p. 189). Another group of theologians called voluntarists, including to various degrees Bonaventure, Duns Scotus, and most prominently, William of Ockham, were defenders of the notion that the natural law was the product of God's will, not his intellect. As such, God could make the natural law, and thus morality, be anything he wished. Suárez writes: "This is the view one ascribes to William of Occam ... inasmuch as he says that no act is wicked save in so far as it is forbidden by God and that there is no act incapable of becoming a good act if commanded by God" (p. 190).

Suárez himself, however, takes a middle course between the "intellectualist" and "voluntarist" positions, which he sees as being consistent with Aquinas. Suárez claims that the natural law not only demonstrates what is intrinsically good and evil but also "contains its own prohibition of evil and command of good" (p. 191). As indicating intrinsic good and evil, the natural law cannot be said to be simply willed by God. However, this does not mean that there is no divine command to follow the natural law on top of whatever rational obligation we might have to follow it. In fact, "it is revealed by the light of natural understanding, that God is offended by sins committed in contravention of the natural law, and that the

judgments and the punishment of those sins pertain to Him" (p. 207). What this means is that although right reason can show us the intrinsic moral status of actions, and somehow produces some binding moral force, it is natural law's necessary connection to (but not identity with) the divine law that provides commanding obligation. Suárez writes:

The binding force of the natural law constitutes a true obligation; and that obligation is a good in its own way, existing in point of fact; therefore, this same obligation must proceed from the divine will, which decrees that men shall be bound to obey that which right reason dictates. ... Therefore, although the additional obligation imposed by the natural law is derived from the divine will, in so far as it is properly a preceptive obligation, nevertheless ... that will presupposes a judgment as to the evil of falsehood, for example, or similar judgments (pp. 196-197; 199).

Suárez thus describes a natural law that is both morally independent of God's Will but always joined by willed legislation to follow it.

The concerns over the actual obligations implied by natural law made their way into important political and cultural disputes, including the formal debate between the theologians Juan Ginés de Sepúlveda (1494–1573) and Bartolomé de Las Casas (1474–1566) over the treatment of Native Americans by the Spanish kings. Sepúlveda, appealing to Aristotle (who claimed slavery was justified by nature in his *Politics*), Aquinas, and Augustine, argued that the Native Americans were "barbaric ... ignorant, unreasoning ... sunk in vice ... cruel, and are of such character that, as nature teaches, they are to be governed by the will of others" concluding "that the Indians are obliged by the natural law to obey those who are outstanding in virtue ... This is the natural order, which the eternal and divine law commands to be observed ... " (Las Casas 1992, p. 11-12). Las Casas, defender of the natives, relies partially on natural law ideals by arguing that the leaders of a community are obligated to seek the common good and waging war does not seek that end, and also that the Indians are not unreasoning but instead have rational, though still incorrect, defenses of their barbaric practices. For the most part, however, he gives consequentialist arguments as to why war should not be waged, arguing that war will produce much more harm than good.

## MODERN SOURCES

Hugo Grotius (1583–1645) is variously credited with being the “father of modern natural law,” the “father of natural rights,” and the “father of international law.” While Grotius spends most of his writing analyzing the nature of international war and its adjudication, his appeal to natural law leads in several influential directions. First, Grotius rejects the skeptical view (typified by classical Greek opponent of natural law, Carneades [c. 214–129 BCE]) that humans and all animals are simply driven by self-interest and that therefore all laws have their source in individual expediency, which may change as conditions do. Instead, Grotius argues in his *Prolegomena to the Law of War and Peace*, humans have “an impelling desire for society, that is, for the social life—not of any and every sort, but peaceful, and organized ... this social trend the Stoics called ‘sociableness’” (*Prolegomena* 6). Grotius indicates that this innate sympathy and desire for peace is central: “This maintenance of the social order, which we have roughly sketched, and which is consonant with human intelligence, is the source of law properly so called. To this sphere of law belong the abstaining from that which is another’s, the restoration to another of anything of his which we may have ... the obligation to fulfill promises” (*Prolegomena*, pp. 8-9). In addition to sociableness, humans also have the rational power to discriminate between alternative actions and can choose what will actually “follow the direction of a well-tempered judgment, being neither led astray by fear or the allurements of immediate pleasure, nor carried away by rash impulse. Whatever is clearly at variance with such judgment is understood to be contrary also to the law of nature, that is, to the nature of man” (*Prolegomena*, p. 10).

Second, and largely because of this innate sociality and intelligence, Grotius claims that “what we have been saying would have a degree of validity even if we should concede that which cannot be conceded without the utmost wickedness, that there is no God, or that the affairs of men are of no concern to him.” (*Prolegomena*, p. 10). While Grotius was not the first to conceptually detach the natural law from God, his arguments lead to a significant shift in natural law language, making it easier to talk about natural law as intrinsically part of being human rather than something that reflects a divine idea. In fact, Grotius’s later clarification on the importance of God’s will—“the law of nature ... proceeding as it does from the essential traits implanted in man, can nevertheless be rightly attributed to God because of his having willed that such traits exist in us”—ends up showcasing more the belief that human nature immediately provides

the law, whatever the ultimate source of human nature (*Prolegomena*, p. 11). This move will permit the disconnection of God and natural morality, while making the source of obligation to follow the law a significant problem.

Third, the shift away from specifically religious natural law is made even more rhetorically available because of Grotius’s development of the concept of natural rights. In *The Rights of War and Peace*, he first describes the term “right” as signifying what is just or at least not unjust, but then he goes on to say that “there is another signification of the word RIGHT ... which relates directly to the person. In which sense, RIGHT is a moral quality annexed to the person, justly entitling him to possess some particular privilege, or to perform some particular act” (1901, p. 19). While the idea that individuals can possess moral qualities that produce privileges and impose duties on others has many conceptual problems, the upshot is that it allows for a discourse of human rights that steers clear of theological connections.

The emphasis on the social nature of human beings becomes central at this point, informing as it does both the content and general character of natural law. Some will agree with Grotius that humans have a natural sociability; some will argue that humans are naturally individualistic self-maximizers who are sociable only for practicality’s sake. But the philosophical import of this talk is that even though modern philosophers will generally agree that there is a more or less fixed human nature and will continue to use the phrase “natural law,” they may mean significantly different things by it.

For example, Thomas Hobbes (1588–1679) argues that nature has provided humans with certain set traits, including rough physical and intellectual equality. Out of this equality come roughly equal hopes of attaining the objects of desire and thus competition over goods, resources, and honor. With no limitations on such competition, violence ensues and a “war of every man against every man” arises. In analyzing a way out of this situation, Hobbes discusses “rights of nature,” “laws of nature,” and other phrases associated with the natural law tradition. Yet, when we read what Hobbes says about the character of natural laws, something seems to have changed. Hobbes says that

a law of nature, (*lex naturalis*) is a precept, or general rule, found out by reason, by which a man is forbidden to do, that, which is destructive of his life. ... and consequently it is a precept, or general rule of reason, that every man ought to endeavor peace ... and when he cannot

obtain it ... seek and use all helps and advantages of war. ... From this fundamental law of nature ... is derived a second law; that a man be willing, when others are so too ... to lay down this right to all things. (1988, pp. 86–87)

What appears to be happening here, in spite of some of the language used, is not that humans have a natural law moral obligation to seek peace, in the way Grotius might have envisioned, but rather that reason teaches us that our self-interest cannot be satisfied unless we agree with each other to give up some of our liberties and make social contracts. This means that the “law of nature” is not an objective moral obligation, but rather a pure practical realization of what we have to do in order to achieve our goals. Although it is tricky to try to use contemporary language here, it seems as if Hobbes’s natural law is more about factual psychological principles and pragmatic planning. He agrees with traditional natural law theorists that we have a human nature and self-preservation is the first trait of that nature, but he sees the implications of that fact to have more to do with the satisfaction of desire than moral obligation.

This seems even clearer when Hobbes reductively defines human rights of nature as liberties to act and then defines liberties as merely “the absence of external impediments” (p. 86) and then later says that “where no covenant hath preceded, there hath no right been transferred, and every man has right to every thing; and consequently, no action can be unjust” (p. 95). Contrasting sharply with the traditional natural law claim that theft, for example, is immoral, Hobbes argues that theft only has meaning, and only becomes wrong, after social covenants are set up describing it as so. So here we see a case where the language of natural law is used but the substance is one of self-interested prudence. It is not surprising here that Hobbes’s phrase, “state of nature,” describes a dangerous environment that reason must be used to change. Our natural state is one of horror; our happy and peaceful state is one of artifice produced by reason.

Samuel Pufendorf (1632–1694) takes an approach both similar and somewhat more traditional. He agrees that humans are naturally self-interested and likely to engage in warlike activity to acquire the things they want. However, humans also seem to go beyond nature in excessive pursuit of the basics nature has provided them—lusting more than is necessary for procreation, seeking clothes more for show than for necessity, desiring tasty food far beyond what we need for nutrition (1991, p. 34). In a vein similar to Hobbes, Pufendorf writes:

Man, then, is an animal with an intense concern for his own preservation ... incapable of protection without the help of his fellows.... Equally, however, he is at the same time malicious, aggressive, easily provoked, and as willing as he is able to inflict harm on others. The conclusion is: in order to be safe, it is necessary for him to be sociable.... The laws of this sociality ... are called natural laws. On this basis it is evident that the fundamental natural law is: every man ought to do as much as he can to cultivate and preserve sociality. (p. 35)

Here, though the term “natural law” and “ought” are used, they seem to be used prudentially, not as objective moral terms. However, Pufendorf recognizes, as did Suárez, this divide between self-preserving practicality and moral obligation and brings God back in to secure obligation. “Though these precepts have a clear utility, they get the force of law only upon the presuppositions that God exists and rules all things by His providence, and that He has enjoined the human race to observe as laws those dictates of reason which He has Himself promulgated by the force of the innate light. For otherwise though they might be observed for their utility, like the prescriptions doctors give to regulate health, they would not be laws” (p. 36). Thus, Pufendorf reverts to a modified form of divine command theory in order to fasten down the lawfulness of natural law.

John Locke (1632–1704), the most important social contract theorist after Hobbes, forms yet another subtle synthesis that ends up making natural law a moral constraint on the sorts of social contracts we can legitimately produce. As in that of Hobbes, in Locke’s state of nature humans have the ability to do whatever they want but unlike Hobbes, they do not have the right to do whatever they want. Locke writes:

Yet he has not liberty to destroy himself, or so much as any creature in his possession, but where some nobler use, than its bare preservation call for it. The state of nature has a law of nature to govern it, which obliges every one: And reason, which is that law, teaches all mankind, who will but consult it, that being all equal and independent, no one ought to harm another in his life, health, liberty or possessions. For men being all the workmanship of one omnipotent and infinitely wise Maker ... they are his property ... made to last during his, not another’s pleasure. (Locke 1960, p. 271)

So we see here that even in the state of nature there is a natural law that provides a minimum moral code, namely, not to interfere with another's body, freedom, or property, and as Locke later lays out, the natural law also provides each person the authority to enforce and punish violations of this natural law (the abuse of which leads to the need to develop an unbiased state through social contract).

What is a bit uncertain here is the role of reason and God. In one sense, Locke says that reason is the natural law, which suggests a kind of prudential characterization, but he also says that it is the fact of our being the property of God that obliges us not to harm each other, which suggest a divine origin of obligation. However, it may be that reason teaches us first the moral principle that property is sacrosanct and that this principle is what informs us that as God's property we do not have the right to harm others. Locke also says that what makes a criminal is that he chooses to live by some other rule than reason, but then states that reason "is that measure God has set to the actions of men, for their mutual security" (Locke 1960, p. 272). In his constant appeal to reason for determining the specific obligations the natural law requires of us, however, Locke seems to work with the idea that reason both teaches us the content of moral truth instrumentally (we consult it), and is the natural law itself in some way.

With these sort of modifications, revisions, and perhaps even reversals, it is not surprising that natural law as a general ethical theory began to wane and by the eighteenth and nineteenth centuries, concerns about ethical theory shifted to debates among social contract theorists, skeptics, moral sense theorists, Kantians, and utilitarians. While the early social contract theorists still used the language of natural law, other philosophers clearly challenged the language and theory explicitly.

David Hume (1711–1776) famously maintained that it is a simple logical mistake to think you can "derive" a moral obligation from a biological or psychological fact (the is/ought distinction) and argued that because of the divergent definitions of the term "natural" that "nothing can be more unphilosophical than those systems which assert, that virtue is the same with what is natural, and vice with what is unnatural" (2000, pp. 302, 305).

Immanuel Kant (1724–1804) sought moral obligation in the realm of pure reason and repudiated any connection of actual contingent human psychology with moral truth. He argued in *Groundwork of the Metaphysics of Morals* that

everyone must grant that a law, if it is to hold morally, that is, as a ground of an obligation, must carry with it absolute necessity; that, for example, the command 'thou shalt not lie' does not only hold for human beings, as if other rational beings did not have to heed it ... ; that, therefore, the ground of obligation here must not be sought in the nature of the human being or in the circumstances of the world in which he is placed, but a priori in concepts of pure reason. (1997, pp. 2–3)

It is worth noting, however, that one of Kant's formulations of the categorical imperative is "Act as if the maxim of your action were to become by your will a universal law of nature" (p. 31). In spite of this phrasing, this is not natural law theory. What Kant is talking about is the understanding of a law of nature as a Newtonian universal regularity and is asking us to consider whether we could logically will our maxims to have such a universal character. He writes: "The universality of law in accordance with which effects take place constitutes what is properly called nature in the most general sense ... that is, the existence of things insofar as it is determined in accordance with universal laws." (p. 31) and later comments that "We must be able to will that a maxim of our action become a universal law. ... Some actions are so constituted that their maxim cannot even be thought without contradiction as a universal law of nature" (p. 33).

John Stuart Mill (1806–1873) criticized the entire project of trying to couple morality with nature, arguing that virtually all of our actions alter nature in some way and that an attempt to imitate nature would have us follow a guide of cruelty (1969, pp. 373–402). Of course, Mill here is arguing against the claim that we should look to nature in the large sense as a guide to behavior rather than specifically paying attention to the narrower concept of human nature (something he did pay attention to), which indicates how the concept of "nature" as a more narrow moral guide was being used by the 1800s.

Finally, John Austin (1790–1859), the founder of modern legal positivism, argued that law

may be said to be a rule laid down for the guidance of an intelligent being by an intelligent being having power over him. ... in the largest meaning which it has ... the term law embraces the following objects:—Laws set by God to his human creatures, and laws set by men to men. The whole or a portion of the laws set by God to men is frequently styled the law of nature, or natural law: being, in truth, the only natural law

of which it is possible to speak without a metaphor. ... But, rejecting the appellation law of nature as ambiguous and misleading, I name those laws or rules ... the Divine law, or the law of God. (2004, p. 24)

This command theory of law undermined the position that an obligation to act followed from anything other than sheer power and thus reduced natural law to nothing more than a confusing way of referring to divine command.

### CONTEMPORARY SOURCES

In the twentieth century there was a revival of interest in natural law, as seen in the works of Jacques Maritain, Elizabeth Anscombe, Yves Simon, Ralph McInerny, Russell Hittinger, Robert George, Peter Geach, Anthony Kenny, and Alisdair McIntyre. In large part, the new attention to natural law was spurred by the Catholic Church's teachings on social and moral issues, including Pope Paul VI's encyclical letter *Humanae Vitae* (1968), which drew on Aquinas's moral theories to condemn artificial birth control. Prominent among the theological and philosophical defenders of the church's natural law teaching on contraception, abortion, homosexuality, and healthcare (though not necessarily following in the Thomistic tradition) were Germain Grisez and John Finnis. Grisez published an influential commentary on Aquinas's natural law system in 1965, which inspired John Finnis's work, culminating in *Natural Law and Natural Rights* (1980).

The heart of that book is Finnis's list of basic human goods, including life, knowledge, play, aesthetic experience, sociability (friendship), practical reasonableness (intelligently choosing and affecting one's own life), and religion (concern with transcendence) (1980, pp. 85–90). These are not moral goods, but more basically goods-for-us. It is our fundamental and self-evident awareness of these basic goods that creates moral choices for us—what are we to do? How are we to use our practical reasonableness to decide what to do? Finnis then attempts to use a “natural law method” of ethics, while still only using modern (presumably not natural law) terminology, to show purely through logic and other self-evident truths what we ought to do (p. 103). He argues for a set of basic requirements of practical reasonableness, which include a coherent, rational plan for our lives, no arbitrary preferences among either the basic goods or among persons, detachment and commitment, choosing efficient methods to achieve good, a limited attention to preference satisfaction (excluding such things as theft and murder), seeking the common good, following conscience, and

perhaps the most controversial principle, “one should not choose to do any act which of itself does nothing but damage or impede a realization or participation of any one or more of the basic forms of human good.” (p. 118).

It is this latter principle that Finnis believes rules out any consequentialist reasoning. Consequentialist ethics, he argues, is irrational because goods cannot possibly be measured, and therefore the ends never justify the means where the means includes damaging a basic good. Once he rules out consequentialism, the principle that a basic good cannot be impeded is “self-evident” and the moral rule can be summarized as “Do not choose directly against a basic value” (pp. 119, 123). This formulation of natural law begins with empirical claims about what things it is in our nature to value and then logically tries to come to our obligations. However, with no legislator to provide the traditional source of obligation (such as Suárez's and Pufendorf's God) there remains the question of whether this theory is actually a natural law theory. Finnis himself tells us that, like scientific laws, which are actually only metaphorically laws, “‘Natural law’—the set of principles of practical reasonableness in ordering human life and human community—is only analogically law” (p. 280).

Finnis seems to think that reason by itself provides obligation, but it is not clear how this is supposed to occur. Reason can help us discover what desired ends we find in our psychological constitutions and can help us determine instrumentally how to achieve those ends, but how does reason create an *obligation* to pursue any end?

This question of whether their theory is properly called natural law theory also follows the most prominent twentieth century legal theorists. Lon Fuller (1964) describes a set of eight requirements that civil law must meet in order to be considered genuine law—requirements such as generality, noncontradictoriness, and non-retroactivity. In this, he is appealing to a set of objective conditions that one may subject civil laws to as a test for true lawfulness, but he emphasizes that this test is procedural rather than substantive (Bix 1996). Ronald Dworkin (1967, 1986) argues that principles of values always govern how we produce and interpret civil laws, and so there is no fundamental separation of the realms of law and morality, but this could be essentially a descriptive claim and does not imply that there is a self-evident objective moral order to which civil laws must adhere in order to provide obligations. It is perhaps primarily in the sense of providing opposition to legal positivism that these theories are classified as natural law theories.

## CONNECTIONS TO OTHER ETHICAL THEORIES

While natural law is its own set of theories, the differences between it and other ethical theories are often exaggerated and oversimplified. There are significant connections and shared assumptions. For example, although Kant explicitly rejects appealing to empirical facts about human nature to determine the moral law, he begins his moral philosophy with a teleological principle widely held by natural law theorists, stating in *Groundwork* that “in the natural constitution of an organized being ... we assume as a principle that there will be found in it no instrument for some end other than what is also most appropriate to that end and best adapted to it” (p. 8). Unlike natural lawyers, however, he concludes from this that the job of reason cannot be to produce happiness, because instinct would best accomplish that. Instead, reason’s purpose is to produce a good will. Kant does connect nature and law through teleology though by claiming in *Idea for a Universal History from a Cosmopolitan Point of View* that “If we gave up this fundamental principle, we no longer have a lawful but an aimless course of nature” (1963, p. 13), and concluding that “The greatest problem for the human race, to the solution of which Nature drives man, is the achievement of a universal civic society which administers law among men” (p. 16). In view of these commitments, it might be said that Kant shares with the Stoics a view of the metaphysical and epistemological aspects of the natural law, but not the essential moral aspects.

Mill, for all his criticisms of the use of the term “natural” in moral theory (Nature), is as quick as a natural law theorist to point to empirical facts about human psychology:

The only proof capable of being given that an object is visible, is that people actually see it ... the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it ... No reason can be given why the general happiness is desirable, except that each person, so far as he believes it to be attainable, desires his own happiness. (1998, p. 168)

He is quick also to appeal to our consciences as guides: “The internal sanction of duty ... is one and the same—a feeling in our mind; a pain, more or less intense, attendant on violation of duty. ... This feeling, when disinterested ... is the essence of Conscience” (p. 161).

And of course, given the natural law emphasis on the pursuit of happiness, the importance of developing char-

acter traits which lend themselves to happiness and flourishing, the fundamental desire for self-preservation, the practical need to interact with others, and the ability to apprehend our obligations through internal self-observation, we see strong shared assumptions with virtue theory, social contract theory, and intuitionism.

## PROBLEMS FOR NATURAL LAW

As seen through its historical development, the primary arguments for natural law have been that it is warranted theologically, that nature or human nature somehow imply that we should act in certain ways, that reason itself simply shows us the self-evident truth of natural law, and that it is necessarily practical that we act in certain ways given our nature. Criticisms have been leveled against these arguments and other aspects of natural law theory.

First, concerns about religion: If natural law theory relies on the existence of God, then proof of God must be forthcoming before we can move on to moral metaphysics—a complicated task. However, this point would only obviously apply to those versions of natural law which require God for moral obligation and some versions of natural law do not make this assumption. Problems do arise, though for relating natural law to divine command theory. For example, if, as Grotius argues, innate human traits have been directly willed in to us by God, then God’s will is the source of moral obligation and thus natural law may be only a thin technical layer between human obligation and divine command theory. If, as Aquinas seems to think, some sort of natural law would proceed automatically from whatever world God created, irrespective of God’s will, then this sort of moral relationship seems to be at least as fundamental and necessary as God—a point about which voluntarists are concerned.

Philip Quinn (2000), for example, actually emphasizes the divine command elements of Aquinas’s thought, arguing that the *Summa*’s exoneration of Abraham in the sacrifice of Isaac story (*Summa*, Part 2, Part 1, Question 100, Answer 8, Reply 3) shows that Aquinas believed “the slaying of Isaac by Abraham, which would be wrong in the absence of the divine command, will not be wrong in its presence if Abraham obeys it” (p. 62). The issue is fundamentally about whether natural moral obligations are products of pure reason, and whether this implies there is some truth or reality that does not depend entirely on God.

Second, concerns about relativism: Just as voluntarist divine command theory is often seen as a type of moral relativism because God could (in some views at least)

have made anything a moral obligation, the apparent natural law assumption that morality depends on the actual contingent facts of biology and psychology seems to make morality relative to species (rather than culture or the individual, as traditional relativisms argue). This is not a practical problem for determining obligations when there is only one sapient species to consider, but for ethicists such as Kant, morality could only be said to be truly objective if it was necessary for all possible rational beings.

Third, concerns about is and ought: Hume pointed out that many attempts at moral philosophy make a near-imperceptible shift from the way things are to the way things should be—a move that logically requires connecting premises often not given (Hume 2000, p. 302). This criticism has been analyzed at great length (Hudson 1969). Natural law may be an attempt to breach the is/ought divide, but historically it often either does nothing to supply the connection, or supplies it arbitrarily, or tries to supply the connection simply by appealing to reason. It is unclear, however, how reason is supposed to produce moral obligation. It may be true, for example, that choosing a short-term pleasure over a long-term basic good interferes with comprehensive happiness, and thus may in one sense be called unreasonable or irrational. But this sense of “unreasonable” is more a matter of acknowledging empirical constraints on what will actually satisfy our desires, health, or continued existence rather than serving as any sort of logical proof of a moral obligation.

Instrumentally, reason can help us to satisfy the desires and inclinations we do in fact naturally have, but it is not clear how reason is supposed to indicate that we should try to satisfy them. There is nothing formally illogical about not satisfying desires we have or securing our own health and happiness. For versions of natural law that retain God as a moral lawmaker, this problem seems to be avoided because obligation can be seen in a positivist sense as legislated—but then this Ockamist or Austinian approach returns us to the problem of whether natural law simply reduces to divine command theory.

Fourth, concerns about the goodness of nature: There is the assumption in natural law that human nature is fundamentally good (even though flawed), which legitimates our appeal to it. This is an inheritance of Christian theology, even for those versions of natural law that argue for no dependence on God. Other explanations, less committed to design and eternal law formulations of the world’s development, see aspects of human nature as more adventitious and thus less morally authoritative. Human traits are not necessarily here because they are

supposed to be but because they survived. As a result, many inherent traits may be prone to producing what we think of as evil acts and ends. As Mill writes in “Nature”:

With regard to this particular hypothesis, that all natural impulses, all propensities sufficiently universal and sufficiently spontaneous to be capable of passing for instincts, must exist for good ends ... this is of course true of the majority of them, for the species could not have continued to exist unless most of its inclinations had been directed to things needful or useful for its preservation. But unless the instincts can be reduced to a very small number indeed, it must be allowed that we have also bad instincts which it should be the aim of education not simply to regulate, but to extirpate. ... among them one which they call destructiveness: an instinct to destroy for destruction’s sake. I can conceive no good reason for preserving this. (p. 398)

Fifth, and related to the fourth, concerns about best explanation: One of the key purposes of natural law ethics, particularly in its modern versions, is to oppose the idea that there is no human nature, or that human nature is so widely divergent that no cultural or moral norms can be said to be better or worse than any other. In this sense, natural law is opposed to cultural moral relativism, behaviorist environmental determinism, and postmodern social constructivism. However, natural law is not the only theory that holds there is a human nature, that can produce a list of basic human goods, pays attention to biology and psychology, and opposes relativism. To some extent Rawlsian contractarianism does this, but in a way even more related to natural law, evolutionary ethics does as well.

Evolutionary ethics can take seriously the claim that the moral law is “written on our hearts” and that we only need our conscience to apprehend it. As Grotius defended the existence of the natural law by pointing to widespread regularities in moral beliefs (1957, pp. 25–26), evolutionary theorists defend the existence of an evolved moral sense, which explains cross-cultural similarity in moral emotions such as guilt and shame, and cross-culturally widespread moral restrictions on murder, betrayal, and sexual infidelity. But there is a difference.

Just as evolutionary theory covered much of the same territory as the argument from Design for the existence of God, but could explain both complexity and the existence of “imperfections” such as vestigial organs (having given up a perfect designer and therefore eliminating any expectation of perfect design), evolutionary ethics

can explain both the widespread facts of human cooperation and widespread selfish violations of moral norms (having given up a perfect moral inculcator and therefore eliminating any expectation of perfect moral inculcation).

Even for nonreligious versions of the natural law, there remains the idea that our consciences and innate natures are essentially good and trustworthy and thus have some difficulty explaining why warmongering, murder, lying, addiction, and rape are both so self-evidently bad and so persistent. It seems to some then that evolutionary ethics does a better job of explaining human moral nature and human immoral nature. Of course, evolutionary ethics is at heart descriptive, arguing that moral attitudes are simply what have been successful at replication over time and not that they represent any objective moral truth (anymore than our bodies reflect imperfectly some infallible objective body). This is indeed a disadvantage if one is in search of moral prescriptions, but evolutionary ethicists can attempt moral prescription as well, having at first glance no lesser or greater obstacle to overcome in moving from facts to obligations than natural law theorists (Rachels 2000).

## CONTEMPORARY STANDING

Natural law theory is still active as an applied ethics (forming as it does the foundation of the Catholic Church's moral philosophy). It is also still active in some academic investigations, generating numerous titles each year in ethics and legal philosophy. It is safe to say, however, that it is a minority position in mainstream academic ethics, at least in its traditional form, and typically appeals mostly to ethicists of particular religious bents. However, the descendants (or perhaps distant cousins?) of natural law theory thrive in the form of natural rights or human rights theory, which form the backbone of much of the world's international moral discourse—particularly when criticizing a particular state's or culture's practices. Practically speaking, though, much of the rhetoric concerning natural law in its more explicit and narrow sense (in appeals to naturalness and unnaturalness) is spent on ethical issues of sexuality and reproduction, leading some critics to claim that debates over sexual morality are actually the last stand for popular traditional natural law appeals (Mohr 2005, pp. 122–123).

## NATURAL SELECTION

See *Evolutionary Theory*

## NATURE, PHILOSOPHICAL IDEAS OF

In its widest sense "nature" can mean "the totality of things," all that would have to appear in an inventory of the universe. It can also refer to the laws and principles of structure by which the behavior of things may be explained. These two senses cannot be kept independent of each other at any sophisticated level of inquiry, for to state in any of the sciences what an entity is involves describing what it does, its patterns of activity or behavior, and the activity of its constituent elements, as far as they can be known and subsumed under laws.

In a particular philosophical context the sense in which nature is being used can be brought out most clearly by insisting upon the question "What is nature (or the natural) being contrasted with in this context?" In one group of cases the natural is contrasted with the artificial or conventional. This contrast requires some conception of how the object or organism would behave by reason of its immanent causality alone, the causal factors that are peculiar to that type of thing and make it whatever it is—a stone, a fish, or a man. The artificial and conventional are seen as interferences, modifying by an alien causality the characteristic patterns of behavior. In the sphere of human nature this distinction is at the center of an ancient and continuing controversy, for it is by no means easy—if, indeed, possible—to delineate a human nature free of interferences, left to itself. Organism and environment, individual and cultural climate, are in ceaseless interplay. An activity (like moral evaluation or social organization) that seems to some theorists on the "con-

vention side” of the boundary may be represented by others, with no less reason, as a development of natural potentialities. The controversy is further complicated by the intrusion of evaluative nuances in the distinction itself, so that the natural, for instance, may come to be more highly esteemed than the artificial and conventional, as the spontaneous or the basic is contrasted with the labored and derivative. The preference may be reversed, however; the natural can be taken as the mere raw material, the unfinished and preparatory, requiring artifice to complete and crown it.

In some contexts man is contrasted with nature; in others he is taken as part of nature. The difference is not trivially linguistic. To set man against nature is to emphasize his distinctiveness—his rationality, creativity, and freedom. But it may also support an unwarranted and distorting anthropocentricity. To count man as part and parcel of nature emphasizes the continuity of the human, animal, organic, and inorganic worlds and suggests that human behavior may be amenable to the same kinds of investigation that are effective in studying other domains of nature. Similarities as well as differences can be exaggerated, however, and overfacile generalizations can be made from the behavior, say, of rats to human behavior. Human distinctiveness and complexity may be overlooked in a tempting reductive analysis like that of behaviorism.

In still other contexts the natural world, man included, is contrasted with the supernatural. In part at least, the idea of the supernatural has tended to be constructed from allegedly miraculous events, events that, it is claimed, the power and laws of nature could not bring about. (There can be also an a priori element in the grounding of belief in the supernatural. Belief in a transcendent creator-God, who may be himself the subject of a priori proofs, implies the belief that nature’s laws and processes can be overruled.)

It is anything but easy, however, to elaborate coherently the nature-supernature distinction. Crucial to it is the claim that we can distinguish what lies within the capacities of nature from what lies beyond them. Our knowledge of nature’s powers and laws is itself derived from our experience and observation of events. What we judge to be possible depends upon what we have reason to believe actually occurs or has occurred. When we assemble the experiences out of which we are to construct these judgments about the possible, what shall we do with the happenings that, eventually, we wish to label miraculous? To exclude them would be to imply that we *already* know what nature’s powers are, that there are criteria

prior to experience by which we interpret our observations. But to include them makes it impossible for us to treat them later as miraculous exceptions to natural laws.

Certainly, it is not legitimate to move from saying, “This event is inexplicable in terms of our scientific knowledge of nature,” to saying, “This event must be a supernatural intervention.” The scientist is by no means committed to claiming that he has at any particular moment the concepts and theories adequate for every explanatory task. He is constantly revising and adding to these. We are not, therefore, forced to conclude that an event has a supernatural source on the grounds that it is inexplicable or anomalous in terms of present-day science. Indeed, it is only with the help of an independently established set of beliefs about God that one could plausibly interpret an event as supernatural. (See P. H. Nowell-Smith, “Miracles,” in A. G. N. Flew and A. MacIntyre, eds., *New Essays in Philosophical Theology*, New York, 1955; and A. G. N. Flew, *Hume’s Philosophy of Belief*, London, 1961.)

Although it has been implied above that God must be conceived in contradistinction to nature, this is true only if God is transcendent, not immanent (or, if immanent, then transcendent as well). In a pantheistic view if nature may be distinguished from God, it is only as different views or aspects of one and the same reality.

## HISTORICAL TRANSFORMATIONS

The history of philosophical ideas of nature almost coincides with the history of philosophy itself. Where a philosophy is at all systematic, even if it is avowedly antimetaphysical, it cannot avoid stating or implying some interpretation of nature. This makes it impossible to compress the history of these interpretations into one entry. The comments that follow are thus no more than indications that the philosophers named made significant contributions to the development of the idea.

When the Ionian pre-Socratic philosophers asked, “What is nature?” they assumed that the question demanded an answer in terms of a primitive substance or substances out of which the world is constructed. One of the more reasonable answers was that of Anaximander, who claimed that the ultimate world stuff must be indeterminate and indefinite (apeiron) and could not be identified with familiar stuffs like water, air, and so on. But although plausible, Anaximander’s answer was also unhelpful precisely because the apeiron lacked all determinateness and explanatory power. Far more fruitful was the Pythagorean concern not primarily with the question “What is nature made from?” but with “What is its struc-

ture?” where “structure” means geometrical form. We need to know only that the constituents of the world are able to receive mathematically describable form, and the way is opened for investigating how natural objects are related, in detail, to their underlying geometrical structure.

To Plato the possibility of knowledge of nature (or of the natures of things) rests on the intelligibility of the Forms that things imitate (or in which they participate). The creation story in the *Timaeus* (which came to have enormous influence) represents God and the Forms as distinct from each other, the spatiotemporal world—mutable nature—being created after the model of the eternally unchanging Forms. It is a world necessarily deficient in important respects; the very existence of time makes it unstable and incomplete. On the other hand, it is the product of a *divine* creativity. God in his goodness does not withhold being from anything that might exist, and thus nature displays his fecundity. Here is the initial statement of the vision of nature as a great chain, or ladder, of being.

Aristotle’s Unmoved Mover stands to nature as its final or teleological cause, inspiring nature to imitate the divine activity as far as its various constituents are able. Particular things, therefore, are seen as striving to realize their appropriate forms, and in so doing, they realize their own natures. Underlying this view of nature is a clear analogy with biological growth.

To Christian thinkers the primary distinction has, of course, been between the underivative creativity of God and the derivativeness and dependence of nature. Augustine, for instance, contrasts the divine “first cause that causes all and is not caused itself” with “the other causes” (the world of nature) that “both cause and are caused” (created spirits) or are primarily passive effects, corporeal causes (*City of God* V, 9). This does not preclude a wider use in which mutable spatiotemporal nature is contrasted with divine nature, “the Nature which is immutable is called Creator” (*Epistolae*, 18, Sec. 2). In Thomas Aquinas, too, God can be called *natura naturans* and the contrast made with *natura naturata*, the creating contrasted with the created nature (*Summa Theologiae* IIa–IIae, 85, 6).

It was the Pythagorean-Platonic strand in philosophy of nature that furthered and came to dominate the rise of modern science. In Johannes Kepler, for example, nature appears as the realm of the quantitative, a realm amenable to mathematical study and, indeed, to more precise study than ancient philosophy ever demonstrated. Such a view of nature could coexist with a religious inter-

pretation of things, for the mathematical structure could be taken as supplied and sustained by the mind of God.

Although in one way the growth of a mathematical science promised most impressively to unify nature by bringing widely diversified phenomena under laws, in another way it produced new problems about the relation of man to his world, problems that led to various dualisms—bifurcations of nature—such as René Descartes’s. Those aspects of our experience that were not amenable to exact measurement were no longer to be identified with objectively real, accurately cognized features of the world. The measurable qualities were primary, the rest secondary, qualities—colors, sounds, tastes, and the like. Although materialist metaphysics boldly attempted (and still attempts) to reunite nature and man by describing the full range of his perceptual, moral, and imaginative life in terms of matter and motion, in a writer like Thomas Hobbes, for example, such explanations were only promissory notes. A great deal of development in physiology had to occur before the details of the mechanisms involved could be conjectured with any real plausibility.

Descartes gave the world of mind distinct ontological status alongside corporeal nature. Although this dualism saved mind from loss of reality or reduction to the nonmental, it introduced the problem, unsolvable in Cartesian terms, of how this bifurcated nature can yet be one, how the processes of mind and of matter can impinge on each other. The philosophies of nature in Benedict de Spinoza and Gottfried Wilhelm Leibniz both try strenuously to deal with this problem. Spinoza affirms a monistic and pantheistic position (*Deus sive natura*), but the dualism breaks out again in the inexplicable relation between extension and thought—a dualism not of substances but of attributes. In Leibniz’s pluralist world the relation between material and mental aspects of monads is no more intelligible.

George Berkeley’s account of nature involves a radical criticism and rejection of the notion of material substance. Our experience could, he argued, be explained simply in terms of minds and their ideas, including, crucially, the divine mind, in which the totality of sensible things exists.

In the philosophy of Immanuel Kant the burden of creativity further shifts to the human percipient. If we ask Kant why nature presents to us the persistent basic structure that it does present (such as the ubiquity of cause-effect relations and the spatiotemporal nature of all experience), his answer is that we are here dealing with the inescapable conditions for any experience of nature at

all because “the understanding is itself the source of the laws of nature” (*Critique of Pure Reason*, A 127). The natural world, in the sense of the totality of things, is not in Kant’s view a given whole, not an object of knowledge; for instance, whether we try to show that the world is finite or infinite, our thought runs into an impasse.

In G. W. F. Hegel the dominant language is of development, *nisus*, toward the realization of Absolute Spirit, the end for which nature exists. Necessary transitions, logical rather than temporal, are made from level to level, from nature as inert matter with its externality to life, consciousness, the inwardness of spirit. Subsequent philosophies of nature, however, like those of Henri Bergson, Samuel Alexander, and A. N. Whitehead, were avowedly evolutionary, understandably so in an age that saw rapid development of the biological sciences, particularly biological evolutionary theory, and that had a new historical consciousness of human existence. Alexander saw the evolutionary process as the continuing “emergence” of the qualitatively new: God was to be conceived not as the initial creator or sustainer of nature but as the extrapolation of the evolutionary process to an ideal limit.

Theories involving a life force or other speculative, teleological accounts of nature have been strenuously opposed by various forms of materialism and antimetaphysical positivism.

**USE OF ANALOGIES.** Successive conceptions of nature (like conceptions of the state) can be seen as a procession of images or controlling analogies. Dominant in Greek cosmology, for instance, was the image of nature as suffused with life and intelligence, like a living and growing organism. At the opposite pole, as in some seventeenth- and eighteenth-century cosmologies, nature is pure machine, directed from without by the divine intelligence. Or, again, nature is neither permeated by mind nor is it a mechanism in the hand of its Mechanic; it is a self-transforming system, essentially temporal, whose development is best understood through the analogies of biological evolution or human history. To make explicit the guiding analogy is an important step in appraising an account of nature. For example, it is a standing temptation for a philosopher who is working out such an account to overextend an explanatory principle that is proving dramatically fruitful in some limited area of investigation to make it seem to cover nature as the totality of things and processes.

## NATURE AS NORM

Corresponding to different philosophies of nature are markedly different answers to questions about the relation of nature to value: Can values be in any way derived from descriptions of nature? does nature set any norms for man? can appeals to nature and the natural properly settle moral or aesthetic perplexities? Various answers to these questions have been suggested in naturalistic ethical theories and in discussion of the naturalistic fallacy.

If, on the one hand, nature is seen as irreducibly complex, the theater not of a simple cosmic process but of countless and diverse processes, and if these processes have produced mind but are not themselves guided by intelligence, then there will be little plausibility in arguing directly from “natural” to “good” or “obligatory.”

On the other hand, where nature is taken as created by a wholly good, wise, and omnipotent deity, to be natural is *prima facie*, to be *worthy* of being created by such a deity. But the existence of evil, however accounted for, makes the inference, even in this context, unreliable. The natural man may now be contrasted with the regenerate man, and “natural” thus come to have a depreciatory sense. Alternatively, the sinful can be held as unnatural—that is, as perverting the divinely appointed course of nature. The question “What is natural?” cannot now, however, be answered from a simple inspection of what actually happens in the world.

**HISTORICAL EXAMPLES.** The demand that we should follow nature occurs in a wide variety of ethical theories, not only in Christianity. It was against an ethic of following nature that J. S. Mill eloquently argued in his “Essay on Nature” (in *Three Essays*). To Mill nature means either (1) “the sum of all phenomena, together with the causes which produce them” or (2) those phenomena that take place “without the agency ... of man.” Which of these senses can be intended when someone is enjoined to follow nature or when some act is condemned as unnatural? In the first sense *every* action is natural; no ground is given for discrimination between alternative courses. But is the second sense more helpful? “For while human action cannot help conforming to Nature in the one meaning of the term, the very aim and object of action is to alter and improve Nature in the other meaning.” Behind the injunction to follow nature lies a dim belief that “the general scheme of nature is a model for us to imitate.” Look at nature in some detail, however. Its processes are quite indifferent to value and desert. “Nearly all the things which men are hanged or imprisoned for doing to one another, are nature’s every day per-

formances.” Even if it were true that some good ends were ultimately and obscurely served and realized by nature’s processes, that would give no license to men to follow nature as a moral exemplar (to “torture because nature tortures,” for example).

In any case, Mill argues, the presence of evil and indifference to value in nature cannot be reconciled with theistic claims about the omnipotence and perfect goodness of God. It is nonsense to argue that such a God has to bend to stubborn necessities since he “himself makes the necessity which he bends to.”

With regard to *human* nature, as with nature at large, Mill’s imperative is “not to follow but to amend it.” Morality cannot be founded on instinct but on a strenuously achieved victory *over* instinct, as courage is a victory over fear. Similar views are found in T. H. Huxley and even, with important qualifications, in the later Sigmund Freud.

Philosophical views of nature can be relevant to problems of evaluation in much more complex ways than we have thus far noted. One’s conception of how man is related to the rest of the natural world may help to determine—in conjunction with many other factors—one’s sense of the importance or unimportance of human life, the roles judged reasonable and unreasonable for men to adopt. Here are some historical examples.

Did a geocentric astronomy give a uniquely privileged place to Earth and to humanity? The symbolism was ambiguous; to be in the center was certainly to be the focus of the cosmic drama of fall and redemption. “Man is but earth,” said John Donne. “’Tis true; but earth is the centre” (“Sermon Preached at St. Paul’s, Christmas Day, 1627”). Yet the center, the sublunary region, was nevertheless the humblest position, the realm of mutability, in contrast to the unchanging heavens. The shift to a heliocentric view was not, therefore, a catastrophic and disorienting demotion. It could be seen as an equally effective symbolic expression of creatureliness, Earth being placed in a proper subordination to the sun (for example, see Nicolas Copernicus and Kepler). “The sun, seated on his royal throne, [does] guide his family of planets” (Kepler, *De Revolutionibus*, Book I, Ch. 10).

A far more radical shift in sixteenth- and seventeenth-century cosmology was the move toward acceptance of the universe as infinite and with that the obliterating of a locatable center or circumference. But this view, which, in fact, had no effective *scientific* backing, was largely a late development of the metaphysical Platonic idea of God’s infinite fecundity, a view that also

guaranteed humanity a position of dignity in the ladder of being (see A. O. Lovejoy, *The Great Chain of Being*, Ch. 4). This well shows how (at least in a period of metaphysical confidence) the importance or unimportance of man has not been a matter of attempted inference from observations of nature alone.

The same point can also be illustrated from sixteenth- and seventeenth-century arguments about the alleged “cosmic fall.” If nature is inclement and hostile, this is because nature participated in the effects of man’s fall into sin. It follows that the proper, God-intended destiny of man cannot be found in this fallen nature; it must be discovered in the revealed word of God.

More generally, reference to man’s place in nature, for instance to his physical minuteness, could be used to depreciate the quest for “worldly” glory as a preparation for spiritual discipline. “Who can be great,” asked Drummond of Hawthornden, “on so small a Round as is this Earth?” And Blaise Pascal asked: “Qu’est ce qu’un homme dans l’infini?” (“What is a man in face of the infinite?”). The vastness of nature could equally well be taken as evidence of man’s importance in God’s eyes; for on independent theological grounds the whole of nature could be seen as primarily a dwelling place for man. As Pierre de la Primaudaye expressed it, “I cannot marvel enough at the excellencie of Man, for whom all these things were created and are maintained.” Most of these arguments, with their ingredients capable of endless variation, assume that “in order to form a correct estimate of ourselves we must consider the results of the investigations ... into the dimensions and distances of the spheres and stars” (Maimonides)—*mutatis mutandis* for later cosmologies.

In sharp contrast, at a time when there is little or no metaphysical and theological confidence and when deriving value judgments from statements of fact is deemed logically impossible, it is tempting to deny that accounts of nature can have any bearing on problems of value. F. P. Ramsey wrote: “My picture of the world is drawn in perspective, and not like a model to scale. The foreground is occupied by human beings, and the stars are all as small as threepenny bits” (*Foundations of Mathematics*). It is possible to make one’s judgments about the value of human life independently of cosmic reflections and then to adopt an imaginative picture of the natural world that harmonizes rather than conflicts with that evaluation. There can be no logical or philosophical objections to that as long as one realizes exactly what is being done. Such an imaginative exercise, however, must be distinguished from a thoroughgoing anthropocentric philoso-

phy of nature, and Ramsey himself has been criticized for falling into exactly that (see J. J. C. Smart, *Philosophy and Scientific Realism*, New York, 1963, p. 25). For Ramsey went on to say: “I don’t really believe in astronomy, except as a complicated description of human ... and possibly animal sensation.”

It is worth noting, finally, that arguments about aesthetic judgments have also relied on the vocabulary of *nature* and *natural* and relied on it in many differing and conflicting ways. Presenting or being true to nature has sometimes meant the faithful mirroring of the empirical world or the pursuit of the ideal type or the pursuit of the average type or a concern with whatever has not been modified by man (see A. O. Lovejoy, *Essays in the History of Ideas*, “Nature as Aesthetic Norm”). Works of art have been commended as sharing the characteristics of nature through being regularly patterned (compare to nature’s mathematical intelligibility), through being rich in content, or through being austerely simple. To be natural can be to show spontaneity, to be unfettered by artificial rules, to reach toward the unspoiled and primitive. Where there is such extraordinary conflict of senses, only a scrutiny of the context can determine what criteria are being applied in any particular case, and a writer who is aware of this web of ambiguities in “natural” and “nature” may well decide to choose—wherever possible—words of greater precision and stability of meaning.

## NEGATION

Negation, or denial, is the opposite of affirmation. It may be something that somebody does (“I deny what you have said”) or the answer “No” to a question, but its full expression is generally a sentence. One sentence or statement may be the negation or denial of another, or we may

call a statement simply a negation, or a negative statement, as opposed to an affirmative one, or affirmation. A negation in the last sense will contain some sign of negation, such as the “not” in “Grass is not pink” or “Not all leaves are green,” the “no” in “No Christians are communists,” or the phrase “it is not the case that” in “It is not the case that grass is pink.” The negation of a sentence may simply be the same sentence with “it is not the case that” prefixed to it, or it may be some simpler form equivalent to this. For example, it might be said that “It is not the case that grass is pink” is negated or denied not only by “It is not the case that it is not the case that grass is pink” but also by the plain “Grass is pink” and that “If he has shut the door, it must have been open” is negated or denied by “He could have shut it even though it was already shut.”

Contradictory negation, or contradiction, is the relation between statements that are exact opposites, in the sense that they can be neither true together nor false together—for example, “Some grass is brown” and “No grass is brown.” Contrary negation, or contrariety, is the relation between extreme opposites (which may very well both be false)—for example, “No grass is brown” and “All grass is brown.” Incompatibility is the relation between statements that cannot both be true, whether or not they stand at opposite ends of a scale (“This is black all over” is incompatible with “This is green all over” as well as with “This is white all over”). Incompatibles imply one another’s denials (what is black all over is not green all over or white all over).

Some of these technical expressions apply to terms as well as to statements. The terms *black*, *green*, and *white*, for example, are incompatible; nothing can be more than one of these at once, at least not at the same time, at the same point, from the same angle, and so on. There are also “negative terms,” usually formed by prefixing “non” or “not” to the corresponding positive term—for instance, *nonred*, *not-red*.

The concept of negation is closely related to that of falsehood, but they are not the same. Sometimes it is the negation that is true and the corresponding affirmation that is false. But in denying a statement, we implicitly or explicitly assert that the statement in question is false, though, of course, the assertion that something is false may itself be true.

There is also a connection between the concept of negation, especially as applied to terms, and that of otherness or diversity. What is not red is other than anything that is red, and what is other than anything that is red is not red. The class of things that are other than all the things included in a given class—that is, whatever exists

besides the members of that class—constitutes the remainder or complement of the given class.

## INTERNAL AND EXTERNAL NEGATION

When a proposition is complex, it is often important to distinguish the negation of the proposition as a whole (“external” negation) from propositions resulting from the negation of some component or components of it (“internal” negation). The Stoics noted, for example, that the contradictory denial of an implication “If  $p$ , then  $q$ ” should not be formulated as “If  $p$ , then not- $q$ ” but as “Not (if  $p$ , then  $q$ )”—“That  $p$  does not imply that  $q$ .” “If  $p$ , then  $q$ ” and “If  $p$ , then not- $q$ ” are not even incompatible, although when they are both true, it follows that the component  $p$  (since it has contradictory consequences) must be false. Again “Not ( $p$  and  $q$ ),” which is true as long as  $p$  and  $q$  are not true together, is not to be confused with “Not- $p$  and not- $q$ ,” which is true only if  $p$  and  $q$  are both false and is equivalent to “Neither  $p$  nor  $q$ ”—that is, “Not ( $p$  or  $q$ ).” “Either not- $p$  or not- $q$ ” is similarly equivalent to “Not ( $p$  and  $q$ ).” These relations between the internal and external negations of “and” and “or” statements are called De Morgan’s laws, although they were well known to the medieval Scholastics long before the birth of the nineteenth-century logician Augustus De Morgan.

Some of the distinctions made in the preceding section are now commonly treated as special cases of external and internal negation. For instance, propositions with negative terms are thought of as involving the negation, not perhaps of internal propositions strictly so called, but of internal “propositional functions” (“open sentences”)—for example, “Every non- $A$  is a non- $B$ ” may be paraphrased as “For any  $x$ , if it is not the case that  $x$  is an  $A$ , then it is not the case that  $x$  is a  $B$ ”; the difference between “No  $A$  is a  $B$ ,” the contrary opposite of “Every  $A$  is a  $B$ ,” and the contradictory opposite of the latter, “Some  $A$  is a  $B$ ” or “Not every  $A$  is a  $B$ ,” is perhaps simply that between the internally negated form “For every  $x$ , if  $x$  is an  $A$ , then not ( $x$  is a  $B$ )” and the external negation “Not (for every  $x$ , if  $x$  is an  $A$ , then  $x$  is a  $B$ ).” It is obviously possible to place a sign of negation either inside or outside a variety of other qualifying phrases; for example, we may distinguish “It will be the case that (it is not the case that  $p$ )” from “It is not the case that (it will be the case that  $p$ )” and “It is thought that (it is not the case that  $p$ )” from “It is not the case that (it is thought that  $p$ ).”

By the use of open sentences all the varieties of negation are reduced to the placing of “not” or “it is not the case that” before some proposition or proposition like expression, the whole being either contained or not con-

tained within some wider propositional context. This reduction assumes that with the basic singular form “ $x$  is an  $A$ ” or “ $x \phi$ ’s” there is no real distinction between the internal negation “ $x$  is not an  $A$ ” (or “ $x$  is a non- $A$ ”) or “ $x$  does not  $\phi$ ” and the external negation “Not ( $x$  is an  $A$ )” or “Not ( $x \phi$ ’s).” When the subject “ $x$ ” is a bare “this,” such an assumption is plausible, but when it is a singular description like “The present king of France,” we must distinguish the internal negation “The present king of France is not bald” (which suggests that there is such a person) from the external negation “It is not the case that the present king of France is bald” (which would be true if there were no such person). The thesis that all forms of negation are reducible to a suitably placed “it is not the case that” can be maintained only if the last two cases have an implicit complexity and may be, respectively, paraphrased as “For some  $x$ ,  $x$  is the sole present king of France, and it is not the case that  $x$  is bald” and “It is not the case that (for some  $x$ ,  $x$  is the sole present king of France and is bald).”

### POSITIVE PRESUPPOSITIONS

It is sometimes held that no negation can be bare or mere negation and that whenever anything is denied, some positive ground of denial is assumed, and something positive is even an intended part of what is asserted. It is trivially true that even in denials, such as that grass is pink, something is made out to be the case—namely, that it is not the case that grass is pink. But something more than this is usually intended by the contention.

One thing that could be meant is that every denial must concern something which, whatever else it is not, is itself and, indeed, simply is (exists). We have seen that some types of denial—“This is not a man” and “The man next door does not smoke” (also “Some men do not lie”)—do assert or presuppose the existence of a subject of the denial. But this does not seem to be the case with all forms; for example, no existing subject seems to be involved when we say that there are no fairies. Or if this is taken to mean that among existing things no fairies are to be found (thus presupposing a body of “existing things”—of values for the bound variable  $x$  in “For no  $x$  is it the case that  $x$  is a fairy”), even this positive presupposition seems absent from “There could not be round squares.”

It is also sometimes said that in denying that something is red, we at least assume that it is some other color (counting white, black, and gray as colors); in denying that something is square, we assume that it is some other shape. In general (to use the terminology of W. E. John-

son), in denying that something has a “determinate” form of some “determinable” quality, we assume that it has some other determinate form of it. Sometimes a distinction is made at this point between the predication of a negative term and the simple denial of a predication; for example, it is argued that in saying that a thing is non-blue, we do assume that it is some other color but we do not assume this in simply saying that it is not blue. Others contend that we assume that a thing is some other color even in simply denying that it is blue. All denial, it is said, is implicitly restricted to some universe of discourse; if we deny that something is blue or classify it as nonblue, it is assumed that we are considering only colored things.

Against the weaker form of the theory that the predication of a negative term has positive implications which the denial of a predication does not have, it may be objected that there is no more than a verbal difference between “ $x$  is a non- $B$ ” and “Not ( $x$  is a  $B$ ).” Against the stronger form the objection is that it is perfectly proper to say that virtue is not blue simply on the ground that it is not the kind of thing that could have any color at all. We must always distinguish between what we say and our reasons for saying it (otherwise, there could be no inference at all, as premises and conclusion would coalesce), and there may be diverse reasons for saying exactly the same thing of different subjects—Jones’s favorite flower is not blue because it is pink, and virtue is not blue because being an abstraction, it is not colored at all. But it is perfectly true of each of these subjects, and true in the same sense, that it is not blue.

It may be answered that “This flower is blue” and “Virtue is blue” fail to be true in profoundly different ways—the former because it is false, and the latter because it is meaningless, as meaningless as, for example, “Virtue is but” would be—and, further, whereas the denial of a false statement is true, the denial of a meaningless form of words (that is, the result of attaching a negation sign to it) is itself a meaningless form of words. To this, one possible reply (made by J. M. Shorter in “Meaning and Grammar”) would be to deny that the negation of a meaningless form of words is meaningless; even “Virtue is not but” might be defended as true precisely because it is not only false, but also meaningless, to say that virtue is but. Less desperately, it could be argued that “Virtue is (is not) blue” is not on a par with “Virtue is (is not) but” since the former is at least a grammatically correct sentence while the latter does not even construe. Perhaps, however, the conception of grammar that suggests this distinction is a rather superficial one. Grammar

concerns what words go with what; it is not a set of commands directly fallen from heaven but reflects at least partly the feeling we already have for what does and what does not make sense. Perhaps we need only let this feeling lead us to slightly finer distinctions than the crude one between an adjective and a conjunction to see that “is (is not) blue” no more goes with “virtue” than “is (is not) but” goes with anything.

What is important is the line between falsehood (the negation of which is true) and nonsense (the negation of which is generally agreed to be only further nonsense), wherever this line be drawn. It is also important that what looks like true or false sense may on closer inspection turn out to be nonsense.

### NEGATIVE FACTS

Many philosophers who have found negation a metaphysically embarrassing concept have expressed this embarrassment by denying that there are any negative facts. There are obviously negative as well as affirmative statements, but according to these philosophers, it is incredible that the nonlinguistic facts that make our statements true or false should include negative ones. (The linguistic fact that there are negative statements is, of course, not itself a negative, but a positive, fact.)

This question should not be confused with the question of whether there are objective falsehoods—that is, whether the universe contains such objects as the falsehood that Charles I died in his bed even if no one has ever believed or asserted this falsehood (whether there are falsehoods which are, as it were, waiting around to be asserted or believed, or even denied or disbelieved, just as there are facts waiting to be discovered and stated). For such objective falsehoods, if there were any, would not be facts—a fact is what is the case, not what is not the case. The present question is, rather, whether there are special facts that verify true negative statements, whether, for example, there is any such fact as the fact that Charles I did not die in his bed. There is nevertheless some connection between the two questions. For if there is any such language-independent and thought-independent fact as the fact that it is not the case that Charles I died in his bed, then, that Charles I died in his bed, which in itself is not a fact but a falsehood, would nevertheless seem to have some kind of existence “out there” as a constituent of this more complex object that is a fact.

In both cases, moreover, what deters the philosophers is partly the multiplicity of the objects involved. They cannot believe that there should be not only the fact that Charles I died on the scaffold but also, over and

above that fact, the additional facts that he did not die in his bed, that he was not immortal, that he did not die by drowning, and, furthermore, the facts that he did not die in his bed of appendicitis, that he did not die in his bed of consumption, that he did not die by drowning in six minutes, that he did not die by drowning in six and a half minutes, and so on. This causes an embarrassment of the same sort as the idea that, over and above the fact that he died on the scaffold, there are “out there” the falsehoods that he died in his bed, that he was immortal, that he was drowned in six and a half minutes, and so on.

The most obvious way to reduce this excessive metaphysical population, and the one taken by Raphael Demos (one of the main opponents of negative facts), is to hold that what makes it false to say that Charles I died in his bed and true to say that he did not, false to say that he died by drowning and true to say that he did not, and similarly with all the other alternatives is simply the one positive fact that he died on the scaffold. Against this, however, it may be said that what is asserted by any true statement would seem to be some fact, and the true statement that Charles I did not die in his bed does not assert that he died on the scaffold (even if this is also true). It may be suggested that what the true statement asserts is that Charles died in some positive way that was incompatible with his dying in his bed. This suggestion has the disadvantage (*a*) that it only exchanges negative facts for facts that are vague and general in the way that assertions about something or other (but nothing in particular) are always vague and general and that philosophers who are uneasy about the former (because whatever is real must be particular and positive) are likely to be equally uneasy about the latter. The suggestion also presupposes (*b*) that there are facts of incompatibility—for example, the fact that Charles I’s dying on the scaffold is incompatible with his dying in his bed and that these would seem, like straightforwardly negative facts, to contain objective falsehoods as constituents and would have the same dismaying multiplicity as negative facts or objective falsehoods do.

One way of answering objection (*b*) is to argue that the facts of incompatibility which explain the truth of negative statements never concern incompatibilities between propositions but always concern incompatibilities between qualities, like the incompatibility between red and blue or between one way of dying and another. This is to make a certain sort of internal negation the fundamental form in terms of which all other types of negation are to be defined. This eliminates the horde of positive falsehoods that are incompatible with the actual

positive facts in favor of a possibly smaller and anyway more acceptable horde of incompatible qualities, each capable in itself of qualifying a real object but unable to do so at the same time as the others. But although there is some plausibility in accounting for simple singular negations in this way (that is, in taking the simple “ $x$  is not  $A$ ” to be true, when it is true, because  $x$  is something incompatible with being  $A$ ), it is hard to deal similarly with the negations of more complex forms—for example, “Not everything is  $A$ ” or “It is not the case that if  $x$  is  $A$ , then  $y$  is  $B$ .”

Difficulties in dealing with more complex negations also arise with the suggestion that the facts that verify negative statements are facts not so much about incompatibility as about otherness. It is important to note that the otherness account cannot take quite the same form as the incompatibility one; although the fact that  $x$  is something incompatible with being red will suffice to verify “ $x$  is not red,” “ $x$  is something other than red” will not, for  $x$  may be something other than red (for instance, round) and be red as well. The otherness account would have to claim that what verifies “ $x$  is not  $A$ ” is the fact that  $x$  is other than everything that is  $A$ . This account, like the preceding one, seems to be applicable only to simple singular negation. However, if the complexities that can arise are capable of being listed, it might be possible to give a separate account of the negation of each kind of complexity. Thus, having said what the simple “ $x$  is not  $A$ ” means, we may say that in forms like “Not (not- $p$ ),” “Not ( $p$  and  $q$ ),” “Not ( $p$  or  $q$ ),” “Not (everything  $\phi$ ’s),” and “Not (something  $\phi$ ’s)” (that is, “Not anything  $\phi$ ’s”), the apparently external “not” is to be defined in terms of a comparatively internal “not” as follows:

- Not (not- $p$ ) =  $p$ ,
- Not ( $p$  or  $q$ ) = (Not- $p$ ) and (not- $q$ ),
- Not ( $p$  and  $q$ ) = (Not- $p$ ) or (not- $q$ ),
- Not (for every  $x$ ,  $x$   $\phi$ ’s) = For some  $x$ , not ( $x$   $\phi$ ’s),
- Not (for some  $x$ ,  $x$   $\phi$ ’s) = For every  $x$ , not ( $x$   $\phi$ ’s).

In any given complex formed in these ways the innermost negations—the only ones that remain when all the reductions have been performed—will be simple singular negations explainable as above in terms of otherness or incompatibility.

## NEGATION, FACTS, AND FALSEHOOD

Another way of eliminating negative facts might be by defining negation in terms of disbelief or falsehood. Affirmative statements, we might say, express beliefs whereas negative ones express disbeliefs. Disbelief, however, is not just the absence of belief, and like belief it

must have an object—it must be disbelief in something or disbelief of something—and it must be justified or unjustified; if justified, whatever justifies it must be either a negative fact or whatever we replace negative facts with when using some other and more objective method of dissolving them.

In terms of falsehood we might say that the contradictory negation of a statement is the statement that is true if the given one is false and false if the given one is true. This amounts to defining negation by means of its truth table, a course advocated by Ludwig Wittgenstein in the *Tractatus*. To this it may be objected that talk of the statement which is true when a given statement is false and false when it is true is legitimate only if we know that there is one and only one statement which meets these conditions, and this seems unlikely; for example, since “Oxford is the capital of Scotland” is false in any case, “Either Oxford is the capital of Scotland or grass is not green” is true if “Grass is green” is false and false if it is true, but what is stated by this complex does not seem to be simply the negation of “Grass is green.” It may also be objected that statements are not simply true and false in themselves, as if truth and falsehood were simple properties requiring no further explanation. By the usual definition “Grass is green” is true if grass is green and false if it is not, but to say this is to define falsehood in terms of negation rather than vice versa.

Perhaps the whole problem about negative facts—and the problem about the objective falsehoods that would be parts of such facts if there were any—arise from thinking of facts (and falsehoods) too literally as objects or entities. It is not merely that there are no negative facts but, rather, that there are no facts. That is, expressions of the form “The fact that  $p$ ” do not name objects, whether or not our “ $p$ ” is negative in form. The word *fact* has meaning only as part of the phrase “it is a fact that” (that is, “it is the case that”), and “It is a fact that grass is (or is not) green” is just another way of saying the simple “Grass is (or is not) green.” “There are negative facts” is true and, indeed, makes sense only if it means “For some  $p$ , it is not the case that  $p$ .” But in this sense it is true and metaphysically harmless; it does not mean that there are objects called “That  $p$ ” which go through a performance called “not being the case,” and still less does it mean that there are objects called “The not-being-the-case of that  $p$ .”

Even with this caution, however, one can sensibly inquire whether signs of negation are really indispensable—whether what we say when we use them cannot also be said, and more directly, without them—and whether signs of negation are not just convenient abbreviations

for complex forms into which no such signs enter. Putting the question in this way, modern logic has evolved other devices for eliminating negation besides the ones thus far mentioned, devices which are worth examining, even though they are a little technical, and which require some preliminary account of negation as the logician sees it.

**LAWS OF NEGATION.** Negation figures in formal logic primarily as the subject of certain laws, of which the best known are those of contradiction and excluded middle. The law of contradiction asserts that a statement and its direct denial cannot be true together (“Not both  $p$  and not- $p$ ”) or, as applied to terms, that nothing can both be and not be the same thing at the same time (“Nothing is at once  $A$  and not- $A$ ”). The law of excluded middle asserts that a statement and its negation exhaust the possibilities—it is either the case that  $p$  or not the case that  $p$ —or, as applied to terms, that everything either is or is not some given thing—say,  $A$ . Each of these laws may be put in the form of an implication, or “if” statement; the law of contradiction then appears as “If  $p$ , then not not- $p$ ,” and the law of excluded middle as “If not not- $p$ , then  $p$ .” Sometimes the combination of these two, “ $p$  if and only if not not- $p$ ,” is called the law of double negation.

Each of these laws involves a number of derived or related laws. From the law of contradiction it follows that what has contradictory consequences is false; if  $p$  implies  $q$  and also implies not- $q$  (and so implies “ $q$  and not- $q$ ”), then not- $p$ . From the law of excluded middle it follows that what is implied by both members of a contradictory pair is true; if  $p$  implies  $q$  and not- $p$  equally implies  $q$ , then  $q$ . Again, because of the law of contradiction whatever implies its own denial is false, for if  $p$  implies not- $p$ , it implies both  $p$  and not- $p$  (since it certainly implies  $p$ ) and thus cannot be true. This is the principle of *reductio ad absurdum*. To take an ancient example, if everything is true, then it is true (among other things) that not everything is true; hence, it cannot be the case that everything is true. Perhaps we can also argue that if it is a fact that there are no negative facts, then that is itself a negative fact; thus, it cannot be that there are no negative facts. Correspondingly, from the law of excluded middle it follows that whatever is implied by its own denial (that is, what we are compelled to affirm even when we try to deny it) is true. (The later Schoolmen called this the *consequentia mirabilis*.)

Another important law involving negation is the law of contraposition, or transposition, that if  $p$  implies  $q$ , then the denial of  $q$  implies the denial of  $p$  or, for terms,

if every  $A$  is a  $B$ , then every non- $B$  is a non- $A$ . If this is combined with the first law of double negation (“If  $p$ , then not not- $p$ ”), we obtain “If  $p$  implies not- $q$ , then  $q$  implies not- $p$ ”; if it is combined with the second law of double negation (“If not not- $p$ , then  $p$ ”), we obtain “If not- $p$  implies  $q$ , then not- $q$  implies  $p$ ,” and with both we obtain “If not- $p$  implies not- $q$ , then  $q$  implies  $p$ .”

Many logicians have questioned the law of excluded middle and the laws associated with it. In particular, the intuitionist logic of L. E. J. Brouwer and Arend Heyting contains none of the laws “Either  $p$  or not- $p$ ,” “If not not- $p$ , then  $p$ ,” “If  $p$  implies  $q$  and not- $p$  also implies  $q$ , then  $q$ ,” “If not- $p$  implies  $p$ , then  $p$ ,” “If not- $p$  implies  $q$  (not- $q$ ), then not- $q$  ( $q$ ) implies  $p$ .”

**FORMAL DEFINITIONS OF NEGATION.** The laws just discussed and many others figure in modern symbolic calculi as theorems derived by stated rules of inference from given axioms. Some of them, indeed, may themselves appear as axioms, different formulas being taken as axiomatic in different symbolic presentations. The symbols used, moreover, will be divisible into “primitive” symbols that are introduced without explanation and other symbols that are introduced by definition as abridgments of complexes involving other symbols. Which symbols are taken as primitive and which are defined will vary with the particular systematic presentation adopted.

Gottlob Frege, for example, took symbols corresponding to “if” and “not” as undefined and introduced the form “ $p$  or  $q$ ” as a way of writing “If not- $p$ , then  $q$ ” (“Either I planted peas, or I planted beans” = “If I did not plant peas, I planted beans”). Bertrand Russell at one stage did the same, but he later took “not” and “or” as his primitives, defining “If  $p$ , then  $q$ ” as “Either not- $p$  or  $q$ ” (“If you smoke, you’ll get a cough” = “Either you won’t smoke, or you’ll get a cough”) and “ $p$  and  $q$ ” as “Not either not- $p$  or not- $q$ .” Other writers have defined all the other symbols in terms of “not” and “and.” For example, they have defined “If  $p$ , then  $q$ ” as “Not ( $p$  without  $q$ )”—that is, “Not ( $p$  and not- $q$ )” and “ $p$  or  $q$ ” as “Not both not- $p$  and not- $q$ .”

In all these examples the negation sign appears as one of the primitive or undefined symbols, but there are also systems in which this is not the case and in which “not” is defined in terms of something else. For example, Jean Nicod uses a single undefined stroke in such a way that “ $p | q$ ” amounts to “Not both  $p$  and  $q$ ” and “Not- $p$ ” is defined as “ $p | p$ ” (Not both  $p$  and  $p$ ). Russell sometimes attempts to avoid even the appearance of complexity in

his verbal rendering of Nicod's stroke by reading " $p \mid q$ " as " $p$  is incompatible with  $q$ ," but this would ordinarily be understood as a little stronger than what is intended. We would not normally say that "London is the capital of England" was incompatible with "Berlin is the capital of France," but it is correct to say "London is the capital of England  $\mid$  Berlin is the capital of France," since the two components are not both true.

An earlier and more interesting device was that of C. S. Peirce, who defined negation as the implication of something false. This is not quite a definition of negation in terms of falsehood. Formally, what is meant is that we arbitrarily choose some false proposition—say, "The ancient Romans spoke Polish"—and introduce "Not- $p$ " as an abbreviation for "If  $p$ , then the ancient Romans spoke Polish." It is also possible to take as our standard false proposition for this purpose a formula which itself has some logical significance. In his later years Peirce himself liked to use the proposition "For all  $p, p$ ," which is, roughly, "Everything is true" (which was shown to be false in the previous section of this entry). In common speech we come close to defining "Not- $q$ " as "If  $q$ , then for all  $p, p$ " when we say of something we wish to deny, "If you believe that, you would believe anything." A similar definition of "Not- $p$ ," used by Russell in his early writings, is "For all  $q$ , if  $p$ , then  $q$ ." Starting in this way, it is possible to define all the symbols of logic in terms of "if" and the quantifier "for all  $x$ ." Certain further technical devices make it possible to define both "if" and "for all  $x$ " in terms of a single operator that can be read as "For all  $x$ , if ..., then ..." or "If ever ..., then ..." (Russell's "formal implication," perhaps better called "universalized implication").

Given definitions of this type, the characteristic laws of negation fall into place as special cases of the characteristic laws of implication or of universality (or both). For instance, the law of transposition, "If (if  $p$ , then  $q$ ), then (if not- $q$ , then not- $p$ )," expands to "If (if  $p$ , then  $q$ ) then if (if  $q$ ; then anything-at-all), then (if  $p$ , then anything-at-all)," which is just a special case of the law of syllogism, "If (if  $p$ , then  $q$ ), then if (if  $q$ , then  $r$ ), then (if  $p$ , then  $r$ )." Moreover, the peculiarities of the intuitionistic negation of Brouwer and Heyting turn out simply to reflect those of intuitionistic implication.

Intuitionistic logic, for example, contains the law "If  $p$  implies  $q$ , then if  $p$  also implies that  $q$  implies  $r$ ,  $p$  implies  $r$ "; therefore, it contains the special case "If  $p$  implies  $q$ , then if  $p$  also implies that  $q$  implies the falsehood, then  $p$  implies the falsehood"—that is, "If  $p$  implies  $q$ , then if  $p$  also implies not- $q$ , then not- $p$ ." But it does not

contain the law "If  $p$  implies  $r$ , then if  $p$ 's implying  $q$  also implies  $r$ , then  $r$ " (this law, being verified by the usual truth-tables for "if" and "not," does appear in nonintuitionistic or classical implicational logic) and therefore does not contain the law "If  $p$  implies  $r$ , then if  $p$ 's implying the falsehood also implies  $r$ , then  $r$ " ("If  $p$  implies  $r$ , then if not- $p$  also implies  $r$ , then  $r$ ").

It is also possible in both intuitionistic and classical logic to separate those laws of negation which are (or may be represented as) merely special cases of laws of implication (as in the above examples) and those that reflect the special features of what a proposition is being said to imply when we negate it. For example, both versions of logic contain the law (1) "If  $p$ , then if also not- $p$ , then anything-at-all." But neither logic contains as a law the implicational formula of which this would be (if they had it) a special case, "If  $p$ , then if  $p$  implies  $r$ , then anything-at-all." However, they do both have, quite naturally, (2) "If  $p$ , then if  $p$  implies that everything is true, then anything-at-all." To get (1), in other words, it is important not only that we should see "Not- $p$ " as something of the form "If  $p$ , then  $r$ " but also as this particular thing, "If  $p$ , then everything is true." If we drop from intuitionistic logic those laws of negation which require attention to this more special point, we obtain the "minimal" calculus of I. Johansson ("Der Minimalkalkül," *Compositio Mathematica*, Vol. 4, 119–136).

## TECHNICAL ELIMINATIONS OF NEGATION

Do the developments just sketched mean that we can dispense with negative facts by saying that the facts stated by true negative statements are ones that do not involve any special concept of negation but only (in one version) Nicod's stroke or (in the other) implication and universality? The suggestion, especially in its Peircean form, has its attractions. Peirce's definition would at least explain why negation is a proper subject of study for pure logicians. Logic studies universal rules of implication; even the purest logic must study whatever is involved in the very notions of implication and universality; and what Peirce means by negation is thus involved. Facts as to what is not the case are in this view only an instance of a more general type of complex fact without which logic would be impossible—namely, facts as to what leads to what.

Against this suggestion one might adduce the extreme artificiality and arbitrariness of these symbolic devices. Consider the fact that it is equally possible in a symbolic system to define "and" in terms of "or" and

“not” and “or” in terms of “and” and “not.” Whatever this fact signifies, it cannot signify that “Not (not- $p$  or not- $q$ )” is the real meaning of “ $p$  and  $q$ ” and that the very form “ $p$  or  $q$ ” that is used in this explanation has for its real meaning “Not (not- $p$  and not- $q$ ).” This procedure would obviously be circular, and for this reason we cannot, even symbolically, have both definitions in the same system. It is obvious that the form “or” cannot be both simple and unanalyzable and a complex built up out of “and” and “not”; at least, it can only be this by being used ambiguously and, similarly, *mutatis mutandis*, with “and.” The systems with the different definitions are equivalent in the sense that, given suitably chosen axioms, the same formulas will appear in them as theorems, and the undefined “and” (or “or”) and the defined one are equivalent in the sense of having the same truth tables. But if there is an intuitively simple meaning of the form “ $p$  and  $q$ ,” “and” in this sense simply does not appear (is not symbolized) in a system which has only “or” and “not” as its undefined symbols and introduces “ $p$  and  $q$ ” as short for “Not (not- $p$  or not- $q$ ).” Primitiveness in a convenient calculus is one thing; intuitive or conceptual simplicity, another. No one symbolic system, we may surmise, can express everything, and in any given system we can take whatever we please as undefined, even if its intuitive meaning is complex.

Turning now to the calculi in which “not” is defined, it is notoriously difficult to explain the meaning of Nicod’s stroke except by saying that “ $p | q$ ” means “Not both  $p$  and  $q$ ” or that it means “Either not- $p$  or not- $q$ ”; furthermore, the “not” that is introduced by defining “Not- $p$ ” as “ $p | p$ ” cannot be the “not” which is used in this explanation, though for purposes of logical calculation it may serve just as well. It could similarly be said that the “if” which Peirce uses in his definition of “not” cannot be understood without a more primeval “not” being presupposed. For Peirce did not use “If  $p$ , then  $q$ ” in the familiar sense in which it means that  $q$  would be a logical consequence of  $p$ ; it is not true that whenever  $p$  happens not to be the case, it would logically follow from it that everything whatever is true. Even the colloquial “If you believe that, you would believe anything” is not said of anything we wish to deny but only of particularly outrageous items (things that not only are not, but also could not, be the case). What Peirce meant by “If  $p$ , then  $q$ ,” it might be said, can be explained only by saying that it means “Not at once  $p$  and not- $q$ ,” and this explanation uses a “not” that cannot be derived from his definition because the definition presupposes that “not.”

Additionally, it might be argued that our intuitions as to what is a construction from simpler conceptions and what is itself simple are not very reliable and that if a definition introduces new economies into a calculus and, still more, if it brings a new unity to a whole subject, this may well be a symptom that it also reveals what is conceptually fundamental. The treatment of “not being the case” as an extreme case of implication—as “implying too much,” so to speak—does at least reflect something important about the relation between the two concepts. A proposition’s implying something, having consequences, is like its taking a risk, and its not being the case is its having too strong consequences.

## NEGATION IN INDIAN PHILOSOPHY

From the early centuries CE onward, the philosophical traditions of ancient India produced theories of negation in a broad variety of contexts, dealing with such diverse issues as negative existentials, the referentiality of empty terms, and the laws of the excluded middle and double negation. Highly technical expositions of logical principles pertaining to negation can be found in particular, though not exclusively, in the literature of the so-called New Nyāya (*Navya-Nyāya*) as of approximately the tenth century (Ingalls 1951, Matilal 1968). Earlier theories are noteworthy especially for their reflections on the nature of absence and its knowledge, in other words, for addressing the issue of negative facts and negative knowledge. These theories developed on the background of an overarching discourse about instruments of knowledge (*pramāṇa*) that shaped philosophical debate from the first centuries CE onward throughout the first millennium and is one of the most distinctive traits of classical Indian philosophizing.

Modern research on Indian theories of negation is still at a preliminary stage, and source materials in some important areas are transmitted only in fragments. On the basis of what is currently known, the Vaiśeṣika, the Nyāya, and the Mīmāṃsā traditions of Indian philosophy, as well as the logico-epistemological branch of Buddhism, deserve to be highlighted for their theories of negative knowledge. The Vaiśeṣika, an early philosophy of nature that emerged during the first two centuries CE, is mainly concerned with comprehensive enumeration and identification of the constituents of the world. The Nyāya, which originated in an old debate tradition and is primarily interested in the method of proof, integrated the Vaiśeṣika’s ontological foundations into its own set of logical and epistemological principles (Franco and Preisendanz 1998). The Mīmāṃsā, originally devoted mainly to the exegesis of the Veda, likewise took over Vaiśeṣika ontology, but with much more creative adaptation. Within the Mīmāṃsā, the views of Kumārila (early seventh century CE) about absence and its knowledge differ from those of Prabhākara, who may have been Kumārila’s contemporary. The logico-epistemological branch of Buddhism has as its two main representatives Dignāga (late fifth/early sixth century) and Dharmakīrti (early seventh century), of whom the latter developed a succinct theory of negative knowledge, perhaps in critical response to Kumārila.

### FORMS OF ABSENCE AND THEIR KNOWLEDGE IN VAIŚEṢIKA LITERATURE

In the *Vaiśeṣikasūtra* (*VS*), a compilation of often elliptic mnemonic sentences that gradually grew as of the first two centuries CE, we find disparate identifications of specific forms of absences and brief statements of how some of them are known. As interpreted by the earliest available commentary by Candrānanda (active between the sixth and tenth centuries), *VS* 9,1–5 present four varieties of absence: the prior absence of an effect in its cause (*prāgabhāva*), the posterior absence of a cause after its destruction (*pradhvaṃsābhāva*), the mutual absence (*anyonyābhāva*) as the mutual difference between two things like a cow and a horse, and the absolute absence (*atyantābhāva*) of, for example, a hare’s horn. Further forms of absences, added in *VS* 9,8–11, were most likely inserted into the text at a later stage. *VS* 9,6–7 describe, again according to Candrānanda, how prior and posterior absence are known, but without specifying an instrument of knowledge.

According to the *Praśastapādabhāṣya* by Praśastapāda (early sixth century), which comes to represent classical Vaiśeṣika thought, absence is cognized through inference, but not through a separate instrument of knowledge, for just as an arisen effect is an inferential sign for the occurrence of its sufficient causes, so is the nonarisen effect an inferential sign for the nonoccurrence of its sufficient causes. Candramati, whose *Daś-apadārthaśāstra* was most probably composed between 450 and 550 and is only preserved in Chinese translation and presents an idiosyncratic version of Vaiśeṣika, lists absence as a separate ontological category. Divided into five forms, it is the object of inference. In Śrīdhara's *Nyāyakandalī* (late tenth century), and in Udayana's *Kiraṇāvalī* (early eleventh century), absence is likewise accorded the status of a separate ontological category.

#### THE KNOWLEDGE OF ABSENCE IN NYĀYASŪTRA, -BHĀṢYA, AND -VĀRTTIKA

In the *Nyāyasūtra* (NS), the foundational text of the Nyāya tradition that was formed between the second and fifth centuries, the knowability of further forms of absences, over and above prior and posterior absence—mutual and absolute absence are not dealt with—is emphatically defended, on the basis of an example that Vātsyāyana's commentary *Nyāyabhāṣya* (late fifth century) explains as follows: With regards to a pile of marked and unmarked clothes, someone is told “get the unmarked clothes!” and then cognizes the absence of marks in some clothes (commentary on NS 2,2,8; Kellner 1997; for a different interpretation of this section from NS, compare Matilal 1968). Whereas these remarks can be read as an attempt to expand the scope of knowable absence, the beginning portion of the *Nyāyabhāṣya* addresses the knowability of absence from a general viewpoint. For Nyāya, knowing reality, that is, the “being such [of the sixteen cardinal principles of Nyāya]” (*tattva*), is required for attaining liberation from the cycle of rebirth. Reality is the existence of what exists and the nonexistence of what does not exist. Knowledge that something does not exist arises when, through a certain instrument of knowledge, something else is known to exist, based on the thought process “if this [absentee] existed here, it would have to be cognized just like this [actually existing thing]; because its cognition is absent, it does not exist.” The instrument of knowledge that illuminates something existent also illuminates something nonexistent. In keeping with this line of thought, the subcommentator Uddyotakara (c. 550–610) specifies absence as an object of

sensory perception in his *Nyāyavārttika*; this becomes the orthodox Nyāya position.

#### THE MĪMĀṂSAKA KUMĀRILA: A SEPARATE INSTRUMENT OF KNOWLEDGE FOR KNOWING ABSENCE

Both the Buddhist epistemologist Dharmakīrti and the Mīmāṃsaka Kumārila developed comprehensive and detailed theories about the knowledge of absences. But whereas Dharmakīrti appears to have found his way of formulating and addressing the knowledge of absence as a philosophical problem only gradually, in the course of his works *Pramāṇavārttika*, *Pramāṇavinīścaya*, and *Hetubindu* (Kellner 2003), Kumārila's conception of absence and its knowledge in his *Ślokavārttika* is already part and parcel of a general philosophical approach that John Taber (2001) dubs a theory of the unitary nature of substance. All features of a substance, while different from each other, are identical with the substance itself and indirectly with each other. Nonexistence is an integral building block of reality in that every real entity is existent as itself and nonexistent as everything else (Kellner 1996, 1997). Accordingly, nonexistence has the function of accounting for the unmixed character of real entities. Kumārila distinguishes the four types of absence that are later enumerated by Candrānanda while commenting on *Vaiśeṣikasūtra* 9,1–5. In keeping with the claim that an entity is nonexistent as something else, Kumārila describes all four types with the help of relational statements—a hare's head, for instance, is nonexistent as a horn-bearer, or a cow is nonexistent as a horse.

Though a part of every real entity, nonexistence is nevertheless separate from existence and requires an instrument of knowledge of its own. The five instruments of knowledge—perception, inference, verbal knowledge, analogy, and implication—are limited to grasping existence, whereas nonexistence is apprehended by the sixth instrument of knowledge called absence, an idea that in general must have been voiced already before Praśastapāda, as he rejected it. According to his commentators, Kumārila took it over from an earlier commentator on the *Mīmāṃsāsūtras* cited in the *Sabarabhāṣya* (early sixth century), but Kumārila's interpretation of this commentator's statements are heavily contested by the Prābhākara-Mīmāṃsakas.

As an instrument of knowledge, Kumārila's *absence* is the nonarising of the other five instruments. It can manifest itself either as the soul's (*ātman*) not being transformed into the knower of the absentee as existent, or as

the knowledge of nonexistence as a part of a real entity (on the latter alternative whose interpretation is problematic, see Kellner 1996, Taber 2001). Whether an entity is known as itself, or as not another, depends on the cognizing subject's intention; the respectively uncognized part always acts as a supporting factor. Kumārila strongly disagrees with the Nyāya view that absence is grasped by sensory perception; his main counterargument is that the five external senses are incapable of coming into contact (*sannikarṣa*) with absence, and Nyāya, after all, requires such contact for any sense perception. Among others, it is this argument that led later Nyāya philosophers like Jayanta (late ninth century) and Bhāsarvajña (tenth century) to revisit the role of contact in the definition of perception (for Jayanta, see Gillon 1997). In addition, Kumārila also argues against the theory that the absence of an object is known through an inference from the nonarising of the five other instruments of knowledge, mainly because this nonarising cannot have an established inferential connection with the absence of the object that any inference requires for being sound, and because the nonarising itself cannot be known—as the absence of arising, it would itself have to be inferred from a further nonarising of instruments of knowledge, and so forth.

In the *Ślokavārttika* and in his *Tantravārttika*, Kumārila applies this instrument of knowledge in arguments that reject entities that opponents assume to exist (Kellner 1996). After demonstrating that these cannot be known by any of the five other instruments, Kumārila concludes that they can only be known through absence, as a result of which they are nonexistent. Such types of arguments are aimed at, for instance, the emptiness (*śūnyatā*) of external reality of Buddhist idealism, a human author of the Vedas as propagated by Buddhists, and an omniscient human being that is, again, assumed by Buddhists. On the whole, Kumārila's theory of nonexistence and its knowledge seems to be geared to accounting for the nature of reality and to establishing philosophical and religious truths. Empirical knowledge of negative states of affairs in everyday life are at best a secondary concern.

### DHARMAKĪRTI'S THEORY OF NEGATIVE ASCERTAINMENT THROUGH INFERENCE

Like other Buddhist philosophers before him, Dharmakīrti believed that absence cannot be an object of perception because perception arises from its particular object as a cause, bearing the object's shape; an absence, however, is devoid of any causal capacity. This belief also

informs Dharmakīrti's rejection of absence as a separate instrument of knowledge, condensely articulated in *Pramāṇaviniścaya*, chapter 3, prose after verse 48, for any such instrument would have to be directly or indirectly caused by its object, and *absence* as an object lacks such a capacity.

Because for Dharmakīrti there is no further instrument of knowledge besides perception and inference, negative knowledge is for him the result of inference. While perception has direct and unmediated access to real particulars in a nonconceptual fashion, inference operates with properties and concepts that are superimposed on particulars in accordance with the practical function that these jointly fulfill, and in accordance with linguistic conventions. As a result, inferences that establish negative states of affairs, based on a special type of evidence called nonperception (*anupalabdhi*) that is exclusively reserved for this purpose, ultimately prove that something is suitable for being ascertained as, and in a second step verbally referred to or physically treated as absent. They do not in any way prove a real absence that might be given independently of being cognized.

Furthermore, such inferences are limited to ascertaining the absence of particular objects that, if they existed under given circumstances, would inevitably be perceived. For entities where such a necessary perceivedness cannot be ensured, either because they are intrinsically beyond the realm of perception or because the specific environmental conditions for their perception are incomplete, not perceiving them only establishes that we do not know that they exist, not that we know that they do not exist. A proper inference on the basis of the nonperception of a perceptible object is accordingly exemplified as "in this spot on the ground, a jar does not exist because, as an object that would necessarily be perceived if it existed here, it is not perceived." From this basic inferential structure, a variety of patterns are derived with the help of further relationships such as causality, extensional relations between genus and species, and factual incompatibility, as well as contrariety and contradiction between concepts.

In his further explication of the nonperception of perceptibles, Dharmakīrti works with the notion of an implicative negation (*pariyudāsa*) developed in Sanskrit grammatical literature (Cardona 1967). When understood as expressing implicative negation, a negative nominal compound formed with the prefix *a(n)*—here: *an-upalabdhi*—affirms a state of affairs other than the negated one. Nonperception is thus explicated as another perception, that is, as the perception of a specific object

other than the absentee—not perceiving an entity like a jar is nothing other than perceiving an empty spot on the ground.

In Dharmakīrti's earliest work, the *Pramāṇavārttika*, this claim is adopted because the alternative consideration of nonperception as the mere absence of a perception would result in specific antinomies, such as an infinite justificational regress. As an absence of a perception, nonperception itself would have to be established with the help of a further instance of nonperception, and so forth. Once nonperception is assumed to be the perception of another object, it can be established through the intrinsic self-awareness of that perception. In its most developed form in the *Hetubindu*, the absence of the absentee is likewise explained away as the presence of the perceived object, and the argumentation acquires a more reductive ontological flavor. In addition, the otherness of the absentee and the object perceived in its stead is narrowed down to one where, if both objects existed, they would have to mix within one perception. Prabhākara, the Mīmāṃsā philosopher who rejects Kumāri's separate instrument of knowledge, is credited with a similar view that identifies the nonperception of one object with the perception of another that lacks the absentee. However, as his statements in the *Bṛhatī* are highly elliptic, further details of his theory and its historical and theoretical relationship to Dharmakīrti's remain obscure.

Dharmakīrti's commentators contrast his account with that of his teacher, Īśvarasena (late sixth/early seventh century), whose works are lost. Īśvarasena is said to have understood nonperception as the simple absence of the absentee's perception, based on the notion of a simple negation (*prasaṅgyapratīṣedha*), which, like that of implicative negation (*paryudāsa*), was developed in grammatical literature. As a counterpart to implicative negation, simple negation involves only the denial of an action—here: perception—and does not further imply the affirmation of a different state of affairs. It is not known whether Īśvarasena developed his theory of nonperception, which he is said to have assumed as a third instrument of knowledge besides perception and inference, merely to solve specific problems of the theory of inference, or whether he intended it as a general theory of negative knowledge.

## NELSON, LEONARD

(1882–1927)

Leonard Nelson, a German critical philosopher and the founder of the Neo-Friesian school, was born in Berlin. After studying mathematics and philosophy he qualified for teaching as a *Privatdozent* in the natural science division of the philosophical faculty at Göttingen in 1909. In 1919 he was appointed extraordinary professor.

### THE CRITICAL SCHOOL

Nelson's philosophical work was concerned mainly with two problems: the establishment of a scientific foundation for philosophy by means of a critical method and the systematic development of philosophical ethics and philosophy of right and their consequences for education and politics.

Nelson's search for a strictly scientific foundation and development of philosophy soon led him to critical philosophy. Nelson took the *Critique of Pure Reason* to be a treatise on method and regarded the critical examination of the capacities of reason as its decisive achievement. Through this critique alone could philosophical concepts be clarified and philosophical judgments traced back to their sources in cognition. Therefore, Nelson undertook a close examination of the thought of Jakob Friedrich Fries (1773–1843), the one post-Kantian philosopher who had concentrated on Immanuel Kant's critical method, carried it further, and tried to clarify its vaguenesses and contradictions.

While Nelson was still a student, he began to collect Fries's writings. These were not easily available, for Fries was hardly known at that time; when he was mentioned at all in philosophical treatises, it was as the representative of an outmoded psychologism. In his own first works Nelson attempted to defend Fries against this reproach. Together with a few friends whom he had interested in Fries's philosophy, he began to publish a *neue Folge* (new series) of *Abhandlungen der Fries'schen Schule* in 1904—the same year in which he wrote his doctoral dissertation on Fries. A few years later he founded, together with these same friends, the Jakob-Friedrich-Fries-Gesellschaft to promote the methodical development of critical philosophy.

### CRITICAL METHOD AND CRITIQUE OF REASON

In his own writings devoted to the critical method, Nelson distinguished between the critique of reason and two

misinterpretations of it, transcendentalism and psychologism. The critique of reason was to prepare the grounds for a philosophical system and to give this system an assured scientific basis by means of a critical investigation of the faculty of cognition. Posing the problem in this way seems to require the critique of reason and the system of philosophy to be adapted to each other in such a way that either the critique of reason must be developed a priori as a philosophical discipline, because of the rational character of philosophy, or philosophy must be conceived as a branch of psychology, since the investigation of knowledge by means of the critique of reason belongs to psychology. Transcendentalism sacrifices the main methodical thesis of the critique of reason, that the highest abstractions of philosophy cannot be dogmatically postulated but must be derived from concrete investigation of the steps leading to knowledge. Psychologism fails to recognize the character of philosophical questions and answers, which is independent of psychological concepts.

Kant did not unequivocally answer the question whether the critique of reason should be developed as a science from inner experience of one's own knowledge or as a philosophical theory from a priori principles. His subjective approach, according to which philosophical abstractions should be introduced by a critique of the faculty of cognition, indicates the first interpretation, but in carrying out his investigations—and in the asserted parallelism between general and transcendental logic as well as in the demand for a transcendental proof of metaphysical principles—Kant tacitly assumed the second interpretation and interpreted the theorems of the critique as a priori judgments. Fries, who was mainly concerned with countering the contemporary tendency to develop Kant's teaching in the direction of transcendentalism, took the subjective approach and developed it consistently from inner experience, without, however, transforming philosophical questions and answers into psychological ones. The boundary between Fries's work and psychologism is not so clear, and for this reason most of his critics misunderstood his philosophy as a psychological system, albeit not a consistent one.

Nelson solved the problem that philosophy based on the critique of reason seemed necessarily to lead either to transcendentalism or to psychologism by proving that both tacitly assume that a basis of knowledge must consist of proving philosophical principles from theorems of the critique of reason. If the theorems of the critique and the foundations of the philosophical system were in fact related to each other in the same way that the premises and conclusions of logical problems are related, then

indeed the critique of reason and philosophy would have to be identical—that is, they would both have to be either empirical and psychological or rational and a priori. By investigating the problem of the critique of reason Nelson showed that and why this premise is mistaken: The critique serves to clarify one's understanding of the origin of philosophical notions and of their function in the human cognition of facts. Cognition is an activity of the self, motivated by sensual stimulation; data acquired by sensual stimulation are related to one another by cognition of the surrounding world. The function of the critique of reason is to demonstrate the connecting ideas in this process and the assumed criteria by which these ideas are applied by analyzing the concrete steps in cognition and to follow these connecting ideas back to their origin in the cognitive faculty by means of psychological theory; it is not its function to prove the objective validity of the principles in which these criteria are expressed. These principles themselves are of a philosophical rather than a psychological nature. They cannot be derived from the statements of the critique; indeed, since they are the basic assumptions of all perception, they cannot be derived from any judgments more valid than they are.

**CRITIQUE OF REASON AND PHILOSOPHY.** The connection between the critique of reason and the system of philosophy, according to this theory, is not one of logical proof; it is derived, rather, from “reason’s faith in itself,” as Fries put it, from the fact that all striving for knowledge assumes faith in the possibility of cognition. This faith is faith in reason, inasmuch as reason is the faculty of cognition instructed by the stimulation of the senses. This faith is maintained by the agreement of cognitions, but it cannot be further checked or justified by a comparison of cognitions with the object cognized. This sets an unsurpassable limit to the provability of cognitions. Nelson expressed this in his paper on the impossibility of the theory of knowledge, in which he understood the theory to be an attempt to investigate scientifically the objective validity of cognition. In contrast, the critique of reason should limit itself to investigating the direction in which faith in cognition is in fact turned.

In carrying out this investigation Fries and Nelson distinguished between indirect cognition, supported by some other claim to truth, and direct cognition, which simply claims the faith of reason and which therefore neither needs nor has any justification, even when it is obscure and enters consciousness only in its application as a criterion for the unity of sensually perceivable isolated cognition. Fries and Nelson, in agreement with Kant, considered the criteria which belong solely to rea-

son to include the pure intuition of space and time and their metaphysical combinations according to the categories of substance, causality, and reciprocal action.

**NATURAL PHILOSOPHY.** Nelson’s interpretation of cognition led him to the problem of a mathematical natural philosophy that had been sketched by Kant and further developed by Fries; this philosophy established a priori an “armament of hypotheses” for the empirical-inductive investigation of natural laws. It coincided in fact with the basic principles of classical mechanics and thereby came into conflict with modern physics. Nelson neither minimized this conflict nor confused it with problems of the principles of critical natural philosophy. He saw physics as being in the process of a radical changeover to modern theories, which had by no means yet been ordered into a conflict-free system comparable to that of classical physics. He was sure that every physical theory must go beyond the data provided by observation and experiment in developing concepts and making assertions. And he was convinced that the positivistic, antimetaphysical tendencies of contemporary physicists promoted a tacit and therefore uncritical metaphysics. Without himself being able to solve the conflict that had arisen within critical philosophy, he was convinced the progressive clarification of modern theories would lead back to a physics based on classical mechanics.

### CRITICAL ETHICS

**BASIC PRINCIPLES.** Nelson systematically applied the critical method in his studies in practical philosophy—ethics in the broadest sense of the word, including philosophy of right and philosophically based educational and political theory. He added his own critique of practical reason to those of his predecessors. He developed his own processes, both for what he called abstraction (analysis of the assumptions underlying practical ethical value judgments) and for determining, by an empirical study of value judgments, “the interests of pure practical reason,” that is, ethical demands put to the human will by reason itself. It is these interests that make value judgments possible. Nelson derived two basic ethical principles from these interests: the law of the balanced consideration of all interests affected by one’s own deeds and the ideal of forming one’s own life independently, according to the ideas of the true, the beautiful, and the good. These two principles were linked by the fact that, on the one hand, the law of balanced consideration, as a categorical imperative, determines the necessary limiting condition for the ideal value of human behavior; on the

other hand, the ideal of rational self-determination leads to the doctrine of the true interests of man and finds in these interests the standard for a balanced consideration of conflicting interests.

**NELSON'S SYSTEM.** From these two principles alone Nelson developed his system of philosophical ethics; he limited himself to such consequences as could be derived from these principles purely philosophically—without the addition of experience—but he attempted to grasp them completely and systematically. In this he was influenced, first, by his interest in systematically and strictly justifying the assumptions used in every single step and the logical connections of the concepts appearing in the principles and, second, by his interest in applying this practical science. The principles demonstrated are formal and permit determination of concrete ethical demands only through their application to given circumstances as justified by experience. But it is precisely this application of the principles to the world of experience that requires preparatory philosophical investigation if the application is to be guarded against hasty generalization of single results, in which changing circumstances are not taken into account, and against opportunistic adaptation to circumstances without regard for the practical consequences of ethical principles. In the system as a whole, ethics and philosophy of right appear side by side. Nelson distinguished between them according to different ways of applying the law of balanced consideration. As a categorical imperative, this law demands of the human will the balanced consideration of other persons' interests affected by its actions. By its content it determines the duties of the individual by the rights others have with regard to him; in this respect it is related to communal life and thereby provides a criterion for the value of a social order. Nelson defined this criterion as the concept of the state of right, by which he meant the condition of a society in which the interests of all members are protected against wrongful violation. Ethics, by this definition, is concerned with the duties of the individual; philosophy of right is concerned with the state of right. To each of these disciplines Nelson added another concerned with the conditions of realizing the values studied by them: philosophical pedagogics, as the theory of the education of man to the ethical good, and philosophical politics, as the theory of the realization of the state of right.

**VALIDITY OF ETHICAL PRINCIPLES.** The logically transparent construction of the entire system reveals clearly that the principles behind all further developments are strictly valid in all cases but can be applied only

through full consideration of the concrete circumstances in each individual case; since they are objectively valid, they are not subject to arbitrary decisions and are valid even in cases where human insight and will fail to understand them; but they are justified only by reference to reason, which makes possible for each individual the autonomic recognition of these standards and the critical examination of their applications. Thus, the demands of equality for all before the law and of equality of rights are compatible with the demand to differentiate according to given circumstances; and the demands of force against injustice remain linked to those of freedom of criticism and of public justification for the legal necessity of certain coercive measures. Such coercive measures are particularly necessary when the freedom of man to form himself rationally within the framework of his own life is threatened; this freedom can be threatened because man's true need for it is at first obscure and can therefore be mistaken and suppressed.

*Nature and chance.* One conclusion appears again and again, determining the structure of the whole system. In each case it is a question of fighting with chance, to which the realization of the good is subject in nature. What happens in nature is, according to the laws of nature, dependent on the given circumstances and on the forces working through them, which are indifferent to ethical values: Under the laws of nature it is a matter of chance whether what should happen is in fact what happens or whether ethical demands are ignored. But what ethics demands should not be subject to chance but assured by the human will. Following this line of thought, Nelson derived the law of character in ethics, which demands from man the establishment of a basic willingness to fulfill his duty, by which he makes himself independent of given concrete circumstances; his inclinations and the influences on his will may or may not be in agreement with the commands of duty.

In the philosophy of right Nelson correspondingly finds certain postulates. These determine the forms of reciprocal action in society which alone assure just relations between individuals; among them are public justice, prosecutability, the law of contract, and the law of property. The transitions from ethics to pedagogy and from philosophy of right to politics are made in the same spirit. Education, among the many influences on man, should strengthen or create those elements that develop his capacity for good and oppose those that could weaken this capacity. Politics is concerned with the realization and securing of the state of right determined by the postulates of philosophy of right. This problem leads to the

postulation of a state seeking the rule of law and having the power to maintain itself against forces in society opposing the rule of law. A sufficiently powerful federation of states is necessary to regulate the legal relationships between states.

The same conclusion is reached in the last section of Nelson's *System der philosophischen Rechtslehre und Politik*. Here again, in a state of nature it is a matter of chance to what degree states realize the rule of law or violate its demands, unless men having insight into justice and moral will work to transform the existing state into a just state. These men must interfere in the struggle between social groups and parties and must themselves band together into a party. In this case, therefore, the ideal of a just state leads to that of a party working to achieve it.

**FREEDOM AND NECESSITY.** The conflict between natural necessity and man's freedom and responsibility impelled Nelson's thinking. Ethical standards are valid for human action in nature and are therefore directly relevant to two apparently mutually exclusive forms of legality: The theoretical form, according to which everything that happens in nature (including human behavior) is determined by natural laws working through the existing powers, and the practical one, which presents the human will with duties that can either be violated and ignored or become man's purpose.

Thus on the one hand Nelson insisted that demonstrated ethical standards be maintained without compromise and rejected the skeptical assumption that man, as a limited creature of nature, was incapable of maintaining them; this assumption he considered a sacrifice of known ethical truth, a mere excuse for those who were able but not willing. On the other hand, he expected the human will to act according to the strongest motivation of the moment, without any guarantee from nature that this motivation would direct man toward what is ethically required. For this reason he rejected any speculation that in a state of nature the good would pave its own way.

Within the framework of the critique, Nelson thoroughly examined the question of how man's freedom could be reconciled with this natural law. He sought the answer in the doctrine of transcendental idealism that human knowledge is limited to the understanding of relationships in the sphere of experience but cannot achieve absolute perception of reality itself. In the consciousness of his freedom, which is indissolubly bound to the knowledge of his responsibility, man relates himself by faith to the world of that which is real in itself and superior to the limitations of nature. Nelson unified the two points of

view by connecting two results of his investigations of the critique of reason: the principle of the existence of pure practical reason, which as a direct moral interest makes moral insight and moral motivation possible, and the principle of the original obscurity of this interest, according to which it does not determine judgment and will by its very existence but rather requires enlightenment and is dependent on stimulation.

**EDUCATION AND POLITICS.** Concern with the realization of ethical requirements led Nelson beyond his philosophical work to practical undertakings, in which he gave primary emphasis to politics, particularly to political education.

Toward the end of World War I Nelson collected a circle of pupils and coworkers who were willing to undergo intensive education and discipline in preparation for the political duties imposed by ethics and philosophy of right. Together with these pupils he founded the Internationaler Jugendbund and in January 1926 developed his own political organization, the Internationaler Sozialistischer Kampf-Bund. In 1924 he opened a "country educational institution," Landerziehungsheim Walkemühle, directed by his coworker Minna Specht. Here youths and children were trained in a closely knit educational and working community for activity in the workers' movement, until the school was closed and appropriated by the National Socialists in 1933.

As a teacher and educator Nelson had a strong effect on his pupils. He led them by masterly Socratic discussions to a clarification and critical examination of their own convictions, and he required them to carry out what they had recognized as just and good in their actions with the same consistency that he demanded of himself. "Ethics is there in order to be applied."

## NEMESIUS OF EMESA

(fl. c. 390)

Nemesius of Emesa was the author of a treatise, *De Natura Hominis* (On the nature of man), which is the earliest extant handbook of theological or philosophical “anthropology.” All that is known of his life is that he was probably bishop of Emesa in Syria.

As a Christian, Nemesius viewed the Bible as his primary authority, but he derived the content of his work chiefly from Galen’s *On the Use of the Parts of the Body*, which is superior to Nemesius’s treatise both in thoroughness and originality; from Origen’s *Commentary on Genesis*; and from some commentators on Aristotle, a few works by the Neoplatonist Porphyry, and doxographical materials. His subjects and sources can be outlined as follows: Ch. 1, man in the creation (Galen, Origen); Chs. 2–3, the soul and the body (doxographical, Porphyry, Galen); Chs. 4–5, the body and the elements (Galen); Chs. 6–14, the faculties of the soul, including human development, the senses, thought and memory, reason and speech (Galen, Porphyry); Chs. 15–28, the parts of the soul, the passions, and such matters as the nutritive and generative faculties and respiration (mostly Galen); Chs. 29–41, freedom, possibility, and fate (commentaries on Aristotle, Neoplatonists); Chs. 42–44, providence (in part ultimately from Posidonius, in part from Christian theologians).

In the last part of his book (Chs. 35ff.), Nemesius turns from minimizing the function of free will in human affairs (deliberation concerns only indifferent possibilities) to an elaborate attack upon the Stoic doctrine of fate and teaching about destiny. Utilizing Aristotle’s distinction between voluntary and involuntary acts, he insists that men actually have free will, that its extent can be discovered (interrelated with the action of providence), and that it was given to mutable men so that they might become immutable. The work ends abruptly and seems to lack a conclusion.

Nemesius argued that the soul is an incorporeal being and is therefore immortal (in his opinion the latter point is also proved by the Bible). The problem of how it is united with the body is solved (Chs. 20–21) by following the Neoplatonist Ammonius. “Intelligibles” are capable of union with things adapted to receive them, but in such a union they remain confused and imperishable. The soul is “in a body” not locally but “in habitual relation of presence.” From this analysis Nemesius turns in Ch. 22 to discuss the union of the divine Word with his manhood—as William Telfer points out, thus reversing

the usual patristic argument. Nemesius claims that the union in Christ is therefore not by “divine favor” but is “grounded in nature.”

## NEO-KANTIANISM

“Neo-Kantianism” is a term used to designate a group of somewhat similar movements that prevailed in Germany between 1870 and 1920 but had little in common beyond a strong reaction against irrationalism and speculative naturalism and a conviction that philosophy could be a “science” only if it returned to the method and spirit of Immanuel Kant. These movements were the fulfillment of Kant’s prophecy that in a hundred years his philosophy would come into its own.

Because of the complexity and internal tensions in Kant’s philosophy, not all the Neo-Kantians brought the same message from the Sage of Königsberg, and the diversity of their teachings was as great as their quarrels were notorious. At the end of the nineteenth century the Neo-Kantians were as widely separated as the first-generation Kantians had been at its beginning, and the various Neo-Kantian movements developed in directions further characterized by such terms as Neo-Hegelian and Neo-Fichtean. But whereas G. W. F. Hegel, Friedrich Schelling, Johann Gottlieb Fichte, and others had used the words of Kant while being alien to their spirit, the Neo-Kantians were, on the whole, faithful to the spirit while being revisionists with respect to the letter.

Attempting to legitimize their revisions by the *ipsissima verba* of Kant, they established the craft of “Kant-philology” and began an analysis of Kant’s texts that had not been equaled in microscopic punctiliousness except in the exegesis of the Bible and of a few classical authors. Hans Vaihinger’s immense commentary on the first seventy pages of the *Critique of Pure Reason* (*Commentar zu Kants “Kritik der reinen Vernunft,”* 2 vols., Berlin and Leipzig, 1881–1893) is an exemplar of this craft and industry.

Neo-Kantianism grew out of the peculiar social-cultural situation of German science and philosophy, and in turn it constituted a new academic situation with many characteristics of a long intellectual fad. Most of the groups of Neo-Kantians had their own journals—the *Philosophische Arbeiten* at Marburg, *Logos* at Heidelberg, the *Annalen der Philosophie und philosophischer Kritik* of Vaihinger, and the *Philosophische Abhandlungen* at Göttingen. (*Kant-Studien*, like the *Kant Gesellschaft*, was open to all.) Doctrines were known by the names of the universities where they originated; men entered and left the movement as if it were a church or political party; members of one school blocked the appointments and promotions of members of the others; eminent Kant scholars and philosophers who did not found their own schools or accommodate themselves to one of the established schools tended to be neglected as outsiders and contemned as amateurs. As many as seven distinct schools have been described by historians, but they do not agree on the programs, heresies, and bona fide membership of each school.

### THE BEGINNINGS

So far as an intellectual movement can be said to have a beginning at a specific moment of time, Neo-Kantianism began with the publication at Stuttgart in 1865 of Otto Liebmann’s *Kant und die Epigonen*, whose motto—“Back to Kant!”—has become famous. German philosophy was generally weak toward the middle of the nineteenth century; there was less interest in it, and less ability among its practitioners, than at perhaps any other time in modern German history. Earlier in the century, when Kant’s philosophy had been submerged first in the great idealistic systems and then in those of nature-philosophy, there had been modest calls for a return to Kant (for instance, by I. H. Fichte, the son of J. G. Fichte, and by Ernst Reinhold, the son of K. L. Reinhold) as a means of escape from the kinds of philosophy that Kant would have held to be impossible and that seemed more and more to offer nothing of value to German cultural life as a counterbal-

ance to the materialism attendant upon the flourishing of natural science, technology, and national economy. However, in the decade preceding Liebmann's book there had been signs of change.

**ZELLER AND FISCHER.** Eduard Zeller (1814–1908), in his Heidelberg lecture, *Ueber Bedeutung und Aufgabe der Erkenntnistheorie* (published Heidelberg, 1862), called for a return to epistemology; and this, he spelled out explicitly, meant a return to Kant. Kuno Fischer (1824–1907), the greatest historian of philosophy at that time and the teacher of Liebmann, Johannes Volkelt, and Wilhelm Windelband, in 1860 published a monumental book on Kant (*Kants Leben und die Grundlagen seiner Lehre*, Mannheim and Heidelberg) that presented, in a form still useful although outmoded in details, a picture of Kant that could not but excite interest in and study of Kant. In 1865 Fischer initiated a great controversy with Adolf Trendelenburg on the proper interpretation of Kant's theory of space; this controversy mobilized most of the philosophical public in Germany on one side or the other, including Trendelenburg's pupil Hermann Cohen, who had hitherto concentrated mostly on Plato.

**HELMHOLTZ AND LANGE.** Two other men, Hermann von Helmholtz and F. A. Lange, almost simultaneously with Liebmann made their spiritual pilgrimage to Königsberg.

**Helmholtz.** Hermann von Helmholtz (1821–1894), then Germany's greatest scientist, had been arguing for years for a view whose origin he found in Kant. The doctrine of specific energies of sensory nerves had led him to a theory of the subjectivity of sensory qualities, which he regarded as signs of unknown objects interacting with our sense organs; he then extended this commonly held view to the conclusion that space itself is dependent upon our bodily constitution. This theory made it possible for Helmholtz to argue that there could be alternative spaces and geometries, each appropriate to a particular kind of nervous apparatus and necessary to the being so constituted, but none of them picturing the real structure of the world. Thus, while Helmholtz gave up Kant's theory of the unique status of Euclidean geometry, he held that his own theory of space was in keeping both with Kant's theory and with the most modern work in mathematics, physics, and physiology. Moreover, in his theory of unconscious inferences he accepted the Kantian theory that perception involves judgment. The guiding principle in such unconscious inference is the a priori principle of causation, which extends our knowledge no further than possible experience, but gives us the right to posit

unknown causes of our sensations. Helmholtz vigorously rejected metaphysics but extolled philosophy as an ancilla to science. Both the strengths and the obvious weaknesses of Helmholtz's Kantianism were effective in making a return to Kant seem fruitful to science, for it meant that the greatest of German thinkers could be used on the side of science, against metaphysics.

**Lange.** The year 1866 saw the publication of Friedrich Albert Lange's *Geschichte des Materialismus* (Iserlohn and Leipzig; translated by E. C. Thomas as *History of Materialism*, 3 vols., London, 1877–1879). Lange, who was born in 1828 and died, while professor of philosophy at Marburg, in 1875, wrote his massive but readable book to point out the metaphysical mysteries and pretensions of materialism, which traditionally claimed to be only a courageous but unspeculative extension of the results of science into regions previously occupied only by theology and superstition. Like Helmholtz, Lange held that the sensible world is a product of the interaction between the human organism and an unknown reality. The world of experience is determined by this interaction, but the organism itself is only an object of experience, and it is to be understood by psychology and physiology. Causality, needed in all such sciences, is a mode of thought necessary to a mind constituted like ours; processes and principles of thought have physiological bases. Thus, materialism (although a phenomenal materialism, since matter itself is only a phenomenon) is the most likely truth about reality so far as it can be known. But what of Kant's intelligible world? Lange completely rejected Kant's teaching of the rational necessity of the structure of an intelligible but unknowable world; he held that our views of it are only products of poetic fancy (*Dichtung*). While Lange defended materialism as a doctrine of reality (phenomena) that serves as a bulwark against theology and metaphysics, he held that because knowledge is not man's whole goal, *Dichtung* is also important. "Man needs to supplement reality [about which materialism is the best truth we know] with an ideal world of his own creation," and this is a world of value "against which neither logic nor touch of hand nor sight of eye can prevail" (*History of Materialism*, Vol. III, pp. 342 and 347).

Two things stand out in the works of these precursors—if not direct progenitors—of Neo-Kantianism. Their Kantianism was exclusively theoretical, oriented entirely around the *Critique of Pure Reason* and neglectful or disdainful of Kant's practical philosophy. This puts them in the line of development of German positivism, a line that goes from them through Alois Riehl and the fic-

tionalist Hans Vaihinger to Ernst Mach and Moritz Schlick. Their Kantianism was also psychological and even physiological—the a priori elements they acknowledged were dependent upon the human constitution; the transcendental and logical aspects of Kant’s work were neglected or rejected. In this respect they were followed by Hans Cornelius (1863–1947) and by Richard Höningwald (1875–1947), a pupil of Riehl.

### METAPHYSICAL NEO-KANTIANISM

Theoretical and physiological Kantianism was in the air when the twenty-five-year-old Liebmann published his manifesto. *Kant und die Epigonen* argued that Kant made one great mistake: believing in the existence of the thing-in-itself. This belief, however, was not an essential part of Kant’s doctrine, but only a dogmatic residue that could be removed without damage to the rest of the system. However, Fichte, Schelling, Hegel, Jakob Friedrich Fries, Johann Friedrich Herbart, and Arthur Schopenhauer either did not recognize the belief that there is a thing-in-itself as an error (for instance, Schopenhauer) or, while recognizing it as an error, made analogous errors in their efforts to correct it (Fichte’s transcendental ego is as unknowable and unthinkable as the thing-in-itself). The weaknesses thus introduced into their systems were fatal, since they depended upon a concept that Kant had only inadvertently admitted. Hence, none of them could be followed; one had to return to their common source, remove its error, and apply this improved Kantianism to present problems.

While Liebmann’s first book showed remnants of a psychological interpretation of Kant, his next book, *Zur Analysis der Wirklichkeit* (Strasbourg, 1876) argued for a strictly transcendental “logic of facts” whose inspiration was as much Spinozistic as Kantian. In this book Liebmann stood close to the Marburg school, at least in his conclusions. However, in his later *Gedanken und Tatsachen* (2 vols., Strasbourg, 1882–1901) he admitted the need and argued for the possibility of a “critical metaphysics” as a “rigorous consideration of human views and hypotheses about the essence of things,” growing out of “deep-rooted, ineradicable spiritual needs and intellectual duty” (ibid., 2nd ed., Vol. II, p. 113). His critical metaphysics makes hypotheses about the transcendent and the unknowable, but leaves open a field for value decisions that do not depend on claims to valid knowledge, but only on our wills as they are nurtured by culture. In this line of thought Liebmann seemed to draw closer to the Heidelberg school, but even in his earlier work there were anticipations of Windelband’s famous

analysis of the differences between historical and scientific knowledge.

RIEHL. Less openly metaphysical than Liebmann’s was the realistic Neo-Kantianism of Alois Riehl (1844–1924). In contrast to Liebmann, Riehl insisted that Kant held to the real existence of things-in-themselves and that this concept is essential to Kant’s—and to any sound—theory of knowledge. He asserted that Kant proved only that things-in-themselves cannot be known by pure reason, not that they are not known mediately in sense perception. Phenomena are simply their modes of appearance; they are not in a different ontological realm, but are merely actualizations of their Aristotelian potentialities in the context of a mind. The laws of the organization of phenomena are transcendently (not psychologically) based on the activity of self-consciousness; their specific characteristics depend on the reality of that of which they are appearances. All knowledge is or can become scientific; philosophy is nothing but a theory of science; metaphysics is “an opiate of the mind.”

Nevertheless, Riehl believed it both unavoidable and legitimate to reason hypothetically from phenomena to reality, for metaphysical hypotheses cannot be entirely excluded from science itself. He argued, for instance, for a double-aspect psychophysical theory of the relationship between mind and the world, for a partial duplication of phenomenal laws in the real world, and for complete determinism. The tone of his philosophy, however, was somewhat positivistic; he said he acknowledged “the metaphysical” but not “metaphysics.” With *wissenschaftliche* (scientific) philosophy he contrasted *unwissenschaftliche* philosophy, or classical speculative metaphysics, which he rejected; and with both he contrasted *nichtwissenschaftliche* philosophy as a practical discipline for the realization of humanly created values (*Wertbegung* and *Geistesführung*). In his later life he was most concerned with the latter.

OTHER METAPHYSICAL INTERPRETATIONS. Another realistic metaphysical interpretation of Kant was given by the Kant philologist Erich Adickes (1866–1928) in his *Kants Lehre von der doppelten Affektion unseres Ich* (Tübingen, 1929).

Other attempts at “critical metaphysics” on a Kantian basis were made by Johannes Volkelt (1848–1930) and by Friedrich Paulsen (1846–1908). The former’s *Kants Erkenntnistheorie* (Leipzig, 1879) and the latter’s *Entwicklungsgeschichte der Kantischen Erkenntnistheorie* (Leipzig, 1875) tried to show that Kant himself was an idealistic

metaphysician *malgré lui*. Later works designed to bring out the metaphysics in Kant were by Max Wundt (*Kant als Metaphysiker*, Stuttgart, 1924), Heinz Heimsoeth (articles collected in *Studien zur Philosophie Immanuel Kants*, Cologne, 1956), and Gottfried Martin (*Kant, Ontologie und Wissenschaftslehre*, Cologne, 1951; translated by P. G. Lucas as *Kant's Metaphysics and Theory of Science*, Manchester, U.K., and New York, 1955). Martin Heidegger's *Kant und das Problem der Metaphysik* (Bonn, 1929; translated by J. S. Churchill as *Kant and the Problem of Metaphysics*, Bloomington, IN, 1962) presented an extreme form of this view but falls outside the scope of Neo-Kantian intentions.

### MARBURG NEO-KANTIANISM

By the standards of recent philosophy Marburg Neo-Kantianism, or panlogistic transcendental philosophy, was no less metaphysical, but by the standards of the time its orientation around the “fact of science” seemed to make it at least antispeculative. In launching the journal of the Marburg school, Hermann Cohen and Paul Natorp wrote: “Whoever is bound to us stands with us on the foundation of the transcendental method.... Philosophy, to us, is bound to the fact of science, as this elaborates itself. Philosophy, therefore, to us is the theory of the principles of science and therewith of all culture” (*Philosophische Arbeiten*, Vol. I, No. 1, 1906).

HERMANN COHEN. Hermann Cohen (1842–1918), a younger colleague of Lange's at Marburg, rejected the naturalism he believed to be inherent in the Kantianism of Helmholtz, Lange, and Liebmann. They were wrong in thinking philosophy should begin with an analysis of consciousness and should show how conscious human beings apply concepts to the data of sensation in order to produce phenomenistic world pictures that are distinguished from things as they are. The fact to be understood is not this highly dubious psychological process; the fact is science itself and, in ethics, it is not human motives and aspirations and feelings of duty but the fact of civil society under law as constructed in the science of jurisprudence. Kant himself had tried to understand “the fact of science and culture,” but he failed to separate this fact from dubious psychological and phenomenological facts he seemed to be dealing with.

Logic for Cohen is not at all psychologistic; it is not even formal. The very notion of formal logic presupposes something not formal: data drawn from some other source, be it pure intuition or perception. Logic, as Cohen saw it, is the logic of knowledge, not the logic of empty

thought; it is the logic of truth, in which any assertion gains its status as true solely by virtue of its systematic position in a body of universal laws that, in turn, require each other on methodological grounds. Thought, Cohen taught, accepts nothing as given and is not true of anything independent of it—certainly not of intuitional data, as Kant believed. Thought generates content as well as form, and the content of self-contained thought is reality itself as object and goal of knowledge. This extravagant panlogism was based on Cohen's ingenious interpretation of the history of the differential calculus, which he saw as the logic of mathematical physics. Not number and not observed motion, as Kant believed, are given as raw data to science; rather, the mathematical differential, which is not given at all but is created by thought, is the necessary device for the creation of nature as object of possible experience: “This mathematical generation of motion [by integration of the derivative] and thereby nature itself is the triumph of pure thinking” (*Logik der reinen Erkenntnis*, Berlin, 1902, p. 20). Through an interpretation of Kant's teachings concerning intensive magnitudes of sensations, Cohen saw in the method of the calculus a paradigm of the category of origin (*Ursprung*) and the logical process of production (*Erzeugung*) to which every fact owes its reality; that is, its position in a logically necessary scheme.

Through the work of thought on its own materials, Cohen believed he could dispense with all independent givens in knowledge. Nothing is given (*gegeben*); all is problematic (*aufgegeben*). Fact is that which is completely determined by thought. The thing-in-itself is not a thing at all. It does not exist, but is only a thought of a limit (*Grenzbegriff*) to our approach to a complete determination of things as they are; that is, as they would fully satisfy systematic thought.

Cohen's pupil Ernst Cassirer spoke of him as “one of the most resolute Platonists that has ever appeared in the history of philosophy.” When Cohen said, for example, “Thinking itself produces what is to be held to be” (*ibid.*, p. 67; cf. p. 402), he was not speaking of thought as a process in an individual. “Thought” is not the name of a process, but refers only to the corpus of the unending history of science. To be, then, is to be thought, but not to be thought in somebody's consciousness; to be thought means to be asserted under valid and immanent a priori principles that inescapably determine the unique structure of mathematical physics. Cohen was as much of a dogmatist as Kant himself with regard to the structure of science.

The original stages of Cohen's teachings are found in his three commentaries on Kant (*Kants Theorie der Erfahrung*, Berlin, 1871; *Kants Begründung der Ethik*, Berlin, 1877; *Kants Begründung der Aesthetik*, Berlin, 1889), one on each *Critique*. They are continuous criticisms of all of Kant's "givens"; for example, experience, intuition, categories, duty, things-in-themselves. The final stages are contained in his three systematic works (*Logik der reinen Erkenntnis*, Berlin, 1902; *Ethik des reinen Willens*, Berlin, 1904; *Aesthetik des reinen Gefühls*, 2 vols., Berlin, 1912), which parallel the three *Critiques*. At its midpoint Cohen's thought was close to the contemporary rejections of psychologism by Alexius Meinong and Edmund Husserl; at its end it would have taken only the "bathos of experience," to use Kant's words, to change it, in principle, into a kind of positivism or even historicism.

NATORP. The principal thinker among the second generation of Marburg Neo-Kantians was Paul Natorp (1854–1924). It fell to him to deal with the new developments in science (especially the theory of relativity, in his *Die logischen Grundlagen der exakten Wissenschaften*, Leipzig, 1910) by penetrating to a deeper level of methodology than Cohen could reach in his own work, which was largely restricted to classical mathematics and physics.

More important, it was Natorp's task to introduce the whole field of psychology into the body of knowledge considered and understood in Cohen's way, and thereby to fill the lacuna Cohen left between *Bewusstsein überhaupt* (consciousness in general, the "fact" of science) and the limited individual human consciousness. Natorp's *Einleitung in die Psychologie* (Freiburg, 1888) and his *Allgemeine Psychologie nach kritischer Methode* (Tübingen, 1912) attempted, first, to apply Cohen's transcendental method to psychology instead of leaving it exposed to the naturalistic methods of Cohen's and Natorp's rivals, such as Riehl. In this attempt Natorp came close to results like those of Wilhelm Dilthey without, he thought, having to draw his relativistic, skeptical, and historicistic conclusions. And, second, these books attempted to bridge the gap between the objective world of phenomena and the nonphenomenal, nonnatural self that possessed the knowledge of the phenomenal world. Cohen had moved so far from Kant toward Hegel that it was for him an almost insignificant accident that individual men and women know anything; *Bewusstheit* (known-ness), not *Bewusstsein* (consciousness), was important for him. Natorp had to undertake another almost Copernican revolution against objective panlogism without at the same

time naturalizing the knowing subject, which would have led to relativism and skepticism.

He performed the first part of his task by the classical Kantian move of seeing empirical ego and empirical object as standing in a necessary correlation with each other, not as independent phenomena; the latter part he accomplished by insisting that the pure ego cannot be an object—it is as much a *Grenzbegriff* as the thing-in-itself. For Natorp the objective and the subjective were not two realms, either opposed to each other or one including the other. Rather, they were two directions of knowledge, objectification and subjectification, each starting from the same phenomenon and each employing the transcendental method of categorial constitution, resolution into *Ursprung* and *Erzeugung*. Just as Cohen's antipsychologistic panlogism had brought him close to Husserl's *Logische Untersuchungen*, Natorp's linking of psychology and panlogism brought him close to Husserl's *Ideen*; and it is easy to see how Nicolai Hartmann, Natorp's pupil, could move over into the phenomenological camp (J. Klein, "Hartmann und die Marburger Schule," in *Nicolai Hartmann, der Denker und sein Werk*, by Heinz Heimsoeth and Robert Heiss, Göttingen, 1952).

CASSIRER. The last great representative of Marburg Neo-Kantianism was Ernst Cassirer (1874–1945), whose works on the philosophy of science continued the line of argument initiated by Natorp and show some close resemblances to positivism. Cassirer's most important contribution, however, was to extend the Marburg conception of *Erzeugung* to the whole range of human culture (language, myth, art, religion, statecraft), ending not in panlogism but in "pansymbolism."

Other important Marburg Neo-Kantians were Rudolf Stammler (1856–1938) in the philosophy of law; Karl Vorländer (1860–1928), the historian of philosophy and the leading Kantian socialist (*Kant und der Sozialismus*, Berlin, 1900; *Kant und Marx*, Tübingen, 1911); Artur Buchenau (1879–1946), Albert Görland (1869–1952), and Arthur Liebert (1878–1946). A moderate form of Marburg Neo-Kantianism is represented in America by W. H. Werkmeister (*The Basis and Structure of Knowledge*, New York, 1948).

## GÖTTINGEN NEO-KANTIANISM

In strong reaction against Marburg there arose, at the beginning of the twentieth century, the Neo-Friesian school in Göttingen, under the leadership of Leonard Nelson (1882–1927). Jakob Friedrich Fries (1773–1843) had interpreted Kant psychologically, not transcenden-

tally; in this he was followed by Jürgen Bona Meyer (1829–1897) in his *Kants Psychologie* (Berlin, 1870). Lange and Helmholtz were psychologistic in their Kantianism, taking the results of experimental psychology as having a bearing on the a priori. Nelson, on the contrary, professed to avoid psychologism and its attendant skepticism by using psychological introspection to discover the principles of experience in the spontaneity of reason; these principles could then be deduced (in the Kantian sense) from the analysis of experience into its necessary conditions. In this, Nelson developed the views of Fries, whom he defended against the accusation of psychologism, and opposed the psychological or physiological interpretations of the experimental and empirical psychologists.

Kant's transcendental deduction was regarded by Nelson as circular if it was meant as a proof; it began with the experience (science, mathematics, morality) it was meant to justify. The circle might have been broken by Kant's subjective deduction, but this was jettisoned in the second edition of the *Critique*. Nelson proposed to reestablish it, or rather to put his own deduction into its place. Upon introspection, we find principles we know immediately to be true and that we hold by a Cartesian-like "principle of the self-confidence of reason." The discovery of these self-evident principles is a psychological process; the principles, however, are not psychological but metaphysical in Kant's sense; that is, as a priori synthetic truths based on concepts, not on intuition. They are shown to be the same as those uncovered by a transcendental analysis of science and ordinary experience. (In ethics Nelson followed an analogous procedure.) In this way Nelson thought he could use psychology without falling prey to either naturalism or skepticism. A good example of his method is to be found in the well-known *Das Heilige* (Gotha, 1917; translated by J. W. Harvey as *The Idea of the Holy*, New York, 1958) by Nelson's colleague Rudolf Otto. Nelson never had the influence in Germany that was enjoyed by many other Neo-Kantians, although he was revered by many disciples in fields related to philosophy. There has recently been an increased interest in his work, and several English translations have appeared.

#### HEIDELBERG NEO-KANTIANISM

The Heidelberg school of Neo-Kantianism, led by Windelband and Heinrich Rickert, was not restricted to the University of Heidelberg, and is sometimes known as the Baden school or the Southwest German school of Neo-Kantianism. Wilhelm Windelband (1848–1915) was

the most eminent historian of philosophy of his time, with the possible exception of Dilthey. Like Dilthey, he did not succeed in working out a complete system of philosophy, but certain of his ideas were decisive for the more systematic work of his followers in Heidelberg. His most characteristic doctrine was that the epistemological problem is really a problem in axiology; a judgment is known to be true not by comparison with an object (thing-in-itself) but by its conformity to an immediately experienced obligation to believe it. The teaching for which Windelband is chiefly remembered, however, was his distinction between natural and historical sciences as nomothetic and ideographic (law-giving and picturing the unique individual), respectively. The elaboration of these two points led to the systematic priority of axiological criteria to epistemological criteria, to the theory of the parallelism of norms and cultural consciousness, and to efforts to develop a Kantian categorization of historical and cultural experience.

RICKERT. The great system builder of the Heidelberg school was Heinrich Rickert (1863–1936), professor in Freiburg and then Windelband's successor in Heidelberg. Rickert, like Windelband, regarded judging as a form of valuing, truth being the value intended by this act. There are two realms of objects that may be judged; that is, that are objects of knowledge—the sensible world of science (about which Rickert accepted most of Kant's views) and an intelligible world of nonsensuous objects of experience that we know not by perception but by understanding (*Verstehen*). These latter are cultural objects (history, art, morality, institutions). Although not reducible to sense and thus not under the categories of nature, they are not metaphysical but are within experience and correspond, roughly, to Hegel's objective spirit. Both cultural objects and nature, as objects, require (in the Kantian manner) a correlative subject that cannot be objectified. This is "the third realm of being," which Rickert calls "pro-physical"; it is Kant's transcendental ego and Hegel's subjective spirit. There is a fourth realm of being, the metaphysical proper, which is only an object of faith (in the Kantian sense) and which we refer to in religion and in the transition from scientific philosophy to *Weltanschauung*.

By keeping the ethical "this side" of the division between the experiential and the metaphysical, Rickert was able to bring about a closer liaison between the theoretical and the practical than Kant had established. The primacy of practical reason does not, for Rickert, mark the supremacy of valuing over knowing, but signifies the valuational dimension of knowing itself. Autonomy is

thus the basis not only of ethics but also of thought even in science. Rickert criticized the Kantian conception of experience as too thin; not only nature, but also history, must be categorized out of the heterogeneous continuum of data, and from these categorizations arise the nomothetic and ideographic disciplines. In all these points Rickert was under the influence of both Fichte and Hegel, but his conceptual framework remained Kantian: a transcendental nonobjectifiable basis (realm 3) for experience (realms 1 and 2) and an unknown realm of objects of faith (realm 4).

**OTHERS.** Other important Heidelberg Neo-Kantians were Hugo Münsterberg (1863–1916), Jonas Cohn (1869–1947), Bruno Bauch (1877–1942; *Wahrheit, Wert und Wirklichkeit*, Leipzig, 1923), and Richard Kroner (*Von Kant bis Hegel*, 2 vols., Tübingen, 1921–1924). Kroner's *Kant's Weltanschauung* (Tübingen, 1914, translated by J. E. Smith, Chicago and Cambridge, U.K., 1956) is the only presentation in English of the characteristic Heidelberg interpretation of the historical Kant.

#### SOCIOLOGICAL NEO-KANTIANISM

Several philosophers close to *Lebensphilosophie* and concerned with the methodology of the *Geisteswissenschaften* were influenced by Kant's doctrine that we categorially construct the world of experience and that speculative metaphysics is impossible as science, but instead of having theories concerning the transcendental origin of the structural factors, they found the origin of the world of experience in the social situation. The most important of these philosophers were Wilhelm Dilthey (1833–1912), who is not usually characterized as a Neo-Kantian although Kantian elements are present in his thought, and Georg Simmel (1858–1918).

At various times Simmel took different attitudes toward, or at least emphasized different aspects of, Kantianism—the psychologistic and pragmatic, the transcendental, and the sociohistorical. He held that categories develop in the course of history, and that the structures of Hegel's objective spirit are historical products that cannot be taken ready-made for analysis in the Marburg manner. “[Even] the kind of science humanity has at any given moment depends upon the kind of humanity it is at that moment” (*Hauptprobleme der Philosophie*, Leipzig, 1910, Ch. 1). Because forms cannot be discerned except in the specific contents in which they appear, no categorial system is capable of structuring all experience. Different types of individuals have different styles for this structuring, and cultures are identified by their production of

specific a priori forms for knowledge, the experience of values, and images of the world as a whole (systems of metaphysics).

Between the Heidelberg tradition and the Dilthey-Simmel position there were Max Weber (1864–1921) and Eduard Spranger. Neo-Kantian elements in the sociology of knowledge are especially clear in the works of Max Adler (*Das Soziologische in Kants Erkenntniskritik*, Vienna, 1924) and Karl Mannheim (1893–1947).

Windelband said, “To understand Kant means to go beyond Kant.” Most of the philosophers dealt with here did go beyond Kant, and their later works contained little that was specifically Kantian. Even the movements as a whole were more explicitly Kantian in their early periods than in their later ones. All this was to be expected of active and creative minds and groups. By the end of World War I, Neo-Kantianism as an institution ceased to be a dominant force in German intellectual life, partly through the death of most of its leaders and partly through defection. Rapid changes in logic and natural science favored the more pragmatic systems of positivism in Berlin, Prague, and Vienna; the greater experiential resources of phenomenology favored the rival school in Freiburg, Munich, and Cologne; the German cultural crisis called for *Lebensphilosophie* and speculative metaphysics. None of these movements, however, was free of Kantian elements, which might not have been passed on to them but for the Neo-Kantians' rediscovery of Kant. Their Neo-Kantian heritage has given repeated confirmation of an aphorism attributed to Liebmann: “You can philosophize with Kant, or you can philosophize against Kant, but you cannot philosophize without Kant.”

## Bibliography

- Studies of and works by individual Neo-Kantians are listed in the respective articles. There is very little material in English on Neo-Kantianism, but see Ernst Cassirer, "Neo-Kantianism," in *Encyclopaedia Britannica*, 14th ed. (1930), Vol. XVI, pp. 215–216; and R. B. Perry, *Philosophy of the Recent Past* (New York: Scribners, 1926), pp. 145–160. A complete history is being written by Mariano Campo; Vol. I of his *Schizzo storico della esegesi e critica kantiana* (Varese, 1959) covers the period up to about 1900. The most complete study, with excellent bibliographies, is K. Oesterreich in *Friedrich Überwegs Grundriss der Geschichte der Philosophie*, 12th ed. (Berlin, 1923), Vol. IV, pp. 410–483.
- G. Lehmann reports the beginnings of the movement in "Kant im Spätidealismus und die Anfänge der neukantischen Bewegung," in *Zeitschrift für philosophische Forschung* 17 (1963): 438–457; see also his "Voraussetzungen und Grenzen der systematischen Kantinterpretation," in *Kant-Studien* 49 (1957): 364–388.
- Good comparative studies of Neo-Kantianism are included in Wolfgang Ritzel, *Studien zum Wandeln der Kantauffassung* (Meisenheim, 1952) and H. Levy, *Die Hegel-Renaissance in der deutschen Philosophie* (Charlottenburg, Germany: R. Heise, 1927). Johannes Hessen, *Die Religionsphilosophie des Neukantianismus* (Freiburg: Herder, 1924) gives a Catholic criticism.
- Authoritative presentations of two school programs are Paul Natorp, *Kant und die Marburger Schule* (Berlin, 1912); also in *Kant-Studien* 17 [1912]: 193–221 and Heinrich Rickert, *Die Heidelberger Tradition und Kants Kritizismus* (Berlin, 1934). The posthumously published (and incomplete) work by H. Dussort, *L'école de Marburg* (Paris, 1963) is excellent on the movement up through Cohen.

## NEOPLATONISM

### GENERAL CHARACTERIZATION

Neoplatonism was the dominant philosophical current in late antiquity, and it had a lasting influence in the Middle Ages when it was adopted by Christian and Muslim thinkers. The term Neoplatonism was coined in the late eighteenth century and was used (in a rather pejorative sense) to distinguish authentic Platonism (as found in Plato's dialogues) from the later systematization and transformation(s) it underwent in the third through fifth centuries, starting with Plotinus.

By using the term Neoplatonism, historians of philosophy wanted to dissociate themselves from the perspective that for centuries had determined, if not distorted, the interpretation of Plato. Yet Plotinus would have been surprised if he had known he would once be called a Neoplatonist. He never intended to be anything other than a faithful interpreter of Plato's doctrines, coming, as he saw it, after centuries of neglect and distortion during which Stoicism and Aristotelianism had set the philosophical agenda, and true, that is, dogmatic, Platonism had, as it were, gone underground in order to survive. This is also how Augustine presents the history of the Platonic Academy in his *Against the Academics*: "Once the clouds of errors had been dispelled, Plato's face, which is the most pure and bright in philosophy, shone forth, above all in Plotinus. This Platonic philosopher is considered to be so similar to Plato that one could believe that they had lived together; but as there is so much time between them, one should think that Plato revived in him." (XVIII 41). One and a half centuries later, Proclus, in his *Platonic Theology* hails Plotinus and his followers Porphyry, Iamblichus, and all others following him, until his master Syrianus (d. 437CE), for having restored Platonism in its original splendor.

**PLOTINUS'S RENEWAL OF PLATONISM.** What then was so innovative in Plotinus's interpretation of Platonism to praise him so lavishly and to consider him as the founder of Neoplatonism? Plotinus came after two centuries of Platonic revival (in handbooks since Karl Praechter (1858–1933), this period is commonly called Middle Platonism). This does not mean that Plato had ever been neglected during the Hellenistic period. His dialogues, however, seem to discuss problems without arriving at a definite solution, they use dramatic scenery and mythological stories, and do not always provide concordant views. It may have seemed impossible to find in the works of Plato a systematic philosophy that could

compete with that of the Stoics. This could explain why a skeptic, nondogmatic interpretation of the dialogues prevailed for a long time. In the schools of the early Roman Empire, however, Plato was rediscovered as a dogmatic author, and Platonists attempted to systematize his views in handbooks and explain them in commentaries. Many innovations attributed to Plotinus are already present in the Platonists of the first centuries (such as Atticus, Alcinous, and Numenius of Apamea). Recent research has questioned the distinction between Middle and Neoplatonism and stressed once again the continuity of the Platonic tradition. In fact, the debate over the right interpretation of Plato's philosophy had already started in the Old Academy. Neoplatonism is in many respects a development of tendencies already present in the early school and even in the later dialogues of Plato himself as well as in his *unwritten doctrines*, in particular, in the speculations about the derivation of all beings from first principles. This continuity should not, however, make us underestimate the innovative character of Plotinus's philosophy.

The later tradition has always seen the doctrine of the three hypostases—Soul, Intellect, the One (or the Good)—as the most characteristic feature of Neoplatonism and has credited Plotinus with the first clear statement of this theory. Yet most elements of the doctrine are to be found in previous philosophers, as Plotinus himself admits, and, of course, in Plato's own work. With all Platonists, Plotinus strictly distinguishes the sensible from the intelligible realm. The sensible world is not a *hypostasis*, that is, it is not an independently subsisting reality, but depends for its being entirely on incorporeal principles that derive ultimately from the ideal Forms. Only what is incorporeal and intelligible can have hypostatic reality. Within this realm we have to distinguish between Soul, Intellect, and the One, which constitute an ascending series. This theory could strike one as a needless complication of reality and not as its explanation. From a Neoplatonic view, however, these three hypostases are essential steps in the ultimate explanation of all that exists.

Neoplatonism is, in fact, the most radical answer to the question that motivates Greek philosophy since Thales: What are the first principles of all things? To explain a complex reality such as this cosmos means to reduce it to the more simple elements from which it originates. To explain the multiple, Plotinus argues, is to reduce it to its ultimate principle of unity (*anagôgê eis hen*). Whatever exists, exists thanks to its unity. For without unity a thing has no essence, no being, falls apart: A house would no longer be a house but a mere heap of

stones; a living being not an organism but flesh and bones; the soul not a soul but a bundle of emotions, memories, thoughts, and so on. Unity, then, is much more fundamental than *essence* or *form*. For being depends on being one. As Plotinus puts it, *being* is a *trace of the One*. Neoplatonism does not primarily offer a theory of being, an ontology as can be found in the Aristotelian metaphysics, but a doctrine of what is one and what ultimately explains unity and is therefore rather a henology. Proclus's *Elements of Theology* start with the proposition that "every multiplicity in some way participates in unity". It is not itself, however, the One, but a unified manifold, having unity as an attribute, and is therefore posterior to the One upon which it depends. For that reason no being can ultimately be explained by a principle of unity that is intrinsic to it. Unity that is participated in depends upon a transcendent principle of unity. Thus the living organism is one thanks to the soul giving life and unity to the body. The One must be identified with the Good, since it is the proper function of the One to hold together all things and maintain them in existence, which is also the function of the Good. For to hold a thing together and make it one is to give it its perfection and well-being whereas dispersion is the cause of its destruction and evil. Therefore, all things pursue unity as the good because they all strive to continue to exist and shun division as evil. Therefore, the One is to be identified with the Good, and the origin of the procession (*proodos*) of all things is also the end of their return (*epistrophê*).

In our search for an ultimate explanation, we will find always higher levels of unity until we arrive at the One itself. The whole sensible cosmos is one complex living organism wherein all things are connected in a chain of causes and linked by mutual sympathy, as the Stoics said. But what explains the unity and coherence of this world cannot itself be a material principle, such as the Stoic active principle, but has to be an incorporeal world soul. As Plato argued in the *Timaeus*, the soul is an intermediate between the sensible and the intelligible, the temporal and the eternal. But because it is incorporeal, the soul, at least the rational soul, is never entirely cut off from the intelligible world, not even when it is incarnated in a body. The soul, however, is not itself the origin of the specific forms and of the organic structure incorporated in this world. Whatever the soul (as *demiurge* or creative cause) conveys to this world derives from the ideal Forms contemplated by it. In fact, all production results from contemplation. If one subtracts from this sensible world matter, mass, spatial differences and time, coming to be, corruption and death and only understands what is

essential and eternal in it, one finds a wonderful organism, an articulated system of specific forms, eternal objects of thought. This is the intelligible world, true reality and divine Intellect, as one perfect science that comprehends in itself all being known in its essential structures. Although comprehending all forms eternally and at once, this self-thinking Intellect or Intelligible Being cannot be the ultimate explanation of the universe, as Aristotle thought. For it is characterized by the multiplicity of the Forms and by the duality of thinker and object of thought. This leads Plotinus to a provocative conclusion that seems to go against the grain of philosophy itself: “For thinking itself does not come first either in reality or in value, but is second and is what has come into being when the Good [already] existed.” (V 6, 5, 5–6). This Good is, as Plato famously said, *beyond (epekeina)* thinking and being. It desires nothing, needs nothing. It is just One. Because it is nothing, it can be the origin of all things, not because it creates or produces them, but because they all come forth from its overflowing simplicity. Characteristic of Neoplatonism is this double transcendence: that of the Intelligible with respect to the sensible and that of the Good with respect to the Intelligible.

**A SPIRITUAL EXPERIENCE.** The amazing success of Neoplatonic philosophy, also beyond the limited circle of pagan philosophers, cannot be explained solely by elements of the doctrine. What made it so attractive was that it not only offered a theoretical understanding of reality, but also promised a way to ascend to the first principle of all, bringing the soul back to its own origin. Philosophy begins with the Delphic maxim *know thyself*, which is understood as an exhortation to return into thyself. “Go back into yourself and look,” says Plotinus (I 6, 9, 7). This *epistrophè*, or return, of the soul upon itself is also the beginning of the return to the intellect and the One from which the soul proceeded. For within itself the soul does not only discover its own essence but also has access to the intelligible world to which it belongs essentially. Plotinus tells us of his personal experience: “Often I have woken up out of the body to my self and have entered into myself, going out from all other things. I have seen a beauty wonderfully great and felt assurance that then most of all I belonged to the better part; I have actually lived the best life and come to identity with the divine” (IV 8, 1, 1ff.). The truly wise person therefore “has already finished reasoning and turned to himself: all is within him” (VI 5, 12 17–18). The three hypostases, Soul, Intellect, the One do not solely exist *in nature*: We find them in ourselves, at least if we first discover that we are a *self*.

Through a moral life we have to gather our self from the fragmentation of the daily needs of the body, which distract our attention toward the outside. We are more than souls taking care of our body. We belong to the intelligible world, or rather, each of us is the intelligible world, and in our deepest self, we are one, one with one another, one with the One cause of everything.

The different hypostases of reality are not just three levels of reality; they are different levels of spiritual existence, or different modes of being *self*. Neoplatonic philosophy is not just a theory about unity, for such a theory could never succeed on its own. It is an exhortation to find the one by becoming one and simple, eventually giving up reasoning and explanation, just being one, or even going beyond being, by reaching an *ecstatic experience*. This unification with the One is not an alien supplement, not a denial of philosophy, but a realization and radicalization of what always was the intention of philosophy: to reach the first principle; to overcome the distinction of knower and object known.

**NEOPLATONISM: THE FULFILLMENT OF HELLENIC CULTURE.** Neoplatonism is not just an effort to offer a comprehensive understanding of the Platonic doctrines scattered all over the dialogues. It also integrates within this Platonic perspective the whole philosophical tradition starting with Pythagoras. Aristotle himself is seen as essentially a Platonic thinker, at least if purified of the distortions of some later Peripatetics. Without a full knowledge of the Aristotelian logical writings and his treatise *On the Soul* it is not possible to understand the subtle Neoplatonic theory of knowledge. Aristotle’s analyses of substance, matter and form, potency and act, quality and quantity, the different forms of causality provide the conceptual framework in which Plato’s arguments are construed. To the Neoplatonists we owe the great commentaries on Aristotle, which made possible the reception of his philosophy by the medieval thinkers. When Neoplatonism took over the intellectual hegemony, after five centuries of being dominated by Stoicism, it also adopted many Stoics doctrines, in particular (part of) their ethics, and their views on providence and fate. Thus, they secured it an influence beyond antiquity. In short, Neoplatonism not only comes at the end of ancient philosophy, it integrates, in a way, the whole philosophical tradition in all its richness and diversity, making a synthesis of what had been for a very long time opposing schools.

In contrast to Plotinus, the later Neoplatonists became increasingly interested in the wisdom transmit-

ted through the ancient religious traditions, not only the Hellenic religion (as it was known through Homer and Hesiod (c. 700 BCE) between the Orphic revelations), but also the arcane doctrines and rituals of the barbarians, in particular, the Egyptians and Chaldaeans. Of particular interest for the later development of the school were the so-called *Chaldaean Oracles*. These oracles offer, in epic hexameters, a mythical theogony and cosmogony of Platonic inspiration. They are supposed to have been revealed by the gods to a certain Julian the Chaldaean and his son, the *theurgist* (c. 160–80 BCE). The term *theurgy* (divine work) indicates certain ritual actions, which connect those who practice them with the gods. From Iamblichus onward, the *Chaldaean Oracles* gained a considerable authority comparable only to that of the sacred texts of Jews and Christians. This positive attitude toward the diverse religious traditions did not, however, include Christianity. Porphyry and Iamblichus wrote polemical treatises against the Christians and, following them, the emperor Julian, called the Apostate (331–363), even started persecuting them. They considered Christianity as a threat for the whole of Hellenic culture with its tradition of education, literature, religious practices, and philosophy. The intolerant attitude of the Christians made it impossible to integrate their views together with the other religious traditions in one comprehensive *Platonic theology*. The growing opposition against Christianity may explain why Neoplatonic philosophy itself, from Iamblichus onward, became increasingly *theological* in its project. The Christian authors liked to point to the contradictions within the pagan philosophical tradition. They perceived all schools to have divergent opinions, which would almost naturally lead to skepticism. In response to this the Neoplatonists made an attempt to systematize and reconcile the most diverse doctrines from an overall Platonic perspective, integrating in it all that was valuable in the mythological and religious traditions. Just like the Christians they had their own sacred books (which were wonderfully in agreement with Plato's wisdom), and their theurgical practices could be seen as a rival to the sacramental practices of the Christians aiming for the salvation of the soul.

At the end of antiquity, in particularly in the Athenian school, Neoplatonism had thus become the ideological justification of the old pagan culture wherein all the wisdom of the Hellenic tradition was integrated: the theology of Homer, Hesiod and Orpheus, Pythagoras, Parmenides, Plato himself, and also Aristotle and the Stoics.

## HISTORICAL SURVEY

**THE LEGACY OF PLOTINUS.** Plotinus undoubtedly set off the Neoplatonic movement, though it is difficult to call him the founder of a school. His philosophy was in a way too *original*, too much linked to his own spiritual experience. Plotinus is provocative and daring in his expression, as he himself admits, as when he says that the soul is never fully distanced from the intellect. From a scholarly point of view, much in what he says remains unclear: How can the One be beyond all things and still be the *power of all things*; how can the One bring forth a multiplicity; what exactly is the role of the soul in the production of the World; and so on. Particularly challenging was Plotinus's philosophical appropriation of religion. The philosopher is the true priest who can ascend within himself to the divine principle of all. He has no need to go to temples, the gods "will come to him" (*Vita Plotini*, 10). Enough questions to stimulate further debate in the later school for over two centuries.

It would wrong, indeed, to see Neoplatonism as a unified movement: There was considerable divergence within the school, with conflicting interpretations of Plato; different views on essential points of the doctrine, such as the status of the One and the explanation of the procession of all things; the relation between the Intellect and the intelligible and the status of the Ideas; the role of the demiurge in the creation of the sensible world; the function of demons and other intermediary beings; the nature of the soul and its relation to the intelligible world; and above all, the role of theurgy. Nevertheless, all shared a common doctrine, the three hypostases: the transcendence of the One, the distinction between the sensible and the intelligible, the return upon the self as the origin and the end of philosophy.

The following survey shall sketch the main lines of the historical and institutional development of Neoplatonism, referring to the relevant entries in this Encyclopedia for more in-depth studies of major figures.

**THE FIRST GENERATION AFTER PLOTINUS.** After his arrival in Rome, Plotinus soon attracted to his lectures students and devotees who often belonged to the high Roman society. We are well informed about the intellectual climate in this close circle—about the texts that were read and the topics they discussed, about the interaction in the group—thanks to the *Life of Plotinus* written by his close disciple Porphyry as an introduction to his edition of the works of his master. As Porphyry tells us, Plotinus for a long time refused to write down his lectures. Only at the age of forty-nine, at the insistence of his students, did

he start scribbling down his arguments. It took Porphyry a great effort and a long time to make the texts ready for publication. The *Enneads*, as they were called (they consist of six groups of nine essays), were published about thirty years after the death of the master. This edition made the reputation of Plotinus and gave his thought a wide circulation beyond the circle of his immediate disciples. Soon a Latin adaptation of the work was made (probably a selection), which attracted enthusiastic readers among young intellectuals in Milan, as the example of Augustine shows. Porphyry also wrote a systematic introduction to Neoplatonic philosophy, the “Pathways to the Intelligible,” making abundant use of material from Plotinus. Without the effort of Porphyry, the philosophy of Plotinus, this original individual, would never have had such an immense influence on the development of late antique and medieval thought. Porphyry defended *the harmony of Plato and Aristotle* (this is the title of one of his lost works) and contributed to the reception of Aristotle’s works in the Neoplatonic curriculum as an introduction to the study of Plato. He wrote two commentaries on Aristotle’s *Categories* and a short *Introduction (Eisagôgê)* to the study of categories, which soon gained the authority of an Aristotelian treatise.

In a famous treatise (the concluding part of which is known as Ennead II 9 [33]), Plotinus attacked some Gnostic Christians and defended the beauty of the Cosmos against their dualistic views. Porphyry in his *Against Christians* launches a direct attack against the Christians. This anti-Christian outlook would also be that of the later school. Despite his anti-Christian polemics, Porphyry has a great interest in the diverse religious traditions as a source of wisdom. He is the first philosopher to pay attention to the *Chaldaean Oracles* and is fascinated by the theurgical rituals as a means to achieve the *salvation of the soul* (that is, the return of the soul to God). But, maybe under the influence of Plotinus, he adopted a more intellectual interpretation of religion, which led him to question theurgy and other aspects of the Egyptian religion (for which he would be criticized by Iamblichus). Hence, Porphyry limits the efficacy of theurgical practices to the lower degrees of salvation (those concerned with the purification of the pneumatic body and the lower soul) while demanding strictly philosophical means for achieving the union with the One.

**THE SYRIAN SCHOOL OF IAMBlichus.** The Syrian Iamblichus stayed for some time as a student with Porphyry in Rome. He had, however, diverging views on many issues and did not hesitate to attack Porphyry in writing. Having returned to his native Syria at the end of

the third century, he set up his own school at Apamea. While Porphyry’s influence remained mostly limited to the Western part of the Empire (including the Latin tradition), Iamblichus left a definitive stamp on the development of Neoplatonism in the Greek world, both through his metaphysical speculations on the first principles and his passionate defense of theurgical practices. Whereas Porphyry, interpreting Plotinus, intended to see the One as the summit of the Intellect, Iamblichus emphasizes even more the transcendence of the first principle, putting the Ineffable even beyond the One. Within the intelligible realm, he further distinguishes the purely intelligible from the intellectual level. And whereas Porphyry, following Plotinus, identified the supreme part of the soul with the intellect, Iamblichus insists that the soul is a separate ontological entity, intermediate between the intelligible and the sensible and therefore lower than intellect. Situated between the soul and the intellectual gods, the classes of demons, angels, and heroes have an important mediating function. All this announces a tendency that will become dominant in the later development of the school: the introduction of ever more intermediaries in the procession from the One to the multiple to make the transition from one level to another less abrupt. It is also Iamblichus who introduces the distinction between a non-participated and a participated status of a principle (such as soul or intellect). He also develops the triadic schema of remaining, procession, and reversion and applied this and other structures to different ontological levels. Iamblichus seems to have developed all important principles that support the architecture of Neoplatonic metaphysics. He also deserves credit for having established the educational canon of Plato’s dialogues as well as their reading order and for having developed the exegetical principles for the interpretation of Plato, the most important of which being the determination of the right scope or intention of a dialogue. Iamblichus also initiates the Pythagoreanizing trend in Neoplatonism. He considers Pythagoras as the real founder of the philosophical tradition in all of its branches and as the model of the philosophical life. Plato himself, so Iamblichus believes, was the most eminent exponent of that tradition. Iamblichus’s Pythagorean leanings also explain the heavy emphasis on mathematics as the most universal science, having applications in all possible branches of philosophy, not only in physics, and astronomy, but also in ethics and theology. For his attempt to fuse Pythagoras and Plato into one mathematical–metaphysical system, Iamblichus could find inspiration in Neopythagorean authors of the first centuries CE, such as Nicomachus of Gerasa (c. 60–120 CE).

Even more important for the future development of the school is Iamblichus's novel attitude to religious rites. He could not agree with Porphyry's reserved rationalistic attitude toward religious practices and theurgy in particular, as is evident from his anonymous reply to the latter's *Letter to Anebo* (an Egyptian priest). Iamblichus's reply, since the Renaissance known under the title *On the Mysteries of the Egyptians*, is a comprehensive defense of religious practices, magic, and sacrifices:

It is not thought that links the theurgists to the gods: for otherwise what should prevent the theoretical philosopher from enjoying a theurgic union with the gods? But this is not the case; theurgic union is attained only by the perfective operation of ineffable acts worthily performed, which are beyond all understanding, and by power of the unutterable symbols, which are intelligible only to the gods.

By thus insisting on the necessity of the practice of theurgic rites to accomplish the union with the gods, Iamblichus rejects, as E. R. Dodds notes, "the whole basis of the Plotinian intellectual mysticism" and "opens the door to all those superstitions of the lower culture which Plotinus had condemned in that noble apology for Hellenism, the treatise *Against the Gnostics*." (Dodds 1963, p. XX with quotation of *De myst.* II 11).

Some of Iamblichus's students devoted a lot of attention to the philosophical justification of magical and esoteric practices. They set up a school in Pergamum that seems to have gained some reputation when one of its students, Julian, became emperor. Julian drew upon Neoplatonic philosophy in his attempt to restore pagan rituals and traditions against the increasing influence of the Christians. Sallustius (fl. fourth century CE), who published a small introductory manual of Neoplatonic theology *On the Gods*, was probably a member of the same school.

**THE ATHENIAN SCHOOL.** The philosopher Plutarch of Athens (d. 432 ) gave a new inspiration to the Platonic Academy in Athens, which from then on adopted the philosophical style of Iamblichus. Although they no longer taught in the original building of the Academy, the successive heads of the school in Athens proudly considered themselves to be the "*diadochoi*," successors of Plato. Of Plutarch we have only indirect and fragmentary evidence. Proclus attributes to him an important role in the search for the right interpretation of the Parmenides. As a young student, he read with him Aristotle's treatise *On the Soul* and Plato's *Phaedo*. One would like to know how

Plutarch attempted to reconcile the opposing views of Plato and Aristotle on the nature of the soul and its immortality, and on the origin of knowledge (anamnesis vs. abstraction).

After Plutarch's death in 432, Syrianus, a native from Alexandria, became the new head of the school. Of Syrianus we have only a commentary on some books of the *Metaphysics* in which he is often very critical of Aristotle. He recognizes Aristotle's great contribution in logic, ethics, and natural philosophy, even in theology. But, as he says, Aristotle's attack on the doctrine of the first principles of Pythagoras and Plato (an in particular, the doctrine of the Forms) is so unfair and shows so much misunderstanding that he felt compelled to defend the truth by showing Aristotle's arguments to be invalid (*In Metaph.* 80, 4-81, 14.)

When Syrianus died (c. 437), he was succeeded by Proclus who was born from a Lycean family still faithful to the old religion and had come from Alexandria to study philosophy in Athens. After a short term with Plutarch, Proclus continued his philosophical education under the guidance of Syrianus: "In less than two years Proclus read with him all of Aristotle's treatises on logic, ethics, politics, physics, and the theological science which surpasses them all. When Proclus was suitably educated through those studies which, so to speak, are a kind of preparatory initiation, or lesser mysteries, Syrianus led Proclus to Plato's mystagogy." (Marinus, *Life of Proclus*, §13).

Because of the loss of most of Syrianus's work, it will never be possible to determine which ideas and doctrines Proclus inherited from his master and which ones he contributed himself. But it is evident that Syrianus had a profound influence on Proclus, as the latter gratefully acknowledges: "It is he who has granted us the privilege of partaking in the philosophy of Plato as a whole and who has communicated to us what he had received in secret from those senior to himself, and, above all, who joined us with himself as co-celebrants of the mystical truth of the divine principles." (*Theol. Plat.* I 1, p. 6.16-7.8 ed. Saffrey-Westerink, transl. J. Dillon). As is clear from this text, Proclus understands his Platonic education not just as a transmission of a philosophical doctrine but as a revelation of a mystical truth coming from the gods through Plato, and even as an initiation in a mystery cult and a participation in a ritual practice of life.

As we know from his biographer (and successor) Marinus (c. 440–c. 500), Proclus's whole life was devoted to teaching and writing. He wrote commentaries on the Platonic dialogues that were part of the Neoplatonic

school curriculum. The course started with the reading of the *Alcibiades I*, a dialogue about self-knowledge, which was regarded as an introduction to philosophy. The curriculum culminated in the explanation of the two major dialogues of the Platonic corpus, which were considered to incorporate the whole of Plato's philosophy, namely the *Timaeus* (about the generation of the physical world), and the *Parmenides* (about the procession of all beings from the One). The commentaries of Proclus are masterpieces in their genre, as they not only offer a systematic interpretation of the text but also provide a wealth of information about the discussions within the Platonic tradition. In addition to his commentaries, Proclus owes his reputation to his two great syntheses of Neoplatonic philosophy, the *Elements of Theology* and the *Platonic Theology*.

In the *Elements of Theology*, Proclus demonstrates in a geometrical way the most fundamental theorems of the theological or metaphysical science as he understands it. The first part examines the fundamental principles that govern the structure of all reality, such as the relation between the One and the many; cause and effect; whole and parts; transcendence and participation; procession and reversion; continuity and discontinuity. In the second part he expounds the procession of the divine principles (henads, intellects, souls). The *Elements of Theology* is without doubt his most original work, not so much because of its content (which offers the standard doctrine of the Athenian school) but because of its extraordinary attempt to develop the entire Neoplatonic metaphysics from a set of axioms. It also had a tremendous influence, in particular through the Arabic adaptation that was made in the ninth century in the circle of Al-Kindi (805–873). In the middle of the twelfth century, this Arabic treatise was translated into Latin. The *Liber de Causis*, as it was named, circulated as the work of Aristotle and thus obtained a great authority in medieval scholasticism. The systematic character of the *Elements* and its rigorous method make it the best introduction for the student not only to Proclus's own thought but also to Neoplatonism in general.

Proclus was convinced that the truth about the gods had been revealed in many different ways—in obscure oracles, myths, and symbols. It was his ambition to prove the harmony between Plato and the other sources of divinely inspired wisdom, in particular, the *Chaldaean Oracles* and the Orphic poems. In his view only a genuinely philosophical approach could offer the conceptual framework for such a comprehensive interpretation. One finds such a framework in the *Parmenides* if one adopts

the theological interpretation of this dialogue developed first by Syrianus. The *Platonic Theology*, written at the end of Proclus's life, is the perfect realization of this theological project—a pagan Summa of theology.

It is difficult to evaluate the originality of a thinker who, in most of his works, proclaims to be nothing but a faithful follower of his master Syrianus. But it is Proclus who put his mark on the subsequent development of Neoplatonism in Byzantine, Arabic, and Latin medieval thought. His huge influence—much greater than that of Plotinus—could extend itself mainly through two important indirect channels of transmission: the Arabic adaptation of the *Elements* in the *Liber de Causis*, and the Christianization of his Platonic theology by Dionysius the Areopagite. The latter author pretends to be, and was for centuries believed to have been, the Dionysius mentioned in the Acts of the Apostles who became Christian after the preaching of Saint Paul on the Areopagus (Acts 17:34). This *authorship* gave this work an almost apostolic authority both in Byzantium and in Latin Europe. Although the real identity of this author still remains unknown, he probably was a Syrian Christian who followed classes in Athens at the end of the fifth century (he may even have been a direct disciple of Proclus). In his works, and in particular in his treatise *On the Divine Names*, he expounded the Christian doctrine of the transcendent God, of the Trinity, and of creation and incarnation in terms of Proclus, eliminating references to the pagan religion and substituting the Christian sacred writing for the *Chaldaean Oracles*.

Among Proclus's fellow students under Syrianus were Hermias, who would return to his hometown Alexandria and start teaching there, and Domninus of Larissa (c. 420–480), who had a predominantly mathematical interest and was criticized by Proclus for his unorthodox interpretation of Plato.

On the further history of the Platonic school in Athens at the turn of the fifth century, inside information is provided by Damascius, the last head of the school, in his *Life of Isidore* (Isidore [fifth century] was his predecessor). Thanks to his energetic reforms and inspiring teaching, the Academy would revive one last time. Damascius is known, among other things, for his commentaries on the *Philebus* and the *Parmenides*, but above all things, for his treatise *On the First Principles* (*De principiis*). This work concludes a period of a thousand years of philosophical speculation on the first causes. Damascius has no ambition to develop a system that would surpass that of his predecessors. His own thought is primarily aporetic: He raises critical questions in the

margin of the doctrine of the principles as it had been developed in the Neoplatonic tradition and confronts it with all sorts of difficulties. When he risks a solution—and on many issues he can be very original (for instance, his doctrine on time)—he again calls it into question by raising new aporias. The most fundamental aporia is discussed at the beginning. Is the first principle itself a part of the whole of which it is the principle? The first, it seems, is neither principle nor cause nor does it fit in any other category used to explain relations between beings: It is an ineffable *nothing* we have to postulate beyond the one whole. This ineffable is even beyond the One, which is the first principle of all things. More than any other Platonic philosopher, Damascius is aware of the precarious nature of all rational discourse when dealing with questions that go beyond the limits of what can be experienced. About the first principles we can only speak by making use of analogies and *indications*. His sharp critical mind does not, however, lead him to skepticism. If a philosophical explanation remains tentative and fragile, there is also the mythological tradition and religious practice, to which Damascius remains very devoted. In many ways his work is a wonderful swan song of pagan Hellenism.

The renaissance of the Academy under Damascius may have been one of the reasons for its closing by a decree of the emperor Justinian (c. 482–565) in 529. The decree is one of the multiple measures of the emperor against pagans: They were formally excluded from all official positions, including teaching. According to the historian Agathias (536–582), Damascius, together with Simplicius, Priscianus the Lydian, and other philosophers went into exile at the court of King Chosroes (?–579) in Persia. After two years Chosroes concluded a peace treaty with Justinian, which contained a clause about the exiled philosophers: “They were free to return to their country and live quietly by themselves without being compelled to accept any belief against their conviction or to renounce the creed of their fathers” (Agathias, II, 28–32 ed. Keydell, transl. Westerink). Whether they returned to Athens or Alexandria or stayed in other places remains uncertain.

**ALEXANDRIAN SCHOOL.** Alexandria had always been a city with a dynamic intellectual life, and it remained so in late antiquity though Christian theological debates now dominated the scene and church authorities set restrictions to the teaching of pagan philosophy. A notorious case, symbolic of the changing times, is the lynching of Hypatia in 415 by a Christian mob. Educated by her father Theon (335–405), Hypatia had become an outstanding mathematician. What her philosophical inter-

ests were are unknown, but among her admiring disciples was Synesius (c. 370–414), author of *On Dreams* of Neoplatonic inspiration, who also shows an interest in the *Chaldaean Oracles* even after he had become a Christian bishop.

The first to introduce Neoplatonic philosophy in Alexandria was Hierocles (c. 400–460 CE), who studied in Athens with Plutarch. He is the author of a commentary on the *Golden Verses* of Pythagoras and a treatise *On Providence*. In the introduction of the latter work, he criticizes “all those who try to break up the unanimity of Plato and Aristotle”. Thanks to his master Plutarch, he was educated in a tradition that harmonizes the thought of both great philosophers and goes back to Ammonius (c. 175–243 CE), who was teacher of Plotinus in Alexandria: “This man, Hierocles says, was the first to bring the teachings of Plato and Aristotle into one and the same view and to transmit a philosophy without factions to all his students.” This hermeneutical approach—different from the more polemical attitude to Aristotle of Syrianus and Proclus—would be continued in Alexandria by the following generations of philosophers and find its magnificent expression in the great commentaries on Aristotle of Simplicius.

The leading Neoplatonic philosopher in Alexandria was another Ammonius (c. 440–526) who had come from Athens with his father Hermias. In his youth Ammonius followed courses with Proclus, and he would adopt the basic principles of the latter’s Neoplatonic synthesis. Of Ammonius, however, we possess only commentaries on Aristotle, one of which he wrote himself (on *De Interpretatione*), others of which were published in the form of lecture notes by his students. Since most of his teaching was devoted to the explanation of Aristotle’s logic and (meta-)physics, the typical Neoplatonic doctrines (the three hypostases; the procession of all things from the One; the structure of the intelligible world; the ascent and mystical union of the Soul) are rarely discussed and explained. Had we also had Ammonius’s commentaries on Plato, the picture might have been somewhat different. But it may also be the case that Ammonius intentionally avoided controversial subjects as he noticed the growing number of Christian students in his audience. The Alexandrian School was a much more open system of education than the Athenian Academy, which had in its last phase become somewhat of an esoteric group. However, from the extant texts, it emerges that Ammonius had more interest in explaining the structure of the physical world than in elucidating the architecture of the intelligible world.

Scholars have often said that the Alexandrian School represents a different kind of Platonism from that of Athens:

In Athens the speculative, mystical, theurgic, and religious elements predominated; and that school remained to the end a stronghold of paganism. In Alexandria scholarly interests and a noncommittal exegesis of texts prevailed. The Platonism that the Alexandrian School professed was in some respects closer than that of the Athenian School to the pre-Plotinian version; thus, the doctrine of the ineffable One and the mystic union with it had no prominent place.... Thus, the "baptizing" of Greek philosophy—including the stress on those parts of the Aristotelian philosophy that were metaphysically neutral—so often considered characteristic of the medieval period, was to a certain extent anticipated in Alexandria; after the Arab conquest it was perhaps replaced by 'Islamizing'."

Thus writes Ph. Merlan in the first edition of this Encyclopedia, following the views of Praechter. Recent studies (in particular, by Ilsetraut Hadot), however, tend to minimize the differences between the two schools. There were indeed very close relations, even family relations, between the members of both schools, and there was a lively intellectual exchange. All members were educated in the same tradition. The fact that some doctrines are less prominent in the extant works of the Alexandrians can be explained by the fact that only their work on Aristotle have come down to us. A close reading of the works of the Alexandrian philosophers shows that they had fundamentally the same views on the most important metaphysical issues (such as the distinction between the demiurge and the absolute One) as their colleagues in Athens. And yet it cannot be denied that there are important differences between the two schools and that the view of Praechter and Merlan contains some truth. First, as noticed, there is the harmonizing, not polemical, approach to Aristotle. One may even go so far to say that the Alexandrians were primarily interested in presenting a Platonized Aristotle. Second, though Hadot may be right in denying that the Alexandrian thinkers return to a pre-Plotinian form of Platonism, they tend to simplify considerably the highly complicated Proclean system. Third, the philosophy of the school of Ammonius is less connected with openly pagan beliefs. The project of a comprehensive Platonic theology seems to be alien to them. According to Damascius (who speaks about it with contempt), Ammonius had concluded a pact with the patriarch Athanasius. We

do not know what concessions he made to preserve the freedom of teaching in the school. Maybe he promised not to discuss certain doctrines contrary to Christian faith, such as the eternity of the world or the preexistence and reincarnation of the soul.

Two of the most famous students of Ammonius deserve special mention: John Philoponus and Simplicius. The latter is rightly famous for his voluminous commentaries on the *Physics*, the *De Caelo*, and the *Categories* (the commentary *On the Soul* is not his work but probably of his colleague Priscianus), which still are of great use to any interpreter of Aristotle. Simplicius attended Ammonius's courses on Aristotle, but he mentions also Damascius as his teacher. This double education situates him somehow halfway between Alexandria and Athens. He is well acquainted with Damascius's metaphysical speculations (on the procession of all things, on time and place), but never forgets the first intention of his work, which is to offer a faithful elucidation of the views of Aristotle in a Neoplatonic perspective. His commentaries also contain rich historical and doxographical information on the Presocratics (of whom he preserves many fragments), on Stoic philosophy, and on the later developments of the Peripatetic and Platonic school. He also quotes long sections from Plato's *Dialogues* and misses no opportunity to demonstrate that there is no contradiction between Plato and Aristotle in doctrinal matters. When Aristotle does seem to attack his master, so Simplicius argues, his critique only concerns the manner in which Plato expresses his views. For Plato often uses a narrative form and a metaphorical language, which, if taken literally, may lead the reader to erroneous views. To defend the harmony of Plato and Aristotle was for Simplicius also of great strategic importance in his controversy with the Christian Philoponus. The latter liked to exploit the oppositions within the philosophical tradition in order to undermine it.

Philoponus was one of the brightest students of Ammonius. He published several of his lecture courses and continued to comment on Aristotle in the manner of his master. What sets Philoponus apart from the other members of the school, however, is the publication of a treatise against Proclus in which he attacked, from an overtly Christian point of view, the doctrine of the eternity of the world. Philoponus attempts to prove that the world had a temporal origin and that this was also the authentic doctrine of Plato in the *Timaeus*. In the later versions of his commentaries on Aristotle, he adopts the same polemical attitude whenever he finds Aristotle in

contradiction with the Christian understanding of creation.

The publication of *Against Proclus* in 517 must have provoked quite a scandal in the school, where Philoponus was one of the leading figures. Scholars have advanced many solutions to explain his sudden change from a Neoplatonic to a Christian philosophy. The fact that the publication of the polemical treatise coincides with the closing of the Academy in Athens and with other hostile measures that were taken against pagan philosophers may provide a useful clue. By publishing his book against Proclus, Philoponus probably wanted to distance himself from the allegedly pagan elements in Neoplatonic philosophy. In his later work he is only engaged in theological discussions.

Simplicius says he never met Philoponus and speaks of this *newcomer*, not really a *philosopher*, with utter disdain. In his commentary on the *De Caelo*, he came to the defense of Aristotle and of the old Hellenic pagan view of the cosmos as an everlasting, wonderful expression of the intelligible world.

The successor of Ammonius as head of the school was Olympiodorus (c. 500–565). We also have some of his commentaries on Plato, which show that he did not consider himself to be a Christian. For he continued to defend, though with caution and without offending his audience, some views that belonged to the pagan tradition. He upheld polytheism by explaining the lower gods as powers of the first God rather than as many gods.

Olympiodorus's two pupils, Elias and David, who lectured on Aristotle's *Organon*, certainly were Christians though their belief does not really have an impact on their teaching. The last teacher in the school was Stephanus, who became professor at the newly founded academy in Constantinople (in 610). The transfer of the school (and its library) to Constantinople may explain why so many works of pagan Neoplatonists have survived.

**LATIN NEOPLATONISM.** In the western part of the empire, too, we find authors who were influenced by Neoplatonic ideas. Since they all wrote in Latin, they would have a determinative influence on the formation of Medieval Platonism. There are, of course, Christian thinkers, such as Ambrose (c. 339–397), Marius Victorinus (c. 280–365), and above all Augustine, who all considered Plato closer to Christian faith than any other philosopher. Yet besides them there also was a small group of authors who continued to practice philosophy in the old tradition. Even if they were Christians, their

beliefs had almost no effect on their arguments (contrary to what we see happen in Augustine). A good example is Calcidius (late fourth century), who translated and commented the *Timaeus* and followed Porphyry in many of his interpretations. His work had an immense success in the early Middle Ages. The same is true for the *Commentary on the "Dream of Scipio"* by Macrobius (c. 400), who quotes also from Plotinus and Porphyry. Also Martianus Capella (early fifth century), author of the much read *On the Marriage of Philology and Mercury* that offers an allegorical introduction to the seven liberal arts and makes them part of the philosophical wisdom, shows a thorough acquaintance with the Platonism of late antiquity. Last but not the least is Boethius who is undoubtedly a Christian (as his theological work shows). Yet in his practice of philosophy, he does not allow Christian arguments to interfere directly. He is author of the celebrated *Consolation of Philosophy*, which is profoundly Neoplatonic in its argument, but he also wrote translations and commentaries on Aristotle. It was his ambition to translate and comment on all of Plato's and Aristotle's works and to demonstrate that they are in agreement on fundamental questions. This program situates him in the tradition of Alexandria, with which he was well acquainted. He shows also to be familiar with the works of Porphyry and Plotinus.

## EPILOGUE: CHRISTIAN NEOPLATONISM

As we have seen Neoplatonic philosophy from the beginning took a very polemical attitude toward Christianity. Plotinus attacked some Gnostic Christians in his entourage; Porphyry wrote a vehement attack against the Christians, as did Iamblichus and Julian. The latter even used the Neoplatonic philosophy in his policy of restoration of paganism. In the Athenian School Neoplatonism became the ideology of pagan religion in its multiple guises. When Christianity became the dominant religion, philosophers had to be more cautious and could only make indirect criticism. Proclus and Damascius just ignored Christian thought and looked down with contempt upon the Christian establishment. The Christian authors, of course, attacked paganism, but were, on the other hand, surprisingly positive toward Neoplatonism, which they considered to be the philosophy that came closest to the Christian Weltanschauung. This is the case for Augustine in the west and for Gregory of Nyssa and Gregory of Nazianzus in the East. The reasons for this fascination are manifold: the other-worldness of Neoplatonism; the emphasis on the transcendence of God; the

nondualistic doctrine of creation (procession); the spiritual antimaterialistic interpretation of the world; the immortality of the soul; the access to the divine through the soul's return upon itself. The differences were no less evident, in particular, the doctrine of incarnation, personal providence, and the belief in resurrection. Whereas Christian thinkers were often deeply influenced by Neoplatonic thought, the pagan philosophers, on the contrary, showed no influence from Christianity: They absolutely ignored it. There was no interaction between Neoplatonism and Christianity, only a strong influence in one direction.

The integration of Neoplatonic arguments in the explanation of the Christian wisdom give rise to original speculations about creation, the world, the place of humankind, and the relation of soul-body. Some scholars may argue that this Christian appropriation of Neoplatonism is a betrayal of the original spirit of philosophy. But this transformation is in itself a wonderful testimony to the creativity of Neoplatonic thinking. Take the concept of the *self*, which in Neoplatonism gained a much greater richness than ever before in Greek philosophy. Augustine took over the notion of self-reflexivity but gave it an incredible concrete existential richness, making it a leitmotif of his autobiography (*Confessions*). Another example is eschatology. According to the Neoplatonic view, the procession and return are constitutive movements of each being in relation to its cause. Christian thinkers historicized this process: At the beginning of time, all things proceeded from God and will return to Him at the end of time. This interpretation made it possible to give a meaning to history and even to the contingent events of human life.

Thanks to this creative modification, Neoplatonism had a continuing and expanding influence after the death of the pagan intellectual culture. Already prior to Justinian's decision to close the school of Athens, the pagan philosophical tradition had become a rather marginal phenomenon in late antique civilization. Its practitioners were an esoteric group of intellectuals, nostalgic for the past glories of Hellenic culture, practicing magical rituals, and praying to old gods. Pagan Neoplatonism had become an ideology at the service of a disappearing civilization. Once this philosophy became integrated in the Christian culture, and later in the Muslim world, it gained a new importance, which Plotinus could never have foreseen.

## NEOPLATONISM [ADDENDUM]

When Islam took over the Middle East it came into contact with a flourishing local culture heavily influenced by Greek thought. As far as philosophy was concerned, neoplatonism was the leading approach. For example, many of the most important neoplatonists such as Plotinus, Porphyry, and Proclus had studied in Alexandria, a city conquered by the Muslims in 642. A number of key texts became important when translated into Arabic. These were the *Theology of Aristotle*, in fact mainly parts of Plotinus's *Enneads* and the *Liber de causis*, based on Proclus's *Elements of Theology*. Also popular among philosophers were the extensive commentaries on Aristotle by Alexander of Aphrodisias, Themistius, and others—commentators imbued with the values of neoplatonism to some extent. One significant aspect of neoplatonism was the idea that Plato and Aristotle did not differ much on important issues, together with the doctrine of emanation and a cosmology that has the world being produced out of one being or principle. The translation project that transmitted Greek manuscripts into Arabic introduced a

good many of these ideas and doctrines into the Islamic world, and so philosophy in the sense of *falsafa* or Peripatetic philosophy became identified in the first few centuries with neoplatonic philosophy.

### THE MAIN DOCTRINES

The emphasis on the unity of the creator may well have found a welcoming reception by Muslim thinkers, and it is certainly there strongly in Islamic neoplatonism. One of the central issues is how there came to be many things in existence when really there exists only one absolute being or principle. An explanation is that the One thinks and through thinking brings other things into existence, because once it thinks it realises that it is a thinking thing, and this brings about a mental bifurcation in its unity, a bifurcation that leads to the production of a range of beings that exist either closer or more distantly from it. The more perfect and abstract they are, the closer they are, the less perfect and the more material are more distant.

Another issue was how God related to the world. If God is identified with the One, then the usual account is that he creates the world by emanation, not production. God thinks about himself and through a variety of stages other things are brought into existence, but it would be an interference with God's perfection were he to know about any of these lesser things. The only thing he should think about is himself, and so the world comes about as an indirect effect of this form of thought. An implication of this is that the world is eternal, because God has always existed, and so has always thought about himself. He did not suddenly start thinking, since it is part of his essence to think. Because God is eternal, his thinking must be eternal, and whatever stems from it eternal also. As can be seen, these are all doctrines that do not fit neatly within the framework of a religion such as Islam. The Qur'an suggests, although does not explicitly state, that God created the world at a particular time, when he wanted to, and it states that he knows everything that goes on in the world. The indirect account of creation as emanation in neoplatonism seems different from the understanding of creation in the Qur'an.

### THE MAIN PHILOSOPHERS

The first Islamic philosopher to construct a thoroughly neoplatonic philosophy was al-Fārābī, and he led the way to Ibn Sīnā (Avicenna), who produced the most developed such theory. They both described emanation as consisting of ten intellects that link the Necessary Being or One with our world, where the active intellect (often

identified with the moon) is the highest level of thought that we can attain. The political implications of the theory are important too. Those who can attain the active intellect are the appropriate rulers, and prophets are those who are able to think at the level of the active intellect, or come into contact with it at least occasionally. This enables them to understand the organization of the world because the active intellect is the most abstract form of thought that human beings can attain, and once it is combined with the facts we observe in the world the prophet can easily predict what is going to happen. For one thing, the organization of the world, according to Ibn Sīnā, is in terms of necessity, so the pattern of existence is something that may be understood rationally by an advanced thinker.

### ATTACKS ON NEOPLATONISM

Neoplatonism came under attack by Muḥammad al-Ghazālī, who criticized it in his “Refutation of Philosophy” both for being heretical and also for being invalid philosophically. He picked out in particular the theses that God cannot know individual things, that the world is eternal and that bodily resurrection is inconceivable. The latter follows from neoplatonism due to its prioritization of the soul over the body, and the principle that the material aspects of human beings are not important enough to survive death. The account of immortality in the Qur’an is clearly material, and the idea that only souls survive death does not seem to fit it. God would not know individual things because he has no sense machinery and he is separated from the everyday activities of this world. Yet as al-Ghazālī argues, how can he punish and reward us on the day of judgement if he has no idea what we do in this world? He rightly points to a range of ideas that really give God little to do, whereas the God of the Qur’an is directly involved in our everyday affairs.

But these are theological points, and al-Ghazālī also uses the arguments of his opponents to refute them. He tries to disprove the whole neoplatonic apparatus, importing God’s will to keep nature in operation as a unified system instead of necessity. He argues in particular that causal necessity is only an idea we have and we could easily think of different connections, or no connections at all, between familiar causes and effects. This really does threaten the whole neoplatonic system, because this involves necessary connections between events, so that when one thing occurs, something else has to occur also. Al-Ghazālī makes a lot of use of imagination here, using thought experiments to try to show that the putative necessary connections are not necessary at all. When Ibn

Rushd (Averroes) responded to his attack in his “Refutation of the Refutation” he was fighting with one hand tied behind his back, because Ibn Rushd disapproved of many of the neoplatonic principles as incompatible with the thought of Aristotle, where his main allegiance lay. Ibn Rushd was able to discern many of the divergences between Aristotle and neoplatonism, but in order to defend philosophy as such he was obliged to defend neoplatonism, because this was the main form of philosophy in the Islamic world at that time. Islamic neoplatonism also had a considerable effect on Isma‘īli thought, and on ishrāqī (illuminationist) thought. The esoteric Brethren of Purity (Ikhwān al-Safa’) were thoroughly imbued with neoplatonic ideas, although often not very orthodox ones.

### DECLINE OF ISLAMIC NEOPLATONISM

Neoplatonism also came under attack by the mystics in Islam who saw its limited access to God as a significant problem. The highest we can come to God is to come into contact with the active intellect, a range of abstract thinking that is really a long way from God. Mystics tend to advocate a much closer connection to God and criticized neoplatonists for their view on this. However, they could use aspects of the theory to explain different levels of reality and their interconnections, although these had to be suitably reinterpreted of course along Sufi lines. Similarly some ishrāqī thinkers replaced the language of the levels of intelligences and worlds with levels of illumination, while at the same time arguing against neoplatonism itself. Neoplatonic philosophy went into a serious decline in the Arab world after the twelfth century, but interest in it continued up to now in the Persian cultural sphere, because its contribution to ishrāqī and Sufi thought was acknowledged and respected.

## NEUMANN, JOHN VON

(1903–1957)

American mathematician, physicist, and economist John von Neumann was born in Budapest, Hungary. He showed an early precocity in mathematics and was privately tutored in the subject; his first paper was written before he was eighteen. He studied at the universities of Berlin, Zürich, and Budapest and received his doctorate in mathematics from Budapest in 1926, almost simultaneously with an undergraduate degree in chemistry from Zürich. After serving as *Privatdozent* at Berlin, he accepted a visiting professorship at Princeton in 1930. Following three years there, he became a professor of mathematics at the Institute for Advanced Study, a position that he held for the rest of his life. In 1955 he was appointed one of the commissioners of the U.S. Atomic Energy Commission, on which he served brilliantly until his death.

Von Neumann made fundamental contributions to mathematics, physics, and economics. Furthermore, these contributions were not disjointed and separate but arise from a common point of view regarding these fields.

Mathematics was always closest to his heart, and it is the field to which he contributed the most. His earliest significant work was in mathematical logic and set theory, topics that occupied him from 1925 to 1929. His accomplishments were of two sorts; they concerned the axiomatics of set theory and David Hilbert's proof theory.

In both of these subjects he obtained results of extraordinary importance. He became the first to set up an axiomatic system of set theory that satisfied the two conditions of allowing the development of the theory of the whole series of cardinal numbers and employing axioms that are finite in number and are expressible in the lower calculus of functions. This work contained a full classification of the significance of the axioms with regard to the elimination of the paradoxes. With regard to Hilbert's proof theory, von Neumann clarified the concept of a formal system considerably.

His work on the theory of Hilbert space and operators on that space was probably stimulated by what he had done on rigorous foundations for quantum theory. Essentially, von Neumann demonstrated that the ideas originally introduced by Hilbert are capable of constituting an adequate basis for the physical consideration of quantum theory and that there is no need for the introduction of new mathematical schemes for these physical theories. Von Neumann's papers on these subjects constitute about one-third of his printed work and have stimulated extensive research by other mathematicians.

Von Neumann was one of the founders of the theory of games; since the publication of von Neumann's first paper in 1928 it has become an important combinatorial theory, applied and developed with continuing vigor. Von Neumann's first paper contains rigorous definitions of the concepts of pure strategy (a complete plan, formulated prior to the contest, that makes all necessary decisions in advance) and of mixed strategy (the use of a chance device to pick the strategy for each contest). The central theorem in this theory, the minimax theorem, was not only enunciated and proved by von Neumann but in his hands became a powerful tool for obtaining new methods for combinatorial problems.

A decade after this fundamental paper was written, von Neumann began a collaboration with Oskar Morgenstern that led to *The Theory of Games and Economic Behavior*, a book that has decisively affected the entire subject of operations research.

Von Neumann's principal interest in his later years was in the possibilities and theory of the computing machine. He not only conceived the concept of the so-called stored program computer in 1944 but he made three other signal contributions. First, he recognized the importance of computing machines for mathematics, physics, economics, and industrial and military problems; second, he translated this insight into active sponsorship of a machine (it was called Johniac by his collaborators) that served as a model for several impor-

tant computers; third, he was one of the authors of a series of papers that provided a theoretical basis for the logical organization and functioning of computers. These papers set out the complete notion of the flow diagram and contained the genesis of many programming techniques.

### **Bibliography**

Much of von Neumann's work, with the exception of certain still-classified reports or papers that are essentially duplicates of other works, is published in *John von Neumann, Collected Works*, 6 vols. (New York: Macmillan, 1961–1963). Other important books by von Neumann are *Continuous Geometry*, 2 vols. (Princeton, NJ: Institute for Advance Study, 1936–1937); *Mathematical Foundations of Quantum Mechanics* (Princeton, NJ: Princeton University Press, 1955); *The Computer and the Brain* (New Haven, CT: Yale University Press, 1958). For a survey of von Neumann's life and work, see the memorial volume *John von Neumann, 1903–1957, Bulletin of the American Mathematical Society* 64 (3:2) (May 1958).

*Herman H. Goldstine (1967)*

## NEURATH, OTTO (1882–1945)

Otto Neurath, an Austrian sociologist and philosopher, was one of the originators of logical empiricism and an independent Marxist socialist. A man of great vitality, intelligence, and good humor, Neurath was a polymath and an energetic organizer of academic, educational, and economic affairs. His major work was in sociology, economic and social planning, scientific method, and visual education, this last especially by means of an international language of simplified pictures (“isotypes”), but he was also interested in the history of science, political and moral theory, economic history, and statistical theory and was engaged in recurrent efforts to create a new encyclopedism.

### ECONOMIC AND COMPARATIVE HISTORY

Neurath's first article, published in 1904, was “Geldzins im Altertum” (Commercial interest in antiquity), and in 1909 he published a popular history of the economic systems of classical Greece and Rome, *Antike Wirtschaftsgeschichte* (Leipzig, 1909), which he supplemented by

shorter studies of ancient economic thought. His historical interests then turned to physical science. A little-known paper of 1915, “Prinzipielles zur Geschichte der Optik,” compared the ideas on optics of Isaac Newton, René Descartes, Nicolas Malebranche, Francesco Maria Grimaldi, Christian Huygens, Thomas Young, Augustin-Jean Fresnel, Jean-Baptiste Biot, and Étienne-Louis Malus with respect to their conceptual images of periodicity, polarization interference, and Huygens's principle of continuity of centers of force.

Neurath generalized the logic of this analysis to compare systems of hypotheses by a procedure that selects basic notions to be calculated and then enumerates all theories that may be constructed from permutations of these notions. The simple view that theories of light may be divided into wave theories and corpuscular theories is replaced by a more accurate, complex, and systematically clear historical development. To Neurath this use of basic explanatory notions, which are sometimes images and sometimes abstractions, illustrated the value of philosophical understanding for the historian of natural and social science. Neurath's own philosophical understanding anticipated later reliance on alternative sets of epistemologically basic sentences in the structural elucidation of scientific theories.

In 1916, Neurath wrote a general paper on classification, “Zur Klassifikation von Hypothesensystemen,” and elaborated on this topic in his monographs *Empirische Soziologie* (1931) and *Foundations of the Social Sciences* (1944). Classification by hypotheses seemed to Neurath to be a principal method for comparative studies of theories and explanations and a crucial tool for rational understanding of cross-cultural phenomena.

### ECONOMIC PLANNING, WAR, AND SOCIALISM

During 1919, Neurath served in the Central Planning Office of the Social Democratic government of Bavaria and of its successor, the short-lived Bavarian Soviet Republic. Although he was a civil servant and not a party man, he was imprisoned when the Communist regime was overthrown; upon his release in 1920 he went to Vienna. He there took up again an earlier career as a publicist for socialist economics by efforts on behalf of a socialist conception of civic education, moral and religious reform, and individual responsibility. With Josef Popper-Lynkeus, Neurath was one of the first socialists to call for a centrally planned, rational economy based on Marxist concepts but deriving its policy recommendations from welfare goals and a statistical analysis of the

production and distribution of goods and of standards of living.

Less clear to Neurath than equitable distribution of wealth was how a community spirit could be developed while the workers themselves were still overwhelmed by the established culture and the habits of the competitive capitalist order. Nevertheless, he fused his hypotheses about social-economic planning with a moral optimism about the acceptance by the workers of enlightened and rational attitudes toward all life's problems. Neurath's *Lebensgestaltung und Klassenkampf* poignantly tried to teach the reader about a transformed way of life in which he could realistically experience something of the peaceful and cooperative future at least in his private life, and at the same time come to sober realization of the obstacles placed by exploitative society in the way of a rich inner life and good personal relations as well as in the way of the transformation of society by rational socio-economic planning.

### EMPIRICAL SOCIOLOGY

In the 1930s and early 1940s, between the publication of the two monographs on sociology (the *Empirische Soziologie* and the *Foundations*), Neurath published several smaller papers on sociological topics. The most important were "Soziologie im Physikalismus," a physicalist restatement of sociological theories and problems, "Soziologische Prognosen," on social-historical predictions, and "Inventory of the Standard of Living," on the problem of making a rational calculation of the standard of living.

To make sociology scientific, Neurath urged the use of a physicalist language in which all the possible empirical statements would be descriptive of space-time things and properties; this was, roughly, a demand for behaviorism in social theory. He believed that this social behaviorism carried out Karl Marx's claim that historical materialism was empirical, starting from the factual situation of real men in objective circumstances and basing theories upon hypotheses which are free of wishful or evaluative assumptions. Human beings, streets, religious books, prisons, gestures can be so described, and they may be grouped in accord with physicalist theoretical systems. Happiness and suffering, too, may be described empirically, even in a manner similar to a mechanical description of space-time entities. But man, in some situations, dominates the lawlike mechanism of the natural environment. In Neurath's typical formulation: Formerly when there was a swamp and man, man disappeared; nowadays the swamp disappears.

But the language of mechanism is laden with myth and metaphysical presuppositions, and Neurath tried to eliminate all impure or careless terminology. Just as he would ban metaphysics as a misuse of unverifiable but grammatically correct word-signs, so he wished to forbid social theorists to use words that carry multiple meanings and assumptions; he himself never used the word *capital*. Sociological descriptions demand arguments over the entire range of environmental and causal science; biological, geological, ethnological, and chemical statements must join social, psychological, economic, legal, and other statements of purely human reference. Hence it would be useful to invent an empirical language suited to all the sciences, one that avoids descriptive distinctions that are the result of mere linguistic convention. Neurath hoped that empirical sociology might be formulated with clear and univocal physicalist predicates. However, we start with inexact "clots," with indistinct and unanalyzed evidence, and we must tolerate and even carefully devise a correspondingly rich vocabulary which is also amenable to analysis of regularities and at times to the creation of a calculus.

Neurath often wrote of an essential uncertainty in all scientific description and predication, of the probabilistic nature of learning from experience. Historians should explain the present from knowledge of portions of the past, but to predict the future with precision is beyond us. There are too many variables; at least some of these are unknown, and the greater the anticipated change, the less our scientific assurance about its realization. We may, in Neurath's view, strive to construct a future state of affairs, but whether we feel hesitant or confident, we have in sociological lawlike historical statements no rational ground for predictions that are certain. Moreover, some predictive statements, notably self-fulfilling or hortatory prophecies, are codeterminant; they carry causal weight which disturbs their subject matter. Other predictions seem impossible on their face. How should a nation that could not invent the wheel predict the invention of the wheel? Others are too complex. Will painters in misty regions paint misty pictures or, just because of the mistiness, sunny ones? Neurath carried out this analysis of pseudorational certainty throughout his work, using it with a moral force. Decisions cannot be replaced by calculation or by reasoning—not in practical life, and not in scientific work.

### SCIENTIFIC METHOD

Physicalism was developed mainly by Neurath and Rudolf Carnap. It may be seen as Neurath's attempt to

express, in epistemological terms, the materialist (objective) foundation of knowledge, since the persistent recognition he gave to the natural fact of socially intersubjective agreement was a principal source of his antiphenomenalist role within the Vienna circle. Despite Neurath's insistence on a sharp distinction between scientific and metaphysical expressions by means of criteria for empirical meaning, it was his view that intersubjective agreement provides approximate unanimity about the grounds for judgments, not for meanings. By use of a physicalist language, skeptical inquirers display and share a common standard for confirmation. Physicalism had the further merit for Neurath that it was a linguistic doctrine which overcame any systematic mutual incomprehension of special disciplines not by reduction to the special discipline of physics but by a doctrine of reference to the generalized physics of public space-time states (in the human macroscale).

Neurath freely admitted that this doctrine was a hypothesis; the world was assumed to be unified, a causal network whose multiplicity of descriptions should tend toward a unified language that includes the social, biological, and physical sciences. Moreover, as an analysis of the process of scientific knowledge, physicalism programmatically explicated (for any special science) the relations among the physiology and social psychology of sensuous perception, the physics of experimental and measurement technology, and the known scientific or common-sense entities. Neurath saw physicalism as the further hypothesis that the world is knowable in principle everywhere and throughout. Finally, in "Protokollsätze" (1932) Neurath represented physicalism as providing a sophisticated revision of the doctrine of atomic bits of knowledge, conveyed by individual reports, or "basic sentences," also known at the time as "protocol sentences," by demanding that they, too, be intersubjective and, however psychologically certain, logically tentative and empirically testable. Indeed, the truth of protocol sentences was attributable to their cohering role in a theory (or system of theories) to which empirical evidence gave confirmatory evidence, and consequently the possibility existed that a conflict between a particular protocol statement and a theoretical statement of more complex form and function might, by choice and for convenience, be resolved by discarding the protocol. Neurath found his early analysis of alternative hypothesis systems and their fact-fitting auxiliary statements borne out within this empirical conventionalist interpretation of the physicalist basis.

## VISUAL EDUCATION

Both the union of scholars and ordinary workers and the overcoming of national and linguistic divisions were in Neurath's mind when he began to develop his "Vienna method" of visual education. In rudiment, he used an invariant and self-explanatory pictorial sign for a given thing, so as to give quick information, unencumbered by irrelevancies and easily remembered. Neurath's maxims were simple: He who knows what best to omit is the best teacher; to remember simplified pictures is better than to forget accurate figures.

## UNITY OF SCIENCE AND ENCYCLOPEDIISM

Neurath was the principal organizer of several related philosophical enterprises. By 1929 the regular but informal Thursday meetings of philosophers and scientists who met for discussion with Moritz Schlick in Vienna had gathered sufficient force to produce a noted manifesto of a scientific world conception, signed by Neurath, Hans Hahn, and Carnap although it was largely Neurath's work. This led in the same year to the first of a series of international congresses for scientific philosophy. Neurath's stress upon the unification of the sciences by means of a unifying language, unity of method, and interdisciplinary dialogue led him to plan the *International Encyclopedia of Unified Science*, edited by himself, Carnap, and Charles Morris as the principal effort of the new Institute for the Unity of Science (founded in the Hague in 1936 and later removed to Boston, Massachusetts), directed chiefly by Philipp Frank. The first two introductory volumes appeared in parts, but even these were still incomplete nearly two decades after Neurath's death. Only the Institute for Visual Education (Isotype) continued with vigor after 1945, directed by Neurath's colleague and third wife, Marie Reidemeister Neurath.

## NEUROSCIENCE

Neuroscience is the scientific study of nervous tissue, activity, organization, systems, and interactions. It is paradigmatically interdisciplinary, currently including biophysics, organic and biochemistry, molecular through evolutionary biology, anatomy and physiology, ethology, neuropsychology, and the cognitive and information sciences. Investigators include basic scientists and clinicians. During the late twentieth century, neuroscience underwent enormous growth. Quantitative information available on the Society for Neuroscience's Web site speaks to this. Beginning in 1970 with 500 members, at last count (summer 2004) the Society boasts more than 34,000 members worldwide. More than 30,000 registrants attended the 2004 annual meeting, where more than 14,000 posters and oral presentations were delivered. There are now more than 300 graduate training programs worldwide in neuroscience. With its increasing academic influence and its obvious connection with philosophy's perennial mind-body problem, it was inevitable that philosophers would begin taking serious interest.

Academic philosophy's systematic interest might be dated to 1986, the year that Patricia Churchland's *Neurophilosophy* appeared. She boldly proclaimed that “nothing is more obvious than that philosophers of mind could profit from knowing at least something of what there is to know about how the brain works” (p. 4). Her book presented what was then textbook neuroscience, contex-

tualized by developments in postlogical empiricist philosophy of science. It set the stage for much neurophilosophy and philosophy of neuroscience that followed, especially the branch of neuroscience that philosophers attended to (cognitive neuroscience). This entry will present some neuroscientific techniques and results that have attracted philosophers' attention. In the interest of pedagogy, the emphasis will be on the scientific details. It will close with a section describing another field of contemporary neuroscience that unfortunately has captured less philosophical attention, followed by a more detailed discussion of implications for mind-brain reductionism. Space limitations preclude a comprehensive survey and the bibliography is limited, both in number of entries and primarily to textbook sources and review articles (all containing extensive references to the primary scientific literature, however). This is befitting an encyclopedia entry, but philosophers who are interested in acquiring a serious understanding of actual neuroscience are urged not to stop with these sources. There is no shortcut around delving into the primary literature. Superficial neuroscience still serves too often in straw arguments in the philosophy of mind.

Ideally this entry would also include work on pain processing, especially on the two types of pain circuits (rapidly conducting Aδ and slowly conducting C fibers) and the different pain qualities carried by each; the neural mechanisms of dream sleep, especially endogenously produced activity in sensory regions; the discovery of mirror neurons in primate brains that are active when the subject performs a specific motor task and when the subject observes a cohort performing that task; the sea change in computational neuroscience during the 1990s, away from abstract network modeling (inspired by early successes of "connectionist" artificial intelligence) and toward compartmental modeling, where the patch of neural membrane and its ion-specific conductance capacities become the basic units of analysis; and the neurobiology and behavioral genetics of schizophrenia (as elaborated in numerous publications by Kenneth Schaffner). Philosophers have argued for implications from each. But choices were necessary.

## FUNCTIONAL NEUROIMAGING

Functional neuroimaging provides a window into the active, healthy brain. Results from two imaging techniques have dominated philosophers' attention: positron emission tomography (PET) and functional magnetic resonance imaging (fMRI). PET is based on radioactive decay of positrons (positively charged electrons). Subjects

are injected with water (or sugars) labeled with a radioactive, positron-emitting isotope (such as oxygen-15, whose nuclei are manufactured to contain the normal eight protons but only seven neutrons). During the minute following injection, radioactive water accumulates in biological tissues in amounts directly proportional to local blood flow. Positrons leave the nuclei of the unstable, radioactive atoms and travel only a short distance through biological tissue (at most a few millimeters).

After losing their kinetic energy positrons are attracted to negatively charged electrons. This collision annihilates both and the resulting energy manifests in two photons traveling 180° away from the annihilation site. These photons exit the tissue being imaged and are detected by radiation detectors arranged in coincidence circuits (the "PET camera"). Photons arriving simultaneously at opposing detectors are counted and these counts are converted into an image that reflects the relative number of annihilation collisions localized to a given region. A single ring of coincident detectors can only image a single "slice" through the tissue; but modern PET cameras contain multiple rings and so can image multiple parallel "slices" simultaneously. Powerful algorithms and computer graphics can reconstruct the functional images in any desired orientation. Color codes are typically used to denote intensity of activity.

By subtracting images generated during a carefully selected control task from those generated during an experimental task, PET generates a picture of the location and intensity of activity specific to performing the experimental task. These are the colorful images published in PET studies. But what PET measures directly is localized blood flow to a small region of biological tissue. The activity interpretation exploits the known (and independently verified) positive correlation between increased local blood flow and increased cellular activity in that region.

fMRI—more precisely, Blood Oxygenation Level Dependent (BOLD-) fMRI—also exploits the established correlation between localized blood flow changes and cellular activity in tiny neural regions. But to measure these changes, it takes advantage of the different properties of oxygen-bearing and deoxygenated hemoglobin in a strong magnetic field. Oxygenated hemoglobin is more prevalent in the bloodstream in regions of high cellular activity. The metabolic demands of highly active neurons and glial cells generate signals to blood vessels to increase blood flow to the region (the "hemodynamic response"). The resulting supply exceeds the cells' capacity to remove oxygen from hemoglobin. As of 2004, these different

magnetic properties can be measured and localized in fMRI scanners approved for human use to less than one millimeter. Stronger magnetic fields generate more precise measurements and localizations. Algorithms and graphics capabilities comparable to PET technology reconstruct “slices” through the imaged tissue at any desired orientation. By normalizing and contrasting BOLD signals across experimental and carefully selected control tasks, experimenters can image activity location and intensity specific to the experimental task. A variety of postprocessing techniques are employed to account for the potentially variable hemodynamic delays between neural activity generated by task performance and increased blood flow.

A handful of functional neuroimaging studies (mostly older ones from the early days of PET!) recur in philosophical discussions. (All of the studies discussed below are also discussed and referenced in Michael Posner and Marcus Raichle’s popular book, *Images of Mind*, 1997.) One still sees reference to Per Roland and his colleagues’ regional cerebral blood flow studies from the mid-1980s. Their subjects performed a number of cognitive tasks, including verbalizations, arithmetical calculations, and a complicated memory imagery task involving walking familiar streets and making a system of turns while reporting landmarks visualized along the way. The memory imaging task produced increased blood flow bilaterally to regions in the parietal and temporal lobes—regions that lesion data from human neurological patients had previously revealed to be involved in mental imagery. Stephen Kosslyn’s work on mental imagery using neuroimaging techniques, especially work reported in his *Image and Brain* (1994), is also discussed often by philosophers in debates about the structure of cognitive representations. Much of Kosslyn’s work demonstrates that the same neural regions are activated when subjects form a visual mental image and when they visually perceive a similar stimulus. He has demonstrated these effects as far back in the visual processing pathways as primary visual cortex (V1). They hold for locations containing neurons known to specialize for the size of perceived stimuli and for stimuli viewed from typical or atypical perspectives.

Much philosophical attention on functional neuroimaging focuses on its implications for localization hypotheses of cognitive functions. Steve Petersen and his colleagues’ studies on language processing and use from the late 1980s are still cited and discussed. They employed PET and a hierarchical experimental design that enabled them to separate activations generated by passively view-

ing words, passively listening to words, speaking words viewed or heard, and generating semantically related words to those viewed or heard. Different tasks in this hierarchy produced PET activation increases in different neural regions, suggesting to some the localization of different tasks involved in language processing, including word perception, speech production, and semantic access. Localization arguments and their scientific grounding in functional neuroimaging studies have been challenged, notably by William Uttal in *The New Phrenology* (2001).

A handful of functional neuroimaging studies on attention rose to philosophical prominence with growing interest in consciousness. A popular example uses the Stroop task to induce conflict. Color words are presented visually in either compatible or incompatible print colors (e.g., compatible: “red” printed in red; incompatible: “red” printed in green). Subjects are asked to name the color of the print. Behaviorally, as measured by errors and response time, subjects find incompatible conditions much harder. Some psychologists have argued that incompatible conditions require conscious effort to inhibit saying the color word. José Pardo and his colleagues in the early 1990s found strong activation effects specific to the (forebrain) anterior cingulate gyrus when compatible PET activation results were subtracted from incompatible ones. These results are consistent with behavioral data from patients with anterior cingulate lesions and lend empirical support to earlier speculations about the neural components of an executive attentional control network.

## CLINICAL NEUROPSYCHOLOGY AND NEUROLOGY

Philosophers have long taken interest in the behavioral effects of brain damage and disease. (Bryan Kolb and Ian Whishaw’s *Fundamentals of Human Neuropsychology*, 2003, is an excellent textbook that includes discussions of topics covered in this section and extensive references to the primary scientific literature.) Commissurotomy (“split brain” surgery) is one contemporary example. To treat otherwise intractable epilepsy, neurosurgeons in the early 1960s revived a surgical technique of cutting a patient’s corpus callosum. The corpus callosum is a huge bundle of axon fibers that connect homologous regions of the left and right cortical hemispheres.

The procedure was clinically successful with a minimum of apparent behavioral effects, until Roger Sperry and his collaborators (Michael Gazzaniga, Joseph Bogen) applied more sophisticated tests. They discovered that

these patients had lost the capacity of their two cerebral hemispheres to communicate directly with each other. Owing to the segregation and crossing of axon projections from sensory receptor organs to relay neurons in the thalamus and sensory cortex, experimenters could direct, for example, different visual stimuli to the left and right cortical hemispheres. If one then asked the subject to pick up an object related to the visual display with his or her left hand, the subject would pick up an object related to the visual display in his or her right hemisphere. (As with sensation, the motor system also crosses over: Right motor cortex controls left side movement and vice versa.) If one then asked that subject to explain verbally why he or she was holding that object (and the subject was among the roughly 85 percent of humans with speech localized to the left hemisphere), the subject indicated no awareness in his or her verbal response of the display presented to the right visual hemisphere and instead confabulated a verbal account that related the chosen object to the left hemisphere's visual display. The variety and number of similar results led to speculations about two seats of conscious awareness and control in a single human brain, and subsequent philosophical reflections about the unity of self (or lack thereof).

Blindsight refers to preserved visual capacities following damage to visual cortex. Such damage produces a scotoma (a "blind spot") at circumscribed locations in the patient's visual field. Despite no conscious awareness of visual stimuli presented there, these patients nevertheless display some impressive visual abilities when prompted to guess about stimuli presented in their scotoma, including pointing accurately to visual stimulus location, detecting movement, and discriminating shapes (and in a few cases, colors). Their performances far exceed chance. As reviewed in Lawrence Weiskrantz's *Consciousness Lost and Found* (1998), experimental work over the past three decades has mostly confirmed early results and has introduced controls to address methodological criticisms of the early studies. Blindsight has figured into philosophical discussions of the nature of visual consciousness and the location of its neurobiological mechanisms, as well as epistemological discussions about accurate perceptual judgments and the purported necessity of awareness.

Denial symptoms are the opposite of blindsight. Blindness denial (Anton's syndrome) can result from cortically induced blindness and renders patients functionally blind by all objective tests and measures; yet these patients vehemently claim that they can see. Paralysis denial can result from damage to motor cortex and ren-

ders patients functionally paralyzed on the side of their bodies opposite the damage; yet these patients vehemently deny that they are paralyzed. Many patients generate spontaneous confabulations (e.g., "it is dark in this room," "I have bad arthritis in my left shoulder—it hurts to move my left arm") to explain their failures on simple behavioral measures. Numerous controls are standard in neurological assessment to rule out cases of confusion or persistent stubbornness to accept or admit the deficit. Some philosophers and neurologists have argued from these clinical details toward revisions of our commonsense conceptions of awareness, conscious control, and the initiation of behavior. Vilayanur Ramachandran and Susan Blakeslee's popular book, *Phantoms of the Brain* (1998), is a good example, with elaborate discussions of clinical cases and a good bibliography to primary sources.

Contralateral neglect ("hemineglect") is a condition whereby patients ignore the side of their body and the world opposite the side of damage to parietal cortex. (Typically the damage is to right hemisphere, producing left side neglect.) The neglect invades all sensory modalities, is sometimes accompanied by denial and confabulation (to the point of patients denying that their neglected limbs even belong to them), and even invades memories and images. A famous study from the late 1970s by neurologist Edoardo Bisiach and his colleagues asked recent stroke patients demonstrating neglect symptoms to remember a famous square in Milan from one vantage point and to describe all objects they remembered. They were then asked to visualize the square from the opposite vantage point and describe the objects remembered. In both cases, they described objects only on their non-neglected sides—meaning that they described a different set of objects from the separate vantage points. Hemineglect appears to be an awareness deficit. If the only available objects for patients to attend are on the neglected side, they can attend to them. But when objects are present on the nonneglected side, they seem to lose all awareness of the opposite space. Philosophers working on consciousness, awareness, their brain mechanisms, and on body awareness and body-in-space representations have appealed to neglect data.

## THE BINDING PROBLEM

Conscious experiences are present to us as unified wholes. Visual object perception provides rich examples. In ordinary circumstances I see a football zooming toward me, not separately brown color, oblong shape, in motion (speed, trajectory) toward me. Yet each of these visual qualities is extracted by neuronal activity in spa-

tially separated areas. Separate neural pathways respond to qualities that characterize a perceived object's identity (the ventral or "what" stream through inferior temporal cortex) and its location, motion, and my actions toward it (the dorsal or "where/how" stream through posterior parietal cortex). Neurons specialized for specific aspects of the visual stimulus are at distinct locations within each pathway. Seeing an object requires neuronal activity in spatially separated regions and there is no evidence for "grandmother" neurons further downstream onto which all of these active neurons project. This is the "binding problem." How is activity in these spatially separated regions bound together to become active as a unit and so produce a unified visual percept? And given that an object seen is often also heard, felt, or smelled simultaneously, and that these multimodal perceptual experiences are also unified in conscious experience, we actually confront a set of binding problems. (Neuropsychologist Ann Treisman's 1996 review article is an excellent introduction.)

Throughout the 1990s a variety of "temporal synchronicity" solutions were popular. These held that binding results from induced synchronous activity in specific neurons in the separate pathways and processing areas. The discovery of a robust "40 Hz oscillation pattern" across the mammalian cortex during wakeful attention and rapid eye movement (REM, "dreaming") sleep inspired this approach. Feedforward and reciprocal feedback anatomical projections between sensory modality-specific and nonspecific neuron clusters ("nuclei") in the thalamus and sensory cortex provided a biologically plausible hypothesis for how temporal synchronicity might be induced.

However, problems quickly surfaced. It is notoriously difficult to determine the "binding window," the time interval during which the spatially separated processing must occur. Are mechanisms sensitive to temporally coherent discharges tied to the full length of activated neuronal discharges, making the binding window up to several hundred milliseconds? If so, then because distinct and changing stimuli clutter the visual field continuously over this long an interval, how do we successfully bind together the right combination of features? Is activity onset or rise time of discharge the relevant temporal feature? If so, this leads to difficulties when we consider the variable latencies of activity in different areas of modality-specific sensory pathways. Latency differences exist all the way back to activity in sensory receptor cells: Hair cells at different locations on the cochlea and photoreceptors at different locations on the retina respond at slightly different times to a single auditory or

visual stimulus. Moving up both auditory and visual processing streams, the temporal differences at which information about different aspects of a single stimulus reaches later points can be tens of milliseconds. Somehow, a temporal synchronicity binding mechanism must compute these processing time differences. (The problem of latency differences is exacerbated when we consider multimodal—for example, visual-auditory binding mechanisms.)

These biological details suggest the need for neural regions where temporal information converges (to carry out the latency computations); but now temporal synchronicity solutions confront a similar problem to the one that sunk purely spatial solutions—no solid evidence for such convergence sites. Temporal synchronicity solutions are less popular now. But the binding problem continues to attract philosophers' attention due to its obvious connections with consciousness and brain mechanisms. Rodolfo Llinás and Patricia Churchland's *The Mind-Brain Continuum* (1996) is a good edited volume that was published at the time that these debates about binding and temporal synchronicity were raging.

## MOLECULAR AND CELLULAR COGNITION

The reader might have noticed that most examples of neuroscientific work that has attracted philosophers' attention are dated. This is not necessarily a bad thing. Philosophical reflection on scientific results depends on their scientific credibility and that takes time to establish. However, this limitation risks missing important new developments and changing foundational assumptions in a rapidly developing science. The lessons philosophers draw might then be dated as well. There is evidence that "foundational" change has occurred recently in neuroscience, having to do with the increasing impact of molecular biology.

More than a decade ago neurobiologists Eric Kandel, James Schwartz, and Thomas Jessell, in the third edition of their textbook, *Principles of Neural Science* (1991), wrote that "the goal of neural science is to understand the mind: how we perceive, move, think, and remember. In the previous editions of this book, we stressed that important aspects of behavior could be explained at the level of individual nerve cells. ... Now it is possible to address these questions directly on the molecular level" (p. xii). With the publication of the text's fourth edition (2000), and after another decade of cellular and molecular investigations, these same authors announce mind-to-molecules "linkages" as accomplished scientific results:

This book ... describes how neural science is attempting to link molecules to mind—how proteins responsible for the activities of individual nerve cells are related to the complexity of neural processes. Today it is possible to link the molecular dynamics of individual nerve cells to representations of perceptual and motor acts in the brain and to relate these internal mechanisms to observable behavior. (p. 3–4)

These are heady claims, backed up by more than 1,400 pages of textbook evidence drawn from a huge scientific literature. Yet to read much philosophical discussion of neuroscience, one would not even know that this work and attitude exists—much less that it constitutes the current mainstream of the discipline. (This mountain of supporting evidence also refutes the pitying lament so often uttered by philosophers and cognitive scientists: “If we only knew more about how the brain works ...” We do.)

Much of this research is congealing around a field dubbed “molecular and cellular cognition.” According to the Molecular and Cellular Cognition Society’s Web site, the field’s stated goal is to discover “explanations of cognitive processes that integrate molecular, cellular, and behavioral mechanisms, literally bridging genes and cognition.” The field emerged in the early 1990s, after gene engineering techniques were introduced into mammalian neurobiology to generate knockout and transgenic rodents for behavioral studies. Memory has been a principal research focus, with an emphasis on consolidation (the transformation of labile, easily disrupted short-term memories into stable, enduring long-term forms) and on hippocampus-based memories that neuropsychologists call “declarative” or “explicit.” This field’s methodology is ruthlessly reductive. Its basic experimental strategy is to intervene into cellular or intracellular molecular pathways and then track their effects in the behaving animal using standard tests borrowed from experimental psychology for the phenomenon under investigation. (So despite the new molecular-genetic techniques for intervening directly at increasingly lower levels of biological processes, the basic experimental logic remains interestingly similar to that of classical lesioning and pharmacological studies.)

At last count, more than sixty molecules have been implicated in the molecular mechanisms of mammalian long-term potentiation (LTP), an activity-dependent form of synaptic plasticity with memorylike features. However, a few figure prominently and have been targets of bioengineered mutations and subsequent behavioral

study in declarative memory consolidation tasks. Cyclic adenosine monophosphate (cAMP) is a product of adenosine triphosphate (ATP) conversion into energy to drive cellular metabolism and activity. cAMP is the classic “second messenger” of molecular biology, functioning as an intracellular signal for effects elsewhere in the cell. When available in high quantities in active neurons it binds to the regulatory subunits of protein kinase A (PKA) molecules, freeing the catalytic PKA subunits. In high enough quantities, the latter translocate back to the neuron’s nucleus, where they phosphorylate cAMP response element binding proteins (CREB), a family of gene transcriptional enhancers and repressions that turn on or inhibit new gene expression and protein synthesis.

Specific targets of phosphorylated CREB transcriptional enhancers include genes coding for regulatory proteins that keep PKA molecules in their active state and effector proteins that resculpt the structure of active synapses, keeping those synapses potentiated to pre-synaptic activity for days to weeks. Numerous features of LTP have made it an attractive theoretical mechanism for memory consolidation for years; results from molecular and cellular cognition have finally lent experimental backing to this decades-old speculation.

Alcino Silva’s group has used mice with a targeted mutation of the CREB gene on a variety of short- and long-term memory tasks, including the Morris water maze task, a combined environment-conditioned stimulus fear conditioning task, and a social recognition memory task. These mice do not synthesize the CREB molecules required for long-lasting “late” LTP (L-LTP), although they have all the molecules necessary for shorter-lasting “early” LTP (E-LTP). Eric Kandel’s group has developed PKA regulatory subunit transgenic mice that overexpress those molecules in specific neural regions. When activity-driven cAMP molecules release PKA catalytic subunits, an abundance of regulatory subunits are available to block PKA catalytic subunit translocation to the neuron’s nucleus (in the regions of the brain where the transgene is expressed). This effect halts the gene expression and protein synthesis necessary for L-LTP. If the molecular mechanisms of L-LTP are those of memory consolidation, then Silva’s CREB enhancer mutants and Kandel’s PKA regulatory transgenics should be intact in short-term memory tasks but impaired in their long-term form. These are exactly their published experimental results. Kandel’s results are especially compelling because the transgenic mice acquire long-term memories on tasks that involve activity in brain regions where the transgene is not expressed—tasks they learn

simultaneously with the long-term memory tasks on which they fail. This suggests that the deficit is not sensory, motor, or attentional, but instead is specific to memory consolidation.

New results from molecular and cellular cognition are reported in virtually every issue of journals such as *Cell*, *Neuron*, *Journal of Neuroscience*, *Journal of Neurophysiology*, and *Nature Neuroscience*. However, they have yet to creep into philosophical awareness. This is unfortunate for at least two reasons. First, this is mainstream neuroscience at the turn of the twenty-first century, employing techniques common to the bulk of the discipline's practitioners (especially compared to the number of cognitive neuroscientists). Second, this work is reductionistic, especially compared to higher-level neuroscience. Philosophers who limit their attention to the latter not only come away with a mistaken impression of what constitutes state-of-the-art neuroscience; they also miss the reductionist attitude that informs the mainstream. This carries problems especially for philosophy of mind. These implications are serious enough to motivate fuller discussion in the final section.

#### PHILOSOPHICAL IMPLICATIONS: REDUCTION REVISITED

When presenting important neuroscientific findings above, some philosophical implications were mentioned. In this final section, implications for reductionism will be discussed in more detail. Philosophical attention to neuroscience began with this concern. Reduction occupied an entire chapter in Patricia Churchland's ground breaking *Neurophilosophy* (1986). Other concerns emerged as philosophers engaged neuroscience, but reduction remains central to neurophilosophy—as witnessed by its prominent treatment in the first single-authored, introductory neurophilosophy textbook (Churchland 2002). Unfortunately, the term “reduction” is less univocal than it once was, and its philosophical treatments and discussions remain frustratingly abstract and distant from actual scientific practice. These features cast suspicion on assessments of psychoneural reductionism's philosophical potential. Might closer attention to mainstream (cellular and molecular) neuroscience rectify this?

Philosophical discussions of reduction were clearest and most fruitful when *intertheoretic reduction* was their explicit concern. This treatment goes back most prominently to Ernest Nagel's classic *The Structure of Science* (1961, ch. 11). According to Nagel, reduction is deduction—of the reduced theory, characterized syntactically as a set of propositions, with the reducing theory serving

as premises. In interesting scientific reductions, the reduced theory contains descriptive terms that don't occur in the reducing, so the premises of the derivation must also contain bridging principles or correspondence rules. Typically these principles were treated as material biconditionals (although Nagel explicitly permitted material conditionals) containing terms from the two theoretical vocabularies. In interesting scientific cases, the reducing theory also often corrects the reduced. On Nagel's account, this feature is handled by introducing premises expressing counterfactual limiting assumptions and boundary conditions on the application of the reducing theory.

Both of these features came under serious philosophical criticism, many of which resulted from attempts by philosophers to apply Nagel's account to increasingly better described cases from the history of science (including classical equilibrium thermodynamics to statistical mechanics and the kinetic theory of gases, Nagel's own detailed example). Led by Thomas Kuhn, Paul Feyerabend, Kenneth Schaffner, Lawrence Sklar, Robert Causey, and Clifford Hooker, philosophers of science proposed alternatives to Nagel's conditions. Patrick Suppes even proposed scraping the entire syntactical view of theories and replacing it with a semantic view—theories as sets of models sharing set-theoretic or category-theoretic features. Intertheoretic reduction then turns into a mapping of these sets into one another in light of a variety of constraints and conditions.

One problem with applying these detailed accounts from the philosophy of science to philosophy of mind is that neither neuroscience nor psychology seems to provide robust enough theories. Most theories of intertheoretic reduction require a complete account of lower level phenomena in terms of laws, generalizations, or their model-theoretic counterparts. But even in the best cellular and molecular neuroscience, as in cell and molecular biology in general, few (if any) explanations are framed in terms of laws or generalizations. Many interactions are known to occur with predictable regularity and have both theoretical and experimental justification; but biochemistry hasn't even provided molecular biology with a general (and hence generalization-governed) account of how proteins assume their tertiary configurations. Molecular biologists know much about how specific molecules interact in specific contexts, but few explanatory generalizations are found in experimental reports, review articles, or textbooks; and the few that are found do not by themselves yield extensive predictions or explanations of lower level interactions. Finally, real molecular neuro-

science does not provide what some law-based accounts of scientific theory structure require. Its explanations do not specify how molecular biological entities interact in all possible circumstances. In light of these mismatches, intertheoretic reduction looks like a naive account of actual scientific practice.

Furthermore, its philosophical successor, *functional reductive explanation*, fares no better. According to this view, whose prominent advocates include Jaegwon Kim, David Chalmers, and Joseph Levine, a reductive explanation of a higher-level phenomenon is a two-step process. Step 1 requires a functional characterization of the phenomenon, in terms of its principal causes and effects. Step 2 involves the empirical, scientific search for the lower level processes, events, or mechanisms that realize this functional characterization. The reductive explanation of water by aggregates of H<sub>2</sub>O molecules is a commonly cited example. Scientists characterize the causal roles of water and its basic properties, like its boiling point at sea level; and empirical research reveals that aggregates of H<sub>2</sub>O molecules, with their physical and chemical properties and dynamics, provide the underlying mechanisms for those causes and effects. (This account of reductive explanation is often employed by critics of mind-brain reductionism. Many philosophical champions of the qualitative features of consciousness insist that no reductive explanation of them should be expected, because any attempt to functionalize these features will fail to capture their qualitative essence. Hence Step 1 of their potential reductive explanation cannot be achieved.)

It is not illuminating—quite the reverse, in fact—to force the actual details of state-of-the-art “molecular and cellular cognition” into this format. No procedures that typically occur in these experiments are serious candidates for Step 1 functionalization. And the empirical searches for mechanisms typically focus on finding specific *divergences* from control group behavior in experimental protocols that are commonly used to study the cognitive phenomenon whose neurobiological reduction is at issue. The key step in these experiments is the intervention step, where techniques of cell and molecular biology are used to manipulate increasingly lower levels of biological organization in living, behaving organisms. Animals receiving the intervention—be it cellular, pharmacological, or a bioengineered mutation—are compared to control animals on a variety of behavioral tests to find specific, narrow behavioral deficits.

These experiments are designed to leave most behaviors intact. For only then do experimenters claim to have

found a “reduction,” an “explanation,” or a “mechanism” of cognition. To force this experimental practice into the common philosophical model of functional reductive explanation occludes the subtlety of choosing which cellular or molecular pathways to intervene into, the exquisiteness of the invention techniques employed, and the specificity of the measured behavioral effects when these experiments are successful. Good philosophical accounts of a scientific practice should illuminate, not obscure, these types of features-in-practice. Any consequences drawn about “psychoneural reduction” from an account that obscures them should be treated with suspicion.

This problem is beginning to look like one of imposing borrowed philosophical ideals onto actual scientific practice. Based on prior epistemological or metaphysical commitments, many philosophers approach the neuroscientific literature with preconceptions about “what reduction has to be.” When they fail to find their relation obtaining, they either deny that psychoneural reduction is on offer or redescribe actual cases so that these at least approximate it. Both responses are objectionable. The first drives philosophy of mind continuously farther away from mainstream neuroscience, which grew increasingly reductionistic in the last two decades of the twentieth century. The second keeps borrowed philosophical ideals alive when their actual value grows increasingly questionable, and engenders criticisms of “reductionism” based on “better knowledge of the actual scientific details.” A better approach within the philosophy of neuroscience might be to articulate the actual practices of reductionistic neuroscientists—the ones whose work contributes to the “mind-to-molecular-pathways-linkages” expressed in the quote cited above by Kandel, Schwartz, and Jessell. The result will be an account of real reduction in real reductionist neuroscience. One could then ask the different question of whether these practices and their results serve the philosophical purposes that reductionism claimed to serve.

It is still too early in this metascientific investigation to know the answer to the last question. But careful examination of the experimental work described toward the end of the previous section above shows that the dominant reductionistic methodology involves *intervening* into cellular or molecular processes and then *tracking* the behavioral effects in the living animal using standard tests drawn from experimental psychology. Often much *in vitro* experimental work must be done first to discover where these interventions are best placed and which intervention techniques are best suited for the task. Cellular physiology still contributes intervention techniques

such as cortical microstimulation; pharmacology still contributes a variety of drugs and delivery systems. During the last decade of the twentieth century, transcranial magnetic stimulation developed more precise techniques for delivering a circumscribed magnetic field to increasingly precise neuronal targets. And molecular biology and biotechnology provided powerful techniques for gene manipulations, enabling experimenters to develop targeted gene knockouts and to insert transgenes to inhibit or exacerbate specific protein synthesis. Attached to appropriate promoter regions (base pair sequences in the genetic material that control the onset of gene expression), transgenic expression and subsequent protein synthesis can be limited to increasingly localized neuron populations.

Armed with these cellular and molecular intervention techniques, and coupled with detailed neuroanatomical knowledge about cell circuits leading ultimately to motor neurons and the muscle fibers they innervate, neuroscientists can make increasingly accurate predictions of behavioral effects on a variety of experimental tasks. Successful experimental results yield the conclusion that the specific cognitive phenomenon, “operationalized” using the behavioral tests employed, reduces to the cellular or molecular processes intervened into, within the neurons comprising the circuits leading ultimately to the musculature. Appeals to “higher level” neuroscientific concepts and resources no longer appear in the resulting explanations. One reads in this scientific literature about contributions to “a molecular biology of cognition, to “bridges linking genes and behavior,” and to explanations “of cognitive processes that integrate molecular, cellular and behavioral mechanisms.” Within “molecular and cellular cognition,” resources from cognitive neuroscience play essential heuristic roles. But once they have served their purposes to yield new “intervene molecularly and track behaviorally” results, they fall away from the discipline’s best available account of cognition’s neural mechanisms. Philosophers (and many cognitive scientists) might not recognize these scientific practices and results, but that reaction reflects nothing more than their lack of familiarity with ongoing neuroscientific practice. This methodology is central to mainstream reductionistic neuroscience at the turn of the twentieth century. If one wishes to rail against “psychoneural reductionism,” one should at least rail against the actual practices and results of real reductionistic neuroscience—not against preconceived assumptions about what those practices and results “have to be.”

This final point raises the intriguing question of whether neuroscience as a whole is univocal about the nature of reduction. More than likely it is not. Midway through the first decade of the twenty-first century, neuroscience is a remarkable interdisciplinary melding of different experimental techniques, methodological hunches, and interpretive assumptions. Molecular biology revolutionized the discipline in the late twentieth century, but so did new tools for functional brain imaging. Dynamical systems mathematics, applied initially to analyze artificial neural networks, provided fruitful new formal resources. Neuroscience’s traditional core disciplines, neuroanatomy and electrophysiology, have enjoyed continual refinement. Rigorous neurological and neuropsychological assessment continue to develop. With so many questions being pursued—and philosophers would do well to compare attendance at their annual professional meetings with the more than 30,000 registrants at the 2004 Society for Neuroscience annual meeting—and so many techniques pitched at so many different levels of brain organization, it would be astonishing if “reduction”’s meant the same thing across this discipline. Perhaps disagreements within philosophy about the neuroscientific plausibility of “psychoneural reduction” result more from philosophers latching onto different uses of this notion across neuroscience, rather than from ignorance or mistaken analysis. Sorting through these notions and discovering which neuroscientific practices employ each is one way that philosophers could contribute to ongoing neuroscientific development, instead of serving as mere sideline spectators or “science journalists.”

## NEWCOMB'S PROBLEM

See *Decision Theory*

## NEW ENGLAND TRANSCENDENTALISM

The New England transcendentalists were an influential but decidedly heterogeneous group of young writers, critics, philosophers, theologians, and social reformers whose activities centered in and around Concord, Massachusetts, from about 1836 to 1860. Insofar as they can be considered to have subscribed to a common body of doctrine, their leader and spokesman was Ralph Waldo Emerson (1803–1882). Apart from Platonism and Unitarian Christianity, the chief formative intellectual influence on the group was German idealism. It was not, however, the dense and difficult epistemological works of Immanuel Kant, Johann Gottlieb Fichte, Friedrich Schelling, and G. W. F. Hegel that primarily attracted the transcendentalists; although nearly all had made some attempt to read the German philosophers, very few had persevered to the point of mastering them. Rather, it was the more personalized and poetic expressions of Johann Wolfgang von Goethe, Novalis, William Wordsworth, Samuel Taylor Coleridge, and Thomas Carlyle, together

with the belletristic expositions of Mme. de Staël's *De l'Allemagne* (New York, 1814) and Victor Cousin's *Introduction à l'histoire de la philosophie* (English translation, Boston, 1832) that provided Emerson and his disciples with whatever philosophical nourishment they possessed. Thus, far from being in any strict sense a primarily philosophical movement, New England transcendentalism was first and foremost a literary phenomenon. It was a passionate outcry on the part of a number of brilliant and highly articulate young Americans who had become so intoxicated with the spirit of European romanticism that they could no longer tolerate the narrow rationalism, pietism, and conservatism of their fathers.

After Emerson and Henry David Thoreau (1817–1862), the more important early transcendentalists were William Ellery Channing (1780–1842)—“Dr. Channing,” as Emerson called him—distinguished clergyman and social reformer, leader of the Unitarian revolt against Calvinism; Amos Bronson Alcott (1799–1888), mystic, educationalist, and reformer; George Ripley (1802–1880), Germanist, disciple of François Marie Charles Fourier, and one of the founders of the Brook Farm community and of the *Dial* (the chief transcendentalist periodical); Orestes Augustus Brownson (1803–1876), journalist and clergyman whose lifelong attempt to reconcile religious conviction with radical views about social reform led him to embrace, in turn, nearly every available variety of Christianity from Presbyterianism to Catholicism; Frederic Henry Hedge (1805–1890), scholar, authority on German philosophy, founder in 1836 of the informal Transcendental Club for “exchange of thought among those interested in the new views in philosophy, theology and literature”; Margaret Fuller (1810–1850), literary critic, political radical, feminist, author of *Woman in the Nineteenth Century* (1845), and first editor of the *Dial* (1840–1844); Theodore Parker (1810–1860), dissenting Unitarian preacher and abolitionist whose ordination discourse, “The Transient and Permanent in Christianity” (delivered in Boston in 1841), denied the necessity of believing in biblical inspiration and in miracles and led Emerson to nickname him the Savonarola of transcendentalism; Jones Very (1813–1880), poet and eccentric; James Freeman Clarke (1810–1888), Unitarian minister and religious pamphleteer; and Christopher Pearse Cranch (1813–1892), minister, painter, critic, and poet. Among the later transcendentalists were John Weis (1818–1879), Samuel Longfellow (1819–1892), J. E. Cabot (1821–1903), O. B. Frothingham (1822–1895), and Moncure D. Conway (1832–1907). It is debatable whether Nathaniel Hawthorne should be counted as a transcendentalist, but

it is certain that, with other major imaginative writers like James Russell Lowell, John Greenleaf Whittier, Henry Wadsworth Longfellow, and Walt Whitman, Hawthorne owed much to his contact with transcendentalist modes of thought and feeling.

## THE NATURE OF TRANSCENDENTALISM

“What is popularly called Transcendentalism among us,” Emerson explained to a Boston audience in 1842, “is Idealism; Idealism as it appears in 1842” (“The Transcendentalist”). Yet we must add that it was a form of idealism that included and frequently confused the technical or epistemological idealism of the post-Kantian philosophers and the more vaguely understood “idealism”—in the sense of romantic aspirationism—of Wordsworth’s “Intimations” ode and Novalis’s *Fragmente*. The term *transcendental* was derived, Emerson claimed, from the use made of it by Kant, who had demonstrated that there was “a very important class of ideas, or imperative forms, which did not come by experience, but through which experience was acquired; that these were intuitions [*sic*] of the mind itself”; and that Kant had called them “Transcendental forms.” This somewhat subjective exposition (contrast, for example, *Critique of Pure Reason*, B 25, A 11–12) led Emerson to conclude that consequently “whatever belongs to the class of intuitive thought, is popularly called at the present day *Transcendental*.” Here, of course, the word *intuitive* is being employed in its most general sense, quite dissociated from any philosophical use, so that Emerson could immediately go on lamely to characterize the “Transcendentalist” as one who displays a predominant “tendency to respect [his] intuitions.”

The failure on the part of the movement’s leader to give any really informative definition of transcendentalism is nevertheless instructive. Because of their intellectual eclecticism and avowed individualism, their subjective fads and eccentricities, and, above all, their wide range of activities, which embraced almost every aspect of American cultural life in the mid-nineteenth century, any attempt to express the outlook of the New England transcendentalists in a single formula is bound to fail. O. B. Frothingham was certainly right when he admitted that transcendentalism was not a systematic theory of life but something more like a state of mind, “an enthusiasm, a wave of sentiment, a breath of mind that caught up such as were prepared to receive it, elated them, transported them, and passed on—no man knowing whither it went.”

In a clear sense, however, the transcendentalists were the inheritors of certain forms of sensibility already well developed within the European romantic movement: a vague yet exalting conception of the godlike nature of the human spirit and an insistence on the authority of individual conscience; a related respect for the significance and autonomy of every facet of human experience within the organic totality of life; a consequent eschewal of all forms of metaphysical dualism, reductivism, and positivism; nature conceived not as a vast machine demanding impersonal manipulation but as an organism, a symbol and analogue of mind, and a moral educator for the poet who can read her hieroglyphics; a sophisticated understanding of the uses of history in self-culture; in general, the placing of imagination over reason, creativity above theory, action higher than contemplation, and a marked tendency to see the spontaneous activity of the creative artist as the ultimate achievement of civilization—these were the more pervasive principles shared by all thinkers of the New England school. Yet if “idealism,” or, better still, “romanticism,” serves roughly to denote the genus of transcendentalism, it is important to determine the specific characteristics of the American version.

## AMERICAN CHARACTERISTICS

American transcendentalism differed from its European counterparts in at least two important ways. First, unlike most forms of European idealism in the nineteenth century, transcendentalism was not simply closely allied with contemporary theological speculation and debate but arose directly out of it. The majority of its original adherents, including Channing, Emerson, Parker, Ripley, and Cranch, were, or had been, Unitarian clergymen, and from the point of view of cultural history the advent of transcendentalism must be seen as the final liberation of the American religious consciousness from the narrow Calvinism that Unitarianism had already done much to ameliorate. This is not, however, to imply that transcendentalism was primarily a movement within the Christian church. For its outcome, as the works of Emerson and Thoreau, for example, amply testify, was essentially secular and humanist in the widest sense.

Second, the later inception of romantic idealism in the United States led its exponents to less fluctuating and at the same time less radical programs of social reform. If the typical German or English romantic began with an enthusiasm for the ideals of the French Revolution, became disillusioned by the Terror, and ended his career a conservative, Emerson’s disciples felt the outcome of the Revolution as something more distant and, in any case,

European. Their social philosophy was the natural outcome of their reactions to the very different American scene. The majority of transcendentalists never wavered in their active opposition to slavery, imperialism, bureaucratization, and cultural philistinism; yet, partly because the United States had already achieved a democracy and partly because Western expansion kept economic conditions relatively good, the transcendentalists were not incited to the more extreme forms of political protest characteristic of such European inheritors of idealism as Karl Marx and Pierre-Joseph Proudhon.

### Bibliography

Perry Miller's two collections, *The Transcendentalists: An Anthology* (Cambridge, MA: Harvard University Press, 1950) and *The American Transcendentalists: Their Prose and Poetry* (Garden City, NY: Doubleday, 1957), provide excellent selections of transcendentalist writings; they also contain bibliographies. O. B. Frothingham, *Transcendentalism in New England: A History* (New York: Putnam, 1876), is still the best intellectual history of the movement.

*Michael Moran (1967)*

## NEW ENGLAND TRANSCENDENTALISM [ADDENDUM]

The transcendentalist departure from Unitarianism was bolstered by the Biblical criticism of Johann Gottfried von Herder, who suggested in *The Spirit of Hebrew Poetry* (1782/1833) both that the Bible is a human poetic construction, and that works just as authoritative can still be written. This was precisely Emerson's standpoint at the opening of *Nature* (1836), where he asked, "Why should not we have a poetry and philosophy of insight and not of tradition, and a religion by revelation to us, and not the history of theirs?" (1971–, 1:7). In his controversial

"Divinity School Address" (1838), Emerson urged Harvard graduates to find redemption in the "Soul," not in an "eastern monarchy of a Christianity" that proceeded "as if God were dead" (1971–, 1: 82, 84).

In "Experience" (1844), Emerson developed most fully and creatively the Kantian idea that there are forms through which we acquire experience. Stating that the universe "inevitably wear[s] our color," Emerson developed a categorical scheme that he called "the Lords of Life"—including "Temperament," "Surface," "Succession," "Surprise," and "Illusion." Against this background he set out an epistemology of moods, according to which moods are like beads strung on the iron wire of temperament, each showing "only what lies in its focus" (1971–, 3: 30). Emerson stated in "Circles" that "our moods do not believe in each other" (1971–, 2: 182)—a statement showing that moods contain beliefs and at the same time indicating their radically inconsistent outlooks.

Emerson's ethical thought centered on "self-reliance," which is both a positive search for the best in oneself—our "unattained but attainable self," as he put it in "History" (1971–, 2: 5)—and, in its negative moment, an "aversion" to "conformity." Emerson characterized society as "in conspiracy against the manhood of every one of its members" (1971–, 2: 29)—a conspiracy all too effective in producing individuals who "skulk" and "sneak" through their lives, or gather together like "bugs" and "spawn." Emerson's critique was thus directed not so much at specific actions as at a manner of living. He gave an existentialist twist to a passage from René Descartes's *Meditations* when he wrote, "Man is timid and apologetic; he is no longer upright; he dares not say 'I think,' 'I am,' but quotes some saint or sage" (1971–, 2: 38). For Emerson, as for his contemporary Søren Kierkegaard, thinking and existing are not just given; they are risky ventures. Emerson's heroes manifest a sense of command and overflowing worth, as well as a tendency toward spontaneity and whim. Friendships of such heroes are alliances of "large formidable natures, mutually beheld, mutually feared" (1971–, 2: 123).

Henry David Thoreau, in *Walden* (1854/1989), produced a work of ethical and political philosophy that, like Plato's *Republic*, considers the necessities of life. On the basis of his "experiment" of living at Walden Pond for two and a half years, Thoreau concluded that he can survive for a year on six weeks of labor. This left him time to "own" the landscape by sitting in it, sound the depths of the pond, watch the spring come in, talk with the occasional visitor, and, more generally, "improve the nick of time." Guided by the Greek and Roman philosophy he

read as an undergraduate at Harvard College and by his readings in Indian and Chinese thought, Thoreau understood philosophy as the search for “a life of simplicity, independence, magnanimity, and trust.” In this sense, he observed, “there are nowadays professors of philosophy, but not philosophers” (p. 14).

In the “Economy” chapter of *Walden*, Thoreau considered human life as a precious commodity: “The cost of a thing is the amount of what I will call life which is required to be exchanged for it, immediately, or in the long run.” He concluded that people pay a high cost for the lives they lead, that their lives are modes of strange “penance,” and that a “stereotyped but unconscious despair is concealed even under what are called the games and amusements of mankind” (p. 8).

Although he portrayed himself variously as growing beans, peering through the ice of the pond, walking and sitting and “suddenly finding himself neighbor to the birds,” the main outcome of Thoreau’s time at Walden Pond was the book in which he recorded his life there, a book that, in the chapter “Reading,” offered a theory of itself. Thoreau contrasted with the “classics” of every great culture a popular series of books called “Little Reading”: books, as he put it, that “we have to stand on tiptoe to read and devote our most alert and wakeful hours to.” After he finished *Walden*, Thoreau began to think of his immense journal as just such a book, perhaps even closer to nature, with “each page ... written in its own season & out of doors” (1993, p. 67).

Thoreau’s “Resistance to Civil Government” (1849) was a response to his night in jail for not paying the poll tax, and served as a source for the nonviolent resistance practiced by Mahatma Gandhi and Martin Luther King Jr. Thoreau argued that the citizen has no duty to align his conscience with the state, and a responsibility to oppose its immoral actions. He wrote, “I cannot for an instant recognize that political organization as my government which is the slave’s government also” (1973, p. 67). The country could rid itself of slavery, he argued, if large numbers of people refused to pay their taxes and were willing to go to jail. Later, as Thoreau and Emerson became more agitated about slavery, Thoreau supported violence to end it. In “A Plea for Captain John Brown” (1859), he stated, “A man has a perfect right to interfere by force with the slaveholder, in order to rescue the slave” (1973, p. 132).

Margaret Fuller’s death in a shipwreck in 1849 deprived the transcendentalists of a powerful journalist and feminist writer. In *Woman in the Nineteenth Century* (1845), a revision of her essay “The Great Lawsuit”

(1843), she maintained that masculinity and femininity are intertwined, that there is “no wholly masculine man, no purely feminine woman.” Women’s free self-development, she argued, is necessary for the renovation of society, including marriage. “Union,” she wrote, “is only possible to those who are units” (Myerson 2000, pp. 418, 419).

## INFLUENCES ON PHILOSOPHY

Friedrich Nietzsche read Emerson at three critical points in his life, transcribed passages from Emerson’s essays in his journals, and wrote, “*Emerson*.—Never have I felt so much at home in a book, and in *my* home” (Goodman 1997, p. 160). Emerson’s ideas about nobility, history, friendship, overcoming self-inertia, and self-reliance presage Nietzsche’s *Untimely Meditations* and *Thus Spoke Zarathustra*. A sentence from Emerson’s “History” is the epigraph to the first edition of Nietzsche’s *Gay Science*: “To the poet, to the philosopher, to the saint, all things are friendly and sacred, all events profitable, all days holy, all men divine” (Emerson 1971–, 2: 8).

In the United States, Emerson’s stress on action and the future, his humanistic or Kantian portrayal of the role of the self in forming the world, and his focus on the individual chimed with central emphases of William James’s pragmatism. John Dewey considered Emerson “the one philosopher of the New World fit to have his name uttered in the same breath with that of Plato,” and found in his writings an anticipation of his view that ideals are present in our “immediate experience.” Emerson and Thoreau are central to Stanley Cavell’s investigations of “reading,” “aversive thinking,” and “moral perfectionism,” and to his related discussions of Martin Heidegger, Friedrich Nietzsche, and Ludwig Wittgenstein in *The Senses of Walden* (1981), *Emerson’s Transcendental Etudes* (2003), and other works.

## NEWMAN, JOHN HENRY (1801–1890)

John Henry Newman, an English philosopher of religion and cardinal of the Roman Catholic Church, was born in London, the son of a banker (later a brewer) who gave his children a love of music and literature. The young Newman was thoroughly familiar with the writings of both the romantic poets and the English deists. Raised as an Anglican, he underwent a deep religious experience when he was fifteen, and thenceforth he was strongly convinced of God's interior presence and providence. The mottoes chosen by Newman at this time foreshadowed his religious quest and interest in development: "Holiness rather than peace," and "Growth the only evidence of life."

He matriculated in 1816 at Trinity College, Oxford, where he read strenuously in the classics and mathematics. A fellowship at Oriel College at Oxford won him entrance to its common room, which proverbially "stank of logic." In 1824 Newman took holy orders.

The Oriel noetics, led by Richard Whately, gave Newman a taste for cool logical analysis of religious problems. His greatest influence at Oxford was exerted in company with Richard Froude, John Keble, and Edward B. Pusey. The Oxford movement sought to revive a living, full sense of the church and tradition through a series of incisive *Tracts for the Times* (1833–1841), culminating in Newman's *Tract 90*, which earned him an official censure. Newman's historical research in the Church Fathers and his theory of development in Christian doctrine eventually convinced him that the ideal of an Anglican *via media* was illusory. In 1845 he was received into the Roman Catholic Church, in 1847 he was ordained, and in 1848 he established the Birmingham Oratory as a center for those who shared his aspirations.

Newman struggled futilely during the years 1851–1858 to succeed as rector of the new Catholic University of Ireland, but political forces were too strong for him. Out of this defeat, however, came his main educational work, *The Idea of a University* (1852, 1859), which looked forward to a new synthesis of scientific, humanistic, and theological studies. Newman's strongly felt defense of his religious integrity and conversion expressed in his *Apologia Pro Vita Sua* (1864) restored his

rapport with educated readers in England. It also cleared the path for the presentation of his basic philosophical views on knowledge and his defense of the reasonable character of the act of religious faith. Newman regarded his *Essay in Aid of a Grammar of Assent* (1870) as his way of discharging an intellectual debt to his generation and to religious seekers of every age. In recognition of his distinguished service to the church, Pope Leo XIII created him a cardinal in 1879. Even in his last years, Newman kept up an active interest in questions of science, biblical criticism, and religious beliefs.

Newman belongs in the tradition of British churchmen who have contributed to philosophical thought. This he did in the course of dealing with certain problems of a religious and theological nature. He was well read in such Enlightenment sources as David Hume, Voltaire, and Thomas Paine and had an early awareness of the modern philosophical difficulties propounded against Christianity. Under pressure from such critics, Newman felt obliged to sift the grounds for his own adherence to theism and the Christian faith. He made a close study of the rationalistic apologetic used by William Paley and by Whately in defense of the existence of God and the basic articles of the Christian creed. Although Newman appreciated their search for rigor, he remained unconvinced by their particular way of achieving it. Their formalism remained completely impersonal and abstract, leaving out of account the process whereby the individual mind comes to see the import of an argument and gives its assent to the statements under discussion. Newman found a much more realistic account of mental operations in the analyses of inquiry made by three sources: Aristotle (especially in the *Nicomachean Ethics*), the Greek Fathers, and Joseph Butler. These sources all stressed the importance of probable reasoning and analogy, especially in cases involving contingent realities and moral questions. Somewhat to his surprise, Newman also discovered a similar stress in Francis Bacon, Isaac Newton, and the Newtonians as soon as they faced the problem of relating their formal structures to concrete nature.

#### FORMAL AND INFORMAL REASONING

Groping during his Oxford years for a way of stating the difference between the sequence of logical steps and the path of the mind in discovery, Newman came to the distinction between formal and informal reasoning. In mathematics and formal logic, the regulative principle is furnished by the formal relations among the elements of the argument and the internal consequence of steps. The relations can be stated in a general way without taking

into account the difficulties that individual minds may have in following the formal entailments. From the logicomathematical standpoint, questions about our way of grasping the proof are either deemed irrelevant or assigned to the psychological order. Newman accepted this position insofar as it was meant to preserve the integrity of the standpoint of formal reasoning and the rigor of its deductive method. But he was unable to accept Whately's rationalistic conclusion that nothing more is ever required for establishing a doctrine than to exhibit its conformity with a pattern of formal reasoning. If a statement asserts something about existent things and if we are invited to accept this assertion, then something more is involved than the application of a general pattern of formal argument. The particular ways of backing the argument must be considered, and they must be considered by individual minds called upon to weigh their agreement with the world we experience.

When Newman himself tried to set down in the *Apologia Pro Vita Sua* the stages in his religious journey toward Catholicism, he found further evidence of his contention that the grounds and stages of argument in concrete matters cannot be fully formalized. He did not regard religious inquiry as being peculiar in this respect, but rather as agreeing with the common human condition of informal reasoning. The religious inquirer uses his mind in much the same way as does the jurist, the historian, and the biologist: All share in a common pattern of inquiry that demands a distinctive and responsible use of intelligence moving in a region somewhere between formalism and psychologism. A prominent task of Newman's main philosophical book, *An Essay in Aid of a Grammar of Assent*, was to explore the middle ground of inference that eludes complete formalization and yet achieves results capable of surviving the formal tests. In a general way, he described this region as a concrete personal mode of reasoning, which he customarily divided into natural and informal inference.

#### "CONCRETE" REASONING

The reasoning is called "concrete" as an indication of its ultimate terms of reference and control. Newman was strongly convinced that ours is a world of individual unit things, each of which has its unique nature and history. There is sufficient likeness among individuals to permit comparison and general statements, but there is no real identity and hence no completely general way of following the logical rules to establish our statements about them. In the study of individual entities, a gap eventually opens between general rules and concrete matters of fact.

It cannot be closed by carrying on some further manipulation of the formal procedures in logic, and one is forced to bring into play the personal discernment of the living mind working upon what it experiences. Man's reasoning becomes concrete in response to this situation.

When he inquires about concrete existents, each man assumes personal responsibility for the conduct of his own understanding. Although he cannot violate the logical system or the pattern of the language, he must determine issues that cannot be settled solely in their formal terms. In the ordinary course of life, one does not stop to reflect upon the methodological issues involved but plunges directly into the particular matters at hand. Newman refers to this unreflective and implicit sort of concrete thinking as a natural mode of inference, one that is not burdened by any second-level questioning about the kind of use being made of the mind. Every person is faced with practical decisions and moral choices that require a personal assessment of the circumstances and particular means and end in view. There is a point at which even a great military leader cannot rely solely upon the rules of strategy and his formal conception of warfare; he must place all these aids at the service of his personal estimate of a particular military situation in order to make a responsible decision. He is directly engaged in concrete reasoning in the natural mode of inference.

Yet Newman did not restrict concrete reasoning to conditions of great practical stress, where reflection on one's method is a luxury that cannot be indulged. He recognized the pattern of concrete intelligence in the judgments made by the historian, the art critic, the jurist, and the scientist. Here there is often an opportunity for attending to the problem of method. In the degree that individuals who make these judgments reflect upon their procedures and make an explicit theme of them, they are involved in what Newman calls concrete reasoning in the informal mode of inference. The concrete uses of intelligence are now thematized and critically controlled. The reasoning is informal insofar as it deals with questions that cannot be settled by appealing simply to the formal logical rules, but still it is a quite deliberate and reflective way of reasoning. Informal reasoning is required by our world of particulars, but this world does not prevent us from reflecting upon the way in which we explore and interpret it.

### THE ILLATIVE SENSE

Newman proposed the theory of the illative sense to account for the certitude that may be attached to informal judgments. Here he was not trying to burden the

mind with a new and esoteric faculty but sought instead to account for a definite feature of our intellectual activity. Hence he remarked that illative sense is only a grand name for designating a very ordinary way of using the mind.

A distinction is needed between certainty and certitude. Newman regarded certainty as a formally determinable quality of propositions and assigned its study to the logician. Newman's own interest centers upon certitude as a quality of the mind when it is engaged in concrete reasoning of both the natural and the informal sort. Concrete reasoning yields certitude when it enables us to recognize and affirm the truth of some proposition. Certitude is not achieved, as the rationalists maintain, through an impersonal coercion of the mind by the force of the formal elements contained in it. In all reasoning, but especially in concrete inference, certitude consists in an active response of the mind to the weight and tenor of the argument, a living recognition of the meaning and the truth of the proposition that states some findings. Furthermore, this certitudinal apprehension of the truth of the proposition is an inalienably individual act. I come to grasp the import of an argument; I see the bearing of the evidence; I give my assent to the proposition as true.

For my warrant in accepting the proposition, I cannot fall back exclusively upon the general canons of logic and the common structure of the language. Although Newman recognized their indispensable contribution by way of opposition to sentimentalism in thought, he believed that in the final analysis these elements cannot settle issues about the concretely existent. The illative sense refers to the type of operation of the human mind as it engages in concrete reasoning, reaches a conclusion of inference, and determines whether to give its certitudinal assent to the inferred proposition about a concrete reality:

The sole and final judgment on the validity of an inference in concrete matter is committed to the personal action of the ratiocinative faculty, the perfection or virtue of which I have called the Illative Sense. . . . It is the mind that reasons, and that controls its own reasonings, not any technical apparatus of words and propositions. This power of judging and concluding, when in its perfection, I call the Illative Sense. (*Grammar*, Ch. 9)

Thus when Newman claimed to be developing a theory of the mind more empirical than John Locke's, he instanced this functional analysis of the illative sense.

The illative use of the mind is observable not only in the concluding act of an inference in concrete issues but also at the outset and along the way of the reasoning. Newman pointed out the need for a personal use of intelligence—especially in creative work as done, for example, by Newton or Edward Gibbon—in order to suggest the governing hypothesis, to gauge the strength of some particular stage in the inquiry, and to discern the bearing of many outlying investigations upon the main problem. We seek to conduct ourselves responsibly in all these operations, and the term *illative sense* refers to the intellectual mastery or perfection that an individual develops for inquiries in some concrete field. It comes close to the Aristotelian habit of prudence or practical wisdom, except that it can reach into the speculative order and attain certitude there. Newman added that despite a similar pattern of concrete logic for different fields, the personal mastery cannot simply be transferred from one area to another. A man may give us good grounds for trusting his judgment in military affairs or biological questions, whereas he may be utterly lacking in sagacity in respect to political legislation.

Newman did not isolate religious inquiry from other concrete uses of intelligence but required it to conform to the common requirements of concrete inquiry. The religious person is not concerned solely with abstract and general issues but seeks the truth about the reality of God, the person of Christ, the complex life of the church, and the individual soul's response to them all. These matters belong in the region of concrete existence and thus impose their own requirements upon the searcher's mind. The interested individual cannot do justice to the issues if he confines himself to what can be ascertained exclusively from the use of formal reasoning. Such a restriction is bound to lead to a noncommittal attitude, not because of the religious issues as such but because of the failure to make use of the concrete reasoning required by the situation.

### PROBABILITY AND ASSENT

At this juncture, however, Newman was confronted with a strong objection propounded by William Froude (brother of Richard Froude) and other members of the Victorian scientific community. They noted Newman's statement in the *Apologia* about his agreement with Joseph Butler that probability is the guide of our life. In addition they noted the function assigned by Newman to the illative sense of discerning the convergence of probabilities among several strands of argument. To Froude, it seemed that the unavoidable result is that Newman's way

of concrete reasoning can yield nothing higher than a probable conclusion, which is essentially open to constant revision. This falls considerably short of the certitude claimed by Newman for the act of religious faith.

Newman's treatment of this difficulty constitutes another major topic in the *Grammar of Assent*. Indeed, the book's title derives from his wrestling with this issue, as recorded in the following entry in his journal. "At last, when I was up at Glion over the Lake of Geneva, it struck me 'You are wrong in beginning with certitude—certitude is only a kind of assent—you should begin with contrasting assent and inference.' On that hint I spoke, finding it a key to my own ideas" (*Journal*, August 11, 1865). In fixing upon assent as something different from inference, Newman was able to clarify his position with respect to Froude's objection. His terminology was geared to the earlier, Lockean era in British empiricism, but the thrust of his argument concerns the relationship between religious faith and what Charles Peirce was already calling the ideal of scientific fallibilism.

Newman felt that at least one difficulty rested upon a linguistic confusion. His critics treated probability as a trait belonging to propositions and arguments, in which respect they contrasted it with the certainty of propositions. But just as he considered certitude a quality of the mind, so Newman viewed probability as a relationship involving the mind in an existential situation, rather than as a relationship among propositions in an argument. In Newman's conception, reasoning is probable to the extent that it is nonformal. Whenever inference is carried on in a context other than that of formal logic and mathematics, it is probable in the sense of not being governed by the intention of yielding a logicomathematical sort of proof. So understood, the probable is not contrasted with the demonstrative and the certain as such, but rather with the formal kind of demonstration and the abstract kind of certitude. Whenever the mind is inquiring about a concrete matter of fact, it is engaged in probable reasoning. This means that we are adapting our investigation to the conditions of particular existents, not that we are seeking only a weaker form of evidence and consequence in our reasoning. Thus probability, as understood by Newman, does not exclude certitude of assent but permits it to be achieved in matters pertaining to the concrete world and its connections in being.

Historically, Newman had to face Locke's restriction of probability to those inevident relations among ideas that permit neither intuitive nor demonstrative knowledge. Locke also held that belief is an act of assent that cannot rise above the probability of the inference leading

to it and hence cannot enjoy the certainty of intuition or demonstration. Newman had two grounds of disagreement with this teaching. First, there is no general rule necessarily subsuming religious assent under Lockean probability. Whether there is certitude in an act of religious faith cannot be settled by general stipulation about the meaning of probability and the judgment of belief. There must be a direct examination of the particular case and its grounds for claiming something about the order of concrete fact. Second, the act of assent is no mere shadow or reduplication of the conclusion of the inferential process. Using J. S. Mill's canons of induction, Newman sought to show the distinctive nature of assent as an act of the mind that remains irreducible to either the formal conclusion of an inference or to its psychological correlate in the act of concluding. We always conclude in a referential and conditional way, in view of what the premises state. But assent is made directly to the proposition as true; hence assent intends the certitudinal acceptance of the proposition in itself as being a true one. Newman made an extensive analysis of such expressions as "half assent," "conditional assent," and "hesitating assent." These describe circumstances surrounding the assent or features of the content to which assent is given rather than the act of assent itself.

The drift of Newman's reply to Locke and Froude is fairly clear. The sort of probability that he accepts as a guide and about which the illative sense must make an appraisal consists in a relation of the human mind to concrete modes of being. We follow the way of probability when we adapt our analysis to the concrete particulars and make a personal appraisal of the particular evidence. Our concrete personal thinking does not always attain certitude, but there is no *a priori* reason drawn from the definition of assent and probability that prevents us in principle from attaining it. Furthermore, there remains a difference in structure and intention between the inferential process and the act of assent. The revisability attaching to the former, especially in scientific inquiries, does not prevent the achievement of assent with certitude in some concrete instances. Newman's defense of the certitude in the act of religious faith depends upon keeping inference and assent distinct, as well as upon interpreting probability in terms of his theory of concrete reasoning.

## NOTIONAL AND REAL ASSENT

Within the order of assent itself, Newman distinguished between notional and real assent. His view cannot be understood if it is taken as implying an opposition in principle between these modes of assent, or as assigning

all the intellectual worth to real assent. The distinction is a functional one, arising from Newman's study of the interpretative operations of the mind. In assenting to a proposition, we can intend to accept the statement itself as true or to accept the real thing intended by the statement. A notional assent is one made to the truth of the proposition itself, whereas a real assent is one made to the reality itself intended by the proposition. Thus one may give a notional assent to God in terms of some abstract divine attributes and also give a real assent to God considered as a personal being who cares for one as an individual person. This is a matter of interpretation on the part of the mind that is considering the statement. In the case of purely ideal inquiries, a notional assent is sufficient. But we live in a translinguistic world, and our questions reach out to the community of real existents, especially to other persons. Here, the mind's notional assent must be integrated with, and further perfected by, a real assent to the very realities under investigation.

For Newman, the fully appropriate intellectual response to our human situation is unavoidably a complex one, involving both notional and real assents. Taken by itself, the way of real assent is intense but unclarified. We need to engage in both formal and informal inference, weighing the evidence carefully and arriving at a careful act of notional assent. Inference and notional assent are indispensable elements in human cognition; otherwise we could not weigh the pertinent evidence on an issue, do justice to the difficulties, or formulate the theoretical findings with cool precision of statement. Thus Newman assigned a large role to the modes of formal and informal inference and to notional assent in the total composition of human knowledge.

But he also insisted upon the need for directly relating the mind to individual existents. The act of real assent achieves our intellectual orientation toward the domain of concrete existents and their values. It does so by furnishing a concrete image of the individual being under consideration and by establishing the relevance of that imaged reality to the inquirer's own personal life. Real assent does not necessarily ensure action, but it does furnish a necessary condition for our practical responses by directing our mind toward the real existent, grasped in an image that can appeal to our passions and will.

There is a strongly theistic motive behind Newman's insistence upon blending inference, notional assent, and real assent. Humankind's relationship to God is not yet one of direct vision; hence we must engage in inference. Since theistic inquiry concerns a real existent, it is not enough to employ formal inference, even though its

resources must be used to analyze and test our arguments. A concrete personal mode of reasoning is also required in order to proportion our inquiry as fully as possible to the situation of man's search after the truth about God. Our aim must be the complex one of attaining some definite and well-grounded propositions to which we can legitimately give our notional assent, and also of forming a concrete image of the personal, morally good, and providential God to whose reality we can then give our real assent and practical attachment.

### CONSCIENCE AND THE MORAL LIFE

Newman's final philosophical problem in the *Grammar* was to describe the area where he personally could realize this synthesis of intellectual acts bearing on the being of God. He readily admitted that there are many ways to God and that many natural informants lead us to him: the way of causality and purpose, the meaning of human existence and history, and the import of our moral life. As a reader of Hume and a contemporary of Charles Darwin, however, Newman refused to grant independent value to the design argument, which he regarded as a supplementary way of looking at nature on the part of those who already accept God on other grounds. To reach the transcendent, personal God, Newman examined the witness of our moral life, for this is a personal region where relations with other persons are best established. It is here that we have the experience of conscience, of being under command to do and not to do, of being responsible to a just and caring person who transcends our human reality but does so in a way that keeps him personally concerned about our conduct. Conscience as a commanding act discloses the full human situation of our responsibility toward the good God.

Three features of the living command of conscience recommend it to Newman as the best way of achieving real as well as notional assent to God: its intentional character, its personal significance, and its practical ordination. The dictate of conscience by its very structure refers the conscientious man beyond himself, pointing him toward the reality of the supreme lawgiver and judge of his moral actions. This is not a purely abstract orienting of our mind but involves a concrete image of God as our concerned father. Another advantage of the way of conscience is that the moral relationship in which it consists is personal in both poles of reference. Conscience engages me precisely as a personal self; hence it enables me to give a real assent to God as a morally concerned person. Finally, the acts of conscience relate us to the personal God in a concrete way that leads to moral and religious

actions. Hence the approach to God from conscience encourages us to assent to the truth about God not only notionally but really, not only in respect to our propositions but also in respect to the personal, providential reality of God himself as the practical goal of our knowledge and love.

As a reader of Hume and Mill, Newman was very sensitive to the naturalistic criticism based upon physical and moral evil in our world. He suggested that the moral problem of theism be treated within a moral context. One cannot pose an objection to theism on moral grounds and then rule out the conditions that would permit theism to present its moral type of interpretation. Real assent to God as the lord of conscience furnishes a frame of reference for wrestling with evil and discerning his providential presence. A mind that is carefully formed upon the theistic implications of conscience "interprets what it sees around it by this previous inward teaching, as the true key of that maze of vast complicated disorder; and thus it gains a more and more consistent and luminous vision of God from the most unpromising materials. Thus conscience is a connecting principle between the creature and his Creator" (*Grammar*, Ch. 5). Whereas the naturalistic critic appeals to the vast disorder as an antecedent reason for withholding our assent from God, Newman asks us to secure first of all the inward principle of interpretation provided by the personal and moral relation of men to the lord of conscience. The work of this principle is not to soften or gloss over the power of evil, but to bring in the other considerations concerning God and moral man that will enable us to understand and work with hope against physical and moral evil in our world.

### HISTORICAL DEVELOPMENT AND SOCIAL PRINCIPLES

Like other nineteenth-century thinkers, Newman was dissatisfied with the older empiricism's emphasis on the solitary and static individual perceiver. Hence he widened his horizon to include the social, developmental, and historical aspects of human experience. His *Essay on the Development of Christian Doctrine* (1845) opens with a chapter on the general nature and kinds of development among ideas. Here Newman explores the logic of those social ideals that grip the minds of men and account for developments in their beliefs and institutions.

For Newman, two questions are of prime importance in understanding the social growth of ideas and institutions: Why do certain ideas display themselves only through historical development? What pattern is com-

mon to diverse sorts of developing social principles? As an answer to the first question, Newman points to the interpretative activity of many minds as they are engaged in judging, relating, evaluating, and dealing practically with our complex world. There are some meanings that can be worked out only in this gradual social way. Historically important ideas are those that contain many facets and require the interpretative activity of many minds, testing and developing them over many years. "Ordinarily an idea is not brought home to the intellect as objective except through this variety; like bodily substances, which are not apprehended except under the clothing of their properties and results, and which admit of being walked around, and surveyed on opposite sides, and in different perspectives, and in contrary lights, in evidence of their reality" (*Development*, Ch. 1). We can grasp the intentional structure of basic human meanings only through studying their various perspectives, forcing them to enter the battlefield of critical discussion, and sometimes embodying them in visible, powerful social institutions.

Newman also suggested that there is a common pattern of development that has certain traits distinguishing a healthy growth from a sickly one. His seven criteria for genuine development are preservation of the type of principle that is socially influential, continuity of these principles, their capacity for assimilation of new data, their logical sequence in organizing a complex social process, their anticipation of their own future, conservation of their past achievements, and their chronic vigor. He deliberately illustrated these criteria by showing their development in kingdoms, economic policies, religious convictions, scientific hypotheses, and philosophical theories. Although the entire analysis is applied ultimately to the theological question of development among Christian doctrines, Newman's comparative use of empirical materials indicates the wider significance of his study of the dynamics of human thought and institutional forms. He himself, in fact, makes an explicit application of this theory of development to the ideas of civilization, the political constitution, and the university.

## THE UNIVERSITY

Newman's effort at interpreting the Western ideal of the university in the context of his theory of development is revealed in *The Idea of a University*. He was more keenly aware than most of his contemporaries that the crucial decisions affecting the course of cultural development were being made within the university. It was replacing the episcopal palace, the banking house, and the parlia-

mentary floor as the real center for determining the long-range direction of human history. Newman looked for a fresh synthesis of tradition and originality in the university community. The task of such a community is to educate men for the world by gradually introducing them to the full complexity of our humanistic, scientific, and religious interpretations. This it should try to do by cultivating an understanding of the various methods and ways of knowing, along with an awareness of their differences, limitations, and possibilities for unification.

As a Catholic churchman, Newman devoted the bulk of his writings to problems raised by the Christian faith and its practical institutions, especially as they are brought into close relation with modern humanistic and scientific ideas. His contributions to these issues might be considered as a sustained effort at education that draws its strength from both Christianity and the other components in the university ideal.

## Bibliography

### WORKS BY NEWMAN

The following are modern editions of Newman's works: *Two Essays on Biblical and on Ecclesiastical Miracles* (New York, 1924); *An Essay in Aid of a Grammar of Assent*, edited by C. F. Harrold (New York: Longmans, Green, 1947); *The Idea of a University*, edited by C. F. Harrold (New York: Longmans, Green, 1947); *Essays and Sketches*, 3 vols., edited by C. F. Harrold (New York: Longmans, Green, 1948); *Apologia Pro Vita Sua*, edited by C. F. Harrold (New York: Longmans, Green, 1947); *An Essay on the Development of Christian Doctrine*, edited by C. F. Harrold (New York: Longmans, Green, 1949); *Sermons and Discourses*, 2 vols., edited by C. F. Harrold (New York: Longmans, Green, 1949); and *The Letters and Diaries of John Henry Newman*, edited by C. S. Dessain (New York: T. Nelson, 1961–; to be published in 30 vols.).

*James Collins (1967)*

## NEWMAN, JOHN HENRY [ADDENDUM]

Since 1967, the publication of new primary source material has generated an expanding resource pool for secondary scholarship on Newman, particularly with the appearance of 24 new volumes to complete the thirty-one volume collection of Newman's *Letters and Diaries*. In addition, two volumes of Newman's *Theological Notebook* (1970), two volumes of his *Theological Papers* (on Faith and Certainty [1976], and on Biblical Inspiration and Infallibility [1979]), and an annotated bibliography of his Tract and Pamphlet Collection (1984) have been published. A new critical edition of the *Grammar of Assent* was produced by Ian Ker in 1985, and new editions of several of Newman's works appeared: *Oxford University Sermons* (1970), *Apologia Pro Vita Sua* (1993), and *Arians* (2001). The celebration in 1990 of the centenary of Newman's death was the occasion for two new biographies by Ian Ker (1989) and Sheridan Gilley (1990). Moreover, the journal *International Cardinal Newman-Studien* (known until 1987 as *Newman-Studien*) continues to appear annually. The result of these increased resources has been a wide variety of secondary literature documenting Newman's contributions to classical themes, as well as the opening up of some new directions in scholarship.

Of particular relevance to philosophy is the continuing discussion of Newman's understanding of the relation between faith and reason and the relation between faith and doubt. Debates that locate Newman in the history of responses to skepticism (including Wittgensteinian responses) continue about the plausibility of Newman's

claims that there are no degrees of assent, that assent (including the reflex assent of certitude) is an act of the will, that indubitability (the absence of "reasonable" doubt) can be achieved through convergent, nondemonstrative reasoning, and that certitude is indefectible. In particular, the period from 1969 to 1980 saw increased attention to a debate about whether Newman was a "volitionalist" (aligned with people like René Descartes and Søren Kierkegaard)—that is, whether assent was an act of the will distinguished from and following on the reasoning process, according to a "logic of decision." While there continue to be advocates of Newman's volitionalism, this debate opened up a new direction for research—namely, the theme of Newman and rhetoric. In addition to three book-length studies of Newman as a rhetorician, in the sense of classical rhetoric, three new studies of his preaching appeared. A collection of essays on romanticism and rhetoric in Newman's thought was complemented by the beginning of significant discussion of the role of imagination in Newman's proposals concerning concrete reasoning and the illative sense.

Theological interest in Newman's thought has resulted in works on his ecclesiology, and the topics of liturgy and revelation. Another interesting new direction in Newman studies has been an increased emphasis on spirituality. Although there were earlier works on Newman's spirituality, such as Hilda Graef's *The Spirituality of John Henry Newman* (1968), the late 1980s and early 1990s saw the publication of three additional works on Newman's spirituality, his "spiritual theology" and Newman's teaching on "Christian holiness." Perhaps this increased interest in spirituality is related to the initiation of the process of beatification and canonization of Newman begun by the Roman Catholic Church in 1980; in 1991 the first official step in that process was taken when Pope John Paul II declared Newman "Venerable."

While there has been no notable book-length feminist study of Newman's thought, there has been some interest in Newman's relation to women (Joyce Sugg, *Ever Yours Affly: John Henry Newman and His Female Circle*, 1996), as well as the influence of Mariology (Philip Boyce, *Mary: The Virgin Mary in the Life and Writings of John Henry Newman*, 2001).

Finally, in addition to publications in church history, in which Newman is related to the Oxford Movement and to Modernism, the centenary celebration of Newman's death brought about a number of retrospectives in the form of edited volumes of essays by specialists, for example, Ian Ker and Alan Hill's 1990 *Newman After a Hundred Years*. There followed a decade of increased interest

in Newman, including two collections of interdisciplinary studies in which scholars consider Newman from the perspectives of literature, history, and education (edited by Magill, 1993 and 1994).

## NEW REALISM

"New Realism" arose at the turn of the twentieth century in opposition to the Idealist doctrines that the known or perceived object is dependent for its existence on the act of knowing and that the immediately perceived object is a state of the perceiving mind. The Austrian philosophers Franz Brentano and Alexius Meinong first enunciated the cardinal tenet of this new realism: that what the mind knows or perceives exists independently of the acts of knowing and perceiving. Developing mainly as a polemic against Idealism, this new realism was represented prior to 1900 in England in the works of such men as John Cook Wilson, Thomas Case, H. W. B. Joseph, and H. A. Prichard. Similar realist polemics were taking place in Sweden and Italy.

In America the movement known as New Realism dates from the critical writings of William P. Montague and Ralph Barton Perry in 1901 and 1902. Their immediate aim was to refute Josiah Royce's "refutation" of realism, which he had based on the claim that the knower and the known could not be independent of each other and still be related. The movement took definite form when Montague and Perry were joined by four others in a statement of a New Realist program ("The Program and First Platform of Six Realists") in 1910.

In England, New Realism took explicit form in the works of T. P. Nunn, Bertrand Russell, and G. E. Moore. In both America and England, New Realists asserted the independence of consciousness and its object, but serious differences soon appeared between the two groups and between individuals within each group. The differences were particularly noticeable in their statements about the nature of consciousness and of its object, and of the relation between them. Moore claimed that the act of consciousness included both a nonmental, independent object and a transparent, or "diaphanous," mental act of consciousness. He agreed with Brentano and Meinong that consciousness involved awareness in the form of an act of intending something other than itself. To have an idea, to perceive or be aware at all, is already to be beyond consciousness and to be confronted by an independent object. American New Realists, on the other hand, took their view of consciousness from William James. While he, too, described consciousness as a relation, James

denied that there was anything uniquely mental or psychic about it at all, and associated consciousness rather with the behavioral responses or functions of the organism.

But there were also differences between Moore, Nunn, and Russell. Nunn argued that both primary and secondary qualities not only exist as they are perceived, but also are really *in* their objects, whether perceived or not. He even argued that pain is something independent of mind, with which mind may come into various relations. In this he was closer to the American New Realism of Perry and E. B. Holt. Russell was influenced by Nunn's view, but his New Realism took a frankly Platonic turn that brought it closer to the New Realism of Montague. Russell's Realism, however, was soon significantly altered. Another variant of English New Realism, perhaps more a development from it than a version of it, was Samuel Alexander's. It, too, resembled American New Realism.

#### AMERICAN NEW REALISM

Although American, English, and, to a lesser extent, European New Realists influenced one another, it was among the Americans that New Realism flourished, particularly as a movement. Their aim was to produce an account of how a real object could be present in consciousness and knowledge and still be independent of that relation, and they sought to do this without a dualistic separation of knower and known. "The independence of the immanent" was their manifesto. Their first platform statement consisted of six lists of doctrines that had been discussed at length, revised, and agreed to by all, and that all thought were consistent. The lists were signed by Holt and Perry at Harvard, Walter T. Marvin at Rutgers, Montague and Walter B. Pitkin at Columbia, and Edward C. Spaulding at Princeton.

At a Philosophical Association meeting in 1909, five of these six had found themselves in agreement against a common foe that still spoke with authority and was listened to with deference: Idealism. Pitkin and Montague are credited with the idea of translating their agreement into an articulate statement, and papers soon began circulating. F. J. E. Woodbridge at Columbia gave encouragement, although he declined an invitation to join. Montague, in "Confessions of an Animistic Materialist," described E. B. McGilvary, Morris R. Cohen, J. E. Boodin, J. Lowenberg, and Douglas C. Macintosh as "unofficial" New Realists. Believing that philosophic disagreements were the result chiefly of a lack of precision and uniformity in the use of words, plus a lack of planned cooperation in research, the original six banded together in the

hope of revealing the genuine philosophic disagreements that were more than mere differences of personal opinion. They hoped thereby to open the way to the solution of genuine philosophic disputes. They called for a new alliance between philosophy and science and formulated a statement of principles and doctrines, a program of constructive work with a method based on these, and an agreed-upon system of axioms, methods, hypotheses, and facts.

In 1912 they published their cooperative volume, *The New Realism; Cooperative Studies in Philosophy*. Although they were still preoccupied with polemics, the six authors hoped to go beyond criticism to produce a complete philosophy that would play a major part in human thought. They saw themselves as proponents of a doctrine concerning the relation between the knowing process and the thing known. They described their most urgent problem (one that had not been resolved by naive realism, dualism, or subjectivism) as how to give an adequate account of "the facts of relativity" in the knowing process from a Realist point of view; how, in other words, to reconcile the apparently hopeless disagreement of the world presented in immediate experience with the true or corrected system of objects in whose independent reality they believed. While New Realism succeeded in showing the fatal weaknesses in dualistic answers to this problem, it nonetheless failed to provide an adequate answer of its own.

THE "FACTS OF RELATIVITY." New Realism faced the above problem not just because Idealism had failed to resolve it but also because Idealism had made it impossible to ignore these "facts of relativity." Thus, any attempt by New Realists to return to the naïveté of earlier doctrines of realism, to a primitive notion that nothing intervenes between subject and object (particularly nothing attributable to the subject), was out of the question. Equally closed to them was any recourse to a Lockean or Cartesian dualism that, they thought, never escaped the subject's own mental states. The third traditional answer to the problem, subjectivism, was also impossible. Of the three approaches, subjectivism was most often the object of criticism by New Realists, and they identified it as the fatal doctrine of Idealism. They saw it as an illicit argument from the "egocentric predicament," an argument based on the difficulty of conceiving known things to exist independently of their being known. New Realists refuted Idealism by refuting this argument; but then it became their turn to reconcile the facts of relativity, of which the predicament was one, with their theory of the

independent existence, or reality, of objects of consciousness and knowledge.

New Realist writings thus were largely devoted to such facts of relativity as illusion, error, secondary qualities, and—later—choosing, valuing, meaning or intending, and purposing. The New Realists also thought that Idealism had gone too far in its view of the subject's role. However, if Idealism went too far in that direction, New Realism went too far in the opposite direction; its polemical theory of independence could not be reconciled with the facts of relativity. This in turn provoked such reactions as Critical Realism, Perspective Realism, and Objective Relativism.

Chief among the positive aspects of the doctrines of the New Realists was what they called the “emancipation of metaphysics from epistemology,” the result of their theory of independence. Contrary to the Idealist claim that knowing was the universal condition of being and hence constitutive of it, the New Realists argued that knowing and being were independent. This, Perry showed, did not mean they were therefore unrelated, as Royce had argued, but simply that there was not the particular relation of dependence between them. Dependence is a special type of relation in which the dependent element contains, implies, or is exclusively caused or implied by that on which it is dependent. Between knowing and being, therefore, it was possible for there to be relations both of independence (external relations) and of dependence (internal relations). In holding out this possibility against the Idealist claim that all relations are internal, New Realism became identified with a theory of external relations.

In “immediate and intimate connection” with this theory was the doctrine that the content of knowledge is numerically identical with the thing known; things, when consciousness is had of them, become contents of consciousness, thus figuring both in the external world and in “the manifold which introspection reveals.” This view was very close to James's Neutral Monism, but only Holt worked out its fullest implications. The theory of numerical identity soon became the target of critics of New Realism, and it was difficult to determine whether, and to what extent, any New Realist other than Holt maintained it. Yet for a time, at least, it was said to be fundamental to New Realism. If there was a numerical identity between consciousness and its contents, then the “things” of thought would have to be given full ontological status along with the “things” of sense. This the New Realists claimed to do in their volume. They said they were Platonic Realists in granting this status to subsistents as well

as existents. Here, again, a belief held by all in the beginning became in the end the belief of but a few, notably Montague and Spaulding.

**THE EGOCENTRIC PREDICAMENT.** The facts of relativity haunted New Realism throughout the life of the movement. That the New Realists ultimately failed in their professed aim of doing justice to these facts was in part the result of their constant polemical concern with asserting their doctrine of independence against Idealism and in part the result of their failure to recognize some possibly constitutive elements within the knowing relation. One such fact was the egocentric predicament, described by Perry as the fact that the “extent to which knowledge conditions any situation in which it is present cannot be discovered by the simple and conclusive method of direct elimination” (“The Ego-Centric Predicament”). Perry thought this was merely a methodological difficulty, one faced by all philosophers. Idealism had used it to argue that since it was impossible to discover anything that is, when discovered, undiscovered by someone, therefore it is impossible to discover anything that is not thought. The argument, Perry contended, rested on a confusion between “everything which is known, is *known*,” and “everything which *is*, is known.”

Perry concluded that the predicament could not be used to support either Idealism or Realism. Idealists could not use it as an argument for dependence, or internal relations, and New Realists could not use it as an argument for independence, or external relations. But while exposing its illicit use, New Realists did not offer a convincing way out of the predicament. As a test for the dependence or independence of any element in consciousness, Perry proposed that insofar as the element was deducible from anything other than consciousness, it was independent. To be dependent, or subjective, the element would have to be exclusively determined by consciousness. However, it was pointed out, the predicament would prevent us, by the very test Perry proposed, from reaching an object that we could be sure was independent of consciousness, for we would be using consciousness (deduction) in order to get to it.

Spaulding maintained that New Realism had provided a solution to the predicament and that this solution was its most important doctrine. He argued that any sort of analysis purporting to discover—and not merely create—what is *there* would be impossible if it did not presuppose a Realist position; that is, presuppose relatedness with independence. Even a theory that argued against the Realist position would have to take that position toward

the very state of affairs it described, assuming that it was a genuine state of affairs, not one created, altered, or modified by virtue of the knowing relation. Every philosopher, knowingly or not, solves the predicament by the Realist attitude he assumes toward his subject. But the question remained: What warrant do we have for such an assumption?

Pitkin attempted to support the doctrine of external relations by refuting the assertion that biology provided evidence for the internalist view. On the contrary, he argued, biology supports the externalist view through the discovery that organic parts do not depend upon the whole in which they naturally occur; and an organic whole does not depend upon its individual parts for its total specific organic character.

Beyond this, and apart from showing that independence did not rule out relatedness, the New Realists did not demonstrate how the knowing relation was external and independent, nor did they show how the facts of relativity were to be reconciled with externality and independence. In their cooperative volume they had refused to recognize ultimate immediacies, or any nonrelational or indefinable entities other than the simples in which they claimed analysis terminates. Their view that the knowing relation was external required such simples, or “neutral entities,” that would maintain their identity no matter what relations they entered into. But it was never clear why analysis had to stop where the New Realists said it did—usually with the simples of mathematics and logic. Nor was it clear whether these simples were the product of their analysis or a genuine discovery by it.

**EPISTEMOLOGY AND ONTOLOGY.** In its constructive phase, New Realism proposed an epistemological monism and an ontological pluralism. James had argued that consciousness was not a substantive entity, and Moore similarly argued that it was diaphanous and transparent. In both cases, consciousness of something was viewed as a direct, unmediated, immanent affair. All content of consciousness, with the exception of Moore’s psychical, diaphanous element, was thus objective in the sense that it consisted of objects in the real, external world. This was New Realism’s epistemological monism: Thought and its object are numerically the same.

Its ontology was pluralistic, however: Some elements of the object would not be found in the consciousness of that object. Any elements in consciousness not found in the object would give consciousness a constitutive role beyond mere selection or grouping. The problem was to account for all of the “facts of relativity” through the

selective and grouping function of consciousness without jeopardizing the New Realist theory of immanence that asserted that it was the “real” objects of the external world that were present in consciousness.

There were two principal positions taken on this matter among New Realists. Montague called them the left and right wings of New Realism. One was Neutral Monism, developed by Holt and, to a lesser extent, by Perry, but eventually abandoned by both. The other was a Platonic Realism developed by Montague into what he called Subsistential Realism.

**Holt and Perry.** Neutral Monism derived from James’s idea of “pure experience.” Pure experience was pure because it was uncontaminated by such distinctions as “object,” “content,” “subject,” or “knower and known.” It was “neutral” in terms of these distinctions; such distinctions could only be made later in terms of the relations between portions of pure experience. A “thing” could be said to be one portion of pure experience that was represented by another portion. A “thought” could be said to be one portion of pure experience that represented another portion. The dualisms of “inner” and “outer,” mind and body, thus were undercut. All such distinctions were a matter of relations between bits of pure experience, but these relations had to be external. Hence, “mental,” “nonmental,” “real,” “external,” and “physical,” are accidental features. New Realists thus were driven back to a realm of indefinable simples that come into and go out of various relations but never change their original identities. Where could such a realm be found? And what could these simples be?

Where James thought they were bits of pure experience (and may have been working toward an identification of experience with nature), Holt and Perry, influenced by developments in mathematics and symbolic logic, found these entities in a mathematical-logical realm of “being.” It was a realm of entities having no definition or identity: neutral entities. These entities were similar to the simples that the New Realists had said analysis ultimately discloses. What we call consciousness is a grouping of these entities resulting from the selective (although not constitutive) response of the nervous system. This explanation enabled Holt and Perry to maintain the New Realist claim that consciousness and its objects were identical: Error and illusory experiences were no less objective or real than veridical experience. However, it failed to give an account of the difference between objects grouped and objects not grouped by consciousness. And it was still no easier to give an account

of the organism's response to objects that were spatially or temporally distant.

Although he espoused Neutral Monism in his early years, Perry never went as far as Holt. He admitted that error and other nonveridical experiences were cases of "mis-taking" entities for something other than what they are. In a later development he identified this mis-taking as an anticipation or expectation of an event that does not, when acted on or verified, occur as expected. By this time, however, Perry had departed from the New Realist theories of independence and immanence.

*Spaulding and Montague.* Spaulding also identified error as a mis-taking, but he described it as a case of taking something to be existential that was only "subsistential." This mis-taking was the only subjective feature in consciousness. Therefore, he concluded, illusory objects and errors are objective and real because both the existential and subsistential are objective and real. It is the taking of a thing to be what it is not that is the psychic or subjective element in consciousness, and the problem of error—why error occurs—is one for psychologists and not for philosophers. Along with Pitkin, Spaulding also took a behaviorist view of consciousness, describing its objects as nonspatial projections or dimensions of spatial objects resulting from the interaction of organism and environment.

The second major attempt to formulate a New Realist epistemology and ontology consistent with the doctrines of independence and immanence was developed furthest by W. P. Montague, the only one of the New Realists who argued for uniquely mental, subjective elements in knowledge and experience. While admitting this was dualism, he insisted it was not the psychophysical dualism rejected by New Realism. He invoked a realm of subsistents, identifying them as propositions of which existential propositions, and hence existence, were a part. Error was a case of mis-taking the "merely" subsistential to be an existent as well.

**CRITIQUES OF NEW REALISM.** All of these attempted solutions raised the question of whether New Realism's epistemology, based on an independently real object immanent in experience, could coexist with its view that the real object was part of the commonsense world. When the independence of the object of knowledge was emphasized, the facts of relativity were slighted, but the object could more easily be identified with commonsense objects. On the other hand, when immanence of the object was emphasized, it tended to lose its commonsense quality, becoming instead a neutral entity, or subsistent,

or simple, supposedly disclosed by a rather sophisticated analysis. At the same time, however, the facts of relativity could more easily be taken into account. The former emphasis moved in the direction of dualism; the latter in the direction of monism.

Criticisms of New Realism in the second decade of the twentieth century were concerned mainly with showing that the organism intervenes in a considerably less naive way than the New Realists had thought and that their theories of external relations, independence, and immanence did not adequately account for what was given in knowledge and experience. Describing New Realism as the first phase of the "revolt against dualism," A. O. Lovejoy said its constructive program argued that since nothing "mental" could be admitted without leading to subjectivism and skepticism, therefore no content could be held to be psychically generated or dependent upon percipient functions. New Realism was left with things in a purely external relation to consciousness, or at best a bare and sterile awareness of them. In rejecting all mediated knowledge, he argued, New Realism could only hold the position that all content of experience must be identical with reality; everything before or "to" mind or consciousness was "objective." When this claim collided with the manifestly disparate content of nonveridical experience, an objective but "subsistent" content was said to be directly present or immanent; or, alternatively, this content was said to be no less objective than veridical content because it was at bottom ("neutrally") the same as it. But, Lovejoy concluded, this was little more than what the earlier naive, or commonsense, realism had said.

Although the New Realists hoped to produce other collections of studies, and although their discussions continued through 1914, according to Perry disagreements that had been subordinated and only imperfectly concealed, divergence of interests, and the ambition of each to write his own book soon divided them. As a movement, New Realism was soon displaced by the second major realist movement of the twentieth century, Critical Realism, which also developed and published a platform and joint program.

## Bibliography

### WORKS BY NEW REALISTS

- Holt, Edwin B. et al. "The Program and First Platform of Six Realists." *Journal of Philosophy* 7 (July 21, 1910): 393–401. Reprinted in their cooperative volume *The New Realism; Cooperative Studies in Philosophy*. New York: Macmillan, 1912.
- Montague, William P. "Confessions of an Animistic Materialist." In *Contemporary American Philosophy*, edited by W. P. Montague and G. P. Adams. New York: Macmillan, 1930. Vol. II, 135–158. Pieces by other New Realists, "official" and otherwise, will be found in both volumes of this work.
- Montague, William P. "Professor Royce's Refutation of Realism." *Philosophical Review* 11 (January 1902): 43–55.
- Moore, G. E. "The Refutation of Idealism." *Mind*, n.s. 12 (1903): 442–453. Reprinted in Moore's *Philosophical Studies*. London: Routledge, 1922.
- Perry, Ralph B. "The Ego-Centric Predicament." *Journal of Philosophy* 7 (1) (1910): 5–14. Reprinted in *The Development of American Philosophy*, edited by W. G. Muelder and L. Sears. Boston: Houghton Mifflin, 1940; 2nd ed., 1960.
- Perry, Ralph B. "Professor Royce's Refutation of Realism and Pluralism." *Monist* 12 (1901–1902): 446–458.
- Perry, Ralph B. "William Pepperell Montague and the New Realists." In "William Pepperell Montague." *Journal of Philosophy* 51 (21) (October 14, 1954): 593–637.
- Spaulding, Edward G. *The New Rationalism*. New York: Holt, 1918.

### WORKS ON NEW REALISM

- Bowman, Lars. *Criticism and Construction in the Philosophy of the American New Realism*. Stockholm, 1955. One of the two extant studies devoted entirely to American New Realism, this work is mainly expository, using the tools of modern philosophical analysis in order to determine the central doctrines of New Realism. It includes one of the better short bibliographies.
- Chisholm, Roderick M. *Realism and the Background of Phenomenology*. Glencoe, IL: Free Press, 1960. A collection of readings, with probably the best bibliography of the works of all major Realists and their critics.
- Harlow, Victor. *A Bibliography and Genetic Study of American Realism*. Oklahoma City: Harlow, 1931. One of the best separate bibliographies of American Realism.
- Hasan, Syed Zafarul. *Realism: An Attempt to Trace Its Origins and Development in Its Chief Representations*. Cambridge, U.K., 1928. An extensive treatment of New Realism (particularly of E. B. Holt) that includes a useful bibliography.
- Hill, Thomas E. *Contemporary Theories of Knowledge*. New York: Ronald Press, 1961. Although limited to theories of knowledge, this work includes an extensive critical treatment of American New Realists, centering on Perry ("polemical"), Holt ("radical"), and Montague ("conservative").
- James, William. "Does Consciousness Exist?" *Journal of Philosophy* 1 (18) (September 1, 1904). Reprinted in James's *Essays in Radical Empiricism*. New York: Longmans Green, 1938.

- Kremer, René. *Le néo-réalisme américain*. Paris: Alcan, 1920. Devoted exclusively to New Realism.
- Lapan, Arthur. "The Significance of James' 'Essay.'" PhD diss., Columbia University, New York, 1936.
- Lovejoy, Arthur O. *The Revolt against Dualism: An Inquiry concerning the Existence of Ideas*. La Salle IL: Open Court, 1930. Lovejoy was probably the most persistent and incisive critic of New Realism.
- Morris, Charles W. *Six Theories of Mind*. Chicago: University of Chicago Press, 1932. A discussion of the relationships of the various realisms, Pragmatism, and Objective Relativism.
- Passmore, John. *A Hundred Years of Philosophy*. London: Duckworth, 1957. The chapter on New Realism is mainly concerned with English New Realism, most particularly Alexander's. Selected bibliography.
- Piller, Christian. "The New Realism in Ethics." In *The Cambridge History of Philosophy 1870–1945*, edited by Thomas Baldwin. Cambridge, U.K.: Cambridge University Press, 2003.
- Royce, Josiah. *The World and the Individual*. New York, 1912.
- Schneider, Herbert W. *Sources of Contemporary Philosophical Realism in America*. Indianapolis: Bobbs-Merrill, 1964.
- Werkmeister, W. H. *A History of Philosophical Ideas in America*. New York: Ronald Press, 1949. A good survey of the development of New Realism, including a detailed account of the polemical exchanges beginning with early New Realist statements in 1907.

## NEWTON, ISAAC

(1642–1727)

Isaac Newton formulated the theory of universal gravity, was an inventor of the calculus, and made major discoveries in optics. He has long been regarded as, perhaps, the greatest scientist and as one of the greatest mathematicians ever to have lived. More recently, philosophers have begun to appreciate the extent to which Newton's remarks on scientific method illuminate the seminal contribution he made, especially in his *Principia*, to the transformation of natural philosophy into the physical sciences as we know them today. We now know, also, that Newton put at least as much effort into alchemy and theology as he did into his celebrated contributions to mathematics and science.

### LIFE

Newton entered Trinity College Cambridge in 1661. In what has come to be called his *annus mirabilis*, he spent much of 1665 and 1666 at his family home in Woolsthorpe while the university was closed because of the plague. This time at home was part of an extraordinarily productive period of intense effort concentrated on mathematics and natural philosophy. The binomial theorem and the fundamentals of the calculus are among the important new results in mathematics he obtained during this period. In natural philosophy he developed mechanics, including an analysis of circular motion. During this period he, also, conducted optical experiments that led to his account of white light and colors. In 1667 Newton became a fellow of Trinity College at Cambridge University.

In 1669 he became Lucasian Professor of Mathematics, presumably through the recommendation of Isaac Barrow (1630–1677), the first Lucasian Professor. It was Barrow who, in late 1671, delivered the reflecting telescope Newton had designed and built to the Royal Society of London. This led to Newton's being offered a fellowship in the Royal Society and to the publication in the Society's *Philosophical Transactions* of his account of white light and colors in 1672. This paper occasioned considerable debate. In that debate Newton began to articulate what he called his "experimental philosophy," which sharply distinguishes experimentally established results from conjectured hypotheses. By the late 1670s Newton withdrew from correspondence in natural philosophy.

In late 1679 Robert Hooke (1635–1703), who had recently become secretary of the Royal Society, wrote to

encourage Newton to resume his public participation in natural philosophy. In this letter he invited Newton to use his mathematical methods to determine the trajectory a body would follow under a combination of inertial motion and an inverse-square force directed toward a center. In August 1684 a visit by Edmund Halley (1656–1742), who later became the Astronomer Royal, convinced Newton of the importance of the relation he had established between elliptical orbits and inverse square centripetal forces. By November Newton had sent Halley a small but revolutionary treatise, *De Motu*. An extraordinarily intense effort by Newton transformed this small treatise into his masterpiece, the *Principia*. It was published in 1687. Halley, who appreciated the importance of what Newton had achieved, oversaw the printing and paid for it out of his own pocket.

In 1689 and again in 1701, Newton was elected to represent Cambridge University in Parliament. He was made warden of the mint for England in 1696. By 1698 he had successfully carried out a major recoinage for the English economy. In 1699 he became master of the mint. In 1699 Newton also became an associate member of the French Academy of Sciences. He resigned his professorship at Cambridge in 1701. In 1703 he became president of the Royal Society of London, a post that, along with that of master of the mint, he held until his death. He was knighted in 1705.

In 1704 Newton published the first edition of his *Opticks*. It included two earlier mathematical papers as supplements, one of which was his first publication on the calculus. Newton's long delay in publishing his work led to his priority dispute with Gottfried Wilhelm Leibniz (1646–1716) over the invention of the calculus. This dispute extended from the mid-1690s until after Leibniz's death and came to focus on differences over natural philosophy as well as the calculus priority claims.

The second edition of *Principia* was published in 1713, after four years of effort under the able guidance of its editor Roger Cotes (1682–1716). The third edition was published in 1726. Conspicuous ways in which these two differ from the first edition appear to be responses to objections by Christian Huygens (1629–1695), Leibniz, and others. Some claims that had been called *Hypotheses* at the beginning of Book 3 in the first edition became, with changes and additions, *Regulae Philosophandi*, and others, such as Kepler's area and  $3/2$  power rules, became *Phaenomena*. The famous General Scholium clarifying what Newton took to be the proper practice of natural philosophy was added at the end.

The Latin editions of the *Optics* in 1706 and 1717 included queries that shed further light on his “experimental philosophy,” as does his attack on Leibniz in his “Account of the Book Entitled *Commercium Epistolicum*” published anonymously in 1715. It ends as follows: “And must Experimental Philosophy be exploded as *miraculous* and *absurd*, because it asserts nothing more than can be proved by experiments, and we cannot yet prove by Experiments that all the Phaenomena in Nature can be solved by meer Mechanical Causes?” (1715, p. 224).

### THE EXPERIMENTAL PHILOSOPHY IN THE LIGHT AND COLORS DEBATE

Newton’s response to Hooke in the debate over his light and colors paper is a good illustration of his experimental philosophy. In that paper Newton claimed that his experiments conclusively established that the phenomenon of the oblong shape of the image of sunlight shined through a round hole and refracted through a prism is caused by sunlight’s being made up of rays that are refracted different amounts by the prism. (Newton’s reflecting telescope was designed to avoid problems caused by such differential refraction by using mirrors instead of lenses.)

Hooke interpreted Newton as claiming that the experiments established a corpuscular theory of light and argued that his own wave hypothesis could account for the results equally well. Newton responded by pointing out that the hypothesis that light is a body was put forward only as a conjecture suggested by the experiments, and not as part of what he claimed to have been established by them.

But I knew, that the *Properties*, which I declar’d of *Light*, were in some measure capable of being explicated not only by that, but by many other Mechanical *Hypotheses*. And therefore I chose to decline them all, and to speak of *Light* in *general* terms, considering it abstractly, as something or other propagated in every way in streight lines from luminous bodies, without determining, what that thing is (1958, pp. 118–119).

Newton went on to outline how Hooke’s wave hypothesis, as well as several other mechanical hypotheses, could explain the properties of differential refraction of different kinds of light he had concluded from the experiments.

In other contributions to the debate, Newton outlined how, according to his experimental philosophy, diligently establishing properties of things by experiment is

to take precedence over framing hypotheses to explain them. He also made clear that the propositions he regarded as conclusively established by experiment were, nevertheless, subject to correction based on detailed criticism of the experimental reasoning establishing them or on further experimental results challenging them.

### MATHEMATICS

Newton’s mathematical papers include substantial discoveries in algebra, pure and analytic geometry, as well as his extensive work on the calculus and infinite series. His results on converging series allowed mathematicians to treat such infinite series as legitimate alternative forms of the functions they represented. These results also provided the basis for his approach to the calculus. In 1669 Newton first allowed one of his manuscripts on the calculus to circulate.

The basic mathematics of the *Principia* is not the calculus but a new form of synthetic geometry incorporating limits. Newton’s lemmas on first and last ratios, which open Book 1, show that this alternative geometrical approach can recover many of the basic elementary results of the calculus. The need to rely on geometrical figures, however, makes this approach less able to facilitate more complex calculations made accessible by algebraic manipulation in the symbolic calculus.

### STUDIES IN ALCHEMY, THEOLOGY, AND CHRONOLOGY

Newton’s alchemical work may well have contributed to a corpuscular theory of matter that may have informed his scientific thinking; however, like his conjectured corpuscular account of light, such a theory of matter was not something Newton claimed to have established.

His extensive notes on his alchemical work indicate a number of elaborate chemical experiments carried out from the mid-1670s until 1693. These display Newton’s great discipline as an experimenter. The reported results, however, appear to include nothing that would have altered the course of chemistry had they become public at the time.

Newton first became preoccupied with theology in the early 1670s, probably in response to the requirement that he accept ordination to retain his Trinity fellowship. (He was granted a dispensation in 1675.) By 1673 he had rejected the doctrine of the Trinity and concluded that Christianity had become a false religion through a corruption of the scriptures in the fourth and fifth centuries. He returned to these studies and to work on chronology

and prophecies in subsequent decades, especially in the last years of his life. During his lifetime he conveyed his radical views to only a few. But, two such manuscripts were published within a few years of his death.

Recent investigations of the alchemical and theological writings suggest that Newton's natural philosophy was to be part of a larger investigation that would look through nature to see God. This may have helped him to free himself from the restraints of the mechanical philosophy. Newton's intense religious faith was no impediment, and may well have aided, his extraordinarily successful applications of his experimental philosophy in pursuit of empirically establishing scientific knowledge. Moreover, Newton's efforts at scientific understanding of nature did not prevent his efforts to inform his faith by the study of scripture.

### SPACE, TIME, AND THE LAWS OF MOTION

Newton's distinction between absolute (or true) and relative (or apparent) motion are based on his laws of motion, which he described as "accepted by mathematicians and confirmed by experiments of many kinds" ([1687] 1999, p. 424). His distinctions between absolute and relative space and time, which have been such salient targets of criticism by philosophers, are mostly designed to accommodate this primary distinction between true and merely relative motions. Newton was aware of the empirical difficulties raised by such distinctions: "It is certainly very difficult to find out the true motions of individual bodies and actually to differentiate them from apparent motions, because the parts of that immovable space in which bodies move make no impression on the senses" (p. 414).

The *Principia's* title, *Mathematical Principles of Natural Philosophy*, refers to the propositions of Books 1 and 2 that Newton demonstrated from his laws of motion. These provide his resources for addressing this difficulty: "But in what follows, a fuller explanation will be given of how to determine true motions from their causes, effects, and apparent differences, and conversely, of how to determine from motions whether true or apparent, their causes and effects. For this was the purpose for which I composed the following treatise" (p. 415). In Book 3 Newton shows how the calculation of centripetal forces and masses of central bodies from orbital motions around them can determine the center of mass of the planetary system. This calculation picks out the sun-centered Keplerian system as approximately true and the

corresponding earth-centered Tyconic system as wildly inconsistent with the measured masses.

Such inconsistencies among the measured forces and masses indicate a failure to be dealing with true motions. For Newton, the adequacy of his appeal to absolute space, time, and motion was an empirical issue to be decided by the long term development and application of a science of motion.

### INFERENCES FROM PHENOMENA AND RULES OF NATURAL PHILOSOPHY

The propositions of Books 1 and 2 are powerful resources for establishing conclusions about forces from phenomena of motion. For example, propositions 1 and 2 together establish that Kepler's area rule holds if and only if the force acting on the moving body is centripetal. A corollary adds that the rate at which areas are swept out by radii from the center increases just in case the net force is off-center in the direction of motion, and decreases just in case it is off-center in the opposite direction. These systematic dependencies make the constancy of the areal rate measure the centripetal direction of the force. Similar systematic dependencies are involved in the inferences to the inverse-square variation of orbital centripetal forces from Kepler's  $3/2$  power rule and from the absence of orbital precession.

Newton was not the first to exploit such theoretical dependencies to draw inferences from phenomena. Huygens had used his laws of pendulums to measure the acceleration of gravity from the lengths and periods of pendulums. But, Newton turned the technique into a general way of using theory mediated measurements to do empirical science.

The rules of reasoning strengthen the inferences that can be drawn from measurements by phenomena. (See Scientific Method) The first two rules, for example, endorse the inference identifying the force holding the moon in orbit with terrestrial gravity on the basis of the moon-test, which shows that the length of a seconds pendulum at the surface of the earth and the centripetal acceleration of the moon's orbit can count as agreeing measurements of a single earth centered inverse-square acceleration field.

The third rule supports the inference that all bodies gravitate toward each planet with weights proportional to their masses. Newton argues that terrestrial pendulum experiments and the moon-test show this for gravitation toward the earth. Similarly, the harmonic laws for orbits

about them show this for gravitation toward Saturn, Jupiter, and the sun. In addition, the agreement between the accelerations of Jupiter and its satellites toward the sun, as well as between those of Saturn and its satellites and those of the earth and its moon toward the sun also show this for weight toward the sun. All these count as phenomena giving agreeing measurements of the equality of the ratios of weight to mass for all bodies at any equal distances from the sun or any planet.

The fourth rule authorizes the practice of treating propositions appropriately supported by reasoning from phenomena as either “exactly or very nearly true notwithstanding any contrary hypotheses, until yet other phenomena make such propositions either more exact or liable to exceptions” (p. 796). It was added in the third edition to justify treating universal gravity as an established scientific fact, notwithstanding complaints that it was unintelligible in the absence of an explanation of how it results from mechanical action by contact. This rule and the related discussion of hypotheses in the General Scholium most distinguish Newton’s experimental philosophy from the mechanical philosophy of his critics.

#### GRAVITY AS A UNIVERSAL FORCE OF INTERACTION

The systematic dependencies via which the basic inverse-square forces are measured by Keplerian phenomena are one-body idealizations. Universal gravity entails interactions among bodies, producing perturbations that require corrections to the Keplerian phenomena. Such corrections can count as higher-order phenomena that carry information that can be exploited to develop successively more accurate approximations.

The *Principia* includes a successful treatment of two-body interactions and some limited results on three-body interactions including Newton’s account of the variational inequality in the lunar orbit. Applications of calculus facilitated by the use of Leibniz’s notation by such figures as Leonard Euler (1707–1783), Jean Le Rond d’Alembert (1717–1783), and Alexis-Claude Clairaut (1713–1765) led to successful Newtonian treatments of more complex interactions. By the mid-1700s such successes in the treatments of the shape of the earth, the precession of the equinoxes, the lunar precession and motions of comets had led to the virtual abandonment of vortex theories as serious rivals. By the end of that century, the monumental treatise on celestial mechanics by Pierre Simon de Laplace (1749–1835), with his successful treatment of the long recalcitrant great inequality in

Jupiter-Saturn motions as a periodic perturbation, led to general acceptance of a Newtonian metaphysics of bodies interacting under deterministic laws.

Newtonian treatments of perturbations do more than provide the required corrections to Keplerian phenomena. They also show that Newton’s original measurements of inverse-square centripetal forces continue to hold to high approximation in the presence of perturbations. Interactions with other bodies account for the precessions of all the planets except Mercury. The zero residuals in these precessions are agreeing measurements of the inverse-square variation of gravity toward the sun.

Even in the case of Mercury the famous forty-three seconds of arc per century residual in its precession yields  $-2.00000016$  as the measure of the exponent, instead of the exact  $-2$  measured for the other planets. That such a small discrepancy came to be a problem at all testifies to the extraordinary high level to which Newton’s theory of gravity had realized a standard of empirical success. On this standard of empirical success, a theory succeeds by having its parameters be accurately measured by the phenomena it purports to explain.

In 1915, Einstein discovered that his theory of general relativity explains the missing forty-three seconds. The success of this explanation depends on the capacity of general relativity to also account for the additional precession of about 530 seconds per century explained by Newtonian perturbations of Mercury’s orbit. This requires that Newton’s theory count as an appropriate approximation for explaining that part of the phenomenon of Mercury’s orbital precession.

Einstein’s great excitement over this discovery is appropriate because it showed that his theory of general relativity did better than Newton’s theory of universal gravitation by Newton’s own standard of empirical success. There was and is no need to appeal to additional or different standards to count general relativity as better supported. The subsequent development of testing frameworks for general relativity continues to be guided by the same standard. Newton’s methodology of successive approximations supported by the empirical success of theory mediated measurement accommodates, even, the radical conceptual transformation from Newton’s metaphysics of bodies under forces of interaction to Einstein’s conception of gravity as given by the geodesic structure of curved space-time.

## NICHOLAS OF CUSA (1401–1464)

The theologian, philosopher, and mathematician Nicholas of Cusa, also known as Nicholas Kryfts or Krebs, was born at Kues on the Moselle River between Trier and Koblenz. After attending the school of the Brothers of

the Common Life in Deventer, Holland, he studied philosophy at Heidelberg (1416), canon law at Padua (1417–1423), and theology at Cologne (1425). Nicholas received a doctorate in canon law in 1423. About 1426 he gave legal assistance to Cardinal Orsini, papal legate to Germany. At about the same time began his lifelong interest in collecting classical and medieval manuscripts. Among his notable discoveries were twelve lost comedies of Plautus. He took an active part in the Council of Basel, first as a lawyer of Count von Manderscheid and later as a member of the deputation *De Fide*. Nicholas's *De Concordantia Catholica*, a vast program for reform of the church and the empire, supported the conciliar theory of the supremacy of the council over the pope. Later, disillusioned by the council's failure to reform the church, he abandoned the conciliar theory and supported the papal cause.

Nicholas carried out several missions for the pope in an effort to unify and reform the church. He was a member of the commission sent to Constantinople to negotiate with the Eastern church for reunion with Rome, which was temporarily effected at the Council of Florence (1439). In 1450 Nicholas was sent to Germany as a legate to carry out church reforms. He was created a cardinal in 1448 and appointed bishop of Brixen (Bressanone) in 1450. He died in Todi, Umbria.

## KNOWLEDGE

According to Nicholas, a man is wise only if he is aware of the limits of the mind in knowing the truth. Knowledge is learned ignorance (*docta ignorantia*). Endowed with a natural desire for truth, humans seek it through rational inquiry, which is a movement of the reason from something presupposed as certain to a conclusion that is still in doubt. Reasoning involves a relating or comparing of conclusion with premises. The greater the distance between them, the more difficult and uncertain is the conclusion. If the distance is infinite, the mind never reaches its goal, for there is no relation or proportion between the finite and infinite. Hence, the mind cannot know the infinite. The infinite is an absolute, and the absolute cannot be known by means of relations or comparisons.

Accordingly, the mind cannot comprehend the infinite God. By rational investigation we can draw ever nearer to him but cannot reach him. The case is the same with any truth, for every truth is an absolute, not admitting of degrees. Since reason proceeds by steps, relating conclusion to premises, it is relational and hence never arrives at absolute truth. According to Nicholas, "our

intellect, which is not the truth, never grasps the truth with such precision that it could not be comprehended with infinitely greater precision" (*De Docta Ignorantia* I, 3). As a polygon inscribed in a circle increases in number of sides but never becomes a circle, so the mind approximates to truth but never coincides with it.

Thus, knowledge at best is conjecture (*coniectura*). This is no mere guess or supposition that may or may not be true; it is an assertion that is true as far as it goes, although it does not completely measure up to its object. Reason is like an eye that looks at a face from different and even from opposite positions. Each view of the face is true, but it is partial and relative. No one view, nor all taken together, coincides with the face. Similarly, human reason knows a simple and indivisible truth piecemeal and through opposing views, with the result that it never adequately measures up to it.

The weakness of human reason was evident to Nicholas because its primary rule is the principle of non-contradiction, which states that contradictories cannot be simultaneously true of the same object. He insisted that there is a "coincidence of opposites" (*coincidentia oppositorum*) in reality, especially in the infinite God. He criticized the Aristotelians for insisting on the principle of noncontradiction and stubbornly refusing to admit the compatibility of contradictories in reality. It takes almost a miracle, he complained, to get them to admit this; and yet without this admission the ascent of mystical theology is impossible.

Nicholas preferred the Neoplatonists to the Aristotelian philosophers because they recognized in humans a power of knowing superior to reason which they called intellect (*intellectus*). This was a faculty of intuition or intelligence by which we rise above the principle of non-contradiction and see the unity and coincidence of opposites in reality. He found this faculty best described and most fruitfully cultivated by the Christian Neoplatonists, especially St. Augustine, Boethius, Pseudo-Dionysius, St. Anselm, the School of Chartres, St. Bonaventure, and Meister Eckhart. Following their tradition, he constantly strove to see unity and simplicity where the Aristotelians could see only plurality and contradiction. He frequently expressed his views in symbols and analogies, often mathematical in character, because the rational language of demonstration is appropriate to the processes of reason but not to the simple views of the intellect.

## GOD

Nicholas was most concerned with showing the coincidence of opposites in God. God is the absolute maximum

or infinite being, in the sense that he has the fullness of perfection. There is nothing outside him to oppose him or to limit him. He is the all. He is also the maximum, but not in the sense of the supreme degree in a series. As infinite being he does not enter into relation or proportion with finite beings. As the absolute, he excludes all degrees. If we say he is the maximum, we can also say he is the minimum. He is at once all extremes, the absolute maximum as well as the absolute minimum. In short, in God, the infinite being, all opposition is reconciled in perfect unity.

The coincidence of the maximum and minimum in infinity is illustrated by mathematical figures. For example, imagine a circle with a finite diameter. As the size of the circle is increased, the curvature of the circumference decreases. When the diameter is infinite, the circumference is an absolutely straight line. Thus, in infinity the maximum of straightness is identical with the minimum of curvature. Or, to put it another way, an infinite circle is identical with a straight line.

Nicholas offered several a priori proofs for the existence of the absolute maximum, or God. The first argued that the finite is inconceivable without the infinite. What is finite and limited has a beginning and an end, so that there must be a being to which it owes its existence and in which it will have its end. This being is either finite or infinite. If it is finite, then it has its beginning and end in another being. This leads either to an infinite series of actually existing finite beings, which is impossible, or to an infinite being which is the beginning and end of all finite beings. Consequently, it is absolutely necessary that there be an infinite being, or absolute maximum.

The second proof argued that the absolute truth about the absolute maximum can be stated in three propositions: It either is or is not. It is and it is not. It neither is nor is not. These exhaust all the possibilities, so that one of them must be the absolute truth. Hence there is an absolute truth, and this is what is meant by the absolute maximum.

As the absolute maximum, God contains all things; he is their “enfolding” (*complicatio*). He is also their “unfolding” (*explicatio*) because they come forth from him. Creatures add nothing to the divine reality; they are simply limited and partial appearances of it. As a face reproduces itself more or less perfectly in a number of mirrors, so God reflects himself in various ways in his creatures. In this case, however, there are no mirrors.

God transcends the universe but is also immanent in it, as a face is present in its mirrored images. Each crea-

ture is also present in every other, as each image exists in every other. Thus, as Anaxagoras said, everything is in everything else. Gottfried Wilhelm Leibniz recalled this doctrine of Nicholas’s in his *Monadology* when showing that each monad mirrors every other.

Like all medieval Platonists, Nicholas upheld the reality of universal forms. According to him, the most universal of all created forms is the form of the universe, called the Soul of the World. This form embraces in its unity all lower forms, such as those of genera and species. These lower forms are “contractions” of the form of the universe; they are the universe existing in a limited way. They exist in the universe, and in turn exist in a limited way in them. Individuals are further contractions of universal forms—for example, Socrates is a contraction of the form of humanity. The universe as a whole is a contraction of the infinite God. Thus, all things exist in a unified manner in the universe, and the universe in turn exists in the unity of God. Oppositions and contradictions that appear on the level of individuals and lower universal forms are reconciled in the unity of the universe and ultimately in the unity of God.

## COSMOLOGY

Since the universe mirrors God, it too must be a maximum—not the absolute maximum, to be sure, but the relative maximum, for it contains everything that exists except God. Nicholas denied that the universe is positively infinite; only God, in his view, could be described in these terms. But he asserted that the universe has no circumference and consequently that it is boundless or undetermined—a revolutionary notion in cosmology. (See Alexandre Koyré, *From the Closed World to the Infinite Universe*, Baltimore, 1957.) Just as the universe has no circumference, said Nicholas, so it has no fixed center. The earth is not at the center of the universe, nor is it absolutely at rest. Like everything else it moves in space with a motion that is not absolute but is relative to the observer.

Nicholas of Cusa’s cosmology in some respects broke with the Ptolemaic and Aristotelian cosmological views of the Middle Ages and anticipated those of modern times. He was above all concerned with denying the absolute oppositions in the world of Ptolemy and Aristotle. In Nicholas’s world there was no center opposed to its circumference, no maximum movement of the spheres opposed to the fixity of Earth, no movement of bodies in absolutely opposed directions, such as up and down. Nicholas also denied that the heavenly bodies are com-

posed of a substance different from that of sublunar bodies.

Nicholas extended his principle of the coincidence of opposites to religion. In his irenic work *On the Peace of Faith*, while maintaining the superiority of Christianity over other religions, he tried to reconcile their differences. Beneath their oppositions and contradictions he believed there is a fundamental unity and harmony, which, when it is recognized by all, will be the basis of universal peace.

In a century of social, political, and religious unrest, Nicholas revitalized Neoplatonism as the most effective answer to the needs of his time. His thought was firmly rooted in the philosophy of Proclus and Christian medieval Neoplatonism and was opposed to the Aristotelianism that had prevailed in western Europe since the thirteenth century. It was also highly original and expressed in a language abounding in symbolism and paradox. Nicholas of Cusa had many of the traits of the Renaissance person: love of classical antiquity, all-encompassing curiosity, optimism, cultivation of literary style, critical spirit, preoccupation with the individual, and love of mathematics and science. His works were widely read for several centuries, and they influenced the philosophy of the Renaissance and of early modern times.

## NICOLAI, CHRISTIAN FRIEDRICH

(1733–1811)

Christian Friedrich Nicolai, a German publisher, editor, and author, was born in Berlin and studied there and at a Pietist institution in Halle, but he never attended a university. Nicolai spent three years as a business apprentice in Frankfurt an der Oder. Upon his father's death in 1752, he took over the family bookstore, managing it—except for a short period—until his death and expanding it into a very successful and lucrative publishing house. He became a close friend of G. E. Lessing and of Moses Mendelssohn, and was active in Berlin intellectual life. He edited the *Bibliothek der schönen Wissenschaften und freien Künste* (Library of aesthetics and fine arts) from 1757 to 1758, the *Literaturbriefe* (Letters on literature) from 1759 to 1765, and the *Allgemeine deutsche Bibliothek* (Universal German library) from 1765 on. The last-mentioned journal became the most famous German literary review of its time and was widely influential in theology as well.

Nicolai's own works, like those of many Enlightenment figures, were largely higher journalism consisting mainly in forceful and lively attacks on contemporary intellectual and literary personalities and trends. His *Briefe, den jetzigen Zustand der Schönen Wissenschaften betreffend* (Letters on the state of the arts; Berlin, 1755) were directed against the influential literary critic J. C. Gottsched. His philosophical novel *Sebalduß Nothanker* (3 vols., Berlin, 1773–1776) was an attack on certain reactionary circles in Halle. In various articles in his journals he attacked J. G. Hamann, Johann Caspar Lavater, Christian Garve, and others. He quarreled with J. G. Herder and F. H. Jacobi. The novels *Daniel Säuberlich* (Berlin, 1777–1778) and *Die Freunden des jungen Werthers* (Berlin, 1775) were parodies of Johann Wolfgang von Goethe, Johann Gottfried Herder, G. A. Bürger (author of the ballad *Lenore*), and the *Sturm und Drang*. He attacked Catholicism as a source of superstition and Jesuitism; and, although he was himself a member of the Order of the Enlightened (*Illuminaten*) and of the Freemasons, he accused both of being secret instruments of the Jesuits (which resulted in his forced resignation). In the philosophical novels *Geschichte eines dicken Mannes* (The story of a fat man; 2 vols., Berlin, 1794) and *Sempronius Gundibert* (Berlin, 1798) and in other works, he accused Immanuel Kant and his school and Johann Gottlieb Fichte of being crypto-Catholics. His *Vertraute Briefe von Adelheid B. an ihre Freundin Julie S.* (Confidential letters

from Adelaide B. to her friend Julie S.; Berlin, 1799) was directed against Friedrich Schleiermacher.

Nicolai wrote many other works, notably a large work devoted to the economic, cultural, social, and religious life in Germany and Switzerland, *Beschreibung einer Reise durch Deutschland und die Schweiz im Jahre 1781* (Description of a journey through Germany and Switzerland in 1781; 12 vols., Berlin, 1783–1796). Although Nicolai was awarded an honorary doctorate by the Helmstedt Theological Seminary in 1799 and was made a corresponding member of the Academy of St. Petersburg in 1804, his hostility toward the most influential persons of his time and his lack of understanding of the new critical philosophy and of romanticism led to a negative evaluation of his work by his leading contemporaries and by the following generation.

Nevertheless, Nicolai was one of the most typical representatives of “popular philosophy.” Basing his theories on common sense, he avoided abstract thought and complex speculation and favored useful and easy knowledge. He opposed orthodoxy, intolerance, enthusiasm, mysticism, and secret machinations. He attacked the scholastic Wolffian philosophy; the newer critical and idealistic philosophies; Protestantism, both orthodox and mystical, and Catholicism; secret societies; Gottsched's classicism in literature as well as the glorification of the peasant by J. H. Voss and Bürger; *Sturm und Drang*; and early romanticism. He considered them all to be reactionary and pernicious, and his writings were full of misunderstandings, misrepresentations, and exaggerations.

His religious views incorporated his rejection of intellectualism, dogmatism, and mysticism. He held that religion and science should not be confused. Orthodox religion corrupted morality and tended toward an obnoxious hierarchical system. He denied original sin and eternal damnation and accepted the doctrines of free will and of the immortality of the soul. Religion should be based on the individual conscience and not on revelation—on common sense and not on enthusiasm.

According to Nicolai, religion and morality are not the same. Morality is based on social sense and experience; religion is a feeling for God's goodness and providence as mirrored in the goodness and beauty of the Creation. Although Nicolai was a deist himself, he did not believe that a purely natural religion would suffice for the common people, and therefore he refused to reject publicly the Christian tradition.

Nicolai was influenced in aesthetics by the classicists Nicolas Boileau and Jean Baptiste Dubos and by the Swiss

critics J. J. Bodmer, J. J. Breitinger, and J. G. Sulzer. He tried to find a middle ground between the classical doctrine of the imitation of nature and the newer stress on the imagination. He opposed the classical ideal of literature as deduced from a set of rules, the sentimental school of literature, and the *Sturm und Drang* emphasis on intuitive genius. He held that poetry should be simple and reasonable and designed chiefly for moral improvement.

## NICOLAS OF AUTRECOURT

(c. 1300–after 1350)

Nicolas of Autrecourt, also called Nicolaus de Ultracuria, was a leading anti-Aristotelian philosopher of the fourteenth century. The condemnation of extreme Aristotelianism at Paris in 1277 was probably responsible for the critical tendencies in many fourteenth-century philosophers and theologians. An extreme form of this critical tendency is to be found in the writings and lectures of Nicolas of Autrecourt. He was at the Sorbonne as

early as 1328, lectured on the *Sentences* at Paris, and in 1340 was summoned by the Roman Curia to answer charges of heresy and error. His trial was interrupted when Pope Benedict XII died, and was resumed under Pope Clement VI by Cardinal Curty. In 1346 the trial was concluded, Nicolas was forced to recant many of his published statements, his works were publicly burned, and he was declared unworthy of advancement and unworthy to continue teaching. We last hear of him as a deacon at the cathedral of Metz in 1350.

His literary remains consist of (1) two complete letters to the Franciscan Bernard of Arezzo, a reply to a certain Giles (whose letter to Nicolas is also extant), and the fragments of seven other letters to Bernard of Arezzo; (2) a theological discussion concerning the increase of cognitive powers; and (3) the “universal tractate of Master Nicolas of Autrecourt for seeing whether the statements of the Peripatetics are demonstrative” (usually called *Exigit Ordo Executionis* from its *incipit*), which survives in a single manuscript that breaks off toward the end.

The continuing research on fourteenth-century thought will probably show that many other Schoolmen of the period expressed doctrines similar to those of Nicolas. In fact, similar doctrines have already been found in Robert Holkot and John of Mirecourt on epistemological issues, and in Henry of Harclay, Gerard Odo, and some others on atomism and the constitution of the continuum. Nevertheless, there is some reason to attribute to Nicolas a considerable measure of originality and of persistent thought. For one thing, his contemporary John of Mirecourt attributes to Nicolas the proof that causal connections cannot be demonstrated. This may mean merely that Mirecourt was making an acknowledgement to a colleague and was unaware that similar doctrines were taught at Oxford. But there must be some significance in the fact that Nicolas was singled out for attack by the decrees of the Paris faculty in 1339 and 1340 and was one of those summoned to the Curia in 1340.

The main historical origin of Nicolas’s skeptical and critical views about the extent of natural knowledge was undoubtedly the prominence given to the article of the Creed “I believe in one God, Father Omnipotent, Maker of heaven and earth, . . .” after the condemnation of 1277. As the theologians of the fourteenth century interpreted this article, it meant that God can accomplish anything the doing of which involves no logical contradiction. Now, the miracles of the Old Testament and New Testament are incompatible with the doctrines of Aristotle and his strict interpreters, especially Averroes, in ways that touch directly on the point. Whereas Aristotle denies the

possibility of accidents without substrata, the Eucharist involves the supernatural existence of the accidents of bread and wine after the substance no longer exists (that is, after the substance of bread and wine has been converted into the body and blood of Christ when the priest consecrates the Host). Again, whereas Aristotle had held that effects inevitably arise from their causes unless there is some natural impediment, the episode of the three Israelites who were not consumed in the fiery furnace involves the miraculous interruption of the natural effects of causes where there is no impediment. Consideration of these and like cases led theologians to the following result: The common course of nature can, without logical absurdity, be interrupted by divine power. Hence, the relation of causes and effects or of substances and their accidents is not logically necessitated.

### CERTITUDE, SUBSTANCE, AND CAUSE

Nicolas of Autrecourt must have begun his reflections from the consideration of the theological doctrine just mentioned. He maintained that, excepting the certitude of faith, there is but one kind of certitude and this certitude depends on the principle of contradiction: Contradictories cannot be simultaneously true. Nothing is prior to this principle and it is the ultimate basis of all certitude. This certitude is absolute and no power can alter it. It has no degrees and all certitude is reducible to it. Thus, all reasoning by syllogism depends on the principle of contradiction. In every implication (*consequentia*) that is reducible to the principle of contradiction either immediately or by a number of intermediate steps, the consequent of the implication and the antecedent (or a part of the antecedent) are really identical. Otherwise it would not be evident that the antecedent is inconsistent with the denial of the consequent. From all this Nicolas derives the following result: From the fact that one thing is known to exist it cannot be inferred with an evidence reducible to that of the principle of contradiction that another thing exists. Neither the existence nor the nonexistence of one thing can be evidently inferred from the existence or nonexistence of any other thing.

The consequences of this discovery, Nicolas thought, were enough to destroy the whole intellectual enterprise of the Schools. Not only is it impossible that the existence of effects entails the existence of causes, but there is no way to have any evident knowledge of any substance other than one's own soul starting from the objects of sensation or of inner experience. Things apparent to the senses are not substances, and therefore substance cannot be evidently inferred from sensibly appearing objects.

Hence the existence of material substances or of other spiritual creatures cannot be inferred with certitude from the evidence of the senses. But this is not all. In one sense of "probable," there is not even a probability that there are any substances. For, in the sense in which the probable is what happens frequently, we can say, for example: When I in the past put my hand toward a fire, it was warmed; it is now probable that if I put my hand toward a fire, it will be warmed. But since there has never been (and could never be) a conjunction in my experience between any appearance and a substance, there is no appearance that renders the existence of a substance so much as *probable* in this sense of the word.

Some of Nicolas's critics urged that substance is deducible from appearances and that causes are deducible from their effects. But he replied that all such deductions depend upon descriptions of appearances and effects that, implicitly or explicitly, contain reference to substances or causes. The deductions from such descriptions are perfectly valid, but nothing in experience or in our stock of self-evident propositions provides the slightest evidence that anything corresponds to such descriptions. In a word, every attempt to prove the existence of substances or causes from appearances or effects begs the question. This point was made in other philosophical writings both before and after Nicolas. The Muslim theologian Mohammad al-Ghazālī, in his *Tahāfut al-Falāsifah* (Incoherence of the Philosophers; see Averroes' *Tahafut al-Tahafut*, edited and translated by Simon van den Bergh, London, 1954, pp. 329–333), pointed out that logically guaranteed inferences concerning causes depend on the description and definitions of terms and so, in a sense, are mainly verbal arguments. Nicolas could not have had access to this work because the relevant sections were not translated until sometime later. David Hume's negative critique of belief in causation and belief in substance parallels that of Nicolas very closely, but Hume had no possible access to the writings of Nicolas because these were not discovered until the nineteenth and twentieth centuries in the Bibliothèque Nationale and the Bodleian Library.

### CRITIQUE OF ARISTOTLE

The purpose of Nicolas's critique of Aristotle and his followers is set forth in the prologue to his *Exigit Ordo Executionis*. He tells us that he read the works of Aristotle and his commentator Averroes and discovered that the demonstrations of their doctrines were defective, that arguments for the opposite of these doctrines can be found that are more plausible than arguments for them.

(The word *plausible* here is intended to translate the Latin word *probabilis* because, in this usage, it does not mean “frequent” but “plausible.”) Moreover, men have spent their entire lives studying Aristotle to no avail while neglecting the good of the community. Men would live better lives and contribute to the common good, in matters religious and moral, if only they knew that very little certitude about things can be learned from natural appearances and that what little can be learned can be obtained in a short while, provided men attend to things rather than the treatises of Aristotle and Averroes. In a word, the intellectual culture of Nicolas’s age is condemned as largely vain; and the purpose of his criticism is simply to show this in detail. This is not to say that Nicolas is opposed to empirical investigation, but it would be a mistake to see in his attack on Aristotle an interest in empirical investigation such as we find in the promoters of natural science in the sixteenth and seventeenth centuries.

The criticism of Aristotle as set forth in the *Exigit* has an aspect not indicated in his controversy with Bernard of Arezzo. In the letters to Bernard he declared that nothing that is said about infrasensible reality is even probable. In another sense of probability, introduced in the *Exigit* (but one of the accepted senses of the term in the Middle Ages and derived, in fact, from Aristotle), a proposition or opinion is probable if there are arguments in its favor that, although inconclusive, would be approved by an impartial judge. In this sense, a proposition or opinion has a probability that varies as our information increases. Accordingly, Nicolas begins with a conception that is accepted by his adversaries: The principle that the Good exists in our minds as a kind of measure for evaluating things. According to this, we may assume that the things in the universe are so arranged that whatever is good exists and whatever is bad does not exist. Since there is no way of demonstrating that things exist in a certain arrangement, we are obliged to depend on the principle of the Good in order to determine what is probably the case. Following this principle we can suppose that (1) all things in the universe are mutually connected so that one thing exists for the sake of another (like Aristotle’s view that all things are ordered to one ultimate end, that is, God; cf. Aristotle, *Metaphysics* 1075a15ff.); (2) there is systematic subordination of all things to a single end so that nothing exists that does not somehow contribute to the good of the entire universe; (3) the universe, so conceived, must be at all times equally perfect.

## ATOMISM

From the above, Nicolas concludes that any particular thing that now exists has always existed and will always exist. For whatever now exists, exists for the good of the whole, and because this whole is always and everywhere equally perfect, all its parts must always exist. Hence, on the principle of the Good, every ultimate entity in the universe is eternal.

The eternity of things is obviously incompatible with Aristotle’s thought, in which the generation and corruption of substances and their accidents is an essential feature. Here Nicolas is content to show that all the Aristotelian arguments to prove the occurrence of generation, corruption, or other kinds of change are inconclusive. For example, we cannot prove conclusively that sensible qualities cease to exist. The only method of proving this is to argue that a quality ceases to exist because it no longer appears to us, and this is obviously inconclusive. Hence, Nicolas argues, the atomic theory in its most radical form is more plausible than Aristotle’s nonatomistic theory of change. The *appearance* of change can be accounted for in terms of the aggregation and separation of atomic particles.

There is much of interest in the finer details of Nicolas’s atomism, particularly in his defense of indivisible minima as the ultimate constituents of the continuum, his defense of the vacuum, and his theory of motion. But here he is by no means original. His theory of the nature of motion, for example, is taken over from William of Ockham, and his views about indivisibles owe much to other fourteenth-century Scholastics. Moreover, there are radical deficiencies in his views on these subjects. Nicolas also adopted the radical Ockhamist thesis that relations are reducible to their terms, so that there are no extracognitive referents to our relational concepts. The denial of extracognitive relations is mistaken, and this part of Nicolas’s speculations suffers from this error.

The *Exigit* also develops a theory of knowledge in terms of which whatever appears to be the case is the case, that is, that the objects of cognition are all in some way real. Nicolas also develops a positive theory of causation, and there is a related theory of eternal recurrence. Whether he derived this from Stoic sources is not clear.

## INFLUENCE AND IMPORTANCE

The skeptical and critical views, as well as Nicolas’s probabilistic defense of atomism, produced some responses among his contemporaries and successors. Albert of Saxony, Jean Buridan, and others replied to his critical views

on causation and substance, and Thomas of Strasbourg discussed his atomism. Many references to his views on the nature of propositions occur in later fourteenth-century theologians. Moreover, although Nicolas's views were formally condemned by the Curia in 1346, at the end of the century Cardinal Pierre d'Ailly not only adopted many of these views but also wrote that "many things were condemned against [Nicolas] because of envy which were later publicly stated in the schools."

The importance of Nicolas of Autrecourt in the history of thought can best be summarized as follows: He was a radical representative of an increasing tendency in fourteenth-century thought to reject the idea that any of the principles of natural theology admit of demonstration, and he thus contributed to the decline of the authority of Aristotle. Although some of his reflections are both important and valid, they seem not to have had any direct effect on the development of philosophy in early modern times. From one point of view, he and some of his contemporaries achieved a clarity about the nature of beliefs in causation and substance that was neither equaled nor surpassed until the eighteenth century in the writings of Hume.

## NICOLAS OF AUTRECOURT [ADDENDUM]

Documentation about Autrecourt's life is scarce. His date of birth is now placed sometime between 1295–1298. He came from the diocese of Verdun and attended the arts faculty at Paris. He also held a degree in civil law, which he must have obtained outside of Paris. His membership in the Collège de Sorbonne places Autrecourt back in Paris in the 1330s as a student in theology. He died in 1369, either on July 16 or 17.

Over the last two decades, it has become apparent that the study of Autrecourt's thought has been wrongly placed in the larger context of putatively skeptical tendencies in scholastic thought and the battle against Ockhamism at the University of Paris in the years 1339–1347. In his *Universal Treatise* (*Exigit ordo*), which originated at the arts faculty during the years 1333–1335, he defends the Aristotelian thesis that our sensory experiences are reliable—that what appears really is, and that what appears to be true really is true (*Metaphysics* IV, 5). He finds this view more plausible than its opposite, namely that the intellect is incapable of certitude.

In his *Letters*, Autrecourt attacks the "Academics" or ancient Skeptics. Yet, at the same time, he challenges the prevailing Aristotelian tradition, in particular of substance-accident structure of reality and the principle of causality. This view is the result of his stance that all *evident* knowledge (with the exception of the certitude of faith) must be reducible to the principle of noncontradiction (*primum principium*). This outlook was developed in his correspondence with a Master Giles (of Feno?) and his two extant letters to the Franciscan theologian Bernard of Arezzo, which must have been written sometime between October 1335 and June 1336. These exchanges hark to a previous discussion between Autrecourt and Bernard of Arezzo at their inaugural lectures (*Principia*) on the *Sentences* about the validity of Aristotle's principle of noncontradiction.

## NICOLE, PIERRE (1625–1695)

Nicole Pierre was born in Chartres, the son of Jean Nicole, a member of the Parlement de Paris. In 1642 he began his studies in philosophy in Paris, where he received his Master of Arts in 1644. Subsequently, he studied theology with Alphonse Le Moine and Jacques Sainte-Beauve, and under the direction of the latter he started an intensive consideration of the theological writings of St. Augustine. During this time Nicole became involved in the activities of the reformist convent of Port-

Royal des Champs through his aunt, Marie des Anges Suireau, who was for a short time the abbess there. Nicole taught in the *petite écoles* attached to Port-Royal, where one of his students was Jean Racine, the future poet. After receiving his Bachelor of Arts degree in 1649, he withdrew to Port-Royal, becoming one of the *solitaires* associated with the convent.

During the 1650s Nicole went against the French theological and political establishment in defending the theological orthodoxy of the *Augustinus* of Cornelius Jansenius, the late theologian and bishop. He joined his fellow *solitaire* Antoine Arnauld and other Port-Royalists in protesting the papal bulls in the 1650s that attributed to this work four heretical propositions and one false proposition concerning sin, free will, and grace. The controversy that derived from this protest was such that when he returned to Paris in 1654, Nicole was forced to take the assumed name of M. de Rosny.

In 1658, during a tour in the German territories, he translated the *Provinciales* (1656–1657) into Latin, using the pseudonym Guillaume Wendrock. This work, written by the brilliant Port-Royalist Blaise Pascal, was a popular satirical critique of Jesuit moral theology. Nicole also defended both the *Augustinus* and Port-Royal throughout the 1660s, when Louis XIV exerted considerable pressure on the members of the convent to bring them into conformity with official church policy. During this time, in 1662, he published with Arnauld, under the pseudonym of Sieur le Bon, the first of what was to be six editions of the *Logique ou l'art de penser*. This work reflects the teaching at the *petite écoles* at Port-Royal before their disbandment by Louis XIV in 1660. This work combines an Augustinian distinction between a theology grounded in trust of authority and a philosophy grounded in trust of natural reason with René Descartes's rejection of radical Pyrrhonian skepticism and his metaphysical conclusion that mind as a thinking thing is a substance really distinct from body as an extended thing. Nonetheless, Nicole was never as enthusiastic about the new Cartesian philosophy as his coauthor, Arnauld, was. In several letters published in his four-volume *Essais de morale* (vol. 2, 1679) Nicole emphasized the weakness of human reason and the inability of the Cartesians to offer more than probable conclusions. This sort of emphasis was in line with the skepticism concerning the new philosophy reflected in the views of Port-Royal *solitaires* such as Le Maître de Sacy and Louis-Paul du Vaucel. Such skepticism belies the claim of the Calvinist Pierre Jurieu that "the theologians of Port-Royal are as attached to Cartesianism as they

are to Christianity” (*La politique du clergé de France* [Cologne, 1681], 107).

The Peace of the Church that Pope Clement IX established in 1669 with the help of Louis XIV brought about a decade-long cessation of hostilities against the Jansenists. During this period Arnauld and Nicole devoted themselves to their three-volume *La perpétuité de la foy*, in which they defended the Catholic doctrine that Christ is “physically present” in the Eucharist against the view of the Calvinist minister JeanClaude that Christ has a merely “spiritual presence” in this sacrament. Nicole and Arnauld also condemned the attempt of the French Benedictine Robert Desgabets to defend the view in Descartes’s unpublished correspondence that the physical presence of Christ involves merely the union of His soul with the matter of the Eucharistic elements. The anonymous publication of this defense in the *Considérations sur l’état présent* (1671) was one of the triggers of the official campaign against Cartesianism in France during the 1670s.

The Peace of the Church officially ended with Louis XIV’s banishment of Nicole and Arnauld, along with other Port-Royalist sympathizers, to the Spanish Netherlands (now Belgium) in 1679. In contrast to Arnauld and the other Port-Royalists, however, Nicole was eager to reconcile himself with the French authorities, and negotiations with the bishop of Paris, François de Harlay de Champvallon, allowed him to return to Paris in 1683. After this return, he further revised his *Essais de morale* and attacked in print the views of the Calvinists. Nicole also attempted (unsuccessfully) to moderate the tone of the increasing bitter philosophical and theological debate during the 1680s and early 1690s that pitted Arnauld against the French Cartesian Nicolas Malebranche.

In the 1690s Nicole also became embroiled in his own dispute with Arnauld over Nicole’s view that God grants us a “general grace” that involves at least an implicit knowledge of moral truth. Appealing to the Cartesian doctrine of the transparency of the mind, Arnauld objected to any knowledge of moral truth that does not involve explicit awareness. The response to this line of objection in Nicole and his defenders, including the Louvain theologian Gommaire Huygens and the French Benedictine François Lamy, invoked the purported implication in Augustine that we see truths in God by means of divine illumination that we do not grasp completely. The case of this dispute serves to further illustrate the complexities of the relations between Augustinianism and Cartesianism during the seventeenth century.

During the 1690s, Nicole also found himself opposed to Lamy over the “quietist” doctrine of the French Cardinal François de Fénelon that we are to have a “pure love” of God that involves no concern for the self. Whereas Lamy defended Fénelon, Nicole joined the French Bishop Jacques-Bénigne Bossuet in arguing for the conclusion, which Rome later endorsed, that quietism is heretical. Soon after this dispute, Nicole suffered a stroke, and he died in Paris on November 16, 1695, a little over a year after Arnauld’s death.

## NIEBUHR, REINHOLD

(1892–1971)

Reinhold Niebuhr was eminent in two fields. One was social action and analysis of current social problems; the other was the interpretation of the Christian faith. This entry will concentrate on his religious and ethical thinking.

Niebuhr was born in Wright City, Missouri. His father was Gustave Niebuhr, a minister in the Evangelical Synod of the Lutheran Church, who came to the United States when he was seventeen years old. His mother was

the daughter of the Reverend Edward Jacob Hosto, a second-generation German American of the same religious sect. Niebuhr studied at Elmhurst College, Eden Theological Seminary, and Yale University. He was ordained in 1915 and was pastor at the Bethel Evangelical Church of Detroit until 1928. He was then appointed professor at the Union Theological Seminary in New York, where he taught until 1960, when he became professor emeritus.

## RELIGIOUS VIEWS

The central theme of Niebuhr's religious teaching can be stated as follows: A divine, forgiving, and timeless love "beyond history" gives meaning to human life. Nothing actually operating in human history can ever be sufficiently dominant over sinful pride and sensuality to deliver men from despair, although men attempt to conceal reality with optimistic illusions. But if we look beyond the temporal process to transcendent being, we find, through faith, a forgiving and perfect love that gives to human life a grandeur beyond the reach of despair and a zeal beyond the reach of apathy. This love from beyond history has been revealed to us in Jesus Christ. We know it is from beyond history because in history this kind of love, called agape, is ineffective before the powers that rule this world. It is futile and meaningless except when, as in the Christian faith, it reveals the ultimate purpose of our existence by an evaluation that transcends history.

**SIN AND ANXIETY.** Sin arises from anxiety, although anxiety is not sinful in itself. Man is rendered anxious by criticizing himself and his world, by recognizing his own limitations and the contingencies of his existence, and by imagining a life infinitely better than what actually is.

Anxiety would not lead to sin if we brought it under control by trusting ourselves to God's forgiving love and ultimate power. But instead of this, we seek to bring anxiety under control by pretending to have power or knowledge or virtue or special favors from God, which we do not have. This pretense leads to pride, cruelty, and injustice. Or we seek to escape anxiety by dulling the awareness of it with sensuality. All this is sin because it is a turning away from God to a self-centered existence. Sin thus induced is not inevitable, but it is universal. Also Niebuhr obscurely suggested that sin was in the world before men became sinners, this prehuman sin being symbolized by Satan.

In this predicament we have two alternatives. We may trust ourselves along with the whole of human history to God's forgiving love. The other alternative is

twofold: to sink into annihilating despair or to conceal our predicament with illusions that render our condition even more desperate in the end. If we take the first alternative, we live not only for whatever love can be attained in history but also and primarily for the divine love beyond history. In this way the whole of history takes on meaning. Otherwise we have only glimpses of meaning in developments occurring here and there but no meaning for the whole of history.

**TRANSCENDENCE.** Themes continuously recurrent throughout Niebuhr's writing are transcendence, freedom, reason, and love. Niebuhr's language often suggests that by "transcendence" he means the timeless ideal of perfect love. But for Niebuhr this love is not merely an ideal. It is a God who loves, yet is beyond time, cause, and world.

Self-transcendence is a central theme in Niebuhr's thought. If this merely meant that the self can change into a better self, the meaning would be obvious. But Niebuhr seems to mean that the self, while never escaping finitude in one dimension, does somehow, in another dimension, transcend time and causation and self. It does this by surveying past and future and by self-criticism. But to survey past and future is to be aware of one's involvement in time; and in self-criticism the self in retrospect is criticized by the present self; and this criticizing self may in turn be criticized by the self at a later time. Niebuhr would seem to be wrong, therefore, in claiming that in self-criticism the self can transcend time and causation.

**FREEDOM AND REASON.** Niebuhr affirmed human freedom by paradox: Man is both bound and free, both limited and limitless; he is, and yet is not, involved in the flux of nature and time. As spirit he "stands outside" time, nature, world, and self, yet is involved in them. Freed of paradox, these affirmations assert that humankind is free in the dimension of spirit but not in the dimension of natural existence. The human spirit transcends the self, time, and nature because the individual can know himself as an object, can judge himself to be a sinner, can survey past and future. "The ultimate proof that the human spirit is free is its recognition that its will is not free" (*Nature and Destiny of Man*, Vol. I, p. 258).

Niebuhr would seem to be making contradictory statements. The self is not free if only the "spirit" transcending the self is free. The critical comment made above on his concept of transcendence would apply here also.

Reason is an instrument, says Niebuhr, which can be used for either good or evil. One evil use of reason is to impose rational coherence upon reality and to reject as unreal what cannot be fitted into that coherence. But Niebuhr is mistaken in thinking that one who insists on subjecting every affirmed belief to the tests of reason is thereby claiming that reason comprehends all reality. To the contrary, such a person fully admits that unknown reality extends beyond his knowledge; but he refuses to conceal his ignorance by superimposing religious beliefs where knowledge cannot reach. Niebuhr defended such beliefs because they relieve anxiety by providing courage and hope.

Another sinful use of reason, says Niebuhr, is to make it the basis of a false security, thus turning away from the one sure ground of security, which is a belief beyond the tests of reason, namely, that God in forgiving love will overrule all evil "at the end of history." Here again the question arises: Is true security to be found in beliefs exempt from the tests of reason or is it to be found by rejecting such beliefs and recognizing the unknown without concealing it beneath beliefs that cannot be rationally defended?

On the other hand, Niebuhr used to the full his own magnificent powers of rational intelligence in dealing with problems arising in the temporal process of human existence. He completely accepts the powers of reason in dealing with such problems. For him reason has the further use of demonstrating its own incapacity for dealing with those religious beliefs that Niebuhr affirms while admitting that they cannot be rationally defended.

In June Bingham's book *Courage to Change* (p. 224) she reports that Niebuhr wrote to a friend that he (Niebuhr) adhered to the religious pragmatism of William James. He validates Christian belief, when it cannot be rationally defended, by the courage, hope, peace, zeal, love, sense of being forgiven, and other psychological effects resulting when these beliefs are affirmed. Niebuhr identified these psychological effects as the grace bestowed upon us by God when we affirm these beliefs with the total self. Thus are we assured that we are loved and forgiven by God while we are yet sinners. Niebuhr also affirmed that beyond all the incoherence of our existence and beyond all our rational powers to know there is an all-comprehending and perfect coherence that somehow overcomes and absorbs all the manifest incoherences that we experience.

LOVE. Niebuhr distinguished three kinds of love: heedless love (agape), which seeks nothing in return; mutual

love; and calculating love. Heedless love is God's way of loving; and human beings by God's grace may have it to some degree. Since it seeks nothing in return, it cannot have the intention of awakening responsive love, although this may be its unintended result. Suffering endured with intention to awaken responsive love would be calculating love. Hence God's suffering love in Christ is not to awaken responsive love, although this may be its unintended result; but the intention is to protect God's righteousness in forgiving sin because forgiveness without atonement would be condoning sin.

## POLITICAL VIEWS

In making political judgments, the individual is inevitably biased by the social position and historical process in which he finds his security and personal identity. No one can be entirely free of this bias, but its distortions are reduced by a faith that finds its ultimate security not in any social position or historical process but in the God of love and mercy who rules supreme over the whole course of history, determining its final outcome as no plan or purpose of man can ever do. Such a faith in God's power and forgiveness enables one to practice "Christian realism," whereby one is able to see the evil in the self and in the historical process with which the self is identified, as well as the depth of evil in all of human life. Political judgment can then be more free of the illusions generated by false pride, on the one hand, and by despair, on the other.

Justice requires the coercions of government to support moral demands; and the power of opposing parties must be equalized if one is not to be subordinated unjustly to the interests of the other. Also, to have justice, freedom to criticize is required. Justice serves love by providing the social conditions required for the practice of love. Love is the final norm but cannot by itself guide political action, because every project set forth in the name of love amid the contests for political power is infected with self-interest whereby the needs of others are falsely identified with those of self.

With his highly developed rational powers and critical intelligence, Niebuhr sharply distinguished between problems subject to rational treatment and religious beliefs that cannot be rationally defended. This gives us what at times seems to be two Niebuhrs: One, the naturalist struggling with the problems of our existence with all the tools of human reason; the other, the mystic upholding a superstructure of religious belief beyond the tests of reason. Whether one of these, or both, will prevail in the course of history, only time can tell. However, the

impact of Niebuhr's thought and action on our civilization will continue in one form or another for a long time.

## NIETZSCHE, FRIEDRICH

(1844–1900)

Although trained as a philologist, Friedrich Nietzsche has been among the philosophers most influential upon European and North American culture and philosophy during the twentieth century. While he has always had an audience among writers, artists, and Germanists, through the first half of the twentieth century—and especially among philosophers—Nietzsche was read and discussed primarily by German philosophers, including Martin Heidegger, Karl Jaspers, and Karl Löwith. His criticisms of traditional philosophical positions, along with his often metaphorical and hyperbolic writing style, led to his being taken much less seriously by English-language philosophers. And Nietzsche's political views and the posthumous appropriation—many would argue misappropriation—of some of his ideas by thinkers associated with fascism and National Socialism (Nazism) led initially to a hostile response to his works among many British and French readers.

By the early 1960s, however, Nietzsche's fortunes had begun to change considerably. Anointed along with Marx and Freud as one of the three "masters of suspicion," Nietzsche's philosophical works found enthusiastic readers among those coming of age philosophically in the 1960s, and this—along with a new critical edition of his works and several generations of scholarly explication and analysis—resulted in Nietzsche being among the most widely read and known of Western philosophers by the end of the twentieth century.

## BIOGRAPHY

Nietzsche was born October 15, 1844, in Röcken, a small village in Prussian Saxony, on the birthday of King Friedrich Wilhelm IV of Prussia, after whom he was

named by his father Karl Ludwig, 31, and his mother Franziska (née Oehler), 18. His father, as well as both of his grandfathers, were Lutheran ministers. In 1846, Nietzsche's sister Elisabeth was born, and two years later, his brother Joseph was born. The following years were difficult ones: in 1848, Nietzsche's father became seriously ill; he died on July 30, 1849, of what was diagnosed as "softening of the brain" (a frequent diagnostic notation for tertiary syphilis). The following year, Nietzsche's younger brother died; and in April 1850, Nietzsche's mother moved the household—which now included her two young children, as well as Nietzsche's paternal grandmother and her two sisters—to Naumberg, a much larger town of 15,000 people.

In 1858, Nietzsche was offered free admission to Pforta, the most prestigious high school in Germany, located only a few miles from Naumberg. He was an excellent student and graduated in 1864 with a thesis in Latin on the Greek poet Theognis. After graduation, he registered at the University of Bonn as a theology student, but quickly changed his focus to philology, as Bonn's department had a distinguished reputation grounded on the work of two professors: Otto Jahn (1813–1869) and Friedrich Wilhelm Ritschl (1806–1876). There were, however, deep personal and professional disagreements between the two and when Ritschl decided to leave for the University at Leipzig, Nietzsche followed him there in 1865 and registered as a student of classical philology. Nietzsche soon became Ritschl's star pupil, and he was invited by Ritschl to publish an essay on Theognis in *Das Rheinische Museum für Philologie*, which Ritschl edited. In addition to his work in philology, writing essays on Diogenes Laertius and Democritus, among others, three other events took place in Leipzig that would profoundly influence the rest of Nietzsche's life: his discovery of Schopenhauer's *Die Welt als Wille und Vorstellung* (*The World as Will and Representation*) in 1865, of F. A. Lange's *Geschichte des Materialismus* (*History of Materialism*) in 1866, and in 1868, his meeting Richard Wagner, with whom he shared a love of music, of Schopenhauer, and a hope for the revitalization of European culture.

When a position at the University of Basel appeared in 1869, Ritschl gave an extraordinary recommendation for Nietzsche, who had not yet written a doctoral thesis, and Nietzsche was appointed to the Chair of Classical Philology at Basel in 1869 at the age of twenty-four. The University of Leipzig proceeded to confer the doctorate without either thesis or examination, and Nietzsche moved to Basel in April 1869. Basel offered him not only a university appointment but also easy access to the Wag-

ner residence at Tribschen, which allowed Nietzsche to develop a close relationship with both Wagner and his wife Cosima, the daughter of Franz Liszt. While at Basel, Nietzsche lectured on Homer, Hesiod, Plato, Aristotle, the pre-Socratics, Diogenes Laertius, and classical rhetoric. He was becoming increasingly disengaged from philology, however, and spent much of his time working on the texts of ancient Greek and Roman philosophy and thinking about broad cultural issues. These two features can be seen in his first book, *The Birth of Tragedy* (1872), which merged philosophical reflection with philological interpretation as it sought to frame Wagnerian opera as a way to recuperate what European culture had lost since the demise of ancient Greek tragedy. While Nietzsche thought his work would revolutionize the discipline of philology, it was poorly received and all but destroyed his professional standing as an academic philologist.

During the 1870s in Basel, Nietzsche became increasingly uncomfortable with Wagner and the Wagner circle at Tribschen and Bayreuth. While there is no question that *The Birth of Tragedy* proclaims Wagner's world-historical importance as a cultural phenomenon, *Richard Wagner in Bayreuth*, the fourth of his *Untimely Meditations*, is much more ambivalent. By 1878, Nietzsche had had enough of Wagner and among the reasons he offers subsequently to explain his break with Wagner are Wagner's turn to Christianity in *Parsifal* and his support for and association with political anti-Semitism. In 1879, Nietzsche resigned his chair at Basel because of the increasing severity of his health problems, and over the next ten years, he lived in several places in Europe, including Sils Maria, Switzerland, and Genoa and Turin, Italy. During these ten years, Nietzsche wrote ten books, living off a modest pension from the university, and he was plagued by constant and severe health problems. He suffered a total mental breakdown in Turin in January 1889, and after a brief stay at the psychiatric clinic run by Dr. Otto Binswanger in Jena, he spent the remaining years of his life under the care of his mother and then his sister until his death in Weimar on August 25, 1900.

No account of Nietzsche's life can avoid his health and his madness. Beginning in childhood, his health was poor. He was plagued by headaches that, as young as nine, kept him from school, and by age twelve, his eyes began to cause him serious problems. Throughout his life, his work habits were affected by the migraines that forced him to remain in darkened rooms, gastrointestinal problems, and limited eyesight that made reading at times painful and at times impossible. Not surprisingly, the themes of sickness, convalescence, and health, both

metaphorically and literally, hold a central place in his philosophical reflections.

The question of his madness has been a focus of attention and speculation almost from its outbreak. What is clear is that on the morning of January 3, 1889, Nietzsche saw a horse being beaten by its coachman on a street in Turin, embraced the animal, and then collapsed. In the few days preceding and following this event, he sent letters to Jacob Burckhardt, Peter Gast, George Brandes, Cosima Wagner, and August Strindberg, among others, that, while at moments lucid and beautiful, are also clearly not the writings of a sane individual. While there has been much speculation as to the cause of Nietzsche's insanity, there is no conclusive evidence to support either of the two most common hypotheses: that he inherited syphilitic dementia from his father or he caught syphilis from prostitutes in a Leipzig brothel during his time as a student there. Recently, new research carried out by Dr. Leonard Sax, director of the Montgomery Center for Research in Child Development in Maryland and published in the *Journal of Medical Biography*, suggests that Nietzsche's symptomatology is consistent with cancer of the brain and in fact is not consistent with syphilis (based on the number of years Nietzsche remained alive following his breakdown). The syphilis story, it appears, can be traced to a book written by psychiatrist Wilhelm Lange-Eichbaum in 1946, *Nietzsche: Krankheit und Wirkung*, that sought to discredit Nietzsche, and this story was then adopted as fact by intellectuals who shared Lange-Eichbaum's politically motivated desire to destroy Nietzsche's reputation.

## WRITINGS

During the sixteen years of Nietzsche's productive life, he wrote eighteen books in addition to leaving an extensive correspondence and several thousand pages of unpublished writings. While there are some minor differences in the way his works are periodized by scholars, his writings tend to be divided into three periods: his early more scholarly, philological work written while teaching in Basel from 1872–76; his aphoristic texts, written between 1878–1882; and his mature works, which begin with *Thus Spoke Zarathustra* in 1883 and continue until his last works in 1888.

**THE BASEL WRITINGS.** Nietzsche's early works, written while a professor of classical philology at the University of Basel, include *The Birth of Tragedy out of the Spirit of Music*, and the four *Untimely Meditations: Richard Strauss, Confessor and Writer; On the Use and Disadvan-*

*tage of History for Life; Schopenhauer as Educator; and Richard Wagner in Bayreuth.* In addition to these published works, there are several unpublished works from this period that have attracted scholarly attention, the most important of which are the essays "On Truth and Lies in an Extra-moral Sense," "Homer's Contest," and "Philosophy in the Tragic Age of the Greeks."

First published in 1872, *The Birth of Tragedy* offers a theory of tragedy, a theory of art, and a proposal for cultural renewal. A second edition, published in 1886 with a new preface titled "Attempt at a Self-Criticism," and a new subtitle, "Hellenism or Pessimism," takes note of Nietzsche's move away from the Schopenhauerian sensibilities that marked this text by highlighting the opposition between Greek cheerfulness and Schopenhauerian pessimism. *The Birth* opens with Nietzsche's distinction between the Apollonian and Dionysian, which designates both forces of nature and basic artistic impulses. As forces of nature, the Apollonian names the principle of individuation that gives form to the chaos by isolating and distinguishing between things, whereas the Dionysian names the primal unity of all things in an endless play of forces of becoming. As artistic impulses, the Apollonian marks the world of beautiful illusions, whereas the Dionysian marks the sensual world of rapturous frenzy. Sculpture is the purest Apollonian art as a transfiguration of the real into a beautiful, illusory image, whereas music is the purest Dionysian art insofar as music is the process of change itself, with nothing that endures but the whole that survives each individual note's destroying what has come before it.

Nietzsche argues concerning Greek culture that when faced with the absurdity and horrible and terrifying aspects of existence, the Apollonian and Dionysian denote two opposing tendencies of human nature: to cover existence with beautiful illusions or to plunge into the absurdity and horror of existence and affirm it, as such, as a world of continual creation and destruction. From this comes his thesis about tragedy: Attic Tragedy—Sophocles and Aeschylus; Oedipus and Prometheus—manifests the pinnacle of Greek art as the perfect union of Dionysian joy and Apollonian illusion: It reflects both the Greek tragic wisdom that by accepting destruction as part of the great world-game, the tragic hero masters the cruelty of fate, and reveals the tragic Dionysian wisdom that the human spirit will not be broken by the pains and hardships of existence. This is the "metaphysical comfort" that tragedy leaves one with: "that life, despite all the changes in appearances, is at bottom indestructibly powerful and pleasurable" (§ 7). This tragic insight, which

gave birth to Attic Tragedy, was, according to Nietzsche, destroyed by Socrates and his tragedian spokesman Euripides, for whom in order to be beautiful, everything had to be intelligible. Much of Nietzsche's *Birth* is spent analyzing the death of tragedy at the hands of Socrates and Euripides, and the anticipation of its rebirth in Wagnerian opera.

Nietzsche's four *Untimely Meditations* were published between 1873 and 1876. Originally planned as a series of thirteen volumes of cultural criticism, Nietzsche only published four (though he completed a substantial amount of work on a fifth volume on academic philology, "Wir Philologen"). In *David Strauss, the Confessor and Writer* (1873), Nietzsche criticizes Strauss, a Hegelian and author of *The Life of Jesus* (1835) and the then (1870s) popular work *The Old and New Faith*, for his smugness and the ease with which he dispenses with Christian doctrine. Strauss is also treated as representative of German popular culture, pleased with itself and its cultural "superiority" following Prussia's victory in the Franco-Prussian war, and Nietzsche spends much of the text challenging the *Bildungsphilister* or "cultural philistines" who mistake their "popular" culture for "genuine" culture. Because of Strauss's popularity, this was one of Nietzsche's most popular works, which although often critically reviewed was widely read.

*On the Use and Disadvantage of History for Life* (1873) has been the most widely discussed of the four meditations, although it was the least successful in its day. Taking as his critical foil Eduard von Hartmann's *Philosophy of the Unconscious* (1869), Nietzsche challenges the neo-Hegelian historicist tendency to valorize the present as the goal toward which history had been teleologically directed. While attacking the high value placed upon history in contemporary German culture and education, Nietzsche offers his tripartite account of historical scholarship—antiquarian, monumental, and critical—and offers an early version of what later became his genealogical method of examining the past in order to better understand the present.

*Schopenhauer as Educator* (1874), which Nietzsche later came to realize should have been called "Nietzsche as Educator," offers an early account of the exemplary individual engaged in a project of self-perfection. One finds relatively little comment in this text about Schopenhauer's philosophical views, about which Nietzsche had, by the time of its writing, come to question. Instead, one finds Nietzsche discussing Schopenhauer as an exemplary philosopher who willingly suffers in pursuit of the truth. It is, then, not Schopenhauer's philosophy but the

Schopenhauerian image of man that educates, and Nietzsche's third meditation is one of his most personal books in providing several comments that describe the exemplary individual that Nietzsche himself wanted to become.

That *Richard Wagner in Bayreuth* (1876) came to be published at all is due largely to Nietzsche's friend Heinrich Köselitz ("Peter Gast," 1854–1918). Begun in 1874, Nietzsche's adoration of Wagner began to fade in 1874–75 and he abandoned the project in 1875. Gast read the unfinished manuscript early in 1876 and persuaded Nietzsche first to complete the manuscript as a gift to Wagner for his birthday (May 22), and Nietzsche subsequently decided to publish the volume as the fourth *Untimely Meditation*, presenting it to Wagner in August during the first festival at Bayreuth. Although on the surface an homage to Wagner, with its liberal quotation and paraphrase from Wagner's own writings, the text also suggests that Wagner and his circle may themselves be "cultural philistines" who are failing to live up to the cultural and aesthetic ideals that Wagner's writings proposed. While important in terms of understanding Nietzsche's ambivalence toward Wagner during this period, and offering several insightful comments on art, culture, language, and science, this volume stands as perhaps Nietzsche's least popular and least read work.

In addition to these five published works, Nietzsche also left a number of unpublished essays and fragments from this period. Of these, three are of particular significance: "On Truth and Lies in an Extra-Moral Sense" (1873), in which he offers a tropological account of the origins of knowledge as grounded in the fundamental human drive toward the formation of metaphors; "Homer's Contest" (1872), in which he discusses the role of the *agon* or competition in Greek culture and democracy; and "Philosophy in the Tragic Age of the Greeks" (1873), in which he offers some of his most sustained commentary on the major pre-Socratic philosophers, including Heraclitus, Parmenides, Anaximander, and Anaxagoras.

APHORISTIC TEXTS. Between 1878 and 1882, Nietzsche wrote five works that, on the back cover of the final one, he noted as having a common goal: "to erect a new image and ideal of the free spirit." Motivated in part by his dissatisfaction with Wagner, he turned in these works against art, but more importantly, these works display a sympathy toward science as a legitimate source of truth and knowledge that has led some to refer to the works of this middle period as Nietzsche's "positivistic" works.

These works also shared a common style, that of the aphorism, which Nietzsche adopts in part as a way to mark his antipathy to the German philosophical tradition (Kant, Hegel) and his sympathy to French moral psychologists such as La Rochefoucauld, Montaigne, and Chamfort, whose aphoristic works he was then reading with his new friend Paul Rée (1849–1901).

In each of his aphoristic works, although themselves divided into chapters or parts, Nietzsche numbers his paragraphs sequentially from beginning to end. Some of these paragraphs are several pages long, and others are as short as a single sentence. The first of these works was *Human, All Too Human* (1878). Dedicated to Voltaire on the centenary of his death and subtitled “A Book for Free Spirits,” it surveys a full range of philosophical topics, including metaphysics, epistemology, morality, religion, science, art and literature, culture, society, the family, and the state. In addition to being a public announcement of his break with Wagner, this volume also marked a break with the style of his earlier writings, and the multiplicity of authorial voices that speak through the 638 aphorisms are the first published expression of Nietzsche’s perspectivist approach. *Human, All Too Human* was followed by two sequels, *Mixed Opinions and Maxims* (1879) and *The Wanderer and His Shadow* (1880), which each offer a collection of aphorisms on a variety of topics that have no apparent organizational structure, and were subsequently published together in 1886 as Volume Two of *Human, All Too Human*.

Unlike his earlier aphoristic works, *Daybreak: Thoughts on the Prejudices of Morality* (1881) remains relatively focused on the single topic of morality and the various themes that moral theorists typically address: moral judgment, moral psychology, moral values, the emotions, the virtues, and so on. It is an important text because it offers an early version of his critique of morality that anticipates many of the ideas that will receive extensive discussion in Nietzsche’s later works, especially as concerns the origins of morality in general and some of the Western philosophical and religious traditions’ privileged moral values in particular. In *Human, All Too Human*, one glimpses Nietzsche’s first explorations into a naturalistic approach to ethics; in *Daybreak*, one finds Nietzsche much more committed to the idea that our moral values have their genesis in our biological and psychological needs.

*The Gay Science* (1882, 1887) is clearly the most significant work of this middle period, both in bringing to completion the series devoted to the free spirit and in being the text in which Nietzsche first formulates two of

his most famous themes: the death of God (§125, “The Madman”) and the eternal recurrence (§341: “The Greatest Weight”). While sharing the aphoristic style with the other works of this period, *The Gay Science* stands out in terms of its consistency with the themes that will be expressed in his subsequent writings. It stands out as well in terms of the internal coherence between aphorisms: Where the organization among the various aphorisms in his preceding four books often seems unclear if not non-existent, there is often in *The Gay Science* a development from the topic of one aphorism to the next that rewards a careful attention to their sequence.

A case in point is the last three sections of Part Four—the last three sections of the first edition—in which Nietzsche moves from “The Dying Socrates” (§340), where Socrates, on his deathbed, discloses his true belief that existence is a disease; to “The Greatest Weight” (§341), in which Nietzsche first introduces the eternal recurrence through the voice of a demon, echoing Socrates’s *daimon*, and suggests that contrary to Socrates’s judgment, life might be affirmed; to *Incipit Tragœdia* (§342; “The Tragedy Begins”), which is identical to the first section of the Prologue of Nietzsche’s next book, *Thus Spoke Zarathustra*, thus introducing Zarathustra as a teacher with an alternative to the moral teachings of Socrates, Kant, and Christianity. In 1887, Nietzsche published a second edition of *The Gay Science*, now with a new preface, an appendix of “Songs of Prince Vogelfrei,” and a fifth book that offers some of Nietzsche’s most sophisticated reflections on questions of language, consciousness, science, morality, religion, and art. Although appended to this earlier work, the fifth book really belongs to Nietzsche’s “mature” period, in which he has fully committed to the perspectivist and constructivist accounts of knowledge.

**MATURE PERIOD: TRANSVALUATION OF ALL VALUES.** The texts of Nietzsche’s mature period, written from 1883 to 1888, include those for which Nietzsche as a philosopher is best known: *Thus Spoke Zarathustra*, *Beyond Good and Evil*, and *On the Genealogy of Morals*. In addition to these works, he also wrote five books in 1888: two books on Wagner—*The Case of Wagner* and *Nietzsche contra Wagner*—*Twilight of the Idols*, *The Antichrist*, and *Ecce Homo*, an autobiography and appraisal of his works, which was published posthumously in 1908.

In *Thus Spoke Zarathustra*, Nietzsche offers the fictional narrative of Zarathustra, his image of the yes-saying spirit, who offers an alternative to the messages of the New Testament. Intentionally parodying the Gospels and,

to some extent, the life of Jesus, Zarathustra opens by taking note of the death of God and subsequently offers his alternative teachings concerning the transvaluation of all values in which the values of this world, the body, self-overcoming, and creativity are all affirmed. Within the beautiful prose of this work, one can find all of Nietzsche's major themes discussed and, in particular, three of Nietzsche's most well-known themes find their primary expressions among his published works here: the *Übermensch* or overhuman (man is something to be overcome), the eternal recurrence (standing at the gateway of the *moment*—the present—two paths confront human beings, one forward in time, one backward, each infinite. And then each person must ask him- or herself: Must not all things that *can* happen *have already* happened and will they not continue to happen? Is not everyone entangled in a complex causal network that cannot be changed and that recurs eternally, in the identical form?), and the will to power (the metaphysical principle that animates all life).

While *Thus Spoke Zarathustra* was the work that first attracted attention to Nietzsche as a philosopher, and it had a profound influence on the existentialist interpretation of Nietzsche's philosophy, it is on the basis of his next two books, *Beyond Good and Evil* and *On the Genealogy of Morals*, that Nietzsche's reputation as a major philosopher resides. In the nine chapters of *Beyond Good and Evil*, Nietzsche offers his clearest criticisms of many central themes in the history of philosophy (free will, the Cartesian ego, the representational model of knowledge, idealism, realism, reason vs. instinct, Kant's transcendental philosophy). He also offers some of his most striking criticisms of religion, of morality (§260 first introduces the distinction between master morality and slave morality), of nationalism, and provides his clearest expression of a philosophy of power (§13: "A living thing seeks above all to discharge its strength.").

*Beyond Good and Evil* also offers Nietzsche's most sustained defense of perspectivism and his most serious questioning of the value of truth. The text opens with a preface that places truth, aligned with Plato, Christianity ("Platonism for the people"), and dogmatism, in contrast to perspective, and from there moves in Part One—"On the Prejudices of Philosophers"—to question the value of truth as well as the value of many of the central ideas, presumed to be true, of past philosophers, including Plato's Forms, Kant's thing-in-itself, Descartes's ego, and Schopenhauer's will. Throughout his analysis, Nietzsche suggests that the question that should be asked, when considering these philosophical articles of faith is not

"Are they true?" but "Why is belief in their truth necessary?"

*On the Genealogy of Morals* offers Nietzsche's most sustained and powerful account of the origin and value of morality. The work itself unfolds in three carefully constructed essays. In the first, Nietzsche distinguishes between two moral frameworks: the noble morality that is based on distinguishing "good and bad," and the slave morality that makes judgments of "good and evil." The central idea of this first essay, Nietzsche writes, is his discovery of the birth of Christianity out of the slave's spirit of *ressentiment*. The second essay traces the moral concept guilt (*Schuld*) back to its origins in the economic relation of creditor and debtor, and offers an interpretation of the psychology of conscience, not as the voice of God in man, but as the instinct of cruelty that turns back on itself after it can no longer discharge itself externally.

In the third essay, Nietzsche inquires into the meaning of the ascetic ideal and, following an examination of the appearances of the ascetic ideal in philosophy, religion, art, morality, and science, discovers that the ascetic ideal is the harmful ideal par excellence. But the third essay also argues that the ascetic ideal has performed an essential, preservative function in that even though what the ascetic ideal has willed, throughout its long history, has in fact been imaginary (i.e., it has willed "nothing"), through its willing of nothingness, the will itself—that is, the ability to will—was saved. Nietzsche's genealogy of the ascetic will reveals that this will to nothingness, in the form of willing God or willing truth, while an aversion and hostility to life, was still a will that has preserved itself and has driven the deployment of *reactive* forces that is the history of the ascetic ideal. He offers, however, only tantalizing suggestions of a counter-will, a will to power that would no longer be a will to truth but would allow for the deployment of *active* forces that would make possible the overcoming of nihilism that has resulted from two thousand years of ascetic willing.

In 1888, the last year of his productive life, Nietzsche composed five short books. The first, *The Case of Wagner*, is Nietzsche's most sustained criticism of Wagner, and offers as well several insightful comments on art. Nietzsche describes *Twilight of the Idols* in letters on September 12 and 14, 1888, to his friends Peter Gast, Paul Deussen (1845–1919), and Franz Overbeck (1837–1905) as a "summary of my essential philosophical heterodoxies" (*Nietzsche Briefwechsel*), and this short text does indeed offer something of a survey of his basic themes while displaying his stylistic mastery, evidenced well in the title's play on Wagner's 1876 opera *Götterdämmerung*

(Nietzsche's *Götzen-Dämmerung* spoofing Wagner's "Twilight of the Gods"). Among the most interesting sections are his discussions of Socrates ("The Problem of Socrates") Kantian rationalism ("Reason" in Philosophy), philosophy ("Four Great Errors"), the influence of religion on morality ("Morality as anti-Nature"), and his highly condensed, six sentence history of Western philosophy and religion ("How the 'Real World' at last Became a Myth: History of an Error"), in which he moves from Plato to Christianity to Kant to positivism to the death of God and Nietzsche's own contributions of the free spirit and Zarathustra.

*The Antichrist*, which when published Nietzsche conceived, as he noted in the preface to *Twilight*, as the first volume of a longer work to be titled *Transvaluation of All Values*, is Nietzsche's most aggressive critique of Pauline Christianity. *Ecce Homo*, while completed in 1888, was withheld from publication by his sister Elizabeth until 1908. In it, Nietzsche offers a hyperbolic autobiographical and literary self-appraisal that only recently, with the increased attention to Nietzsche's writing style, has attracted the serious philosophical attention it deserves. Nietzsche's final published work, *Nietzsche Contra Wagner*, was dated Christmas 1888, less than two weeks before his collapse. Nietzsche's shortest work, he here reproduces with some minor emendations a selection of his earlier criticisms concerning Richard Wagner, thus making clear that the prosecution of Wagner in *The Case of Wagner* was not a late motif that Nietzsche arrived at only following Wagner's death.

No discussion of Nietzsche's work can fail to take account of his unpublished *Nachlass* of 1883 to 1888, in part because his sister published *The Will to Power*—a relatively small (slightly more than ten percent) and highly edited selection of these notes, first as approximately 400 sections in 1901, and in a second, expanded edition of 1067 sections in 1906—as if it had been a text written by Nietzsche himself. There is no doubt that for several years Nietzsche considered publishing a major work with this title, but there is equally no doubt that he definitively abandoned this project well before his collapse. As a consequence, claims made by Elisabeth and others as to this work being Nietzsche's *magnum opus* clearly cannot be sustained.

Heidegger's claim that *The Will to Power*, by which Heidegger meant the entire 1883 to 1888 *Nachlass* and not just Elisabeth's edition, contained the essence of Nietzsche's philosophizing is a more difficult claim to refute, especially as it relates as much to Heidegger's own desire to situate Nietzsche as the culminating figure in the his-

tory of metaphysics. What is clear is that many of Nietzsche's comments on his so-called major themes—most importantly, the eternal recurrence, will to power, and the *Übermensch*—are found primarily in these unpublished notes and, were one to discount the unpublished notes as well as Nietzsche's fictionalized account in *Thus Spoke Zarathustra*, it would be difficult to justify any of these three themes as being a significant part of Nietzsche's published prose works. That said, there is much of interest in these published notes for the philosopher as well as the Nietzsche scholar. While some passages are rough, or simply notes to himself for future work, or ideas and thought-experiments that he played with and chose, quite consciously, not to publish, others may well be ideas that he was still actively working on when his productive life ended.

Of particular note in this regard are his comments on scientists and scientific texts, especially biological texts, that he was reading in the mid- to late-1880s. Nietzsche was during this period reading as much if not more in scientific texts than philosophical texts, and while his biologicistic account of life makes its way into some passages in *Beyond Good and Evil* and elsewhere, the best evidence of his thinking on these issues remains to be read in the unpublished notes of the *Nachlass*.

## INFLUENCE

Walter Kaufmann opened and closed his article on Nietzsche in the first edition of the *Encyclopedia of Philosophy* with allusions to Nietzsche's influence upon modern philosophy and literature. Yet Kaufmann could scarcely have imagined the explosion of interest in Nietzsche's works, particularly in philosophical circles, that began in the mid-sixties and still continues. Kaufmann's bibliography, a perspectival review to be sure, lists only two secondary works on Nietzsche written in English—his own *Nietzsche: Philosopher, Psychologist, Antichrist* (1950) and George A. Morgan's *What Nietzsche Means* (1941). But since 1967, almost two thousand volumes focused primarily on Nietzsche—more than half of them in English—have appeared in English, French, and German, and perhaps ten times that number of essays, articles, or book chapters have been published.

Charting the expanding horizons of Nietzsche's influence quickly becomes a sociological study of the dominant motifs of late twentieth-century culture, and surveying the influence within the narrower field of philosophical inquiry is equally complex. There may in fact be no philosopher whose works admit less happily to a canonical or consensus interpretation, a claim sup-

ported by the staggering diversity of interpretations of Nietzsche's philosophy that have appeared since 1967. Nevertheless, some general observations can be made concerning the range of these new interpretations.

One can locate at least three primary factors in the increased philosophical attention to Nietzsche over the past forty years. First is the tremendous influence of Martin Heidegger's reading of Nietzsche. Published in Germany in 1960, translated into French in 1962 and into English between 1979 and 1987, Heidegger's overarching interpretation of Nietzsche as the culminating figure in the history of metaphysics inspired an enormous range of exegetical and critical response while leading several generations of philosophers and philosophy students back to read or re-read Nietzsche's texts.

A second reason for the increased attention by philosophers to Nietzsche can be located in the discovery of a "new Nietzsche" that emerged in conjunction with the rise of recent French philosophy. While most widely associated with Jacques Derrida and the deconstructionist attention to questions of textuality and the styles of philosophical discourse, Nietzsche's inclusion, along with Marx and Freud, as one of the three "masters of suspicion," and his importance in the philosophical works of Michel Foucault and Gilles Deleuze, have shown him to be an intellectual influence on much of what is called poststructuralist thought. And, as in the case of Heidegger, the popularity of poststructuralist French thought brought with it a renewed interest—among literary critics and theorists, historians, political theorists, and philosophers—in Nietzsche's thinking.

The third reason for the increased attention to Nietzsche concerns the transformation of philosophy within the anglo-American tradition. In the 1960s, Kaufmann's text, along with Arthur Danto's *Nietzsche as Philosopher* (1965), had first to justify Nietzsche as a philosopher whose ideas warranted serious philosophical consideration. As the scope of English-language philosophy has broadened, a distinctly anglo-American tradition of Nietzsche interpretation has appeared which is informed by the questions of ethics, metaphysics, and epistemology that occupy analytically trained philosophers.

This entry concludes with a brief survey of some of the main issues that have emerged in recent Nietzsche scholarship. To be sure, there is still much work offering interpretations of the classical Nietzschean themes: will to power, eternal recurrence, *Übermensch*, nihilism, perspectivism, and so on. But other issues have appeared as well. For example, an attention to questions of texts and textuality has played a role in much of the recent litera-

ture. It has become increasingly common to distinguish between Nietzsche's published texts and his unpublished notes, especially as concerns themes whose primary expression is to be found in the "book" constructed by his literary executors after his death and titled *The Will to Power*. One also finds an increasing tendency to read Nietzsche's texts as texts, following their internal development as opposed to simply viewing these texts as collections of remarks from which one can pick and choose the comments relevant to one's own argument. A third theme emerging from the recent interest in textuality is an attention to the various styles of Nietzsche's philosophical prose, in other words, an attention to his use of metaphor, to the literary character of much of his writing (in particular, *Thus Spoke Zarathustra*), to the different genre of writing (aphorism, essay, polemic, poem, etc.), and to other issues characterized collectively as the "question of style."

A second range of topics within the recent Nietzsche literature addresses some of the classic questions of philosophy: Does Nietzsche have a "theory of truth"? Does he have a "theory of knowledge"? An "ontology"? Is Nietzsche a metaphysician in the way that Heidegger defines metaphysics? Is Nietzsche an ethical naturalist? Within these questions, a topic that continues to draw attention is the issue of self-reference; in other words, when Nietzsche makes claims (about truth, reality, being, subjectivity, etc.), do these claims refer or apply to or hold true for his own philosophical conclusions? The most obvious case where the question of self-reference arises concerns the question of truth and interpretation: if Nietzsche claims that "there is no Truth," or that "everything is an interpretation," are these claims put forward as "true"? If they are, then they appear to contradict themselves; but if they are not true, then why should we be interested in them? The issue has been extended beyond the confines of epistemology, however, and one finds discussions of the eternal recurrence or the *Übermensch* or the ascetic ideal in terms of the question of self-reference.

A third and final set of issues that warrants noting is the extension of Nietzschean themes into new areas not discussed, or only hinted at, in the earlier Nietzsche scholarship. Among the most important topics producing much recent scholarship are Nietzsche's influence on postmodernism, his position on "woman" and his relevance for feminism, and his political philosophy and impact on twentieth-century political and social movements.

"Some are born posthumously," Nietzsche wrote in 1888. "One day my name will be associated with the

memory of something tremendous,” he claimed in *Ecce Homo*, at the beginning of a chapter titled “Why I am a Destiny?” One hundred years later, these remarks appear prophetic, and at the beginning of the twenty-first century, it would be difficult to find a philosopher whose influence on matters philosophical and cultural exceeds that of Nietzsche.

## Bibliography

### NIETZSCHE'S PUBLISHED WORKS AND SELECTED ENGLISH TRANSLATIONS

The definitive editions of Nietzsche's works as well as his letters and biography are the following:

*Nietzsche Werke. Kritische Gesamtausgabe*, edited by Giorgio Colli and Mazzino Montinari. Berlin: Walter de Gruyter, 1967ff. An English translation of the slightly abridged German critical edition *Kritische Studienausgabe* (Berlin: Walter de Gruyter, 1980) was begun under the General Editorship of Ernst Behler for Stanford University Press. The General Editorship was subsequently taken over by Bernd Magnus, and now is under the control of Alan D. Schrift and Daniel W. Conway.

*Nietzsche Briefwechsel: Kritische Gesamtausgabe*, edited by Giorgio Colli and Mazzino Montinari. Berlin: Walter de Gruyter, 1975ff.

Janz, Curt Paul. *Friedrich Nietzsche: Biographie*, 3 vols. Munich: C. Hanser Verlag, 1978–1979.

There are many translations available of Nietzsche's works. What follows are the full German titles, with year of publication, and the best available English translations:

**Die Geburt der Tragödie aus dem Geiste der Musik** (1872)

*The Birth of Tragedy*. Translated by Walter Kaufmann. New York: Random House, 1967.

*The Birth of Tragedy and Other Writings*, edited by Raymond Geuss and Ronald Speirs. Translated by Ronald Speirs. Cambridge, U.K.: Cambridge University Press, 1999.

*The Birth of Tragedy*. Translated by Douglas Smith. Oxford: Oxford University Press, 2000.

**Unzeitgemäße Betrachtungen**: I. *David Strauss, der Bekenner und Schriftsteller* (1873); II. *Vom Nutzen und Nachteil der Historie für das Leben* (1873); III. *Schopenhauer als Erzieher* (1874); IV. *Richard Wagner in Bayreuth* (1876)

*Untimely Meditations*. Translated by R. J. Hollingdale. Cambridge, U.K.: Cambridge University Press, 1983.

*Unmodern Observations*, edited by William Arrowsmith.

Translated by Herbert Golder, Gary Brown, and William Arrowsmith. New Haven, CT: Yale University Press, 1990. (Includes a translation of *Wir Philologen* [We classicists]).

*Unfashionable Observations*. Translated by Richard T. Gray. Stanford, CA: Stanford University Press, 1995.

**Menschliches, Allzumenschliches: Ein Buch für freie Geister** (1878); *Menschliches, Allzumenschliches* Vol. II; *Vermischte Meinungen und Sprüche* (1879); *Der Wanderer und sein Schatten* (1880)

*Human, All Too Human: A Book For Free Spirits*. Translated by R. J. Hollingdale. Cambridge, U.K.: Cambridge University Press, 1986. 2nd edition, 1996.

*Human, All Too Human. Vol. One*. Translated by Gary Handwerk. Stanford, CA: Stanford University Press, 1997.

**Morgenröte: Gedanken über die moralischen Vorurtheile** (1881)

*Daybreak: Thoughts on the Prejudices of Morality*. Translated by R. J. Hollingdale. Cambridge, U.K.: Cambridge University Press, 1982. 2nd edition, edited by Maudemarie Clark and Brian Leiter, 1997.

**Die fröhliche Wissenschaft (“la gaya scienza”)** (1882, 1887)

*The Gay Science*. Translated by Walter Kaufman. New York: Vintage, 1974.

*The Gay Science*. Translated by Josefine Nauckhoff. Cambridge, U.K.: Cambridge University Press, 2001.

**Also sprach Zarathustra: Eine Buch für Alle und Keinen** (1883–1885)

*Thus Spoke Zarathustra*. Translated by Walter Kaufmann. New York: Viking Press, 1954.

*Thus Spoke Zarathustra*. Translated by R. J. Hollingdale. Harmondsworth, U.K.: Penguin, 1961.

**Jenseits von Gut und Böse: Vorspiel einer Philosophie der Zukunft** (1886)

*Beyond Good and Evil: Prelude to a Philosophy of the Future*. Translated by Walter Kaufmann. New York: Random House, 1966.

*Beyond Good and Evil*. Translated by Marion Faber and Robert C. Holub. Oxford: Oxford University Press, 1998.

*Beyond Good and Evil*. Translated by Judith Norman. Cambridge, U.K.: Cambridge University Press, 2002.

**Zur Genealogie der Moral: Eine Streitschrift** (1887)

*On the Genealogy of Morals*. Translated by Walter Kaufmann and R. J. Hollingdale. New York: Random House, 1967.

*On the Genealogy of Morality and Other Writings*, edited by Keith Ansell-Pearson and Carol Diethe. Translated by Carol Diethe. Cambridge, U.K.: Cambridge University Press, 1994.

*On the Genealogy of Morals*. Translated by Douglas Smith. Oxford: Oxford University Press, 1996.

*On the Genealogy of Morality: A Polemic*. Translated by Maudemarie Clark and Alan J. Swensen. Indianapolis: Hackett, 1998.

**Götzendämmerung: Oder wie man mit dem Hammer philosophiert** (1888)

*Twilight of the Idols*. Translated by Walter Kaufmann. In *The Portable Nietzsche*. New York: Viking Press, 1954.

*Twilight of the Idols*. Translated by R. J. Hollingdale. Harmondsworth, U.K.: Penguin, 1968.

- Twilight of the Idols: or How to Philosophize with a Hammer.* Translated by Duncan Large. Oxford: Oxford University Press, 1998.
- Der Antichrist** (1888)  
*The Antichrist.* Translated by Walter Kaufmann. In *The Portable Nietzsche.* New York: Viking Press, 1954.
- The Anti-Christ.* Translated by R. J. Hollingdale. Harmondsworth, U.K.: Penguin, 1968.
- Nietzsche contra Wagner** (1888)  
*Nietzsche Contra Wagner.* Translated by Walter Kaufmann. In *The Portable Nietzsche.* New York: Viking Press, 1954.
- Der Fall Wagner** (1888)  
*The Case of Wagner.* Translated by Walter Kaufmann. New York: Random House, 1967.
- Ecce Homo: Wie man wird, was man ist** (1888)  
*Ecce Homo.* Translated by Walter Kaufmann. New York: Random House, 1967.
- Ecce Homo: How One Becomes What One Is.* Translated by Duncan Large. Oxford: Oxford University Press, 2004.
- Der Wille zur Macht** (1883–1888)  
*The Will to Power.* Translated by Walter Kaufmann and R. J. Hollingdale. New York: Random House, 1967.

## NIHILISM

The term *nihilism* appears to have been coined in Russia sometime in the second quarter of the nineteenth century. It was not, however, widely used until after the appearance of Ivan Turgenev's highly successful novel *Fathers and Sons* in the early 1860s. The central character, Bazarov, a young man under the influence of the "most advanced ideas" of his time, bore proudly what most other people of the same period called the bitter name of nihilist. Unlike such real-life counterparts as Dmitri Pisarev, Nikolai Dobrolyubov, and Nikolai Chernyshevskii, who also bore the label, Bazarov's interests were largely apolitical; however, he shared with these historical personalities disdain for tradition and authority, great faith in reason, commitment to a materialist philosophy like that of Ludwig Büchner, and an ardent desire to see radical changes in contemporary society.

An extreme statement by Pisarev of the nihilist position as it developed in the late 1850s and 1860s in Russia is frequently quoted: "Here is the ultimatum of our camp: what can be smashed should be smashed; what will stand the blow is good; what will fly into smithereens is rubbish; at any rate, hit out right and left—there will and can be no harm from it" (quoted in Avrahm Yarmolinsky, *Road to Revolution*, p. 120). Bazarov echoes this idea, though a bit feebly, when he accepts a description of nihilism as a matter of "just cursing."

Use of the term spread rapidly throughout Europe and the Americas. As it did, the term lost most of its anarchistic and revolutionary flavor, ceasing to evoke the image of a political program or even an intellectual movement. It did not, however, gain in precision or clarity. On the one hand, the term is widely used to denote the doctrine that moral norms or standards cannot be justified by rational argument. On the other hand, it is widely used to denote a mood of despair over the emptiness or triviality of human existence. This double meaning appears to derive from the fact that the term was often employed in the nineteenth century by the religiously oriented as a club against atheists, atheists being regarded as ipso facto nihilists in both senses. The atheist, it was held, would not feel bound by moral norms; consequently, he would tend to be callous or selfish, even criminal. At the

same time he would lose the sense that life has meaning and therefore tend toward despair and suicide.

## ATHEISM

There are many literary prototypes of the atheist-nihilist. The most famous are Ivan in Fëdor Dostoevsky's *Brothers Karamazov* and Kirilov in Dostoevsky's *The Possessed*. It was into Ivan's mouth that Dostoevsky put the words, "If God does not exist, everything is permitted." And Dostoevsky made it clear that it was Ivan's atheism that led him to acquiesce to his father's murder. Kirilov was made to argue that if God does not exist, the most meaningful reality in life is individual freedom and that the supreme expression of individual freedom is suicide.

Friedrich Nietzsche was the first great philosopher—and still the only one—to make extensive use of the term *nihilism*. He was also one of the first atheists to dispute the existence of a necessary link between atheism and nihilism. He recognized, however, that as a matter of historical fact, atheism was ushering in an age of nihilism. "One interpretation of existence has been overthrown," Nietzsche said, "but since it was held to be *the* interpretation, it seems as though there were no meaning in existence at all, as though everything were in vain" (*Complete Works*, Edinburgh and London, 1901–1911, Vol. XIV, p. 480). Albert Camus later dealt with this historical fact at some length in *The Rebel* (1951).

The tendency to associate nihilism with atheism continues to the present. It is to be found, for instance, in a work by Helmut Thielicke titled *Nihilism*, which first appeared in 1950. During the course of the twentieth century, however, the image of the nihilist changed, with a corresponding change in the analysis of nihilism's causes and consequences. Professor Hermann Wein of the University of Göttingen wrote, for instance, that the members of the younger generation of his time tended to think of the nihilist not as a cynical or despairing atheist but as a robotlike conformist. For them nihilism is caused not so much by atheism as by industrialization and social pressures, and its typical consequences are not selfishness or suicide but indifference, ironical detachment, or sheer bafflement. The literary prototypes are not the romantic heroes of Dostoevsky but the more prosaic and impersonal heroes of Robert Musil's *Man without Qualities* (first volumes published 1931–1933) or Franz Kafka's *The Trial* (1925).

## MORAL SKEPTICISM

If by nihilism one means a disbelief in the possibility of justifying moral judgments in some rational way and if

philosophers reflect the intellectual climate of the times in which they live, then our age is truly nihilistic. At no period in Western history, with the possible exception of the Hellenistic age, have so many philosophers regarded moral statements as somehow arbitrary. For many Continental philosophers, especially the atheistic existentialists, moral values are products of free choice—that is, of uncaused, unmotivated, and nonrational decisions. The most notable statement of this view is in *Being and Nothingness* (1943) by Jean-Paul Sartre. In England and America, most philosophers tend to the view known as emotivism, according to which moral statements are ultimately and essentially products of pure social conditioning or brute feeling. The most noted, though not the most extreme, representatives of this position are A. J. Ayer and Charles Stevenson.

It is impossible to state here with reasonable detail and accuracy the positions so summarily described in the last paragraph, much less to discuss their logical merits. For an understanding of nihilism, however, it is important to note how these positions relate to the ideas of those to whom nihilism of this kind is anathema. As already indicated, the most vociferous antinihilists were originally theologians, like Dostoevsky, who feared that disbelief in God would lead to selfishness and crime. If, they argued, there is no divine lawgiver, each man will tend to become a law unto himself. If God does not exist to choose for the individual, the individual will assume the former prerogative of God and choose for himself. For these antinihilists the principal enemy would have been Sartre. The later antinihilists, however, tend to save their fire for the emotivists, whom they accuse of sanctioning moral indifference and mindless conformity. If all moral codes are essentially matters of feeling and social pressure, then no one would be better or worse than another. The wise man, like the Sophists of Plato's day, would simply adjust as best he could to the code of the society in which he happened to be living. John Dewey's fervid insistence upon critical individual intelligence as the prime agent of social and moral reconstruction places him squarely in the second group of antinihilists.

Whether belief in atheistic existentialism or emotivism does in fact have the kinds of consequences suggested above is not at issue here. The point is simply that antinihilists of the older variety do not regard conventional morality, especially in its other-regarding aspects, as adequately justified unless it has a cosmic or divine sanction, whereas more contemporary antinihilists do not regard any moral code as adequately justified unless there is some standard or touchstone more universal than

pure feeling or social pressure to which it may be shown to conform. The pertinent question here is whether the antinihilists have a good case for these views.

It would appear that the demand for justification of conventional moral rules by appeal to a divine or cosmic power cannot be logically admitted without abandoning widespread and deeply felt notions about the nature of moral justification. If the higher power that presumably legitimizes our moral code is by definition good and just, an appeal to that power would involve us in a vicious circle. How would we know that that power was good and just unless there were some purely human ideas about the good and the just to which we felt entitled independently of that power's sanction? If, on the other hand, the presumed higher power is not by definition good or just, if, for instance, it were defined merely as a creator and sustainer of life, by what right could we appeal to it to legitimize our moral views? Might or power, even the power to create and sustain life, is not to be confused with right or legitimacy.

The demand that moral codes be justified by more universal standards than pure feeling or social dictate is, on the contrary, much more consonant with widespread, intuitive notions about the nature of moral justification. If social pressure is taken as the touchstone of morality, we once again court a confusion between might and right; if feeling is taken as the touchstone, we must apparently abandon not only the notion of a universal morality, feelings being notoriously fluctuating and individual, but also the notion that one of the functions of morality is to refine, direct, and control individual feelings. It may, of course, be the case that there is no universal morality and that whatever power morality possesses must derive from individual feeling and social conditioning alone. It would be surprising, however, if even the emotivists did not experience a certain chagrin that the truth in ethical theory should be so contrary to human hopes.

### MEANINGLESS OF LIFE

Passing to the second meaning of the term *nihilism*, we find that the pertinent questions are less logical or technically philosophical than psychological or sociological. There are two questions here, corresponding to the two forms of antinihilism. Is it true that a loss of faith in God or cosmic purposes produces a sense of despair over the emptiness and triviality of life, consequently stimulating selfishness and callousness? Is it true that industrialization and conformist social pressures have trivialized life in a similar way, causing us to adopt an attitude of ironic detachment? A negative answer to these questions would

appear to fly in the face of most contemporary social criticism and analysis as well as the testimony of most contemporary literature.

It is doubtful, however, whether a simple yes would be a proper response to the first question. When it is assumed that humankind needs a sense of divine or cosmic purpose in order to lead a rich and morally wholesome life, one is generalizing far beyond the evidence. The most that the evidence can be made to support is that relatively large numbers of people in certain societies at certain times have felt this need. No one who has read, for instance, Lev Tolstoy's account of his religious crisis in middle age could doubt the depth of his despair or the reality of his need for a vital relationship to an eternal being. One can reasonably doubt, however, whether that need and despair spring from universal and firmly rooted human aspirations. Some psychologists regard Tolstoy's conversion crisis as a symptom of involitional melancholia, and there are many who believe it to be a consequence of Tolstoy's social position as a member of Russia's decaying aristocracy.

Bertrand Russell went through a similar crisis earlier in life. He not only survived that crisis without reverting to faith in God or cosmic purpose; he also survived it, as his essay "A Free Man's Worship" (1902) attests, by deliberately espousing a world outlook that emphasizes the finitude and cosmic isolation of humankind. And no one who is familiar with the facts of his life would dare to suggest that the later Russell was less morally earnest than the young believer or less wholeheartedly and happily engaged in the process of living.

Those who attribute the nihilistic malaise of our time to industrialization and conformity are less vulnerable to the charge of overgeneralization. This is not because they limit their analysis to a given historical epoch, for they, too, are making an implicit generalization about universal human needs. Their point is that all people need, if they are to be whole and healthy, the sense that they can by a unique and personal effort contribute to the social process and that society will appreciate and reward this individual effort. This generalization is less vulnerable than the first simply because there is more evidence for it. Novels and biographies, ethnographic reports and individual clinical histories, not to mention commonsense attitudes of most men in all societies at all historical periods, tend to support it. And the issue raised by nihilism in this sense of the term is one of the great unresolved political and social problems of the twentieth and twenty-first centuries. Whether philosophers in their

professional capacity are competent to contribute to its solution is a question we shall not attempt to answer here.

## NIRVĀṆA

Nirvāṇa is the ultimate goal of Buddhist practice, although there has been disagreement among Buddhists concerning its nature and the means of attaining it. The word derives from a Sanskrit verbal root meaning "to blow" and a prefix meaning "out." The underlying meaning of the word is traditionally explained as expressing one of two metaphors. The first is that the term means

the act of blowing out or extinguishing, as of a flame. The second is that it means the act of being cooled down, as by a breeze. The two metaphors have in common the notion of fire or heat as a source of pain that is alleviated by a breeze. So the principal characteristic of nirvāṇa is relief from pain and the prevention of future pain through the eradication of its root causes. It is, in other words, the permanent release from the conditions that make pain possible, both physical pain and forms of psychological suffering such as sadness, grief, despondency, melancholy, frustration, and anxiety. Traditionally nirvāṇa is said to occur in two stages: the extinction of the causes of rebirth and the end of rebirth itself. For ease of exposition, the latter will be discussed first.

### NIRVĀṆA AS THE END OF REBIRTH

The Buddhist doctrine of nirvāṇa arose in the context of a view of the world that was common throughout India at the time when Buddhism was founded, in the sixth century BCE. According to that view, the world is both beginningless and endless and constantly changing. Among the many kinds of change in this world are the various stages undergone by a living being, or, more properly, an individual continuum of conscious. Such a being is born, matures, decays and eventually dies. When a living being dies, it does not cease to exist; rather it is transformed into another living being that also undergoes birth, maturity, decay and death. The cycle of rebirths that any given being undergoes is beginningless. The doctrine of Buddhism, and of many other systems of thought in ancient India, asserts that the cycle can, however, come to an end, provided that the conditions that keep the cycle going are eliminated. The name that is given to the end of the cycle of rebirths for any given continuum of consciousness is final nirvāṇa. It is described in Buddhist texts as the cessation of the process of being reborn into any kind of existence in any realm in the cosmos. Since all kinds of existence are at least potentially painful, the only way of eliminating the very possibility of experiencing physical or psychological pain is to stop existing altogether.

### NIRVĀṆA AS THE EXTINCTION OF THE CAUSES OF REBIRTH

According to Buddhist doctrine, the ultimate cause of rebirth is simply the desire to continue existing. When a deity or human being or animal dies wishing that life could continue, life does continue. The consciousness of the dying person then finds itself associated with a different body, which may or may not belong to the same bio-

logical species as the body that has just died. The type of body with which the continuing consciousness finds itself associated is determined by the overall mentality of the consciousness continuum at the time of the death of the previous body. What all rebirth has in common is the desire to continue existing, and this is the consequence of delusion, a fundamental misunderstanding about the real nature of existence. The real nature of existence is that every existing thing is characterized by impermanence. Because of this impermanence, nothing that anyone experiences endures, and therefore nothing, however pleasant it may be, can be a source of enduring satisfaction. Because every satisfactory experience comes to an end, it is ultimately disappointing and unsatisfactory.

These two characteristics of existence, impermanence and disappointment, give rise to a third feature of existence, namely, that no existing thing is part of an abiding self, and nothing can ever be owned. The delusions that fuel the desire to continue existing, therefore, are the erroneous beliefs that anything can be permanent, satisfactory, and either part of oneself or a potential piece of property that one can own. Nirvāṇa, then, is the elimination of those delusions by understanding existence as it really is. This correct understanding is called awakening or enlightenment. All of Buddhist doctrine and practice, then, can be seen as a process of working toward the state of enlightenment that makes final nirvāṇa possible. Enlightenment is therefore described as a name that is given to the absence of specific delusions, in the same way that final nirvāṇa is a name given to the absence of further rebirth.

### STAGES LEADING TO NIRVĀṆA

According to most schools of Buddhism, the path to enlightenment is incremental. One does not rid oneself of all delusion at once, because delusion itself is part of a complex mentality that consists of various vices that are caused by and that in turn reinforce the habit of having a naive and superficial perspective on one's experience. Although the specific manifestations of superficiality and its attendant vices differ for every individual, there is said to be a general pattern of how progress to enlightenment is made.

To understand the stages along the way to nirvāṇa, it is helpful to know that Buddhist tradition enumerates ten mental habits that obstruct peace of mind. They are

- (1) the opinion that complex objects are real,
- (2) suspicion or intense doubt,

- (3) abiding by rules and vows for the sole purpose of gaining merit for oneself,
- (4) desire for sensual pleasure,
- (5) malevolence,
- (6) passion for material things and for material forms of existence,
- (7) passion for spiritual or nonmaterial things, such as meditative states, and for nonmaterial forms of existence,
- (8) conceit, which is explained as the habit of constantly comparing and measuring oneself against others,
- (9) agitation or excitement,
- (10) misconception or ignorance, which includes any kind of failure to see things as they really are.

The first stage on the path to nirvāṇa is reached when the first three of these obstacles have been eliminated, and it is claimed that all three of these first three are eliminated at the same time, since the second and third are effects of the first. This first stage is also said to be reached more easily when one keeps good company, that is, the company of others who have reached at least the first stage. For this reason, much of Buddhist practice centers on maintaining a community of men and women who are helping one another strive for nirvāṇa. Although much of that struggle requires personal effort and a thorough knowledge of one's own mentality, the individual's efforts are said to be nearly impossible without the support of a community of like-minded people.

The second and third stages of the path to nirvāṇa are reached when one reduces and then eliminates the fourth and fifth obstacles. The final goal, nirvāṇa itself, is reached when one has eliminated all ten obstacles, and especially the passions for both material and spiritual states of being. A person who has attained nirvāṇa is called an *arhant* (feminine *arhatī*), which literally means "a person worthy of admiration." The *arhant* is someone who has all the characteristics of a buddha and differs from a buddha only in having required instruction to achieve nirvāṇa, whereas a buddha achieves nirvāṇa without ever having been taught how to attain it. All people who have reached any of these four stages that culminate in arhant hood are collectively known as nobles (*ārya*), and the path to nirvāṇa is known as the noble path or the path of the nobles.

## KNOWLEDGE OF NIRVĀṆA

According to a formula often repeated in canonical sources, when a person attains nirvāṇa, then he or she knows “what needed to be done has been done, and I shall never again be reborn in any realm in any form.” This raises the difficult question of how one can know an absence and especially a future absence. Obviously, one cannot directly experience an absence, nor can one directly experience anything that takes place, or fails to take place, in the future. The knowledge of the absence of one’s future rebirths, then, must be an inference of some kind. Even the knowledge that in the present life there will never again arise the ten obstacles enumerated above must be an inference of some kind. Just how such an inference might work and what kind of inference is involved occupied the attention of Buddhist scholastics from the time of Dharmakīrti on.

## THE SPECIAL ONTOLOGICAL STATUS OF NIRVĀṆA

According to Buddhist teachings, all conditioned things are impermanent, because the conditions upon which something depends can disappear, and when they disappear, so does anything that depends on them. nirvāṇa, however, is said to be a permanent achievement. If it is permanent, then it cannot be conditioned. From these considerations one of two possibilities follow. Either all things are conditioned, in which case nirvāṇa cannot be a thing at all, or nirvāṇa is an exception to the otherwise universal rule that all things are conditioned. Both of these possibilities have had their advocates among Buddhist scholastics. Those who regarded nirvāṇa as an unconditioned thing came to characterize nirvāṇa as a permanent entity that is constantly lucid and blissful, or as a state of being aware of a permanently lucid and blissful and essentially transcendent reality.

## LATER DOCTRINAL DEVELOPMENTS: NONABIDING NIRVĀṆA AND HAPPY REALMS

Several centuries after the founding of the Buddhist community, a movement arose that placed an emphasis on a kind of virtuoso known as a bodhisattva. The term itself originally referred to a person who was dedicated to becoming a buddha and thus referred to the Buddha Gautama (the founder of Buddhism) in his previous lives. In an extension of that original meaning, the term *bodhisattva* came to be applied to anyone who had come to realize that suffering is present in all realms of the universe, that the vast majority of sentient beings lack the

capacity to achieve nirvāṇa on their own strengths, and that they therefore require the help of someone dedicated to helping others attain nirvāṇa. A bodhisattva is a person who not only realizes all that but also vows not to attain final nirvāṇa until all other sentient beings have also attained it. Texts dealing with the bodhisattva ideal say that a bodhisattva may either postpone his or her own attainment of nirvāṇa until others have attained it or, preferably, may attain nirvāṇa and then renounce it in order to remain among sentient beings in need of help. Attaining nirvāṇa and then renouncing it is said to be preferable because the bodhisattva who does this already knows the way and can therefore better show others. This nirvāṇa that the bodhisattva attains and then renounces is called nonabiding nirvāṇa.

Another doctrine that began with the realization that most beings are incapable of attaining nirvāṇa through their own discipline alone was the myth that some buddhas have attained final nirvāṇa only after establishing special realms in which there are no environmental obstacles to tranquility. In such a realm, known as a happy land (*sukhavatī bhūmi*) or, following Chinese translations of the Sanskrit term, a pure land, all who abide there are surrounded by inspirational teachings. Even the babbling of brooks and the chirping of birds are discourses on virtue. In the absence of a painful external environment and in the presence of incessant sermons, the residents of the happy lands quickly attain final nirvāṇa. Two mythological buddhas who are said to have established happy lands are Amitābha and Akshobhya, the former of whom became the focus of an extensive cult in China and East Asia.

## NISHI AMANE

(1829–1897)

Nishi Amane, the pioneer in bringing Western philosophy to Japan, was born in Tsuwano, Shimane prefecture.

After the usual Confucian training he went to Edo (Tokyo) for further studies and was attached to Bansho Torishirabe-sho (Center for the Investigation of Western Books). In 1862 he was sent with other promising Japanese to Holland to study Western law and military science. In Holland his interest in philosophy was reawakened, and with his friend Tsuda Masamichi he became acquainted with the positivism of Auguste Comte, the utilitarianism of J. S. Mill, and Immanuel Kant's *On Eternal Peace*. He returned to Japan in 1865 and was appointed to the Kaisei School in Edo, where the government of the shogun requested him to translate books on law. After the Meiji restoration, Nishi was put in charge of educational matters for the Ministry of Military Affairs. At this time he also wrote most of his philosophical books. He became a member of the *Meirokeisha*, the group of leading intellectuals of the time, who advocated Western culture and mores. Nishi was several times president of the Tokyo Academy. He was made a baron and was appointed to the upper chamber of the legislature, the House of Peers, in 1890.

Nishi's importance as the "father" of Western philosophy in Japan lies in the new terminology he created—from his Japanese term for philosophy, *tetsugaku*, to his various translations—and in the original works that established a new tradition of speculative thinking. His positivist bent is revealed in *Reikon ichigenron* (Monism of the soul), one of his earlier works. More famous are his panoramic treatments of Western learning and philosophy in *Hyakugaku renkon* (Encyclopedia; written in 1874), a kind of philosophical or cultural dictionary, and *Haykuichi shinron* (A new theory on the many doctrines; written in 1874). In these Nishi prefers Mill's inductive method to Comte's positivism. In 1874 Nishi also wrote *Chichi keimō* (Logic, an introduction), the first of its genre in Japan. His utilitarian ethics is clearly manifested in "Jinsei sampō-setsu" (The three treasures theory of man's life), which appeared in the *Meiroke Journal* in 1875. He replaced Confucian ethics with a quest for the three treasures: health, wealth, and knowledge.

As a translator Nishi has to his credit Mill's *Utilitarianism* and a work titled *Mental Philosophy* by Joseph Haven, an American philosopher influenced by Scottish realism.

In later life Nishi became more conservative in his view of Western ideas, an attitude consonant with the country's post-1886 reaction against ultra-Westernization. As a director of a teacher's college, Shihan Gakkō, he proposed a combination of East and West in ethics; but in the last analysis he remains an expositor of Western phi-

losophy who never really tried to combine East and West in his thought and writing.

### Bibliography

Nishi's collected works are available in two editions. One is *Nishi Amane zenshū* (The complete works of Nishi Amane), 3 vols., edited by Okube Toshiaki (Tokyo, 1960–). Vol. I contains Nishi's philosophical works. The other edition is *Nishi tetsugaku chosakushū* (Collected philosophical works of Nishi Amane), edited by Asō Yoshiteru (Tokyo, 1933). Studies of Nishi can be found in *Japanese Thought in the Meiji Era*, edited by M. Kōsaka, translated into English by D. Abosch (Tokyo: Pan-Pacific Press, 1958), pp. 99–113; Gino K. Piovesana, *Recent Japanese Philosophical Thought, 1862–1962* (Tokyo: Enderle Bookstore, 1963), pp. 5–18; and R. F. Hackett, "Nishi Amane, A Tokugawa-Meiji Bureaucrat," in *Journal of Asian Studies* 18 (2) (1959): 213–225.

## NISHIDA, KITARŌ (1870–1945)

One of modern Japan's most prominent philosophers, Nishida was born in the village of Unoke, located on the Japanese Sea near Kanazawa, which was the capital of the Ishikawa prefecture. He attended the Prefecture Gymnasium in Kanazawa, where he began a lifelong friendship with Teitaro (Daisetz) Suzuki. He then enrolled at the University of Tokyo, choosing philosophy over mathematics, in which he was quite gifted, and studied Western philosophy there from 1891 until 1894. After completing his studies with a thesis on David Hume, Nishida returned to his home, married, and devoted himself intensely for about ten years after 1897 to the practice of Zen.

In 1899 he was appointed as a teacher at the Forth Senior High School (previously the Prefecture Gymnasium) in Kanazawa, where he taught logic, ethics, psychology, and German until 1909. During this period, which Nishida would later characterize as the best of his life, he laid the solid and fertile groundwork for his subsequent philosophical work, a groundwork based on the unusual combination of Western philosophy and Zen. Each day he faithfully practiced Zen meditation and sitting exercises (*Zazen*), but he also worked through the main texts of Western philosophy from Plato and Aristotle through to Henri-Louis Bergson, William James,

Heinrich Rickert, and Alexius Meinong. His own philosophy was to emerge out of the seemingly impossible combination of these two parallel directions.

In 1910 he received an appointment as assistant professor for ethics at the University of Kyoto. The following year his first work titled *An Inquiry into the Good* appeared, in which a philosophy of pure experience is developed. It is the first monumental philosophical work in Japan according to the full sense of the word *philosophy* as it was imported into Japan from the West. In 1913 he was named full professor for the philosophy of religion and then in 1914 full professor in philosophy. This was the beginning of what has come to be known as the Nishida period in the philosophy department at the University of Kyoto, during which a philosophical community arose around him with both high scholarly standards and close personal attachments. Hajime Tanabe, later Nishida's successor, and Tetsurō Watuji were recruited by him. Similarly successful students arose under his tutelage, including Kiyoshi Miki and Keiji Nishitani. The philosophical department flourished during this period and became a significant factor in the intellectual and academic life of modern Japan. This circle of scholars came to be known as the Kyoto School. He retired from the university in 1928.

His family life during this time, however, was difficult and painful, as he recalled on the occasion of his retirement: "For ten years, I have pursued my scholarly work while faced with continually unbearable, unfortunate circumstances in my family, which has been very difficult for me." In 1920 he lost his beloved first son, in 1925 he lost his wife, who had been bedridden at home for six years as the result of a serious stroke. One of his daughters suffered with tuberculosis for several years. Two others were hospitalized for acute typhoid fever, one of whom never completely recovered. Earlier, during the Kanazawa period, he had already lost his brother and two young daughters. In several philosophical essays, Nishida wrote, "What impels one towards philosophy is the sorrow and pain of human life." Not wonder that there is something rather than nothing, not methodical doubt as a means to achieve certainty, but rather the fate of human life as a whole on earth motivated Nishida to pursue philosophy. Nishida's basic question is, "What is the structure of the actual world into which we are born, in which we labor, and in which we die? What is our self in this actual world?"

Nishida's concern is not only the life-world, not only the historical world, but also the world of life and death. Nishida is not concerning solely with the self that lives in

the world, but rather the whole self that is born, lives, and dies. Sorrowful, painful events in human life tear open the world. This tear or rift opens up a window and gives access to the profundity of the world. Nishida says that "Grasping the common everydayness of our lives most profoundly leads to the most profound philosophizing." This profundity is nothing other than the profundity of everyday life. Nishida speaks of eschatological everydayness.

In the middle of the painful sorrows of his life, Nishida could say: "The ground of my heart, infinitely deep, will not be reached by all of the waves of joy and cares." For Nishida profundity or depth was experienced profundity. In his calligraphic work, for which he also counts as an artist, Nishida expresses a beautiful power rising out of this profundity. In spite of the difficult circumstances he faced in his life, he worked continuously every day. Even in the year in which he retired, he published five essays, including *Predicative Logic*, *The Place Wherein One Sees Oneself and the Place of Consciousness*, and *The Intelligible World*. His creative powers were sustained up to the end of his life, whereby the pathway for his thinking did not get any easier.

After his retirement Nishida spent half of each year in Kyoto and half in Kamakura at the seashore. He said, "I love the sea. There is something infinite that is suspended and moves in the sea." One student characterized Nishida's philosophy as a philosophy of the sea. His boyhood friend Suzuki also lived in Kamakura after he had returned from the United States so there the two of them often met for conversations in the space between Zen and philosophy, and Nishida attributed much in his philosophy to the influence of Suzuki. After his second marriage in 1931, Nishida's family situation was much better, but his concerns over Japan's worsening internal political situation and its external policies became increasingly grave. In 1939 the Second World War began and in 1941 the Pacific War with the United States began, which plummeted Japan on the war to its catastrophic defeat in August of 1945.

In May of 1945, Nishida wrote to Suzuki regarding the impending defeat: "Things are happening as we always feared they would. A state that is based on military power will perish by military power." As he was intensely searching for the possibility of a world culture that could unite humanity in the newly unified world that was to come after the world war, Nishida died on June 7, 1945, on account of an acute kidney infection. On his desk lay the unfinished manuscript of an essay *Concerning My Logic*. Nishida worked up until the last day of his life.

During the year before he died, he wrote articles titled *Concerning A Philosophy of Religion Governed by the Pre-established Harmony, Life, Philosophical Foundations of Mathematics*, and *The Logic of Place and the Religious World View*.

## HIS WORK

In 1926 the essay *Place (Basho)* appeared. Concerning that article, Nishida wrote, "It seems to me that I attained my final standpoint with the notion of 'place.'" Nishida's philosophy can in a real sense be characterized as a philosophy of place. The basic idea behind the notion of place is: Everything that is, is located in a place. *Being* means *being in*. The proposition "S is P" means in truth that "S is in P." Nishida states one time simply and concretely, "Place is where we are located." *Place* for Nishida, then, corresponds to what Martin Heidegger called *world* as a component of being in the world. For Nishida, place consists both of the place of being and the place of the absolute nothing in the sense that the place of being is surrounded by the place of absolute nothing. The place of being as the place of limited disclosedness is located within the place of nothing as the unlimited disclosedness, infinite openness. *Place* thereby has a twofold disclosedness for us. Those of us who find ourselves in a place find ourselves not only in a world, but also in the unlimited openness that surrounds the world, a view that is different from Heidegger's. Nishida explicitly discusses the *we* as something that is located in a place in his essay *I and Thou* (1932).

According to Nishida, *I and thou* means that I am what I am in that I am nothingness in the unlimited openness, and conversely, *I and thou* means that you are what you are in that you are in the nothingness of unlimited openness. Nishida views the relationship differently than Martin Buber in that the I-thou is an aspect, the face-to-face aspect of the full reality of what is located in a place, a reality that consists in the fact that this one single individual and this other single individual are both in contradiction and in unity based on the abyss of the absolute nothingness where there is neither *I* nor *thou*. The basic traits of the notion of place according to Nishida can only be understood in correspondence to an originary pure experience because the notion of place is developed out of this experience.

Nishida's philosophy of pure experience arose through an original and radical encounter between West and East. There is a qualitative divide between the thinking of Western philosophy and the nonthinking in Zen. This rift inside Nishida himself, where both philosophy

and Zen coexisted, threatened to rip him apart, but instead it came to serve as a magnetic field in which philosophy and Zen actually touched and permeated each other. This is where Nishida's philosophy was born, a philosophy of another beginning. For a philosophy of pure experience, it is crucial to explain everything through the fact that the only real reality is pure experience. In attempting to explain everything within a single context, Nishida orients himself on Western philosophy; his pure experience, however, comes from Zen.

Pure experience is not a monadic substance-like foundational entity, but rather an original occurrence of experiencing, an event like the following: "In the moment of seeing, of hearing, still without reflections such as 'I see flowers' and without judgments like 'These flowers are red,' in this moment of momentary seeing or hearing, there is neither subject nor object." This immediately experiencing experience occurs as the ground of the truly real reality because in immediate seeing and hearing the undifferentiatedness that obtains before splitting into difference is at work. Here, a direct connection between the empirical and the metaphysical is revealed in a unique way. For Nishida, the metaphysical does not disclose itself beyond experience but rather within experience, that is, within the immediately experiencing experience. Nishida sees the origin of the true self in pure experience because in it shackles of the ego are shattered. The empirical, the metaphysical, and the existential are integrated here prior to their differentiation.

Human experience, which is usually encountered as constrained or shackled inside the subject/object framework, breaks through this framework into the unlimited openness through the originary event of pure experience as immediate seeing and hearing. Pure experience is then articulated within the subject-object framework, but now not as a constraining frame, but rather as a projective ladder into openness. The place for the self-articulation of experience is now in the subject-object framework within the infinite openness. This is then the equivalent to the place of being within the place of the absolute nothingness. From this perspective, pure experience articulates itself as the originary unified whole, sometimes from the subjective side, but not as a subject, and sometimes from the objective side, but not as an object. Illustrating the differentiation of pure experience in dynamic relationships is what we mean by explaining everything.

Nishida actually does present these explanations. Explanation, however, is work that takes place at the level of reflection. How are pure experience and explanation related? To answer this question, the standpoint of

pure experience turns into the standpoint of self-consciousness/self-awareness, which unites intuition and reflection within itself. Here, once again, the question of the place of self-consciousness is fundamental. This kind of awareness is more than self-consciousness because the limited place in the unlimited place of openness, this duality of place, is mirrored in the limited place that arises as the focal point of self-consciousness that is transparent to itself for the unlimited openness. Self-consciousness/self-awareness says, “I am I, in not being I” instead of simply “I am I.”

The dynamic connection of “pure experience, self-consciousness or self-awareness, and place” (Basho) serves as the basis for further philosophical deliberations that Nishida carried out in the areas of art, history, society, the state, practical philosophy, the study of experience, mathematics, physics, and others areas in which he showed over and again how they are all permeated by this fundamental constellation. In the course of thinking that does not always proceed smoothly, Nishida tried out some unique categories such as active intuition, historical body, absolutely contradictory self-identity, and converse parallel to name just a few.

Nishida’s thinking proceeds from a new beginning. Its basic category is place instead of substance, God, or the modern notion of an absolute (transcendental) subject. Logic as the logic of a contradictory self-identity, or rather the self-identity of the self-contradictory (the logic of place) instead of a logic of identity; the unity of the contradictory subject-object on the basis of something-before-the-split instead of a subject-object schema; reason as something that is active in intuition or rather acts as intuition instead of one side of a regional, qualitative distinction between sense and reason—all of these things arise out of pure experience. If global philosophy is going to take into account non-Western cultural traditions, Nishida’s philosophy needs to be discussed within the horizon of that philosophy.

## NOMINALISM

*See Goodman, Nelson; Hobbes, Thomas; Quine, Willard Van Orman; Roscelin; Universals, A Historical Survey*

## NOMINALISM, MODERN

In its main contemporary sense, nominalism is the thesis that abstract entities do not exist. Equivalently, it is the thesis that everything that does exist is a concrete object. Since there is no generally accepted account of the abstract-concrete distinction, and since it remains genuinely unclear how certain (putative) entities are to be classified, the content of modern nominalism is to some degree unsettled. Certain consequences of the view are, however, tolerably clear. For example, it is widely agreed that the objects of pure mathematics—numbers, sets, functions, abstract geometrical spaces, and so on—are to be classified as abstract. It is also widely agreed that certain objects of metaphysics and semantics—propositions, meanings, properties and relations, and so on—must be abstract if they exist at all. Modern nominalists thus commit themselves to rejecting these paradigmatic abstract entities and hence to rejecting any scientific, mathematical, or philosophical theory according to which such

things exist. In this sense nominalism is standardly opposed to platonism (or, less commonly, antinomialism).

## EARLY HISTORY

The first significant philosophical system in the modern period to insist on the existence of abstract objects is due to Gottlob Frege. Frege (1980) held that the truths of pure mathematics concern a domain of mind-independent abstract entities. Frege (1984) further held that any adequate account of thought and language must allow that meaningful linguistic expressions are associated, not simply with concrete worldly items, but also with senses (*Sinne*), and that for various reasons these linguistic senses must exist in a “third realm,” distinct both from the realm of subjective mental items and the realm of sensible, concrete things. Frege’s vigorous defense of platonism in semantics and the philosophy of mathematics forms the background for the emergence of modern nominalism in the 1920s.

The Warsaw school of logicians centered around Stanisław Leśniewski and Tadeusz Kotarbiński set itself the task of reconstructing modern logic and mathematics along nominalistic lines. Kotarbiński’s reism, for example, was a methodological position according to which, wherever possible, statements that apparently concern abstract entities (e.g., “Bonds of brotherhood unite Orsetes and Electra”) are to be replaced by statements that concern only concrete entities and parts thereof (e.g., “Orestes is Electra’s brother”) (Kotarbiński 1955). The principal motivation for the program was to prevent scientific work in these areas from becoming embroiled in ancient metaphysical and epistemological controversies. The nominalistic project was introduced into Anglophone philosophy by W. V. Quine, who first encountered it in conversations with Leśniewski and Alfred Tarski in 1933. Quine’s main positive contribution to the program was the seminal 1947 manifesto “Steps Toward a Constructive Nominalism,” coauthored with Nelson Goodman. Quine soon abandoned nominalism in favor of a moderate and distinctive form of platonism. It may nonetheless be said that all subsequent discussion of modern nominalism in the Anglophone tradition derives directly from this paper.

## MOTIVATIONS FOR NOMINALISM

In “Steps Toward a Constructive Nominalism” Goodman and Quine defend their rejection of abstract entities by invoking “a philosophical intuition that cannot be justified by appeal to anything more ultimate” (1947: 97). In

subsequent years philosophers have sought to provide a more explicit motivation for the view.

**OCCAM’S RAZOR.** According to a slogan associated with the tradition of medieval nominalism, “entities are not to be multiplied beyond necessity.” Some modern nominalists appeal to this principle in motivating their position. These writers typically concede that existing scientific and mathematical theories entail the existence of abstract entities and are therefore nominalistically unacceptable. They maintain, however, that it is possible to produce nominalistically adequate versions of, or surrogates for, these theories, and so to “dispense” with abstract objects. Occam’s razor is then invoked to argue that when such parsimonious surrogates are available, it is rational to reject the standard platonistic theories and to embrace the surrogates instead.

Much of the constructive work in the nominalist tradition consists in providing nominalistic surrogates for existing theories. Roughly speaking, a nominalistic surrogate  $T_N$  for a platonistic theory  $T_P$  is a theory whose quantifiers range only over concrete objects, but which is nonetheless fit to do much of the same theoretical or explanatory work as the original. For example, standard formalizations of physical theories involve quantifiers that range over both concrete physical entities (particles, fields, points, and regions of space-time, etc.) and mathematical entities (real numbers, vectors, functions, etc.) A nominalistic alternative to (say) classical electrodynamics would be a theory whose quantifiers range only over concrete objects, but whose predictive and explanatory power exactly matched that of the standard platonistic formulations.

Nominalistic surrogates for standard theories have been developed in a number of domains (Field 1980, Hodes 1984, Chihara 1990, Balaguer 1998). However, the significance of these reconstructive programs is open to doubt for several reasons. For example, while the nominalistic surrogates do indeed typically posit fewer entities than the platonistic originals, they are typically inferior to the originals in other respects. In some cases they require a substantial extension of the extensional first-order logic that suffices for platonistically formulated science. In most cases the nominalistic theory is significantly less perspicuous and flexible than its platonistic counterpart.

One may therefore concede that other things being equal, nominalistic theories are to be preferred on grounds of parsimony, while insisting that since other things are not equal, Occam’s razor has no clear application. A more profound challenge is directed at the razor

itself. Contemporary philosophers who cite ontological parsimony as a basis for theory choice often suppose that the principle derives its authority from its role in the sciences. But as critics have pointed out (Burgess and Rosen 1997), there is scant evidence that scientists accept the principle in its most general form. Scientists may be concerned to minimize the number of physical mechanisms or fundamental laws in the theories they accept. But working scientists and mathematicians have shown no interest in reducing the number of abstract entities posited by the mathematical theories they invoke. To the contrary, in mathematics and mathematical physics there is some concern to maximize the range of mathematical objects and structures (Maddy 1997). If this is correct, then proponents of the Occamist case for nominalism must maintain that the impulse to ontological parsimony to which they appeal is not a principle of scientific methodology, but an independently compelling philosophical principle.

**THE ACCESS PROBLEM.** The most widely cited ground for nominalism derives from Paul Benacerraf (1973). Benacerraf notes that since abstract mathematical objects are causally inert and therefore incapable of affecting our senses, even indirectly, there is a question as to how one might come to know that they exist. Benacerraf invokes the *causal theory of knowledge*, originally proposed by Alvin Goldman (1967) for other purposes, according to which, roughly, a person S knows that p only if S stands in some suitable causal relation to the objects with which p is concerned. This principle entails that true claims about abstract objects cannot be known to be true, even if they are true. And while this does not entail that there are no abstract entities, it does entail that platonism is unstable in the following sense: Proponents of a Platonistic theory must concede that they cannot know whether the theory they accept is true. However, as critics were quick to point out the causal theory of knowledge on which Benacerraf relies is objectionable on other grounds (Steiner 1975). In the subsequent debate nominalists rarely invoke this or any other detailed theory of knowledge. Instead, they maintain that the causal inefficacy of the abstract leaves our access to the abstract domain an utter mystery. Since it is clearly desirable to avoid such mysteries, this provides a motivation for pursuing, and perhaps also for accepting, nominalistic alternatives to standard theories.

**THE DISPENSABILITY ARGUMENT.** Hartry H. Field (1980, 1989) provides a number of motivations for nominalism that do not depend on the causal theory of

knowledge. Field begins with a question for the platonist: What reason might one have for believing the claims of standard mathematics? If one has reason to believe the axioms, then one might acquire reason to believe the theorems by constructing proofs. So the question becomes: What reason might one have for believing the axioms of standard mathematics? Since the axioms involve substantial existential claims, it is hard to see how they could be known *a priori* (but see Wright 1983, Hale 1988). And since these claims concern causally inert abstract entities, it seems clear that they cannot be verified directly by observation or experiment. Field thus concludes that the only reason one can have for believing the axioms is that they play an indispensable role in one or another well-confirmed scientific theory. Earlier writers (Quine 1960, Putnam 1971) defended platonism in this way. For example, Hilary Putnam (1971) notes that since the laws of physics are standardly formulated in mathematical terms, someone who denies the existence of (say) real numbers is not in a position to formulate, much less to employ, even the most elementary laws of physics. Quine and Putnam thus offer the following indispensability argument for platonism:

- (1) One is justified in believing that abstract objects exist if, but only if, theories that entail the existence of such objects are indispensable for scientific purposes.
- (2) Standard mathematics entails the existence of abstract objects.
- (3) Standard mathematics is indispensable for scientific purposes.
- (4) Therefore, one is justified in believing that abstract objects exist.

Field rejects premise (3), thereby turning the argument on its head. He argues that in certain cases it is possible to produce reasonably attractive nominalistic versions of standard platonistic theories: versions in which the only objects posited are material bodies and space-time regions. Field maintains that to the extent that such nominalistic surrogates are available, they establish that abstract objects are dispensable for scientific purposes. The construction of such surrogates thus undercuts the only reason one might have had for believing in abstract objects, and so provides a roundabout motivation for nominalism.

Field concedes that the nominalistic alternatives he constructs are in certain respects inferior to the standard platonistic theories on which they are based. They are

typically unwieldy and imperspicuous: Derivations are typically longer and harder to follow. Field concedes that it would be unreasonable for working scientists to use these nominalistic theories for most purposes and hence that platonistic theories are indispensable in practice. His central claim is that they are nonetheless dispensable in principle and that for the purposes of the Quine-Putnam challenge dispensability in principle is what matters.

One distinctive ingredient in Field's view is a demonstration that scientists who accept only the nominalistic physics that Field constructs are nonetheless entitled to use platonistic mathematics in the course of their work. This claim is supported by a formal result. Let  $T_p$  be a standard platonistic theory, and let  $T_N$  be a nominalistic surrogate for  $T_p$  constructed according to Field's method. It may then be shown (with certain important qualifications) that for any nominalistic statement  $S$ —that is, any statement whose quantifiers are restricted to concrete entities— $S$  is a theorem of  $T_p$  if and only if  $S$  is a theorem of  $T_N$ . This conservative extension theorem supports the claim that a theorist who accepts  $T_N$  may legitimately employ the full mathematical resources of  $T_p$  for the purpose of deriving nominalistic claims about the concrete world (for a discussion on this, see Shapiro 1983, Burgess and Rosen 1997). Such theorists may then legitimately regard the mathematical apparatus of  $T_p$  as a useful fiction in which they indulge for various practical purposes. Field's version of nominalism is thus a form of fictionalism about mathematical objects.

Field's work has provoked an intense critical response (Irvine 1990). Field himself notes that his procedures for nominalizing platonistic theories are inapplicable to an important class of theories, including Albert Einstein's general theory of relativity and quantum mechanics, and hence that it remains an open question whether platonistic theories are dispensable even in principle for the purposes of contemporary physics (compare Balaguer 1996). Others wonder why Platonistic theories that are indispensable in practice should not provide one with adequate grounds for believing in the abstract objects they posit. Perhaps the most fundamental philosophical response to Field's approach calls into question premise (1) of the indispensability argument, which is also a crucial premise in Field's positive defense of nominalism. In effect, the premise asserts that abstract objects have the status of theoretical entities, in the sense that one acquires reason for believing in them only when the assumption of their existence is required for some urgent scientific purpose.

Against this, critics maintain that some propositions about abstract objects—for example, the claim that there is a number between 3 and 5, or the claim that Jane Austen wrote six novels—are perfectly ordinary claims. Anyone who has learned basic arithmetic can supply a reason for believing that there is a number between 3 and 5 (Parson 1986), and anyone who knows how to use the library can verify that Austen wrote six novels. It is a presupposition of the debate between Field and proponents of the indispensability argument that these relatively nontheoretical justifications for platonistic claims are inadequate. But this claim may be challenged. If one's ordinary reasons for believing platonistic claims are good enough, then the fact that such claims are dispensable for certain theoretical purposes has no immediate bearing on the debate over nominalism.

## REVOLUTIONARY VERSUS HERMENEUTIC NOMINALISM

In the nominalist tradition that runs from Goodman and Quine (1947) to Field (1980), it is generally conceded that since standard mathematics entails the existence of abstract objects, the nominalist must supply an alternative to standard mathematics, both pure and applied. This alternative might take the form of a genuinely novel formulation, as with Field's nominalistic version of Newtonian gravitational theory. But it may also take the form of a reinterpretation of existing theories. On this approach the nominalist proceeds by supplying a revisionary account of the meanings of mathematical statements. For example, the nominalist may maintain that while existential arithmetical statements like "There is a number between 3 and 5" in fact affirm the existence of abstract entities, they should be reinterpreted as claims about (say) concrete numeral inscriptions. In either case the nominalist must argue for a revision in accepted science and mathematics. Nominalist programs of this sort have thus been labeled *revolutionary* (Burgess 1983).

Revolutionary nominalism is contrasted with hermeneutic nominalism. Hermeneutic nominalists maintain that it is a mistake to interpret ordinary mathematics as involving claims about abstract objects in the first place. They might maintain, for example, that as they are ordinarily understood, existential claims like "There is a number between 3 and 5" are in fact claims about concrete numeral inscriptions and hence that such claims might be true even if there were no abstract entities. On this sort of account nominalism requires no revision in settled doctrine.

The most straightforward version of hermeneutic nominalism would maintain that abstract singular terms like 3 and *the cosine function* denote particular concrete objects. Claims of this sort are rarely plausible, however, and so proposals in this domain are typically more complex. For example, Geoffrey Hellman (1989) proposes that a statement *S* in the language of arithmetic is true if and only if a certain modal condition holds: (a) there might have been an infinite sequence of objects satisfying the axioms of arithmetic, and (b), if there had been such a sequence, a certain structural condition derived from *S* would have been true of it. Hellman then argues that since this sort of modal claim might be true even if there are in fact no abstract objects, the original mathematical claim is nominalistically acceptable, appearances to the contrary notwithstanding.

There are two main objections to hermeneutic proposals of this sort. The first notes that since such claims are ultimately claims in empirical linguistics—they are claims about the meanings of ordinary mathematical statements—they require empirical support and that in the relevant cases no such support has been forthcoming (Burgess 1983). The second notes that even if hermeneutic nominalists' semantic claims were tenable, it is not clear that they would serve their purpose. Unlike their revolutionary counterparts, hermeneutic nominalists do not deny the claims of standard mathematics. But these claims include *existence theorems*: assertions of the form "There exists a number *n* such that ..." Hermeneutic nominalists must therefore allow that these ordinary existence claims are true and hence that by their own lights, numbers and the like exist. On the face of it, however, this claim is incompatible with their nominalism (Alston 1958, Burgess and Rosen 1997; see also Stanley 2001).

### CONTEMPORARY FICTIONALISM

As they are usually understood, the programs of revolutionary and hermeneutic nominalism both require detailed constructive work. Theorists proceed by constructing an autonomous, independently intelligible nominalistic theory  $T_N$ , which is then used either to replace or to interpret the original (apparently) platonistic theory,  $T_P$ . The development of a suitable theory  $T_N$  is typically a nontrivial task, which in many cases requires a profound analysis of the original.

However, some nominalists maintain that detailed constructions of this sort are unnecessary. Easy fictionalism, as the approach is sometimes called, holds that even in the absence of an autonomous nominalistic alternative, nominalists may make free use of standard mathe-

matics and of other platonistic theories without thereby committing themselves to the existence of abstract objects.

Consider for example the claim (S): (S) the mass (in grams) of *A* = 3.6. On its face (S) asserts that the object *A* stands in a certain relation to a number. The claim is literally true only if two conditions are satisfied: on the concrete side, the object *A* must have a certain intrinsic property—a property for which one may have no standard name that does not invoke a relation to numbers; and on the abstract side, the number 3.6 must exist. To maintain the literal truth of (S) is thus to maintain that abstract objects exist. But consider the claim that things are, in all concrete respects, as if (S) were true. The suggestion is that this claim says just what (S) says about the intrinsic configuration of the concrete world, while making no claim whatsoever about the existence of abstract entities.

Easy fictionalists propose that as a matter of convenience one routinely pretends that abstract objects of various sorts exist and that one conveys information about the concrete world by endorsing theories that purport to affirm relations between concrete things and abstract things. Their suggestion is that in "endorsing" these theories, one commits oneself only to the nominalistically acceptable claim that things are, in all concrete respects, as if one's theories are true.

Easy fictionalism comes in a number of varieties. It may be put forward as a hermeneutic proposal, describing the attitude that scientists and mathematicians normally adopt toward their own claims about abstract entities (Yablo 2001). More commonly, it is put forward as a revolutionary proposal. Here, the suggestion is that in light of the arguments in favor of nominalism, it would be rational (or at least, rationally permissible) to adopt a fictionalist attitude toward discourse about abstract objects (Balaguer 1998, Rosen 2001). The main challenge for easy fictionalism is to provide a clear account of the central idiom, "Things are, in all concrete respects, as if *S* were true," or perhaps, "According to the fiction of mathematical objects, *S*." The most natural account involves a counterfactual conditional. To say that things are in all concrete respects as if *S* were true is to say that if there were abstract objects (and the concrete world were just as it is in all intrinsic respects), then *S* would be true. But counterfactuals of this sort are problematic. It is widely held that the existence of abstract objects could not possibly be a contingent matter (Hale and Wright 1992; compare Field 1993). And if this is right, then by nominalists' own lights, such conditionals involve a necessarily false

antecedent. A second challenge for the approach is to provide an account of pure mathematics, where the aim of the discourse is not simply to provide information about the configuration of the concrete world.

## NOMOS AND PHUSIS

*Phusis* is the ancient Greek word for "nature," cognate with the verb "to grow" (*phuein*); as in English, it can be used both for the natural world as a whole and for the "nature" (i.e., the essential or intrinsic characteristics) of any particular thing, which it has "by nature" (*phusei*). *Nomos* encompasses both law and unwritten, traditional social convention. The contrast between the two concepts is central to ancient sophistic thought, with roots in the pre-Socratic inquiry into the underlying natures of things.

For the Sophists, *nomos* and *phusis* are polar terms, roughly equivalent (respectively) to the socially constructed and the universally, objectively given. The contrast was most strikingly applied in relation to justice. Antiphon's *On Truth* argues that justice is a matter of *nomos*, and *nomos* and *phusis* conflict; one should observe the requirements of justice when there are witnesses, but follow the dictates of nature otherwise. By "nature," Antiphon seems to understand what is physio-

logically given to all humans (Greeks and barbarians alike). By following it one gains what is advantageous to one's existence: life, pleasure, and freedom. In Plato's *Gorgias*, Callicles argues, with an appeal to animal behavior, that it is a matter of "justice according to nature," as opposed to convention, for the strong to prey upon the weak.

However, the same conceptual framework, including the assumption that nature represents an authoritative norm, could be used to support the opposite stance. The *Anonymous Iamblichii* argues that law and justice should be obeyed as having "kingly rule" among human beings—a rule established by human nature itself. So the nomos-physis contrast was a framework for discussion rather than a theory in itself. It allowed for fruitful debate as to where the testimony of nature might be observed, what guidance it could provide, and how the norms of law and morality might relate to it.

Far from being restricted to justice, nomos-physis is best understood as a catch phrase for the general sophistic inquiry into the institutions of human society. Thus various Sophists seem to have applied the concepts to slavery, gender roles, language, and religion. For instance, the *Sisyphus* fragment (by either Critias or Euripides) argues that religion was invented by ancient sages as a device for social control, implying that the gods exist only by convention. The contrast could even be extended to questions of general epistemology. Democritus (usually classed as a pre-Socratic, but associated by sources with Protagoras) summed up his atomism by claiming that sensory properties, such as colors and tastes, are merely conventional; in reality there are only atoms and the void. Here, conventional seems to be tantamount to mind-dependent, or merely apparent.

The adoption of nature as a normative standard is the most powerful legacy of sophistic thought. Plato and Aristotle both constructed their ethics and politics around their understanding of human nature, and took this to be in harmony with the nature of the cosmos and the divine. Later, Epicureans and Stoics both argued that the good life is one lived in accordance with nature (*kata phusin*), which they explicated by invoking animal behavior in the "cradle argument." But these philosophers differed widely in their treatment of nomos, and the nomos-physis polarity as such faded from prominence after the Sophists.

## NONCOGNITIVISM

Noncognitivists (or nondescriptivists) hold that the function of normative judgments is not, or not primarily, to describe or state facts and that because of this, these judgments lack a truth-value. A strong form of ethical nondescriptivism says that moral judgments have no descriptive function, but weaker forms say only that their nondescriptive function is primary or dominant.

Differing accounts of the nondescriptive function of moral language generate a variety of nondescriptivisms. Moral judgments have been said to express emotions, feelings, attitudes, or stances; and they have been characterized as tools for performing other nondescriptive tasks such as commanding, requesting, endorsing, or commending. A. J. Ayer, whose position is called emotivism, said that "ethical terms" express emotions or feelings and that they "are calculated also to arouse feelings, and so to stimulate action" (1952, p. 108). C. L. Stevenson, whose metaethical theory is called noncognitivism, argued that the major use of "ethical statements" is dynamic rather than fact stating. They are not, he said, primarily used to describe interests or attitudes but rather to change or intensify attitudes and to influence behavior. What Stevenson called the emotive meaning of ethical terms makes this dynamic use possible and also explains why ethical judgments, unlike factual ones, are capable of moving us to action.

From the thought that moral judgments are exclamations and disguised commands Ayer concluded that they "have no objective validity whatever" and that "it is impossible to dispute about questions of value" (1952, p. 110). Stevenson tried to show that there is a place for ethical arguments, but he did not go beyond the claim that a reason is "relevant" when it is likely to influence some attitude. This means, at least to the critics of Stevenson, that the relation between the premises and the conclusion of an ethical argument is psychological rather than logi-

cal and that there is no clear distinction between ethical argument and propaganda.

Both Ayer and Stevenson were in the positivist tradition, but by the 1950s an interest in ordinary language also led increasing numbers of analytic philosophers to nondescriptivism. These thinkers acknowledged that moral language can be used descriptively, but they insisted that its “primary” (basic, fundamental) use is to perform any of a number of nondescriptive speech acts. R. M. Hare argued that the primary function of the word *good* is to commend and that when we commend anything “it is always in order, at least indirectly, to guide choices, our own or other people’s, now or in the future” (1952, p. 127). Words such as *right* and *ought* are used for giving advice or, as he said, for prescribing. According to Hare, the claim that something is good has both descriptive and prescriptive meaning. The descriptive meaning of the word *good* changes as it is applied to different things, but the prescriptive meaning remains constant because *good* is invariably used to commend. This is why the prescriptive meaning is primary.

Hare described his own position as nondescriptivism, but he was more positive than Ayer and Stevenson about the role and value of logic in ethical arguments. Moral judgments, he said, are a subclass of “prescriptive” rather than “descriptive” language—they are “universalizable prescriptions.” Unlike attempts to persuade or to influence attitudes, a judgment that something is good or right is a prescription that is complete in itself, even if no change is brought about in the hearer’s attitudes or behavior. Hare believed that there could be logical relations among prescriptive judgments, even commands; and he developed a logic of prescriptive discourse to account for those relations. In the end he concluded that while we can argue logically about what to do, a complete justification of a moral decision will always require the adoption, without justification, of some basic principle or principles as a part of a freely chosen “way of life.”

P. H. Nowell-Smith offered a form of nondescriptivism he called multifunctionalism. He said that evaluative language is used “to express tastes and preferences, to express decisions and choices, to criticize, grade, and evaluate, to advise, admonish, warn, persuade and dissuade, to praise, encourage, and reprove, to promulgate and draw attention to rules; and doubtless for other purposes also” (1954, p. 98). Though his position is more complex than Hare’s, he does agree that “the central activities for which moral language is used are choosing and advising others to choose” (p. 11).

After the contributions of Ayer, Stevenson, Hare, Nowell-Smith, and others, nondescriptivism was neglected as interest in applied ethics flourished and as those who did think about metaethics developed naturalistic forms of descriptivism. The new naturalists conceded that normative language has nondescriptive functions, but they then pointed out how those functions are compatible with simultaneous descriptive intent and therefore with the possibility of evaluating normative pronouncements in terms of truth and falsity. In the 1980s interest in metaethics was stimulated by new forms of nondescriptivism developed by Simon Blackburn and Allan Gibbard. The dominant issue at that time, however, was the dispute between moral (or ethical) realists and antirealists. Nondescriptivists are more likely to be antirealists, and descriptivists are more likely to be realists, but there are complications.

Formerly, both intuitionists and naturalists were descriptivists. Intuitionists identified moral facts with nonnatural facts, and naturalists identified moral facts with natural facts. If one who believes that moral facts are natural facts can be said to be a moral realist, then both naturalists and intuitionists were moral realists and were in a position to say that moral judgments are true when they correctly describe some natural or nonnatural reality. But there is a way to combine descriptivism with antirealism and another way to combine nondescriptivism with at least the practices of the realist. J. L. Mackie develops a descriptivist account of much normative language, but he argues that judgments of moral obligation, which are thought to be both objective and prescriptive, and judgments of “intrinsic” value are always false. One who says that something is “good in itself” is always speaking falsely because nothing is good in itself.

Both Blackburn and Mackie begin with a Humean projectivism according to which the normativity we think we discover in nature is projected onto a value-free world by us. When we see and are moved by cruelty to the bull, we objectify our negative attitude, and promote it too, by saying that bullfighting is wrong. Projectivists are antirealists. Mackie combines his antirealism with descriptivism and takes this to result in an error theory. Blackburn begins with antirealism, adds his version of nondescriptivism or “expressivism,” and emerges with what he calls quasi realism, the idea that the linguistic practices of the realist—saying that bullfighting is really wrong, for example—are perfectly in order and that no error is made. One of his main concerns is to defend this quasi realism by showing how we “earn the right” to “practice, think, worry, assert, and argue” as though

moral commitments are true in some straightforward way (1984, p. 257).

Blackburn's view is that we do not describe reality correctly or incorrectly when we make moral claims—we express “stances.” He characterizes a stance as a “conative state or pressure on choice and action” but admits that we could also call this an attitude. But whatever we call it, “its function is to mediate the move from features of a situation to a reaction, which in the appropriate circumstances will mean choice” (1993, p. 168).

Gibbard also defends a nondescriptivist or “expressivist” account of normative judgments. Normative judgments, he says, take the form of saying that some act, belief, or feeling is “rational,” or “makes sense.” The point of making such a judgment is not to describe something, not to attribute a property to it, but “to express one’s acceptance of norms that permit it” (1990, p. 7). A norm, according to Gibbard, is “a linguistically encoded precept,” and the capacity to be motivated by norms “evolved because of the advantages of coordination and planning through language” (p. 57). There are norms of many kinds, but when we say that what someone did was morally wrong, we are expressing and endorsing norms that govern feelings of guilt by the agent and of anger by others.

Three arguments are traditionally deployed against nondescriptivists. According to the grammatical argument, since moral judgments are phrased in ordinary indicative sentences, there is a *prima facie* reason to treat them as statements and to treat those who make them as attempting to make statements. Nondescriptivists will reply that here the grammar is misleading, but they can then be asked to explain why this should be so. There is also a logical argument against nondescriptivism. If moral judgments lack a truth-value, then it is impossible for them to play a role in truth-functional constructions (implication, conjunction, and negation, for example) and in arguments. It is also difficult to know how they are to be interpreted when they occur embedded in complex constructions such as statements of belief and doubt. According to what has been called the phenomenological argument, not only do moral claims look and behave like descriptive utterances, they “feel” like them too. When we claim that something is good or right, we do not seem, even to ourselves, to be merely expressing ourselves or ordering others to do things. Nondescriptivists will try to explain why these judgments have this distinctive feel, but descriptivists will insist that the feeling is important data that cannot easily be explained away.

Starting with Ayer, each nondescriptivist has been forced to develop some reply to these, as well as to other, difficulties. Blackburn, for example, responds to the logical argument by developing an expressivist account of truth. He wants to show how it makes sense to claim moral truth even if there are no moral facts and even if our moral claims are no more than expressions of stances or attitudes. Gibbard sketches a solution to the embedding problem that exploits the idea that when we make a normative statement we are expressing a state of mind that consists in “ruling out various combinations of normative systems with factual possibilities.” He develops a formalism that allows him to use this idea to account for “the logical relations that hold among normative statements” (1990, p. 99).

Owing to the work of Blackburn and Gibbard, nondescriptivism is alive and well, but its prospects are uncertain because it is truly difficult to develop convincing and definitive answers to the objections from grammar, logic, and phenomenology. Furthermore, nondescriptivism needs a fact/value distinction, and this is something about which philosophers have become increasingly nervous. The early descriptivists tried to reduce values to facts, or they accepted the fact/value distinction and then relegated values to a philosophically insignificant pragmatic limbo. Since then there has been a tendency to argue that many statements that appear to be safely descriptive must be understood to have nondescriptive elements. Nondescriptivists now point out that even if the line between facts and values is blurred or moved, we can still draw an important distinction between assertions and expressions. This claim, however, will continue to be challenged by those who are impressed by the descriptive nature of norms or the normative nature of descriptions.

## NONDESCRIPTIVISM

See *Noncognitivism*

## NONEXISTENT OBJECT, NONBEING

We think and talk about things that do not exist—or so it seems. We say that Santa Claus lives on the North Pole and that unicorns are white. We admire Sherlock Holmes or judge him to be more clever than J. Edgar Hoover. People search for the Northwest Passage and the Fountain of Youth. They dream about lottery winnings and fear disasters that do not materialize. A childless couple hopes for a daughter. So, according to Alexius Meinong and others, there are things that do not exist. Even to deny that Santa Claus or the Fountain of Youth exists, we must be able, it seems, to identify what it is whose existence we are denying.

Bertrand Russell's rejection of this line of thought is well known. Sentences containing expressions that appear to denote nonexistents are to be paraphrased, in accordance with his theory of descriptions, with ones that do not. Russell shifted the emphasis from thoughts and other intentional attitudes that appear to have nonexistents as objects to the language in which those thoughts and attitudes are expressed. Many later analytic philosophers shared with Russell a distaste for what they saw as Meinong's bloated universe. Even those who rejected his theory of descriptions often assumed that apparent references to nonexistents can somehow be paraphrased away. But there have been few serious attempts since Russell's to

show how this can be done, and the task has proven to be much more difficult than it once seemed. Since 1970 several very different sophisticated realist theories were developed, some of which claim not that there are non-existent objects, but that the entities in question exist (Woods, Van Inwagen, Parsons, Routley, Wolterstorff, Thomasson). These have been countered by a new generation of antirealist theories, many of them based on notions of pretense or make-believe (Evans, Walton, Yablo, Kroon; also see Currie).

Many discussions after 1970 have focused especially or primarily on one variety of purported nonexistents: characters and other objects in fiction and mythology. Posits of failed scientific theories (Vulcan, ether, phlogiston), sought after marvels and wished-for children, the golden mountain, the round square, and the present King of France are often treated along the way, although the issues they involve are not entirely analogous to those concerning fictions. Fictions are in some ways especially compelling, and also especially puzzling. We speak easily and elaborately about fictional characters as though they were ordinary people, describing Sherlock Holmes as a detective who lives on Baker Street, speculating about Hamlet's motivations, and recounting the amorous adventures of the various Don Juans. Yet when pressed in certain ways, we readily deny that there are such things as fictions. Parents assure their frightened children that there really are not any goblins or monsters or ghosts like the ones in storybooks, and they confess to having lied about Santa Claus.

### LITERALISM

What sorts of things are nonexistents, if there are such? Some take descriptions of Sherlock Holmes as a man and a detective at face value, understanding characters to be people, to possess the same kinds of ordinary properties that real people do, and to differ only in lacking existence. The golden mountain is, literally, golden and a mountain, according to Meinong, and the wished-for child is a child. Such *literalists*, as Kit Fine (1982) calls them, usually accept that, unlike existing objects, most nonexistents are *incomplete* (Holmes neither has a mole on his back nor lacks one) and some are impossible (fictional time travelers, the round square).

Literalism threatens to get out of hand, at least as far as fictions are concerned. Not only do we readily describe Holmes as a person and a detective, we are also prepared to say, in much the same spirit (that is, speaking within the story), that he and other characters exist. Macbeth's dagger may be a mere figment of his imagination, but

Macbeth himself is real; he exists. (We do not, in a comparable spirit, describe the childless couple's wished-for child or the golden mountain as existing.) In general, we are prepared to assert what we take to be true in a story, or *fictional*. It is fictional both that Holmes is a person and that he exists. If Holmes is literally a person, it is awkward to deny that he literally exists. But fictional statements that do not involve fictitious particulars—statements such as “There are ghosts” and “Julius Caesar was warned of the ides of March” understood literally and straightforwardly, obviously may fail to be true. Why should “Holmes is a person,” not to mention “Holmes exists,” be different?

The most obvious alternative to literalism, in the case of fictions anyway, is to treat statements like “Holmes is a person and a detective” as elliptical, as short for “It is fictional (true in the story) that Holmes is a person and a detective.” Of course, we still seem to have an entity on our hands—Holmes. He (or it) is not literally a person or a detective, but he is such that it is fictional that he possesses these attributes. And it is fictional that he exists, which does not have to mean that he literally exists. Holmes may possess other kinds of properties as well, ones that do not consist in something being fictional of him: He is a fictional character, and (on some accounts) was created by Conan Doyle, and is admired by millions of readers. Abandoning literalism in this way removes the embarrassment of an incomplete Holmes, and we need not worry about running into inconsistent fictional objects. Holmes is not such that fictionally he has a mole on his back, nor is he such that fictionally he does not have a mole on his back, even though, it is fictional that he either does or does not have one there. A character may, be such that it is fictional both that she is both *P* and that she is not *P*, but that does not mean that the character *really* does possess incompatible properties.

In an alternative to this strategy, developed by Edward Zalta (1988), Holmes is not a person in the sense that J. Edgar Hoover is; he does not *exemplify* personhood. Unlike Hoover, Holmes exemplifies properties such that of being a fictional character. Holmes bears a different relation, which Zalta calls *encoding*, to personhood, to being a detective, and to the other properties attributed to him in the Sherlock Holmes stories. J. Edgar Hoover, by contrast, is not the kind of thing that encodes properties.

### ABSTRACT OBJECT THEORIES

If Holmes is not a person, what is he? What sort of thing is fictionally a person (or encodes personhood)? Realists who are not literalists usually understand fictions to be

abstract entities of one sort or another, and to have whatever ontological standing the abstract entities in question do. Some take properties like being a person and a detective to *constitute* (rather than characterize) fictions, and so identify Holmes with the class of properties or conjunction of properties attributed to him in the stories. Some construe fictions as abstractions of other sorts: “theoretical entities of literary discourse” (Van Inwagen 1977), “kinds” (Wolterstorff), or “abstract artifacts” (Thomasson 1999). Zalta (1988) has fictions exemplifying abstractness. Different abstract-object theories give different answers to a battery of tricky questions about the identity and individuation of fictions and other nonexistents or nonactuals. Are they Platonic entities that *are* (some even say “exist”) necessarily and eternally (Parsons 1980), or are they created when, for example, the relevant story is written or when they are thought about (Van Inwagen 1977, Thomasson 1999)? Do they cease to be if the story is destroyed and forgotten? If characters in different unrelated stories happen to have exactly the same characteristics attributed to them, are they identical? Are undifferentiated characters in a single fiction distinct from one another (the individual sheep in a fictional flock, for instance if nothing is said about any of them apart from the others)? Can the same character appear in more than one story if the characteristics attributed to it in each of them are not exactly the same? If so, by virtue of what are the characters identical?

The apparent fact that readers admire Holmes, or care about characters in stories, poses an awkward challenge for abstract-object theories. Do readers admire and care about abstract entities, be they properties or classes or theoretical entities or abstract artifacts? This is certainly not how readers themselves think of their experiences. It hardly helps to claim that Holmes is a person in the sense that he “encodes” personhood. He belongs to an ontological category fundamentally different from that of the usual objects of admiration—Mahatma Gandhi, Abraham Lincoln—which *exemplify* personhood and do not encode any properties at all.

The antiliteralist might deny that people do, literally, admire or care about Holmes or Willy Loman or Desdemona, just as he denies that it is literally true that they are persons (or that they exemplify personhood). But then what *is* the reader's relation to them? Does the reader *imagine* admiring or caring about these abstractions, or is it true in an extended fiction that he admires them? Does the reader imagine of an abstract object that it is a person, one that he admires and cares about? That would be quite an imaginative feat!

Similar worries arise simply with the notion of fictionality and infect purported nonexistents of other kinds, as well as fictions. Fictional propositions are commonly characterized as propositions that appreciators or readers are to imagine, or ones that works of fiction invite them to imagine. If it is fictional that Holmes is a person, readers are to imagine of this abstract object that it is a person (or to imagine of something that encodes personhood that it exemplifies personhood instead). To imagine this would be to imagine a blatant impossibility. If a wished-for daughter is not actually a daughter or a person but an abstract entity, does the childless couple wish, futilely, of this abstraction, that it is a daughter and a person?

### PRETENSE THEORIES

Pretense or make-believe theories return to a more intuitive understanding of statements like “Holmes is a detective,” without embracing literalism. The speaker pretends to refer to an ordinary existing person and to attribute to him, in the ordinary way, the ordinary property of being a detective. *Within the scope of the pretense*, everything is normal. Yet nothing is actually referred to, and what is said, understood literally, is not true. This is pretense, yet with a serious purpose. The speaker does actually assert something by engaging in the pretense, very likely something about the Sherlock Holmes stories. Pretense theorists need to give some account of what is asserted, though it may be asking too much to expect an exact literal paraphrase. Part of the point of speaking in pretense to make a serious assertion may be to express something that is difficult or impossible to express literally (Yablo 1998).

Some philosophers find pretense accounts of “Holmes is a detective,” “Hamlet hesitated,” and the like plausible, but draw a sharp line between these statements and statements such as “Holmes is a fictional character” and “Holmes is smarter than any real detective.” In the Sherlock Holmes stories it is presumably fictional that Holmes is a detective; readers are to imagine that this is so. In saying “Holmes is a detective,” speakers are playing along with the fiction, pretending to assert of a person they refer to as “Holmes” that he is a detective. But it is not fictional in the stories that Holmes is a fictional character. So, it is claimed, to say “Holmes is a fictional character” is not to play along with the fiction; the speaker must really be referring to something by means of “Holmes,” not just pretending to, and attributing to the thing referred to the property of being a fictional character.

This line is not a sharp one, however, and in any case, it is not to be drawn in the place indicated. People often speak with tongue more or less evidently in cheek when what they are expressing is not fictional in an established work of fiction, not what a recognized work of fiction prescribes or invites them to imagine. We play along with established fictions in special or unusual or unauthorized ways, altering or extending them in various directions, in order to make serious points by engaging in pretense. Sometimes we improvise new fictions. The commentator who remarks that the Hardy Boys, still living at home and attending Bayport High, have turned 75, and that their publisher now equips them with cell phones, is speaking in pretense, although what he pretends to assert is not fictional in any of the stories or the series as a whole. He is, in effect, observing that the Hardy Boys stories have been published for 75 years, and that it is fictional in some of them that the brothers use cell phones. In explaining the tenets of a discredited scientific theory, we may convert it into a fiction, speaking as though we accept it as true. An example: “Vulcan is a planet in our solar system between Uranus and Neptune.”

Pretense theorists propose to understand other kinds of apparent references to fictional objects and nonexistents as merely pretended, or at least as less than straightforwardly literal. Evaluating such proposals is not easy. Apparent references to wished-for children, failed scientific posits, and claims of existence and nonexistence often lack any apparent tongue-in-cheek flavor. But pretending, like other psychological states and processes, need not be explicit, conscious, or open to introspection. That people are engaging in pretense may be the conclusion of inferences to the best explanation. Moreover, there is room for adjusting or refining the notion of pretense, or replacing it with something weaker. Some pretense theorists prefer to characterize speakers as merely *making as if* referring to something.

In the end, what matters is the success of one or another variant of the pretense theory as a whole and how it compares to its competitors.

## NON-LOCALITY

### LOCAL PHYSICAL MAGNITUDES

Non-locality, as the term suggests, is best approached via the notion of locality. As it will be seen, the notion of

locality as it appears in physics has several components, but the foundational component is that of a local state in space-time. If one conceives of space-time as a four-dimensional (or eleven- or twenty-six-dimensional) manifold, one can think of covering the manifold with overlapping open neighborhoods, such that every point is contained within at least one neighborhood. One can also imagine indefinitely shrinking the size of the neighborhoods and indefinitely increasing their number. For any particular neighborhood, the intuitive notion of a neighborhood-local state is a physical state that depends only on what is inside the neighborhood. To get a more formal handle on this, a necessary condition for a neighborhood-local state is that the values of quantities for such a state put no constraints on the values of neighborhood-local states for any nonoverlapping neighborhoods. By this criterion, familiar physical properties, like the locations and velocities of particles or the values of electric fields, are neighborhood-local, while global physical properties, like the total charge of the universe, are not. (It is tempting to try to take this notion to the limit, where the neighborhoods become punctate, but this leads to many technical problems that are unrelated to the basic notion.)

Classical physics has many neighborhood-local quantities: for example, mass and charge densities, field strengths, velocities and accelerations, and the relativistic space-time metric. Anything represented by a tensor in a classical theory will be, by this account, neighborhood-local. Indeed, in classical physics it appears that all non-neighborhood-local quantities, such as the total charge of the universe, are functions of the neighborhood-local ones in the following sense: Cover the space-time manifold with open neighborhoods in any way one likes and specify the neighborhood-local quantities in each neighborhood and the neighborhood-local quantities in all intersections of neighborhoods, and one will thereby fix the value of the global quantities. Given the charge in every little patch, and in the intersections of all the little patches, the total charge of the universe follows.

Physics textbooks do not typically present the notion of neighborhood-locality in this way: They rather get at it via an account of coordinatizing the manifold. Rather than demanding a single, global coordinate system that completely covers a manifold (which in many cases will not exist), one is rather required only to break up the manifold into overlapping neighborhoods (each of which is topologically simple) and to coordinatize each neighborhood. The coordinatization of each neighborhood is called a chart, and a collection of charts for neighbor-

hoods that cover the manifold is called an atlas. In addition, one is required to specify how the coordinates assigned to a point in one chart are related to the coordinates assigned by any other chart in which the point occurs. That is, one is required to specify how the different coordinate systems relate to one another where they overlap. The assumption that all the physics is ultimately neighborhood-local is then essentially the supposition that physical states can be assigned to each charted neighborhood such that the total physical state of the universe is determined by the information in the atlas. One can say that in such a case the total physics is neighborhood-local.

The neighborhood-locality of physics accepts the physical reality of many global properties, such as the total charge. It also accepts the physical reality of more subtle global properties. Consider, for example, a cylinder and a Möbius strip. In a certain sense, a cylinder and a Möbius strip can be made to match locally: each can be divided into overlapping neighborhoods such that every neighborhood of the Möbius strip is exactly like the corresponding neighborhood of the cylinder. In this sense, the twist in the Möbius strip is not located anywhere in particular: it is a global rather than local feature of the space. Nonetheless, one could tell from an atlas whether one was dealing with a cylinder or a Möbius strip. Begin, for example, by drawing an F on one chart. The chart contains enough information to determine how the F could move rigidly in the neighborhood covered by the chart. So one could move it into a region that overlaps another chart, and the functions relating the chart would show how the F shows up in the new region. Continuing in this way, one could determine from the information in the atlas what the result of any rigid motion of the F would be. On a Möbius strip, some such motion will bring the F back to the original neighborhood mirror-reflected, while on a cylinder this can never happen.

The notion of neighborhood-locality is therefore quite broad: all of classical physics and relativity theory (both special and general) count as neighborhood-local in this way. One's commonsense picture of the world is also neighborhood-local. Albert Einstein powerfully expressed the notion of neighborhood-locality this way:

It is ... characteristic of ... physical objects that they are thought of as arranged in a space-time continuum. An essential aspect of this arrangement of things in physics is that they lay claim, at a certain time, to an existence independent of one another, provided these objects "are situated in different parts of space." Unless one makes

this kind of assumption about the existence (the "being-thus") of objects which are far apart from one another in space—which stems in the first place from everyday thinking—physical thinking in the familiar sense would not be possible. ... This principle has been carried to extremes in the field theory by localizing the elementary objects on which it is based and which exist independently of each other, as well as the elementary laws which have been postulated for it, in the infinitely small (four-dimensional) elements of space.

(IN BORN 1971, P. 170)

If one reads "situated in different parts of space" as "situated in nonoverlapping neighborhoods," and understands the "existence (the being-thus)" as the demand that the physical state defined on one neighborhood puts no constraint on the physical state in a nonoverlapping neighborhood, one sees that Einstein is expressing the same idea.

Suppose that physics is neighborhood-local in the sense that the physical information provided in any atlas is complete (determines all the physical properties of the universe). This appears to be a mild constraint, seeing as it takes in all of classical physics and relativity. It is hard to see, in fact, how the postulate of neighborhood locality puts any real empirical constraint on a theory: Could not any set of phenomena be accounted for by a neighborhood-local physics? As it will be seen, this is correct: To get an empirical constraint one will have to add on to neighborhood-locality in this sense. However, the postulate of neighborhood-locality does do something: It implies that, for any region in space-time, there is something that counts as the physical state of that region. Recall the twin requirements: The physical state in any neighborhood should not put any constraints on the physical state in a nonoverlapping neighborhood and the totality of physical states in an atlas (including appropriate information about overlapping charts) should determine the total physical state of the universe. Meeting these requirements demands that many well-defined quantities cannot count as local. For example, although the center of mass of the solar system is, one may suppose, always located at some particular point in space, it does not count as a part of the local physical state of that space. For taking a small neighborhood that contains that point, one cannot specify that the center of mass of the solar system occupies that point without thereby constraining the physical state of the nonoverlapping neighborhoods that contain the sun and planets.

If the requirement of neighborhood-locality is so mild, why was Einstein concerned with it? Because, taken at face value, the quantum theory rejects neighborhood-locality. Consider a pair of particles in the singlet state

$$1/\sqrt{2}|x\text{-up}\rangle_{\text{R}}|x\text{-down}\rangle_{\text{L}} - 1/\sqrt{2}|x\text{-down}\rangle_{\text{R}}|x\text{-up}\rangle_{\text{L}}$$

where the particle on the right and the particle on the left are far apart, in different regions of space. Then one's atlas could contain a neighborhood that includes particle R but not particle L, and a nonoverlapping neighborhood that contains L but not R. And the requirement of neighborhood-locality would then demand the existence of some physical state that can be assigned to (the neighborhood containing) R that puts no constraint on the state of L, and a state that can be assigned to L that puts no constraint on the state of R, such that from these two local states the singlet state for the pair can be recovered.

The singlet state itself cannot be used for this purpose: It makes reference to both particles and requires for its existence the existence of both particles. There is a well-defined state that quantum mechanics associates with particle R alone: It is called the reduced state for R from the singlet state. The reduced state supplies enough information to make quantum-mechanical (probabilistic) predictions for the result of any experiment carried out on R alone. There is a similar reduced state for L. These states are, mathematically speaking, mixed quantum mechanical states.

Why, then, can one not take the reduced state for R to be its neighborhood-local state, and the reduced state for L to be its neighborhood-local state, and do the physics using these? The reason is because different joint quantum mechanical states for the pair of particles give rise to exactly the same pair of reduced states for R and L, and these different joint states make different predictions for some measurements that involve both particles. For example, the singlet state is mathematically distinct from the  $m = 0$  triplet state

$$1/\sqrt{2}|x\text{-up}\rangle_{\text{R}}|x\text{-up}\rangle_{\text{L}} + 1/\sqrt{2}|x\text{-down}\rangle_{\text{R}}|x\text{-down}\rangle_{\text{L}}.$$

Furthermore, the  $m = 0$  triplet state makes different predictions for the pair: If one measures the spin of both particles in the  $x$ -direction, the singlet state predicts that the outcomes on the two sides will be different, while the  $m = 0$  triplet state predicts they will come out the same. Even so, the reduced states for R and L that can be derived from these are identical (they both predict a 50 percent chance for the measurement of  $x$ -spin to be up). So one cannot use the joint state as a neighborhood-local state,

and one cannot use the reduced states as neighborhood-local states (and recover the full physical state of the pair from the atlas), and quantum mechanics provides no other states one can use.

What Einstein saw was that quantum mechanics is not neighborhood-local on account of the entanglement of states for spatially separated systems. And since Einstein thought that physics must be neighborhood-local, he thought quantum mechanics must not be giving one a complete account of the physical states of things.

## NON-LOCALITY AND EXPERIMENT

So far, all one has is a remark about the formalism of quantum mechanics, not about the empirical predictions of quantum mechanics. However, Einstein saw that the peculiar entanglement of quantum-mechanical states forced another kind of non-locality on the standard quantum mechanical accounts of experiments.

Consider a pair of separated particles in the singlet state. Given only that state, the quantum formalism permits no definite predictions about the outcome of an  $x$ -spin measurement on either side: For each individual particle, quantum mechanics assigns a 50 percent probability for each possible outcome. If the quantum description is complete and leaves no physical facts about the particle out of account, then these probabilities must reflect objective indeterminacy in nature: Nothing in the universe determines which outcome will occur. Nonetheless, as Einstein saw, quantum theory does make a perfectly definite prediction: Whatever the outcome of the experiments on the two particles, the results for the pair will be opposite—one will yield  $x$ -spin up and the other  $x$ -spin down (in the  $m = 0$  triplet state, the results are instead guaranteed to be the same). So the question is: If nothing in the whole universe determines what the result of measuring the particle on the right will be, and if the particle on the left can be arbitrarily far away, what could possibly ensure that the outcome on the left will be the opposite of that on the right?

In the standard quantum formalism, this correlation between the outcomes is secured by the collapse of the wave function: when the particle on the right displays, for example,  $x$ -spin up, then the overall quantum state for the pair suddenly changes from  $1/\sqrt{2}|x\text{-up}\rangle_{\text{R}}|x\text{-down}\rangle_{\text{L}} - 1/\sqrt{2}|x\text{-down}\rangle_{\text{R}}|x\text{-up}\rangle_{\text{L}}$  to  $|x\text{-up}\rangle_{\text{R}}|x\text{-down}\rangle_{\text{L}}$ . Because of the non-locality of the wave function, this change is a change not only in the physical state of particle R but a change in the state of particle L as well. When particle R displays  $x$ -spin up, particle L changes from a state of

indefinite  $x$ -spin to a state of definite  $x$ -spin down. It is by this “spooky action-at-a-distance” that the standard quantum interpretation manages to secure the correlation in spins between distant particles, neither of which is initially in a definite spin state.

There are several ways in which the wave collapse is “spooky.” One is that it is unmediated: The measurement on the right influences the state on the left without the aid of any particles or waves traveling between the two sides. However, more important, the collapse is instantaneous: Even if there were mediating particles or waves, they would have to travel faster than light. This last property seems to contradict the theory of relativity. Einstein rejected the quantum theory because of this feature. He saw that, in this particular case, the spooky action-at-a-distance is not required by the empirical phenomena: The perfect correlations can be easily explained in a neighborhood-local physics without resorting to any direct causal connection between the two sides. One need only suppose (as the quantum theory does not) that the results of the spin measurements are predetermined by the local state of each electron and that the electrons are created in states in which they are disposed to give the opposite outcomes to all spin measurements.

Putting Einstein’s two requirements together, one can now specify what it is for a theory to be simply local: First, all the fundamental physical properties of the theory should be neighborhood-local, and second, no physical influences in the theory should be allowed to propagate faster than light. (One could also add that causal connections between events should be mediated by continuous processes, but that is not needed for the sequel.) Einstein’s argument against quantum theory as complete is that taking it to be complete requires that one treat the physics as non-local, even though the phenomena do not force non-locality on the theory. Einstein thought it perverse to insist that the theory is complete instead of trying to supersede it by a local theory that recovered all the same empirical predictions.

A local theory can be either deterministic or indeterministic. In a deterministic theory, every event is determined by the physical state that precedes it, and in a local deterministic theory, those determining factors cannot be so far away that it would require a superluminal influence for them to have their effect. Putting these together, it follows that in a local deterministic theory, every event is determined by the neighborhood-local state on its past light cone.

In an indeterministic local theory, an event need not be determined by the physical state of its past light cone,

but the probability for the event will be. Furthermore, nothing outside the past light cone can have any influence on the event. That is, conditionalizing an event on the state of its past light cone should yield a probability that is screened off from any further information about events at space-like separation. (The probability will not be screened off from events in the future light cone, which can be effects of the event in question.) So positing that a theory is local is not the same as positing that it is deterministic, but it puts definite mathematical constraints on the nature of any local theory, whether deterministic or indeterministic. What Einstein had argued, in the 1935 Einstein, Boris Podolsky, and Nathan Rosen (EPR) paper, was that quantum mechanics is an indeterministic, non-local theory, but the sorts of correlations he discussed admit a deterministic, local explanation. And despite Einstein’s oft-cited remarks about God’s gambling habits, it was the spooky action-at-a-distance, the non-locality, that was the focus of his criticism in the EPR paper. As it turns out, if one is to recover the perfect EPR correlations with a local theory, it must also be a local deterministic theory (otherwise the correlations will not be perfect), but recovering determinism is not the main issue.

#### BELL’S THEOREM AND LOCALITY

What Einstein did not realize is that although the perfect correlations he discussed can be recovered by a local theory, the full range of quantum mechanical predictions cannot be recovered by any local theory. This was proven in 1964 by John Bell. Bell demonstrated that the predictions of any local theory, deterministic or indeterministic, must satisfy a certain statistical constraint called Bell’s inequality. Furthermore, the predictions of the quantum theory violate that inequality, and the violations have been experimentally confirmed in the laboratory. So the non-locality of quantum theory is not just an artifact of the quantum formalism: It is a physical aspect of nature.

Although in principle a neighborhood-local theory could predict violations of Bell’s inequality (by use of neighborhood-local items that travel faster than light), the only presently existing accounts of physical non-locality employ the quantum wave function, which is not a neighborhood-local object. The role of the wave function differs from interpretation to interpretation, but in every case it is the wave function that secures the violation of locality and the superluminal physical connection between the distant particles.

It is a first-order technical problem to reconcile the non-locality of quantum theory with the space-time structure postulated by the theory of relativity. The sim-

plest way to construct a non-local theory is to add a preferred foliation of space-time to the relativistic picture, thereby violating the spirit of relativistic physics. Such a foliation also allows for a straightforward causal account of the phenomena: Interaction with one of the particles is the cause of a change of behavior in the other. It is, however, feasible (although quite tricky) to construct theories that achieve non-locality but employ only the relativistic space-time structure. In these cases, it appears that standard causal locutions cannot be recovered: there is a real physical connection between space-like separated events, but one cannot identify one of the events particularly as a cause and the other as an effect.

## NON-MONOTONIC LOGIC

Modern symbolic logic was developed beginning in the latter part of the nineteenth century for the purpose of formalizing mathematical reasoning, in particular that process by which mathematicians arrive at conclusions on the basis of a small number of distinct basic principles. This kind of reasoning is characterized by a particular type of cogency: The conclusions are not merely *probable* or *plausible* on the basis of whatever evidential support the basic principles might provide, but *certain* and *indubitable*. In particular mathematical reasoning enjoys a property referred to as *monotonicity* by modern logicians: if a conclusion follows from given premises *A*, *B*, *C*, ... then it also follows from any larger set of premises, as long as the original premises *A*, *B*, *C*, ... are included.

By contrast in many instances of ordinary or everyday reasoning, people arrive at conclusions only tentatively, based on partial or incomplete information, reserving the right to retract those conclusions should they learn new facts. Such reasoning is often called *defeasible* or *non-monotonic*, precisely because the set of accepted conclusions can become smaller when the set of premises is expanded.

Taxonomies provide a rich source of examples of defeasible reasoning (but they are not by any means the only source). Suppose for instance that you are told that *Stellaluna* is a mammal. It is then natural to infer that *Stellaluna* does not fly, because mammals by and large are not capable of flight. But upon learning that *Stellaluna* is a bat, such a conclusion is retracted in favor of its opposite. In turn even the new conclusion can be retracted upon learning that *Stellaluna* is a baby bat and so on, in complex retraction patterns that seem to cry out for systematization.

The aim of non-monotonic logic is precisely that of providing such a systematization. There is, in fact, no one thing which is called "non-monotonic logic," but rather a family of different formalisms, with different mathematical properties and degrees of material adequacy, that aim to capture and represent such patterns of defeasible reasoning.

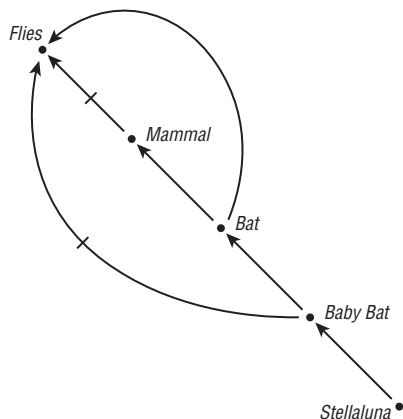

A broad class of non-monotonic formalisms can be characterized as "consistency-based" approaches. The name is derived from the fact that while all non-monotonic formalisms deal with conflicts between new facts and tentative conclusions in the same way (the facts win and the conclusions are retracted), some of these formalisms also allow for potential conflicts between the tentative conclusions themselves (and then they might differ as to the way this second kind of conflicts are handled).

Non-monotonic inheritance networks provide a consistency-based formalism developed for the purpose of representing taxonomies. A non-monotonic inheritance network is a collection of nodes (each associated with a particular taxonomic category) and directed links between nodes, representing the subsumption relation between categories. Suppose for instance that you are told by a reliable (but fallible) source that Nixon is both a Quaker and a Republican, and that while Quakers by and large are pacifists, Republicans are not. The network corresponding to this situation is given below:

Obviously here we have a conflict between the two potential conclusions that Nixon both is and is not a pacifist. Steps need to be taken to maintain consistency. We will not go into detail here, but in general one can take a *credulous* approach and endorse one or the other conclusion, or one can take a *skeptical approach* and in the presence of conflict refrain from endorsing either conclusion.

Sometimes, special considerations such as *specificity* can be brought to bear on the resolution of conflicts in other inheritance networks. In the Stلالuna example above for instance one wants to conclude that bats fly (because information about bats is more specific than information about mammals) but that Stلالuna does not (because information about baby bats is more specific than information about bats). A network representing the situation is given below:

Inheritance networks are not well suited to deal with complex information (e.g., disjunctive or conjunctive statements). For this reason a more expressive formalism, *default logic* was developed. The basic representation formalism of default logic is the *default inference rule*, a rule of the form  $A : B / C$ , whose intended interpretation is that if  $A$  is known, and we have no reason to reject  $B$  (i.e.,  $B$  is *consistent* with our knowledge base), then we can

conclude  $C$ . Default logic provides a way for the consistency condition to be satisfied both *before* and *after* the default rule is applied.

Among the approaches to non-monotonic logic that are not consistency based, one needs to mention *circumscription*, which is based on the idea that many instances of defeasible reasoning have to do with the *minimization* of certain predicates, particularly those representing the set of *exceptions* to a given generalization. Circumscription uses the expressive power of second-order logic to ensure that any generalization has as few exceptions as possible. So, for instance, in the absence of information to the effect that bats are exceptional mammals, one would conclude that they do not fly, but when that information is adjoined to our knowledge base, circumscription immediately accounts for the exception.

## NONNATURALISM

See *Ethics, History of*; *Ethics, Problems of*; Moore, George Edward

## NONREDUCTIVE PHYSICALISM

Beginning the 1960s Hilary Putnam, Jerry Fodor, and Richard Boyd, among others, developed a type of materialism that denies reductionist claims. In this view, explanations, natural kinds, and properties in psychology do not reduce to counterparts in more basic sciences, such as

neurophysiology or physics (Putnam 1967, 1974; Fodor 1974; Boyd 1980a). Nevertheless, all token psychological entities—states, processes, and faculties—are either identical with (Fodor 1974) or just wholly constituted of (Boyd 1980a) physical entities, ultimately out of token entities over which microphysics quantifies. This view was soon widely endorsed and since then has persisted as an attractive alternative to reductionist and eliminativist forms of materialism. Reductionists, notably Jaegwon Kim, have raised a series of serious objections to this position, to which nonreductivists have responded, thereby developing the view more thoroughly.

### IRREDUCIBILITY, MULTIPLE REALIZABILITY, AND EXPLANATION

In his early argument for nonreductive materialism, Putnam adduces the phenomenon of multiple realizability as its main justification (Putnam 1967). Kinds or types of mental states can be realized by many kinds of neurophysiological states, and perhaps by many kinds of non-neurophysiological states, and for this reason they do not reduce to kinds of neurophysiological states. Multiple realizability also has a key role in Fodor's more general argument against reductionism in the special sciences (Fodor 1974). Consider a law in some special science:

$$S_1x \text{ causes } S_2x$$

where  $S_1$  and  $S_2$  are natural kind-predicates in that science. A standard model for reduction requires that every kind featured in this law be identified with a kind in the reducing science, by way of bridge principles. Bridge principles might translate kind-predicates in one science into those of a more basic one, or they might specify a metaphysical relation, such as *being identical with* or *being a necessary and sufficient condition for*, between the kinds of one science and those of the reducing science. But in some cases, Fodor contends, the sort of bridge principle required for reducibility will not be available. If kinds in psychology, for instance, are multiply realizable in an indefinite variety of ways at the neurophysiological level, purported bridge principles for relating psychological to neurophysiological kinds will involve open-ended disjunctions. These purported bridge principles will be of the form:

$$P_1 = N_1 \vee N_2 \vee N_3 \dots$$

which states that a certain psychological state,  $P_1$ , is identical with an open-ended disjunction of neurophysiological states,  $N_1 \vee N_2 \vee N_3 \dots$ , or

$$P_1 \leftrightarrow N_1 \vee N_2 \vee N_3 \dots$$

which states that a certain psychological state is necessary and sufficient for an open-ended disjunction of neurophysiological states. Fodor argues that because open-ended disjunctions of kinds in neurophysiology are not natural neurophysiological kinds, psychological kinds cannot be reduced to neurophysiological kinds. Fodor's reason for denying that such disjunctions are not natural kinds is that they cannot appear in laws, and they cannot appear in laws because "laws" involving such disjunctions are not explanatory. Such "laws" are not explanatory because they do not satisfy our interests in explanation. Fodor's argument for irreducibility, then, appeals to the fact that purported explanations for psychological phenomena are unsatisfying when couched in terms of open-ended disjunctions.

One reductionist reply is that these open-ended disjunctions nevertheless constitute genuine laws and explanations, even if they fail to meet certain subjective requirements. If only we were capable of taking in more information at once, we wouldn't have any trouble regarding open-ended disjunctive "laws" as genuine laws (Jaworski 2002). That people fail to find laws satisfying when they contain open-ended disjunctions may simply show a failing on our part, rather than a failing of the putative laws. This standard argument for nonreductive materialism appears to rely on a certain formal prescription for laws and explanations—that they cannot contain disjunctive properties, or at least not wildly disjunctive properties.

But even if the formal argument fails, multiple realizability can still sustain an important component of nonreductive materialism. In general, whether or not a property is multiply realizable can indicate the level at which it should be classified. Is the kind *corkscrew* a kind of steel thing? No, for it also has a possible aluminum realization. Is the kind *believing that cats are nearby* a neural kind of thing? If mental states are also realizable in silicon, then no. Multiple realizability might then provide the key to precluding classification of mental states as essentially neural, or as essentially classified at some lower level yet.

Kim argues that multiple realizability might fail to undermine reductionism for a different reason. He contends that a higher-level property is precisely as projectible as the disjunction that expresses its multiply realizable character at a more basic level, and thus a generalization involving such disjunctive properties is just as lawlike as the higher-level generalization that it was

meant to reduce (Kim 1992). The reason is that a higher-level property is nomically equivalent to such a disjunctive property. Nomic equivalence might be defined in this way: properties F and G are nomically equivalent if they are coextensive in all possible worlds compatible with the laws of nature. If Kim is right, then Fodor's formal argument does not appear to be sound, for it relies on the possibility that generalizations involving a higher-level property be lawlike whereas those involving the corresponding disjunctive property are not. But furthermore, Kim contends that wildly disjunctive properties are not projectible, and hence higher-level properties that are nomically equivalent to such properties are not projectible either. As a result, such higher-level properties cannot figure into laws, and they are not genuinely scientific kinds.

The example of a disjunctive property Kim adduces to make his point is *being jade*. "Jade" is a category that comprises two mineralogical kinds, *jadeite* and *nephrite*, and hence *being jade* is the same property as *being either jadeite or nephrite*. As a result, *being jade* will not be projectible. But in reply, *being jade* might turn out to be projectible despite its underlying complexity. Ned Block points out that all samples of jade share certain appearance properties, similarities that give rise to a certain degree of projectibility (Block 1997). More generally, properties that are multiply realizable can yet be projectible with respect to properties of selection, learning, and design. Because there are typically only a few ways in which entities of a particular higher-level type can be designed and produced, one can expect relatively broad similarities among these things that would render corresponding higher-level properties significantly projectible (Antony and Levine 1997).

Thus the heterogeneity of the possible realizations of a property is compatible with their having significant features in common, features that will sustain the projectibility of the property to some degree or other. This point is consistent with Kim's claim that a higher-level property is precisely as projectible as the disjunctive property that comprises all of its possible realizations. One should not conclude from the heterogeneity of the possible realizations of a higher-level property that there is no feature that can undergird its projectibility—in fact, of both the higher-level property and of the disjunctive property that comprises all of its possible realizations. Indeed, the projectibility-sustaining feature of a kind could be a characteristic that is significantly homogeneous across its heterogeneous realizations, one that

might instantiate a unitary causal power at the level of description of the kind (Pereboom 2002).

## FUNCTIONALISM AND MENTAL CAUSATION

By way of objecting to Kim's reductionism, Block asks: "What is common to the pains of dogs and people (and all other species) in virtue of which they are pains?" (Block 1980, pp. 178–179). In reply to this concern, Kim points out that nonreductive materialists typically argue from a functionalist perspective, and that functionalists characterize mental states solely in terms of purely relational features of those states. Functionalism identifies mental state types with type-level dispositions to cause mental states and behavioral outputs given perceptual inputs and mental states—with the understanding that these dispositions are purely relational: that they are to be analyzed in terms of causal relations to perceptual inputs, behavioral outputs, and other mental states, and no intrinsic mental components. Functionalists claim that what all pains would have in common, by virtue of which they are all pains, is a pattern of such relations described by some functional specification. Kim then argues that in providing an answer to Block's question, the local reductionist—the one who opts for species- or structure-specific reductionism—is no worse off than the functionalist. Both are committed to the claim that there is no nonrelational or intrinsic property of pain that all pains have in common, and both can specify only shared relational properties (Kim 1992).

Kim implies that a functional specification does not provide a genuinely satisfactory answer to Block's question (Kim 1999). On the nonreductive view, if M is a mental property and B is its neural or microphysical base, then realizers for M can be found in B (at the level of B). This position allows that nondisjunctive realizing properties might be found in B for individual species- or structure-types—as long as there is no well-behaved (not wildly disjunctive) property in B that realizes every possible instance of M. The nonreductive materialist claims that none of this entails a genuine reduction of M to properties in B. As Kim assumes, the standard strategy for preserving M as meeting these specifications is to envision M as a functional mental property. But in Kim's view, the problem with the functionalist picture is that the causal powers of any instance of M will be causal powers in the physical base—they will not, at the token level, be irreducibly mental causal powers (Kim 1992, Block 1990). Hence functionalism cannot preserve the view that there exist causal powers that are in the last

analysis irreducibly mental, and it is thus incompatible with a genuinely robust nonreductive materialism about the mental. Furthermore, Kim points out that given the genuine multiple realizability of the property *M*, the causal powers of the realizers of *M* in *B* will exhibit significant causal and nomological diversity, and for this reason the causal powers of *M* will exhibit such diversity. Thus, in his estimation, *M* will be unfit to figure in laws, and is thereby disqualified as a useful scientific property. He concludes that the functionalist model cannot protect *m* as a property with a role in scientific laws and explanations.

However, there is available a nonfunctionalist account of these higher-level powers that nevertheless remains nonreductive (Pereboom 1991, 2002). Functionalists typically maintain that the causal powers that have a role in explaining the dispositional features of mental states are nondispositional properties of their realization bases. For example, many suppose that nondispositional neural properties, which instantiate neural causal powers, would serve to explain why being pinched causes wincing behavior. But if these causal powers are all nonmental, a robust sort of nonreductive materialist account of the mental is precluded, for then none of the causal powers would be essentially mental themselves. By contrast, the nonreductivist might endorse intrinsic mental properties that instantiate specifically mental causal powers (Pereboom 1991, 2002; Van Gulick 1993). Such a view would be incompatible with functionalism. It need not deny that there exist functional mental properties, or, more generally, relational properties of mental states, but it would endorse nonfunctional mental properties that, by virtue of the causal powers they instantiate, play an important part in explaining dispositional features of mental state types.

Consider the example of a ball piston engine, the most recent version of the rotary internal combustion engine, which has a specific internal structural configuration. Characteristic of this engine is its having parts with particular shapes and rigidities, and these parts must be arranged in a particular way. These features are manifestly not functional relations that such an engine stands in; rather, they constitute intrinsic characteristics of this type of engine. At the same time, these characteristics are multiply realizable. The parts of the engine can be made of material of different sorts—as long as the material can yield, for example, the required shapes and rigidities. The ball piston engine, then, has nonfunctionalist intrinsic structural properties that instantiate its causal powers, but nevertheless admit distinct realizations.

Similarly, it might be that the heterogeneous physical realizations of the dog's and the human's belief *that cats are nearby* exhibit a structure of a single type that is intrinsic to this kind of mental state, a structure that instantiates the causal powers of this belief. This structure may be more abstract than any specific sort of neural structure, given that it can be realized in distinct sorts of neural systems (Boyd 1999). Perhaps this same structure can be realized in a silicon-based electronic system, and such a system could then also have the belief. Imagine a silicon system that replicates the capacities of and interconnections among neurons in a human brain as closely as possible, and suppose this system is excited to mimic as nearly as possible what happens when a human being has this belief about cats. It is possible that this silicon state would realize the same belief, and have a structure that, conceived at a certain level of abstraction, is similar enough to the structure of the ordinary neural system for both to count as examples of the same type of structure. In this case and more generally, one does not seem forced to retreat to mere functional resemblance prior to investigating whether the relevant similarities extend to intrinsic properties.

#### EXPLANATORY EXCLUSION

According to nonreductive materialism, an event such as Jerry's feeding the cat (*M2*) will have a psychological explanation in terms of a complex of mental states—beliefs and desires he has (*M1*). Each of *M1* and *M2* will be wholly constituted of microphysical events (*P1* and *P2* respectively), and there will be a microphysical explanation of *P2* in terms of *P1*. The explanation of *M2* by *M1* will not reduce to the explanation of *P2* by *P1*. Underlying the irreducibility of this explanation is that *M1* is not type-identical with *P1*, and that *M2* is not type-identical with *P2*.

This picture gives rise to a pressing question: What is the relationship between the microphysical and psychological explanations for *M2*? In particular, given that both sorts of explanation refer to causal powers, what is the relationship between the causal powers to which the microphysical explanation appeals and those to which the psychological explanation appeals? Here is where Kim's challenge from causal or explanatory exclusion enters in (Kim 1987, 1998). If a microphysical account yields a causal explanation of the microphysical constitution of *M2*, then it will also provide a causal explanation of *M2* itself. How might there also be a distinct psychological causal explanation of this action? Kim argues that it is implausible that the psychological explanation appeals to

causal powers sufficient for the event to occur, and at the same time the microphysical explanation appeals to distinct causal powers also sufficient for the event to occur, as a result of which the event is overdetermined. It is also implausible that each of these distinct sets of causal powers yields a partial cause of the event, and that each by itself would be insufficient for the event to occur.

By the solution to this problem that Kim develops, real causal powers exist at the microphysical level, and so the microphysical explanations refer to real microphysical causal powers. Only if psychological explanations in some sense reduce to microphysical explanations does it turn out that the psychological explanations also appeal to real causal powers—these causal powers will then ultimately be microphysical. Psychological explanations that do not reduce to microphysical explanations will fail to refer to causal powers, and thus will have some diminished status—such explanations might express regularities without at the same time referring to causal powers. This strategy solves the exclusion problem because if the causal powers to which the psychological explanation appeals are identical with those to which the microphysical explanation appeals, then there will be no genuine competition between explanations, and if the psychological explanations do not refer to causal powers at all, there will be no competition either. However, this solution, which Kim believes is the only possible solution to the problem he raises, would rule out any nonreductive view about mental causal powers.

Various proposals have been advanced in the name of nonreductive materialism according to which mental properties are causally relevant or causally explanatory, without being causally efficacious as mental properties. Such views, like Kim's, claim that all causal efficacy is nonmental (for example, Jackson and Pettit 1990). As Kim points out, these proposals do not amount to a robust sort of nonreductive materialism, which would preserve the claim that mental properties, as mental properties, are causally efficacious (Kim 1998).

What sort of response might the advocate of the robust view provide? First, in Kim's conception, any token causal powers of a higher-level property at a time will be identical with some token (micro)physical causal powers. There would be no token causal powers distinct from token microphysical causal powers, and this would preclude any robust nonreductive materialism. Higher-level kinds and explanations would at best group token microphysical causal powers in a way that does not correspond to the classifications of microphysics itself (Kim 1998, Horgan 1997). Such a classification might be of value for

prediction, but there would remain no sense in which there exist causal powers that are not microphysical.

However, is token mental state M identical with P, its actual token microphysical realization base? Suppose that M is realized by a complex neural state N. It is possible for M to be realized differently only in that a few neural pathways are used that are token-distinct from those actually engaged. One need not rule at this point on whether the actual neural realization N is token-identical with this alternative—it might well be. But it is evident that this alternative neural realization is itself realized by a microphysical state P\* that is token-distinct from P. It is therefore possible for M to be realized by a microphysical state not identical with P, and thus M is not identical with P. But furthermore, this reflection would also undermine a token-identity claim for mental causal powers—should they exist—and their underlying microphysical causal powers. For supposing that the token microphysical realization of M had been different, its token microphysical causal powers would also have been different. Consequently, there is good reason to suppose that any token mental causal powers of M would not be identical with the token microphysical causal powers of its realization (Boyd 1980a, Pereboom and Kornblith 1991, Pereboom 2002).

On this conception, a token mental state would have the mental causal powers it does ultimately by virtue of the token microphysical states of which it is constituted (setting aside any fundamentally relational causal powers). For this reason it makes sense to say that token mental causal powers are wholly constituted by token microphysical causal powers. More generally, the causal powers of a token of kind F are constituted of the causal powers of a token of kind G just in case the token of kind F has the causal powers it does by virtue of its being constituted of a token of kind G.

And now, just as no competition between explanations arises in the case of reduction and identity, competition also does not arise in the case of mere constitution. For if the token of a higher-level causal power is currently wholly constituted by a complex of microphysical causal powers, there are two sets of causal powers at play that are constituted from precisely the same material (supposing that the most basic microphysical entities are constituted of themselves), and in this sense we might say that these powers *coincide constitutionally*. That they now coincide in this way might give rise to the thought that these causal powers are token-identical, but, as has been shown, there is a substantial argument that they are not. And because it is possible for there to be wholly constitutionally coin-

ciding causal powers that are not even token-identical, it is possible that there be two causal explanations for one event that do not exclude each other and at the same time do not reduce to a single explanation (Pereboom 2002).

If identity and not just constitutional coincidence were necessary for explanatory noncompetition, then there would be features required for noncompetition that identity has and current constitutional coincidence does not. The candidate features would be constitutional coincidence at all other times, and constitutional coincidence at all other possible worlds, even now. But it is difficult to see how the token causal powers' constitutional noncoincidence at some past time, or at some future time, or their merely possible constitutional noncoincidence even now would result in explanatory competition, whereas actual current constitutional coincidence in absence of any features of this sort (i.e., identity) would guarantee noncompetition.

Imagine that a person's current token mental state M actually constitutionally coincides with token microphysical state P. Now assume with Kim that if M were identical with P, and if their causal powers were identical, there would be no explanatory competition. Then if mere constitutional coincidence without identity resulted in explanatory competition, that would have to be because at some time in the past or in the future, or at some other possible world even now, M and P and their causal powers are constitutionally noncoincident. Suppose that M would still exist even if a few neural pathways in its neural realization were token-distinct from what they actually are. These neural changes would render M's microphysical realization base distinct from P, and thus M and P would be constitutionally noncoincident in some other possible world, and, similarly, *mutatis mutandis* (that is, the necessary changes having been made) for their causal powers. How could a possibility of this sort introduce explanatory competition? It would appear that actual current constitutional coincidence alone is relevant to securing noncompetition, and thus for this purpose constitutional coincidence without identity would serve as well as identity. Consequently, it would appear that available to the nonreductivist is a solution to the exclusion problem no less adequate than Kim's own.

### THE THREAT OF EMERGENTISM

Kim contends that nonreductive materialism is committed to emergentism (sometimes called *strong* emergentism, which he thinks is a radical and implausible view. In his analysis, emergentism claims a distinction between two sorts of higher-level properties, *resultant* and *emer-*

*gent*, that arise from the basal conditions of physical systems (Kim 1999). The basal conditions of a physical system comprise (i) the basic particles that constitute the physical system, (ii) all the intrinsic properties of these particles, and (iii) the relations that configure these particles into a structure. The higher-level properties that are merely resultant are simply and straightforwardly calculated and theoretically predictable from the facts about its basal conditions—which presumably include the laws that govern the basal conditions—whereas those that are emergent cannot be calculated and predicted. Theoretical predictability contrasts with inductive predictability. Having regularly witnessed that an emergent property is realized by particular basal conditions, we would be able to predict this relationship, but this sort of inductive predictability is not at issue. Rather, according to emergentism, knowledge of the basal conditions alone, no matter how complete, does not suffice to yield a prediction of an emergent property.

Emergentism also endorses downward causation; it claims that higher-level states can have lower-level effects. Emergentism about the mental asserts that mental events can cause microphysical events. Plausibly, nonreductive materialism also countenances downward causation of this sort—M1 causes M2, but because M2 is wholly constituted of P2, M1 also causes P2. Kim thinks that by virtue of endorsing this sort of downward causation, nonreductive materialism is committed to emergentism.

However, the nonreductive view's allowing for downward causation is not by itself sufficient to render it emergentist. Endorsement of downward causation would indeed be radical if it also specified that mental properties could effect changes in the laws that govern the microphysical level independently of any emergent properties (call them the *ordinary* microphysical laws). Supposing that M1 were such an emergent mental property, M1 could cause P2 in such a way that P2 is no longer governed by the ordinary microphysical laws, but instead by laws that take into account the special characteristics of the emergent properties, or no laws at all. But nothing essential to nonreductive materialism entails this radical variety of downward causation (Pereboom 2002).

We might suppose that the capacity for altering the ordinary microphysical laws is what provides emergent properties with their distinctive nature. And this potentially explains why such properties would not be predictable from the microphysical base together with these ordinary laws. Information about the ordinary laws and the microphysical base might be insufficient to predict the law-altering behavior of the higher-level property. But

there is no feature of the nonreductive model per se that renders higher-level properties any less theoretically predictable than they would be on a reductive model. In each model, holding relational conditions fixed, a particular set of basal conditions will necessitate the same unique higher-level properties. The nonreductivist is no more committed to some factor that threatens theoretical predictability, such as the capacity of higher-level properties to alter the ordinary microphysical laws, than is the reductionist.

Arguably, therefore, nonreductive materialism can respond effectively to the most serious arguments made against it over the last forty years, and as a result, it remains a viable position about the nature of the mental.

Derk Pereboom (2005)

## NON-TRUTH- CONDITIONAL MEANING

There are two dominant approaches to semantics. One sees the task of semantics as to provide a systematic account of the truth conditions of (actual and potential) sentence uses. The other assumes that a use of a sentence expresses a statement (proposition, thought—terminology varies here), a statement being the sort of thing that can be asserted and believed, and also the sort of thing that, as a representation of how the world is, can be

assessed as true or false. The task of semantics, on this view, is systematically to spell out how sentence uses are associated with statements.

While the aims of the two types of theories are different, they are related. A use of a sentence to make a statement is, after all, presumably true (or false) in virtue of the truth (or falsity) of the statement made. Hence, to assign statements to sentence uses is to assign those uses truth conditions. Thus both approaches give pride of place in semantics to an account of how sentence uses come to be true or false.

No one thinks that giving an account of truth conditions or of what statements say, for a language, says all there is to say about conventional meanings of expressions in the language, though exactly what more there might be is a matter of controversy. Here are the main candidates for what might be left out of such accounts.

### MOOD AND FORCE

The theories just discussed aim to illuminate what is going on when one uses the sentences of a language to make assertions, to commit to the truth of a claim. But, of course, we can do much more than make assertions with our sentences, and some aspects of conventional meaning are obviously keyed to doing things other than asserting. Examples are grammatical and phonological forms associated with questioning, ordering, and exclaiming. It is a fact about conventional meaning if anything is, that subject/auxiliary inversion is used to question in French, German, and English, that prefixing a declarative sentence in English with “if only” signals a wish, that sentences such as “Yuck!” and “Damn it!” express attitudes that are not to be evaluated as true or false. One task not discharged by truth-conditional or statement semantics, then, is detailing when and how linguistic forms have as part of their conventional meaning the task of signaling that a particular sort of speech act (asserting, questioning, promising, warning, expressing disgust, etc.) is being performed.

One might question the extent to which this is more than just an appendice to truth-conditional or statement semantics. One might say that interjections like “Grody!” and “Awesome!” are elliptical for truth bearers (“That is grotesque!” “That’s awesome!”) uttered with a particular force. Whether or not this is so, the interjections do not combine with connectives and the range of sentences in the language to produce complex sentences; their meanings, if different from that of declaratives, would thus seem to be walled off from other aspects of meaning. There seems to be a rather small catalog of devices, like

auxiliary inversion and the subjunctive, to indicate force; such devices, furthermore, do not seem to be iterable, as constructions that contribute to truth conditions are. While one can disjoin a negation, then enclose the result inside the consequent of a conditional, etc., force indicators *seem* by and large to exclude one another (one cannot, for example, turn the optative “would that he were gone” into a question). Furthermore, it is not clear that any particularly novel sort of meaning is required in an account of the meanings of, for example, orders and questions. One might suspect that in some sense the content of the declarative “You will sit” and of the imperative “Sit!” are the same, the difference lying only in the force of their utterance. Perhaps questions have a slightly novel meaning. For example, it is often suggested that the meaning of “Who will sit?” is something like the set of (contextually relevant or possible) answers to it. But this makes the meaning of a question just a set of statements.

J. L. Austin once claimed that a good deal of natural-language vocabulary has meanings whose job is to signal that one is, and is only, performing a (nonassertive) speech act. For example, on Austin’s view, to utter “I promise to meet you at 5:00” is not to assert anything, but to make a promise. Austin (1962) gives a lengthy catalog of verbs (part of) whose conventional meaning, he claims, is to signal (when used in the first-person present) that a particular speech act is being performed, representative examples being “acquit,” “nominate,” “bet,” “toast,” and “concede.” He suggests that the number of such verbs contained in English is “of the third order of the power of 10.”

There are arguably many expressions whose purpose is in part or in whole to signal that, whatever else the speaker might be doing, he is performing a particular nonassertive speech act, though exactly which expressions do this is a matter of controversy. “Just between you and me” (as in “Just between you and me, the provost hates the president”) might be a conventional means to warn or ask one’s audience not to divulge the information imparted by the rest of the sentence. Racial slurs are, *inter alia*, conventional means of insulting and displaying contempt for their targets, as are the merely obscene or insulting things we may call someone in the course of commenting on them. Presumably, though, to utter something like “That jerk Smith is at the door” is to say something true or false, depending (only) on whether Smith is at the door.

## CONVENTIONAL IMPLICATURE

Grice (1967/1989) drew a distinction between what the use of a sentence “strictly” says and what it implies. Both what is said and what is implicated are statements. Indeed, what a sentence use says, in Grice’s sense, seems to be the statement that a semantic theory (of the second sort discussed above) aims to assign to the use. According to Grice, it is what a sentence strictly says, and *only* what it strictly says, that is relevant to the question of whether the use of the sentence is true.

What, then, is the role of what is implicated by the use of a sentence? Some such implication is a one-off affair, as when one says, “There’s an umbrella in the closet,” expecting one’s auditor to work out that rain is in the offing. Implication of this sort exploits facts obvious to all—for example, that speakers generally try to say helpful and relevant things—to efficiently convey information; it allows us to convey much more than our words literally mean.

Grice distinguished this sort of implication—*conversational implicature*, as he called it—from cases in which “the conventional meaning of the words used ... determine[s] what is implicated, besides helping to determine what is said” (Grice 1967/1989, p. 25). Grice’s examples were the words “therefore” and “but.” In uttering “*A*; therefore *B*,” Grice claimed, I say that *A*, say that *B*, commit myself to *B*’s following from *A*, but I have not “*said* (in the favored sense)” that *B* follows from *A*: “I do not want to say that my utterance ... would be, *strictly speaking*, false should the consequence in question [fail] to hold” (Grice 1967/1989, pp. 25–26). In uttering “He is *F* but *G*,” one speaks truly, Grice said, just in case the relevant individual is *F* and *G*, though one clearly conveys some sort of contrast between being *F* and being *G*. To use “therefore” or “but” is to commit to these implications. Since the implications are carried by the very words used, they are not one-off conversational implicatures but *conventional implicatures*.

A rather large class of expressions have been said to give rise to conventional implicatures. Karttunen and Peters (1979) suggest that words and constructions often said to give rise to presuppositions in fact give rise to conventional implicature. Here are some examples, with the word purportedly carrying the conventional implicature italicized and the implicature roughly indicated in parentheses:

*Even* John understands it. (John is unlikely to understand it.)

Martin *still* loves her. (Martin loved her in the past.)

Jed *failed* to pass. (Jed tried to pass.)

Other examples of purported conventional implicatures are nonrestrictive relative clauses and appositives. “Martina, a yogi, hunts bears” commits the speaker to Martina’s being a yogi, but arguably would be true even if she is not one, so long as she does hunt bears.

It is controversial whether there is such a thing as conventional implicature. Bach (1999) argued that a complete report of Bob’s utterance of “Even Mo likes Jo” is given with “Bob said that even Mo likes Jo”; simply saying, “Bob said that Mo likes Jo” is not giving a complete report. Since “that even Mo likes Jo” is here specifying what Bob said, Bach concluded, part of what Bob’s utterance says must be (something like the claim) that Mo’s liking Jo is unexpected. But if that is part of what is said, then the utterance is true only if it is unexpected that Mo likes Jo. According to Bach, this sort of argument shows that pretty much every expression alleged to carry a conventional implicature in fact does not.

It is not clear that this argument succeeds in showing that conventional implicatures are a fiction. “What is said (by utterance *u*),” as used by Grice, is a technical term. The phrase and its cousins have an everyday use as well. It is not at all clear that Grice assumed that if an utterance would naturally and correctly be reported as saying that *p*, then *p* must be part of what it says *in the technical sense*. We are, after all, pretty loose in how we report indirect speech.

One might hold that conventional implicatures are just as much *said by* a use of a sentence as anything, but have properties and relations to sentence uses that make it worthwhile to distinguish them from other claims literally made by sentence uses. Christopher Potts (2005) distinguished what he called “at issue” claims made by a sentence use (roughly, what Grice had in mind by “what is said”) from conventional implicatures. (However, Potts’s view, unlike Grice’s, is apparently that conventional implicatures are relevant to truth conditions. He takes conventional implicatures to be “entailments,” and holds that sentences carrying such implicatures can typically be paraphrased by conjunctions, one conjunct of which is the implicature.)

For Potts, one putative difference between conventional implicature and at-issue content is that even when a speaker embeds an expression carrying a conventional implicature, the speaker becomes committed to the implicature; this is not so with at-issue content. To see the point, consider “Bob, a linguist, likes clams,” where the at-issue content is that Bob likes clams and the conventional

implicature is that Bob is a linguist. When one embeds the sentence under negation or an attitude verb (as in “It is false that Bob, a linguist, likes clams,” or “Mary said that Bob, a linguist, likes clams”), use of the resulting sentence seems to commit the user to the conventional implicature, but not to the at-issue content.

A conventional implication is like a presupposition in this regard. Potts argues that conventional implicatures are not presuppositions, since false conventional implicatures and false presuppositions have different effects. When a presupposition of a sentence is false, the assertion of its at-issue content is unfelicitous, perhaps without truth value; this is not so with conventional implicature. In the case of conventional implicature, that Bob is not a linguist does not impugn or cast doubt on the claim that Bob likes clams. Knowledge that the presupposition of “It was Bob who stole the book (namely, that someone stole it) is false makes the assertion that it was Bob who did it unacceptable.

### NONPROPOSITIONAL MEANING

What is conventionally implicated has truth conditions. A non-truth-conditional conventional implicature does not enter into the truth conditions of the use of a sentence; its truth or falsity is not relevant to the truth or falsity of the sentence use implicating it. Other alleged sorts of non-truth-conditional meanings, however, are non-truth-conditional in the sense that they simply are not the sort of thing that can be true or false—they are, as it is sometimes said, not truth-apt.

One (alleged) example of such a meaning is presented by those who hold that linguistic meaning, or an aspect thereof, is to be identified with one or another psychological role associated with an expression. It has been proposed that the meaning of a sentence as used by a particular speaker is or involves one or more of: its inferential role (reflected by the speaker’s dispositions to make inferences from and to the sentence), its evidential role (reflected in what observations and experiences incline the speaker to accept or reject the sentence), and its probabilistic role (the function that sends a sentence *S* and a collection *C* of sentences to the subjective probability the speaker would assign *S* if he held all of *C* true). (Developments of such views are in Boer and Lycan 1986, Field 1977, Sellars 1954.) None of these things can sensibly be evaluated for truth or falsity. Those who champion such psychological accounts of meaning often hold that meaning is a two-factor affair, the other factor being truth-conditional. Typically, though not invariably, the two factors are held to be independent.

In part, the appeal of adding psychological role to truth conditions in an account of meaning is that it seems to reflect a genuine tension in our pretheoretic conception of meaning. Consider Putnam’s fantasy (in 1975) that there is a Twin Earth as much like Earth as possible, save that something other than H<sub>2</sub>O, call it XYZ, plays the role that H<sub>2</sub>O plays on Earth: XYZ has all the sensible properties of H<sub>2</sub>O; it is XYZ, not H<sub>2</sub>O, that fills the seas, that people drink and wash with, etc. Putnam holds, and many concur, that “water” means different things on Earth and on Twin Earth, for here it refers to H<sub>2</sub>O, while there it refers to XYZ. But many think that in some very important sense the word has the same meaning in both places, for someone transported to Twin Earth who was innocent of chemistry, it is felt, would not mean anything different by “water” there than he means here. If there are two factors to the meaning of “water”—a truth-conditional one (which varies between Earth and Twin Earth) and a psychological one (which is constant), both intuitions are partially vindicated.

A different kind of nonpropositional meaning is what is sometimes called “expressive” meaning. The idea of such meaning has its roots in the work of emotivists like A. J. Ayer and Charles Stevenson. According to Ayer, the role of ethical discourse is completely noncognitive. Utterances of sentences such as “Stealing is wrong” and “Friendship is good” are not assertions and do not express beliefs. Rather, they are expressions of attitudes of approval or disapproval. Uttering “Stealing is wrong” is doing the sort of thing one does when one shouts “Down with stealing!” or accompanies utterance of the word “stealing” with a disapproving shake of the head. Stevenson’s somewhat more sophisticated take on such sentences is that uttering them both expresses a distinctive sort of approval and exhorts (or at least attempts to bring) the audience to share this approval.

Sentences whose role is clearly exhausted by the expression of attitude—“Boo!” “Liver—yuck!” “Damn!”—are not candidates for combining with connectives and quantifiers to form larger sentences. “If liver—yuck, then I won’t make dinner” does not have a meaning, for it is not even a sentence. But sentences such as “Stealing is bad” quite obviously do combine with connectives and other sentences, and the results certainly do seem to be meaningful. It seems incumbent on any account of semantics to explain what the meaning of a sentence such as “Stealing is bad only if it causes pain to someone.”

Geach (1965), expanding on points in Frege (1918/1952), objects that the emotivist cannot make any

sense of the use of normative vocabulary in complex sentences, of embedded uses, as is sometimes said. Someone who utters “If failing Mary will make her sad, you shouldn’t do it” need not be expressing disapproval of anything. Even if there is a way around this—one might invoke some sort of “conditional disapproval”—emotivist views make the fact that we give normative arguments an utter mystery. The argument “Borrowing and not returning something is bad; if that is bad, so is stealing; so stealing is bad” is valid—its conclusion follows from its premises. But it seems to be nonsense to think that a feeling of disapproval for stealing *follows* from a feeling of disapproval for borrowing and not returning and whatever attitude might be associated with the conditional above. “Following from,” after all, is a relation normally defined in terms of preserving truth. But if this makes no sense, the idea that the argument is valid makes no sense in emotivist terms.

These considerations, incidentally, bear on the view of Austin mentioned above. The argument “If I promise to meet you, I will meet you; I promise to meet you; so I will meet you” seems obviously valid. But there is a sort of ambiguity, on Austin’s view, in “I promise to meet you.” Embedded in the antecedent of a conditional, it presumably does nothing but express the *statement* that its user promises to meet the addressee. Unembedded, it apparently does not do this, as one, in uttering the sentence, does not *assert* that one promises, on Austin’s view; one simply promises. It thus seems like the sense of “I promise to meet you” varies across the two premises of the argument, and thus the argument is not valid.

Expressivists such as Simon Blackburn and Alan Gibbard have recently tried to respond to this sort of objection, giving accounts that (more or less) agree with the emotivist line about simple sentences like “Hooking up is good” and attempting to derive therefrom meanings for complex sentences in which normative vocabulary occurs. Blackburn (1993) agrees with the emotivist that sentences like “Stealing is bad” express motivational states such as attitudes of disapproval. But he aspires to give an account of the meanings of the full range of uses of normative vocabulary, including such sentences as “Mary believes that stealing is bad” and “It’s true that stealing is bad.” The account is to be one that systematically assigns, to complex sentences, complex attitudes—typically in one or another way compounded out of the attitudes expressed by simple sentences. The sentence “If borrowing and not returning something is bad, then so is stealing it,” for example, expresses a commitment to either tolerating borrowing and not returning, or to disapprov-

ing stealing. Such a view would allow us to characterize validity in terms of preservation of commitment—an argument is valid just in case it is impossible to fulfill the commitments associated with premises without fulfilling those associated with the conclusion.

Gibbard (1992, a recast of 1990) suggested that normative sentences—not just sentences from morality, but sentences about what is or is not rational—absorb their meanings holistically from their relations to “immediate motivations,” that is, to the states one expresses if one thinks to oneself “Do/Don’t do that now!” The idea, roughly put, is that just as complex statements get their truth-conditional content from their inferential relations to sentences expressing observations, so normative statements absorb their content from inferential relations to sentences expressing immediate motivations. Gibbard suggests that the meaning of a normative sentence (including complex combinations of normative and non-normative elements) can be represented as a set of “factual-normative” worlds, which are pairs of possible worlds and systems of norms. The idea, again roughly, is this. A simple factual statement holds at world  $w$  and norm  $n$  if it is true there. A simple normative statement such as “That is bad” (whose connection with “Don’t do that!” is obvious) holds at  $w$  and  $n$  provided that  $n$  forbids the act referred to. With this as a basis, one can use standard techniques to assign sets of factual-normative worlds to compound sentences.

One might argue with Blackburn and Gibbard about the details of their approaches, worrying, for example, that Blackburn helps himself without justification to the idea that there is a distinctive sort of moral disapproval. Yet it would seem that something along the lines of Blackburn’s or Gibbard’s story *must* be correct. Here is why.

Forget about claims about morality, rationality, or other obviously normative concerns. Think instead about what is going on when we talk about talk that obviously aspires to be true or false—about what happens when one person says “Jo is bald” and another says “That’s not true,” or when someone says “The sentence on the board isn’t true.” It seems obvious that such talk can get it right without being true. If the sentence on the board is a liar sentence, one thing that we *know* about it is that it is not true. We can, after all, *prove* that it is not. But paradox ensues if we take this thing we know—that the sentence is not true—to be true. After all, if what we know—that the sentence is not true—is true, then, since the sentence *says* just that—that it is not true—what the sentence says is true. So what we know is false. But one cannot know something that is false. Similarly, if vague predicates are

neither true nor false of their borderline cases (and surely this is the most plausible thing to say about them) and Jo is borderline-bald, then while the person who utters “Jo is bald” says something, what he says is *not* true. But if it is *true* that the sentence is not true, then (since what is not true is false), “Jo is bald” must be false. But since Jo is borderline bald, “Jo is bald” cannot be false either.

What should we make of this? Well, for one thing, when we say, referring to the liar, “That is not true,” we should not be understood as *asserting* something, that is, committing to its truth. Rather, we are performing the sui generis speech act of *denial*, where (roughly put) denying a potential truth bearer is the appropriate thing to do if it is *not* true (“not” being used here to deny). This sort of thing applies quite generally to uses of other logical connectives. Sometimes, for example, when someone utters “A if and only if (iff) B,” they are to be understood as asserting the material equivalence of A and B. But when we say things with the form “S is true iff S” and S happens to be a liar sentence, we are not to be understood as *asserting* anything. Rather, we are performing an act that is apt if the claims connected by “iff” have the same (perhaps non-truth-conditional) status.

When we utter sentences, we perform different sorts of speech acts. Sometimes we assert, sometimes we deny, sometimes we perform the sort of act just mentioned. And when we perform such acts, we incur various commitments. For example, assertion commits us to the truth of what is asserted; denial of a potential truth bearer commits us to the nontruth thereof. Sentence-compounding devices, at least on some occasions, contribute not to *sense*, by (for example) expressing truth-functional negation, but to *force*. In the case of “not,” for example, one sometimes signals that one is denying, where to deny S is to commit to the inaptness of whatever commitment is associated with uttering S.

Think of the simplest sentences of one’s language as vehicles for performing speech acts, each such act involving its own distinctive kind of commitment, each commitment having its own conditions of appropriateness and inappropriateness. Annexing words like “not” and “if” to sentences yields (when the connectives signal force) sentences that are vehicles for performing speech acts with their own distinctive kinds of commitments, their own aptness conditions. Compounding sentences with several connectives playing the role of force indicators produces a sentence that can serve as a vehicle for performing a complex speech act determined by the meanings of the constituent sentences and the force-indicating meanings of the connectives. Uttering “If S is a liar

sentence, then it is not true,” for example, performs an apt speech act if it is apt either to deny that S is a liar sentence or to deny that S is true.

Beyond an account of sense or reference, a theory of meaning for a language—at least one component of such a theory—must tell the story of how the acts and commitments associated with the parts of a complex sentence determine the act for which the complex sentence is a vehicle, the commitments one incurs with the act, and the aptness conditions of such commitments. (For the beginning of such a story, see Richard 2006.) Such a story generalizes the sort of ideas Blackburn had. With such a story, one can see that logical validity, in its most basic sense, is preservation of commitment: An argument is valid provided that whenever the commitments associated with the premises are apt, so are those associated with the conclusion.

It was mentioned above that there was something importantly right about Gibbard’s and Blackburn’s accounts of normative discourse. What is important and surely right is not their view of the nature of the acts performed and commitments incurred in normative utterances. Perhaps those accounts are on the right track, because normative discourse is expressive, not truth-apt. Perhaps they are wrong, and normative discourse is no less truth-evaluable than a stock-price quotation. What is important is the insight that validity (and the other properties we associate with rational discourse) are not the exclusive property of truth-conditional discourse. Sometimes meaning and validity are to be explained in terms of truth conditions. But this is not the only case—it is but a special case.

See *Ethics, History of; Normativity*

## NORRIS, JOHN

(1657–1711)

John Norris, the English philosopher and disciple of Nicolas Malebranche, was associated with the Cambridge Platonists. Norris was born in Collingbourne-Kingston, Wiltshire. His father was a clergyman and at that time a Puritan. Educated at Winchester and at Exeter College, Oxford, which he entered in 1676, Norris was appointed a fellow of All Souls in 1680. During his nine years at All Souls, he was ordained (1684) and began to write, mostly in a Platonic vein and often in verse. In 1683 he published *Tractatus adversus Reprobationis absolutae Decretum*, in which he attacked the Calvinist doctrine of predestination. His Platonism and anti-Calvinism naturally attracted Norris to the Cambridge Platonists; in 1684 he began to correspond with Henry More and Damaris Cudworth, the daughter of Ralph Cudworth.

The philosophical essays included in *Poems and Discourses* (1684)—renamed *A Collection of Miscellanies* in the 1687 and subsequent editions—could, indeed, have been written by a Cambridge Platonist. Their main argument is that since truth is by its nature eternal and immutable, it must relate ideas which are also eternal and immutable; this condition, according to Norris, can be fulfilled only by ideas which are "in the mind of God"—that is, manifestations of God's essence. Thus, the existence of God is deducible from the very nature of truth; the atheist is involved in a self-contradictory skepticism.

In Norris's *The Theory and Regulation of Love* (1688)—for all that Norris dedicated it to the former Damaris Cudworth, now Lady Masham, and included as an appendix his correspondence with More—the influence of Malebranche began to predominate. At first, it reinforced rather than weakened Norris's sympathy with Cambridge Platonism. Norris followed Malebranche in distinguishing two kinds of love—desire, which seeks to unify itself with the good it pursues, and benevolence, which seeks good for others. But, as also in *Reason and Religion* (1689), Norris explicitly rejected Malebranche's view that the only proper object of desire is God. The objects of desire, Norris said, form a hierarchy—God, the good of the community, intellectual pleasures, and sensual pleasures are all in some measure good. God is the highest but not the only good.

In 1689, Norris married and resigned his fellowship to become rector of Newton St. Loe in Somerset. In his *Reflections on the Conduct of Human Life* (1690), addressed to Lady Masham and intended as an admonition to her, he condemned the life he had lived at Oxford on the ground that he had interested himself in public affairs and in intellectual pursuits; in the future he proposed to dedicate himself in retirement to the "moral improvement of my mind and the regulation of my life." This is Malebranche's, not the Cambridge Platonists', ideal of conduct; even the pursuit of knowledge is conceived of as a worldly enticement.

In 1691, as a result of John Locke's influence, Norris became rector of Bemerton, near Salisbury, where he died on February 5, 1711. He did not win the approval of his Cambridge Platonist bishop, Gilbert Burnet, who would certainly not have appreciated Norris's attack on toleration in *The Charge of Schism continued* (1691). Norris's *Discourse concerning the Measures of Divine Love (Practical Discourses, Vol. III, 1693)* and *Letters concerning the Love of God* (1695) reveal the complete disciple of Malebranche; we ought, Norris now said, to love nobody but God. Substantially reversing Immanuel Kant's dictum, he

argued that we should treat other human beings as means—occasions of happiness to us—and never as ends. Lady Masham was naturally indignant; in her anonymous *Discourse concerning the Love of God* (1696), a reply to Norris, she argued that men are “made for a sociable life” and should love their fellow men in the same way they love God.

## THOUGHT

Norris’s metaphysical views, sketched in *Reason and Religion*, are set out in detail in his *Essay towards the Theory of the Ideal and the Sensible World* (Vol. I, 1701; Vol. II, 1704), which fully justifies his nickname “the English Malebranche.” Yet the argument of the first volume of the *Essay* would still entitle Norris to be described as a Platonist—or as a Thomist or an Augustinian. Plato, the “Platonic father” Augustine, Francisco Suárez, and Thomas Aquinas all taught, he tried to show, the same lesson as Malebranche—that knowledge is of the eternal and, therefore, of God.

In the second volume, however, when Norris came to consider in more detail how our knowledge of “the world of sense” is related to our knowledge of “the intelligible world,” his break with the Platonist tradition, arising out of his allegiance to Malebranche, is at once apparent. It is true that when he did (mildly) criticize Malebranche, it is on the Platonic ground that his theory of the imagination allows too much to sensation; Malebranche’s phrase “We see all things in God,” he also thought, might suggest to the careless reader that sensation is our analogue for knowledge. “Divine ideas,” Norris preferred to say, “are the immediate objects of our thought in the perception of things.” But these are minor reformulations. Of much greater significance is the fact that he agreed with the Cartesians that “the world is a great mechanism and goes like a clock” and even accepted, although with some little hesitation, the Cartesian doctrine of animal mechanism. He did not even bother to refer to the Platonist theory of “plastic powers” or to More’s criticism of René Descartes’s extension-thought dualism. He is a Platonist only where Malebranche is a Platonist—for example, in his rejection of the Thomas-Locke account of abstraction.

Norris’s philosophy might properly be described, in the phrase commonly applied to Benedict de Spinoza, as “God-intoxicated.” God, for him as for Malebranche, is the efficient cause of all happenings, the only good, the only object of knowledge. We know God directly; everything else is known by way of our apprehension of God’s nature as revealed in the ideas that emanate from him. Norris could not explain, he confessed, how spiritual

ideas can represent a material world; the material world is, indeed, an embarrassment to him, fading into the empty concept of “that which occasions our apprehensions” that George Berkeley criticized. He was so concerned to leave nothing lovable in the world, nothing that could be a source of happiness to us, that he reduced it to a nonentity; it exists only as something to be shunned. The relation between our mind and God’s is left in equal obscurity.

In 1692 Locke and Norris quarreled on a matter involving Lady Masham; Locke came to be very impatient with Norris’s views, which probably provoked his *Examination of Malebranche* (first published in *Posthumous Works*, edited by Peter King, London, 1706); he directly criticized Norris in an essay first published in *A Collection of Several Pieces of Mr. John Locke* (1720). In general, Locke thought of Norris as a completely reactionary thinker.

Other of Norris’s works deserving mention are *An Account of Reason and faith in relation to the Mysteries of Christianity* (1697), in which he argued—in reply to John Toland’s deistic *Christianity not Mysterious* (1696)—that it is not unreasonable to believe the incomprehensible, and *A Philosophical Discourse concerning the Natural Immortality of the Soul* (1708), which makes use of Platonic-scholastic arguments against Henry Dodwell’s *Epistolary Discourse proving ... that the Soul is naturally Mortal* (1706). Many of his works, although not *The Ideal World*, were extremely popular, but it is usually impossible to distinguish his influence from Malebranche’s. One of the least original of philosophers, he nevertheless displays considerable powers of criticism and exposition. He had a direct influence on Arthur Collier.

## NOTHING

"Nothing" is an awe-inspiring yet essentially undigested concept, highly esteemed by writers of a mystical or existentialist tendency, but by most others regarded with anxiety, nausea, or panic. Nobody seems to know how to deal with it (he would, of course), and plain persons generally are reported to have little difficulty in saying, seeing, hearing, and doing nothing. Philosophers, however, have never felt easy on the matter. Ever since Parmenides laid it down that it is impossible to speak of what is not, broke his own rule in the act of stating it, and deduced himself into a world where all that ever happened was nothing, the impression has persisted that the narrow path between sense and nonsense on this subject is a difficult one to tread and that altogether the less said of it the better.

This escape, however, is not so easy as it looks. Plato, in pursuing it, reversed the Parmenidean dictum by insisting, in effect, that anything a philosopher *can* find to talk about must somehow be there to be discussed, and so let loose upon the world that unseemly rabble of centaurs and unicorns, carnivorous cows, republican monarchs and wife-burdened bachelors, which has plagued ontology from that day to this. Nothing (of which they are all aliases) can apparently get rid of these absurdities, but for fairly obvious reasons has not been invited to do so. Logic has attempted the task, but with sadly limited success. Of some, though not all, nonentities, even a logician knows that they do not exist, since their properties defy the law of contradiction; the remainder, however, are not so readily dismissed. Whatever Bertrand Russell may have said of it, the harmless if unnecessary unicorn cannot be driven out of logic as it can out of zoology, unless by desperate measures that exclude all manner of reputable entities as well. Such remedies have been attempted, and their effects are worse than the disease. Russell himself, in eliminating the present king of France, inadvertently deposed

the present queen of England. W. V. Quine, the sorcerer's apprentice, contrived to liquidate both Pegasus and President Harry Truman in the same fell swoop. The old logicians, who allowed all entities subsistence while conceding existence, as wanted, to an accredited selection of them, at least brought a certain tolerant inefficiency to their task. Of the new it can only be said that *solitudinem faciunt et pacem appellant*—they make a desert and call it peace. Whole realms of being have been abolished without warning, at the mere nonquantifying of a variable. The poetry of Earth has been parsed out of existence—and what has become of its prose? There is little need for an answer. Writers to whom nothing is sacred, and who accordingly stop thereat, have no occasion for surprise on finding, at the end of their operations, that nothing is all they have left.

The logicians, of course, will have nothing of all this. Nothing, they say, is not a thing, nor is it the name of anything, being merely a short way of saying of anything that it is not something else. *Nothing* means "not-anything"; appearances to the contrary are due merely to the error of supposing that a grammatical subject must necessarily be a name. Asked, however, to prove that nothing is *not* the name of anything, they fall back on the claim that nothing *is* the name of anything (since according to them there are no names anyway). Those who can make nothing of such an argument are welcome to the attempt. When logic falls out with itself, honest men come into their own, and it will take more than this to persuade them that there are not better cures for this particular headache than the old and now discredited method of cutting off the patient's head.

The friends of nothing may be divided into two distinct though not exclusive classes: the know-nothings, who claim a phenomenological acquaintance with nothing in particular, and the fear-nothings, who, believing, with Macbeth, that "nothing is but what is not," are thereby launched into dialectical encounter with nullity in general. For the first, nothing, so far from being a mere grammatical illusion, is a genuine, even positive, feature of experience. We are all familiar with, and have a vocabulary for, holes and gaps, lacks and losses, absences, silences, impalpabilities, insipidities, and the like. Voids and vacancies of one sort or another are sought after, dealt in and advertised in the newspapers. And what are these, it is asked, but perceived fragments of nothingness, experiential blanks, which command, nonetheless, their share of attention and therefore deserve recognition?

Jean-Paul Sartre, for one, has given currency to such arguments, and so, in effect, have the upholders of "nega-

tive facts”—an improvident sect, whose refrigerators are full of nonexistent butter and cheese, absentee elephants and so on, which they claim to detect therein. If existence indeed precedes essence, there is certainly reason of a sort for maintaining that nonexistence is also anterior to, and not a mere product of, the essentially parasitic activity of negation; that the nothing precedes the not. But, verbal refutations apart, the short answer to this view, as given, for instance, by Henri Bergson, is that these are but petty and partial nothings, themselves parasitic on what already exists. Absence is a mere privation, and a privation of something at that. A hole is always a hole *in* something: take away the thing, and the hole goes too; more precisely, it is replaced by a bigger if not better hole, itself relative to its surroundings, and so tributary to something else. Nothing, in short, is given only in relation to what is, and even the idea of nothing requires a thinker to sustain it. If we want to encounter it *an sich*, we have to try harder than that.

Better things, or rather nothings, are promised on the alternative theory, whereby it is argued, so to speak, not that holes are in things but that things are in holes or, more generally, that *everything* (and everybody) is in a hole. To be anything (or anybody) is to be bounded, hemmed in, defined, and separated by a circumambient frame of vacuity, and what is true of the individual is equally true of the collective. The universe at large is fringed with nothingness, from which indeed (how else?) it must have been created, if created it was; and its beginning and end, like that of all change within it, must similarly be viewed as a passage from one nothing to another, with an interlude of being in between. Such thoughts, or others like them, have haunted the speculations of nullophile metaphysicians from Pythagoras to Blaise Pascal and from G. W. F. Hegel and his followers to Martin Heidegger, Paul Tillich and Sartre. Being and nonbeing, as they see it, are complementary notions, dialectically entwined, and of equal status and importance; although Heidegger alone has extended their symmetry to the point of equipping *Das Nichts* with a correlative (if nugatory) activity of nothing, or nihilating, whereby it produces *Angst* in its votaries and untimely hilarity in those, such as Rudolf Carnap and A. J. Ayer, who have difficulty in parsing *nothing* as a present participle of the verb “to noth.”

Nothing, whether it noths or not, and whether or not the being of anything entails it, clearly does not entail that anything should be. Like Benedict de Spinoza’s substance, it is *causa sui*; nothing (except more of the same) can come of it; *ex nihilo, nihil fit*. That conceded, it remains a

question to some why anything, rather than nothing, should exist. This is either the deepest conundrum in metaphysics or the most childish, and though many must have felt the force of it at one time or another, it is equally common to conclude, on reflection, that it is no question at all. The hypothesis of theism may be said to take it seriously and to offer a provisional answer. The alternative is to argue that the dilemma is self-resolved in the mere possibility of stating it. If nothing whatsoever existed, there would be no problem and no answer, and the anxieties even of existential philosophers would be permanently laid to rest. Since they are not, there is evidently *nothing to worry about*. But that itself should be enough to keep an existentialist happy. Unless the solution be, as some have suspected, that it is not nothing that has been worrying them, but they who have been worrying it.

## NOUNS, MASS AND COUNT

Many languages mark a grammatical distinction that is commonly referred to as the "mass/count-distinction"; for example, the distinction between the occurrences of "hair" as a mass-noun in "There is hair in my soup," on the one hand, and its occurrences as a singular and plural count-noun in "There is a hair in my soup" or "There are hairs in my soup," on the other. Awareness of this linguistic contrast may, in the Western tradition, date as far back as the pre-Socratics, Plato, and Aristotle; in modern times, however, the first explicit formulation of it is usually credited to Otto Jespersen (1924).

### 1. THE PROBLEM OF CLASSIFICATION

Almost every aspect of the mass/count-distinction is unclear and contested, including the question of how it is to be drawn:

#### The Problem of Classification:

- (i) Between what sorts of entities is the mass/count-distinction to be drawn?
- (ii) By means of what sorts of criteria is the mass/count-distinction to be drawn?

What underlies question (i), for one thing, is a certain ambivalence as to whether the contrast concerns uses or occurrences of expressions or expressions themselves (and, if the former, we face the further question as to what a "use" or an "occurrence" of an expression really is; that is, how, for example, occurrences contrast with types and tokens of expressions). (In what follows, for reasons of convenience, we will speak of both uses or occurrences as well as of expressions themselves as being mass or

count.) Moreover, question (i) also encompasses the issue of whether the contrast in question can be properly drawn only with respect to nouns and noun-phrases or whether it can be sensibly extended to other categories, such as adjectives (e.g., with "red" on the mass-side and "circular" on the count-side) as well as verbs and verb-phrases (e.g., with atelic activity-verbs such as "run in circles" being classified as mass and telic achievement- or accomplishment-verbs such as "recognize" or "grow up" being classified as count; see Hoepelman 1976, Taylor 1977, Mourelatos 1978).

Question (ii), on the other hand, asks whether the distinction in question is best drawn, for example, by means of syntactic, morphological, semantic, or pragmatic criteria. To illustrate—restricting ourselves, as is customary, to the category of nouns and noun-phrases, and to such purely syntactic criteria (exhibited overtly in English) as the admissibility of plural-morphology as well as the licensing of "bare" (i.e., unquantified) occurrences or particular kinds of determiners and quantifiers (e.g., "much" versus "many")—we arrive at the following sort of classification:

- (M) *Mass*: "air," "water," "mud," "sand," "dust," "snow," "gravel," "asparagus," "traffic," ...
- (C) *Count*: "beach," "cloud," "chair," "piece of furniture," "virus," "bacteria," "sheep," "university," "hurricane," "football game," ...
- (D) *Dual-Use*: "hair," "chicken," "carrot," "apple," "cloth," "pain," "disease," ...

The nouns in the first list permit "bare" occurrences (as in "Water is wet"); they do not, in their use as mass-nouns, permit pluralization; and they can occur together with such quantifiers as "much" or "little" (as in "much air" and "little air"). The nouns in the second list do not permit (singular) "bare" occurrences (as in "\*Beach is sandy"); but they can, in their use as count-nouns, be accompanied by plural morphology; and they are found together with such quantifiers as "many" or "few" (as in "many beaches" and "few beaches"). The nouns in the third list standardly have both sorts of occurrences. A list of this kind, however, masks several potential sources of trouble, which an adequate treatment of the problem of classification would need to address.

AMBIGUITIES. First, some grammatical contexts are at least at first sight ambiguous, in that the most obvious syntactic criteria such as those just cited do not by them-

selves clearly differentiate a given noun-occurrence as mass or count: examples include the occurrences of “lamb,” “apple,” and “fish” in “Mary had a little lamb,” “The apple in the dessert is moldy,” and “Fish floated in the water”; the occurrence of “home” in “at home”; as well as the occurrence of “tape” in such compound expressions as “tape recorder.”

**TRICKY CASES.** Secondly, while the syntactic criteria mentioned above involving plural morphology and quantification do speak to most of the following cases, we may wonder whether they do not in fact misclassify at least some of them:

- Collective Mass:* “furniture,” “jewelry,” “silverware,”  
“clothing,” ...
- Collective Plural:* “spaghetti,” “groceries,” “news,”  
“clothes,” ...
- Collective Singular:* “crew,” “crowd,” “mob,”  
“committee,” ...
- Irregular Plural:* “scissors,” “pants,” “tweezers,”  
“goggles,” ...
- Proper Names:* “Bertrand Russell,” “the Holy  
Roman Empire,” “the sixties,” ...

Thus, we may feel, for example, that “clothing” and “clothes” are sufficiently similar in their semantic contribution that they should be classified together, even though one occurs standardly as a mass-noun in English, whereas the other standardly occurs as an invariably plural count-noun.

**ABSTRACT NOUNS.** Thirdly, the syntactic criteria mentioned above also apply to nouns and noun-phrases whose denotations are either abstract or at least not straightforwardly concrete, such as the following:

- Abstract Mass:* “knowledge,” “evidence,” “poetry,”  
“money,” “information,” ...
- Abstract Count:* “belief,” “mistake,” “rendition,”  
“symphony,” “discovery,” ...
- Abstract Dual-Use:* “logic,” “truth,” “justification,”  
“science,” “theory,” ...

It has, however, been questioned whether the mass/count-distinction can be sensibly drawn for such nouns and noun-phrases, possibly because the semantic and ontological vocabulary, which will feature prominently below, may not easily extend to their case.

**NEW USES FOR OLD NOUNS.** Fourthly, it should be noted that the examples given so far attest only to the way in which these nouns are currently and standardly used in

English. However, it is relatively straightforward to introduce new uses for old nouns, or even to use a noun in a nonstandard way without much setup. For example, the noun “email” has effortlessly acquired a count-use, even though it was initially used only as a mass-noun; moreover, the use of “car” in “A BMW 300-series is not much car for the money,” while deliberately nonstandard, is, as far as issues of grammar are concerned, not completely out of the question. Thus, the mass/count-distinction cannot be viewed as written in stone even within a particular language; expressions can change their status, if speakers of the language, for whatever reasons, so desire.

**CROSS-LINGUISTIC VARIATION.** Finally, there is considerable cross-linguistic variation in how particular languages pattern with respect to the mass/count-distinction. For one thing, specific nouns that belong to different languages but intuitively have the same meaning can be classified as mass in one language and count in another; for example, the German word for hair (“Haare”) is, except for poetic contexts (such as “Rapunzel, let your hair down!”), standardly used only as a singular or plural count-noun, whereas the English noun “hair” standardly has both mass- and count-uses. Furthermore, different languages can differ in how they mark the mass/count-distinction or, indeed, in whether they do so in any obviously visible way at all. In this context, it has been observed that Asian classifier-languages such as Mandarin Chinese and Japanese are of special interest, because they require that every noun be preceded by a classifier reminiscent of the sort of “reference-dividing” relations we observe in English primarily in connection with mass-nouns and plural count-nouns (“basket of,” “bouquet of,” “bucket of,” ...). This has motivated some writers, such as R. Sharvy (1978) to speculate that perhaps all nouns are at bottom mass not only in these overt classifier-languages, but across the board, on the theory that such classifiers may be present covertly in every language.

## 2. THE PROBLEM OF LOGICAL FORM

While consideration of the problem of classification is often regarded only as a means to an end—namely, as a way of clarifying the nature of the subject-matter beyond the clear cases—its importance should not be underestimated, especially given its role in deciding whether or not a specific, more or less tricky, case should be viewed as a counterexample to a particular analysis. Most of the attention surrounding the mass/count-distinction, however, has been focused on the question of what (if any) its semantic and ontological significance might be. Thus, the

mass/count-distinction, more so perhaps than any other comparable issue, has provided fertile soil on which to debate questions concerning our most central semantic notions—those of meaning and truth, reference, and quantification—as well as ontological questions concerning the basic categories of what there is; and therein, surely, lies its central interest for linguists and philosophers. Among the wealth of semantic issues that are debated in this connection, the following may be singled out as particularly prominent.

### Semantic Role

(iii) What is the semantic role played by mass-nouns and count-nouns?

At least as far as singular count-nouns are concerned, this question is thought to have a straightforward answer; in fact, traditional accounts of meaning, truth, reference, and quantification, with their frequent appeals to the predicate-calculus and the apparatus of set-theory, seem to be in many ways specifically tailored to the semantic needs of singular count-nouns. Such nouns are typically analyzed as playing the semantic role of a predicate whose extension consists of objects, each of which (or so it seems) could at least in principle be referred to as a such-and-such (for some appropriate substantival phrase). These objects, in turn, are thought to compose the domain of values over which variables and quantifiers are interpreted as ranging; and they are taken to enter into set-theoretic relationships with one another.

Mass-nouns and plural count-nouns, on the other hand, have for a variety of reasons resisted straightforward assimilation into this familiar vocabulary. The former in particular have appeared puzzling, for one thing, because they seem to lead, in W. V. O. Quine's words, a "semantic double-life of sorts" (1960, p. 97), in some of their occurrences (e.g., "Snow is white") apparently playing the role of a name or singular term, in others (e.g., "Most snow is white") that of a predicate or general term. This appearance of a "semantic double-life" led Quine to conclude that mass-nouns can play both roles, that of a name and that of a predicate, depending on their position within the statement (see also Ter Meulen [1981] for another version of what may be called the "mixed view"). Others have thought it necessary to choose between these two semantic categories, by defending either a version of the "name view" or the "predicate view." (For examples of the name view, see Parsons 1970, Moravcsik 1973, Bunt 1979, 1985, Chierchia 1982, Link 1983, Lønning 1987, and Zimmerman 1995; for examples of the predicate view, see Burge 1972, and Koslicki 1999; as well as, arguably, Cartwright 1963, 1965, 1970; Montague 1973;

Pelletier 1974; Bennett 1977; Sharvy 1980; Roeper 1983; Pelletier and Schubert 1989; and Higginbotham 1994; though some of these writers are difficult to place.)

Finally, an influential attitude toward the apparently schizophrenic semantic behavior of mass-nouns has also been to detect here a category that resists this sort of classification into either name or predicate, because it harks back somehow to a more "primitive," "pre-individuative," "pre-reference-dividing," "merely feature-placing," "non-objectual," "pre-particular level of thought," one which predates the dichotomy of singular term and general term (see especially Strawson 1953–1954, Quine 1960, Evans 1975, and Laycock 1972, 1975, 1989, 1998 for expressions of this attitude). It is not obvious, however, what to make of this somewhat ambivalent sentiment, because apparently the mode of expression associated with the use of mass-nouns fits comfortably into our present usage and we do not currently inhabit this supposed "archaic" time.

As argued convincingly in Burge (1972), all three views—the mixed view, the name view, and the predicate view—give rise to potential difficulties. The mixed view has trouble capturing inferences which turn on the common semantic core apparently shared by both namelike and predicative occurrences of mass-nouns (e.g., "Snow is white; this stuff is snow; therefore, this stuff is white"). The name view, on the other hand, is forced to invoke an arguably question-begging "reference-dividing" relation, of the form "is a ... of" (e.g., "is a quantity of"), to account for those cases in which mass-nouns play an apparently predicative role (e.g., "most snow," on this view, becomes something along the lines of "most quantities of snow"). Moreover, as noted in Koslicki (1999), the supposed evidence for the name view (and, hence, for one half of the mixed view, as well) is shaky to begin with, because it is drawn from the class of so-called generic sentences; but genericity is not a phenomenon peculiar to mass-nouns and is exhibited to an equal extent by singular and plural count-nouns.

Finally, the predicate view, given our familiar way of thinking about predication as involving domains of objects, threatens to do away completely with the intuitive contrast between the different kinds of noun-occurrences. Whether this threatened obliteration should be taken as cause for alarm, however, depends in part on one's reaction to the kind of skeptical attitude displayed in Burge (1972), according to which the mass/count-distinction seems ultimately to be a pragmatic phenomenon, the grammatical manifestation of the contrast between cases in which, for whatever reasons, standards (though not necessarily clear ones) are already available

for what is to count as a such-and-such (for some appropriate substantival phrase) and cases in which there has not been any comparable pressure to clarify or supplement our current practice.

This skeptical outlook takes the linguistic distinction in itself to be a relatively superficial phenomenon, at least from the point of view of semantics and ontology, though there might be a good deal of interest to be said about it, for example, from the perspective of epistemology, philosophy of science, philosophy of mathematics, and psychology especially concerning our practices of counting and measuring (see for example Frege 1884, Carnap 1926, Carey 1985, 1994, Xu 1997). Some of the considerations raised above in Section 1, especially the striking heterogeneity of class of expressions at issue noted in (b) and (c), as well as the flexibility of current usage and the cross-linguistic variation noted in (d) and (e), might in fact be thought to count as *prima facie* evidence in favor of such a skeptical approach.

In addition to the apparent “semantic double-life” that has been ascribed to mass-nouns by writers such as Quine, this mode of expression has also seemed to pose special challenges with respect to the following question:

**Mass-Logic and Mass-Quantification:**

(iv) How do mass-nouns behave under quantification and in combination with logical connectives such as negation, disjunction, and others?

As R. Sharvy (1980), P. Roeper (1983), J. T. Lønning (1987), and J. Higginbotham (1994) in particular have discussed in detail, it seems that such statements as “The hot coffee did not disappear” or “All phosphorus is either red or black” cannot be understood straightforwardly in terms of quantification over quantities of coffee or phosphorus and in terms of such set-theoretic notions as membership, subset, union, intersection or complement. For example, it has been argued that “All phosphorus is either red or black” does not mean the same as “Every quantity of phosphorus is either red or black,” because, of those quantities of phosphorus that include both red phosphorus and black phosphorus, it is neither true to say that they are red nor that they are black (Roeper 1983, p. 254). Statements of this kind have been taken to provide motivation for thinking that, as in the case of predication, our familiar approach to quantification and other logical operations, as involving domains of objects that can be interpreted as standing in set-theoretic relations to one another, does not do justice to the semantic properties of mass-nouns and the system of determiners that accompanies them.

The suspected failure of the traditional apparatus to yield a fully general logic has commonly been traced to a certain combination of mereological characteristics exhibited by mass-nouns (or their denotations, or the concepts expressed by them). Thus, from the beginning, writers have been struck because not only do sums of, say, mud yield more mud (as of course do sums of, say, people), but because divisions of mud generally (i.e., with the exception of small and not readily accessible parts) also yield more mud (see, for example, Leonard and Goodman 1940, Goodman 1951, Quine 1960, Burge 1972, Laycock 1972, Cheng 1973, Bunt 1979, 1985, Ter Meulen 1981, Roeper 1983, Simons 1987, Higginbotham 1994, and Zimmerman 1995). The first of these properties is known as “cumulativity,” the second as “distributivity,” and their conjunction is often called “homogeneity”; the semantic relevance (if any) of “parts that are too small” (Quine 1960, p. 98) has given rise to what is known as the “problem of minimal parts.”

Moreover, while divisions of mud into more mud, as we now know from empirical inquiry, cannot go on forever, it has been said that, at the very least, it is not part of the meaning of the term “mud” that there are atoms of mud, in the mereological sense of “atom” (i.e., quantities of mud that have no proper parts that are themselves mud), while apparently it does follow from the meaning of such terms as “person” or “people,” or at least from the fact that they are standardly used as count-nouns, that their extensions do consist of such atoms, with each single person counting as one of them.

Thus, if these observations are correct, they would lead to the following tripartite division: (i) singular count-nouns are neither cumulative nor distributive, but they are atomic; (ii) plural count-nouns are cumulative and atomic, but not distributive; and (iii) mass-nouns are homogeneous (i.e., both cumulative and distributive), but nonatomic (i.e., uncommitted as between the properties of atomicity and full-fledged atomlessness). And where there are no atoms, so it has seemed to many writers, these set-theoretic operations and the associated approaches to quantification can take no hold; instead, nonatomic, algebraically characterizable systems (such as Boolean algebra or lattice theory) have seemed more appropriate in light of the semantic peculiarities of mass-nouns (see especially Cartwright 1963, for the first fully developed, but unpublished, algebraic account; later analyses in the same style include Bunt 1979, 1985, Roeper 1983, Link 1983, Simons 1987, Landman 1991, and Higginbotham 1994).

Despite the popularity of this style of approach, however, it is at least debatable, first, whether mass-nouns in fact are homogeneous, given the problem of minimal parts; and, secondly, whether the question of atomicity can in fact carry the semantic weight ascribed to it, given that, for example, we can without difficulty refer to something as a building, even when the object in question has proper parts that are themselves buildings (see Koslicki 1999 for a skeptical voice). Also relevant in this connection is the debate in contemporary metaphysics concerning the so-called “problem of the many” (see, e.g., Unger 1981), which concerns the question of whether each region of space-time occupied by something we would ordinarily refer to as, say, “one person” is in fact occupied by indefinitely many numerically distinct, but largely overlapping, persons: however exactly this debate in metaphysics ought to be resolved, at the very least we cannot accuse the philosophers involved in it of not being competent speakers of English!

### 3. OTHER PURPORTED DIFFERENCES

In addition to the apparent mereological differences as well as the purported differences in semantic role just cited, the following considerations are frequently also thought to bear some relevance to the mass/count-distinction.

**CONSTITUTION AND THE (ALLEGED) “STUFF”/“THING” DICHOTOMY.** Exaggerated emphasis on a relatively small class of examples, such as “mud” versus “chair,” has led to the idea that the linguistic mass/count-distinction maps straightforwardly onto an alleged metaphysical distinction between “stuff” and “things.” A related misconception is that the denotations of mass-nouns constitute the denotations of count-nouns, because it is thought that mass-nouns denote “stuff” and count-nouns denote “things,” and that the former constitutes the latter. Whatever exactly the notion of “stuff” comes to, however, it is simply not true that the constitution-relation connects mass- and count-noun denotations in this one-directional way (because, for example, particular virtues may constitute someone’s virtue and particular pieces of furniture constitute furniture).

Moreover, as it stands, allusions to the notion of “stuff” are, in the absence of further elucidation, not particularly helpful. According to our ordinary usage, the term, “stuff,” is employed in an extremely wide and varied range of contexts and is, in fact, often intersubstitutable with the term, “thing,” as in “the stuff/things you’ve written,” “the stuff/things in your attic,” and so on. Thus,

unless it can be clarified, for example, whether such mass-noun denotations as asparagus, trash, jewelry or traffic should be considered “stuff,” and whether such count-noun denotations as clouds, bacteria or viruses should not be considered “stuff,” and, if so, why, this notion is simply too hazy to be of much theoretical use. Moreover, given the heterogeneity of the class of expressions at issue, the flexibility of current usage and the cross-linguistic variation noted in considerations (b) through (e) of Section 1, it is highly questionable whether any single metaphysical distinction can be found to underlie this linguistic contrast.

**SHAPE-, STRUCTURE- AND SPACE-OCCUPANCY PROPERTIES.** Relatedly, one often finds the mass/count-distinction described as involving a contrast between “units” that are “discrete,” “delineated,” and “definite,” have a “certain shape” or “precise limits,” on the one hand, and something that is more “undifferentiated,” “continuous,” “nondelineated,” or “unstructured,” on the other hand (see for example Pelletier 1991, Jespersen 1924 for representative formulations). It is difficult to tease apart how much of this vocabulary is intended to be understood epistemically (as terms such as “definite” and “precise” intimate) and how much of it is to be understood metaphysically; in either case, however, it is difficult to discern here anything more than what is already contained in either consideration (a) above or consideration (c) below.

**DIVIDED REFERENCE/CRITERIA OF IDENTITY AND INDIVIDUATION.** The mass/count-distinction is almost universally conceived of as involving a contrast between expressions that “carry within themselves” criteria of identity and individuation and ones that fail to supply at least one or possibly both sorts of criteria. Thus, Quine famously remarks that, while “shoe,” “pair of shoes,” and “footwear” all range over the same “scattered stuff,” they differ in that the first two “divide their reference” in different ways and the third not at all (1960, p. 91); and P. F. Strawson comments, equally notoriously, that “the general question of the criteria of distinctness and identity of individual instances of snow or gold cannot be raised or, if raised, be satisfactorily answered,” because, in his view, “we have to wait until we know whether we are talking of veins, pieces or quantities of gold, or of falls, drifts or expanses of snow” (Strawson 1953–1954, p. 242; see also Laycock 1972, pp. 31–32).

However, as Helen Cartwright has argued forcefully in a series of early papers (especially Cartwright 1965, 1970), if “individuation” is what goes on when a noun has a paradigmatically predicative occurrence (e.g., one that

appears next to such determiners such as “all,” “some,” “most,” “the,” “this,” “much,” and “little”), then the mass/count-distinction does not point to a general contrast in whether an expression “individuates,” only arguably in how it does so; moreover, the question of identity is an equally moot point, because, as Cartwright points out, there are as many clear or tricky cases on the count-side as on the mass-side (e.g., compare “word” with “work,” to use Cartwright’s example). Finally, considerations that turn on the phenomenon of change over time, as when we speak for example of something’s being the same water from one time to another, even while the water in question is slowly evaporating, also fail to isolate a feature that is peculiar to the denotations of any one class of expressions (see Laycock 1972, 1975, 1989, 1998).

**COUNTING AND MEASURING.** Finally, we come to a more promising area to explore in connection with the mass/count-distinction, namely the distinction between counting and measuring, that is, the distinction, on the one hand, between the practice of counting and measuring, and that between what we count and what we measure, that is, the subject-matter to which these practice are directed, on the other hand (see for example Parsons [1970] and Cartwright [1975a] for discussion of amounts and measures of amounts). Simply put, the contrast in this area is taken to be the following: whereas mass-noun denotations can only be measured, count-noun denotations can also be counted: thus, in the former case, only the vocabulary of amounts and measures of amount is appropriate, whereas the latter also admits of the apparatus of number and cardinality.

However, even in this area, matters are less clear than is often supposed. For, as it stands, the contrast between what we can and cannot measure really only marks off the sorts of magnitudes discussed by the physicist (e.g., temperature, mass, velocity, distance, and the like) from those entities which, in some way, exhibit these magnitudes; and while it is true that such magnitudes tend to be referred to by means of mass-nouns, the class of mass-nouns is of course thought to be much wider than simply what is encompassed by these magnitude-denoting terms. The area of counting as well is still radically under-explored, at least from the point of view of philosophy, though much interesting work has been done on the subject by psychologists (see for example Carey [1985, 1994] and the references cited therein). If counting involves, as Frege would put it, an association between a concept and a cardinal number, then the key question that arises in this context is just the question G. Frege himself was concerned to answer in Section 54 of the *Grundlagen*, namely

what sorts of requirements must be met by a concept to admit association with number (for discussion, see for example Geach 1962, Dummett 1973, Koslicki 1997, Blanchette 1999). If what has been suggested in the previous paragraph is correct and no general contrast exists between mass- and count-nouns at least in whether they provide criteria of individuation and identity, then the answer to Frege’s question concerning counting must lie elsewhere; and what this answer is, it is fair to say, is still an open question.

#### IV. CONCLUSION

As sobering as we might find this outcome to be, it may be that, at the end of the day, the only absolutely general and incontestable truism that can be stated in connection with the mass/count-distinction is that a true statement containing a singular or plural count-noun, as in “There is a hair in my soup” or “There are hairs in my soup,” insures the presence of either exactly one whole hair, or exactly two whole hairs, and so forth, whatever precisely this comes to in metaphysical terms; whereas a true statement of the form “There is hair in my soup” is compatible with there not being exactly one whole hair, or exactly two whole hairs, and so forth, because what is present may be parts of hairs or sums of parts of hairs or sums of hairs. And while this truth-conditional difference, stated in this stark and austere form, without the usual accompaniment of highly metaphorical and generally unhelpful vocabulary, might at first glance strike us as entirely trivial, its semantic and ontological significance, as can be gleaned among other things from the sorts of inferences that are licensed by it, should not be underestimated. Even if hair, perhaps, is no more “stufflike” than hairs, there is still an interesting story to be told as to what makes something one whole hair, or, for that matter, one whole anything (see Fine 1994, 1999, Harte 2002).

## NOUS

*Nous* is most likely derived from the root *smu*, meaning "to sniff." Homer uses *nous* to mark the realization or understanding of a situation or state of affairs. *Nous* penetrates beyond the surface features of a situation and reveals the underlying truth of the matter. It is not divorced from perception and its most primitive function is that of apprehending or "smelling" danger. In Homer *nous* is also linked to the visualization of a plan of action that is immediately prompted by the awareness of a situation possessing emotional impact.

In Parmenides *nous* maintains its Homeric function as that which reveals ultimate truth. However, it also serves as the source of logical reasoning. In Parmenides *nous* is divorced from perception and it is best understood to mean "thought" or "intellect." In accordance with his rather austere ontology, Parmenides may well hold that that which exists is also that which thinks (i.e., no thing that exists fails to be a thing that thinks).

Anaxagoras treats *nous* as a mass term, like water or air (as opposed to a count term, like man or leaf). He appears to treat *nous*, not as "intellect," but as "reason" or "the virtue of rationality." *Nous*, for Anaxagoras, is the ultimate source of order and motion in the cosmos. By both initiating and governing a vortex, *nous* brings order to an otherwise static primordial chaos. Anaxagoras

asserts that *nous* is the lightest and purest thing. In so doing, he may well be attempting to articulate the idea that *nous* is an immaterial substance.

Plato incorporates elements from Parmenides, Homer, and Anaxagoras into his treatment of *nous*. First, following Parmenides, Plato considers *nous* to be an intellectual faculty that is wholly divorced from perception. Second, following Homer, Plato considers *nous* to be a source of insight or intuition. Still, for Plato, intuition is a nonempirically based grasp of unchanging and eternal truth. Finally, following Anaxagoras, Plato considers *nous* to be the source of order and motion in the cosmos. *Nous*, as rationality itself, is the substance that orders the heavens for the sake of the best. It is the cause of regular celestial motion and it is the cause of rationality in humans.

Aristotle, in his treatment of *nous*, displays acute awareness of views advanced by his predecessors. First, Aristotle takes *nous* to be a source of insight. *Nous* is a grasp of the salient features of a situation, but it is also a grasp of universal scientific principles. *Nous*, even in its later role, is not divorced from perception. It is the grasp of principles that are acquired by induction from perceived cases. Second, Aristotle uses *nous* to mean "intellect." He asserts that one's *nous* is separate from the body. In so doing, Aristotle is likely to be advancing the view that human intellect is an immaterial faculty. Finally, Aristotle's God, the Prime Mover, is *nous*. It is a separately existing and fully actualized rationality. This *nous* is the chief cause of motion, order, and goodness in the cosmos.

## NOVALIS

(1772–1801)

Novalis was the pseudonym of Friedrich Leopold Freiherr von Hardenberg, the lyric poet and leader of the

early German romanticists. Novalis was born of Pietistic parents on the family estate, Oberwiederstedt, in Saxony. In preparation for a civil service career, he studied jurisprudence, philosophy, chemistry, and mathematics at Jena, Leipzig, and finally at Wittenberg, where he completed his studies in 1794. In Jena, Novalis came under the influence of Johann Wolfgang von Goethe, Friedrich Schiller, and especially Johann Gottlieb Fichte. Soon afterward he became friendly with Friedrich and August Wilhelm von Schlegel, Ludwig Tieck, Friedrich von Schelling, and Johann Wilhelm Ritter. While apprenticed to a local official in Tennstedt, Novalis became engaged to thirteen-year-old Sophie von Kühn in 1795. Her death in 1797 reinforced his romantic mysticism and culminated in a poetic transfiguration of his loss, in which his love and his desire to follow her into death are mingled (*Hymnen an die Nacht*, first published in 1800). From 1796 on, Novalis worked in the administration of the Saxon salt works at Weissenfels. From 1797 to 1799 he studied mining at Freiburg, where he became engaged to Julie von Charpentier. He died at Weissenfels.

With Friedrich Schlegel, Novalis is the most characteristic spokesman of early romanticism. In opposition to the ideals of the Enlightenment and early classicism he presented his vision of the romantic life. In his novelistic fragment *Heinrich von Ofterdingen*, which was written in opposition to Goethe's *Wilhelm Meister*, he furnished the age with a poetic description of the poet. The self-consciousness implicit in such an undertaking is characteristic of Novalis. Thinking about his own situation, the poet tries to answer the more general question of the destiny of humankind; the poet is a seer who leads man home. The homelessness presupposed in this theme is also manifest in Novalis's characterization of the modern age as fragmented. By contrast, according to Novalis's idealized picture, the Middle Ages was a time of unity.

These ideas are further developed in *Die Christenheit oder Europa* (1799), an essay on the history of Western civilization, in which Novalis attacks the Protestant Reformation and the Enlightenment for having destroyed medieval unity. Also, he proposes that the most important reason for the homelessness of man is simply that he is a finite being. To be finite is to be in search of the infinite, which can be recovered in the depths of the human soul, a concept which develops ideas derived from Fichte's *Wissenschaftslehre*. Meaning, being, and truth are identified with the absolute ego. When the adept in *Die Lehrlinge zu Sais* (1798) lifts the veil of Isis that hides the meaning of human existence, he discovers only his true

self. At the same time, this discovery is an escape from all that separates man from nature and from others.

The poet, through knowledge of his true self, is intuitively able to grasp the meaning of the world, which is veiled by mechanistic explanations, and to reveal this meaning to others. Poetry is an attempt to draw away the veil of the finite, which hides the mysterious meaning of everything. It thus has an apparently negative effect. The claims of the finite must be destroyed for the sake of the infinite. Romantic irony negates the ordinary significance of things and paves the way for a magic transformation of reality. Novalis's magic idealism may be described as an esoteric game in which relationships are suggested that may seem fantastic but are designed to reveal a higher meaning. The best example of this is *Heinrich von Ofterdingen*, in which past and present, fairy tale and everyday reality, mingle in such a way that the reader loses his bearings. This loss liberates his imagination. The world reveals its meaning when it is transformed into something man has freely chosen, and the opposition between man and nature is thereby overcome. Salvation lies in the godlike freedom of the artist.

Meaning escapes adequate conceptualization; it can only be hinted at. Fragment and aphorism (*Blütenstaub*, published in 1798) lend themselves particularly well to this purpose, as they point to meanings beyond themselves which must remain unstated. The romantic's refusal to mediate between the finite and the infinite, his assertion that there is no relationship between mere facts and transcendent meanings, makes it impossible to give any definite content to that reality which is said to be the goal of man's search. The movement toward salvation becomes indistinguishable from a flight into nothingness. Thus, in his *Hymnen an die Nacht* Novalis celebrates the night, in which all polarities are reconciled, and opposes it to more shallow day—a theme taken up by Arthur Schopenhauer, Friedrich Nietzsche, and their more recent followers.

## NOZICK, ROBERT

(1938–2002)

Robert Nozick was born in Brooklyn, New York, graduated from Columbia University in 1959, and received a PhD from Princeton University in 1963. After stints at Princeton University and the Rockefeller University, Nozick went to Harvard University in 1969, at age thirty, as full professor. There he was named Arthur Kingsley Porter Professor of Philosophy in 1985, then Joseph Pellegrino University Professor in 1998. He was a fellow of the American Academy of Arts and Sciences and served as president of the Eastern Division of the American Philosophical Association.

Nozick and his Harvard colleague John Rawls were the giants of twentieth-century political philosophy. Where Rawls stuck to one task, elaborating and defending his magisterial *Theory of Justice*, Nozick was notably rest-

less and interested in everything. He once said, "I didn't want to spend my life writing *Son of Anarchy, State, and Utopia, Return of the Son*, and so on" (Socratic Puzzles 1997, p. 2). In an age of subspecialization, the range of Nozick's contributions is shocking.

### POLITICAL PHILOSOPHY

In *A Theory of Justice*, Rawls described himself as working toward a theory of pure procedural justice. He proposed as a test of distributive justice that inequalities are just only if they offer the greatest possible benefit to the worst-off. In *Anarchy, State, and Utopia* (1974), Nozick's departure was to develop a *genuinely* procedural theory, aimed at no particular end state. Indeed, Nozick's product was less a theory of just distribution than a theory of just transfer. A transfer from one person to another is truly just, according to Nozick, if truly voluntary.

Nozick's argument sometimes is said to lack foundations, to merely postulate rights. More charitably, Nozick's bold claims about rights are his conclusions rather than his premises. Starting from Rawls's foundation—individuals are separate and may not be sacrificed for others—Nozick, in the process arguing for this premise, carries it to its logical conclusion. Part 1 of *Anarchy, State, and Utopia* argues that a world where persons are respected as separate entities within a minimal state is a *possible* world. Part 3 argues that this is an *attractive* world. Part 2 argues that a world where our separateness is *not* taken to its logical conclusion—not taken to culminate in some more or less literal interpretation of Rawls's call for the "most extensive system of liberty compatible with like liberty for all" (1971, p. 302)—is neither attractive nor just.

In one of the century's more influential philosophical examples, Nozick asks us to suppose that we are in a situation as perfectly just and equal as we can imagine. Then someone offers Wilt Chamberlain a dollar for the privilege of watching him play basketball. Before we know it, thousands of people happily are paying Wilt a dollar each every time he puts on a show. Wilt gets rich. The distribution is no longer equal, but no one is complaining. Nozick's question: If we assume for argument's sake that justice is a pattern of equality achievable at a given moment, what happens if we achieve the ideal? Must we then prohibit everything—consuming, creating, trading, giving—that upsets perfect equality? Recent egalitarian work is an evolving response to the problem Nozick's story revealed. In part due to Nozick's argument, egalitarians at the beginning of the twenty-first century realize that any equality worthy of aspiring to will focus

less on equality as a time-slice property of economic distribution of wealth and more on how people are treated: how they are rewarded for their contributions and *enabled* over time to make contributions worth rewarding.

### METAPHYSICS AND EPISTEMOLOGY

Nozick's last book, *Invariances* (2001), spans a range of topics including truth, objectivity, and consciousness, and his second book, *Philosophical Explanations* (1981), offers fresh ideas on free will, personal identity, and knowledge. For example, philosophers for millennia had analyzed knowledge as justified true belief. That is, *S* knows that *p* just in case *p* is true, *S* believes that *p*, and *S*'s belief is justified. Since 1963, though, philosophy had been reeling from Edmund Gettier's refutation of this seemingly straightforward analysis. Nozick's response is among the most creative. The problem with justification, as Gettier construed it, is that a belief can be justified, in virtue of coinciding with the facts, without being properly *sensitive* to the facts. Nozick, instead of refining or supplementing the justification condition, *replaced* it with a pair of *tracking* conditions:

If it were not true that *p*, *S* would not believe that *p*.

If it were true that *p*, *S* would believe that *p*.

### DECISION THEORY

Nozick's *Socratic Puzzles* (1997), a collection of essays, includes his essay "Newcomb's Problem and Two Principles of Choice." In it Nozick introduced a class of puzzles for prevailing formulas for maximizing expected utility. For example, the devout go to heaven, according to John Calvin, but why? *Because* they are devout? If so, expected utility would suggest that we ought to be devout. Or because of predetermined grace, a side effect of which is an urge to be devout? In this second case, since it is more fun not to be devout, expected utility would suggest that we ought not to be devout. The crucial issue is not whether the outcome is probabilistically linked to one's action but whether it is *affected* by one's action. Therefore, rational choice cannot be entirely captured by any probabilistic formula. Even at its most formulaic, rational choice would have to begin with the problem of choosing a formula to govern subsequent choices, soothe choosing begins prior to having the formula. The chosen formula will be a way of processing information not only about probabilities and utilities but also about causal connections between actions and outcomes. Nozick's essay spawned hundreds of responses.

### NONCOERCIVE PHILOSOPHY

One of Nozick's biggest contributions to philosophy was to reflect on, and poke fun at, the competitiveness of philosophical discourse. Nozick returned to this theme in the introductions to each of his major works; it was the only topic that occupied Nozick continuously. "Philosophical training molds arguers. ... A philosophical argument is an attempt to get someone to believe something, whether he wants to believe it or not. ... To argue with someone is to attempt to push him around verbally. ... Perhaps philosophers need arguments so powerful they set up reverberations in the brain: if the person refuses to accept the conclusion, he *dies*" (1981, p. 4). Nozick's remarks on the ideal of "coercive philosophy" led to a generation of self-deprecating humor in seminars across the United States and eventually to a widespread relaxing of what had been a more confrontational, less cooperative disciplinary style.

## NUMBER

Numbers are central to science. They underlie what Galileo Galilei and Isaac Newton called the primary properties of things, the properties that can be measured (John Locke listed these as number, motion and rest, size, figure, and impenetrability). These underlie secondary properties (like colors and musical harmonies and discords), which in turn underlie the tertiary properties, like beauty, which make life worth living.

The centrality of numbers to science indirectly confers on them philosophical significance, but they have also played a direct role in metaphysics. Plato's theory of universals begins from the problem of the One over Many. Behind the superficial diversity of things in the world, it is often the case that there is one thing that many numerically distinct individuals share in common. For instance, when one doubles the length of the string on a lyre or the length of a column of air in a flute, the note it sounds is always lowered by the same musical interval, an octave. The things that distinct individuals share in common are called universals, and "Platonism" is used as a name for a broad and loose family of theories that affirm the existence of universals.

The existence of numbers has always been central to the history of Platonism, from ancient times to the present. In the nineteenth and twentieth centuries foundational work in the philosophy of mathematics, especially by Gottlob Frege and Bertrand Russell, affirmed the existence of numbers. Following them, Willard Van Orman Quine affirmed the existence of numbers, and he rightly called this doctrine "Platonism". Quine argued that it is reasonable to believe in the existence of numbers because numbers are central to mathematics, which in turn is central to science. This reason for believing in numbers is close to the guiding Pythagorean and Platonist idea that to understand the world we must find the unified mathematical patterns that lie behind the diversities of appearances.

### EARLY HISTORY OF NUMBERS

The history of numbers in India, China, and elsewhere is deep and diverse, but it is still not properly understood.

In ancient and modern histories of ideas in Europe, the origin of geometry was traditionally traced to ancient Egypt; and relatively sophisticated advances in arithmetic and algebra have been recognized as having emerged in Mesopotamia; and both these sources entered European traditions through ancient Greece. Knowledge of this ancient history is improving, but it is still incomplete.

The early mathematical advances of ancient Greece are better known, though even here the evidence is sparse. Almost no written records survive from the Pythagorean oral traditions before Plato. What survives from before Euclid's *Elements* consists in little more than hints in Plato and Aristotle.

Euclid's *Elements*, the first systematic presentation of geometry and arithmetic, is magnificent, but little is known of its sources and motivations. It is relatively apparent, however, that some of his theorems consist in translations of algebraic results, known in Mesopotamia, into geometric counterparts. For instance, an algebraic thesis, like  $(a + b)^2 = (a^2 + 2ab + b^2)$ , would become a theorem concerned with the division of a square into two smaller squares and two rectangles. For some reason, the mathematicians of Plato's Academy emphasized geometry rather than arithmetic, and arithmetic was subsumed under geometry.

### PROLIFERATION OF KINDS OF NUMBERS

Besides the whole numbers (or natural numbers) the Greeks also recognized relationships of ratio between numbers. For example, the numbers 9 and 6 stand in the same ratio as 3 to 2, and one can call this ratio (3:2). This same relationship of ratio that holds between any two numbers will also hold between two possible geometrical lengths.

However, among the relationships of ratio that hold between various magnitudes, as for instance between lengths of lines, there are some that do not hold between any two whole numbers. Plato and Aristotle allude, many times, to a proof that no ratio between whole numbers will match the relationship of proportion that holds between the diagonal and the side of a perfect square. This fact would now be expressed by saying that  $\sqrt{2}$  is an irrational number, which means that there are no whole numbers  $a$  and  $b$  such that  $a / b = \sqrt{2}$ .

The ancient Greeks thought of ratios among lines as forming a domain distinct from the domain of numbers. Numbers consisted simply of whole numbers. As the centuries advanced, the term *number* gradually expanded to

include the entire domain of what are now called the positive real numbers. This domain includes all the irrational numbers, such as  $\sqrt{2}$  and  $\pi$ , that can be represented as nonterminating decimals (such as 3.1415926 ...). This domain includes, as a subdomain, the rational numbers, which are the ratios that hold between whole numbers; and, as a smaller subdomain, the integers, which correspond to just the rational ratios to the unit measure. The domain of number did not initially, however, include the number zero or the negative numbers.

Over several centuries the domain of things that were included as numbers expanded to include zero and negative numbers. First, there was an expansion to include a symbol “0” that was at first to be thought of not as signifying any number, but just as a place holder in the system of Arabic notation that is used today. In the notation “12,” the “1” is placed in the second column from the right, and this means that it signifies one group of ten. Take 2 away from 12 and the result is written “10” with the “0” not referring to anything at all, but just serving to keep the “1” in the second column, so that it continues to signify one group of ten.

As time went by, however, the symbol “0” did come to be thought of as standing for something that might be called “the number zero,” trusting that there was some suitable thing for this symbol to refer to. It was only gradually that any clear conception began to arise of what kind of thing this number zero might be.

Likewise, negative numbers began as notation that did not refer to any extra numbers, but just told one what to do with ordinary, positive whole numbers. With time, however, this notation came to be thought of as referring to new numbers, and eventually a conception emerged about what kinds of things these new numbers might be.

There was also a tentative expansion, with deep philosophical misgivings, to include what are now known as imaginary and complex numbers. Briefly, the imaginary number  $i$ —assuming there is such a thing, and calling it a number—is defined to be that mathematical object that is such that the ratio of 1 to it is the same as the ratio of it to minus 1. That is,  $i / 1 = -1 / i$ , so that  $i^2 = -1$ . Complex numbers consist of all the numbers that can be obtained from  $i$  by taking multiples of it and adding the result to other numbers.

There was also a tentative expansion, with deep philosophical misgivings, to include infinitesimal magnitudes. These extra entities seemed to be indispensable in the new mathematical theory of physical magnitudes like velocity and acceleration, invented by Newton and Got-

tfried Wilhelm Leibniz and referred to as “calculus” or, in its most general form, “analysis”.

Despite the immense success of the calculus in science, the concept of an infinitesimal—a magnitude greater than zero, but less than any finite magnitude—was viewed with some suspicion. In the nineteenth century, through the work of Augustine-Louis Cauchy and Karl Weierstrass, the concept of an infinitesimal was replaced by the concept of the limit of a sequence of numbers. An infinite sequence of numbers  $s_1, s_2, s_3, \dots$  approaches the limit  $l$  if the difference between  $l$  and  $s_n$  can be made as small as one likes by taking sufficiently large values of  $n$ . That is, given any positive number  $d$ , no matter how small, there is some number  $N$  such that the difference between  $l$  and  $s_n$  is less than  $d$ , for every  $n > N$ .

Using this concept, the nineteenth-century mathematicians showed how the concepts of continuity, convergence, differential, and integral could all be precisely defined. In this way, it was shown how talk of infinitesimals could be dispensed with entirely.

A further nineteenth-century development was the introduction by Georg Cantor of the concept of a transfinite number. The transfinite numbers can be thought of as measuring the size of infinite sets. Cantor introduced the symbol  $\aleph_0$  (pronounced “aleph-null”) for the number measuring the size of the set of all positive whole numbers and the symbol  $c$  for the transfinite number measuring the size of the set of all real numbers. By a simple, yet ingenious argument (the celebrated diagonal argument), Cantor was able to show that there are more real numbers than whole numbers:  $c > \aleph_0$ .

Cantor proved that there are always more subsets of a given set than elements of that set (so there are more sets of natural numbers than natural numbers for example). Hence, given any transfinite number measuring the size of an infinite set, there is a larger transfinite number, which measures the size of the set of all subsets of that set.

Cantor developed a transfinite arithmetic for these new numbers, showing how operations corresponding to addition and exponentiation could be defined for them. Again, the new numbers were viewed initially with the deepest suspicion by the mathematical community.

## FREGE AND THE PARADOXES

The work of the nineteenth-century mathematicians had begun a reverse process of defining one kind of number in terms of simpler kinds. The complex numbers, it had been shown, could be defined as pairs of real numbers (like the  $x$ - $y$  coordinates of Cartesian geometry) along

with special rules for adding and multiplying these pairs. The real numbers had been shown by Julius Dedekind and Cauchy to be definable as infinite sequences or sets of rational numbers, while the rational numbers themselves can be identified with sets of pairs of natural numbers.

What of the natural numbers themselves? Frege's work can be seen as an attempt to complete this reverse process of rigorization by providing a firm foundation for the fundamental theory of the natural numbers. Dedekind and Giuseppe Peano had independently specified some simple axioms for that theory (called number theory or arithmetic). However, Frege wanted to answer the questions: What are the natural numbers? How may they be defined? The Dedekind-Peano axioms specify the laws governing the numbers, but do not provide a definition of them.

Imagine if one thought that the number of soldiers in an army was one of the army's most significant properties. One might then think of whole numbers as properties of aggregates. However, as Frege pointed out, if one points to the things on a desk and asks how many there are, one has not yet asked a complete question. There may be two decks of cards; and if so, then there are also 106 cards; and there are a great many molecules; and so on.

This suggests that number is a property of properties. The property of "being a deck of cards on the table" has the property of having one instance; the property of "being a card on the table" has the property of having 106 instances; and so on. The property of "being a unicorn" has the property of having no instances. That higher-order property, the property of having no instances, might aptly be called the number zero.

Consider, then, the theory that the number 2 is a property of a property, namely the property of having two instances, that the number 3 is the property of having three instances, and so on. Frege turned decisively aside from this theory. He argued that numbers could not be universals or concepts, but had to be objects.

For Frege, the fundamental kind of expression used to ascribe numbers to things are expressions like "the number of cards on the desk" or "the number of planets in the solar system." The expression "the number of Fs" is a singular term, purporting to pick out an object, in just the same way as "the brother of John" is a singular term, purporting to pick out a certain individual. So for Frege, ascriptions of number depend for their truth on the existence of objects, which are the referents of expressions of the form "the number of Fs."

Is it legitimate to suppose that given any general term *F*, there is also an object corresponding to the "the number of Fs"? Frege held that it is legitimate to speak of objects of a certain kind, provided there is a criterion of identity for them. What is the criterion of identity for numbers? The answer is given by the following principle, known as Hume's principle: "The number of Fs = the number of Gs if and only if (iff) there is a one-to-one correspondence between the Fs and the Gs."

A one-to-one correspondence is a relation that pairs each *F* with exactly one *G* and each *G* with exactly one *F*. So, for example, the number of knives on the table is equal to the number of forks provided that each fork can be paired with a unique knife and each knife with a unique fork.

Frege demonstrated that all the Dedekind-Peano axioms for number theory can be proved from Hume's principle alone, given appropriate definitions that he devised; a fact now known as Frege's theorem.

Frege attempted to go further by giving an explicit definition of "the number of Fs," from which Hume's principle itself could be proved. He defined "the number of Fs" as the set of all properties that can be put in one-to-one correspondence with the Fs. That is, the number *n* is identified with the extension of the second-order property of having *n*-members.

This was a disaster. The principle concerning sets that Frege appealed to in his derivation of Hume's principle states that every predicate has an extension. The extension of a predicate is the set of all (and only) those objects that satisfy the predicate. As Russell's paradox shows, however, this principle is inconsistent. If every predicate has an extension, then the predicate "is not a member of itself" has an extension, which would be the set of all (and only) the objects that are not members of themselves. Call this set *R*. It follows that *R* is a member of *R* iff *R* is not a member of *R*, a contradiction. Frege's logical system had turned out to be inconsistent. This was the first of a number of paradoxes of set theory that were to have a formative influence on subsequent work in the foundations of mathematics.

There were varying responses to Russell's paradox. Russell and Alfred North Whitehead took one approach: the theory of types. Ernst Zermelo and others took a different approach: that of axiomatic set theory. Given the now standard axioms for set theory, the Frege-Russell definition of the numbers will not work; the assumption that there is a nonempty set of all three-membered sets, for example, leads to a contradiction. A different

approach to the definition of the numbers is required. Instead of taking the numeral  $n$  to refer to the set of all  $n$ -membered sets, it can be taken to refer to some particular, paradigm example of an  $n$ -membered set.

John von Neumann provided an effective sequence of paradigm  $n$ -membered sets. The number zero is the paradigm zero-membered set: the empty set,  $\emptyset$ . The number 1 is the set whose only member is zero. The number 2 is the paradigm two-membered set whose members are 0 and 1. And in general, each number  $n$  is the  $n$ -membered set whose members consist of all and only the whole numbers from 0 up to  $(n - 1)$ .

One can then say that there are  $n$  members of a particular set iff that set can be placed into a one-to-one correlation with the paradigm  $n$ -membered set. For instance, there are two decks of cards on the table iff the members of the set of decks of cards on the table can be placed into a one-to-one correspondence with the members of the paradigm two-membered set  $\{0, \{0\}\}$ .

## PHILOSOPHIES OF NUMBER

Philosophical accounts of number (and mathematics more generally) can be divided into two broad categories: realist and antirealist.

A realist about number holds that statements concerning numbers are objectively true or false. On this view, statements such as “there are nine planets in the solar system,” “there are infinitely many prime numbers,” “ $34957 + 70764 = 105621$ ,” or “every even number greater than two is the sum of two primes” (Goldbach’s conjecture), say something that is objectively either true or false, even if no one knows which it is. In addition, the realist claims that some such statements are indeed true. That is, the realist typically accepts as true most, or all, of accepted mathematics.

By contrast, an antirealist denies one or both of the two realist claims. That is, the antirealist will deny that there is an objective fact of the matter about the truth value of all statements concerning number or that all currently accepted mathematical statements concerning number are actually true.

## THE ARGUMENT FOR PLATONISM

*Platonism*, as that term is used in modern philosophy of mathematics, is the view that mathematics is the study of an objective realm of independently existing objects. In addition, the platonist holds that these objects are abstract, rather than physical objects. A physical object is something that (if it exists) has a location in space and

time, can undergo changes of state, and can interact causally with other spatiotemporally located objects. Cups and saucers, stars and planets, plants and animals, and atoms and photons are all examples of physical objects. By contrast, an abstract object is something that (if it exists) lacks some or all of these properties. Abstract objects have no location in space and time, they have no state and no history, and they do not interact causally with other objects.

The main philosophical argument for platonism in modern philosophy proceeds as follows. Many statements of arithmetic appear to make existential claims. For example, the statement “there is a prime number greater than three” asserts the existence of an object having certain properties. Since many such arithmetical statements are true, it follows that numbers exist. This does not yet show that numbers must be abstract, but various arguments can be given against the alternatives. For example, every physical object has a location in space and exists for a certain time. Numbers have neither of these properties. Then again, there are infinitely many numbers, but perhaps a finite number of physical objects. It follows that numbers, if they exist, must be nonphysical, abstract objects.

The argument for platonism can be summarized as follows:

P1. Arithmetical sentences express statements that are objectively true or false

P2. Some arithmetical statements are true

P3. Arithmetical statements quantify over certain objects (numbers)

Therefore:

C1: Numbers exist.

However:

P4: Numbers, if they exist, must be abstract (non-physical, nonmental) objects.

Therefore:

C: Numbers are abstract objects.

## THE EPISTEMOLOGICAL PROBLEM

The central problem facing a platonist philosophy of number is epistemological. Abstract objects cannot be directly perceived, nor can they have any effects on objects or processes that can be directly perceived. How then is it possible for us to know anything at all about such objects? The causal isolation of abstract objects

appears to make them unknowable. Hence either we have no mathematical knowledge, or platonism is not the correct view of mathematics.

Before Frege, philosophers had postulated that human beings have some kind of direct cognitive access to mathematical objects, through perception or some rational faculty analogous to perception, or (for Immanuel Kant) through an *a priori* intuition or construction.

According to Frege our only access to numbers is through our knowledge of the truth-values of arithmetical statements. Certain sentences of our language contain terms standing for numbers and quantifiers that range over numbers. If it can be shown that some of those sentences are true (and Frege hoped to show that they are logically true), then we will have explained how we can know about numbers, even though we have no direct perceptual or causal contact with them.

If the reduction of arithmetic to logic could be carried out, our knowledge of numbers would have been shown to be based on our knowledge of the truth of the basic laws of logic. Frege thought there was no real problem about how we know that the laws of logic are true; we can just see that they are. Explaining the psychological mechanisms that give us this ability is outside the scope of philosophy and can be left to the psychologists. The discovery of the paradoxes ruined this comfortable picture, showing that we have no infallible insight into the fundamental truths of logic after all. The reduction of arithmetic to set theory does not resolve this problem. Our knowledge of the basic laws of set theory cannot be any more certain or secure than our knowledge of the fundamental laws of arithmetic.

## REALIST ALTERNATIVES TO PLATONISM

In view of the epistemological problem for platonism, many philosophers of mathematics have sought to avoid the conclusion that numbers are abstract objects. However, if that conclusion should be rejected, the argument for platonism given earlier must be unsound. Alternatives to platonism can be usefully classified according to which of the premises of that argument are rejected.

An obvious point at which that argument might be attacked is at premise P4. That is, one could deny that numbers, if they exist, must be abstract. Along these lines are various attempts to provide a physicalist account of mathematical objects such as numbers and sets. Such accounts differ from platonism only in denying that

numbers are entirely nonphysical and abstract. The payoff is epistemological. If, for example, numbers are properties or relations that can be instantiated by ordinary physical objects, then some basic knowledge of numbers could be acquired by ordinary perception.

Another realist alternative is to accept P1 and P2, but deny P3; the claim that mathematical statements quantify over a domain of special objects of some kind. One strategy is to think of arithmetic as the theory, not of a special realm of objects, but of a certain pattern or structure. In the case of arithmetic the structure in question is that shared by any infinite progression of objects (also called an  $\omega$ -sequence) in which (1) there is a unique first element and (2) for any given element there is a distinct, unique next element in the sequence, called the successor of the given element.

According to one variety of structuralism, the truths of arithmetic are simply those that hold in every system of objects that form an  $\omega$ -sequence. An equation such as  $2 + 1 = 3$  is interpreted as elliptical for the generalization; "If  $S$  is any system of objects that form an  $\omega$ -sequence, then the successor of the successor of the first element of  $S$  added to the successor of the first element of  $S$  is equal to the successor of the successor of the successor of the first element of  $S$ ."

Structuralism is often motivated by a certain ontological problem for platonism. According to the platonist, sets and numbers are abstract objects. What is the relationship between them? We have already described one way in which the natural numbers can be defined as sets. This is the definition of the natural numbers as the von Neumann numbers:  $0 = \emptyset$ ,  $1 = \{0\}$ ,  $2 = \{0,1\}$ , and  $3 = \{0,1,2\}$  and in general,  $N+1 = \{0, 1, \dots, N\}$ . This is not the only possible set-theoretic definition of the natural numbers, however. Zermelo, for example, defined the sequence as follows:  $0 = \emptyset$ ,  $1 = \{0\}$ ,  $2 = \{1\}$ , and  $3 = \{2\}$  and in general,  $N+1 = \{N\}$ .

From a purely mathematical point of view the definitions seem equally valid, since they both validate exactly the same theorems of arithmetic. However, the two definitions are certainly not equivalent, since they identify some numbers with distinct sets; on von Neumann's definition  $2 = \{0, \{0\}\}$  (a set with two members), while on Zermelo's definition  $2 = \{\{0\}\}$  (a set with just one member).

From a platonist perspective there is something puzzling about this. If numbers are independently existing objects, then there must be a fact of the matter about which set, if any, the number 2 is identical with. It cannot

be that there are two equally correct definitions of the number 2 that identify it with different sets, but this is exactly what one seems to have in the case of the von Neumann and Zermelo definitions: two equally correct accounts of the number 2 that assign it to distinct sets.

A generalization of this line of argument yields the conclusion that numbers cannot be objects of any kind. Any definition of numbers in terms of particular mathematical objects of some other kind is arbitrary, in the sense that equivalent, but distinct alternative definitions will always be available. However, if, as the platonist holds, numbers are objects, there must be a fact of the matter about which objects the numbers really are. So there must be something wrong with platonism.

From a structuralist perspective, however, this kind of ontological relativity is readily explicable. For on that account, arithmetic is not concerned with a domain of specific objects, but only with what holds good in all  $\omega$ -sequences. The sequences of sets defined by von Neumann and Zermelo are both examples of  $\omega$ -sequences, so both systems have the required structure. Any system of objects (sets or otherwise) having the same structure will do just as well, for arithmetic is just the theory of the properties shared by all  $\omega$ -sequences.

### CONVENTIONALISM

A different approach, long popular with empiricists, is to say that mathematics is concerned not with objects, but with relations between concepts. A good example is the account of mathematics associated with the philosophical movement known as logical positivism, which had its heyday in the 1930s and 1940s. According to the positivists, the truths of logic and mathematics are alike in being analytic, by which they meant that they are true solely in virtue of the meanings of the symbols they contain, meanings that are established by linguistic convention.

On this view,  $2 + 2 = 4$  is true because of the stipulations we have laid down governing the use of the symbols “2,” “4,” “+,” and “=.” As such it is completely without empirical content and this explains the irrelevance of empirical evidence to mathematics. No fact about the world can contradict the statement  $2 + 2 = 4$ , because its truth does not depend on facts about the world, but only on facts about what the mathematical symbols occurring in it mean. What our symbols mean is a matter of arbitrary linguistic convention. We can simply stipulate that our symbols are going to have certain meanings and then the truth of various statements involving them will follow. The truths of arithmetic on this view are records of

the stipulations we have laid down governing the use of the arithmetical symbols.

Largely as a result of criticisms developed by Quine and others, conventionalism is no longer widely accepted. One difficulty is that even if it were possible simply to stipulate that the terms of a mathematical theory are to be assigned whatever meaning makes all the axioms turn out true, the stipulation will backfire if the axioms are inconsistent. Whether the axioms are consistent or not is itself a mathematical fact which is independent of our stipulations and conventions. If so, then not all mathematical facts can be purely conventional or true in virtue of meaning.

The specific objections to conventionalism are however, less significant than the alternative account of the epistemology of mathematics developed by Quine, which if correct, would undermine the main epistemological motivation for conventionalism. Quine’s alternative account is described in the final section of this article.

### NOMINALISM

Nominalism is the philosophical thesis that there are no abstract objects that is, everything that exists is a concrete, physical particular. In interpreting mathematics and science then, the nominalist has two options. One option is to say that despite appearances, mathematical and scientific theories do not involve reference to abstract objects after all. The other option is to say that they do and are therefore literally false. The nominalist may then seek to provide a positive account of mathematical and scientific theories, showing how they can be reformulated so as to avoid any reference to abstract objects. The result would be an error theory of science and mathematics.

This second approach is the one taken by the nominalist philosopher Hartry Field, who has attempted to demonstrate that reference to abstract objects can be eliminated from science by showing how nominalistic versions of physical theories might be constructed: versions which do not presuppose the existence of abstract objects such as numbers or functions. The interested reader is referred to the bibliography for further details of the construction and the philosophical debate surrounding it.

### FORMALISM

This type of nominalist antirealism concerning numbers and other abstract objects consists in a denial only of the second premise (P2) of the argument for platonism given earlier. On such a view, mathematical sentences express

statements which can be true or false, but it is argued that there is no good reason for thinking that any mathematical statements involving quantification over abstract objects are literally true.

More radical types of antirealism deny the first premise (P1) of the argument for platonism. One way of denying that premise is to say that mathematical sentences do not express statements that could be true or false at all, objectively or otherwise. This is the approach taken by the formalist account of mathematics. On this view, mathematics is not a body of statements that can be true or false. Instead, mathematics is thought of as analogous to a game, like chess. It is a game played with symbols according to certain rules.

The most sophisticated version of the formalist account of mathematics is that proposed by the mathematician David Hilbert in the 1920s and early 1930s. According to Hilbert mathematics has a meaningful part and a purely formal part. The meaningful part consists of finitary statements. These are decidable statements concerning only perceptible concrete symbols, such as the numerals 0, S0, SS0, SSS0. The purely formal component consists of ideal statements, statements that involve unbounded quantification over infinite domains such as the natural numbers. All such statements are strictly meaningless, according to Hilbert. Their introduction into mathematical theories was to be justified on purely instrumental grounds. They provide the mathematician with an extremely powerful, but in principle dispensable, means of proving facts about the real finitary subject matter of mathematics.

Hilbert's program was to show, using only finitary methods, that the introduction of such ideal statements into arithmetic could never lead to any false finitary statement becoming derivable. This is equivalent to proving using only finitary methods that classical arithmetic is consistent. He hoped to establish the same result for set theory, thereby establishing that the threat of inconsistency implied by the paradoxes could be guaranteed not to arise there either. "No one," wrote Hilbert, "shall drive us out from the paradise that Cantor has created for us" (Benacerraf and Putnam [1983], p. 191).

There is a fairly broad consensus that Kurt Gödel's second incompleteness theorem shows that Hilbert's program is unachievable, even at the level of arithmetic. Let  $T$  be any standard formal system for arithmetic. Suppose there was a finitary consistency proof for  $T$ . Then that proof could be formalized as a derivation in  $T$  of a formula expressing the consistency of  $T$ . However, by Gödel's second incompleteness theorem, no consistent

formal system for arithmetic can contain such a derivation. It follows that the goal of Hilbert's program is unachievable for arithmetic and so also for set theory.

## INTUITIONISM

A different response to the paradoxes, current at the time Hilbert was writing, was the intuitionist account of mathematics, proposed by the mathematician Luitzen Egbertus Jan Brouwer and developed by Arend Heyting. Intuitionism can be thought of as denying the first premise of the argument for platonism by claiming that although mathematics does constitute a body of statements that can be true or false, the truth or falsity of a mathematical statement is not independent of human beings.

The platonist thinks of the natural numbers as an infinite domain of objects that exist independently of human thought and that make arithmetical statements objectively true or false. By contrast, intuitionists such as Brouwer and Heyting think of the natural numbers as mental constructions, objects that are created by the human mind. On this view, what makes a mathematical statement true or false is not the existence of objects that are independent of human beings, but the existence of a certain kind of mental construction, a proof (though not a proof in a formal system).

This conception of mathematical truth led the intuitionists to reject the law of excluded middle, as applied to mathematics. That is, they denied the universal validity of the logical schema "Either  $A$  or not- $A$ ." For on the intuitionist view, a mathematical conjecture for which neither proof nor disproof has yet been constructed, cannot be said to be either true or false.

Although paradox may be avoided in the intuitionistic reconstruction of mathematics, many contemporary philosophers would reject it. One reason is the apparent truncation of classical mathematics necessitated by intuitionism; many theorems of classical analysis and set theory are false when interpreted intuitionistically. A deeper reason may be a distrust of the reforming nature of the intuitionism. The role of philosophy, it is thought, should be to provide an account or interpretation of mathematics as it actually is, not to reformulate or remake mathematics in a new image.

An exception to this general trend is Michael Dummett. A widely accepted philosophical thesis has it that the meaning of a statement is given by its truth conditions. Dummett argues that this is empty, unless accompanied by a substantive account of truth; an account

which goes beyond the mere equivalence of ‘P is true’ with P. But meaning cannot be explained in terms of a concept of truth according to which truth is something that may apply to a statement quite independently of whether it is possible to know that it does, for then our knowledge of the meaning of a statement would not always be capable of being made manifest by publicly observable behaviour—a condition which is necessary for meaning to be communicable. Instead, meaning must be explained in terms of verification conditions; to know the meaning of a mathematical statement is to know what would count as a proof of it. Thus the argument leads to a version of intuitionism; to say that a mathematical statement is true is to say that we have a proof, while to say that it is false is to say that we have a disproof.

Dummett’s argument depends only on very general considerations concerning the communicability of meaning. If valid, the argument would apply to statements of any kind whatsoever and not just to mathematical ones. For example, it would be a consequence that perfectly ordinary statements about the past which can no longer be verified or refuted could not be considered either true or false, unless it could be shown that there is some special feature of our use of such statements which makes a verification transcendent account of their meaning possible.

### THE INDISPENSABILITY ARGUMENT

The epistemological objection to platonism is one aspect of a more general problem for empiricism. Mathematics appears to be highly non-empirical, in both its subject-matter and its methodology. Empirical evidence does not appear relevant to mathematics. However if, as the empiricist asserts, all our knowledge is ultimately empirical, there seems to be no good reason for thinking that mathematics is true at all. The logical positivist’s claim that mathematics is analytic, or true only in virtue of meaning, was an attempt to solve this problem by showing how mathematical statements could be true, though independent of all empirical evidence.

In a now classic series of papers written in the late 1940s and early 1950s, Quine launched a major critique of this conventionalist solution to the problem, while also developing a significant alternative account of the structure of empirical knowledge and the place of mathematics within that structure. Quine argued that the mistake made by earlier empiricists was to think that individual statements can be tested empirically in isolation from each other. Instead, it must be recognized that our scientific beliefs form an interlocked system or web that “faces

the tribunal of experience as a corporate body.” (Quine, ‘Two Dogmas of Empiricism’, in ‘From a logical point of view’, p. 41). Mathematical beliefs form an indispensable part of this system and are therefore justified to the extent that they contribute to the goals of scientific prediction and explanation. In Quine’s view the mathematics used in a successfully confirmed scientific theory is confirmed along with the rest of that theory. Mathematical objects, like numbers and sets, are theoretical posits, epistemologically on a par with electrons and photons.

Quine draws a further conclusion. If mathematics can be supported by empirical evidence, it can also be undermined by it. Our mathematical beliefs are open to empirical falsification and revision, in just the same way as our scientific beliefs. The illusion of a difference between mathematical and other scientific statements is generated, according to Quine, by pragmatic considerations. We are far more reluctant to revise the mathematical and logical components of our scientific theories because these are so deeply embedded in the system of total science that altering them would result in a major restructuring of the entire system. But if the result of such a restructuring was an overall simplification or improvement in the total system of science, then it would be perfectly rationally justified.

Quine’s epistemology is significant because it provides a solution, consistent with empiricism, to the epistemological problem for platonism. Quine can accept all the premises in the argument for platonism given earlier. Mathematical statements can be taken to refer, as they appear to refer, to abstract objects such as numbers and sets. But the epistemological problem is resolved. Numbers and sets cannot be perceived, either directly or indirectly, but their utility in enabling us to predict and explain the world provides us with all the justification for their existence we need or could ever be entitled to.

The indispensability of mathematics in science has two aspects: one emphasized by Quine, the other by Hilary Putnam. Quine argues from the indispensability of mathematics in the derivation of the observation statements that confirm or disconfirm scientific theories and hypotheses. Putnam emphasizes a different aspect of the indispensability of mathematics in science. Mathematics is used in science, not only in deriving predictions from theories but also in formulating the empirical hypotheses of those theories. Consider Boyle’s law, for example, which states the relationship between the pressure, temperature, and volume of a fixed quantity of gas enclosed in some container. The law states that the pressure of the

gas is equal to a constant multiplied by the temperature of the gas, divided by the volume.

$$P = kT / V$$

Pressure, temperature, and volume are all numerical quantities. The pressure of the gas in kilopascals at a certain time is a real number, as are the volume in cubic centimeters and the temperature in degrees Celsius at a time. The law states that a certain mathematical relationship always holds between these real numbers. Boyle's law is therefore just as much committed to the existence of real numbers and functions as it is to the existence of gases. In this way, realism about physical theory leads to realism about mathematical objects such as numbers.

The Quine-Putnam argument allows for the empirical justification not only of the often highly specific mathematical statements (such as numerical equations) used to derive predictions from a theory but also of any more general mathematical statements, such as set-theoretic axioms, which imply them. Boyle's law can be derived from the more fundamental laws of thermodynamics. Hence any empirical confirmation of Boyle's law accrues also to the thermodynamic laws used to derive it. In just the same way, since arithmetic can be reduced to set theory, the numerical equations used to derive predictions from Boyle's law can be derived from the axioms of set theory. Hence any empirical confirmation of those equations accrues also to the axioms of set theory. In this way, it might be hoped that a great deal of even abstract mathematics can be justified by means of the Quine-Putnam argument.

### Bibliography

On the historical development of the mathematics of number, see Morris Kline, *Mathematical Thought from Ancient to Modern Times* (New York: Oxford University Press, 1972). For Euclid's *Elements*, the standard reference is T. L. Heath, *The Thirteen Books of Euclid's Elements* (New York: Dover Publications, 1956). Collections of mathematical papers by Frege, Cantor, Gödel, Zermelo, and others can be found in D. E. Smith, ed. *A Source Book in Mathematics* (New York: Dover Publications, 1959) and J. van Heijenoort, ed. *From Frege to Gödel: A Source Book in Mathematical Logic, 1879–1931* (Cambridge, MA: Harvard University Press, 1967). For the philosophy of mathematics, the standard collection of papers is Paul Benacerraf and Hilary Putnam, eds. *Philosophy of Mathematics: Selected Readings* (2nd ed. New York: Cambridge University Press, 1983). Also useful is W.

D. Hart, ed. *The Philosophy of Mathematics* (New York: Oxford University Press, 1996).

Frege's classic *Die Grundlagen der Arithmetik* (Breslau, Poland: Koebner, 1884) is translated by J. L. Austin as *The Foundations of Arithmetic* (Oxford, U.K.: Basil Blackwell, 1953).

For philosophical expositions of Frege's work, see Michael Dummett, *Frege Philosophy of Mathematics* (London: Duckworth, 1991) and Crispin Wright, *Frege's Conception of Numbers as Objects* (Aberdeen, Scotland: Aberdeen University Press, 1983). W. Demopoulos, ed. *Frege's Philosophy of Mathematics* (Cambridge, MA: Harvard University Press, 1995) provides an excellent collection of papers on the technical aspects of Frege's work.

On the epistemological problem for platonism, see Paul Benacerraf, "Mathematical Truth," *Journal of Philosophy* 70 (1973): 661–679.

For a survey of work on physicalist accounts of mathematical, see A. D. Irvine, ed. *Physicalism in Mathematics*. Dordrecht, Netherlands: Kluwer Academic, 1990.

On structuralism and the ontological problem for platonism, see Paul Benacerraf, "What Numbers Could Not Be," *Philosophical Review* 74 (1965): 47–73; Hilary Putnam, "Mathematics without Foundations," *Journal of Philosophy* 64 (1965): 5–22; and Charles Parsons, "The Structuralist View of Mathematical Objects," *Synthese* 90 (1990): 303–346.

On the conventionalist account of mathematics and logic, see A. J. Ayer, *Language, Truth, and Logic* (London: V. Gollancz, 1946); Rudolf Carnap, "Empiricism, Semantics, and Ontology" (1956) and Carl Gustav Hempel, "On the Nature of Mathematical Truth," *American Mathematical Monthly* 52 (1954), both reprinted in Paul Benacerraf and Hilary Putnam, eds. *Philosophy of Mathematics: Selected Readings* (2nd ed. New York: Cambridge University Press, 1983).

Quine's critiques of conventionalism can be found in "Truth by Convention" and "Carnap and Logical Truth" in Quine, *Ways of Paradox and Other Essays* (Cambridge, MA: Harvard University Press, 1976).

For the indispensability argument, see Quine, "Two Dogmas of Empiricism" and "On What There Is" in his *From a Logical Point of View* (2nd ed. Cambridge, MA: Harvard University Press, 1980). See also Quine, *Word and Object* (Cambridge, MA: MIT Press, 1960).

Putnam's exposition of Quine's argument is to be found in Hilary Putnam, *Philosophy of Logic* (London: Allen and Unwin, 1971).

On Field's program, see Hartry Field, *Science without Numbers: A Defence of Nominalism* (Princeton, NJ: Princeton University Press, 1980). For a critical analysis, see Stewart Shapiro, "Conservativeness and Incompleteness," *Journal of Philosophy* 80 (1983): 521–531. A. D. Irvine, ed. *Physicalism in Mathematics* (Dordrecht, Netherlands: Kluwer Academic, 1990) also contains a number of relevant articles on nominalism.

David Hilbert's formalist program is outlined in a readable way in his "On the Infinite" (1926), which is reprinted in Paul Benacerraf and Hilary Putnam, eds. *Philosophy of Mathematics: Selected Readings* (2nd ed. New York: Cambridge University Press, 1983, pp. 83–201). A scholarly exposition of this and other foundational programs can be

found in Marcus Giaquinto, *The Search for Certainty: A Philosophical Account of Foundations of Mathematics* (Oxford, U.K.: Clarendon Press, 2002).

On intuitionism, see the papers by Brouwer and Heyting in Paul Benacerraf and Hilary Putnam, eds. *Philosophy of Mathematics: Selected Readings* (2nd ed. New York: Cambridge University Press, 1982). Michael Dummett's *Elements of Intuitionism* (Oxford, U.K.: Clarendon Press, 1977) is a standard reference work on intuitionistic mathematics and philosophy. Dummett's own argument for an intuitionistic interpretation of mathematics can be found in "The Philosophical Basis of Intuitionistic Logic" in his *Truth and Other Enigmas* (London: Duckworth, 1975).

## NUMENIUS OF APAMEA

Numenius of Apamea, the second-century Greek philosopher perhaps best known for his description of Plato as an Atticizing Moses, was a precursor of Plotinus and Neoplatonism and also had affinities with Gnosticism and the Hermetic tradition. Of his life practically nothing is known, and even the approximate dates of his birth and death are uncertain. Since his description of Plato is quoted by Clement of Alexandria (*Stromateis* i, 22.93), he cannot have survived much later than 200 CE, while the latest writers cited in the fragments of his works belong to the time of Nero (37–68 CE). He may have been of non-Greek origin, and his name, like that of Porphyry, may have been a Greek translation of a Semitic original. Our sources commonly describe him as a Pythagorean, but Iamblichus and Proclus call him a Platonist, which comes to much the same thing in an age when Plato was considered a disciple of Pythagoras. Certainly Numenius is best grouped with such Middle Platonists as Albinus. His work was based primarily upon exegesis of Plato and presents a systematization of Plato's thought with a dualist emphasis. It is possible that he had some knowledge of Christianity, but what is truly remarkable is his knowledge of Judaism. It has been suggested that he himself was a Jew, but this is far from certain. What is clear is that he sought to go back before Plato and Pythagoras to the teachings of the ancient East, the Brahmins, the Jews, the Magi, and the Egyptians. In this respect there are links with the Hermetic books and with the *prisca theologia* of such Renaissance writers as Marsilio Ficino and Giovanni Pico della Mirandola, although scholars differ as to the extent to which Numenius's philosophy was actually influenced by Oriental ideas and the extent to which it was purely Greek.

A notable feature of his thought is his doctrine of the Demiurge. He postulates two opposed principles, God and matter, the monad and the dyad, but whereas the Pythagoreans adhered to monism by making the dyad emanate from the monad, Numenius developed a dualistic theory. Matter is evil, and the supreme God can therefore have no contact with it; hence the need for a second god, the Demiurge, who is of dual nature, an *anima mundi* related both to God and to matter (cf. the Philonic Logos). There are also two souls in the world, one good and one evil, and two souls in man, a rational and an irrational; and the only escape from this dualism is by deliverance from the prison of the body. Astrological elements in Numenius's anthropology suggest an attempt to give astrology a rational basis.

Numenius is important for his influence on later Neoplatonists, although some of his views were to be rejected by them. The allegation that Plotinus merely plagiarized Numenius prompted Plotinus's disciple Amelius to write a book pointing out the differences between them (Porphyry, *Vita Plotini* 17). The hierarchy of three gods, for example, appears to be similar to Plotinus's hierarchy of being, but the three entities in each case do not correspond exactly in detail. Moreover, Plotinus rejected Numenius's dualistic and Gnosticizing tendencies.

## NUSSBAUM, MARTHA

(1947–)

Martha Nussbaum has contributed to ethics, political theory, classics, philosophy of mind, legal theory, educational theory, public policy, and gender studies. Educated at New York University (BA, 1969) and Harvard University (MA, 1971; PhD, 1975), she has taught at Harvard, Brown University, Oxford University, and the University of Chicago.

Nussbaum's work ranges widely, but she has consistently returned to such themes as: the nature of emotion and its role in philosophical argument, the extension and application of the "capabilities approach" in the theory of justice, the role of philosophical argument and reflection in the public sphere, and the relationship between philosophy and art and literature. Her work can be helpfully characterized as a sustained critique of Platonism. *The Fragility of Goodness* (1986), her first major book, argued that the Platonic view of the good life marks "an aspiration to rational self-sufficiency through the 'trapping' and 'binding' of unreliable features of the world." Such self-sufficiency omits "a kind of human worth that is inseparable from vulnerability, an excellence that is in its nature other-related and social, a rationality whose nature it is *not* to attempt to seize, hold, trap, and control, in whose values openness, receptivity, and wonder play an important part" (pp. 19–20).

Nussbaum has consistently defended the latter. Against the Platonic-Christian view that transcendent Good or God is at the heart of morality, she advances her own comprehensive, Aristotelian-Kantian-Jewish view that religion highlights the largely autonomous, primary domain of human moral effort. The highest moral paradigms are not such figures as the saints or Gandhi, but those who, like Nehru, found the good life in human finitude and limitation. For Nussbaum, rigorist or ascetic moralism, whether in Gandhi or Plato, betrays a violence

toward the self that may undermine morality and compassion.

*Upheavals of Thought: The Intelligence of Emotions* (2001) develops the moral psychology that figures in Nussbaum's ethical and political work. The Platonic ascent of love is criticized for having the lover climb to such heights as to be beyond compassion and human need, beyond even altruistic contact with actual human beings. Christian and Romantic views fail in the same way, and can reinforce developmental tendencies positively inimical to morality—childhood emotions of shame, disgust, and envy. Nussbaum works out a highly qualified "neo-Stoic" view of the emotions, according to which "once one has formed attachments to unstable things not fully under one's control, once one has made these part of one's notion of one's flourishing, one has emotions of a background kind toward them—on my view, judgments that acknowledge their enormous worth—that persist in the fabric of one's life, and are crucial to the explanation of one's actions" (p. 71). Thus, emotions are a type of evaluative judgment, construed in a way broad enough to allow that nonhuman animals and infants, who lack propositional thought, can also be said to have emotions. And they have a narrative structure, found in one's life history. Acknowledging one's neediness, however, and representing the world from the personal point of view and with considerable ambivalence, the emotions so characterized pose problems for moral and political theories stressing mutual respect, dignity, and concern for others.

Nussbaum's account of such emotions as compassion, shame, and disgust, which also receive extended treatment in her *Hiding from Humanity* (2004), is vital for understanding her political philosophy, which draws heavily on Aristotle, Immanuel Kant, John Stuart Mill, Karl Marx, John Rawls, and Amartya Sen. She defends a broadly Rawlsian political liberalism that frames an account of human flourishing adapted to the demands of liberal political theory, respecting the reasonable plurality of views of the good life to be found in the modern world. Her collaboration with Sen, beginning with *The Quality of Life* (1993), has yielded a critique of conventional economic measures of human welfare and pointed up the virtues of instead measuring people's capabilities, what they are capable of doing or being across central areas of human life. Her aim has been to bring her Aristotelianism into harmony with the capabilities approach, adapted to serve as a form of political liberalism that could also undergird the type of universalistic critique required by feminism.

Nussbaum's development of the capabilities approach in connection with feminism has led her to introduce more Kantian and Millian elements into her arguments and to emphasize the recognition of human dignity as a core feature of political liberalism. *Sex and Social Justice* (1999) and *Women and Human Development* (2000) develop the capabilities theory as the philosophical groundwork for basic constitutional standards, applicable to all governments, defining the minimal requirements of respect for human dignity. These works provide a highly developed account of the central human capabilities—life, bodily health, bodily integrity, senses, imagination and thought, emotions, practical reason, affiliation, concern for nature and other species, play, and political and material control over one's environment—and articulate the political liberal demand that all citizens must, as a requirement of justice, enjoy a basic threshold level of each of these capabilities. Her focus on the injustices confronting women, gays, and lesbians, and others suffering from insidious forms of oppression, has widened to cover problems of international justice and justice with respect to nonhuman animals.

Nussbaum has also paid special attention to education. *Cultivating Humanity* (1997) argues for an education (inspired by Plato's earlier, truly Socratic dialogues) that would awaken students to self-scrutiny and to their capabilities for love and imagination. Promoting a greater role for such philosophical reflection in public life has been one of Nussbaum's chief priorities.

## OAKESHOTT, MICHAEL (1901–1990)

Michael Oakeshott, a wide-ranging thinker mostly known for his work in social and political philosophy, was born in Chelsfield, Kent, on December 11, 1901. Oakeshott read history at Gonville and Caius College, Cambridge, and graduated in 1923. He returned as a fellow in 1925. In 1940 he enlisted in the British Army and served with “Phantom,” an intelligence unit that worked on artillery spotting. In 1949 he went to Oxford as a fellow of Nuffield College and in 1951 he was appointed to the chair of political science at the London School of Economics. He retired in 1969, but continued to be active from his retirement home in Acton, Dorset, where he died on December 18, 1990.

### EXPERIENCE AND ITS MODES

*Experience and Its Modes* (1933) was Oakeshott’s first major work. In the book Oakeshott creates some of the major distinctions that mark his social/political philosophy. The most important concerns experience itself. Influenced by the holism of Plato and Hegel (especially the *Phenomenology of Spirit*) and the idealism of Francis Bradley (*Appearance and Reality*), Oakeshott posits that

“experience is a single whole, within which modifications may be distinguished, but which admits of no final or absolute division; and that experience everywhere, not merely is inseparable from thought, but is itself a form of thought” (1933, p. 10). Within the unity of experience people attempt to make sense of it via interpretative devices such as “history research,” “scientific experimentation,” and “practical reasoning.” But all of these paths will ultimately fail. This is demonstrated by a relentless skepticism. The futile interpretative modes rely upon a false understanding of the primacy of Enlightenment-style rationalism. Instead, the agent finds herself in the midst of her own reflections and poetic imaginings. This agent-centered construction creates a tension in a world of other minds. The result is a necessary travail to reconcile one’s own experience with that of others. This process is necessary to make social existence coherent.

Along with this amalgam of skeptical idealism Oakeshott posits freedom:

The starting place of doing is a state of reflective consciousness, namely, the agent’s own understanding of his situation, what it means to him. And, of course, it is no less *his* situation even though it may be a concern with what he understands to be the situation of another or of oth-

ers. ... And it is in this respect of this starting-place in an understood contingent situation that the agent in conduct may be said to be “free.” (1975, p. 37)

Freedom is thus one of the properties of consciousness that allows the interpretative awareness of consciousness to develop.

Because freedom is a precondition of people’s experience of the world, it is vain for totalitarian dictators to endeavor to suppress it. To do so would mean that the dictator tries to suppress an aspect of human nature that underlies the possibility of human experience. It just can’t happen. Freedom will exhibit itself in one form or another. This is not a teleological expression of human nature but rather an indication that people will interpret and respond to what life presents them. This is a concrete and practical vision. Though some may be drawn to the modes to make sense of it all (a vain endeavor), the primary imperative (à la Berkeley) is first to accommodate the primary data of experience as it presents itself: “And no matter how far we go with it, we shall not easily forget the sweet delight which lies in the empty kisses of abstraction” (1933, p. 356).

### RATIONALISM IN POLITICS

The essays in *Rationalism in Politics* (1991) form the core of Oakeshott’s social/political thought. In the title essay Oakeshott extends some of the concepts of his earlier work to critique Enlightenment rationalism as a device that is serviceable for guiding social and political thinking. He proclaims this Hobbesian skepticism of rationalism as a useful tool for politics in language that is reminiscent of Aristotle (*EN* I.1).

Every science, every art, every practical activity requiring skill of any sort, indeed every human activity whatsoever, involves knowledge. And universally, this knowledge is of two sorts. ... The first sort of knowledge I will call technical knowledge or knowledge of technique. ... The second sort of knowledge I will call practical, because it exists only in use, is not reflective and (unlike technique) cannot be formulated into rules. (1991, p. 12)

This essay then goes on to evaluate these two aspects of reason with a critique of traditional accounts that aspire to make rationalism a transcendent tool. Instead, Oakeshott insists, reason is merely the handmaiden of free holistic experience.

In “The Tower of Babel” Oakeshott sets out a Hegelian understanding of the existing community and its proper influence on the individual. Two sorts of morality are posited: The first represents the existing moral community (akin to the German *Sittlichkeit*). The second is a philosophical critique that may alter the first. Alan Donagan contends that Oakeshott (like Hegel) misses the force of deontological commands by favoring the *Sittlichkeit* over *Moralität*. By being biased toward experience, as such, Donagan believes that fundamental principles that supercede morality are not given their due. The mere existence of the second (philosophical) form of morality is not adequate. This much resembles the Kant-Hegel debate on the proper place of experience in evaluating the moral community. Oakeshott’s position of affirming the existing moral community puts him into the camp of political conservatism. How much one is to make of this is still a subject of critical debate.

“The Voice of Poetry in the Conversation of Mankind” is another key essay in the collection that proclaims an aesthetics that is disinterested. It is not for the sake of instruction nor is it a conscious imitation of nature. “The poet does not recognize and record natural or conventional correspondencies or use them to ‘explore reality’; he does not invoke equivalencies, he makes images” (1991, p. 528). In this way, the work of art is for the sake of the pleasurable contemplation of images. In some ways Oakeshott’s aesthetic stance is reminiscent of Schiller and some readings of Kant. It is consistent with the holism standpoint that was established in *Experience and its Modes*.

### CONCLUSION

Michael Oakeshott may be best known as a conservative political writer in the tradition of Hobbes. However, as the comments above suggest, he is more than that. He grounds his thinking in a comprehensive epistemological theory that also supports other explorations (such as aesthetics, history, and education). To evaluate his work, it is important to view Oakeshott within this larger context.

## OBJECTIVISM

See *Objectivity in Ethics*

## OBJECTIVITY IN ETHICS

What objectivity in ethics is depends, in part, on what ethics is. On the narrowest understanding, ethics consists in judgments about moral constraints, which govern a person’s treatment of other people, as such. On the broadest understanding, ethics includes all normative judgments, which say which responses one ought to have, and all evaluative judgments, which assess people and things against standards, as good or bad, beautiful or ugly, and so on. While it may seem strained to interpret “ethics” so broadly, many of the questions about the objectivity of ethics in the narrow sense apply to normative and evaluative judgments in general.

In one sense, what is objective is what is so independently of one’s particular attitudes or position. But this idea can be specified in different ways. In one sense, a particular ethical judgment is objective if and only if it is correct, where this is an evaluation of the judgment itself, not of how it is formed or sustained. If ethical judgments are beliefs, then it is natural to think that they are correct if and only if they are true. Scholars might call this *objectivity as truth*. But ethical judgments might be correct in some way other than being true. Immanuel Kant held that some ethical judgments are correct, even though ethical judgments are commands, which cannot be true or false. Scholars might call this more inclusive conception *objectivity as correctness*.

In another sense, a particular ethical judgment is objective if and only if it is formed and sustained in response to factors that tend to make such judgments correct. An ethical judgment is objective in this sense if it results from the judge’s responsible assessment of the relevant ethical considerations, not unduly influenced by his or her desires, emotions, or affiliations. Scholars might call this *objectivity as justification*.

A different kind of objectivity, described by Thomas Nagel (1979), is possessed, in the first instance, not by particular judgments themselves, but instead by what those judgments are about. Something has objective

value, in this sense, if it gives everyone reason to respond to it in the same way, regardless of his or her relation to it. For example, human suffering gives everyone reason to do what he or she can to alleviate it. Scholars might call this *objectivity as impersonality* and the associated values “impersonal” or “neutral” values. They contrast with things of “personal” or “relative” value, which give persons who stand in special relations to them reason to respond to them in special ways. For example, a child’s suffering gives that child’s parent more pressing reason to alleviate it than it gives others. There is a tendency, Nagel (1986) observed, to assimilate impersonality with justification and correctness, which misleadingly suggests that judgments of personal value, such as that a parent has reason to care specially for his or her child, are necessarily biased or false.

So far this entry has been considering the objectivity of particular ethical judgments and their contents. But some ask whether ethics as a whole, the sum of humankind’s actual or possible ethical judgments taken together, is objective. Vaguely put, the question is whether ethical judgments are answerable to anything independent of them.

One might interpret this question as asking, “Is there an ethical reality?” where this “reality” is what ethical judgments would be answerable to. This question can be construed, in turn, as asking, “Are there ethical entities existing out there, in the world?” But this may be a tendentious formulation. What makes judgments distinctively ethical is not that they are about entities of a distinctive kind, which might exist somewhere, but instead that they predicate properties of a distinctive kind. What the question “Is there an ethical reality?” more plausibly asks is, “Do things actually have ethical properties?” And this seems to boil down to the questions “Are some actual or possible ethical beliefs, which predicate ethical properties of things, true? Can it be so that something is good or bad, right or wrong?” This is objectivity as truth, generalized to the domain as a whole. Note that in order for ethics to be objective in this sense, it is not enough that ethical judgments be either true or false. The “error theory” that J. L. Mackie (1977) proposed, which denies this kind of objectivity to ethics, asserts that all ethical judgments are false because they all contain a mistaken presupposition that something’s having an ethical property is something that can be so.

Those who deny that ethical judgments are beliefs may still affirm that they can be correct, in some way other than being true. There are right and wrong answers to ethical questions, they may say, even if there is no eth-

ical reality that makes them right or wrong. They affirm objectivity as correctness generalized to the domain as a whole.

In another sense, ethics is objective if some actual or possible ethical judgments are or could be justified. This is objectivity as justification generalized. If ethics lacks justification, it does not follow that it lacks correctness. The fact that no ethical beliefs are justified, for example, does not mean that no ethical beliefs are true. But it may seem to have similar practical implications. Even if one’s ethical beliefs might be true, one has no reason to treat them as true.

In still another sense, ethics is objective if it does not “depend on” one’s psychology. Scholars might call this *objectivity as mind independence*. Since the claim that ethics is mind independent is just the denial of the claim that ethics is mind dependent, the way to come to terms with the former is to come to terms with the latter. To understand what it might mean to deny that ethics “depends on” one’s psychology, in other words, one needs first to understand what it might mean to assert it. It cannot be to assert that ethical judgments depend on one’s psychology. This is a truism; all judgments are psychological phenomena. Nor can it be to assert that the things about which one makes ethical judgments depend on one’s psychology. No one denies that some ethical judgments can be about psychological states, such as intentions to harm others.

A more promising interpretation of the idea that ethics “depends on” one’s psychology—of what is denied by the claim that ethics is objective in the present sense—is that ethical judgments predicate some property involving human psychology. An extension of this idea, which scholars might call *mind dependence of properties*, might capture the sense in which noncognitivism represents ethics as mind dependent. According to noncognitivism, ethical judgments only appear to predicate properties of things, while they in fact only express the judge’s decisions or feelings regarding those things. Noncognitivists, therefore, will not agree that ethical judgments predicate psychological properties. But they may say something that approximates this: that in place of predicating properties, ethical judgments express judges’ psychological states.

Another possible interpretation of the idea that ethics “depends on” one’s psychology, which scholars might call *mind dependence of correctness*, is that what makes ethical judgments correct, when they are, is something about one’s psychology. The mind dependence of ethical properties entails the mind dependence of ethical

correctness. If ethical judgments predicate psychological properties, then what makes those judgments true or false are psychological facts. But one might deny that ethical judgments predicate properties, while still holding, first, that they can be correct and, second, that their correctness is mind dependent. A Kantian theory might claim that ethical judgments do not predicate special ethical properties of actions, but instead command that they be done. But it might hold first that these commands can be correct and, second, that what makes them correct is something about the human will.

A natural way of spelling out the thought that ethical properties are mind dependent, which David Lewis (1989) explored in his work, is dispositionalism. Dispositionalism holds that what it is for something to have an ethical property (to be good, say) just is for it to be the case that subjects in certain conditions would respond to it in a certain way (such as by approving of or desiring it). One reservation about dispositionalism is whether the relevant response can be specified without appealing to the ethical property at issue. If approving of or desiring something consists in believing it to be good, for example, then dispositionalism appears to be circular.

Another reservation is that dispositionalism seems to imply, implausibly, that the extension of ethical properties varies with dispositions to respond, so that if the relevant subjects in the relevant conditions were not to approve of, say, kindness, it would no longer be good. One proposal to overcome this reservation, considered by David Wiggins (1998), is to identify actual dispositions as the relevant dispositions. If dispositions in the actual world are held fixed, then the extension of goodness does not vary across possible worlds, even ones in which dispositions vary. Does this mean, however, that as the identity of the actual world varies, the extension of goodness also varies? If so, then, as Lewis (1989) and Christopher Peacocke (2004) observed, the source of the original reservation seems only to have been relocated. If not, then, as Barry Stroud (2000) argued, it is unclear in what sense goodness is still being said to “depend” on dispositions. The dispositions that are held fixed are held fixed, it seems, simply because they are responsive to goodness.

Dispositionalism, it is sometimes said, is compatible with the correctness—indeed the truth—of ethical judgments. According to dispositionalism, the judgment that something is good is true if and only if subjects in the relevant conditions would approve of it. It might be said, however, that dispositionalism does not allow ethics to be correct in a more thoroughgoing sense. Although dispositionalism holds that judgments about the relevant

responses can be correct, it also holds that there is no sense in which the responses themselves can be correct.

Some theories attempt to make mind dependence hospitable to a more thoroughgoing kind of correctness. John McDowell (1985) and Wiggins (1998) suggested that the relevant responses can be “merited” by their objects, and they proposed that what it is for something to have an ethical property is, in part, for it to “merit” a certain response. In what way, then, are ethical properties still mind dependent? It is a necessary truth about any property that something has that property only if it “merits” a certain response: at very least, the judgment that it has that property. Perhaps the claim is that while this may be a necessary truth about every property, it is not an essential truth about every property. It is not part of “what it is” for something to have a shape property, for example, that it merits a response, whereas it is part of “what it is” for something to have an ethical property.

Kantians also argue for a mind dependence that is hospitable to a more thoroughgoing kind of correctness than dispositionalism allows. What makes an ethical judgment correct, according to Christine Korsgaard (1996), is that endorsing that judgment is constitutive of rational, reflective agency. Thus, the correctness of ethical judgments depends not on contingent tendencies of particular minds, as dispositionalism supposes, but instead on the necessary structure of a mind that is capable of asking ethical questions at all.

So much for what it might mean to assert or deny that ethics, as a whole, is objective. Why might one assert or deny it? Some have thought that ethics could be correct if and only if God laid down ethical laws. There are laws only where there is a lawgiver, the reasoning may go, and mortal lawgivers can establish only conventional laws. Therefore, God alone can establish ethical laws. Do all laws, however, require a lawgiver? Perhaps ethical laws, like logical laws, are not chosen by anyone. Moreover, it is unclear whether God could choose all ethical laws, for reasons given in the *Euthyphro* of Plato. If God chose certain ethical laws without regard for their goodness, then those laws would appear to be arbitrary, which it seems ethical laws cannot be. If instead God chose certain ethical laws because they were good, then God would appear to have been responding to prior and independent ethical laws, which he did not choose.

Others are anxious to deny that ethical judgments can be correct because they wish to justify tolerance of different ethical judgments. It is true that if no ethical judgment is correct, then one cannot ground one’s intolerance of differing judgments on the claim that one’s own

judgments are correct. However, this shows only that there is a false premise in one argument for intolerance. It does not provide any positive justification for an ethical principle of tolerance. Moreover, to justify such an ethical requirement would seem to amount to establishing the correctness of at least one ethical judgment. So it is not clear whether the denial that ethical judgments can be correct is even compatible with the attempt to justify an ethical principle of tolerance.

A more prevalent concern among contemporary academic philosophers is that the objectivity of ethical judgments is incompatible with the apparent link between making an ethical judgment and being motivated to act accordingly. For example, Mackie (1977) denied that ethical judgments can be true, on the grounds that they presuppose “queer” properties: properties such that when someone believes that an object possesses one, he or she necessarily is moved in a particular way. Perhaps what is “queer” here, however, is the unqualified claim that making an ethical judgment entails being motivated to act accordingly. More plausible, as Michael Smith (1994) and Korsgaard (1986) argued in their works, is the thesis that making an ethical judgment entails being motivated, insofar as one is not irrational, to act accordingly. Smith and Korsgaard appeared to believe, however, that this revised thesis can be explained only if the content or correctness of ethical judgments is in a way mind dependent: dependent not on the tendencies of particular contingent minds, but instead on the structure or content of ideally rational psychology.

Other philosophers are impressed by disagreement in ethics. Ethical disagreement alone, however, does not entail that ethical judgments cannot be correct, any more than scientific disagreement entails that scientific judgments cannot be correct. The thought may be—as Mackie (1977), for example, seemed to pursue it—that ethical disagreement is in some way different from other kinds of disagreement, and that this difference is evidence that ethical judgments are explained by something other than their subject matter, or that ethics cannot settle the questions that it asks. As this entry will discuss, however, these claims—that ethics can be given an “unmasking explanation” and that it cannot resolve its own questions—may seem plausible even in the absence of actual disagreement.

Still other philosophers, such as Gilbert Harman (1977), Bernard Williams (1985), and Crispin Wright (1992), doubted that ethics can be objective, on the grounds that its subject matter does not provide causal explanations. That an action was wrong, for example, does not seem to explain why anything that followed took place.

While causal powers might be required by a stipulated sense of “objectivity,” it is not immediately obvious how they are relevant to objectivity intuitively understood as answerability to something independent of judgment. To be sure, some judgments are about causal powers, and so the possession of such powers is straightforwardly relevant to the correctness of such judgments. If celestial events have no influence on the fates of men, for example, then astrological beliefs are false. But as Ronald Dworkin (1996) and T.M. Scanlon (2003) noted, ethics does not purport to make judgments about causal powers. So whether ethical properties possess such powers does not seem to be similarly relevant to the correctness of ethical judgments.

What seems more plausibly relevant to objectivity is the power of the subject matter of ethics to explain, specifically, ethical judgments. If ethical beliefs, for example, are explained by something other than their putative subject matter—if, as Stroud (2000) put it, an “unmasking explanation” can be given of ethics—then it may seem that ethical beliefs are not suitably responsive to their subject matter. And if ethical beliefs are not suitably responsive to their subject matter, then they are not justified. Moreover, an unmasking explanation may be reason to doubt that ethical beliefs are true: to conclude that ethics, as a whole, is a kind of illusion. Such is the upshot of more familiar unmasking explanations of beliefs about, for example, ghosts and desert oases.

Dworkin (1996) and Scanlon (2003) questioned the assumption that beliefs can be suitably responsive to a subject matter, and hence justified, only if they are causally explained by it. Mathematical beliefs, by analogy, seem to be justified without being caused by their subject matter. Stroud (2000) doubted that an unmasking explanation of ethics can even be given. He argued that one cannot recognize ethical beliefs—the *explanandum*—without accepting some ethical claims, which the “unmasking” *explanans* was supposed to avoid.

A final concern, as Wiggins (1995) and Scanlon (2003) have suggested, is simply that ethics may seem unable to settle any, or enough, of the questions it asks. It may seem, for example, that no argument could settle whether lying to one’s friend to spare her feelings in a certain kind of situation is the right thing to do. Here there seems to be a sharp contrast with mathematics, which is able to settle many of the questions it asks. The failure of ethical argument might suggest that ethical judgments cannot be justified: that we lack sufficient reason to hold them. Or it might suggest that ethical judgments cannot be correct: that the subject matter of ethics does not con-

strain unique answers to the questions that can be asked about it.

This is a “first-order” or “substantive” doubt, which arises within ethical thought itself, about the prospects of its success. It is often distinguished from “second-order” or “metaethical” doubts, such as those raised by Mackie (1977) and Harman (1977), which are supposed neither to be based on, nor to imply anything, about the prospects of “internal” ethical argument. Dworkin (1996) doubted that this distinction can be sustained, concluding that purportedly “second-order” positions about the objectivity of ethics are, if they are intelligible at all, simply substantive positions within ethics.

## OCKHAMISM

“Ockhamism” is a term used by some historians of medieval philosophy to characterize the critical and skeptical attitude toward natural theology and traditional metaphysics that became prevalent in the fourteenth century and is ascribed to the influence of William of Ockham (c. 1285–1349). There is little historical basis for speaking of an Ockhamist school, since Ockham had scarcely any avowed disciples; nor was the critical attitude toward natural theology initiated by him, although his logical criteria of demonstration and evidence undoubtedly gave it a powerful implementation. With these reservations one may, in a general sense, attach Ockham’s name to the movement of thought that, in the fourteenth century, closed out the medieval enterprise of synthesizing Aristotelian philosophy with Christian theology and initiated new lines of development that led toward the scientific empiricism of the seventeenth century. The Ockhamist or nominalist movement was known in the fourteenth and fifteenth centuries as the “modern way” (*via moderna*), and was contrasted with the “old way” (*via antiqua*) associated with thirteenth-century Scholasticism.

One may distinguish two main phases of this movement of fourteenth-century thought. The first phase, occurring between 1330 and 1350, was marked by the rapid spread of Ockham’s doctrines and method among the theologians and philosophers teaching at the universities of Oxford and Paris, where Ockham’s logical techniques were used in criticism of the older scholastic

tradition. The second phase, less directly associated with Ockham's own teachings, commenced around 1350 and involved what may be described as a reconstruction of philosophy, and of theology as well, on foundations compatible with Ockham's empiricism and nominalism.

### CRITIQUE OF SCHOLASTICISM

The influence of Ockham's logic and of his nominalistic critique of the thirteenth-century metaphysical syntheses of philosophy and theology was exhibited at Oxford in the work of Adam Wodeham (d. 1349), a Franciscan who had studied with Ockham, and of Robert Holkot (d. 1349), a Dominican theologian who lectured at Oxford around 1330 and later taught at Cambridge. Holkot was an outspoken nominalist who minced no words in stating that theology is not a science and that its doctrines can in no way be demonstrated or even comprehended by human reason. Christian dogma, for Holkot, was accepted by an act of will, on the authority of the church.

Thomas Bradwardine (c. 1290–1349) reacted against what he regarded as a new Pelagianism embodied in the Ockhamist interpretation of revealed theology, but he used Ockham's logical techniques to draw deterministic consequences from the doctrine of divine omnipotence, invoking the authority of Augustine for his views. Other Oxford teachers influenced by Ockham, and particularly by his logical methods, included Richard Swineshead ("the Calculator"), John Dumbleton, William Heytesbury, and Richard Billingham.

### THE "MODERN WAY"

It was at Paris, more than at Oxford, that Ockham's influence led, after an initial resistance, to establishment of a relatively stable, and in some respects scientifically fruitful, philosophical school that endured and spread through central Europe in the late fourteenth and early fifteenth centuries.

One of the first Parisian theologians to embrace Ockham's doctrines was John of Mirecourt, a Cistercian monk who lectured on Peter Lombard's *Sentences* in 1344–1345. His skeptical treatment of the arguments of traditional theology led to a condemnation by the theological faculty at Paris of articles taken from his lectures. In many respects Mirecourt's positions resembled those of Holkot, by whom he may have been influenced.

Another victim of disciplinary action by the authorities of the University of Paris was Nicolas of Autrecourt, who was condemned to burn publicly, in November 1347, his letters to Bernard of Arezzo and his treatise

*Exigit ordo executionis*. Nicolas, reacting to the Ockhamist thesis that God, by his absolute power, could cause an intuitive cognition of a nonexistent object, or could cause sensible qualities to exist without any substance being qualified by them, held that the only things of which man can have certain knowledge are the qualities perceived by his five senses, the acts or affections of his own mind, and those propositions logically evident by the principle of contradiction. From this he argued that we have no ground for belief in substances or for making inferences on the basis of causal relations, and he asserted that the whole philosophy of Aristotle is a fictitious construction devoid of any evidence or even of probability, since it rests on the assumption of substances and of causal necessities that are neither logically nor empirically evident. Preferring certainty to the Ockhamist "hypothesis of nature," Nicolas turned Ockham's critique of metaphysical necessity against Ockham's own empiricism and was rebuked by John Buridan for demanding absolute evidence, or logical necessity, in a domain of inquiry in which only conditional evidence based on the assumption of a common course of nature is appropriate.

In the hands of Buridan, a teacher on the faculty of arts at Paris, Ockham's logic, theory of knowledge, and nominalistic ontology were made the basis of a natural philosophy or physics of empirical type, within which Buridan developed the impetus theory of projectile motion and gravitational acceleration and subjected the assumptions of Aristotelian physics and cosmology to critical analysis in terms of empirical criteria of evidence. Buridan's reconstruction of natural philosophy as a positive and empirically based science of observable phenomena undermined the Aristotelian tradition and provided some of the main starting points for the development of modern mechanics in the seventeenth century.

At the same time a theologian of Paris, Gregory of Rimini (d. 1358), who became general of the order of Augustinian Hermits, made a constructive use of Ockhamist methods and doctrines in a theological synthesis of nominalism and Augustinianism; although he took issue with both Ockham and Buridan on some issues of metaphysics, the later Scholastics regarded him as a modern theologian of the nominalist group.

Natural philosophy, as distinguished from theology, was dominated by the moderately Ockhamist tradition established at Paris by Buridan, developed by Albert of Saxony and Nicholas of Oresme, and carried to the new universities of central Europe by Albert, Marsilius of Inghen, Henry of Hainbuch, and Henry of Oyta. A document drawn up by the faculty of the University of

Cologne in 1425 speaks of the period of preeminence of the *via moderna* as the century of Buridan (*saeculum Buridani*), indicating that the Ockhamism of the later fourteenth century had become associated with Buridan and his followers more than with Ockham.

## RELIGIOUS INFLUENCE

The Ockhamist divorce of Christian theology from Aristotelian metaphysics, with the corresponding emphasis on religious faith and the tradition of the Church Fathers as foundation of Christian doctrine, was reflected in the popular religious movement associated with the school of Deventer and the *devotio moderna* and in the criticisms of the scholastic methods of theological disputation and argument made by Jean de Gerson at the end of the fourteenth century. Gabriel Biel (c. 1410–1495) was the last influential theologian of the Ockhamist school, and in his work the influence of Gerson, Gregory of Rimini, Holkot, and of Ockham himself brought together the diverse strands of this nominalist tradition in a doctrine with strong religious emphasis.

Ockhamism, as a well-developed philosophical and religious tradition, was submerged by the Reformation and the Counter-Reformation, as well as by the humanist revolt against the medieval cultural tradition. However, its leading ideas, in the liberation of both the Christian faith and the scientific investigation of nature from dogmatic Aristotelianism, remained operative outside the schools and bore fruit in the seventeenth and eighteenth centuries.

## OGYŪ SORAI

(1666–1728)

Ogyū Sorai, or Butsu, was a Japanese Confucianist of the *kogakuha* ("school of ancient learning"), and famous as a political thinker. Ogyū was born in Edo (Tokyo). He was a gifted pupil and soon mastered classical Chinese; the classical style is characteristic of his writings. Proud by nature, Ogyū distinguished himself in the defense of official Zhu Xi Neo-Confucianism in polemics against Itō Jinsai. In 1716, however, his views changed, and in *Bendō* (Defining the way) and *Bemmei* (Definitions of terms) he supports most of Itō's ideas. All of Ogyū's other works were inspired by the ancient sages in accord with the maxim "back to antiquity," a maxim applicable to many of his innovations. These innovations were expressed in *Taiheisaku* (A policy for great peace) and *Seidan* (Discourses on government). Ogyū's cosmological views differ little from Itō's; Ogyū, too, rejects the dichotomy of *ri*, the principle, and *ki*, the material energy.

Ogyū holds a positivist and historicist conception of the Way (*dō*); it became for him the factual order of society, with its positive laws and institutions. He rightly points out how Confucius stressed the societal implications of the Way. Ogyū goes much further, excluding personal ethics until only "rites," that is, propriety and social behavior, combined with obedience to the government, remain. In this sense he comes very close to the Chinese Legalists in utilitarian ethics. Although he was apparently inspired by Xunzi c. 295–c. 238 BCE), he does not mention the name. For Ogyū, human nature cannot be much corrected; in this only social institutions are of any use. The sole meaning of "humaneness" is the giving of peace and prosperity to the people, and "virtue" is the virtue of the ruler in discerning able men. His political and economic ideas have little in common with Confucian moralizing. Government is a practical technique (*jutsu*), and the economy is not based on thrift but on sound social policies. He was against the idea of fanatic loyalty to the lord and advocated some social mobility, believing that the lower samurai but not the common people should be allowed to improve their status.

Ogyū's views of history are distinguished by the same practical approach. The founder of a dynasty plays a great role because of the public institutions he has to establish, yet rulers often fall because of the difficulty of preventing economic decline. Living under the Tokugawa shogunate, Ogyū rejected even the nominal sovereignty of the emperor (an opinion his best pupil, Dazai Shundai [1680–1747], concurred in). Shintoism for Ogyū was an invention of Yoshida Kanetomo (1435–1511). Ogyū's stand in favor of the Tokugawa government and his rejection of Shintoism explain why he was not repressed for his daring ideas and anti-Zhu Xi doctrine.

## OKEN, LORENZ

(1779–1855)

Lorenz Oken, a German biologist and philosopher, was born at Bohlsbach, Baden. He was graduated from the faculty of medicine at Freiburg in 1804 and obtained his first professorship in medicine at Jena in 1807. Oken left Jena in 1819 because as editor of the liberal periodical *Isis* he had incurred the disfavor of the authorities. He traveled in Germany and France, lectured at the University of Basel in 1821 and 1822, and after a brief appointment at the University of Munich he became professor of physiology in Zürich, where he remained until his death.

After a few years in Jena, Oken was asked to transfer from medicine to philosophy. Yet ten years later, in his second term at Basel, he was listed as professor of medicine only, with no reference to philosophy. These changes reflect Oken's development and the superseding of romantic nature philosophy by a more objective study of natural phenomena. Under the influence of Friedrich von Schelling and the thinkers of the romantic school, Oken's imagination—rather than a genuine philosophical bent—swept him on to his own version of philosophy of identity. If in his time Oken was thought to be a greater philosopher than even Schelling, it was because he had a much wider knowledge of the natural sciences to illustrate and support his metaphysics. His most significant book in this connection is the *Lehrbuch der Naturphilosophie* (*Elements of Physiophilosophy*). This work aroused great interest, especially among the New England transcendentalists. Oken tried to establish a correspondence between mathematical structures and nature, and between metaphysical essences and nature. Fond of Pythagorean mysticism, he argued that all life is cast in the mold of mathematical symbols. Zero is nothingness and the infinite at the same time. The evolution of positive and negative numbers out of zero is the counterpart of a descending and ascending order of things—the descent being from matter (heavenly bodies, rocks, minerals, etc.) to some primeval mucus, while the ascent is from this mucus, seminated by infusoria and helped along by galvanism, through the whole scale of plant and animal life to man.

Metaphysically, zero is God. The disintegration of matter to mucus and the evolution of living beings illus-

trate God's desire to manifest himself in nature—when he comes to man, he meets himself; man is a god created by God. Theogony turns into hylogeny, the creation of matter. By the same token, all that exists is embedded in and permeated by an everlasting stream of vitality—pantheism and vitalism combine in Oken's view of the universe and its parts.

A poet in science, Ralph Waldo Emerson called Oken admiringly. The appropriateness of this remark is underlined by Oken the physiologist, who regarded man as an assembly of all the sense organs and other bodily parts developed along the ascending path; and by Oken the psychologist, who saw all animals as contributing to the psychology of the crowning organism, man. Mollusks gave man prudence and caution; from the snails man received seriousness and dignity; courage and nobility came from the insects; and the fish brought him the dowry of memory. Oken as a scientist with imagination may have had his merits, but as a philosopher he was unable to raise thought from the level of matter, chemistry, physiology, and cosmogony to a level of creative independence. Mind for Oken was merely a mirror in which God and nature could behold themselves.

In his less poetic moods, Oken came close to being a modern scientist. He held, with Johann Wolfgang von Goethe but independently of him, that the cephalic bones are a repetition of the vertebrae, and he was not far from establishing the cellular structure of living organisms. His publications after *Physiophilosophy-Lehrbuch der Naturgeschichte* and *Allgemeine Naturgeschichte für alle Stände*—reverted to the method of his earlier works: close observation and faithful description. If in Oken's days the natural sciences had to extricate themselves from preconceived mystical notions wrongly called philosophy, they beg today to be understood again in some wider context. The wheel has come full circle, as it must according to Oken's belief in the alternating processes of dynamic expansion and nostalgic reduction to a state of absolute quietness, a belief reminiscent of Friedrich Nietzsche's eternal recurrence of the same. The difference is that for Oken the fascination of this unending spectacle ended where Nietzsche's interest in it began, with the arrival of man and the search for values.

## OLIVI, PETER JOHN

(1248–1298)

Peter John Olivi was one of the most original philosophers of the late thirteenth century. Despite the influence his ideas had in the Middle Ages and in the formation of the early modern thought, his own writings have been studied little. The Council of Vienne (1311–1312) and Pope John XXII (in 1326) condemned some of his views, and after this his works (most of which have survived in the Vatican library) remained mostly in obscurity. His innovative ideas on the philosophy of history, on Aristotelian metaphysics, and especially on human freedom were developed by other philosophers whose texts had a more constant and wider circulation (e.g., John Duns Scotus, William Ockham, and Peter Aureol).

As a twelve-year-old youth in 1261, Olivi entered the Franciscan order and thereby also one of the best educational systems of the time. From 1267 to 1272 he studied in Paris with St. Bonaventure and other famous thinkers. Possibly because of arrogant opinions, he did not receive a doctorate. Nevertheless, he moved on to teach at different Franciscan schools in southern France. After some of his views were condemned in 1283, he withdrew from such duties. He was rehabilitated in 1288 with the help of his former teacher, Cardinal Matthew of Aquasparta, and taught in Florence for two years before returning to Montpellier and later Narbonne, where he stayed until his death on March 14, 1298.

Readers of Olivi's works have often noted that Olivi had a very distinctive writing style. Though his works clearly belong to the genres of medieval academic writ-

ing, they contain a very personal tone that seems to spring from Olivi's intimate experiential touch to philosophical thinking. Olivi clearly had a liking for arguments, and often he refrained from making a determinate solution, although he did not hesitate to take strong stances on some very controversial issues. In general, his habits of thought have a surprisingly modern feel.

## SOCIAL PHILOSOPHY

Olivi's most important innovations in social philosophy are related to the Franciscan ideal of poverty. In his commentary on the Apocalypse and already in the early *Questions on Evangelical Perfection* he formulated a theory of how the Franciscans used the necessities of life without having property in them (*usus pauper*). The theory differs in its detail to what John Duns Scotus and William Ockham presented later, but the crucial philosophical innovations can be found already in Olivi's works.

The idea of subjective right is often connected to early modern political philosophy, but it was developed already in the discussions concerning Franciscan poverty. Olivi's view concerning rights differed from the Aristotelian orthodoxy of the time, for according to him the natural order does not imply rights. Rather, they must be constituted by an act of a free will. This view becomes clear in his theory of property acquisition and of political power. Though Olivi taught for the Franciscans absolute obedience to the superiors, he qualified that the power of the superiors must accord with the purpose of the power. This makes obedience in fact an issue that each person must weigh in his or her own conscience.

Olivi was a theologian, and he wrote many biblical commentaries, often with an apocalyptic message. He also had a historical view of the Church as a changing institution. He has often been understood as claiming that the Antichrist will be a pope.

## HUMAN FREEDOM

The human free will is a topic that receives a large share of what can be called Olivi's main philosophical work, the commentary on Peter of Lombards *Sentences*. Some of Olivi's strongest anti-Aristotelian formulations come from this context. Like apparently all the texts where he explicitly opposes Aristotelian thought, it was written soon after the bishop Etienne Tempier's condemnation of 1277 against 219 more or less Aristotelian theses. Olivi showed no knowledge of the documents of the condemnation themselves, but attacked the Aristotelian positions and apparently also Thomas Aquinas's views quite openly.

According to Olivi's main argument for the freedom of the human will, the ground for human social practices like friendship and gratitude, and even personhood, would collapse if human beings denied the freedom of the will. In Olivi's view, free choice is a real possibility open for all mentally healthy adult humans in their normal condition. Unlike the animals, humans can make choices self-reflexively as their own choices. Olivi discussed the Aristotelian practical syllogism and accepted that humans consider rationally what would be the best course of action given a certain end. But even after this consideration, humans remain free to follow the best course of action or to do something else. Also, the human will is always free to posit a new ultimate end. In Olivi's example, if one hates one's enemy and reasons the best way to harm the person, one remains free not to inflict harm, or even to begin loving the person for his or her own sake. Every human has an almost infinite moral worth based on such freedom, and as a free agent can be treated as a person.

## METAPHYSICS

Olivi's ontological view of the human soul was rejected by the fourteenth-century Church as too dualist. He was understood to have claimed that the soul is not the form of the body, though his point was subtler. According to his metaphysics, all individuals consist of matter and form. However, he distinguished two kinds of matter: corporeal and spiritual. The human soul informs matter of both kinds, but the intellectual soul does not inform any corporeal matter. The human soul is thus a form of the corporeal body only in respect to its sensitive part. Thus, Olivi accepted the Aristotelian metaphysics of form and matter, but thought that the human intellectual soul is a full individual capable of existence and activity even without the body. This tradition of thought was continued by later Franciscans like Scotus and Ockham, although they gave up the idea of spiritual matter and with it also the universality of the form-matter metaphysics, making the intellectual soul an immaterial substance. In this way, Olivi's theory can be seen as direct predecessor of René Descartes's seventeenth-century dualist view.

In the philosophy of mind, Olivi's most important starting point was that the mind is active and the corporeal bodies are passive. He described sensory perception in terms of an intentional relation where the mind comports to the world, thus rejecting the standard Aristotelian model that the corporeal things act upon the

cognitive systems. Olivi also developed a relatively elaborated theory of the self and human self-understanding.

Olivi was a well-educated intellectual working in a way similar to his contemporaries. In most of the topics he treated he refrained from putting forward a full theory. Rather, he aimed at deeper, though incomplete, understanding on the complexity of the problems, and called for recognition of the imperfections of the human reasoning capacities. Olivi did not oppose rational thought, but he saw its limits. Much of his philosophical originality lies in the way he strove for a rationally un-Aristotelian way of thinking at a time in which basic university education was based on Aristotle's texts.

## OMAN, JOHN WOOD (1860–1939)

John Wood Oman, the philosopher of religion and theologian, was a Scotsman from the Orkney Islands. After being educated at Edinburgh and Heidelberg universities and serving for seventeen years in a rural pastorate in

Northumberland, he taught for twenty-eight years at Westminster College, Cambridge, the seminary of the English Presbyterian Church. The chief influence on his developing thought was that of Friedrich Schleiermacher, whose *Reden* Oman translated into English.

In the massive *The Natural and the Supernatural* (1931) Oman portrays the root of religion as man's immediate sense of the Supernatural. The primary religious awareness is not inferential but is, in words that Oman used to describe the similar conception of Schleiermacher, "intuition of reality, an intercourse between a universe, present always in all its meaning, and a spirit, responding with all its understanding" (p. 36). By the Supernatural, Oman does not mean the mysterious, the uncanny, or the miraculous but a larger environment than physical nature, "a special kind of environment, which has its own particular sanctions" (p. 23), through commerce with which man receives his characteristically human degree of independence within his natural environment.

The Supernatural is variously conceived in different types of religion, as is the character of the redemption that the supernatural makes possible. In primitive religion redemption is found by seeking the Supernatural in nature as an animistic force indefinitely many and yet vaguely one. In polytheism the Supernatural consists of individual spirits that rule different parts of nature, and redemption means the managing of nature through its many divine masters. Cosmic pantheism accepts nature in its wholeness as the Supernatural, while the acosmic mysticism of India wholly excludes nature from the Supernatural, as illusion. Religions of the ceremonial-legal type, such as priestly Judaism and Islam, divide the Natural into a sacred realm and a secular realm, cultivating the sacred or religious while leaving the secular outside the sphere of redemption. Finally, for the prophetic monotheism of the Hebrew prophets and of Christianity redemption is reconciliation to the Natural by finding within it the purpose of the one personal Supernatural. To be reconciled to God is to accept all the experiences of one's life as of God's appointing, and one's duties as divine commands. Thus, prophetic religion is intensely practical and this-worldly. Speaking of its Old Testament representatives, Oman says, "What determines their faith is not a theory of the Supernatural, but an attitude towards the Natural, as a sphere in which a victory of deeper meaning than the visible and of more abiding purpose than the fleeting can be won" (p. 448).

Oman emphasizes that knowledge of our environment, whether the natural or the Supernatural, does not

consist in the mere registering of "impacts" but always consists in a perception of "meaning." In order to become aware of our environment, we must rightly interpret its impingements upon us. "Thus knowledge is not knowledge as an effect of an unknown external cause, but is knowledge as we so interpret that our meaning is the actual meaning of our environment" (p. 175). In this interpretative process, the mind exercises a degree of freedom. That degree is established by the individual frontiers of each mind, which are largely controlled from within and across which the meaning of the environment can pass only as a meaning recognized by the individual.

The Supernatural presents itself to the human mind with the quality of the sacred or of absolute worth. To be aware of the Supernatural is to recognize some sacred value that lays an absolute claim upon us, even if in the early stages of man's dealings with the Supernatural this is only an irrational taboo. Religion is "essentially a dealing with an unseen environment of absolute worth, which demands worship" (p. 23). This recognition of and allegiance to the sacred frees man from the dominance of his physical surroundings: "He obtained firm footing to deal with his environment the moment he regarded anything as sacred, because he could say 'No' and was no longer its mere creature" (p. 85).

While man's sense of the Supernatural gives him a fixed point amid the evanescent and a degree of freedom in relation to the natural, he can gain this only by exercise of his own freedom. For "The peculiarity of the supernatural environment is that we cannot enter it except as we see and choose it as our own" (p. 309).

Oman makes no use of the attempted logical coercion of the traditional theistic proofs. He does not try to establish the truth of religion independently of religious experience. Rather he starts from the fact of the religious man's awareness of a larger supernatural environment, in terms of which he lives, and argues that this awareness has no greater need or possibility of philosophical justification than has our awareness of the natural environment. "Among Western thinkers from [René] Descartes onwards, attempts have been made to prove the existence of a material world by other evidence than the way it environs us, but the result was no more reassuring for the reality of the natural world than for the reality of the supernatural" (p. 51).

The same basic standpoint is evident in Oman's contributions to doctrinal theology, especially his *Grace and Personality* (1919). Oman was the first of a series of twentieth-century Christian thinkers—such as Karl Heim, Emil Brunner, H. H. Farmer, and John Macmurray—to

treat as a normative principle of his theology the insight that God is the supremely personal reality, that his dealings with men take place in the personal realm, and that the great central Christian terms—revelation, faith, grace, sin, reconciliation—are to be understood as part of the language of personal relationship and are perverted when construed in nonpersonal ways. Oman taught that religious truths are not infallibilities declared authoritatively from heaven but claim acceptance only because they irresistibly impress our minds as true, and that God seeks our trust only by showing himself to be trustworthy.

There are in Oman's works the elements of a religious philosophy that might well appeal to many today because it is consistently empiricist, being based upon what is given in human experience. However, it is often expressed in Oman's pages on a higher level of generality, and with less detailed precision, than has become customary since he wrote, and there is therefore scope for the development of these same themes in more contemporary terms.

## ONTOLOGICAL ARGUMENT FOR THE EXISTENCE OF GOD

The Ontological Argument for the existence of God was first propounded by Anselm (c. 1033–1109), abbot of Bee and later archbishop of Canterbury, in his *Proslogion* (Chs. 2–4) and in his *Reply* to a contemporary critic.

He begins (*Proslogion* 2) with the concept of God as "something than which nothing greater can be conceived" (*aliquid quo nihil maius cogitari possit*, and other equivalent formulations). It is clear that by "greater" Anselm means "more perfect." (Sometimes he uses *melius*, "better," instead of *maius*, "greater": for instance, *Proslogion* 14 and 18.) Since we have this idea, it follows that "Something than which nothing greater can be conceived" at least exists in our minds (*in intellectu*) as an object of thought. The question is whether it also exists in extramental reality (*in re*). Anselm argues that it must so exist, since otherwise we should be able to conceive of something greater than that than which nothing greater can be conceived—which is absurd. Therefore "Something than which nothing greater can be conceived" must exist in reality.

In *Proslogion* 3 Anselm adds that "Something than which nothing greater can be conceived" exists in the truest and greatest way (*verissime et maxime esse*); for whereas anything else can be conceived not to exist (and thus exists only contingently), "Something than which nothing greater can be conceived" cannot be conceived not to exist (and thus exists necessarily). For that which cannot be conceived not to exist is greater than that which *can* be conceived not to exist, and therefore only

that which cannot be conceived not to exist is adequate to the notion of “Something a greater than which cannot be conceived.”

Anselm explains (in his *Responsio*) that by a being which cannot be conceived not to exist he means one that is eternal in the sense of having no beginning or end and always existing as a whole, that is, not in successive phases. He argues that if such a being can be conceived, it must also exist. For the idea of an eternal being that has either ceased to exist or has not yet come into existence is self-contradictory; the notion of eternal existence excludes both of these possibilities. This latter argument has been revived and developed in our own day (see below).

Many of the earliest manuscripts of the *Proslogion* contain a contemporary criticism (attributed in two of the manuscripts to one Gaunilo of Marmoutier) together with Anselm’s reply. The criticism, summed up in the analogy of the island, is directed against Anselm’s argument as presented in *Proslogion* 2. Gaunilo sets up what he supposes to be a parallel ontological argument for the existence of an island more perfect than any known island: such an island must exist, since otherwise it would be less perfect than any known island, and this would be a contradiction. In reply Anselm develops the reasoning of *Proslogion* 3. His argument cannot be applied to islands or to anything else whose nonexistence is conceivable, for whatever can be conceived not to exist is *eo ipso* less than “Something than which nothing greater can be conceived.” Only from this latter notion can we (according to Anselm) deduce that there must be something corresponding to it in reality.

Perhaps the most valuable feature of Anselm’s argument is its formulation of the Christian concept of God. Augustine (*De Libero Arbitrio* II, 6, 14) had used the definition of God as one “than whom there is nothing superior.” The Ontological Argument could not be based upon this notion, for although it is true by definition that the most perfect being that there is, exists, there is no guarantee that this being is God, in the sense of the proper object of man’s worship. Anselm, however, does not define God as the most perfect being that there is but as a being than whom no more perfect is even conceivable. This represents the final development of the monotheistic conception. God is the most adequate conceivable object of worship; there is no possibility of another reality beyond him to which he is inferior or subordinate and which would thus be an even more worthy recipient of man’s devotion. Thus metaphysical ultimacy and moral ultimacy coincide; one cannot ask of the most

perfect conceivable being, as one can of a first cause, necessary being, unmoved mover, or designer of the world (supposing such to exist) whether men ought to worship him. Here the religious exigencies that move from polytheism through henotheism to ethical monotheism reach their logical terminus. And the credit belongs to Anselm for having first formulated this central core of the ultimate concept of deity.

## DESCARTES’S ARGUMENT

Anselm’s argument was rejected by Thomas Aquinas in favor of the Cosmological Argument and as a consequence was largely neglected during the remainder of the medieval period. It was, however, again brought into prominence by René Descartes in the seventeenth century, and most subsequent discussions have been based upon Descartes’s formulation. Descartes made explicit the presupposition of the argument that existence is an attribute or predicate which, like other predicates, a given  $x$  can meaningfully be said to have or to lack. He claims that just as the idea of a triangle necessarily includes among the defining attributes of a triangle that of having its three internal angles equal to two right angles, so the idea of a supremely perfect being (a different formula from Anselm’s) necessarily includes the attribute of existence. Consequently we can no more think, without contradiction, of a supremely perfect being which lacks existence than of a triangle which lacks three sides.

Descartes considers the following objection: From the fact that in order to be a triangle a figure must have three sides it does not follow that there actually are any triangles; and likewise in the case of the concept of a supremely perfect being. His reply is that whereas the notion, or essence, of a triangle does not include the attribute of existence that of a supremely perfect being does, and that therefore in this special case we are entitled to infer existence from a concept.

## KANT’S CRITICISM

Descartes’s version of the Ontological Argument had some important contemporary critics—for example, Pierre Gassendi and Johannes Caterus (Johan de Kater)—but the classic criticism is that of Immanuel Kant. This moves on two levels. First, leaving the argument’s presuppositions for the moment unchallenged, he grants the analytic connection that Descartes had affirmed between the concept of God and that of existence. In the proposition “A perfect being exists” we cannot without contradiction affirm the subject and reject the predicate. But, he points out, we can without contra-

diction elect not to affirm the subject together with its predicate. We can reject as a whole the complex concept of an existing all-perfect being.

Second, however, Kant rejects the assumption that existence is a real predicate. If it were a real, and not merely a grammatical, predicate, it would be able to form part of the definition of God, and it could then be an analytic truth that God exists. But existential propositions (propositions asserting existence) are always synthetic, always true or false as a matter of fact rather than as a matter of definition. Whether any specified kind of thing exists can be determined only by the tests of experience. The function of “is” or “exists” is not to add to the content of a concept but to posit an object answering to a concept. Thus, the real contains no more than the possible (a hundred real dollars are the same in number as a hundred imagined ones); the difference is that in the one case the concept does and in the other case it does not correspond to something in reality.

**RUSSELL’S ANALYSIS.** Essentially the same point—so far as it affects the Ontological Argument—was made in the twentieth century by Bertrand Russell in his theory of descriptions. This involves an analysis of positive and negative existential propositions, according to which to affirm that  $x$ ’s exist is to affirm that there are objects answering to the description “ $x$ ,” and to deny that  $x$ ’s exist is to deny that there are any such objects. The function of “exists” is thus to assert the instantiation of a given concept. “Cows exist” is not a statement about cows, to the effect that they have the attribute of existing, but about the concept or description “cow,” to the effect that it has instances. If this is so, then the proper theological question is not whether a perfect being, in order to be perfect, must together with its other attributes have the attribute of existence but whether the concept of an (existing) perfect being has an instance. This question cannot be determined a priori, as the Ontological Argument professes to do, by inspection of the concept of God. The nature of thought on the one hand and of the extramental world on the other, and of the difference between them, is such that there can be no valid inference from the thought of a given kind of being to the conclusion that there is in fact a being of that kind. This is the fundamental logical objection to the Ontological Argument.

#### HEGELIAN USE OF THE ARGUMENT

Prior to Kant, the Ontological Argument had been used by Benedict de Spinoza and Gottfried Wilhelm Leibniz. Since Kant, the form of it that he discussed has remained

under the heavy cloud of his criticism. However, G. W. F. Hegel and his school put the argument to a somewhat different use. As Hegel himself expressed it, “In the case of the finite, existence does not correspond to the Notion (*Begriffe*). On the other hand, in the case of the Infinite, which is determined within itself, the reality must correspond to the Notion (*Begriffe*); this is the Idea (*Idee*), the unity of subject and object” (*Vorlesungen über die Philosophie der Religion*, Vol. II, p. 479). Otherwise stated, Being itself, or the Absolute, is the presupposition of all existence and all thought. If finite beings exist, Being exists; when beings think, Being comes to self-consciousness; and in the reasoning of the Ontological Argument, finite thinking is conscious of its own ultimate ground, the reality of which it cannot rationally deny.

The defect of this argument is that its conclusion is either trivial or excessively unclear. It is trivial if the reality of Being is synonymous with the existence of the sum of finite beings; but on the other hand, it is so unclear as to be scarcely interesting if Being is regarded as a metaphysical quantity whose distinction from the sum of finite beings cannot be explicated.

The use of the argument in early twentieth-century French “reflexive” philosophy (see bibliography) has affinities with the Hegelian use.

#### CONTEMPORARY DISCUSSIONS

Discussion of the Ontological Argument has continued throughout the modern period and is perhaps as active today as at any time in the past. For there is perennial fascination in a piece of reasoning that employs such fundamental concepts, operates so subtly with them, and professes to demonstrate so momentous a conclusion.

Among theologians, attempts have been made to maintain the value of the argument, not as a proof of God’s existence but as an exploration of the Christian understanding of God. Thus, Karl Barth regards the proof as an unfolding of the significance of God’s revelation of himself as One whom the believer is prohibited from thinking as less than the highest conceivable reality. On this view Anselm’s argument does not seek to convert the atheist but rather to lead an already formed Christian faith into a deeper understanding of its object. Again, Paul Tillich treated the theistic proofs as expressions of the question of God that is implied in our human finitude. They analyze different aspects of the human situation, showing how it points to God. Thus, the Ontological Argument “shows that an awareness of the infinite is included in man’s awareness of finitude.” This is in effect a Hegelian use of the argument.

HARTSHORNE AND MALCOLM. At the same time, some contemporary philosophers—especially Charles Hartshorne and Norman Malcolm—revived the second argument, or second form of the argument, found in Anselm’s *Proslogion* (3) and in his *Responsio* to Gaunilo. As they have reconstructed it, this argument starts from the premise that the concept of God as eternal, self-existent being is such that the question whether God exists cannot be a contingent question but must be one of logical necessity or impossibility. A being who exists, but of whom it is conceivable that he might not have existed, would be less than God; for only a being whose existence is necessary rather than contingent can be that than which nothing greater is conceivable. But if such a necessary being does not exist, it must be a necessary rather than a contingent fact that he does not exist. Thus God’s existence is either logically necessary or logically impossible. However, it has not been shown to be impossible—that is, the concept of such a being has not been shown to be self-contradictory—and therefore we must conclude that God necessarily exists.

Hartshorne formalizes the argument as follows:

- (1)  $q \rightarrow Nq$  “Anselm’s principle”: perfection could not exist contingently
- (2)  $Nq \vee \sim Nq$  Excluded middle
- (3)  $\sim Nq \rightarrow N\sim Nq$  Form of Becker’s postulate: modal status is always necessary.
- (4)  $Nq \vee N\sim Nq$  Inference from (2, 3)
- (5)  $N\sim Nq \rightarrow N\sim q$  Inference from (1): the necessary falsity of the consequent implies that of the antecedent (modal form of *modus tollens*)
- (6)  $Nq \vee N\sim q$  Inference from (4, 5)
- (7)  $\sim N\sim q$  Intuitive postulate (of conclusion from other theistic arguments): perfection is not impossible
- (8)  $Nq$  Inference from (6, 7)
- (9)  $Nq \rightarrow q$  Modal axiom
- (10)  $q$  Inference from (8, 9)

In this formalization  $q$  stands for  $(\exists x)Px$  (“There is a perfect being” or “Perfection exists”);  $N$  means “analytic or L-true, true by necessity of the meanings of the terms employed”; and  $\rightarrow$  signifies strict implication.

CRITICISM. The above argument seems to depend upon a confusion of two different concepts of necessary being. The distinction involved is important for the elucidation of the idea of God and represents one of the points at

which study of the Ontological Argument can be fruitful even though the argument itself fails. The two concepts are those of logical necessity and ontological or factual necessity. In modern philosophy, logical necessity is a concept that applies only to propositions; a proposition is logically necessary if it is true in virtue of the meanings of the terms composing it. And it is a basic empiricist principle that existential propositions cannot be logically necessary. In other words, whether or not a given kind of entity exists is a question of experiential fact and not of the rules of language. On this view, the notion of a logically necessary being is inadmissible, for it would mean that the existential proposition “God exists” is logically true or true by definition. Anselm’s principle, however, which is used as the first premise of Hartshorne’s argument, was not that God is a logically necessary being (in this modern sense) but that God is an ontologically or factually necessary being. For, as noted above, Anselm was explicit that by a being whose nonexistence is inconceivable he meant a being who exists without beginning or end and always as a whole. (This is virtually the scholastic notion of *aseity*, from *a se esse*, “self-existence,” that is, eternal and independent existence.) Interpreting “For God to exist is for him to exist necessarily” (prop. 1) in this way, we can validly infer from it that God’s existence is ontologically either necessary or impossible (prop. 6). For if an eternal being exists, he cannot, compatibly with the concept of him as eternal, cease to exist: thus his existence is necessary. And if such a being does not exist, he cannot, compatibly with the concept of him as eternal, come to exist: thus his existence is impossible.

However, it does not follow from this that an eternal being in fact exists but only that if such a being exists, his existence is ontologically necessary, and that if no such being exists, it is impossible for one to exist. Hartshorne’s argument can advance from proposition 6 to its conclusion only by assuming at this point that it has been established that the existence of God is (not, or not only, ontologically but) *logically* necessary or impossible. He can then rule out the latter alternative (prop. 7), and conclude that God necessarily exists (prop. 8) and hence that he exists (prop. 10). Thus, in propositions 1–6 “necessary” means “ontologically necessary”; in propositions 6–10 it means “logically necessary”; and proposition 6 itself is the point at which the confusion occurs. (The same illicit shift between the notions of ontological and logical necessity can be observed in Malcolm’s version of the argument.)

The conclusion to be drawn is that the Ontological Argument, considered as an attempted logical demon-

stration of the existence of God, fails. In both of the forms that are found in Anselm, and which are still matters of discussion today, the flaw in the argument is that while it establishes that the concept of God involves the idea of God's existence, and indeed of God's necessary (in the sense of eternal) existence, it cannot take the further step of establishing that this concept of an eternally existent being is exemplified in reality.

### Bibliography

For the general history of the Ontological Argument, see M.

Esser, *Der ontologische Gottesbeweis und seine Geschichte* (Bonn, 1905); J. Kopper, *Reflexion und Raisonement im ontologischen Gottesbeweis* (Cologne, 1962); and C. C. J. Webb, "Anselm's Ontological Argument for the Existence of God," in *PAS* 3 (2) (1896): 25–43. On its alleged origin in Plato, see J. Moreau, "L'argument ontologique" dans le *Phédon*," in *Revue philosophique de la France et de l'étranger* 137 (1947): 320–343, and J. Prescott Johnson, "The Ontological Argument in Plato," in *Personalist* (1963): 24–34. The main passage in Augustine which may have influenced Anselm (in relation to the Ontological Argument) is *De Libero Arbitrio*, Book II, translated by J. H. S. Burleigh as "On Free Will," in *Augustine: Earlier Writings*, edited by J. H. S. Burleigh (London and Philadelphia, 1953).

Anselm's version of the argument occurs in *Proslogion*, Chs. 2–4, and in his exchange with Gaunilo. The Latin text is in Dom F. S. Schmitt's critical edition of the *Opera Omnia*, Vol. I (Edinburgh, 1945), pp. 101–104 and 125–139. The best English translations of the *Proslogion* as a whole are those of Eugene R. Fairweather in *A Scholastic Miscellany: Anselm to Ockham* (Philadelphia: Westminster Press, 1956); A. C. Pegis in *The Wisdom of Catholicism* (New York: Random House, 1949); M. J. Charlesworth, *St. Anselm's "Proslogion" with "A Reply on Behalf of the Fool" by Gaunilo and "The Author's Reply to Gaunilo,"* with an introduction and philosophical commentary by Charlesworth (Oxford: Clarendon Press, 1965); and A. C. McGill in *The Many Faced Argument*, edited by John Hick and A. C. McGill (New York: Macmillan, 1967), where McGill, as well as translating *Proslogion* 2–4, has translated Anselm's exchange with Gaunilo, arranging the texts so as to present Anselm's replies in relation to the specific criticisms to which they refer. The translations by S. N. Deane in *St. Anselm: Basic Writings*, 2nd ed. (La Salle, IL, 1962) include, in addition to the *Proslogion*, Gaunilo's *On Behalf of the Fool* and Anselm's *Reply*. Anselm's dialogue *De Veritate* is also relevant; there is an excellent English translation by Richard McKeon in *Selections from Medieval Philosophers*, Vol. I (New York: Scribners, 1929).

On the interpretation of Anselm, the most important older writings are Charles Filliatre, *La philosophie de saint Anselme* (Paris, 1920); Alexandre Koyré, *L'idée de Dieu dans la philosophie de S. Anselme* (Paris, 1923); Karl Barth, *Fides Quaerens Intellectum: Anselms Beweis der Existenz Gottes in Zusammenhang seines theologischen Programms* (Zürich, 1930; 2nd ed., 1958), translated by Ian Robertson as *Anselm:*

*Fides Quaerens Intellectum* (Richmond, VA: John Knox Press, 1960); A. Stolz, "Zur Theologie Anselms im *Proslogion*," in *Catholica* (1933): 1–21, translated by A. C. McGill in *The Many Faced Argument* (see above); Étienne Gilson, "Sens et nature de l'argument de saint Anselme," in *Archives d'histoire doctrinale et littéraire du moyen âge* 9 (1934): 5–51; and Adolf Kolping, *Anselms Proslogion—Beweis der Existenz Gottes im Zusammenhang seines Spekultativen Programms: Fides Quaerens Intellectum* (Bonn, 1939).

For more recent historical studies, see *Spicilegium Beccense*, Proceedings of the Congrès International du IX<sup>e</sup> Centenaire de l'arrivée d'Anselme au Bec (Paris: J. Vrin, 1959).

For the view that there are two different arguments in *Proslogion*, see Charles Hartshorne, introduction to *St. Anselm: Basic Writings* (see above); "What Did Anselm Discover?," in *Union Theological Seminary Quarterly Review* (1962): 213–222; and *The Logic of Perfection* (La Salle, IL: Open Court, 1962), Ch. 2. See also Norman Malcolm, "Anselm's Ontological Arguments," in *Philosophical Review* 69 (1 (1960): 41–62, reprinted in Malcolm's *Knowledge and Certainty* (Englewood Cliffs, NJ: Prentice Hall, 1963). St. Thomas's criticism of the argument occurs in his *Summa Contra Gentiles* I, 10 and 11, and *Summa Theologiae* I, 2, 1.

For the argument after Anselm, see O. Paschen, *Der ontologische Gottesbeweis in der Scholastik* (Aachen, 1903); John Duns Scotus, *De Primo Principio*, translated by E. Roche (St. Bonaventure, NY: Franciscan Institute, 1949); I. Hislop, "St. Thomas and the Ontological Argument," in *Contemplations Presented to the Dominican Tertiaries of Glasgow* (London, 1949), pp. 32–38; P. L. M. Puech, "Duns Scotus et l'argument de saint Anselme," in *Nos Cahiers* (1937): 183–199; A. Runze, *Der ontologische Gottesbeweis, kritische Darstellung seiner Geschichte seit Anselm bis auf die Gegenwart* (Halle, 1882); O. Herrlin, *The Ontological Proof in Thomistic and Kantian Interpretation* (Uppsala: Lundquistska bokhandeln, 1950); Robert Miller, "The Ontological Argument in St. Anselm and Descartes," in *Modern Schoolman* (1954–1955): 341–349, and (1955–1956): 31–38; and Alexandre Koyré, *Essai sur l'idée de Dieu et les preuves de son existence chez Descartes* (Paris: E. Leroux, 1922).

Descartes's own version of the argument occurs in his *Meditations* (V, but see also III). Spinoza uses the argument in his *Ethics*, Part I, Props. 7–11. Leibniz's version is found in his *New Essays concerning Human Understanding*, Book IV, Ch. 10 and Appendix X, and in his *Monadology*, Secs. 44–45. Kant's criticism of the argument (in its Cartesian form) occurs in his *Critique of Pure Reason*, Transcendental Dialectic, Book II, Ch. iii, Sec. 4.

The Hegelian use of the argument is to be found in Hegel's *Vorlesungen über die Philosophie der Religion*, edited by P. Marheineke (Berlin, 1832), Appendix: "Beweise für das Dasein Gottes," Vol. II, pp. 466–483, translated by E. B. Speirs and J. B. Sanderson as *Lectures on the Philosophy of Religion* (London: K. Paul, Trench, Trubner, 1895), Vol. III, pp. 347–367; and in *Vorlesungen über die Geschichte der Philosophie*, edited by K. L. Michelet (Berlin, 1836), Vol. III, pp. 164–169, translated by E. S. Haldane and F. H. Simson as *Lectures on the History of Philosophy* (London, 1896), Vol. III, pp. 62–67; Edward Caird, "Anselm's Argument for the Being of God," in *Journal of Theological Studies* 1 (1899):

23–39; E. E. Harris, *Revelation through Reason* (New Haven, CT: Yale University Press, 1958); Paul Tillich, “The Two Types of Philosophy of Religion,” in his *Theology of Culture* (New York: Oxford University Press, 1959); and R. G. Collingwood, *An Essay on Philosophical Method* (Oxford: Clarendon Press, 1933). Collingwood’s use of the argument was criticized by Gilbert Ryle in “Mr. Collingwood and the Ontological Argument,” in *Mind*, n.s., 44 (174) (1935): 137–151. There is a reply to Ryle by E. E. Harris in *Mind*, n.s., 45 (180) (1936): 474–481, and a rejoinder by Ryle in *Mind*, n.s., 46 (181) (1937): 53–57. This discussion is reprinted in *The Many Faced Argument* (see above).

For the argument in recent French “reflexive” philosophy, see M. Blondel, *L’action* (Paris, 1893 and 1950), *L’être et les êtres* (Paris, 1935), and *La pensée* (Paris, 1934 and 1948); J. Paliard, *Intuition et réflexion* (Paris, 1925); and A. Forest, “L’argument de saint Anselme dans la philosophie réflexive,” in *Spicilegium Beccense*, pp. 273–294, translated by A. C. McGill in *The Many Faced Argument* (see above).

Some important contemporary philosophical discussions are C. D. Broad, “Arguments for the Existence of God,” in *Journal of Theological Studies* 40 (157) (January 1939); J. N. Findlay, “Can God’s Existence Be Disproved?,” in *Mind*, n.s., 57 (226) (1948): 176–183, reprinted in *New Essays in Philosophical Theology* edited by A. G. N. Flew and Alasdair MacIntyre (London, 1958); Nicholas Rescher, “The Ontological Proof Revisited,” in *Australasian Journal of Philosophy* 37 (2) (1959): 138–148; William P. ## ONTOLOGICAL ARGUMENT FOR THE EXISTENCE OF GOD [ADDENDUM]

Work on the ontological argument since 1970 has been mainly concerned with the so-called modal ontological argument for the existence of a perfect being.

### THE CONCEPT OF A PERFECT BEING

Descartes defined a (supremely) perfect being as a being that possesses all perfections. But if a property F is a perfection, it would seem that a being that is F but might not have been F falls short of perfection. Hence a better definition of a perfect being would be as follows: a being that has all perfections and could not have lacked any perfection—a perfect being is a being that has all perfections *essentially* (has all perfections in every possible world in which it exists).

### THE LOGICAL VALIDITY OF THE MODAL ONTOLOGICAL ARGUMENT

The argument has two premises: (1) A perfect being is possible (exists in some possible world); (2) Necessary existence (existence in every possible world) is a perfection.

Plantinga (1974) has shown that the existence of a perfect being is logically deducible from these two premises. (The proof presupposes the strongest system of modal reasoning, S5. [For more discussion on S5, see the entry “Modal Logic.”] Here we assume without argument that a modal argument that is valid in no weaker system than S5 is not objectionable on that ground. For a contrary view, see Salmon [1989].) Suppose a perfect being exists in some possible world *w* [premise (1)]. This being is necessarily existent in *w* [premise (2)], and must therefore exist in every possible world, for if there were some world in which it did not exist, it would not be *necessarily* existent in *w*. This being has in *w* all perfections [premise (1)]. It must therefore have all perfections in every possible world in which it exists (that is, in every possible world), for if there were some world in which it existed but failed to have all perfections, it would not have all perfections *essentially* in *w*. This being therefore exists in the actual world and in every other possible world, and has all perfections in the actual world and in every other possible world. It is therefore necessarily existent in the actual world (if it were not necessarily existent in the actual world, there would be some world in which it did

not exist) and has all perfections essentially in the actual world (if it did not have all perfections essentially in the actual world, there would be some world in which it did not have all perfections). That is to say— there exists a perfect being.

### THE PREMISES OF THE ARGUMENT

The conclusion of the argument follows (in S5) from its two premises. But are the two premises true? Critics of the argument are typically willing to grant premise (2) but see no reason to accept premise (1).

Plantinga has conceded that there seems to be no way to demonstrate the possibility of a perfect being. (And he recognizes that one may not simply presume that a concept is possible in the absence of a demonstration of its impossibility. So to presume can in fact lead one into contradiction, because there are pairs of concepts, neither of which can be *shown* to be impossible and at least one of which must *be* impossible. If it cannot be shown that a perfect being is impossible, the concept of a perfect being and the concept of a being who knows that there is no perfect being are such a pair.) Plantinga contends, however, that it is not irrational to believe that a perfect being is possible (just as it is not irrational to believe that a private language is possible or that free will is possible: a philosopher who believes in the possibility of these things is not *ipso facto* irrational). He further contends that it is not irrational to believe the demonstrated logical consequences of things that are not rational to believe, and that it is therefore not irrational to believe that there is a perfect being. He concludes that although the modal ontological argument is not a proof that a perfect being exists, its logical validity in effect constitutes a proof that it is not irrational to believe that a perfect being exists. This conclusion has been disputed by van Inwagen (1977).

### GÖDEL'S POSSIBILITY PROOF

The most important recent attempt to prove that a perfect being is possible occurs in a brief note (unpublished in his lifetime) by Kurt Gödel (“Ontological Proof” in Fefferman, ed. [1995]). The argument (slightly modified) is this: Necessary existence and the “essentialization” of every other perfection (having that perfection essentially) are all positive properties, and any set of positive properties is consistent or possible because the set of all positive properties is possible. This last statement is a consequence of two “axioms”: (1) The set of all positive properties is closed under entailment; and (2) If a property is positive, its negation is not positive. (A set of properties entails the property F if it is impossible for something to

have all the properties in that set and to lack F. A set of properties is closed under entailment if it contains every property entailed by any of its subsets.)

**PROOF.** Suppose that the set of all positive properties is impossible or inconsistent. We show that this entails a contradiction. Since an impossible set of properties entails any property, the only set of properties that is both impossible and closed under entailment is the set of all properties: the set of all positive properties is the set of all properties. But the negation of a positive property is not a positive property: the set of all positive properties is not the set of all properties.

Unfortunately, Gödel’s attempts to explain the idea of a positive property are compressed and cryptic. They leave the reader with no reason to suppose that there is a set of properties such that (1) necessary existence and the essentialization of every other perfection are members of that set, (2) that set is closed under entailment, and (3) if a property is member of that set, its negation is not. The modal ontological argument therefore remains inconclusive.

## ONTOLOGY

Ontology is the most general science or study of Being, Existence, or Reality. An informal use of the term signifies what, in general terms, a philosopher considers the world to contain. Thus it is said that Descartes proposed a dual-

ist ontology, or that there were no gods in d'Holbach's ontology. But in its more formal meaning, ontology is the aspect of metaphysics aiming to characterize Reality by identifying all its essential categories and setting forth the relations among them.

### BEING QUA BEING

Existence, as the most comprehensive category of all, should embrace members with the least in common. Nevertheless, Western philosophy long sought some substantive common content present in anything just in virtue of its existence. The history of these attempts to identify the common character of being qua being is not encouraging.

In *The Sophist*, Plato's Eleatic Stranger proposes that a role in the world's causal network is the necessary and sufficient condition for existence, that "Power is the mark of Being." This idea has had some currency in the twentieth century, particularly in the work of David Lewis (1986) and D. M. Armstrong (1978, 1989, 1997). This *Eleatic principle* is an attractive test for reality in the natural world, for whatever is real in nature should be able to make a difference. It might be necessary to weaken the requirement and admit a passive space-time that provides the arena within which the active beings exert themselves. Even so, the Eleatic principle seems to be at best a contingent aspect of the world because there seems to be no impossibility involved in the idea of a completely inert being. It also begs the question against abstract entities such as numbers, or geometric points, or sets, which, if they exist, lie outside the causal nexus.

For Samuel Alexander (1920), to be is to be the exclusive occupant of a volume of space-time. This rules out not only abstract entities, but even a field theory of the natural world, for force fields occupy regions of space-time, yet do not exclude one another.

J. M. E. McTaggart (1921–1927) argued that the mark of being is to stand in a determining correspondence with all of one's infinite parts. A determining correspondence ensures that from a sufficient description of anything, a sufficient description of any of its parts can be derived. This requirement implies that space, the natural world, and most of the contents of minds are unreal. From this consequence the conclusion to be drawn is that McTaggart's proposed mark of being is excessively demanding.

The problem of a substantive content for being qua being is reflected in the idiosyncratic behavior of the verb "to exist." Consider singular negatives: "Aristotle does not

speak Spanish" is true because the predicate "does not speak Spanish" applies to the item referred to by the subject term. But "Pegasus does not exist" cannot be true because its predicate applies to the item referred to by the subject term. If the subject term refers to anything, that item exists, which would make the whole statement false.

Kant famously declared that existence is not a property, and this view has become widely accepted. The modern logic that descends from Gottlob Frege and the *Principia Mathematica* (1910–1913) of Alfred North Whitehead and Bertrand Russell replaces all expressions using "exists" with others using "There are." Thus, "Lions exist" becomes "There are lions," while "Dragons do not exist" becomes "There are no dragons."

In technical terms, this process replaces any existence claim with one using a quantifier ranging over a domain (the world), so that to exist becomes a matter not of possessing the special property *existence*, but of possessing some other, ordinary, properties. The determination to restate all claims to existence or nonexistence with "There are ..." and "There are no ..." is expressed in W. V. Quine's dictum: "To be is to be the value of a variable."

If existence is not a property, it cannot be a perfection. This undercuts those versions of the ontological argument for the existence of God that rely on existence being among the perfections. A recent response has been to argue that, even if existence is not a property, necessary existence is (Plantinga 1974, 1975; van Inwagen 1993).

### REALITY AND ACTUALITY

Is existence all there is, or should we recognize categories even broader than that of Being? In Plato, and even earlier, is to be found the distinction between Reality (What is) and Appearance (What is not nothing, yet only seems to Be). Aristotle distinguishes the fully existent (Being), from that which is still in formation (Becoming). These distinctions are perhaps best seen as advocating different grades of reality within the one category of Being.

Aristotle also distinguishes the fully Real (Act) from that which may be (Potency). This distinction is the forerunner of a strong strand in ontology that recognizes possible worlds in addition to the actual world, the one we inhabit. In the Neoplatonists, and again in Alexius Meinong, the realm of the existent is augmented by that of the subsistent, which encompasses what does not exist although it might have done so, such as golden mountains.

A full-scale ontology of this kind, in which the realm of Essence is wider than that of Existence, was presented

by James K. Feibleman in 1951. In the work of Richard Sylvan (1980), this is extended even further. In Sylvan's system, the individual variables range over not only the actual and the possible, but the impossible as well.

**POSSIBLE WORLDS.** Gottfried Wilhelm Leibniz was the first to make systematic use of the idea that all the possibilities can be regarded as forming worlds—each a complete internally consistent realm that may combine some elements matching the actual world with others in which it differs. The actual world is one of the possible worlds, distinguished from all others by the fact that none of its elements is merely possible. If one is able to refer to possible worlds, it is easy to define *necessary beings*, otherwise so difficult to characterize, as those present in all possible worlds (see below).

**MODAL REALISM.** Possible worlds make available explanations of causal powers, of counterfactual conditionals, of unexercised dispositions, and of real uninstantiated properties. Such advantages led David Lewis (1986) to embrace modal realism, which affirms the literal reality of all possible worlds.

Other philosophers, while appreciating these advantages, have balked at the apparently infinite expansion of the ontology that this requires. This has led to accounts of ersatz possible worlds: Rudolf Carnap and others have proposed that a possible world is a maximally consistent set of sentences. Armstrong and others have developed Wittgenstein's idea that a possible world is a nonactual recombination of the elements of this world. Peter Lopston (2001) advances a reductive realism, which expands the kind of property assigned in the actual world to include might-have-had features. The success of these approaches is subject to continuing controversy.

**MANY WORLDS IN QUANTUM THEORY.** The notion that the world we live in is not the only one has also been canvassed recently in the interpretation of some otherwise baffling paradoxes in quantum physics. On these accounts the world is not a single unified entity, but one subject to continual bifurcation, a process that generates an ever-increasing number of worlds. Many-world views of this kind are in an important way different from modal realism: all these quantum worlds are supposed to be actual but mutually inaccessible.

## THE CATEGORIES OF BEING

The principal task of ontology is to furnish an inventory of the categories, the most general divisions of Reality. The most important of these are:

**SUBSTANCES.** An individual or particular substance is an object, a thing in its own right. Common everyday things, such as bricks and bedsteads, provide a model for the category of substance. Substances are required to have several basic features, although it is not clear that these features are compatible with one another.

*Particularity and individuality.* A substance is both a particular and an individual; not just some duck or other, but this very duck. An object is of the *kind* it is (a duck) on account of its properties. But if these properties are universals, shared by many particulars, they cannot themselves confer particularity. Some philosophers, most notoriously Locke, proposed a constituent of substances that would perform this role, a *substratum* that would confer both particularity and individuality. A substratum would be a bare particular, an item inherently particular and individual, yet without any other feature. It is difficult to see how such bare particulars could be distinguished from one another, but if bare particulars are all exactly alike, how could any one of them individualize its own substance? More generally, bare particulars conflict with Aristotle's dictum that the minimum of being, the least thing there can be, is a "this-such," a particular having a property.

Another proposal is that substances are individuated by their location. Locations—space-time points and regions—are themselves unique particulars; if they can have primitive particularity, that raises the question why other particulars require a substratum or other particularizer. There are other difficulties with location also: Location will not individuate force fields or other physical entities that do not monopolize their space. It fails also for any items of an immaterial kind.

Either individuality—and hence particularity—are primitive, or there are bare particulars, or each substance has a special property, known as *haecceity* or *thisness*, which can bestow particularity and individuality on its bearer. For a discussion see chapter fifteen of John Heil's *From an Ontological Point of View* (2003).

*Indivisibility.* Individual substances must be distinguished from compounds, so a single substance must be indivisible, in the sense that it has no parts that are themselves substances. This disqualifies ordinary things as individual substances. This simplicity requirement is much emphasized in Aquinas's doctrine of God. It leads

in Leibniz to the monadology, and in Roger Joseph Boscovich to the doctrine of material points.

**Persistence.** Substances are distinguished from their properties by a capacity to persist, that is, to retain their identity through at least some changes. A fire truck can change in color, yet remain the fire truck it always has been. The ordinary compound substances of everyday life have some persistence, but cannot survive all changes. A fire truck dismantled and scrapped is no longer a fire truck. Complete persistence belongs only to the fundamental substances.

**Independence.** Any substance could be the only thing in existence. If this independence is interpreted causally, no ordinary object is a substance, for they are all brought into being, and hence depend for their existence on their causes. Space-time and its fields might qualify, yet even these depend, in theistic systems, on the creative activity of God. So in Thomism, God is the substance par excellence, but the natural world includes created substances, dependent on God, but otherwise existent in their own right. Spinoza, insisting on absolute independence, concluded that there can be only one substance, the all-embracing totality, God-or-Nature.

If one takes the independence of substances in a logical, rather than a causal sense, a substance is anything that, in principle, could stand alone. This was David Hume's requirement, and anything meeting it is a Humean substance. For compounds, the requirement is that the thing, including all its parts, could exist alone. This requirement is much less rigorous than causal independence and requires no persistence.

**No-substance theories.** There have been attempts to dispense with substances. Russell has proposed that an ordinary concrete object is no more than a bundle of all its properties. There is always an issue over what it is that binds the bundle. Moreover, as the properties are universals, this theory implies that no two things can be exactly alike.

In Donald Williams's version of the bundle theory (1966), the properties are particular instances or tropes (see below). This avoids any problem with the possibility of there being two exactly resembling objects, but it requires that all members of the bundle be "compresent"—all at the same place in space-time. There are difficulties in treating a space-time location as just one further trope in the bundle, but if it is given special treatment it becomes a substantializing substratum.

Russell also advocated an event ontology as a no-substance view. He used "event" for the occurrence of a

property at a place and a time; such events are not happenings, but states of affairs (see below). He proposed that ordinary substances, and their more fundamental parts, are sequences of clusters of such events.

The basic elements in these ontologies may not be simple or indivisible, and they lack persistence. Nevertheless, these states of affairs or events are Humean substances. Indeed, unless there is nothing at all, something must be a Humean substance, and in that sense, any *no substance* theory must fail.

**PROPERTIES AND RELATIONS.** Properties are the intrinsic features or characteristics of things, which belong to them considered singly. Relations, involving two or more terms, are the ways in which things stand to one another. In many respects, properties and relations can be treated together.

**Properties as universals.** Properties are usually thought of as universals that can characterize indefinitely many instances. There is but one Eiffel Tower, but the tower's height, weight, and iron constitution are features it has in common with many other things. The Problem of Universals is the problem of explaining how any one real entity could possibly exist, fully and completely, in many different instances. This problem has attracted three different proposed solutions: nominalism, conceptualism, and realism. Nominalism and conceptualism both deny that properties are genuinely universal. According to nominalism, the only element common to all iron things is that they can all be described using the predicate "iron," or all are members of the class *iron things*, or all resemble some typical iron objects. According to conceptualism, the universal element consists in an impulse of our minds to group several things together. These reductive theories have had adherents since the time of Plato and were particularly prevalent among the British Empiricists and their descendents. Nominalism and conceptualism were explicitly challenged by Russell in *Problems of Philosophy* (1912). The most thorough case against such views is presented in D. M. Armstrong, *Universals and Scientific Realism* (1978).

Realism regarding universals is at least as old as Plato. His theory of Forms presents a thoroughgoing realism that accords to genuine properties both a real existence, in a realm of their own, and a status superior to any this-worldly instantiations of them there may be. The Forms exist *ante rem*—that is, whether or not they are instantiated. The traditional account of Aristotle ascribes to him a modified realism, according to which properties are real, and universal, but can exist only *in rebus*, as the

properties of concrete instances. Here one encounters again his view that the least that is “apt for being” is a this-such, a union of particular with universal.

Realism has always faced two principal objections. First, that it is uneconomical, especially in its Platonist form. The question of economy is a current issue in the philosophy of science, as it at least appears that our best physical and chemical theories involve uninstantiated properties. The second objection is that it can provide no coherent account of the link between a property and the substance that bears it, the *inherence* relation. Inherence cannot be a normal relation, for then it is just one further universal standing in need of an inherence link to its terms, the substance and the original property. But if it is not a relation in the ordinary sense, what is it? The problem with inherence lends support to versions of realism in which properties are particulars.

**Properties as particulars.** Even if the property *iron* is universal, the particular case of *being iron* that occurs in the Eiffel Tower belongs to the tower alone and is as particular as the tower itself. Trope theory, as developed first by Donald Williams, treats the instance not as a dependent entity arising from the instantiation of a universal, but as a Humean substance in its own right.

When this approach is coupled with a bundle or compresence account of ordinary many-featured substances, the problem of any inherence relation disappears. There is a further significant economy, for there is no need for a separate category of substance. These possibilities are explored further in Keith Campbell’s book *Abstract Particulars* (1990).

**Relations.** When Russell reanimated the realism debate he accorded to relations a status fully equal to that of inherent properties. Indeed, it was his reflections on the role of relations in the foundations of mathematics and of logic that led him to his realism. Armstrong’s realism takes the same form.

There is, nevertheless, a long tradition that accords primacy to the intrinsic properties. Aristotle held that relations are “the least of the things that are”; Hobbes and others held that the existence of relations depends on a mental act of comparison; and Leibniz’s view was that every relation has its foundation in an intrinsic feature of one or both of its terms. This reductive program is expounded in Campbell (1990).

Relations do seem to be dependent in the sense that they must have substances as their terms, and these substances must have intrinsic properties. So unless there are intrinsic properties there can be no relations, but not vice

versa. Bundle theories of ordinary things concern only the intrinsic properties. To include relations in the bundles leads to problems over where to assign the relations, and this in turn induces a tendency towards a monism such as Francis Herbert Bradley’s, in which ordinary substances are absorbed into a single all-embracing totality.

**Powers.** Some properties, such as *square*, seem to belong to how an object is. Others, such as *being a solvent*, seem to refer to what an object can do. This is the distinction between categorical and dispositional properties. One line of thought takes up the Eleatic principle, and identifies real properties as those that confer on their bearer a disposition to act or to be acted upon. Such dispositions are *powers*; a metaphysics of powers is set forth in George Molnar’s *Powers* (2003) and in Brian Ellis’s *Scientific Essentialism* (2001).

COMPLEXES. *Substance* and *property* are basic categories. In combination, they can provide a richer ontology.

**States of affairs.** A basic state of affairs consists in a particular having a property, or in two (or more) particulars standing in a relation. A single property inhering in a single particular is a minimal “this-such.” Wittgenstein’s *Tractatus Logico-Philosophicus* (1921) presented an ontology in which the world is composed of minimal relational states of affairs: those that actually obtain being facts, those merely possible being the remaining states of affairs. These themes—that the basic categories only ever occur in combination, and that these combinations constitute reality—are taken up in D. M. Armstrong’s *A World of States of Affairs* (1997).

**Events and processes.** A state of affairs is static. To account for the dynamic aspects of the world requires an account of change. This can be done by using sequences of states of affairs: stability consists in successive states of affairs closely resembling one another, whereas change consists in the states of affairs at one time being replaced by others systematically different. An event is a single change, involving a pair of states of affairs; a process is a more complex series of events.

Whitehead, in *Process and Reality* (1929) accorded priority to the dynamic; all apparently persisting substances are actually slowly evolving processes. The status of space-time is still controversial. It may be a Humean substance; however, some accounts of matter assign it a place as a process, a sequence of complex, changing relations between particulars.

## ABSTRACT OBJECTS

Human thought, particularly in mathematics and logic, seems to involve entities that have no apparent place in the natural spatiotemporal world, and no causal role. To admit such items challenges the principle of economy, yet successful reductions are difficult to accomplish.

**NUMBERS AND SETS.** Because all numbers can be represented in set theory, there is no need to admit both sets and numbers. Russell had proposed to eliminate sets in favor of propositional functions, but this proved impossible for more than a fragment of mathematics (Goodman and Quine 1947, Quine 1969). Because the variables of set theory have sets as their values, and to be is to be the value of a variable, we are committed to their reality—this is Platonism about sets and numbers. The most important work in attempting to avoid Platonism is Hartry Field's (1980, 1989).

**GEOMETRICAL OBJECTS.** Unlike anything in the natural world, the objects of geometry—Euclidian cubes, for example—are thought of as perfect, changeless, timeless, and without any physical causal powers. Moreover, there are geometries, and corresponding geometrical objects, with many more dimensions than this world has. A geometrical space can be divided and subdivided into an infinity of different shapes of different sizes. Platonism in geometry thus involves an infinite expansion in ontology.

One approach to this issue is to consider geometrical objects as abstracted objects, that is, objects taken from a context. On this view, every cube is just a particular spatial fragment of space-time and every triangle a fragment of one of space-time's spatial surfaces. One problem with this is that not all shapes will be available. If our space-time is nowhere perfectly Euclidean, there will be no real Euclidean cubes. We can treat these nonexistent objects as imaginary variations on the actually existing ones, and geometries that quantify over such things, as not literally true.

**LOGIC.** The philosophy of logic makes reference to propositions, operators, functions, and inferences. These are abstract entities, related to reasoning in much the same way as numbers are related to counting and measuring. The problems and prospects of a reductive treatment of them are also parallel.

## NECESSARY BEINGS

Ordinary things are usually held to exist contingently; that is, they do exist, but might not have. Had our world's

initial conditions or laws of nature been different, there would have been a different group of contingent beings. But some things seem to be immune from the vagaries of cause and chance; being outside the causal net, they cannot be brought into being and cannot be destroyed. These are "necessary beings." If Platonism is correct regarding any of the abstract objects, these will be necessary beings, even, paradoxically, the null class.

For Aristotle, anything that exists through an infinite time is necessary because he held that over infinite time every possibility would at some point be actualized. For Plotinus, any divine being would be outside time, and as such could not change, could not cease to exist, and thus would be a necessary being. For Aquinas, God's necessity derives from his simplicity: God's essence and his existence are identical; in this way he is a kind of being that must exist. For Spinoza, every genuine substance is *causa sui*, containing within itself the sufficient explanation for its own being, and thus it can guarantee its own existence under all possible conditions.

Duns Scotus, then Descartes, linked necessary being with logic: A necessary being is one, the denial of whose existence would be self-contradictory. "Real"—i.e., existing—"beans do not exist" is a self-contradiction, but only trivially because existence has been inserted into the definition of the subject. This does not make beans necessary beings. If existence is not inserted into the subject term's definition, it is doubtful whether any denial of existence would be a self-contradiction. The best discussion of necessary being is in Alvin Plantinga (1974, 1975).

## ONTOLOGY, HISTORY OF

The term *ontologia* was coined by scholastic writers in the seventeenth century. Rudolf Goclenius, who mentioned the word in 1636, may have been the first user, but the term was such a natural Latin coinage and began to appear so regularly that disputes about priority are pointless. Some writers, such as Abraham Calovius, used it interchangeably with *metaphysica*; others used it as the name of a subdivision of metaphysics. Johannes Clauberg (1622–1665), a Cartesian, coined instead the term *ontosophia*. By the time of Jean-Baptiste Duhamel (1624–1706), ontology was clearly distinguished from natural theology. The other subdivisions of metaphysics

are cosmology and psychology, from which ontology is also distinguished. Thus, *ontologia* as a philosophical term of art was already in existence when it was finally canonized by Christian Wolff (1679–1754) and Alexander Gottlieb Baumgarten (1714–1762).

### WOLFF

For the authors mentioned above, the subject matter of ontology was being as such. "Being" was understood univocally, as having one single sense. Ontology can therefore claim as ancestors John Duns Scotus and William of Ockham, rather than Thomas Aquinas. In the case of Wolff himself, Gottfried Wilhelm Leibniz was a stronger influence than scholasticism, but in his *Philosophia Prima Sive Ontologia*, Wolff refers explicitly to Francisco Suárez. According to Wolff, the method of ontology is deductive. The fundamental principle applying to all that is, is the principle of noncontradiction, which holds that it is a property of being itself that no being can both have and not have a given characteristic at one and the same time. From this, Wolff believed, follows the principle of sufficient reason, namely, that in all cases there must be some sufficient reason to explain why any being exists rather than does not exist. The universe is a collection of beings each of which has an essence that the intellect is capable of grasping as a clear and distinct idea. The principle of sufficient reason is invoked to explain why some essences have had existence conferred on them and others have not. The truths about beings that are deduced from indubitable first principles are all necessary truths. Thus, ontology has nothing to do with the contingent order of the world.

The influence of late scholasticism (or of what Étienne Gilson calls "essentialism") on rationalist metaphysics was repaid in kind, for the division of metaphysics into ontology, cosmology, and psychology found its way back into scholastic manuals, where it has persisted until very recently. Along with this division, there persisted the view that being constitutes an independent subject matter over and above the subject matter of the special sciences. The persistence of this view is perhaps to be explained by cultural rather than by intellectual factors. In the eighteenth and nineteenth centuries scholasticism was isolated in seminaries until Pope Leo XIII guided Thomism back into intellectual debate. Only in this way was scholasticism able to avoid the nemesis (in the form of Immanuel Kant) that awaited rationalist metaphysics.

## KANT

In the written announcement of lectures given from 1765 to 1766, Kant treated ontology as a subdivision of metaphysics that included rational psychology but was distinguished, in his case, from empirical psychology, cosmology, and what he called the “science of God and the world”: “Then in *ontology* I discuss the more general properties of things, the difference between spiritual and material beings.” But when Kant came to write the *Critique of Pure Reason*, he settled matters with ontology once and for all. The two key passages are the discussion of the second antinomy of pure reason and the refutation of the ontological argument. Wolff had argued a priori that the world is composed of simple substances, themselves neither perceived nor possessing extension or shape, and each of them different, and that physical objects are composite, collections of such substances. In the second antinomy the thesis is that “every composite substance in the world consists of simple parts, and nothing exists anywhere that is not either simple or composed of simple parts”; and the proof that Kant presented is effectively Wolffian. But he presented an equally powerful proof for the antithesis, namely, that “no composite thing in the world consists of simple parts, and there exists nothing simple anywhere.” In exposing the shared fallacy of both proofs, Kant made it impossible ever again to accept ontology as a deductive body of necessary truths that is akin to geometry in form but has being as its subject matter. His analysis of existence in his refutation of the Ontological Proof is a counterpart to this.

Since Kant, the most influential use of the term *ontology* outside scholastic manuals has been in the writings of Martin Heidegger and W. V. Quine. Both have been greeted by scholastic writers as engaged in essentially the same enterprise as they themselves, Father D. A. Drennen taking this view of Heidegger, and Father I. M. Bocheński of Quine.

## HEIDEGGER

In regard to Heidegger’s ontology, Father Drennen is perhaps partly correct. Heidegger wished to explain what character being must have if human consciousness is to be what it is. He began by quarreling with the principle of sufficient reason in its Leibniz-Wolff form. This, he said, is an inadequate starting point for ontology because the question “Why is there something rather than nothing?” presupposes that we already know what being and nothing are. Heidegger treated “Being” and “Nothing” as the names of contrasted and opposed powers whose existence is presupposed in all our judgments. In negative

judgments, for example, to speak of what is not the case is implicitly to refer to Nothing. Heidegger’s ontology, however, was not deductive or even systematic in form. It proceeds at times by the exegesis of poetry or of the more aphoristic fragments of the pre-Socratic philosophers and is thus very different from scholastic ontology.

## QUINE

In the case of Quine, the name *ontology* has been in fact given to a quite different set of preoccupations. Quine has been concerned with two closely allied questions: To the existence of what kind of thing does belief in a given theory commit us? And what are the relations between intensional and extensional logic? His answer to the first question is that to be is to be the value of a variable: We have to admit the existence of that range of possible entities for which names could occur as values for those variables without which we could not state our beliefs. His answer to the second question is that intensional logics and extensional logics involve the admission not merely of different but of incompatible types of entity. “Both sorts of entity can be accommodated in the same logic only with the help of restrictions such as Church’s, which serve to keep them from mixing, and this is very nearly a matter of two separate logics with a universe for each” (*From a Logical Point of View*, p. 157).

It is clear that Quine’s logical preoccupations are in fact relevant to Wolff and the scholastics only in that an understanding of Quine’s inquiries would preclude one from trying to construct a deductive ontology in the mode of Suárez or Wolff.

## OPERATIONALISM

“Operationalism” is a program that aims at linking all scientific concepts to experimental procedures and at cleansing science of operationally undefinable terms, which it regards as being devoid of empirical meaning. Scientists adopted the operational approach to their subject before the principles of operationalism were made articulate. Operationalist theory was erected not on the basis of independent philosophical considerations but upon what was already implicit in the working practice of scientists. P. W. Bridgman, the Nobel Prize-winning physicist who is commonly regarded as the founder of operationalism, emphasized this point when he said, “it must be remembered that the operational point of view suggested itself from the observation of physicists in action” (“The Present State of Operationalism,” in *The Validation of Scientific Theories*, edited by Philipp Frank, Boston, 1956, p. 79).

A fairly nontechnical illustration of the kinds of development in science in which one can discern an implicit operational point of view is the manner in which physicists treated the concept of physical length. In the nineteenth century it was discovered that Euclid’s geometry was not logically unique and that other geometries based on different axioms were not necessarily internally inconsistent. The question was raised about the nature of physical space. Do lines and figures in physical space obey the theorems of Euclid?

At first sight this seems a perfectly sensible question to which there must be a definite answer. Even today some amount of sophistication is required to ask whether we have a clear notion of what could be done to find out whether space has a certain set of properties. Unless we can give an affirmative answer to this question, we should not take it for granted either that space has or that it lacks certain geometrical properties. By the end of the nineteenth century, however, scientists had accepted the view that if we cannot devise operations that would disclose whether or not space was Euclidean, then no definite geometrical properties can be assigned to space at all.

It is clear that in order to determine the geometrical properties of physical figures we must be able to compare distances. If we are unable to say whether distance  $AB$  is greater, smaller, or equal to distance  $CD$ , where  $AB$  and  $CD$  do not lie alongside one another, then we cannot even begin to investigate the geometrical nature of space. We take it for granted, however, that in order to compare distances we need a rigid measuring rod, that is, a rod which can be relied upon not to change in length while being transported from place to place. But the question whether the lengths of transported rods are preserved cannot be settled unless we presuppose the possession of some other standard of measurement to which these rods could be compared, but it is agreed that the sole standard of length is a rigid rod. Thus, there are no rigid rods except by fiat, and distances consequently cannot be spoken of as being objectively equal or unequal to one another, and the nature of space cannot uniquely be determined. From an operational point of view, therefore, space has no intrinsic metric, and it is a matter of convention whether we say space obeys this or that set of geometrical axioms.

#### THE OPERATIONALIST THESIS

Although the idea that physical entities, processes, and properties do not have an independent existence transcending the operations through which we may ascertain their presence or absence played an influential role in the thoughts of scientists before the 1920s, it was not until

1927 that Bridgman, in his celebrated *Logic of Modern Physics*, stated operationalism as an explicit program, made an articulate case for it, and undertook extensive operational analyses of the foundations of numerous physical concepts.

Bridgman soon had to retreat from his first extreme statement of operationalism. He had maintained that every scientifically meaningful concept must be capable of full definition in terms of performable physical operations and that a scientific concept is nothing more than the set of operations entering into its definition. The untenability of this view was quickly noticed—for example, by L. J. Russell, who in 1928 pointed out that in science one often speaks of certain operations as being better than others and that one cannot do so except in relation to something existing over and above them. Moreover, useful physical concepts do not as a rule lend themselves to an exhaustive definition. Any connection they have with instrumental operations may be loose and indirect: statements in which the concepts appear may, in the context of a set of other statements (but not on their own), entail statements describing physical operations. Consequently, in his later writings Bridgman freely permitted “paper and pencil operations,” by which he meant mathematical and logical maneuverings with the aid of which no more is required of a concept than that it should be “indirectly making connection with instrumental operations.”

It is not hard to see how by taking as one’s model a physical concept like the length of a body one arrives at Bridgman’s original position. But suppose someone objected that the stepping-off procedure carried out by measuring rods is not the only way to compute the length of a body. We may, for example, define it equally well in terms of the result obtained by timing the body’s oscillation when it is allowed to swing as a pendulum and by using the well-known equation connecting the length with the period of oscillation. Length, after all, may enter into all sorts of relationships with other physical parameters, some of which we perhaps have not yet discovered.

To this objection it would have been replied that there is a fundamental difference between the ways in which the two sets of operations are related to the concept of length. The length of a body is “synonymous” with the number of times one can lay a rigid standard of length alongside it; when we speak of the length of a body we mean no more nor less than the number obtained through the stepping-off procedure performed by a measuring stick. When, however, we time a pendulum and then make the appropriate calculations, we merely

measure length indirectly, via the relationship of length to other physical parameters. The second approach does not define length but rather inserts the already defined concept of length into an equation accepted as representing a genuine physical relationship.

It is much more difficult to maintain this distinction in the case of such concepts as temperature. One way to give an operational definition of temperature is in terms of measurements made by a mercury thermometer; another way is in terms of measurements made by a platinum-wire thermometer. The first way relies on the theory that the length of bodies varies with temperature; the second, on the theory that electrical resistance varies with temperature. It is easy to see that the concept of temperature is no more than partially interpreted through each of these, and doubtless other, sets of operations to which it is linked by relevant theories. This same position has become generally adopted toward all physical concepts.

We may thus distinguish three stages in scientific theorizing. In the first, preoperational stage, the universe was thought to contain many things and processes that transcend our theories about them and the operations and manipulations through which we may catch a glimpse of them in the mirror of experience. In the second, “naïve” operational stage, the other extreme was taken, and all the terms of science were regarded as no more than abbreviations for our experimental results. In the third stage, scientific terms are still not regarded as standing for things and processes having an independent existence of their own, but the meaning of scientific terms is given by a more or less elaborate system of empirical theories in which the terms appear, together with the observations on which the theories embodying the terms are grounded. It is recognized that the concepts of science can never be fully grasped as long as the theories which contain them are open to further development.

The three stages in scientific theorizing are perhaps more dramatically accentuated in psychology than in the physical sciences. Until the early twentieth century the prevailing view was that psychology is a unique discipline dealing with a very special class of events, processes, and entities: the constituents of the realm of consciousness, to which no one but the experiencing individual has access. Although this realm is out of the reach of objective public operations and experimentations, many theorists regarded it as real—indeed, as more real than anything else—and believed that it should be studied by a unique method, introspection.

The radical behaviorism that replaced this mentalistic psychology is a form of naive operationalism and is based on the tenet that psychology is the study not of mental events, processes, or entities but of behavior. Psychologists were not to be concerned with publicly unobservable phenomena, and introspection—at best a private method of inquiry—was completely outlawed.

Today, in the third stage, sensations, images, and thought processes are no longer regarded as beyond the reach of scientists. They are studied through overt behavior, just as in physics nonobservables are studied indirectly through what is observed. The situation in psychology is very much like that in physics. That which is conceptualized need not be completely defined in terms of operations, although it must make contact with the world of public experience.

### OPERATIONALISM AND VERIFICATIONISM

Operationalism is a movement within the philosophy of science. It is instructive to study its development in conjunction with a parallel movement in general philosophy: logical positivism, or logical empiricism. Central to logical positivism is the principle of verifiability, according to which any statement that is not a tautology must be verifiable or else is meaningless. It was thought that through the extensive employment of this principle it would be possible to show that many of the traditional unsolved problems of philosophy could be dealt with by demonstrating that they are simply meaningless. It was soon found, however, that the principle as originally conceived would get rid not only of troublesome problems but also of much useful discourse. The principle consequently underwent a number of revisions in rapid succession.

Rudolf Carnap's paper "The Methodological Character of Theoretical Concepts" embodies all the significant revisions. Carnap clearly exhibits a desire not to prescribe what should be regarded as meaningful from some meta-scientific or philosophical point of view but rather to describe what is commonly and usefully regarded as empirically meaningful. As mentioned earlier, operationalism from the beginning sought to explicate an approach already implied in the work of practicing scientists. Whereas verificationists previously tried to embrace all human discourse, they now, like the operationalists, confine their attempts to designing a criterion that will faithfully reflect what is meaningful discourse within empirical science. It has been realized that meanings are contextual and that one is therefore not to inquire whether a given sentence or word has or lacks meaning by

itself but rather whether it has or lacks meaning relative to a specified system of theoretical, observational, and mixed statements.

A third important change, also clearly enunciated for the first time in Carnap's paper, is the departure from the original policy of inquiring directly into the meaningfulness of whole sentences. Instead, like the operationalists, Carnap deals with individual terms. He distinguishes between logical and empirical terms and also between observational-empirical and theoretical-empirical terms. Theoretical-empirical terms are not admitted into empirical discourse unless they can be shown to be anchored in observation. They need not be completely defined observationally, but a sentence must be constructible that, in conjunction with other sentences, logically implies that certain observations take place. A theoretical-empirical term is then regarded as having passed the test of empirical meaningfulness. The empirical significance of a sentence is now made dependent on the possession of significance by the terms it contains: Any syntactically well-formed sentence in which every term is significant (that is, is either a logical, an observational-empirical, or a theoretical-empirical term which has passed the test of empirical meaningfulness) is itself significant in the context of the group of sentences forming our system of science.

The only issue that divides operationalism from logical positivism is that operationalism seems to associate meaningfulness with linkability to experimental activities, whereas the principle of verifiability is satisfied if an expression is anchored to mere passive observation. However, this particular requirement of operationalism can safely be discarded, leading to a complete merger of these two contemporary offshoots of empiricism.

### CRITICISM

Even in its present form, operationalism has not gone uncriticized. The chief complaint is that in the course of weakening its demands in order to accommodate highly theoretical but useful terms that would otherwise have been excluded from science, it has become so watered down as to lose all significance. Operationalism, according to its critics, says nothing we did not know all along. Even in a discipline less precise than physics—for example, in the social sciences—and in a period when standards of rigor had not reached their present stringency, if anyone had advanced a theory employing concepts which had no bearing whatsoever on observables, his theory would have been rejected. It is admitted that operationalism as originally conceived did have practical impact;

there are concrete results, especially in psychology, whose production was motivated by the naive operationalistic distrust of anything remote from experience—for example, results obtained in the investigation of subaudible speech. Psychologists came to this area of inquiry chiefly through their search for objective, nonmentalistic alternatives to thought processes. But now, with the liberalization of the criterion for empirical significance—so the complaint goes—when all that is stipulated is that no term qualifies for membership in the vocabulary of science unless it is in some way connected to the universe of operations, observables, and experience, the principle of operationalism is merely platitudinous.

In attempting to reply to this, we must not forget that the scope of operationalism is not confined to the weeding out from scientific vocabulary of terms devoid of empirical significance. Once we have adopted the operational point of view, we have formed in our own minds a particular image of the nature of scientific concepts, which colors our expectations and influences in all sorts of ways our practical approach and methodology.

The world of experience and observation was at one time looked upon as containing mere dim reflections of the world that is conceptualized in physics and whose real existence was on a transcendental plane ultimately beyond our reach. Admittedly, that which is without any observable manifestations whatsoever, which, so to speak, casts no shadow onto the plane of experience, would never have been considered as being of any use to science. Nevertheless, it is not unimportant whether we regard our operations as capturing at most the shadows of the furniture of the universe or as dealing with the furniture itself. Objects totally dissimilar in substance and even in size and shape may under particular circumstances cast identical shadows. Therefore, from the similarity of shadows one cannot infer a similarity in the corresponding objects or even that these objects always cast similar shadows. Similarly, so long as we regard as mere reflections the observations to which physical concepts are linked, the finding of resemblances between some of them will not give rise to the expectation that they resemble in all particulars. On adopting the operational point of view, on the other hand, we think we are looking not at reflected shadows but at the very entities and processes that are conceptualized in science, and our attitude changes accordingly.

To give an illustrative example, the properties of gravitational force and the laws governing it had been exhaustively investigated in the seventeenth and eighteenth centuries. Electromagnetic forces were comparative newcomers in science. Were they to be expected to

behave like mechanical forces? There are excellent grounds for saying no: the sources from which electromagnetic forces arise, the systems with which they are associated, and the means by which they are generated are totally different from those involving mechanical forces. However, operationalists tend to see in the product of mass and acceleration (that is, in the measure of force) the very substance of force, although others might see in it no more than force's most immediately apparent reflection. Indeed, as soon as it was observed that electromagnetic phenomena are accompanied by the forcelike effect of accelerating masses, it was taken for granted that they are fully governed by all the laws of Newtonian mechanics, even though the latter was developed to deal with an effect of totally different origin.

An important aim of operationalism besides the practical one is philosophical. For philosophical purposes, it is far from sufficient to state generally that every empirically significant term must somehow be linked to observables—one must precisely articulate the nature of this link and construct in full detail a criterion of meaningfulness. Therefore, many concepts in the various sciences were analyzed in detail in order to clarify the exact role instrumental operations and observations play in the definition or explication of them. Believers in the ultimate formalizability of empirical significance hoped that the results would be generalized and expressible in a philosophically satisfactory way. It is, however, by no means clear that such work has been entirely successful. In fact, some philosophers are of the opinion that such efforts are altogether in vain and that although when faced with any individual term we are able quite easily to judge whether it is empirically significant, we shall never succeed in explicating the general criterion distinguishing meaningful from meaningless utterances.

There is thus unquestionably much scope for operationally clarifying basic concepts. The skeptic might try to show that just as there are no formal criteria by which to distinguish a fertile from a sterile theory, so there is no criterion by which to distinguish the empirically significant from the meaningless. One who believes that the contact empirical concepts must make with operations or experience in general can be precisely formalized might try to show that if our demands are modest enough and we do not expect the criterion of empirical significance to provide guidance for future scientific research, there are in principle no obstacles in the way of such formalization. Their next step would be to execute this formalization in a manner that would stand up to all criticism.

## ORESME, NICOLE

(c. 1320–1382)

Nicole (Nicholas) Oresme was a Master of Arts and Theology at the University of Paris, royal counsellor, translator into French of Aristotle's works, and bishop of Lisieux. Of humble origin, he was admitted in the College of Navarre in 1348, where he became Grand Master in 1356, after having obtained the license of Master of Theology. He was born in Normandy probably no later than 1320, in a village near Caen (Allemagne, today Fleury-sur-Orne). His ecclesiastical career depended on his university teaching as well as on his connections with the royal court. The first benefice was granted by Pope Clement VI in 1342, in reply to a supplication list of the University of Paris in order to obtain support for master and students (Oresme is recorded as master); the election to the bishop's chair of Lisieux in 1377 was Charles V's (1364–1380) reward for Oresme's translations of Aristotle's works, made by royal request. His main ecclesiastical functions were in Normandy, a region with high strategic

importance during the wars between France and England. He was appointed canon of Rouen Cathedral in 1362, and two years later he was chosen as dean. He reduced, but did not cut short, his connections with the university and with the royal court in Paris. In 1370 he disputed at the university a quodlibetal question; in 1375 he was charged, together with Simon Fréron and Richard Barbe, to find out if Marsilius of Padua's *Defensor Pacis* had been translated into French. Oresme translated and commented upon Aristotle's *Ethics* (*Le livre de ethiques d'Aristote*), *Politics* (*Les politiques*), *Economics* (*Le livre de yconomique d'Aristote*), and *De Caelo* (*Le livre du ciel et du monde*). He wrote also in French an elementary treatise on astronomy (*Livre de l'éspere*), and a treatise against the astrologers (*Livre de divinacions*). He died on July 11, 1382, in Lisieux.

His commentaries on Aristotle's physical writings (*Physics*, *On the heaven*, *On coming to be and passing away*, *On the soul*, and *Methereologics*), as well as his treatises (*Ad pauca respicientes*, *De proportionibus proportionum*, *De commensurabilitate motuum caeli*, *De configurationibus qualitatum*) bear witness to his prevailing scientific interests, and above all to his conviction of the importance of using mathematics in dealing with physical problems (qualitative changes, motion, duration). In his commentaries, Oresme discusses the main philosophical issues debated at the University of Paris after the dissemination of William of Ockham's works and the condemnations of John of Mirecourt (1347) and Nicolas of Autrécourt (1348).

### THE SUBJECT OF HUMAN KNOWLEDGE AND THE CERTITUDE OF PHYSICAL SCIENCE

Oresme offered rather original solutions to two very important problems traditionally discussed in the opening questions of medieval commentaries on the physical writings of Aristotle: the subject of human knowledge, and the degree of certitude of physical science. Concerning the first, Oresme rejects the reductionist view, usually attributed to William Ockham, according to which human knowledge concerns exclusively the conclusion of a syllogism, as well as the claim that it deals with singular objects. He believes that human knowledge concerns properly what can be expressed through a proposition (*complexe significabile*) rather than through a single term.

On the certitude of physical science, Oresme shares the common position, strongly attacked by Nicolas d'Autrécourt, according to which it does not need the highest degree of certitude typical of mathematics and metaphysics.

The convenience of having recourse to mathematics in physical inquiries, however, permits one in some way to extend to physics this highest degree of certitude.

The possibility of applying mathematics to physics is warranted either by widening the field of physical inquiries to a hypothetical, non contradictory state of things, or by assuming the geometrical model of perspective in explaining physical actions like heating. The extension of imaginary cases to physical inquiries actually increases the potential of physics, whose limits coincide with the law of noncontradiction. In his *Quaestiones de spera* (q. 2), Oresme explicitly upholds the use of mathematical fictions (*imaginationes*), like points and lines, in physics, stating that in astronomy (and in the so called *scientiae mediae*) truth can not be reached without the aid of mathematics and geometry (he quotes for this solution the authority of Aristotle's *De coelo*).

The plurality of worlds and the daily rotation of the earth on its axis while the heavens remain stationary—two of the topics to which Oresme owes his celebrity among historians of science since Pierre Duhem—are such hypothetical cases. Oresme amply discussed the possibility of such hypotheses, concluding always in favor of the traditional view. The relativity of motion is a central issue in the astronomical hypothesis of the earth's daily rotation; Oresme's position concerning the nature of motion is an original attempt to maintain an absolute notion.

### MATHEMATICS AND PHYSICS

One of Oresme's major contributions to natural philosophy is his solution concerning the "intension and remission of qualities"—that is the variation of intensity of qualities, motion, velocity, and every kind of successive thing. *De configurationibus qualitatum* opens by confirming the utility of making recourse to mathematics in physical inquiries: Intensities of qualities can be easily measured by representing them through geometrical figures, whose one line represents the subject where the quality is distributed (*extensio*), on which there are perpendicularly erected lines representing the intensities of the quality (*intensio*). The line connecting the higher points of the intensities (*linea summitatis*) can immediately inform us about the type of change (uniform, uniformly difform, difform).

Oresme avails himself of this method of graphing the varying of intensities of qualities and motions in order to explain the diversity of actions of physical agents, and also of human passions, occult virtues, aesthetic problems, and magical operations. In his effort to reduce uniformly difform types of variation to uniform ones, Oresme proposes

a geometrical demonstration of the so called mean-speed theorem (the distances traversed by two moving objects, the former moving uniformly/differently and the latter uniformly with the mean speed of the former, is the same). Galileo used an analogous geometric demonstration for freely falling bodies in his *Discorsi e dimostrazioni matematiche intorno a due nuove scienze*.

Oresme adhered to Thomas Bradwardine's solution, according to which velocity depends on a proportional change of the force as well as of the resistance. In order to double velocity, it is not enough to double force or to halve resistance, but the square of the proportion between force and resistance must also be obtained.

In *De proportionibus proportionum* III, prop.10, Oresme resorts to mathematics to argue for the high degree of probability of the incommensurability of any two unknown ratios: "because if many unknown ratios are proposed it is most probable that any one would be incommensurable to any other" (E. Grant's translation, p. 247). He proposes a similar argument in *De commensurabilitate* to support the incommensurability of heavenly circular motions in order to invalidate astrological predictions based on planetary conjunctions, which would be unpredictable.

## MODI RERUM

Oresme's *Physics* commentary contains an original philosophical doctrine concerning the nature of motion, place, and time, and more generally the ontology of natural things. Evidently dissatisfied by the two opposing solutions—the reductionist, inspired by Ockham, according to which motion is nothing different than the moving object; and the realist, according to which motion is a quality inherent to the moving object—Oresme proposed to consider motion, as well as place, time, and other continuous natural things, as complex objects or events rather than as simple qualities and properties. To do that he availed himself also of semantical tools like the meaning of the proposition (*complexe significabile*). Oresme was convinced that his solution was able to avoid some ontological problems in natural philosophy: He explicitly quotes intension and remission of qualitative forms, with qualities considered as *modi* of the substance and not accidental properties inhering to the substance.

In addition to the pioneer studies of P. Duhem, *Le système du monde*, 10 vols. (Paris: Herman, 1913–1959, Vols. IV, VII, VIII, and IX) and A. Maier, *Studien zur Naturphilosophie der Spätscholastik*, 5 vols. (Rome: Edizioni di Storia e Letteratura, 1949–1958), where Oresme's role in the history of science was highly appreciated, and to the volume of O. Pedersen's *Nicole Oresme og hans natufileosofiske System* (Copenhagen: Munksgaard, 1956, with a French summary), much new material can be found in the introductions to the editions of his works (above all in Clagett's introduction to *De configurationibus*). Two conferences have been dedicated to Oresme: *Nicolas Oresme. Tradition et innovation chez un intellectuel du XIV<sup>e</sup> siècle*, P. Souffrin, A. Ph. Segonds, eds. (Padova-Paris: Programma e Editori-Les Belles Lettres, 1988, with a very important contribution of H. Hugonnard-Roche, *Modalités et argumentation chez Nicole Oresme*) and *Around de Nicole Oresme*, J. Quillet ed. (Paris: Vrin, 1990). The n. 3 (2000) of the review *Oriens-Occidens. Sciences, mathématiques et philosophie de l'Antiquité à l'Âge classique* is partly dedicated to Nicole Oresme's *Physics*. New material is also in the proceedings of the Parma conference: *Quia inter doctores est magna dissensio. Les débats de philosophie naturelle à Paris au XIV<sup>e</sup> siècle*, S. Caroti, J. Celeyrette eds. (Florence: Olschki, 2004).

Stefano Caroti (2005)

## ORGANISMIC BIOLOGY

The term *organismalism* was coined by the zoologist W. E. Ritter in 1919 to describe the theory that, in his words, “the organism in its totality is as essential to an explanation of its elements as its elements are to an explanation of the organism.” Subsequent writers have largely replaced *organismal* with the more euphonious *organismic* as a title for this theory, for the many variations on its main theme, and for some subordinate but supporting doctrines concerning the teleological and historical character of organisms.

Ritter regards Aristotle as the founder and most distinguished exponent of the organismic theory. But Aristotle is also claimed as the father of vitalism, a view that organismic biologists in general reject. In fact, there is considerable affinity between the two schools. They both agree that the methods of the physical sciences are applicable to the study of organisms but insist that these methods cannot tell the whole story; they agree that the “form” of the single whole organism is in some sense a factor in

embryological development, animal behavior, reproduction, and physiology; and they both insist on the propriety of a teleological point of view. On all of these points, Aristotle not only agrees but presents, in his own terminology, careful and persuasive arguments in their favor. But organismic biology and vitalism differ in one fundamental respect: The latter holds (and the former denies) that the characteristic features of organic activity—all of which fall under the heading of “regulation”—are caused by the presence in the organism of a nonphysical but substantial entity. There are different interpretations of Aristotle (which we cannot examine here) on the question of whether he believes there are such vital entities. In this writer's view, Aristotle is clearly a vitalist.

The affinity between vitalism and organismic biology is more than an accident. In the history of biology it is difficult to disentangle vitalistic and organismic strands, since both schools are concerned with the same sorts of problems and speak the same sort of language. The distinction between them was drawn clearly only in the twentieth century. Organismic biology may be described as an attempt to achieve the aims of the murky organismic-vitalistic tradition, without appeal to vital entities.

The writings of contemporary organismic biologists present a number of difficulties for a philosophical commentator. The position of organismic biology is usually stated in a vocabulary that plays little or no theoretical role in the working language of biology. For example, “whole,” “unity,” “integrity,” “part,” “form,” “principle,” “understanding,” and “significance” all occur frequently in their works. Now any biologist will use these terms occasionally in the course of his professional writing, just because they are perfectly good words in the English language. But they are not technical expressions; they are not, in ordinary usage, laden with biological theory; and they are trouble-free only when employed in contexts that make clear their function as items in the common language. The organismic biologist, however, makes them bear a heavy burden in the description of the nature of living organisms. And many, but by no means all, organismic biologists also assign a great deal of weight to some rather mysterious formulas. Here are a few: “The whole acts as a causal unit ... on its own parts” (W. E. Agar); “The living body and its physiological environment form an organic whole, the parts of which cannot be understood in separation from one another” (J. S. Haldane); “No part of any organism can be rightly interpreted except as part of an individual organism” (W. E. Ritter). And here are a few more that are characteristic but not direct quotations: “The organic whole is greater than the

sum of its parts”; “Knowledge of the goal of an animal’s behavior is necessary for understanding its significance”; “Biological theory should be autonomous, with concepts and laws of its own.” These formulas may be termed “mysterious” because, according to their most natural interpretations (as will be argued), they are all the barest of truisms.

Two additional points should be mentioned. Organismic biologists have employed some of the more obscure technical conceptions of speculative philosophy, such as “formal cause,” “emergence,” “hormic,” “telic,” and so on. And since their writings are a minority report on biological phenomena, organismic biologists are often polemical, engaging in denunciations of other biologists—“mechanists,” “elementalists,” and “reductionists”—whose positions they leave just as obscure as their own. For all of these reasons, an account of the organismic position that aims at answering the questions likely to be raised by philosophers of science involves elements of reconstruction and interpretation. Thus, a fuller description of the position and an interpretation designed to do justice both to the letter and spirit of the organismic tradition follows.

## THE POSITION OF ORGANISMIC BIOLOGY

All organismic biologists hold that there is a gulf between organic and inorganic phenomena in one or more of the following respects.

**ORGANIC UNITY.** Organic systems are so organized that the activities of the whole cannot be understood as the sum of the activities of the parts. All members of the school agree on this point. As the term *organismic* implies, the most important example of such wholes is the single organism, but there are others, such as cells, organs, colonies, and some populations.

J. H. Woodger, whose *Biological Principles* is the most careful and extensive exposition of organismic biology, explains the conception of organic unity in the following way. Consider a system *W* that is *totally* composed of physicochemical parts—elementary particles, for example. The activities of these parts are described by the laws of physics. These particles may be the sole constituents of other systems (for example, molecules) which also totally compose *W* and which exhibit, in addition to activities described by the laws of physics, other activities described by the laws of chemistry. Molecules may similarly be the sole constituents of other systems, which are in turn the constituents ..., up to the whole system *W*. In Woodger’s terminology, *W* exhibits a series of “levels of organiza-

tion.” The parts of *W* belong to a particular level, its physical parts to the physical level, its chemical parts to the chemical level, and so on. System *W* constitutes a perfect “hierarchy” of parts from levels 0 (zero) to *n* (a finite number), if 0-level parts are the sole constituents of all 1-level parts, and if every part at each level *i* (any given level) except the 0-level is totally composed of parts at level *i*–1.

Woodger points out that organisms are not perfect hierarchies, since some parts of the organism at an *i*–level may have parts at the *i*–2 level, while the *i*–2 parts are *not* organized into *i*–1 parts (for instance, blood has cellular *and* chemical but noncellular parts). Nevertheless, he contends, organisms approximate to a hierarchical organization. If we ignore deviations from the perfect hierarchy, we may let *W* represent a whole organism, and we may say that its 0-level parts are physical parts. Now this analysis permits us to say that the organism is composed totally of physical parts. Perhaps some philosophical materialists would be content with this thesis; at any rate, if it is true, it rules out vitalism. But it is false that the organism is composed *only* of physical parts, for there are parts at higher levels of organization. It is Woodger’s contention, and a general thesis of organismic biology, that the laws which determine the behavior of the parts at a given level of organization are silent about some aspects of the behavior of the parts at the higher levels. To use an extreme example, the laws of quantum physics have nothing to say on the question of why honeybees kill their drones. According to Woodger, it is necessary to study the relations between the parts at *each* level of organization. In order to understand the behavior of cells during morphogenesis, for example, we must develop a theory of cell relations and not be content, for example, with only a theory of the relations between molecules.

**DETERMINING FEATURES OF THE WHOLE.** The parts of organic wholes not only exhibit patterns of behavior in virtue of their relations to other parts at the same level of organization, but in addition, *some* of the features of the parts at a given level are determined by the pattern of organization at *higher* (and, of course, at lower) levels of organization. This is the general form of the special thesis that the properties of the whole determine the properties of the part; and it seems to have the methodological consequence that a theory of the elements at a given level could not be complete without a theory of the elements at the higher levels. Woodger puts the point this way: the parts of organisms must be studied *in situ*, for we cannot learn how they would behave *in situ* by studying them in isolation.

**TELEOLOGICAL BEHAVIOR OF ORGANISMS.** One kind of activity, which is a consequence of organization at a level higher than that of the organism's physical parts, is directive or teleological behavior. Directiveness is an aspect of organisms that is shown in their physiology, in the behavior of individual animals, and in the social systems of some animals; and an account of directiveness is not only legitimate but necessary. E. S. Russell argues that since directiveness (processes aimed at the production and maintenance of organic unities) is a fact, then a physiological process, or piece of animal behavior, cannot be understood until we understand its function or its goal.

### INTERPRETATION OF ORGANISMIC BIOLOGY

It was remarked above that if we give the slogans of organismic biology their most direct interpretations, they are nothing more than truisms. Consider, for example, the statement that the whole (if it is an organic unity) is more than the sum of its parts. This looks like a simple warning against the fallacy of composition: we are being warned, for example, that from the premise "No part of a bird can fly" we cannot infer "No whole bird can fly." No weighty volume is required to convince us that a whole may have numberless properties that its parts lack. Of course, there are other possible interpretations of the slogan. It might be taken to mean, especially in the form "The behavior of the whole is more than the sum of the behavior of its parts," that no description of the behavior of the parts could be a description of the behavior of the whole. So far from being a truism, this is obviously false. Finally, it might be taken to mean something like the following. Employing an analysis of Ernest Nagel, we might say that the behavior  $B$  of a system  $S$  is more than the sum of the behavior  $b_1, b_2, \dots, b_n$  of its parts  $s_1, s_2, \dots, s_n$ , with respect to an antecedently specified theory  $T$ , if (1)  $B$  is an instance of a law  $L$ ; (2)  $L$  is not part of  $T$ ; (3) the laws in  $T$  describe  $s_1, s_2, \dots, s_n$  in such a way that they explain  $b_1, b_2, \dots, b_n$ ; and (4)  $L$  is not deducible from a description of  $s_1, s_2, \dots, s_n$  together with laws in  $T$ . An important point to notice here is that  $B$  can be identical with events  $b_1, b_2, \dots, b_n$ , and yet the law of which  $B$  is an instance is not derivable from the laws of which  $b_1, b_2, \dots, b_n$  are instances.

This account makes the "more than" relation relative to a body of theory. Relative to existing physical and chemical theories, it is true (but perhaps not a truism) that much organic activity is more than the sum of the physical and chemical activities of its parts. The thesis that there are cases of higher-level behavior that will

remain greater than the sum of the behavior of its physical parts, for all possible physical theories, is the doctrine of emergence, which many organismic biologists believe to be true. But it is essential to note two points—first, that the thesis is dubious and unproved, and second, that one can be an organismic biologist without believing it (L. von Bertalanffy is an example).

Let us now look at two more formulas of the organismic biologists. Woodger holds that an organic part, such as a cell, has properties in the organism that it does not have in isolation from the organism. This, too, is a truism: An excised eye lacks the property of contributing to the sight of its former owner. Now if we add, as Woodger does, that the properties of the part in the whole could not be uncovered by studying the part outside the whole, the thesis reduces to the thesis of emergence. And certainly, one of the commonest scientific procedures consists in predicting the behavior of a part in a system that has not yet been studied, although this prediction is assuredly made on the basis of knowledge gained by studying the part—not in "isolation," but as a part of other systems. For instance, the behavior of an electron in a cathode ray tube allows us to predict the electron's behavior in a cyclotron.

Finally, we may consider E. S. Russell's remark that understanding the significance of an animal's behavior requires understanding its goal. This, at least on Russell's interpretation, is a truism, for he connects the notion of a goal with the notion of adaptive value for the animal and identifies "significance" with adaptive value.

Omitting specific discussion of the other formulas cited, the general point is clear: Organismic biology seems to collapse either into doctrines that are not controversial or into unclarified, unproved, and dubious assertions about emergence, unpredictability, and irreducibility. Nevertheless, organismic biology is an important and valuable movement, for the following reasons.

First, organismic biology is perfectly correct in pointing out that there are levels of organization above the chemical level which exhibit laws of behavior that are not exhibited at lower levels (for example, molecules do not sting other molecules to death). Higher-level behavior can be treated without reference to behavior at lower levels, which means that the biologist can (and indeed does) construct concepts that are tailored to the description of higher-level behavior. The principles at the higher levels must be formulated before the question of their reducibility to lower level principles can even be considered. A biochemical geneticist is not only a biochemist; he is also a geneticist, because he is involved in elucidating

the processes involved in the sort of gross biological phenomena studied by Gregor Mendel.

Second, the insistence of organismic biologists on the importance of functional analysis is well founded. Focusing on the biological ends of physiological and behavioral processes provides the only means for developing the conceptual schemes that are needed in morphology, ethology, evolution theory, and other branches of biology. This point is developed in detail in Morton Beckner's *Biological Way of Thought*.

Third, although organismic biology is a set of truisms, it is none the worse for being so. The trouble with truisms is their great number: there are so many that we easily overlook, sometimes systematically, some of the most important ones. Even though in fact many biologists agree with the organismic position, they will say that they disagree. This leads to the position (generally deleterious in the sciences) of the scientist's doing one thing and describing it as if he were doing something else.

To sum up, organismic biology is to be interpreted as a series of methodological proposals, based on certain very general features of the organism—namely, the existence in the organism of levels of organization with the biological ends of maintenance and reproduction. These features are sufficient to justify “a free, autonomous biology, with concepts and laws of its own,” whether or not the higher levels are ultimately reducible to the lower ones.

## ORIGEN

(c. 185–253)

Origen, the Christian theologian and exegete of the Bible, was the foremost member of the catechetical school at Alexandria. Born of Christian parents in Alexandria, he was made head of a Christian school there in 204. He taught until 231, when conflict with the bishop forced him to leave for Caesarea in Palestine, where he taught until his death. He apparently heard lectures by Ammonius Saccas, founder of Neoplatonism, although he regarded philosophy as essentially preparatory to theology in the same way that other studies were prerequisite to philosophy itself. However, the influence of philosophy (primarily Platonic but also Stoic) on his thought was highly significant; it can be observed much more clearly in his presuppositions and arguments than in explicit quotations, which are relatively unusual except in the apologetic treatise *Contra Celsum*. The most important of his voluminous writings are *De Principiis*, a treatise on first principles and the earliest extant Christian systematic theology; the treatise *On Prayer*; and *Contra Celsum*.

### DE PRINCIPIIS

A relatively early work, *De Principiis* begins with the statement that apostolic doctrine, as found in the New Testament, is incomplete because the apostles intentionally left some matters untouched for the sake of their spiritual successors. Origen devotes the first book to a consideration of the spiritual hierarchy consisting of the Father, who acts on all beings; the Logos (Word or Reason), who acts upon rational beings; the Spirit, who acts upon those rational beings who are sanctified, and the angels. The second book deals with the material world. Man, created because the angels fell, is a preexistent fallen spirit in a material body. After Adam's transgression came redemption by the incarnate Logos; later there will be resurrection, the last judgment, and the life of all men restored to spiritual bodies (a succession of other worlds may follow as it has gone before). The third book discusses freedom, characteristic of creatures but not of the Creator. When a soul is in a body, it can struggle for victory, helped by angels and hindered by demons. Since it possesses free will, it is capable of choosing the good. After a brief summary, Origen turns in the fourth book to an explanation of how the Scriptures can be shown to have various levels

of meaning. Like man himself, they have flesh (literal meaning), soul (moral meaning), and spirit (allegorical-spiritual meaning). The exegetical difficulties in Scripture were placed there by their ultimate author, God, in the way that similar obstacles to faith were placed in the cosmos so that man could use his mind.

Origen's work, written in Greek, is extant only in fragments (Book IV is almost entire). The Latin version by Tyrannius Rufinus was severely criticized by St. Jerome on the ground that it lacks unorthodox passages that were in the original, but it has come to be regarded more favorably by modern scholars. The title *De Principiis* has parallels in second-century philosophy, as do many of the subjects Origen discusses; his approach, however, seems to be essentially Christian.

### ON PRAYER

In *On Prayer*, written later in his life, Origen discusses prayer in general (Chs. 3–17) and the Lord's Prayer in particular (Chs. 18–30). The principal problem is that presented by prayer to an omniscient God who has fore-ordained everything. Once again, Origen insists upon God's gift of free will; the primary purpose of prayer is not petition as such but sharing in the life of God. Origen classifies prayer as petition, adoration (only of the Father), supplication, and thanksgiving. In each case he emphasizes—as do contemporary middle Platonists—the spiritual attitude of the one who prays.

### CONTRA CELSUM

The late apologetic treatise against Celsus, written in 248, reveals the extent to which Origen was able to argue on grounds shared by his philosophical opponents; there is actually a wide measure of agreement between him and Celsus. Both are opposed to anthropomorphism, to idolatry, and to any crudely literal theology. Origen, however, consistently defends Christianity as he sees it and does not hesitate to attack philosophies and philosophers.

### ORIGEN AND PHILOSOPHY

The precise extent of Origen's debt to philosophy was discussed in antiquity; the Neoplatonist Porphyry claimed (according to Eusebius, *Historia Ecclesiastica* VI, 19, 8) that Origen drew upon Plato, Numenius, Cronius, Apollonius, Longinus, Moderatus, Nicomachus, Chaeremon the Stoic, and Cornutus. Since Origen does refer to many of these writers, whose names occur in Porphyry's description of the Neoplatonic curriculum, Porphyry may be attempting to demonstrate both the extent and

the correctness of Origen's Neoplatonism. The systems and works of various philosophers—except for the “atheists”—were studied thoroughly in Origen's school. Origen himself often made use of philosophical dictionaries for the definitions of various terms, but he also studied the writings of the philosophers themselves, not only those of Plato and the Platonists but also those of the Stoics and, occasionally, the Peripatetics.

It is sometimes claimed that there were two Origenes, one a pupil of Ammonius Saccas and the other the Christian theologian. It is more likely that both aspects were combined within one person, the first Christian to be a genuinely philosophical theologian.

## OROBIO DE CASTRO, ISAAC (c. 1617–1687)

Isaac Orobio de Castro was born Baltazar Orobio de Castro in Braganza, Portugal. He grew up among crypto-Jews who were trying to preserve some of their heritage in the face of the Spanish Inquisition. He became an important Spanish doctor and a professor of metaphysics. He was arrested by the Inquisition for secretly practicing Judaism. After being tortured and tried, he was released. He then fled Spain for France, where he became professor of pharmacy at Toulouse (c. 1660). Finally, deciding to abandon living as a Christian, he moved to Holland, where in 1662 he changed his name from Baltazar to Isaac and became one of the leading intellectual figures and a medical practitioner in the Spanish-Portuguese Jewish community in Amsterdam. When he arrived in the Jewish community, he learned that there had been trouble about a former classmate of his from Spain, Juan de Prado. Prado was apparently involved with the young

Spinoza and they were both charged with various heresies. Orobio wrote an answer, now lost, to one of Prado's works and against a work by Prado's son. Prado and his son held that the law of nature takes precedence over the law of Moses, and Orobio criticized their deism.

Orobio also wrote a metaphysical defense of his religion, based on mainly Spanish-Catholic Scholastic works and an answer to Alonso de Cepeda. His most famous works are an extremely rationalistic and Scholastic answer to Spinoza in geometrical form, *Certamen Philosophicum Propugnatum Veritatis Divinae ac Naturalis* (1684), which was published with Fénelon's *Démonstration de l'existence de Dieu*. The *Certamen* is the only critique of Spinoza by any member of the Jewish community that has survived and was considered one of the most important criticisms of Spinoza at the time.

Orobio engaged in a dialogue with one of the liberal Protestant leaders in the Netherlands, Philip van Limborch. They debated the truth of the Christian religion in 1687. This was a public debate where John Locke was present. The debate was published by Limborch under the title *Amica Collatio cum Erudito Judaeo* (1687) just after his opponent died, and Locke wrote a long review of it. Limborch met Orobio in Amsterdam in the 1680s and was much affected by his report of the Inquisition, which, through Limborch's *Historia Inquisitionis*, became for the next two centuries the best-known study of Inquisitorial investigation and torture methods. Orobio's most important anti-Christian work was *Prevençiones divinas contra la vana idolatria de las gentes*. He did not publish it because, as he explains in the note written in his own hand, he did not want to cause scandal, but he sent it to the Jesuits in Brussels, who liked it very much. It was published in French under the title *Israel vengé* (1770) by Baron d'Holbach. This work was used as important ammunition by French atheists against Christianity.

Through his works, Orobio de Castro showed an extremely acute understanding of metaphysics, using his knowledge of Spanish Scholasticism to buttress his religion against freethinkers and liberal and orthodox Christians. Some of his arguments against the doctrine of the Trinity are close to Spinoza's arguments against the plurality of substance.

## ORPHISM

"Orphism" is a modern term attached to two connected phenomena of Greek religion. The first is a body of traditional poetry, possibly from as early as the seventh century BCE, ascribed to a mythical singer called Orpheus and containing an account of the creation of the world and of the afterlife of the soul, its judgment and punishment for sins on Earth, and its final reincarnation in another living body. The second is the way of life adopted by those who accepted the truth of these writings, such truths being regarded with as much respect as the revelations in the traditional Greek "mysteries" at Eleusis and elsewhere.

#### CONTENTS OF ORPHIC WRITINGS

A number of fragments of the Orphic poems have survived, some of which belong to the poems as they were known in Athens in the fifth and fourth centuries BCE. However, these writings, in the manner of popular poetry, were constantly growing by accretion, and they seem to have become a general compendium of poetical accounts of theogony, cosmogony, and the soul's nature and fate. The contents of the poems as they existed in the fifth and fourth centuries BCE must be derived mainly from evidence in contemporary literature and, to a certain extent, in painting and sculpture.

ORPHEUS. It was in Greek art and literature of the sixth century BCE that Orpheus first appeared as a famous singer. The tradition that Orpheus sang while Musaeus

wrote down his master's songs may reflect the moment of transition from oral to written literature—which probably occurred in the second half of the seventh century BCE—and this may be the time when these songs were composed.

To the poets of classical Greece, Orpheus was the singer possessed of supernatural powers. As such, he was enrolled among the Argonauts. According to an Alexandrian poet, Orpheus soothed his quarreling companions by singing to them of the creation of the world and of the dynasties of the gods. Euripides wrote of Orpheus's special connection with the underworld. A Naples bas-relief, executed at the end of the fifth century BCE, depicts his attempt to bring back his wife Eurydice from the dead. A little earlier in the same century, Polygnotus executed his famous picture of the underworld in which Orpheus was shown lyre in hand, amidst a group of legendary musicians.

It seems likely that this figure of Orpheus reflected the existing body of Orphic poetry, that his traits in fact represent its contents—a theogony which is an account of creation and a description of the underworld and of the soul's fate there.

THEOGONY. Plato's quotation of passages from an Orphic poem (in the *Cratylus* and *Philebus*) and Isocrates' description (in the *Busiris*) of what Orpheus wrote about suggest an Orphic theogony very like the one which is preserved as the work of Hesiod, the eighth-century BCE oral poet. From much later writers (Athenagoras, of the second century CE, and Damascius, of the fifth century CE) we learn of Orphic theogonies that contain non-Hesiodic elements—the cosmic egg and the creator Phanes. Since Phanes seems to be identifiable with the figure Eros that appears, together with the cosmic egg, in a cosmogony related in Aristophanes' fifth-century play *Birds*, both elements may accordingly be regarded as ancient. Three Orphic fragments joined by Otto Kern, which present a picture of the universe, may also be early since this picture of the universe, may also be early, since this picture bears a marked resemblance to Plato's image of the universe in the myth of Er at the end of the *Republic*. According to these fragments, the heaven, the earth, the sea, and the "signs with which the heaven is ringed" are abound round with a bond of Aether.

AFTERLIFE OF THE SOUL. Whereas Hesiod's *Theogony* contained a description of the underworld, inserted nominally in connection with the story of Zeus's overthrow of the Titans, this possibly traditional element was

developed in the Orphic poems into a detailed account of the soul's fate after death, its judgment and its reincarnation. Plato, throughout his writings, plainly drew on an account of the soul's fate which he had read about in Orphic literature. In the *Gorgias* (493B) he refers to "one of the wise, who holds that the body is a tomb" and he also reports the story that the soul of an uninitiated man is like a sieve: In Hades the uninitiated is most miserable, being doomed to an eternity of filling sieves with water, by means of other sieves. Quoting the same story in the *Republic* (363D), he speaks of Musaeus and Eumolpus enlarging on the rewards of the righteous in the other world, and he also speaks of others who "when they have sung the praises of justice in that strain ... proceed to plunge the sinners and unrighteous men into a pool of mud in the world below, and set them to fetch water in a sieve." In the *Phaedo* (69E) he says that "the man who reaches Hades without experiencing initiation will lie in mud, whereas the initiated when he gets there will dwell with the gods." In the *Cratylus* (420B) Plato attributes specifically to the Orphic poets the theory that the body is the tomb of the soul. Two surviving Orphic fragments (Kern Fr. 222) speak of the differing fates of the just and the unjust in the afterlife, and several (Kern Fr. 223ff.) deal with the rebirth of the soul in various forms. Plato must certainly have been referring to Orphic poems when he said in the *Meno* (81A) that among others "Pindar and many another poet who is divinely inspired ... say that the soul of man is immortal, and at one time comes to an end, which is called dying, and at another is reborn, but never perishes. Consequently a man ought to live his life in the utmost holiness."

### THE ORPHIC LIFE

For those who believed the eschatological dogma contained in the Orphic poems, there followed certain consequences for the conduct of life.

**PROHIBITIONS.** *Adikia*, injustice against any living creature, had to be strictly avoided. In Euripides' *Hippolytus* the diet "of food without soul," which was required of followers of Orpheus, is mentioned. Herodotus referred to the Orphic practice, which was also Pythagorean, of avoiding the use of wool (robbed from sheep) in burial. Men who observed these scruples might be described as living as "Orphic life," in the words of Plato in the *Laws*.

**INITIATIONS.** Proclus spoke of those who were initiated under Orpheus's patronage with Dionysus or Kore (in the case of the latter, at Eleusis). In Euripides' play *Rhesus*, Orpheus's amanuensis Musaeus is an Athenian, and

Orpheus himself is closely connected with the Eleusinian initiations. It is certainly to these initiations that Aristophanes referred in the play *Frogs* when a character says, "Orpheus taught *teletai* [initiations] and abstinence from killing."

Evidently, the Orphic initiation had an essentially written character. Euripides referred to the person who observes Orphic scruples as "honoring the smoke of many writings." Plato mentioned "a mass of books" of Orpheus and Musaeus. Later writers contrasted this written initiation with the visual revelation at Eleusis, as when Pausanias wrote, "Whoever has seen an initiation at Eleusis or read the writings called Orphic knows what I mean." The Orphic literature seems to have borne the same relation to visual and oral instruction as a correspondence course bears to "live" teaching, and it appears to have been freely available.

Initiation into the mysteries was supposed to give a revelation of truth that would enable men to reach the next world in a state of guiltlessness. Plato reported that mendicant seers, who "frequented the doors of the rich," capitalized on this belief by offering cities and individuals the means of purification from sins committed. Among these are no doubt to be reckoned the *Orpheotelestai*, of whom Theophrastus spoke.

### SIGNIFICANCE OF ORPHISM

Was Orphism, then, either a philosophy or a religion? It certainly was not a philosophical system, since it had no developed doctrine—merely a mythical account, derived from the popular oral poetry of the past, of the nature of the universe and of the afterlife of the soul. The philosophical importance of the Orphic literature lies in its influence, first of Pythagoras and Empedocles and then on Plato.

Pythagoras seems to have taken over the Orphic stories so completely that they could be referred to by Aristotle as Pythagorean stories, and earlier, Ion of Chios could say that Pythagoras had fathered his writings on Orpheus. The immortality and transmigration of the soul is the one doctrine which can certainly be attributed to the earliest Pythagorean society; Plato spoke of a Pythagorean way of life, based, as we know from other sources, on ritual prescriptions designed to ensure the purity and blamelessness of the soul.

Empedocles, who lived in Sicily in the fifth century BCE, exhibited a similar belief in the soul's immortality and transmigration.

In the *Symposium* Plato does not appear to believe in the soul's immortality, but in the *Meno* he accepts the preexistence and survival of the soul on the authority of "divinely inspired poets," among whom Orpheus is certainly to be reckoned. This doctrine became a cornerstone of Plato's entire metaphysical system.

Orphism was not in itself a religion, although it was closely related to the initiations at Eleusis and elsewhere, which were perhaps the most striking religious manifestations of classical Greece. The Orphic element was, however, merely a traditional poetical account that provided the eschatological dogma that was the basis for certain observances to the described as a way of life. The religious depth of this way of should not be exaggerated. There were no organized rituals, religious communities, or priesthood. In the sense in which we ordinarily use the word *religion* in the study of the ancient world, Orphism was not a religion.

## ORPHISM [ADDENDUM]

A number of archaeological discoveries in the second half of the twentieth century have considerably supplemented our knowledge about Orphism.

### OLBIA BONE PLATES

The bone plates, found in Olbia on the Black Sea and dated to the fifth century BCE, probably functioned as tokens for those who received initiation. The inscription on one of them suggests that initiates could identify themselves as Orphics, even if the initiation did not necessarily imply any radical reform in their lifestyles.

### GOLD LEAVES

The gold leaves are tiny inscribed gold strips buried with the dead containing instructions on what to do and what to say in the underworld. Gold leaves were found in Southern Italy, in Thessaly, and on Crete. Though there was a period of skepticism, newly found specimens make it likely that gold leaves were used by Orphic initiates.

### THE DERVENI PAPYRUS

The Derveni papyrus was found in 1962 in a small sepulchral site near Thessalonica. The text was probably composed in the first half of the fourth century BCE, and its author might have been one of the Orphic initiates (*orpheotelestai*) that Plato and Theophrastus talked about. The first part of the text develops a rationalizing explanation of ritual acts, and quotes Heraclitus' fragments B3 and B94 in such a way that suggests that these fragments originally formed one sentence. In the second part the author interprets verses from a poem he attributes to Orpheus, some of which we know from other Orphic theogonies. The poem focuses on an episode when Zeus swallows all existing beings, so that for a moment everything is contained in him. Zeus then brings them back to light, and the story continues with the birth of new gods. This allows the poet to say, "Zeus is the head, Zeus is middle, and from Zeus all things get their being" (frag. 14.2, Bernabé). This episode expresses in the language of myth some central concerns of the pre-Socratic philosophers, such as the one/many problem and the question of the ultimate source of everything. The commentator interprets the poem allegorically, claiming that it propounds a cosmological theory. He argues that the different divine names in the poem designate the different cosmic functions of a unique god who created the present world order from primordial chaos. This unique god is called Mind (Nous) and is identified with the element air. The commentator's interpretation is heavily influenced by Anaxagoras and, to a lesser extent, Archelaus and Diogenes of Apollonia.

## ORTEGA Y GASSET, JOSÉ (1883–1955)

José Ortega y Gasset, the Spanish essayist and philosopher, was born in Madrid of a patrician family. He was educated at a Jesuit college near Málaga and at the University of Madrid, where he received a doctorate in philosophy in 1904. Ortega spent the next five years at German universities in Berlin and Leipzig and at the University of Marburg, where he became a disciple of the neo-Kantian philosopher Hermann Cohen. Appointed professor of metaphysics at the University of Madrid in 1910, he taught there until the outbreak of the Spanish Civil War in 1936. During those years he was also active as a journalist and as a politician. In 1923 he founded the *Revista de occidente*, a review and series of books that was instrumental in bringing Spain into touch with Western, and particularly German, thought. Ortega's work as editor and publisher, as a contribution toward "leveling the Pyrenees" that isolated Spain from contemporary culture, ranks high among his achievements.

Ortega led the republican intellectual opposition under the dictatorship of Primo de Rivera (1923–1930), and he played a part in the overthrow of King Alfonso XIII in 1931. Elected deputy for the province of León in the constituent assembly of the second Spanish republic, he was the leader of a parliamentary group of intellectuals known as *La agrupación al servicio de la república* (In the service of the republic) and was named civil governor of Madrid. This political commitment obliged him to leave Spain at the outbreak of the Civil War, and he spent years of exile in Argentina and western Europe. He settled in Portugal in 1945 and began to make visits to Spain. In 1948 he returned to Madrid, where, with Julián Marías, he founded the Institute of Humanities, at which he lectured. By the time of his death, Ortega was the acknowledged head of the most productive school of thinkers Spain had known for three centuries, and he had placed philosophy in Spain beyond the reach, not of opposition and criticism, but of the centuries-old reproach that it was un-Spanish or antinational and therefore either a foreign affectation or a subversive danger.

## WRITINGS AND STYLE

Ortega was a prolific writer. His numerous volumes consist mostly of essays and newspaper or magazine articles of general cultural interest. He wrote fewer strictly philosophical works; his vast influence on Spanish philosophy was exercised chiefly through his teaching.

All of Ortega's works are written in magnificent prose. He wrote in a clear, masculine style, and his mastery of Castilian has seldom been surpassed. On the other hand, he had a tendency to be wordy and to be content with literary brilliance and striking metaphor when argument and explanation were crucial.

Ortega's literary gifts had other, more important consequences. He used them to create a philosophical style and technical vocabulary in a tongue that until then had lacked models for philosophical writing and words for many modern concepts. But his literary virtuosity disarmed criticism in much of the Spanish-speaking world, so that his followers have often confounded philosophy with fine writing and emotional declamation.

## RATIO-VITALISM

Ortega called his philosophy the "metaphysics of vital reason," or "ratio-vitalism." By metaphysics he meant the quest for an ultimate or radical reality in which all else was rooted and from which every particular being derived its measure of reality. He found this ultimate reality in *Life*, a word that he first used in a biological sense, like the vitalists, but which soon came to mean "my life" and "your life"—the career and destiny of an individual in a given society and at a certain point in history. In his first philosophical book, *Meditaciones del Quijote* (1914), Ortega sought to go beyond the opposition of idealism (which, he claimed, asserted the ontological priority of the self) and realism (which asserted the priority of the things the self knows). He asserted that in truth self and things were constitutive of each other, each needing the other in order to exist. The sole reality was the self-with-things: *Yo soy yo y mi circunstancia* (I am I and my circumstances). The things around me, he said in the *Meditaciones*, "are the other half of my personality." The experience-matrix comprising self and things is not simply one of coexistence, because the self acts on things and realizes itself in so doing. This activity is life, the dynamic interaction of mutually dependent self and things in the course of which the self carries out a mission of self-fulfillment.

## PERSPECTIVISM

Ortega called his theory of knowledge “perspectivism.” The world can be known only from a specific point of view. There is no possibility of transcending one’s relative perspectives through absolute or impartial knowledge. “The definitive being of the world is neither mind nor matter nor any determinate thing but a perspective.” Each perspective is unique, irreplaceable, and necessary, and all are equally true: “The only false perspective is the one that claims to be the one and only perspective.” Ortega joined perspectivism to his notion of life as comprising the matrix self-with-things in the declaration, “Each life is a point of view on to the universe.”

## REASON AND LIFE

Although the *Meditaciones* seemed to place Ortega in the vitalist tradition, he dissociated himself from its antirationalism. Rather, just as he reconciled idealism and realism, he proposed to reconcile rationalism and vitalism. He agreed with the vitalists to “dethrone Reason,” to dismiss abstract reason and bring it back to its rightful role as “only a form and function of Life.” Yet Ortega stressed so strongly the rationality of the *élan vital* at the human level and underscored so firmly man’s dependence on reason as an instrument for coping with life that he appeared to enthrone reason again beneath a vitalist disguise. He used the terms “Life” and “Vitality” to describe man’s restless search for knowledge, understanding, and spiritual satisfaction, which others would have called “intelligence” or “practical reason.” In fact, Ortega seemed to identify vitality and reason: Thus, in *En torno a Galileo* (1933), he wrote, “Living means being forced to reason out our inexorable circumstances.” Therefore, ratio-vitalism was more rationalism than vitalism, and Ortega’s thought was far removed from the irrationalist, romantic vitalism that flourished after World War I.

## EXISTENTIALISM

Later, when Ortega appeared to have joined the existentialists (or, as he would have said, was joined by them), his insistence on the role of reason in the existential predicament gave his theories a distinctive color and allowed him to pour scorn on the sentimentalism of French existentialism. Ortega’s dissociation from vitalism became complete when he took account of “the historical horizons of human life”—that is, of the social and cultural conditions of vitality in humankind. He gradually came to prefer the term “historical reason” to “vital reason.” Life for Ortega now meant not biological vitality but “one man’s life,” and the vocation of the self was now conceived as what it must

do with things—a mission of self-realization. This is the language of existentialism, and Ortega spoke it with a rare eloquence.

Man does not have a nature, but a history....  
 Man is no thing, but a drama.... His life is something that has to be chosen, made up as he goes along, and a man consists in that choice and invention. Each man is the novelist of himself, and though he may choose between being an original writer and a plagiarist, he cannot escape choosing.... He is condemned to be free.... Freedom is not an activity exercised by an entity that already possessed a fixed being before and apart from that activity. Being free means ... being able to be something else than what one is and not being able to settle down once and for all in any determined nature.... Unlike all the other things in the universe which have a pre-fixed being given to them, man is the only and almost inconceivable reality that exists without having an irrevocably pre-fixed being.... It is not only in economics but also in metaphysics that man must earn his living [*ganarse la vida*, win his life]. (*Historia como sistema*)

Each man has one best choice, and this is his imperative vocation or mission. “Mission” means the awareness that each man has of his most authentic self which he is called upon to realize. The idea of mission is a constitutive ingredient of the human condition.... The being of man is at one and the same time natural and extranatural, a sort of ontological centaur” (*Obras completas*, Vol. V, pp. 209, 334). Ortega’s moral theory thus derives directly from his anthropology; and indeed it is difficult, as with other existentialists, to separate his metaphysics from his anthropology and ethics. The moral life is the authentic one, the one that stays faithful to a life project or vocation; the immoral life is to abandon oneself to transient, outside influences, to drift instead of realizing a personal destiny. The choice of one personality out of the various possible personalities engages the whole of a man’s reasoning powers and requires perpetual lucidity and concentration. This helps to explain Ortega’s emphasis on the rationality of the *élan vital* at the human level. It is by intelligent reckoning with his circumstances that a man gains his being and becomes himself. Reasoned choice is constitutive of human personality.

## SOCIAL THEORY

Life is always a problem, an insecurity, a “shipwreck,” not only for the individual but for societies too. The desper-

ate measures society takes to struggle against perpetual foundering constitute human culture. It was Ortega's social theory, set forth in *La rebelión de las masas* in 1930 (*The Revolt of the Masses*, New York, 1931), that first brought him international recognition. Ortega started from the belief that culture is radically insecure and that a constant effort is required to prevent it from lapsing into barbarism and torpor. That effort is beyond most men, who can merely contribute to it by accepting the leadership of a liberal aristocracy, which does most of humanity's works. The fact that men have no essence or fixed nature but each must choose himself implies their inequality. "Because the being of man is not given to him but is a pure imaginary possibility, the human species is of an instability and variability that make it incomparable with animal species. Men are enormously unequal, in spite of what the egalitarians of the last two centuries affirmed and of what old-fashioned folk of this century go on affirming" (*Meditación de la técnica*, p. 42).

Ortega distinguished interindividual from social relations. In the former, which include love and friendship, individuals behave as rational and responsible persons, whereas in social relationships, which include customs, laws, and the state, we encounter the irrational and impersonal, the imposed and anonymous. The resulting contrast of man and people (*El hombre y la gente*), of the individual and the collectivity, betrayed Ortega's aristocratic distrust of democracy and contemporary mass society. There is no collective soul, he said, because "society, the collectivity, is the great soulless one, because it is humanity naturalized, mechanized and as if mineralized." Everything that is social or collective is sub-human, intermediate between genuine humanity and nature; it is a "quasi-nature." Nevertheless, social relationships have their uses; they make other people's behavior predictable, they carry on inherited traditions, and by automatizing part of our lives, they set us free for creation in the important interindividual sphere. These gains of socialization need constant defense, for men's antisocial drives are never vanquished. Society is neither spontaneous nor self-perpetuating. It has to be invented and reinvented by a minority that, however, must be able to procure the cooperation of the masses. The elite is essential to any society; by proposing a project for collective living, it founds the community and then governs and directs it.

The masses are incapable of framing a project, for they live without plan or effort. When they revolt and claim to govern themselves, society is threatened with dissolution. Ortega thought this was happening in

twentieth-century democracies, whether totalitarian, communist, or parliamentary. Nationalism was exhausted as a collective project, and the next plan had to be supranational. Ortega favored the "Europeanization of Spain" in a supranational entity governed by an irreligious intellectual elite. Catholicism was to be extirpated, but gradually and cautiously, with a first stage of "liberal religion" leading toward the secular state.

The sensitive intellectual would have as little as possible to do with governing, for it was inevitably degrading. "There is no political health when the government functions without the active cooperation of majorities. Perhaps this is why politics seems to me a second-class occupation" (*Invertebrate Spain*, p. 201).

### ARISTOCRATIC LOGIC

The notion of an aristocracy of talents is the key to Ortega's logic. In *Ideas y creencias* ("Ideas and Beliefs," in *Obras completas*, Vol. V, pp. 377–489), he claimed that ideas are the personal creation of the thinking minority, while the mass lazily accepts plain commonsense beliefs that in reality are vulgar ruling opinions imposed by "a diffuse authoritarianism." The archetype of mob belief is empiricism, or as Ortega called it, "sensualism." Sensualism is a reliance on the evidence of the senses, on self-evident truisms, on experiments in science or on documents in history. Philosophy since Parmenides has been a reaction against the vulgar prejudice in favor of the senses. "Against the *doxa* of belief in the senses, philosophy is, constitutionally and not accidentally, *paradox*" (*La idea de principio*, p. 285).

These views were developed with remarkable vigor in his unfinished, posthumously published magnum opus, *La idea de principio en Leibniz y la evolución de la teoría deductiva* (Buenos Aires, 1958; *The Idea of Principle in Leibniz and the Evolution of Deductive Theory*, New York, 1971). He assailed every form of the belief that principles or axioms can be founded on sensible intuition, taking Aristotle as the first representative of this belief and following its transmission through the Stoics and Scholastics. Such a belief, Ortega declared, is "idiot," "plebeian"; it results from a mental derangement akin to catalepsy, in that it entails sitting bemused before brute reality instead of thinking creatively. The only principles available to us, he held, are posed arbitrarily by the mind. They are assumptions that cannot be proved to the satisfaction of the senses, but "prove themselves" by allowing the deduction of a coherent corpus of propositions. This is the advance of post-Cartesian thought over traditional realism. "Modern philosophy no longer begins with

Being but with Thought” (*La idea de principio*, p. 263). The only proof modern philosophy knows is theoretical use: If axioms or methods give good results, there is no more to be said.

Principles can only come from the understanding itself as it is before and apart from any acquaintance with sensible things. From these purely intellectual principles may be deduced consequences that form a whole world of intellectual determinations, that is, of ideal objects. ... The activity of knowing used to seem to consist in an effort to reflect, mirror, or copy in our mind the world of real things, but it turns out to be just the opposite, namely, the invention, construction, or fabrication of an unreal world. (*La idea de principio*, p. 394)

Since he considered this idealist logic a characteristically aristocratic attitude, Ortega thought it significant that Plato and René Descartes, the two men who did most to construct it, were of noble blood. In contrast, the empiricism of Aristotle was popular, vulgar, “demagogic.” “It is the criteriology of Sancho Panza. Faith in the senses is a traditional dogma, a public institution established by the irresponsible and anonymous opinion of the People, the collectivity” (*La idea de principio*, p. 286). Even the principle of contradiction, “that dogma of ontological sensualism,” was a mere commonplace of the collective mind, unsupported by reasons and anything but self-evident. Aristotle had failed to prove the principle of contradiction, that *A* could not both be and not be *X*, and Immanuel Kant’s transcendental deduction of it had no force. Ortega was not seeking to dispense with that principle but to argue that it could not be proven. Logic is a calculus tested by coherence, not an abstraction from sensible experience. Principles are assumptions that are useful for particular purposes.

Philosophy, science, and mathematics are “pure exact fantasy” based on principles that are arbitrary conventions. They are phantasmagoria, not far removed from poetry. They are the creation of an aristocracy of intellect that reveals the characteristics of all aristocracies: playfulness, lack of seriousness, and love of sport and games. Ortega meant quite literally that logic and science were games played according to strict but perfectly gratuitous rules by a minority that seeks to escape the tedium, vulgarity, and deadly seriousness of the world of beliefs. We never really believe in science or philosophy; they remain “mere ideas” to play with, and they are always somewhat spectral and unserious compared with the visceral faith we put into beliefs. Theory, like any fantasy, is by defini-

tion always revocable. Therefore, we ought to play at philosophy, jovially and without pathos, with the mock seriousness required to “obey the rules of the game.”

## OSTWALD, WILHELM

(1853–1932)

Wilhelm Ostwald was a German chemist, philosopher, and historian of science whose main scientific achievement was his pioneer work in physical chemistry, particularly in electrochemistry. With J. H. van't Hoff he founded the *Zeitschrift für physikalische Chemie* in 1887. He was awarded the Nobel Prize in chemistry in 1909.

### ENERGETISM

Ostwald's philosophical outlook, known as energetism or energetic monism, was strongly influenced by his scientific background and by the state of physical science at the end of the nineteenth century. In particular, the first and second laws of thermodynamics—the law of conservation of energy and the law of entropy—decisively influenced his thought. Ostwald claimed that energy is the substrate of all phenomena and that all observable changes can be interpreted as transformations of one kind of energy into another. This claim was based on both epistemological and physical considerations. Ostwald pointed out that we never perceive anything but energy, or more accurately, differences in energy. One

never perceives a material substance itself, but only its energetic interaction with his own organism.

In an argument similar to a classical argument of René Descartes's, Ostwald showed that even impenetrability, which, according to mechanists, is the constitutive feature of matter, is a mere sensory quality that is perceived only when there is a difference in kinetic energy between a piece of matter and one's own organism. No sensation of hardness would arise if a piece of matter which one tried to touch retreated at the same velocity with which his finger moved toward it. Ostwald interpreted all aspects of matter in terms of energy: Mass is the capacity of kinetic energy; occupancy of space is "volume-energy"; gravity is energy of distance. Thus, matter is nothing but a "spatially ordered group of various energies" which do not require any material substrate. Material substance belongs with caloric, phlogiston, and electric and magnetic fluids in the category of discarded and useless fictions. Ostwald prophesied that ether too would soon disappear from science, as the increasing difficulties in constructing a satisfactory model of it indicated.

This difficulty was for Ostwald only one symptom of mechanism's general failure to provide a satisfactory explanation of physical phenomena. He even doubted the usefulness of kinetic explanations of thermal phenomena, although the mechanical theory of heat had been extremely successful. The atom itself was for Ostwald only a convenient methodological fiction, which he refused to reify. (Only around 1908, under the growing pressure of new experimental confirmations of the discontinuous structure of matter, did he modify his view.)

The ubiquity and constancy of energy make it "the most general substance," and the conservation of energy underlies the validity of the law of causation. The succession of cause and effect is nothing but the transformation of one form of energy into another, the total amount of energy remaining constant. The law of conservation of energy guarantees the quantitative equality of cause and effect; and the direction of transformations is determined by the law of entropy, according to which all forms of energy are being gradually transformed into heat. Ostwald rejected all attempts to limit the application of the law of entropy; opposition to applying it to the whole of cosmic history was, in his view, nothing but emotional reluctance to accept the eventual death of civilization and even of humankind. The mechanistic view, which regards all processes as in principle reversible, fails to account for the irreversibility of time embodied in the law of entropy.

Ostwald belonged to a generation of philosophers of science that included Ernst Mach, Pierre Duhem, and J. B. Stallo, who were acutely aware of the limitations of mechanistic explanations. They overlooked the power and fruitfulness of mechanical and particularly of corpuscular models even on the molecular level, and atomic physics was not yet advanced enough to show the inadequacy of corpuscular models of subatomic phenomena. When this inadequacy became apparent, the crisis of the traditional scheme proved to be far more profound than Ostwald expected. While claiming to reduce all manifestations of matter to energy, he still retained mass, the basic concept of mechanism, under the disguised form of “capacity of energy.” He anticipated the later relativistic fusion of mass and energy only in a hazy and qualitative way.

In this respect Ostwald can be compared with Herbert Spencer, with whom he shared other ideas: the substantialization of energy, the deduction of the causal law from the law of conservation of energy, an energetist approach to social science and ethics, and a determinist monistic metaphysics disguised by positivistic and agnostic formulas. Ostwald, however, lacked Spencer’s philosophical sophistication; this is especially visible in his approach to the mind-body problem. Ostwald believed that he had refuted materialism by identifying consciousness with neural energy; he did not realize that his view was only a variant of physicalism. Like Ernst Haeckel, whom he greatly respected, Ostwald believed that his view was identical with Benedict de Spinoza’s double-aspect theory, but this is not true. The haziness of Ostwald’s monism invited criticism from antagonistic camps; Hans Driesch called it disguised materialism, and V. I. Lenin denounced it as “sheer idealism.”

Ostwald devoted much time to propagating his views on monism. He founded the pantheistically oriented League of German Monists in 1906, and in 1911 he began to publish the series *Monist Sunday Sermons* (*Monistische Sonntagspredigten*).

### ETHICS AND SOCIAL THOUGHT

Ostwald regarded the law of entropy as the basis for the theory of values. What we term *mind* or *consciousness* is nothing but a form of neural energy and is subject to the same laws as other forms of energy. In a temporally reversible world the concept of value would be meaningless, whereas it acquires a precise scientific meaning in the framework of energetism. Evolutionary advance consists in the fact that increased coordination between increasingly specialized organs results in increased efficiency of

the organism and a minimum waste of energy. The same law—increased coordination resulting in maximum efficiency—determines the progress of civilization. Immanuel Kant’s categorical imperative should be replaced by the “energetic imperative”: “Do not waste your energy.” Ostwald’s applications of his energetic imperative to social thought were even more ambiguous than his views on the mind-body problem. Prior to 1914 Ostwald regarded war and conflict as a wasting of energy, and he favored internationalism and pacifism. But during World War I he justified his militant nationalism by claiming that the organization, efficiency, and minimum waste of energy of the German state represented the highest existing evolutionary form of human society.

### HISTORY OF SCIENCE

In history of science Ostwald deserves credit for editing *Ostwalds Klassiker der exacten Wissenschaften*, a series of reprints of important scientific writings. His own classification of creative scientific minds into “classics” and “romantics,” however, is probably oversimplified although interesting. Ostwald also founded and edited the journal *Annalen der Philosophie* (1901–1921).

## OTHER MINDS

The question of how all of us know that there are other beings besides themselves who have thoughts, feelings, and other mental attributes has been widely discussed, especially among analytic philosophers in the English-speaking world. At least three of the most influential German philosophers—namely, Edmund Husserl, Max Scheler, and Martin Heidegger—have also dealt with this problem. The problem of “other minds” becomes a serious and difficult one because the traditional and most obvious solution to it, the argument from analogy, is open to grave objections. At the present time it would seem that a majority of the philosophers who have concerned themselves with the question consider the traditional solution—that our belief in other minds can be adequately justified by an analogical argument—at least inadequate, if not radically and unremediably defective.

## ARGUMENT FROM ANALOGY

In general terms to argue by analogy is to argue on the principle that if a given phenomenon *A* has been found to be associated with another phenomenon *B*, then any phenomenon similar to *A* is very likely to be associated with a phenomenon similar to *B*. In the particular case of other minds, it is said, I observe that there is an association between my mental states, on the one hand, and my

behavior and the physical state of my body, on the other. I then notice that there are other bodies similar to mine and that they exhibit behavior similar to my own. I am justified, therefore, in concluding by analogy that mental states like the ones I experience are associated with those other bodies in the same way that my mental states are associated with my body. I notice, for example, that when I have a pain in my tooth, it is likely to be decayed and that I am likely to groan, complain, and hold my jaw. Observing another body like my own that has a decayed tooth and behaves as my body behaves when I have a toothache, I conclude that this body, like mine, is the body of a being that has a toothache.

**OBJECTIONS TO THE ANALOGY ARGUMENT.** The first and least radical objection to the argument from analogy is that it does not establish its conclusion with an adequate degree of certainty. The argument, it is said, would be relatively strong if the correlation of the mental and the physical was observed to hold in a large and varied collection of instances before it was concluded that it also held in other similar cases. But this is not so. If I use the argument from analogy, I have only one case, my own, as a basis for my inference. Moreover, the characteristics and behavior of the other bodies vary markedly from my own. How can I be sure that the differences between myself and others are not associated with the presence of mental attributes in my own case and with the absence of them in other cases?

The other difficulties in the argument from analogy concern two features of that argument—first, that it is logically impossible to check up on the correctness of the conclusion of the argument and, second, that the argument's validity implies that one must learn from one's own case alone what it is to have a mental attribute. Let us elaborate a little on each of these points.

In the case of a normal analogical argument, it makes good sense to suppose that one might check up directly on the conclusion of the argument; in principle one could always dispense with reasoning by analogy, even though this may not be practicable in some cases. Of course, one who says that we know of the existence of other minds by analogy must deny that we can check up on our conclusion in some more direct way, for if we could, the argument by analogy with ourselves could be dispensed with. It also seems that he cannot say that our inability to check up is merely a practical matter. Such checking up cannot consist in making further observations of a person's behavior and body; this we can often do sufficiently well in practice. It would have to consist in some other opera-

tion that we cannot in fact perform but which we can conceive of ourselves performing; perhaps it would be something like telepathy.

But aside from any difficulty in making clear sense of the notion of telepathy, why should telepathy be regarded as a more direct way of checking up than ordinary observation of behavior? Indeed, it seems that one's grounds for thinking that one has telepathic knowledge of another person's state of mind must include the knowledge that what one seemed to know telepathically generally correlates well with what one knows as a result of ordinary observation. The same would also seem to apply to any other extraordinary but conceivable way of knowing about another's mental state. Granted, then, that the supporter of the argument from analogy must hold that the impossibility of checking the conclusion more directly is not any variety of empirical impossibility, why is this held to destroy the argument? Perhaps there is a difference here between this argument and other valid analogical arguments, but why does this difference make this argument unacceptable? The answer given is that this difference renders the conclusion of the argument senseless. What can the phrase "He is in pain" mean to me if no conceivable observation I could make would show that it was true or false, if I have no criterion for its truth, and if I have no idea of what would count for or against it? It will not do to say that the sentence means that he has the same as I have when I am in pain, for, again, what counts as being the same here?

The other main difficulty in the analogical argument centers, as we have said, on the necessity, implied by that argument, for each of us to learn from his own case alone what it is to have a mental attribute. Two arguments have been advanced to show that this is impossible.

According to the first, which derives from Ludwig Wittgenstein, the analogical argument requires that one be able to pick out something (for example, a pain or a state of anger) and thereafter to identify it, when it recurs, as a pain or a state of anger. The trouble is, however, that this account leaves no room for a distinction between a correct and an incorrect identification. Behavioral and other checks are ruled out, leaving no conceivable means of deciding whether a mistake has been made. But a distinction between a correct and a mistaken identification is surely essential to the very notion of identification itself. In this way the analogical argument, which requires that we be able to make correct identifications of our inner states, also deprives the notion of identification of any meaning.

The second argument, which has been advanced by P. F. Strawson, is more complex. According to him, the idea of a predicate involves the idea of a range of individuals to which that predicate can be significantly applied. In the case of mental attributes, this range includes both oneself and others; one cannot have the notion of a mental attribute unless one has a notion of oneself and a notion of another. Since the notion of oneself is the notion of a subject of mental and other attributes, one cannot have the notion of oneself without the notion of some mental attributes. Therefore, one cannot have a notion of oneself without also having the notion of another subject of mental attributes. This notion, however, can be possessed only if one knows how to ascribe mental attributes to such subjects. Hence, until one knows how to do this, one has no notion either of oneself or of another. But the argument from analogy requires that one should first have a notion of oneself, of one's own case, and then discover how to ascribe mental attributes to others by arguing analogically from correlations that are found to hold in one's own case. A person without a notion of his own case could indeed argue analogically. He could find that pain was to be expected when a certain body (his own, as we say) was branded with a hot iron. He could infer that there would also be a pain when another similar body was similarly affected. But he would soon find out that he was mistaken in this conclusion, for he would detect no pain when the hot iron was applied to any body other than his own.

**DEFENSES OF ANALOGY ARGUMENT.** Some persistent attempts (especially by A. J. Ayer) have been made to defend the argument from analogy against the charges laid against it. To counter the charge of weakness, the following suggestions have been made. Emphasis has been laid upon the special feature of the argument from analogy—that people can speak and that their descriptions of their mental states are very like those I would give of some of my own. This, it is claimed, is something more telling than a mere similarity of behavior. Against this it is pointed out that speech can be regarded as something understood by the speaker only if it is accompanied by the appropriate nonverbal behavior.

Another defense is that conclusions drawn analogically from behavioristic similarities are powerfully reinforced by like conclusions drawn by arguments based on similarities in the state of the nervous system. This consideration hardly meets the main complaint—namely, that I base my inference on one case only, my own.

According to a rather more convincing attempt to meet this complaint, no more can be asked of any method of inference than that I be able to test its conclusion more directly in some cases and that when I do so, the conclusion usually turns out to be correct. The argument from analogy satisfies this test. I can suppose that there are, as there seem to be, other people besides myself and that these people argue analogically that I have certain thoughts and feelings. I can check on these imagined inferences and find that their conclusions are generally true. Whether these inferences are in fact made is neither here nor there; I can see that the method would work if it were used. Nor need I be worried because I can check only those cases in which the conclusion is about myself. In all or most inferences there will be a restricted class of cases that I can check up on. It is, for instance, logically impossible that I should make a direct check on a change of color that occurred where I could not observe it. But it would be a mistake to argue that any analogical argument that a color change had occurred was weak because it was based upon one sort of case only—the sort that I was able to observe. Why should it make a difference to the strength of the other minds argument that the relevant class of case is my own mental states as opposed to what I myself observe?

An argument similar to this one can also be used to rebut the charge that there is no conceivable means of checking up on the conclusion of the argument from analogy. There are in fact some cases in which I can make a check—namely, those cases that concern myself. Moreover, although it is logically impossible for me to be some other person and hence to make a direct check on that other person's mental states, this is unimportant, for it is never logically impossible that I should check on the truth of a psychological statement when the subject is referred to by a descriptive phrase, even though that description fits someone other than myself. It is logically impossible, perhaps, that I should be Robinson, but it is not logically impossible that I should now be the man flying a certain aircraft, even though Robinson is in fact that man. Moreover, it is claimed, when I make a statement about Robinson, what is stated is, in effect, that someone who answers to such and such a description has had such and such an experience. To this it has been objected that the only interpretation of this claim that yields the desired conclusion is untrue, namely, the interpretation that "Robinson has a pain" means the same thing as some sentence of the form "The so and so has a pain." However, this objection clearly fails to settle the matter, as can be seen by considering the following statements:

- (1) The man sitting in this chair is angry.
- (2) Robinson is the man sitting in this chair.
- (3) Robinson is angry.

Statement (1) cannot be said to be unintelligible to me on the ground that I, not being the man in question, cannot check up directly, for it is conceivable that I might have been sitting in the chair; statement (2) can also be checked on by me; statement (3) follows from (1) and (2). It is surely quite implausible to hold that statement (3) is unintelligible to me, whereas statements (1) and (2) are not.

There is, however, another possible difficulty in the argument from analogy that is usually not at all clearly distinguished from the one just considered—namely, that it is in principle impossible for more than one person to check directly on the conclusion. It is often said that publicity is the essential requirement. But does this mean that it must be logically possible for each person to make the check, or is it the more stringent requirement that it be possible for everyone, or at least more than one, to do so? If the latter, then the difficulty has not been overcome. Equally it has not been shown clearly why publicity should be required in the more, rather than in the less, stringent form.

This brings us to the reasons given for holding that one cannot understand psychological predicates from one's own case alone, which is a requirement of the argument from analogy. One of these reasons, as we have seen, is that there is no sense in the idea of an identification that is subject to no check, where there is no criterion of correctness. This view has been questioned on two grounds. Strawson has argued that a criterion of correctness is not needed in all cases of identification, and according to Ayer, an identification of a sensation can be satisfactorily checked, without recourse to anything publicly observable, by means of other private sensations.

## OTHER SOLUTIONS TO THE PROBLEM

**BEHAVIORISM.** Assuming that the argument from analogy is unacceptable, the most obvious alternative is to adopt some form of that variety of behaviorism according to which all psychological expressions can be fully understood in terms of behavior. If behaviorism is correct, there is clearly no room or need for the argument from analogy. In ascribing a pain to someone, for example, one is asserting something that is in principle subject to a public check—something about the way the individual is behaving, about how he would behave in certain circumstances, about what the circumstances in fact are,

or the like. There is no need to make any inference from the publicly observable to something radically different.

This is not the place for a general discussion of behaviorism. Any objection to a given form of behaviorism will, of course, be an objection to that form of behaviorism as a solution to the problem of other minds. There is, however, one difficulty that has given rise to a number of closely related attempts to deal with the problem—namely, that it is implausible to give a behavioristic account of some first-person psychological statements. When, for example, I say that I have a terrible pain, I do not say this on the basis of observation of my own behavior and the circumstances in which I am placed. Nor am I speculating about how I would behave in other, hypothetical circumstances.

This difficulty has become of central importance for many philosophers who are impressed by some or all of the arguments that purport to refute the argument from analogy. They regard such arguments as showing, not only that this argument fails, but, more positively, that the connection between mental states, on the one hand, and behavior and circumstances, on the other, is logical or conceptual, not contingent. What is needed to remove the difficulty about our knowledge of other minds, it is thought, is to clear away the obstacles that prevent us from seeing clearly that this connection *is* a conceptual one. The primary obstacle in this instance is the peculiar nature of first-person psychological statements. It is this obstacle that prevents us from wholeheartedly accepting the true view and that makes us always hark back to the picture of mental states as objects to which the owner has privileged access.

There are at least two points involved here. First, if my own statements about my mental states are not about private happenings to which only I have access and if they are not about my behavior either, then what account *is* to be given of them? Second, the statement “I am in pain,” made by me, contradicts the statement “He is not in pain,” made about me by someone else. If one admits that the former is not about my behavior, how can one avoid the conclusion that the latter also is not about my behavior? But if the latter is not about my behavior, how can it be maintained that the connection between my pain and my behavior is a logical one?

WITTGENSTEIN. In dealing with the question “How do words refer to sensations?” Wittgenstein suggested, “Here is one possibility: words are connected with the primitive, the natural, expressions of sensation and used in their place” (*Philosophical Investigations*, Sec. 244). This sug-

gestion, which is not elaborated much by Wittgenstein, has sometimes been treated as an attempt to deal with the first point stated above and has had certain merits ascribed to it—for example, by Norman Malcolm. It explains how the utterance of a first-person psychological statement can have importance for us; such an utterance has the importance that natural expressions of sensation and emotion have. It is also said to explain certain features of the logic of psychological statements, the absurdity of someone’s concluding that he has a pain from the observation of his own behavior, and the impossibility of someone’s being mistaken about whether he has a pain or of wondering whether he has a pain. However, whatever its merits, this stress on the likeness of first-person sensation statements to natural expressions of emotion and sensation merely sharpens the second of the difficulties noted above—namely, that “I am in pain” can contradict “He is not in pain.” It even makes it hard to see how the former can be a statement at all; a cry of pain is not a statement.

This difficulty is obviously insuperable for one who, unlike Wittgenstein, adopts the extreme position that apart from being verbal and learned responses, first-person sensation statements are exactly like natural expressions of sensation. Wittgenstein, however, appears to hold that a statement like “My leg hurts” is never in all respects like a cry of pain but is sometimes more like it and sometimes less, depending on the context of utterance. There seem to be three main likenesses that he wanted to stress in all first-person present-tense expressions of sensation and in many such expressions of emotion—namely, (1) the impossibility of these expressions being mistakenly uttered; (2) the possibility of their being insincere or pretended; and (3) the fact that such statements can justifiably be made without a basis of self-observation. The problem that arises in formulating a successful defense of his views is showing how a statement that bears the above likenesses to a cry of pain can yet be different enough to contradict another statement for which the criteria of truth lie in the realm of the publicly observable—that is, in the behavior of the speaker.

It cannot be said that Wittgenstein himself made a serious attempt to cope with this difficulty. Others have made the attempt, but no attempt has been very convincing. The second and third points of likeness present no great difficulty (see Douglas Gasking, “Avowals”). Any statement can be made insincerely, and there are many nonautobiographical statements that a person can justifiably make without observing that the criteria for their truth are satisfied. For example, some people can tell you

that a certain note is middle C without first carrying out the tests that determine whether it has the appropriate frequency. For such statements to be justified, it is necessary only that those who make them are usually right in such cases.

*Alleged incorrigibility.* The first difficulty, which arises from the alleged incorrigibility (as it is termed) of first-person present-tense statements, is not so easily disposed of. The most hopeful approach—indeed, the only approach—is to exploit the fact that the natural expressions of sensation and emotion can be feigned. An insincere groan is akin to a lie, and a lie is a false statement. Perhaps a verbal expression can reasonably be called false if it is insincere and true if it is sincere, the distinction between sincerity and insincerity being a matter of the behavior of the speaker. In this way a plausible account could be given of how something very like a groan could also in some ways be like a statement and be regarded as such. The incorrigibility of such statements would then be accounted for.

But this is not enough; it does not explain how such a “statement” can be the contradictory of another statement that is logically connected with statements about the behavior of the maker of the “statement.” For (1) “I have pain,” said by me about myself, is the contradictory of (2) “I have not a pain,” said by me about myself. Therefore, since (3) “He has a pain,” said about me by someone else, is also the contradictory of (2), (1) and (3) must both be the same statement. Consequently, if (3) is logically connected with certain behavioral statements, (1) must also have these connections. This makes it difficult to see how (1) can be incorrigible. If I can be mistaken about my own behavior, as is the case, and if there is a logical connection between my pain and my behavior, then, it would seem, I can be mistaken about my pain. This difficulty is not overcome by assimilating the truth of a first-person pain statement to the sincerity of a groan. For (4) “I am sincere in saying I have a pain,” said by me about myself, is the same statement as (5) “He is sincere in saying he has a pain,” said about me by someone else. Therefore, if (5) is logically connected with statements about my behavior, so is (4), and, if (4) is so connected, it must, it seems, be corrigible. For to claim sincerely that  $p$  is to think that  $p$  when one makes the claim, and to claim insincerely that  $p$  is to think that not- $p$  when one makes the claim. If (4) is corrigible, then someone might think he is sincere in claiming he has a pain when in fact he is insincere—that is to say, he might think that he thinks that he has a pain, although in fact he thinks that he has not a pain. If, however, one cannot be

mistaken about one’s own pain, then to think that one thinks one has a pain is to think one has a pain, and to think one has not a pain is not to have a pain. It follows that if (4) is corrigible, someone might think that he has a pain although, in fact, he has not a pain. In short, if (4) is corrigible and (1) is not, then (1) is corrigible.

There are apparently only two ways out of these difficulties that do not involve abandoning the thesis of the incorrigibility of first-person psychological statements and thus ceasing to attach much value to the assimilation of such statements to natural expressions of emotion and sensation. One might deny that (1) and (3) are the same statement, or one might maintain that although (1) is logically connected with behavioral statements about which I can be mistaken, yet I cannot be mistaken about (1). The first of these alternatives would involve finding a satisfactory explanation of why I cannot assert the same thing that someone else does when he asserts (3). The second would require an account of the notion of a logical connection that would allow for the existence of statements that, when made by myself, are incorrigible, but which are logically connected with other statements that, when made by myself, are not incorrigible.

In fact it has been argued by some that there are no psychological statements that are incorrigible and that the problem we have just been discussing is therefore an unnecessary one. It seems to be quite true that there are some ways in which one can be mistaken when one says one has, say, a pain. But the matter has not yet been clarified sufficiently for anyone to be justified in saying with confidence that this renders the problem unnecessary. Even if first-person present-tense pain statements are corrigible, this does not show that they are corrigible in all the ways that other statements are corrigible. Nor has it been shown convincingly that they are corrigible in such a way as to obviate any difficulty that may arise from the fact that “I have a pain,” said by me, contradicts “He has a pain,” said about me.

In addition to the above objections to Wittgenstein’s views on the subject of psychological statements, there is another one that is of a less definite character and to which Wittgenstein himself alludes when he puts into the mouth of an imaginary objector such words as “and yet you again and again reach the conclusion that the sensation itself is a *nothing*” (*Philosophical Investigations*, Sec. 304). He protests, of course, that this is not the sort of impression he wishes to create and that it arises from his “setting his face against the picture of the inner process.” Nevertheless, it cannot be said that he altogether succeeds in dispelling this impression. His problem might indeed

be described in just these terms—to set his face against the inner process picture without creating the impression that he wishes to deny the existence of sensations. It does not seem that he succeeds in this.

P. F. STRAWSON. It is perhaps Wittgenstein's failure that in part gives rise to another attack on the problem—namely, that of P. F. Strawson. Strawson, like Wittgenstein, is convinced that the argument from analogy is mistaken and that skepticism about other minds is senseless or at least empty and pointless. Like Wittgenstein, he holds that the relation of the behavior of other people to their mental states is not contingent: “the behavior-criteria one goes on [in assigning P-predicates—that is, psychological predicates] are not just signs of the presence of what is meant by the P-predicate, but are criteria of a logically adequate kind for the ascription of the P-predicate” (*Individuals*, p. 106).

In spite of this he is out of sympathy with Wittgenstein in many ways. He considers that the assimilation of first-person present-tense psychological statements to the natural expressions of sensation and emotion “obscures the facts and is needless” (*Individuals*, p. 107). He is unconvinced by Wittgenstein's reasoning against the idea of a private language that might serve as a basis for the argument from analogy. He sees little difficulty in the notion of a person's inventing for himself a private language in which he has names for his sensations even when such sensations have no outward expressions: “He might simply be struck by the recurrence of a certain sensation and get into the habit of making a certain mark in a different place every time it occurred” (*Individuals*, p. 85). Nor does he consider the notion of a person's continuing to exist in a disembodied state as logically absurd (*Individuals*, pp. 115–116). He accuses Wittgenstein of hostility to the idea of what is not observed and of a “prejudice against the inner” (“Critical Notice,” p. 91).

All these criticisms of Wittgenstein suggest that Strawson holds the view that the connection between behavior and mental states is, after all, a contingent one. But this, as we have seen, is not so. How, then, does Strawson reconcile these apparently conflicting aspects of his thought? His line of thought appears to be approximately that general agreement in judgment is necessary before it is possible to have a common language. Such general agreement exists about, for example, “what it looks like here,” and this agreement makes possible our common impersonal language of, for example, color. There is no such general agreement about “whether or not ‘it's painful here,’” and there is thus no possibility of a com-

mon impersonal pain language. However, there is something available (namely, pain behavior) on which general agreement is possible, and if we are therefore to have a common pain language, we must each ascribe pain to others on the basis of their behavior. In this way a common personal language becomes possible.

In discussing Strawson's thought, it is crucial to emphasize that until a person decides to ascribe pains to others on the basis of their behavior, he has not got and cannot have our concept of pain, for part of that concept is that a pain is something that someone possesses. Nevertheless, he can have a concept (or perhaps something more rudimentary than a full-fledged concept) that is akin to our concept of pain but does not involve the idea of something that is had or possessed by either himself or others.

Perhaps this can be made more intelligible by considering a conceivable though unlikely case, that of a young child who has not yet got our concept of pain but is on the way to getting it. When he falls and knocks his head or scrapes his knee, he says, “It hurts.” He has learned this sentence, perhaps as a replacement for natural cries of pain, and he uses it to get picked up and otherwise comforted. However, when his twin brother or a brick falls off the table, and the child is asked, “Does it hurt?” he replies, “No.” Nevertheless, he cannot be said to mean by “It hurts” what is meant by “It hurts me,” even though he says the former only when the latter is true, for he attaches no sense to “Does it hurt John?,” as opposed to “Does it hurt me?” Nor, with regard to what he calls hurting, does he see any difference between John and a brick. If John says, “It hurts,” when he himself is feeling all right, he regards what John says as simply untrue. In order for this child to make the transition to the concept of pain as something that either he or someone else has, he must learn to say, “It hurts John,” when John bumps his head and cries and to say, “It hurts me,” when formerly he said only, “It hurts.” Until this linguistic convention is acquired, the child cannot be said to have the concept of pain as a property of persons at all, not even as a property of himself.

Thus, the argument from analogy breaks down because it assumes not only that a person can have a private language but that this language contains our concept of pain (ascribed pain). But such a language could contain at best only a concept of what we may call unasccribed pain. The connection between unasccribed pain and my behavior is a contingent one, but the connection between behavior and ascribed pain is not. We can see now why Strawson says, “I have argued that such a ... ‘justification’

[of our beliefs about others] is impossible, that the demand for it cannot be coherently stated" (*Individuals*, p. 112). To talk about other people's pains at all is to accept and use the concept of ascribed pain, and it is an integral part of this concept that behavior shows any person whether that concept applies to other people.

*Criticisms of Strawson.* Strawson's views are open to some of the criticisms that have been directed against opinions that are the same as his own. In addition, Ayer has directed a number of criticisms specifically against Strawson's positions, asserting that his notion of logical adequacy is obscure and arguing that this obscurity is irremediable. It is certainly true that Strawson does not make the notion of logical adequacy as clear as he might, but Ayer's reasons for thinking that this obscurity could not be remedied are themselves inconclusive. Ayer's other main criticism is directed against Strawson's reason for holding that neither the argument from analogy nor the philosophical skepticism that arises from this argument can be stated coherently. This criticism is based on a failure properly to understand Strawson's position, which in turn leads to the mistaken idea that Strawson cannot allow for the existence of someone with the concept of a person "who was invariably mistaken in ascribing states of consciousness to others" (*The Concept of a Person and Other Essays*, p. 106).

There is nothing in Strawson's position to prevent him from holding that analogy is used in the ascription of states of consciousness to others; the only thing that he rules out is analogical *argument* of the traditional pattern. To understand this, let us use the words "upain" and "utickle" for the concepts of unasccribed pains and tickles. According to Strawson, in order to pass from these concepts to those of (ascribed) pains and tickles, I must adopt verbal rules according to which I say "I have a pain" when there is a "upain" and "He has a pain" when another body exhibits certain behavior, and so on. But what sort of behavior, and so forth? There is no reason that Strawson's answer should not be along some such lines as "behavior, etc., that is like the behavior, etc., that this body (i.e., mine) exhibits when there is a upain." In accepting such a rule, I am not *arguing* by analogy. Now, I can adopt such a rule and thus have the concept of a person, but I can still fail to realize that all the objects I regard as persons are in fact unlike myself in ways that I have not noticed.

Ayer describes an imaginary child who is brought up and taught to speak by lifelike robots and who never meets real people. He argues, quite correctly, that this child would have the concept of a person and yet always

be mistaken when he ascribes mental attributes to anything. But no consequences fatal to Strawson's views follow from this. The child has adopted the verbal rule whose acceptance, according to Strawson, is necessary for the possession of the concept of a person. The child mistakenly thinks that the robots are persons because he believes that they are much more like himself than in fact they are. This gives no ground for the skeptical conclusion that I may here and now be mistaken in my belief that there are other people besides myself. If one accepts Strawson's position, such skepticism need be justified only if what I think to be other people are a great deal less like me in behavior, etc., than I take them to be. If there is a doubt left here, according to Strawson it can have nothing very specifically to do with other minds. The basis of Ayer's misunderstanding is his mistaken belief that Strawson "infers that any attempt to justify the belief that there are other persons by relying on the premiss that one knows oneself to be a person would be circular; the premiss would already assume what the argument is supposed to prove" (*ibid.*, p. 104). But Strawson's objection to the argument from analogy is not that it is a circular argument. According to him, the trouble is that the argument both uses the concept of a person and rejects the verbal rule that is a necessary part of that concept, namely, the rule that mental attributes are to be ascribed to things on the basis of their behavior, and so on.

JOHN WISDOM'S VIEWS. Finally, something should be said of John Wisdom's very important work on this problem. It is quite impossible to summarize Wisdom's contribution as another solution to the problem of other minds. This impossibility is inherent in his views about philosophy and in the method he used in conformity with these views. All that can be done here is to give some idea of what is to be found in his writings on the problem of other minds by sketching his method of dealing with it.

Wisdom was much influenced by Wittgenstein, especially in regard to the idea that the treatment of a philosophical problem is in some ways like the treatment of an illness. Such a problem or puzzle is a symptom of deep-seated intellectual disorder that consists in a persistent tendency to think about a certain area of thought and language in accordance with a misleading and partially inappropriate model. The puzzle is dissipated when one is "cured" of this tendency. Inattention, however, is not the only remedy, nor is the taking of drugs. The only "cure" available to a philosopher qua philosopher is a certain form of insight. The misleading model that distorts one's thinking is largely an unconscious one. Insight and freedom from its grip are obtained by bringing it into the

open, by making quite clear in detail how our thought is governed by it, and by giving us a proper view of the nature of, for example, our knowledge of other minds.

Thus, Wisdom's first aim is to induce and sharpen philosophical perplexity by showing how it arises precisely out of the sort of position that is at first sight the most attractive to us. For example, the most natural answer to the question about other minds is the traditional one. But it is from this answer and the way of thinking that goes with it that philosophical skepticism most easily arises. Skepticism is satisfactorily removed only when we are brought to see that knowing about other minds is not altogether like other ways of knowing that are by analogy and that it need not be. It might be thought that the aim of a philosopher should be to find a correct model that does not mislead. But according to Wisdom, this is not so. Although every statement has its own logic, the logic of every statement is in some degree like that of every other. We cannot usefully create a limited set of pigeonholes into one of which goes our knowledge of other minds along with, say, our knowledge of the past, while our knowledge of any theoretical entity goes into another. The matter cannot come to this sort of a conclusion. There will be important differences that will make inappropriate any such pigeonhole, as well as the likenesses that make it possible. To get a true grasp of the nature of our knowledge of other minds, it is necessary to make a very large number of detailed comparisons between the various ways in which we know or might know things and between the logic of various types of statements. Only then will we see psychological statements and the ways in which we know of the existence of other people's thoughts and feelings in all their idiosyncrasies and in all their similarities to other statements and to other ways of knowing things. Until this is done, we cannot be entirely freed from our tendency to see things as they are not.

As may be deduced, Wisdom's writings about other minds are almost as much about induction, the past, perception, philosophy of science, and so on as they are about other minds. He used his method with subtlety, inventiveness, and imagination. Many points made by later writers on the problem of other minds are little more than elaborations or oversimplifications of points already made by Wisdom.

## OTTO, RUDOLF

(1869–1937)

Rudolf Otto, the German theologian, was born at Peine in Hanover. He studied at Erlangen and Göttingen, where he became a *Privatdozent* in systematic theology in 1897. In 1904 Otto was appointed professor of systematic theology at Göttingen. He accepted similar posts at Breslau in 1914 and at Marburg in 1917, where he remained until his death. In addition to his philosophical work, Otto published works on Christ, on Indian religious thought and its relation to Christianity, and on various theological topics.

### RELIGIOUS FEELING AND RELIGIOUS KNOWLEDGE

Otto's most significant philosophic contribution is to be found in his discussion of religious feeling and religious knowledge—a discussion that begins with his earliest work and culminates in *The Idea of the Holy*.

In *Naturalism and Religion* (1904) Otto discusses the relation of religion to a naturalism that demands that everything be explained on the basis of mathematical-mechanical laws, thus excluding the beyond, purpose, and mystery, which are essential to religion.

**COGNITIVE CLAIMS OF RELIGION.** Religion makes certain claims—that the world is conditioned and dependent, that there is a providence, that there is a side other than that which appears to us. These claims are not put forward as poetry but as truths. They cannot, however, be justified by, nor derived from, a consideration of nature in any straightforward sense. Reason may show that science does not conflict with these claims and even that science is unable to consider their truth-value. Reason may also point out hints in nature that suggest that these claims are true; reason cannot, however, justify them. These truths differ in kind from those of science and common sense and have their own grounds—the heart and conscience, feeling and intuition. Correlations can be made between various feelings, on the one hand, and religious claims, on the other. Corresponding to the claim that the world is conditioned and dependent is the feeling of the dependence and conditionality of all things. The claim that there is a providence, or teleological order, in things implies that certain value judgments are true and these value judgments rest on feeling and intuition. Corresponding to the claim that there is a beyond is piety—a feeling and intuition, which is bound up with our experience of the beautiful and the mysterious, that there is a reality behind appearances.

### RELIGIOUS FEELINGS AND INTUITIONS

In *Naturalism and Religion* it is not entirely clear just what these feelings and intuitions are. Otto sometimes talks of them as if they were feelings in a straightforward sense. At other times he talks of them as if they were half-formulated judgments that carry with them an inescapable sense of conviction, and at still other times he talks of them as if they were cognitive experiences in somewhat the same way that visual experiences are cognitive.

**CATEGORIES AND IDEAS.** The notion of religious feelings and intuitions receives a more complete treatment in *The Philosophy of Religion Based on Kant and Fries* (1909), in which Otto follows the position of Jakob Friedrich Fries. We have an immediate knowledge of reality, the noumenal world, which shows itself in "feelings of truth." These feelings can be brought to full consciousness as ideas. An idea is a concept that can be applied to reality. When temporally schematized, the categories of theoretical reason can be applied to appearances and can also, when schematized by the principle of completeness (a principle based on reason's "perception and knowledge"

that real existence is necessary, one, and complete), be applied to reality itself. A category thus schematized is an idea. These ideas are essentially negative. In effect, they exclude certain characteristics—temporality, contingency, and so on—from reality.

In the case of the practical reason the “feeling of truth” cannot be completely conceptualized. Practical reason does, however, derive the idea of reality as “the reign of purpose” from the principle of the dignity of the person that underlies the concept of duty. The idea is again presumably negative.

The negative judgments obtained through applying the ideas of theoretical and practical reason to reality must be supplemented by positive knowledge, which is gained through feelings or perceptions that cannot be adequately expressed although they can be communicated. These feelings, or perceptions, again seem to be, simultaneously, feelings in an ordinary sense, the ability to make judgments according to criteria that cannot themselves be formulated, and a direct perception of an objective existence—in this case, reality. Otto distinguishes between the feeling of beauty and of the sublime, on the one hand, and religious feelings, on the other. Although the discussion is somewhat obscure, it would seem that all three of these feelings either directly or indirectly disclose reality.

## NUMINOUS FEELINGS

In *The Idea of the Holy* (1917), Otto attempts to make a clear distinction between numinous, or religious, feelings and feelings that might be confused with them, such as the feeling of the sublime. Numinous feelings have two primary aspects—a feeling of religious dread and a feeling of religious fascination. The closest analogue to religious dread, or awe, is the feeling of uncanniness—the feeling one has when the hair on the back of one’s neck rises, the shudder or terror on hearing a ghost story, the dread of haunted places. The feeling of fascination by, attraction to, and prizing of the object that arouses the feeling in question creates both the desire to approach the object and the feeling that one possesses no value when considered in relation to the fascinating and prized object.

Otto’s attempt to describe the various feelings must be distinguished from his theory about numinous feelings. Numinous feelings are unique; they cannot be analyzed as a complex of such nonnuminous feelings as love, fear, horror, a feeling of sublimity, and so on. Second, the capacity for numinous feelings is unexplainable; although the capacity may appear in the world only when

certain conditions are fulfilled, the conditions do not constitute an adequate explanation of the capacity in question.

Numinous feelings are also cognitive. Two claims are made at this point. First, the feelings are the source of the concept of the numinous—the concept of something that is both a value and an objective reality. The numinous feelings are also cognitive in the sense that they are like visual experiences. They have “immediate and primary reference to an object outside the self”—the numinous quality or object, which is an object of numinous feelings in somewhat the same way that visible objects and qualities might be said to be the object of visual experiences.

INTERPRETATIONS. The relation between these two claims is not clear. At least two interpretations are possible. The first interpretation makes central the claim that numinous feelings disclose the numinous object. The encounter with the numinous object through numinous experiences gives rise to the concept of the numinous in much the same way that encounters with objects and qualities through visual experiences are thought to give rise to the concepts of those objects and qualities. The concept of the numinous is, then, a posteriori in the sense that it is derived from the experience of an object or quality. It is, however, a priori in the sense that it is not derived from any sense experience. In this interpretation the feeling is the source of the concept only in the sense that it discloses the object of the concept, the encounter with the object producing the concept of the object.

In the second interpretation the feeling gives rise to both the concept and the disclosure of the numinous object, yet it is not the encounter with the numinous that gives rise to the concept of the numinous. Rather, the feeling furnishes the concept in much the same way that Immanuel Kant’s theoretical reason furnishes the various a priori categories. The concept of the numinous is, then, a priori in a standard sense. The feeling does more than this, however. The feeling that furnishes the concept also discloses the object to which the concept applies. How are these two functions of numinous feelings related? Neither the concept nor the object is, it would seem, given in isolation. Rather, the object is given through the concept or as structured by the concept. The two are given together although one is not derived from the other. In either interpretation Otto makes the claim that feeling puts us in contact with, discloses, is an awareness of, intuits something outside ourselves. In this respect feeling is like visual and auditory experiences. It has an objective referent whether this is structured by an a priori concept or

whether it simply gives rise to a concept. Unfortunately, the difficulties involved in this claim are not discussed. Obvious disanalogies with ordinary perception (the absence of tests for “mis-seeing,” the fact that no sense organ is tied to numinous experiences, the fact that nonpsychological predictions cannot be based on numinous experiences in the way in which they can be based on visual experiences, and so on) are ignored.

### THE NUMEN

Otto calls the object of numinous feelings the numen, something that is both value and object but which can be only indirectly characterized by means of “ideograms”—that is, by designating properties which would appropriately call forth a feeling response analogous to that evoked in the encounter with the numen. For example, the encounter with the numen evokes religious dread. This is analogous to fear. Accordingly, we indicate the property of the numen that arouses religious dread by *wrath*, a term that refers to a property which often produces fear. In addition to this, however, we can and should “schematize” the numen by means of such rational concepts as goodness, completeness, necessity, and substantiality. That is, concepts of this sort may be predicated of the numen. The resulting judgment is synthetic a priori. It may be suggested that the cash value of the last claim is that we just “see” the connection to be appropriate if we possess numinous feelings.

### THE HOLY

When the concept of the numinous and the schematizing concepts are brought together in this way, we have the “complex category of the ‘holy’ itself.” The category is a priori in the sense that (1) the connection between the notion of the numinous and the schematizing concepts is a priori, (2) the concept of the numinous is a priori in that although it arises “amid the sensory data ... of the natural world, ... it does not arise out of them,” and (3) the schematizing concepts are a priori.

The last claim is difficult to maintain, however, for Otto’s examples of the schematizing concepts seem to make this impossible. It could perhaps be argued that schematizing concepts such as completeness, necessity, substantiality, and goodness are a priori. Otto also wishes to say, however, that the concepts of love, mercy, and moral will can function as concepts that schematize various aspects of the numinous. It is difficult to maintain that a concept such as love is a priori. What Otto maintains is that although “love” as applied to the numen and “love” as applied in ordinary situations have the same

content, their form differs. When referred to the numen, the term is taken absolutely; when it is applied in ordinary situations, it is not. Otto seems to mean that love in the ordinary sense admits of degrees that can be arranged on a scale. The love of the numen is the limit of this scale. Since the limit (whatever this might be) is not given to us in sense experience, we may call it a priori.

### RELIGIOUS FEELINGS AND THE NUMEN

We can now explicate more fully the role that religious or numinous feelings play in religious knowledge. They disclose the numen to us. They are the source of the concept of the numinous. Finally, they appear to warrant the synthetic a priori judgments that link the schematizing concepts to the concept of the numinous.

The relation between the account presented in *The Philosophy of Religion* and *The Idea of the Holy* is, I think, clear. The ideas have become the “Idea of the Holy” (which breaks down into the concept of the numinous and the schematizing concepts), reality has become the numen, and feelings and intuitions have become numinous feelings.

### AUTONOMY OF THE SPIRIT

Another theme, although less philosophically interesting, is of central concern to Otto himself—the autonomy of the spirit and of the spirit’s religious capacities. In asserting that the spirit is autonomous, Otto is claiming that the laws of the spirit are fundamentally different from those of the natural world. In effect, they are the prescriptive laws of logic and ethics (and of religion?) rather than the descriptive laws of physics and psychology. Insofar as a spirit determines itself by prescriptive laws, it is free. Otto is further claiming that spirit is the source of concepts, principles, intuitions, and valuations that cannot be derived from sense experience. And, finally, he is claiming that although spirit develops under the influence of external stimuli, it is something unique in its own right. Spirit cannot be explained by, nor can its occurrence be predicted on, the basis of a consideration of sense experience alone. Spirit and its operations “emerge” under certain conditions but are not explained by these conditions.

## OUSIA

In classical Greek philosophy, *ousia* (a noun derived from the present participle of the Greek verb "to be") most often expresses one or another of four closely connected concepts: (1) what something is in itself, its being or essence; (2) an entity which is what it is, at least with respect to essential attributes, on its own and without dependence on any more fundamental entity of another type outside itself (in Plato's middle dialogues, the forms; for Aristotle, substance; for the Stoics, the material substrate); (3) for Plato, being as opposed to becoming; and (4) for the Stoics in some instances, existence as opposed to nonexistence. Depending on the context, *ousia* may be translated as "being," "essence," "reality," or "substance."

Employed in ordinary Greek to speak of a person's wealth and possessions, the word *ousia* was put to philosophical use by Plato in his early dialogue *Euthyphro* to state a requirement on definitions. Asked what piety is, Euthyphro answers that it is what is loved by all the gods. Socrates responds with a clear statement of concept (1), saying that Euthyphro has mentioned merely something that qualifies piety externally and has failed to give the *ousia* of piety (11a4–b1), what it is in itself that leads the gods to love it.

The transition from concept (1) to concept (2) occurs most clearly in the *Phaedo*, a dialogue of Plato's middle period. There the character Socrates introduces several forms, including the just itself and the beautiful itself (65d4–8), and speaks of them as the *ousia* of other things (65d13), in the sense that other things become just

or beautiful, for example, only by participation in, or dependence on, the corresponding form (101c3–4). Each such form is an *ousia* according to concept (2) (76d9, cf. 77a2), a being or reality (78d1) that is always the same and unchanging (78d1–7), an object of thought rather than sensation.

In the *Republic* a similar picture obtains, but there the character Socrates speaks of the forms collectively as *ousia*, with the exception of the form of the good (VI, 509b8–9), and contrasts this invariant, unqualified, and cognitively reliable being first with the many sensible things, which can appear, for example, beautiful in one respect but ugly in another (V, 479c7, cf. 479b6–d1), and then with the collective becoming and decaying of these sensibles (VI, 485b21). This use of the word *ousia* to express concept (3), being as opposed to becoming, is frequent in book VII, where the study of the mathematical sciences serves to lead the prospective philosopher-rulers to turn away from becoming and toward being (VII, 525b5, cf. 525c6, 526e6, 534a3). This strong distinction in the *Republic* between being and becoming has been questioned by some scholars. In any case, it is considerably attenuated in some of Plato's later dialogues, including the *Philebus*, where the character Socrates asserts "Every process of generation ... takes place for the sake of some particular being [*ousias tinas hekastēs*]" (54c2–3).

In the *Categories*, Aristotle uses the word *ousia* occasionally in the concept (1) sense of essence (e.g., at 1a1–2), but at the center of the discussion in the *Categories* is concept (2), and *ousia* in this sense becomes a technical term rendered by most translators as "substance." Moving even further from the view of the *Republic* than Plato does in his later dialogues, Aristotle argues that *ousia* in sense (2) belongs primarily and most of all to sensible entities like a particular human or a particular horse (2a11–14), since these "primary substances" (2a35) are substrates, or ontological subjects, not only of their own essential attributes but also, differently, of invariants from other categories, such as a certain quality or a certain quantity, that happen to be "in" them at one time or another (2a34–b5). He concludes that everything else under discussion in the *Categories*, including the species and genera of primary substances (called "secondary substances" at 2a14) as well as all the invariants in other categories, depend on primary substances for their being, in the sense that without primary substances, none of the others could be (2b5–6). (For an even stronger claim that all depends on substance, the focal or referential theory of the meaning of "being" [Gk. "to on," the participle], see *Metaphysics*, IV, 1003b5–10; cf. Devereux, pp. 220, 232.)

Aristotle's other extended discussion of *ousia* (*Metaphysics*, VII, VIII) accepts the view of the *Categories* that particular animals and plants fall under *ousiai* in sense (2) (VII, 1028b8–10). But book VII, having brought in the distinction between matter and form introduced in the *Physics* (190b1–191a22) to explain the coming-to-be and passing-away of particular sensible substances, subsequently regarded as composites of matter and form, says that such composite sensible substances are "posterior" to both matter and form (1029a30–32). It then argues at length for the thesis that form is primary substance (1037a5–7 and 1037a27–30, cf. 1032b1–2). This thesis raises two important questions. How does the thesis fit with Aristotle's position in the *Categories* that entities like particular horses and particular humans are primary substances? And is the primary substance the form of the species, which, though not a universal (1038b1–16), is nevertheless present in all the particular members of that species, or is it the particular form of a particular member of the species, unique to it and not present in any other member? These issues have been much debated since the 1950s, but in the 1980s and 1990s the weight of scholarly opinion shifted somewhat toward the particular-forms view, even as the widespread assumption that *Metaphysics* VII–VIII is a later work than the *Categories* came into question. (On these issues, see both Frede and Wedin; for a different view, see Loux.) The thesis that form is primary substance opens up the possibility of an inquiry, promised in book VII (1028b27–33), as to whether there can be any substance entirely separate from matter. This inquiry, carried out in book XII, leads Aristotle to conclude that there are not only eternal material substances (e.g., the planets, on his view) but also eternal immaterial substances (1071b4–5), including Aristotle's god, the first unmoved mover whose ceaseless thinking upon thinking (1072b1–30) inspires the movement of the outer sphere of fixed stars (1073a23–30).

Among the Stoics, by contrast, *ousia* in sense (2) is the single material substrate of all things, considered in abstraction from all qualities and relations depending on it (Calcidius, see Long and Hedley, Vol. 1, p. 269–270; for the Stoics' debt here to Plato, *Timaeus* 50a5–c6, see Menn, p. 216). Some Stoics also use the word *ousia* in sense (4), existence as opposed to nonexistence, to distinguish objects of thought that exist, objects that are peculiarly qualified portions of the material substrate *ousia*, for example, a particular horse, from objects of thought that are purely fictional and do not exist, for example, a centaur (Seneca, see Long and Hedley, Vol. 1, p. 162).

## OWEN, G. E. L

1922–1982

Gwilym Ellis Lane Owen was a major force in the post–World War II upsurge of analytically oriented philosophical work on ancient philosophy. The author of articles of enduring value, the subject of much discussion and controversy, many of them among the classics of the philosophical study of pre-Socratic philosophy, Plato, and Aristotle, he was concerned principally with the logic of argument, metaphysics, and philosophy of language; he had no substantive interests in ethics, political theory, or aesthetics. He understood the ancient philosophers as engaged in conceptual investigations of live philosophical interest. Raised in a Welsh family in Portsmouth, England, he matriculated at Corpus Christi College, Oxford, in 1940, completing his bachelor of arts degree in 1948, after war service in the Pacific arena. In 1950 he received a bachelor of philosophy degree under Gilbert Ryle's supervision, with an epoch-making thesis on logic, philosophy of language, and metaphysics in Plato's *Theaetetus*, *Parmenides*, *Sophist*, *Statesman*, and *Philebus*. Its main

ideas formed the basis of his influential, though controversial, first publication, "The Place of the *Timaeus* in Plato's Dialogues."

After postdoctoral research at the University of Durham, Owen returned to Oxford in 1953 as university lecturer in ancient philosophy (from 1958, also nontutorial fellow of Corpus Christi), university reader (1957), and professor of ancient philosophy as first incumbent of that chair (1963). In 1966 he went to Harvard as professor of philosophy and the classics to direct a new PhD program in classical philosophy. In 1973 he returned to Great Britain as Laurence Professor of Ancient Philosophy in the Classics Faculty at Cambridge, and as fellow of King's College, where he remained until his early death in 1982.

Owen's year-long Oxford lectures on pre-Socratic philosophy, and his courses and seminars on Plato and Aristotle throughout his career, were famously exhilarating, challenging, and fast-paced explorations of central texts and topics in the study of ancient philosophy. A remarkably high percentage of the leading ancient philosophers of the next generation learned their craft and drew their initial inspiration from these classes. More than any of his contemporaries, Owen's example and personal influence shaped the growth and expansion in the philosophical study of ancient philosophy in the late twentieth century.

More than half of Owen's published work concerned Aristotle primarily, but his work on Plato and the pre-Socratic philosophers Parmenides and Zeno of Elea was equally ground breaking. He rejected the traditional idea that Plato's *Timaeus*—with its conception of the physical world as a "copy" drawn by a creator god from his intellectual vision of Forms existing in a separate nonphysical realm—was the culmination and permanent legacy of Plato's work in metaphysics. Rather, he read the dialectical and logical investigations of the *Parmenides* and *Sophist*, and others of what under his influence came to be referred to simply as the "late" dialogues, as containing deeper and more adequate reflections on issues of being and not-being, unity and multiplicity, becoming and change.

Confused ideas about these issues had motivated the "middle-period" theory of Forms, of *Symposium*, *Phaedo*, *Republic*, and *Timaeus*. Owen argued that *Timaeus* was in fact composed, not, as traditionally assumed, toward the end of Plato's life, but rather as a premature copestone to the middle-period theory, which was to be undermined and reconsidered in the "late" dialogues. His influential essays, "Notes on Ryle's Plato" and "Plato on Not-Being," dealing respectively with *Parmenides* and *Sophist*, cast new light on these intriguing but very obscure works, and

spearheaded a generation of subsequent scholarly and philosophical work on them. His essays “Eleatic Questions,” “Zeno and the Mathematicians,” and “Plato and Parmenides on the Timeless Present” had a similar effect on studies of Parmenides and Zeno.

Owen’s work on Aristotle concentrated on logic, methodology, physics, and metaphysics, but included one provocative paper on “Aristotelian Pleasures.” This investigates Aristotle’s idea that pleasure is to be conceived not as a passive experience but is itself an activity. Owen advanced the challenging thesis that Aristotle’s two discussions of pleasure in *Nicomachean Ethics* VII and X have interestingly divergent conceptions of the relationship between the activity that pleasure itself is and whatever one takes pleasure in. In “Logic and Metaphysics in some Earlier Works of Aristotle” he paid careful attention to logical and philosophical details in some of Aristotle’s earliest works and showed that the then popular picture of Aristotle’s development (due to Werner Jaeger) was unacceptable. Far from only gradually freeing himself from a committed belief in a universal science of being, gained through the knowledge of middle-period Platonic Forms, Aristotle began by rejecting both the existence of such Forms and the possibility of any universal science of being.

It was only much later, with the employment of what Owen called a theory of “focal meaning” for *being*, that Aristotle could reconcile himself to any general science of being, or metaphysics. It was, however, the being of Aristotelian substances, not Platonic Forms, which provided the linchpin and focus of that science. In “The Platonism of Aristotle” and “Particular and General,” he carried this analysis forward, finding in the middle books of Aristotle’s *Metaphysics* an avowed sympathy with Plato’s general metaphysical program—with Aristotelian forms, not Platonic Forms, at the center of the enterprise. Other well-known papers proposed an influential analysis of the “appearances” that Aristotle notoriously made the basis for the use of dialectical inquiry in physics, ethics, and other areas of philosophy (“*Tithenai ta phainomena*”), and argued that in his theory of categories Aristotle countenanced nonrepeatable individuals only in the category of substance. In other categories the “individuals” were such things as specific, narrowest *shades* of colors, not color-instances possessed uniquely by individual sub-

stances (“Inherence”). His paper “Aristotle on Time” also generated much discussion.

Owen was a moving force for the founding in 1957 of the Symposium Aristotelicum, a triennial select meeting of British, European, and North American scholars for concentrated joint study of a single Aristotelian text or topic. These meetings have done much to bring the diverse national traditions of Aristotelian scholarship into mutual communication. Several of Owen’s articles originally appeared in the Symposium’s triennial volumes. Many of his papers were reprinted in collections too numerous to list. After his death, they were all published together in 1986 (as *Collected Papers*); details of the original and other prior publications can be found there.

## PACIFISM

“Pacifism” is moral opposition to war. The concept embraces a wide range of positions from an absolute prohibition of all use of force against persons to a selective and pragmatic rejection of particular forms of such force under varying circumstances. Pacifists vary on their moral grounds for rejecting war and on their commitments to varieties of nonviolence.

Etymologically, pacifism comes from the Latin *pax*, *pacis*, “peace” (originally “compact”) + *facere*, “to make,” and literally means “peacemaking.” Often, pacifism is incorrectly identified as passivism, which derives from the Latin *passivus*, “suffering,” and means being inert or inactive, suffering acceptance. Pacifists may be passivists but often are activists, choosing nonviolent means to resolve conflict and achieve personal and social goals.

Pacifism consists of two parts: the moral opposition to war and the commitment to cooperative social and national conduct based on agreement. Beyond the mere absence of war, peace is a condition of group order arising from within by cooperation among participants rather than order imposed from outside by domination by others. Pacifism’s opposition to war is much more fre-

quently reflected in philosophic literature than is its active creation of peace.

Moral opposition to war is discussed across the history of Western philosophy. While early considerations of the morality of war can be found in ancient Greek texts (e.g., Plato, *Republic*, Book IV, 469c–471c), more thorough treatments are much later—notably from Desiderius Erasmus in the sixteenth century and Immanuel Kant in the late eighteenth. Adin Ballou articulated pragmatic pacifism in the mid-nineteenth century, and William James explored pacifist philosophy in the early twentieth. Arguments for pacifism tend to focus on the evils of war, including human suffering—especially of innocents—and moral degradation of participants as well as the uncontrollability of modern warfare.

The case for pacifism varies with the form of pacifism being put forth. Absolute pacifism, the view that it is wrong under all circumstances to use force against persons, may rest on one interpretation of Kant’s categorical imperative, on Mohandas Gandhi’s *Satyagraha* (truth force), on Martin Luther King Jr.’s notion of Christian love, or on other moral bases. Weaker forms of pacifism may rest on interpretations of these same principles or on other grounds. Epistemological pacifists stress the impossibility of knowing sufficiently to warrant taking lives,

while pragmatic pacifists trace the empirical history of war to emphasize failures in achieving the ends that were to justify carnage. Nuclear pacifists focus on the projected effects of thermonuclear exchange, and ecological pacifists consider the effects of modern war on ecosystems.

## PAIN

There is no consistent philosophical view concerning the nature of pain, how to understand it, or what an understanding of pain might mean for philosophy of mind. Just

about every conceivable position concerning the nature of pain is held by some leading thinker. Each of these positions has become grist for someone's mill in arguing either that pain is a paradigm instance of a conscious state or that pain is a special case and should not be included in any general theory of consciousness.

### PHILOSOPHICAL VIEWS OF PAIN

Some philosophers and psychologists hold that pain is completely subjective: Either it is essentially private and completely mysterious, or it does not correlate with any biological markers but is completely nonmysterious. The International Association for the Study of Pain (IASP), the formal organization charged with defining pain, has articulated a paradigm subjective view. They write: "Pain is always subjective. . . . Many people report pain in the absence of tissue damage or any pathophysiological cause; usually this happens for psychological reasons. There is usually no way to distinguish their experience from that due to tissue damage if we take the subjective report. . . . [Pain] . . . is always a psychological state" (1986).

However, if one holds that pain does not correlate in some way with some sort of bodily state or event, one becomes a dualist. If pain just is a private experience, and that experience has no consistent underlying physical cause or correlate, then any interesting connection between the mind and the body over pain is lost.

Philosophers can eschew dualism by retreating to so-called token-token identity theory. Every experience in some creature is correlated with—identical to—some event or other in that creature's brain. And every experience in some other creature is correlated with—identical to—some event or other in that creature's brain. If the subjectivists are right, then there is no identifiable neural activity that is the same across all experiences of a type of pain. There is no brain correlate for the type "having a migraine headache," for example. Generic headache experiences occur only at a level of abstraction above brain activity—namely, in the mind and its cognitive states.

However, if philosophers deny type-type identity for larger brain structures across organisms, then they are also denying any hope of discovering mind-brain connections. For mental event-physical state correlations taken one at a time are all a robust token-token identity theory allows.

At the same time, scientists do believe that there are areas in the brain dedicated to pain processing, just as there are other areas dedicated to vision, audition, touch,

and so forth. They believe that these areas are basically the same across humans, despite individual variation. Thus, even though a strict type-type identity might fail for particular sensory experiences, it still underlies views of our sensory systems taken as a whole. Types in science are allowed some play in them. They have to, or else there would be no mechanism by which to pick out any sort of cognitive processing in the brain at all.

All these lessons are missed by proponents of the subjective view, for they identify pain with the experience of pain and then explicitly deny that that experience has any correlation with any particular bodily reaction. But insofar as they want to be materialists interested in a scientific understanding of pain, they will have to permit generalizations connecting something in the body with the sensation of pain (see Hardcastle 1999).

Other philosophers and neurophysiologists argue that pain is completely objective; it is either intrinsic to the injured body part, a functional state, a set of behavioral reactions, or a type of perception. Pain is something that can be measured in bodies or behavior. As such, its connection to mentality, to sensations of pain, is secondary at best. Humans might recognize pain in terms of how it feels—the skin burns, for example. But, according to objective views that take pain as intrinsic to the injured body part, the pain itself is in the tissue. Hence, beliefs or judgments about the condition of the tissue are derivative—that is, pain is inferred from peripheral nociceptive or pain information (Annad and Craig 1996, Derbyshire 1996).

Similarly, if pain is understood as a type of perceptual process, then it works no differently than vision or olfaction. Animals receive some sort of perceptual input on their transducers, manipulate that information in their brains, and then use that manipulated information to alter motor reactions and other mental states. Part of the manipulated information might come into conscious awareness, but that sensation would constitute only a subset of what is meant by pain processing. According to this view, conscious experiences of pain, the damaged tissue itself, and the bodily and emotional reactions are all fundamental to pain processing. Each is one component in a larger process. Working together, these components take pressure, temperature, and chemical readings of tissues and use this information to track what is happening in bodies (Wall and Melzack 1989).

In these cases and most other instances of the objective view, pain is something entirely physical. *Prima facie*, it appears that the states or processes identified with pain could occur without any awareness of them at all. Most

objective views of pain have the unintuitive consequence of divorcing pain from sensations of pain or making the mental events associated with pain processing secondary to and dependent upon the pain processing itself.

There are a few objectivist philosophers who hold that pain is not a purely physical event. Instead, it is something like an attitudinal relation. Pain requires both a bodily state and then cognition over that state. Pain itself is the attitude, the belief, regarding one's bodily condition. This approach gets around the intuitive difficulties of the objective views by identifying pain with the consequent mental state. "Pain" then just refers to the mental event associated with pain processing. According to this view, there is pain processing and then pain proper.

### CENTRAL PHILOSOPHICAL ISSUES

There are three large philosophical difficulties in defending any of the theories about pain processing outlined above: the problem of mental causation, the problem of naturalizing content, and the threat of eliminativism.

The difficulty with mental causation is roughly as follows. If one drops a hammer on one's foot and subsequently experiences pain, *that experience* is the proximal cause of one's writhing, cursing, and gnashing of teeth. Dropping a hammer on one's foot leads to pain behavior only if it causes in one the sensation of pain and the belief that one is in pain. If one were unconscious or otherwise oblivious to one's surroundings, then one could not sense any pain, nor could one believe that one were in pain. One could manifest no pain-related behavior either.

On the other hand, a neurophysiological view of the hammer-dropping incident seems to be able to explain exactly the same events without appealing to mentality or any sort of psychological entities at all. Neurophysiologists might talk about how the intense pressure of the hammer head on a foot stimulates various nerve endings and thus causes action potentials to travel up a leg to a spinal column, where other nerves are then stimulated to fire. These nerves transmit the firing pattern to other nerves, and so it goes until nerves that cause muscles to contract are likewise stimulated and one gets the writhing, wincing, and teeth-gnashing behavior. Why doesn't the possibility of this sort of more precise, purely physical explanation rule out the higher-level, more general mental account? Or why doesn't it make the mental account nothing more than a placeholder until the details of our central nervous system get figured out? As long as one is persuaded by reductionism, then pain provides an exemplar case for why psychological explanations appear so tricky.

There is some evidence that depression is related to pain processing. One view is that untreatable chronic pain causes depression, which in turn increases the sensations of pain. This is a (grossly oversimplified) mentalistic explanation of how a mood causally interacts with other psychological states. At the same time, we know that depression is correlated with a decrease in the neurotransmitter serotonin. Persons suffering from just an imbalance of a neurotransmitter and sensations of pain are some neural state or other, then it seems that the relation between depression and pain should be explained in terms of neurotransmitters affecting neural activity. In this case, the mentalistic explanation is just a stand-in until all the more basic neurophysiological details are revealed.

Mental events causing other mental events seems to be a natural part of the explanatory world. At the same time, accounts of mental causation appear to be nothing over and above a sloppy characterization of more fine-grained and little understood physical details. The difficulty for those who would like to keep the mind intact as an explanatory unit is explicating how it is that mental causation has a legitimate place in an understanding of the universe above and beyond being a surrogate for the real causal story.

Though most philosophers of mind treat mental causation separately from issues concerning reference, explaining the causal powers of the mind really piggy-backs on the problem of naturalizing content. What makes the question of mental causality peculiar is that the content of the mental states is relevant to their efficacy. One winces and nurses one's foot because one's corresponding mental states are about one's foot. If they were about something else, then one would most likely be doing something else. To explain exactly how it is that mental events cause other things, philosophers are first going to have to explain how it is they refer. That is, to justify privileging a mentalistic explanation of sensations and beliefs over a lower-level physicalistic one of neuronal firing patterns or ionic flow, first philosophers have to have a clear grasp on what it means to have mental events with content, since their content is what is causally relevant to subsequent behavior.

The question about the power of the content of beliefs and other mental states is quite important to understanding pain processing (Gamsa 1994). What one is thinking and believing about the world strongly influences how much pain one feels. Athletes intently focusing on their game can break large bones and not even notice it. But the same athletes, alone in their living rooms, will

writhe on the floor if they stub their toes. Chronic pain patients can be trained to diminish their sensation of pain by changing their focus of attention and their beliefs about death and disease. Those suffering congenital indifference to pain often lead short and unpleasant lives both because they can't sense painful stimuli but also because they cannot form appropriate beliefs about the meaning of the vague tinglings they do feel. How pain feels depends to a large extent on the current doxastic milieu. Hence, understanding pain is going to require understanding what beliefs and desires (and other mental states) are and how they refer.

One implication of current scientific theories of pain is that folk ways of describing pains are inadequate and people would be better off eliminating the descriptors from everyday practices (Dennett 1978). The claim is that folkways of talking about pain comprise a rough and ready theory of pain. This theory assumes that pains are identical to the sensations of pain and that the word *pain* can capture the essence of that sensation. From the perspective of some objective views of pain, both assumptions are dubious. Pain processing is enormously complicated, and sensations of pain form only a tiny subset of what these processors do. But even if one focuses exclusively on sensations, the most important to folkways of being, the folk theory is still inadequate. Words to express all the dimensions of pain experiences simply do not exist. The descriptors used are either metaphorical or nonexistent. The folk theory of pain needs to be replaced by something commensurate with the phenomenology.

Consider that not only can the sensory, affective, and cognitive dimensions of pain be distinguished phenomenologically, but they can also be manipulated independently of one another. Mammals can feel a shooting pain in their legs but not suffer in the least from it; they can be in agony from pain without feeling any particular sensation localized to any part of their bodies. Philosophers could just decide by fiat that *pain* is going to refer to the localized sensations, or they could just decide that *pain* is going to refer to the suffering. But either way they do violence to folk notions of pain, which require that a single simple sense datum both seem to occur in some place and be unpleasant.

In response to these sorts of claims, some have argued that folk views of pain do not constitute a theory in any meaningful sense. Some believe that certain introspective facts are known indubitably. Pain is touted as one of those things. Perhaps there are some sensory states, like pain, about which people have special first-person apprehension; no inference of judgment is required.

However, it is quite easy to demonstrate that introspective knowledge of pain can be mistaken. If one burns one's hand by touching something hot, one jerks one's hand away from the heat source. This is a reflex action; the nociceptive information travels up the arm to the spinal column and then back down again. It takes about 20 to 40 msec from stimulus to behavior. The information also travels up the spinal column to the brain. One feels the burn as well. Unlike the reflex movement, this processing is more complicated and takes about 200 to 500 msec from stimulus to percept, a full order of magnitude longer.

Nevertheless, if one introspectively reports on what the incident feels like, one says that one moved one's hand away after one felt the pain; feeling pain initiated the motor sequence. For whatever reason, brains backdate pain sensations so that they seem causally relevant to reflex behavior. But clearly the effect is not caused after it occurs, so the introspective report has to be wrong. There is not any special, first-person knowledge of pains. Whatever knowledge is had is embedded and informed by a conceptual framework of the brains' devising. Despite protests to the contrary, pain experiences have all the earmarks of being at least prototheoretical in nature.

Other detractors point out that even if a completed science of pain does not use folk terms for pain, that would not imply that those sorts of mental states do not exist; they just would not be referred to in scientific discourse. The notion of pain would be analogous to ideas about tables and chairs, germs and gems, and birthday presents and birthday cake. These are perfectly legitimate terms. Science just does not use them. Being cultural artifacts of one stripe or another, they do not refer to things about which there are laws. There might not be a mental science or laws about pains, but folk psychology could still be used as it is now, in everyday explanations of behavior.

There is something undoubtedly right about this charge. In many ways, pain experiences are environmentally determined. Puppies raised without ever experiencing pain and without ever seeing any other dog in pain will exhibit no pain behavior. They will repeatedly sniff a lighted match without fear and then show no reaction when burned. Children learn both pain behaviors and the emotional concomitants to pain from the reactions of others around them. Expressions of pain and reports of sensation and experience are significantly different across cultures. Most of pain experiences and expressions are socially relative, a cultural artifact of sorts.

However, social relativity is not enough to show that folkways of understanding pain are adequate. Different cultures have different experiences; they also have different ways of understanding these experiences. Nevertheless, the burden falls on the folk psychologist to demonstrate how folk theories of pain are actually successful. This work has not just begun.

## THE ETHICS OF PAIN TREATMENT

One of the most hotly debated subjects in pediatric care concerns whether infants are insensitive to pain (cf. Lawson 1988). The presumption historically has been that because young infants are not conscious, they cannot sense pain. As a result, analgesics and anesthetics are rarely used, even in the most invasive of procedures.

At first, this presumption of insensitivity is curious because infants' reactions to painful stimuli are well documented. Even premature neonates exhibit stress responses, hormonal fluctuations, and slowed recovery to painful interventions. In fact, the afferent nociceptive system is up and running by twenty-nine weeks of gestation, even though the pain inhibitory systems do not come on line until later. If anything, infants should be more sensitive to pain than adults. At least, by all indications, infants are sensitive to pain in some sense or other.

However, the question for many doctors is whether infants are aware of their pain. Some argue that unless neonates can consciously apprehend pain, then any sort of response they give to noxious stimuli are merely reflexes. Hence, there is no reason to treat infants' pain because the infants cannot feel anything.

Suppose they are right, even though there is much that goes on in brains that is neither conscious nor mere reflex. It is still the case that infants react to pain, both behaviorally and physiologically, that these reactions can be modified with relatively simple treatments, and that treating pain has an impact on recovery. Early exposure to pain, whether remembered or not, affects later experiences of and reactions to pain by altering the developmental course of the nervous system. Infants, like other newborn animals, learn to attach particular meanings or emotions or importance to particular experiences in virtue of what is associated with those experiences. This sort of behavioral malleability is very important if an organism is going to survive in a complex environment. Consequently, manipulating early experiences can have drastic effects later on, as animal studies show. Merely by changing the smells associated with suckling, scientists can alter adult sexual behavior in male rats, for example. Similar changes occur with pain processing in young

infants. Nociceptive stimuli increase the size of the somatic receptive fields for neurons sensitive to pain and help maintain dendritic connections that would otherwise be eliminated over time. Perhaps, as some believe, chronic pain and hypersensitivity can result from early acute pain episodes, given how the neural receptors change. Early pain experiences have been shown to influence later personality and temperament. Something as common as circumcision can have lasting effects on pain sensitivity if done without anesthesia.

Given the impact early pain processing can have on later development, doctors have every reason to prevent infant pain, even if it feels dissimilar to an adult's, even if it feels like nothing at all to the infant. Whether infants consciously experience pain—and whether they are aware of some noxious stimulus or their own suffering—is a red herring. Available evidence converges around the idea that infants process pain, though perhaps not in the same way adults do. This processing has an impact on current behavior and later development. Because this influence is generally negative, insofar as we are able to prevent or alleviate some of their pain, we should.

## PAIN, ETHICAL SIGNIFICANCE OF

Pain is a paradigm of an intrinsically bad mental state: It is an experience that is harmful to those who undergo it

and makes their life go worse. Virtually all moral theories recognize norms to assist those who suffer from pain and to avoid inflicting unnecessary pain on others, though there is some disagreement about the source of these norms, their exact content, and their scope. The moral status of the pain of animals, for instance, remains a matter of controversy.

Pain has ethical significance when it is understood as an affective experience that is unpleasant or disliked in itself. Thus understood, pain belongs to a family of distinct but overlapping evaluative notions such as distress and suffering. The word "pain," however, is also used to refer to a type of bodily sensation typically associated with damage to body tissue. We normally find such sensations unpleasant, but when they are unaccompanied by an affective response (as reported by patients after frontal lobotomy) or when they are very mild, they are not experienced as unpleasant and no longer have this ethical significance. Furthermore, many hurtful experiences, both physical (nausea, electric shock) and mental (fear, regret) have a negative affective dimension without possessing the specific sensory quality common to cuts and burns. It is thus only pain in the broader, affective sense that is of direct interest to ethics.

The experience of pain is bad in itself but pain is also associated with other ills. Physical pain often accompanies bodily injury, and pain generally tends to incapacitate agents. It is important to distinguish the intrinsic badness of pain from these further harms. We also need to distinguish the badness of pain from a range of goods in which pain can play a part. Pain is instrumentally good insofar as it alerts us to bodily injury, for example. Many regard the painful aspect of just punishment as good, and some view pain as a necessary condition for the development of moral character and spiritual growth, for example. In all of these cases, however, pain can still be said to retain its badness for the agent. Thus pain justly inflicted on those who deserve it counts as punishment, and as good overall, only because it is also bad in itself for the offender. Other cases, such as masochism and the pain of grief, are harder to interpret.

Pain is often contrasted with hedonic states of positive value, such as pleasure and enjoyment. It should not be assumed, however, that pain and pleasure are simple contraries, since the occurrence or prospect of pain appears to have a different moral status, and to give reasons of greater force and urgency, than the occurrence or prospect of pleasure of equal intensity.

Pain also raises questions of ascription and measurement. It is often thought that subjects' sincere reports

about their own pain are authoritative. There are also objective, largely behavioral criteria for ascribing pain. These used to be our exclusive means of detecting pain in animals and infants. These first- and third-person criteria seem ill-equipped, however, to deal with some of the cases reported by doctors and scientists, such as frontal lobotomy and hypnosis. The increased availability of devices that can directly detect the neural correlates of pain may present further challenges to our everyday practice of ascribing and assessing pain.

## PAINE, THOMAS (1737–1809)

Thomas Paine, the author, deist, and American revolutionary leader, was born at Thetford, Norfolk, in England. After an inconspicuous start in life as corset maker and customs officer, Paine emigrated at the age of thirty-seven from England to Philadelphia, carrying a letter of recommendation from Benjamin Franklin. Caught up almost immediately in the turmoil of the developing revolution, Paine published *Common Sense* (January 1776), the first public appeal for American independence as well as the pioneer enunciation of the diplomatic doctrine of avoiding European entanglements. In addition to attacking hereditary aristocracy, Paine expounded the theory that government and society are distinct entities and are not to be confounded, a theory also developed by Jean-Jacques Rousseau and later by William Godwin.

During subsequent stages of the American Revolution, Paine wrote a number of influential newspaper essays, including a famous series, the *Crisis*, concerned with particular political, economic, and military issues. In order to extend his reputation to Europe, Paine wrote the *Letter to the abbé Raynal, on the Affairs of North America*

(1783), refuting among other concepts of the French *philosophes*, the assertion that the Revolution concerned only economic issues and had no moral foundation. A confident affirmation of the idea of progress was incorporated in Paine's notions that the circle of civilization was soon to be completed and that commerce and science had already combined to improve the world to the point where there no longer existed a need to make war for profit.

After the American victory, Paine proceeded to France to seek financial support for an iron bridge of his own invention, once again carrying letters of recommendation from Franklin. In January 1790 he began a work defending Lafayette and the principles of the revolution that had broken out in France, a work that he later converted to an attack on Edmund Burke's highly critical *Reflections on the French Revolution*. The resulting treatise, *The Rights of Man* (Part I, 1791; Part II, 1792), gave a solid theoretical basis to the contingent appeals of Paine's American journalism. Affirming that government should be founded on reason rather than on tradition or precedent, Paine argued that democracy—a society in which all men have equal rights and in which leadership depends upon talent and wisdom—is superior to aristocracy. Although his political principles resemble those of John Locke, Paine later maintained that they were based entirely on his own reasoning and that he had never read the works of the English philosopher.

As a result of his republican writings, Paine was made an honorary citizen of France and in September 1792 he was elected to the French National Convention, taking his seat later that month.

Disturbed by the dogmatic atheism of the French revolutionary leaders, Paine began a treatise on religion, *The Age of Reason*, ostensibly a defense of deism but primarily an attack on Christianity. In Part I (1794), he rejected all forms of supernatural revelation in favor of the religion of nature, elevating, as he put it, reason and scientific observation over the three modes of superstition in Christianity: mystery, miracle, and prophecy. In Part II (1795), Paine continued to praise "the Perfection of the Deity," even though he exposed the abuses of Christianity with such vehemence that he brought upon himself the inaccurate accusation of opposing religion itself.

Although Paine dismissed the miracles of Christianity, he was later ready to believe that providence intervened in his own life. The story is incredible, but it reflects Paine's egoism. Because of his moderate policies in the Convention, particularly in an appeal to save Louis XVI

from the guillotine, he was dismissed from the Convention and incarcerated in Luxembourg Prison. On his return to America, Paine explained that the cell doors of prisoners destined for execution were customarily marked with a number, and he argued that divine providence had protected him by causing his jailer to place the fatal number by mistake on the inside of his door so that it could not be seen the next morning.

One must turn to Paine's minor works to discover the positive side of his deism. His proof of the existence of God (in "A Discourse at the Society of Theophilanthropists") adopts essentially the same reasoning that Isaac Newton had used in a series of letters to an Anglican clergyman, Richard Bentley. Since the laws of mechanics, the argument runs, cannot explain the origin of motion, there must have been an external first cause to give the planets their original rotation. Paine stressed the concept of the plurality of worlds and assumed absolute moral laws. In "Private Thoughts on a Future State," he expressed a faith in an immortality strikingly different from that of most deists. The good people, he believed, would be happy in another world; the wicked would be punished; and those in between—the indifferent ones—would be "dropped entirely." Although contending that religion should be a private affair between each man and his creator, he insisted that no rational mind could logically reconcile new science and old Christianity.

Unable to adjust to French political life under Napoleon Bonaparte, Paine returned to America in 1802, where he was welcomed by liberal Jeffersonians but excoriated by most Federalists. Although he contributed extensively to newspapers under his revolutionary pseudonym of "Common Sense," he failed to regain his earlier influence and died in obscurity.

Paine, as much as any thinker of his age, was obsessed with the notion of the order and uniformity of nature, and he delighted in establishing parallels between one branch of learning and another. He believed that the fundamental laws of nature operative in religion, natural science, and politics were clear, simple, and within the reach of the average man. He developed no epistemology as such but combined a type of Quaker inner light with deistic reason. The fundamental weakness of his system—a weakness shared by most deists—is that he nowhere took up the problem of evil. Although he lavishly praised God for the regularity of the universe, the only suffering he noticed is that caused by social injustice.

Yet even though Paine was more influential as an agitator than as a theorist, he certainly understood and

upheld the ideals of the Enlightenment and deserves to be ranked as one of America's outstanding *philosophes*.

## PALÁGYI, MENYHERT

(1859–1924)

Menyhert (or Melchior) Palágyi, a scientist, literary critic, and philosopher, was born in Paks in west central Hungary. He studied science at Budapest, but his main activity there was as a literary critic. After 1900 he spent much time in Germany, studying informally with philosophers in many places. For a time he held a readership in physics and mathematics in Kolozsvár, Hungary (now Cluj-Napoca, Romania). He had little contact with Hungarian philosophers, however, and eventually returned to Germany, where he died in Darmstadt.

Throughout Palágyi's philosophical works, psychological doctrines and speculations on theoretical physics are mingled with his main interest in epistemology. He interpreted and criticized the then new theory of relativity from the point of view of epistemology, and episte-

mology from the point of view of his psychological theory. As he expressed his views in response to the new developments in these fields, he became somewhat lost in their transitional stages, and the fact that he criticized them from his own particular standpoint hindered his understanding of them. The central dominating idea throughout his works is a broadly Hegelian principle of polarity. It asserts an interdependence of opposites, a sort of cooperative unity, and it was applied by Palágyi with no apparent consistency and even more liberally than Hegelian dialectics would be. Palágyi was a monist who held a curious version of the denial of the distinction between the a priori and a posteriori.

His most purely philosophical work is *Der Streit der Psychologisten und Formalisten in der modernen Logik* (Leipzig, 1902). In it, among other things, he criticized Edmund Husserl for “tearing” logic away from psychology and “submerging” it in mathematics, and for his “ideal meaning” and his distinction between real and ideal laws. (Husserl himself reviewed this book in *Zeitschrift für Psychologie und Physik des Sinnesorgane* 31 [1903].) In the same year Palágyi wrote his *Die Logik auf dem Scheidewege* (“Logic at the Crossroads,” Berlin and Leipzig, 1903). In these works Palágyi’s main concern was not, despite his criticisms of Husserl, a return to psychologism but his principle of polarity. In his psychology, in fact, he tried to rescue from psychologism that which he termed “mental” (even though he only obscurely described the term). The source of all error is to mistake what is mental for what is merely vital (and, in the spirit of “polarity,” what is vital for what is merely mental). He distinguished between mechanical and vital processes and consciousness. The mechanical is publicly observable, and the vital indirectly observable, but consciousness escapes observation by the methods applicable to the other processes: consciousness “punctuates” the vital process and is discontinuous. (He nevertheless explicitly affirmed the unity of the self, although it is doubtful how he could maintain this.) Our knowledge depends on the speed of these punctuations. God is the limiting case who grasps the whole time process instantaneously; for him all punctuations are one. This led Palágyi to such metaphysical claims as that our knowledge catches eternity in the fleeting moment, which is both temporal and eternal.

At the base of this theory of perception was his notion of imagined movement. Touch being the basic sense, all perception depends on our ability to trace the object in the imagination. He mistakenly supported this view by reference to the Kantian role of imagination in perception. His theoretical physics, in which his main

interest was our perception of space-time (space-time being a unity in polarity), can best be understood if approached through this theory of perception.

## PALEY, WILLIAM

(1743–1805)

William Paley was an English theologian and moral philosopher. His father, William, was vicar of Helpston, Northamptonshire, and a minor canon of Peterborough; he later became headmaster of Giggleswick grammar school, where the younger Paley was educated. Paley entered Christ’s College, Cambridge, in 1759, where he studied mathematics and became a senior wrangler. After an interlude of school teaching, he was elected a fellow of his college in 1766 and was ordained a priest in the established church in 1767. He taught at Cambridge for nine years, leaving the university only on his marriage. He held successively a number of different offices in the church, rising to be the archdeacon of Carlisle. Paley was the author of three books, one on morals and two defending Christian belief, all of which were widely read and accepted as textbooks. As late as 1831, Charles Darwin, studying for his BA examination at Cambridge, had to “get up” Paley’s *A View of the Evidences of Christianity*, *The Principles of Moral and Political Philosophy*, and *Natural Theology*. The *Moral and Political Philosophy* contains Paley’s famous satire on property, in which he describes the plight of a flock of pigeons in which private property is permitted. Although he immediately proceeds to list the advantages of a system of private property, his satire is savage (“the weakest perhaps, and worst pigeon of the

flock” controls and wastes all the grain as he pleases), and Paley’s friends are said to have assured him (correctly) that the publication of the passage would cost him a bishopric. It did earn him the nickname “Pigeon Paley.”

Paley’s *The Principles of Moral and Political Philosophy* (London, 1785) is a handbook on the duties and obligations of civil life rather than a philosophical treatise. The subtlety of the work may be gauged by its opening sentence: “Moral philosophy, Morality, Ethics, Casuistry, Natural Law, mean all the same thing; namely, that science which teaches men their duty and the reasons of it.” Paley’s definition of duty follows from his theological utilitarianism. The nature of the human frame implies that it is God’s will for us to be happy in this life as well as in the next. Virtue is doing good to humankind, in obedience to the will of God and for the sake of everlasting happiness. Allegiance to God’s will and a desire for everlasting happiness are sufficient grounds for moral obligation. Paley offers this account of moral obligation after finding that such obligation follows from the command of a superior, which is made persuasive by the prospect of a reward.

We may discover the will of God by consulting either Scripture or “the light of nature,” both of which lead to the same conclusion. The will of God with regard to any action may be found by inquiring into its “tendency to promote or diminish the general happiness.” We should carry out those actions that promote the general happiness and avoid those which diminish it. Promoting the general happiness requires paying attention to the general consequences of our actions. Paley offers a rule for assessing general consequences that resembles Immanuel Kant’s categorical imperative: “The general consequence of any action may be estimated by asking what would be the consequence if the same sort of actions were generally permitted.”

Paley believed that no special faculty is required to enable us to have moral knowledge. Thus he dismissed the views of those who have argued that morality requires either a moral sense, or an intuitive perception of right and wrong, or any other innate or instinctive capacity. All that is required for the foundation of morality is that each man has the wit to see that certain actions are beneficial to himself. Then the sentiment of approbation that naturally arises when these actions benefit him will continue to accompany his perception of these actions when they benefit someone else. Thus the custom of approving certain actions is begun, and children, who learn everything by imitating their elders, carry it on.

The bulk of the *Principles* is a detailed discussion of our duties to others, to ourselves, and to God. The final part is an outline of the elements of political knowledge. The wide acclaim accorded Paley’s work is said to have stirred Jeremy Bentham to bring out his own version of the utilitarian doctrine in *Introduction to the Principles of Morals and Legislation* (1789).

Paley is the author of two theological works with the word *evidence* in their titles. The first, *A View of the Evidences of Christianity* (2 vols., London, 1794), is an essay in apologetics. The second, *Natural Theology; or, Evidences of the Existence and Attributes of the Deity, Collected from the Appearances of Nature* (London, 1802), is, as its title implies, an essay on natural theology. The books, which are similar in tone (they are both presented as judicious, lawyerlike statements of a case) doubtless owe much to Paley’s lifelong interest in trials and the art of advocacy.

*A View of the Evidences of Christianity* demonstrates what can be said on behalf of Christian belief by an appeal to the behavior of the earliest Christians. Paley asks his readers to grant the possibility that God should have destined his human creation for a future state and that he should acquaint human beings with their destiny. If these possibilities are granted, then the need for miracles is clear, for they are the certification of revelation. The credibility of the Christian revelation hangs, therefore, on the issue of whether its miracles are genuine.

It is Paley’s claim that the miracles on which Christianity is based (including those of the Old Testament) are genuine; and that indeed the only genuine miracles are those of Christianity (including its Jewish origins). Paley accepts David Hume’s contention that the believability of Christianity rests ultimately on the reliability of the testimony of the earliest Christians, but he rejects Hume’s thesis that no testimony for a miracle can ever be relied on because such testimony goes against universal experience. He argues that universal experience is too strong a test. By definition, miracles must be exceptions to universal experience or they would not be miracles. The real issue is whether there is a test for the reliability of witnesses who report an event that necessarily only they could have experienced. Paley finds such a test in our observation of whether the person who reports a miracle will cling to his report at the risk of his comfort, his happiness, and even his life. According to Paley, the original witnesses of the Christian miracles pass this test, since they labored and suffered “in attestation of the accounts which they delivered, and solely in consequence of their belief of these accounts.”

Paley's hospitality for miracles is not quite so broad as we might at first think. The miraculous event must be in support of a revelation that is important to human happiness. Mere wonders are thus ruled out; and Paley also holds out against any event that may be resolved into a false perception and against any report that is guilty of exaggeration. But even after setting these limits, Paley maintains that a significant core of miracles stands as the guaranty of the Christian revelation. But the acceptance of these miracles must finally rest on the steadfastness of the original Christians; and the weakness of Paley's argument can be seen when we consider its close resemblance to a lawyer's defending his client by calling for the testimony of none but character witnesses. *A View of the Evidences of Christianity* had a huge success, and the bishops made Paley a prebendary of St. Pancras in the Cathedral of St. Paul's and the subdean of Lincoln.

In his *Natural Theology*, Paley appeals to a number of natural phenomena to establish the existence of a god. He states his argument at the very outset, and the remainder of the work is a train of examples illustrating that argument. The line of the argument runs as follows. If I found a stone while crossing a heath, and if I "were asked how the stone came to be there, I might possibly answer, that, for any thing I knew to the contrary, it had lain there forever; nor would it perhaps be very easy to show the absurdity of this answer. But suppose I had found a watch upon the ground, and it should be enquired how the watch happened to be in that place, I should hardly think of the answer which I had before given, that, for anything I knew, the watch might have always been there. Yet why should not this answer serve for the watch, as well as for the stone?" Paley answers, "For this reason, and for no other, viz. that when we come to inspect the watch, we perceive (what we could not discover in the stone) that its several parts are framed and put together for a purpose"—that is, to tell the time. The care with which the parts have been made and the fineness of their adjustment can have only one implication, namely, that the watch must have had a maker who understood its construction and who designed it for the use for which it is fitted. The conclusion would not be weakened if we had never seen a watch being made or could not conceive of how to make one. Nor would it be weakened if there were parts of the watch whose purpose we could not understand, or even if we could not ascertain whether these parts had some effect in the general purpose of the watch. Nor should we be satisfied if we were told either that the existence of the watch is to be explained by a principle of order which exists in things and disposes the parts of the watch into their present form and situation, or that the

watch is the result of the laws of "metallic nature." Finally, we should be surprised to hear that the mechanism of the watch is no proof of contrivance, but "only a motive to induce the mind to think so." In short, where there is mechanism, instrumentality, or contrivance, there must have been an intelligence who designed and made the machine, the instrument, the contrivance.

Paley then turns to nature with this argument in hand and, in his own words, applies it to adduce evidences of the existence of God. The bones and muscles of human beings, animals, and their insect equivalents, are of special interest to Paley, for the fitting together of joints and the adaptation of muscles are mechanisms that imply most forcefully a designing intelligence. The chemical side of physiology does not interest him much, for chemical action does not suggest the work of a divine mechanic. But Kiell's *Anatomy* is ransacked for appropriate examples, and the hare's backbone is picked apart at the end of the meat course to show the finesse of divine contrivance. The example that most interests Paley, and to which he often returns, is the eye, in its various parts and in the combination of these parts and their adaptation to function as an instrument of sight. As he remarks, he offers many examples of natural mechanism, but a single instance, the eye alone, should suffice to convince us of the existence of the divine intelligence that designed it.

The evidence drawn from nature, in addition to establishing the existence of God, permits us to infer certain of his characteristics. Because God has a mind, he must be a person. That there is a single intelligence at work is shown by the uniformity of the divine plan, as it is applied to all parts of the world. Finally, God's goodness is shown both by the fact that most contrivances are beneficial and by the fact that pleasure has been made an animal sensation.

At bottom, Paley's argument rests on his original decision to regard certain parts of nature as mechanisms or contrivances. If this decision is unquestioned, then his argument takes a long stride toward plausibility. Everything depends, however, on whether the human eye, for example, is analogous to a machine, and if so, how far this analogy takes us in the inference of other characteristics that the analogy might imply. These questions are raised and examined with devastating effect by Hume in the *Dialogues concerning Natural Religion*, a work published a quarter of a century before Paley's *Natural Theology*. It is to be regretted that Paley does not meet Hume's arguments head-on in the *Natural Theology*, in the same way that he meets Hume squarely on the issue of the believ-

ability of miracles in *A View of the Evidences of Christianity*.

## PALMER, ELIHU

(1764–1806)

Elihu Palmer was a radical spokesman for the Age of Reason and Revolution in America, who along with Thomas Paine and Ethan Allen gave expression to the ideals of deism and republicanism. Born in Canterbury, Connecticut, Palmer was graduated from Dartmouth in 1787. Originally a minister, he was persecuted for his extreme religious views and forced to flee the pulpit. In 1793 he was admitted to the bar. Blinded by disease, he spent the last years of his life defending deism. He edited the deistic weekly journal *Prospect, or View of the Moral World* and helped to organize the Deistical Society in New York.

Palmer's religious radicalism stemmed from his reaction to Calvinism. He rejected the doctrine of original sin as well as the idea of a punitive and arbitrary divine being. This reaction developed into a militant anti-Christianity and anticlericalism. Palmer rejected the claims of

divine revelation, miracles, and prophecies, and he accused the Bible of inconsistency, contradiction, and vagueness. Not only did he deny the divinity of Christ, but he considered Jesus, Moses, and Muḥammad indecent and immoral and Christian salvation absurd and irrational. He attacked organized and institutionalized religion for its hypocrisy and self-interest.

Like other deists, Palmer defended a religion of nature, in which the order and harmony of the universe is believed to proclaim the existence of one supreme being, the divine creator. Palmer maintained that evil is not inherent in man or in nature but is due to corrupt social institutions and to defective human knowledge, which can both be corrected. He had boundless faith and optimism in reason, science, and education, believing that man possesses the capacities for intellectual and moral progress. In place of the traditional religious depreciation of human ability and dignity, he proposed a humanistic ethics. With others of this period, he held an empiricist epistemology, locating the source of all knowledge in sensation, and he was sympathetic to scientific and materialistic philosophy. Palmer was an ardent supporter of liberty and republicanism and saw in the American Revolution the inception of a new era for humanity.

## PANAETIUS OF RHODES

(c. 185–110 BCE)

Panaetius of Rhodes was a pupil of Diogenes of Babylon and Antipater of Tarsus, both heads of the Stoic school in

Athens, and he succeeded Antipater as scholarch in 129. Little is known about his life though it is clear that he spent considerable time in Rome and in the circle of P. Cornelius Scipio Aemilianus. None of his writings survive, but traces of his importance do.

First, isolated testimony from antiquity reveals that Panaetius was especially willing to disagree with earlier Stoics about central matters of doctrine. He rejected the Stoic belief in divination, and against the earlier account that the cosmos would be consumed periodically in flames, he insisted that the world is everlasting. He maintained that virtue is not sufficient for happiness, since health, some resources, and strength are also necessary, and he divided virtues into the contemplative and practical, which sits uneasily with traditional Stoic intellectualism.

These examples suggest that Panaetius was keen to incorporate more Platonic and especially Aristotelian doctrines into his Stoicism, and many ancient sources directly attest to this desire. This feature of Panaetius's philosophy links him to his pupil Posidonius, the polymath who showed similar willingness to infuse pre-Stoic ideas into his Stoicism. Together, Panaetius and Posidonius have been taken to epitomize Middle Stoicism, which stands between early Greek Stoicism and later Roman Stoicism, but this periodization is of limited utility because there are more than three ancient Stoicisms. Nevertheless, the affinities between Panaetius and Posidonius distinguish them from most other Stoics. Their broadly shared approach is also linked to the syncretizing philosophy of the first century BCE that is typified by Antiochus of Ascalon. Such thought has been disparaged as *eclectic*, but there is nothing unworthy in the attempt to produce a well-grounded synthesis of a rich and varied philosophical tradition.

The second trace of Panaetius is due to Cicero, who has characters call Panaetius “a great and extremely learned man” (*Leg* III 14) and “chief among the Stoics” (*Acad* II 107). Cicero based the first two books of his *On Duties* (*De Officiis* on Panaetius's *On Duty or Appropriate Action* (*Peri tou kathêkontos*), and this makes Panaetius influential since, as Henry Sidgwick notes: “There is probably no ancient treatise which has done more than [Cicero's] *De Officiis* to communicate a knowledge of ancient morality to medieval and modern Europe” (Sidgwick 1902, p. 95).

Among the prominent features of *De Officiis* that are likely due to Panaetius, the following three are especially important. First, Cicero notes that anyone who is beneficent must choose his beneficiaries carefully, and he insists

that one should help some people more just because one stands in a naturally closer relationship with them. He develops the point by suggesting a hierarchy of natural relationships, from the closest (marriage) to the most remote (the relationship one shares with all other human beings). The later Stoic Hierocles imagines the hierarchy as a series of concentric circles, but Cicero's version of the probably Panaetian idea that one's duties of beneficence are tied to certain relational facts independent of how one feels about those relationships has proven enormously influential.

Second, after identifying the traditional virtue of temperance or moderation with seemliness (*decorum*), Cicero insists that to display *decorum*, one must act in accordance with all of one's roles (*personae*). So, one must consider not only the role that all human beings share in common but also the particular role one has on account of one's peculiar natural talents. Additionally, one must consider the role that fortune assigns by giving one power, wealth, standing, and their opposites, and one must consider the demands of the role one chooses by taking up a particular career. With this schema, Cicero, no doubt inspired by Panaetius, takes the traditional Stoic concern to act appropriately in the particular circumstances, and he incorporates special attention to the ways in which social roles and individual talents matter to the circumstances.

Third, Cicero spends much of *De Officiis* II providing advice about how to pursue honor or glory. Earlier Stoics generally agreed that although honor might be useful, it has no intrinsic attraction. Cicero rejects that view in favor of a more Platonic line, according to which humans are naturally drawn to honor. Because the honorable is dependent upon what other people honor, this line generally ties one's pursuit of natural aims to the values of others in one's society. It also represents an especially concrete way in which the Panaetian approach of Cicero's *De Officiis* moves away from the paradoxical excellences of the early Stoics' sage and closer to the virtues of Roman politicians.

There is a final trace of Panaetius's importance, for he seems to be central to the eventual diffusion of Stoic thought. Most obviously, as a member of the Scipionic Circle, Panaetius helped to spread Stoicism in Rome. More speculatively, one might think that he contributed decisively to the decentralization of the Stoic school. There is no record that Panaetius had a successor as head of the Stoic school in Athens. His student Posidonius attracted pupils not to Athens but to Rhodes, which, curiously enough, was Panaetius's but not Posidonius's

hometown. Did Panaetius arrange to have the school leave Athens? Did he otherwise let it die? Whatever his intentions, later Stoics studied and taught in a variety of places around the Mediterranean, and Stoicism continued to seep into a broad array of intellectual currents.

## PANENTHEISM

*See Emanationism; Krause, Karl Christian Friedrich*

## PANNENBERG, WOLFHART (1928–)

The thought of Wolfhart Pannenberg follows in the tradition of twentieth-century German systematic theology in replying to the secularizing nature of post-Enlightenment thought. Pannenberg's writings, however, unlike those of his near contemporaries, most notably Karl Barth and Rudolf Bultmann, do not reject the characteristic intel-

lectual developments of Enlightenment thought. Rather, Pannenberg seeks to incorporate many of the key components of the Enlightenment into his comprehensive theological world view. Born in 1928, Pannenberg began his education as the University of Berlin. In 1950 he studied theology under Barth in Basle, and in 1951 he moved to Heidelberg where he completed his doctoral studies on the doctrine of predestination in Duns Scotus. Following this, he took up a teaching post at Heidelberg, later becoming Professor of Systematic Theology successively at Wuppertal, Mainz, and finally, in 1968, Munich.

Pannenberg's philosophical development was transformed by what he has described as an "intellectual conversion" to Christianity. This conversion, which was driven by his reading of philosophical as well as theological texts in his youth, has had two important influences on the development of his thought. First, Pannenberg's initial concerns are not with the Church and ecclesial theology. Instead, his thought centers on the role of religious experience on the individual within a created world defined by God. This *anthropological* aspect to Pannenberg's thought lies at the heart of his theological and philosophical system. Second, Pannenberg has been more receptive than many of his contemporaries in understanding and the developments in secular philosophical thought. Through all his writings, Pannenberg argues that many of the problems of modern secular thought can be resolved if God is reestablished as the defining principle of all creation. Pannenberg's most profound contribution to this debate has been through his dialogue with the secular aspects of critical history and latterly with the philosophy of science.

### THE ANTHROPOLOGY OF RELIGIOUS EXPERIENCE

The starting point of Pannenberg's thought is his anthropological account of religious belief. Pannenberg's thought is based on the belief that God can be found naturally and freely within all aspects of human experience. This anthropological approach comes out most clearly in Pannenberg's 1983 work *Anthropology in Theological Perspective*. His main impetus in approaching theological questions in this manner is to address directly the implicit atheism of much post-Enlightenment thought. Pannenberg argues that the philosophical atheism of the Left-Hegelians, especially Ludwig Feuerbach, is in essence misguided anthropology. The philosophical atheism of Feuerbach defines God as merely the creation of the his-

torically developing human mind. Pannenberg takes issue with this, arguing that it crucially misinterprets the place and role of God in human thought. By concentrating on the social and cultural uses of religious forms and structures, Pannenberg argues that the Left-Hegelians were able to dismiss these as constructs of the alienated human mind. Therefore Feuerbach, in particular, was able to collapse theology into anthropology, asserting the form of the divine as God simply a construct of the human mind (Pannenberg 1973, p. 87).

To counter this powerful philosophical criticism of theology and religion, Pannenberg argues that we must consider humans in the first instance without recourse to religious categories or structures. He argues that such an approach is a necessary part of thinking about religion in the post-Enlightenment world, because the Enlightenment moved humans away from the traditional structures and forms of religious belief. Consequently, Pannenberg argues, we must look for God in all parts of human experience, not simply those that are exclusively religious. This approach, which he characteristically describes as coming to God “from below,” places Pannenberg in opposition to the theology of Barth. Barth’s solution to the dilemma presented by philosophical atheism was to stress God as “Wholly Other,” inaccessible to man accept through the initiative of Jesus Christ.

Pannenberg argues that it is self-contradictory to talk of God in a manner that makes him completely inaccessible to humans. If God is the creative force of all creation, he must be accessible to people in all parts of creation. In the first instance one is able to come to this realization, Pannenberg argues, through a process of self-examination. By carrying out this anthropological enquiry, Pannenberg believes that people are able to recognize in themselves transcendent categories such as imagination that draw the human mind above and beyond a simple, mundane corporeal existence. It is through grasping this natural sense of transcendence that the human mind first comes to comprehend the existence of God. In doing this, Pannenberg is not rejecting traditional theological forms; rather he argues that the natural human desire to comprehend the divine is driven by very real human characteristics that God places in the human mind. Pannenberg’s anthropology of religious experience places him between the philosophical atheism of the Left-Hegelians and the Christian supremacy of Barth, stressing the real existence of the divine in all parts of the created world, a world in which humans are intimately and definitively involved.

## HISTORY AS REVELATION

Pannenberg’s primary contribution to the philosophy of religion has been in his attempts to build on this anthropological position to show the unity of human history with the experience God. Pannenberg’s work on this subject is, in the first instance, a reaction to post-Enlightenment critical history. It is also defined in reaction to the rejection of historicism as a category within theology by Barth and, in particular, Bultmann. Pannenberg rejects the belief that historical research, even in areas such as the historical Jesus, do not provide any theological insight. Pannenberg argues that if God is the author of creation, he must be discernible in all parts of creation. Therefore to stress the eschatological and a historic nature of Christ as Bultmann does, is to remove God from the created world that is, by definition historical in form (Pannenberg 1970, p. 87).

The culmination of this work was the publication in 1961 of *Revelation as History*. In this collection of essays, which Pannenberg edited and contributed to, Pannenberg argues that theology, correctly understood, can reconcile the Hegelian understanding of history as the self-disclosure of the *Absolute* with twentieth-century developments in secular critical history. Pannenberg believes he is able to reconcile these two opposing understandings of history by stressing what he believes to be the defining principle of the human history: the desire to comprehend oneself within the created world in which we live. This essentially dialectical understanding of history, Pannenberg argues, underpins the subject areas, method, and approach of secular, critical history. At the most basic level, he argues, the modern secular historian makes judgments about the place and role of actions and events on history. Through this intellectual judgment the historian is implicitly assuming, Pannenberg’s argues, that human history has a fundamental source and purpose. Consequently, the narrowly defined terms of critical history always assume, even at the most basic level, the existence of a suprahistorical intellectual structure. No historical person or event can define this structure; this can only be achieved by God who transcends and encompasses all history within himself. Pannenberg therefore believes one can reconcile theology with history if one accepts that they are different methods of understanding the self-disclosure of God within history. Therefore when we engage with the historical world in any way we are, by definition, understanding something of God’s revelation to the world.

The Hegelian basis of this argument is clear; however, Pannenberg differs crucially from Hegel in two key

components with his argument. First, looking back to his anthropology, Pannenberg asserts a narrower understanding of human reason than the version of reason we find in Hegel. This allows Pannenberg to retain a greater critical distance between the rational nature of God and ability of human reason to comprehend form and nature of God. Second, Pannenberg argues that although God reveals himself to humankind through the process of history this is, unlike in Hegel, not a necessary, but rather a contingent relationship. This more orthodox understanding of the human faculties and of God's relation to creation allows Pannenberg to reclaim something of the Hegelian understanding of universal history from the Left-Hegelian conflation of the God of universal history into anthropology.

This historicism has, inevitably, created new problems that Pannenberg's thought has not fully answered. Most importantly, Pannenberg's view of the contingent nature of God to human history opens up the problem of how to account for the existence of evil in a divinely ordained world. Pannenberg has countered, and to a limited extent answered this criticism by stressing that one has to understand the positive nature of human endeavor and action before one can understand the perversions. That is, we can only understand why humans turn from God if we first know how we are defined in relationship to God in the first instance (Tupper 1973).

## CONCLUSION

The culmination of Pannenberg's intellectual output came with the publication of his three-volume *Systematic Theology* between 1988 and 1993. In this work, which completes the intellectual process begun in his earliest writings, Pannenberg argues that the pursuit of truth, the fundamental object of theology, can only come about within a rigorous and thoroughgoing philosophical framework. Through this framework Pannenberg has argued that it is possible to reconcile scientific research to theology in much the same way as he argues the critical history can be brought into the theological understanding of universal history. By stressing the systematically metaphysical form of theology, Pannenberg argues that theology can save science from intellectual narcissism by providing the overarching structure of truth within which the specific insights of scientific research can be comprehended. Although perhaps not as influential as his writings on theology and history, this engagement with modern science highlights the refreshing willingness, identifiable in all Pannenberg's work, to enter into dialogue with those intellectual disciplines of the post-

Enlightenment world that sit outside the traditional corpus of religious and theological thought.

## PANPSYCHISM

“Panpsychism” is the theory according to which all objects in the universe, not only human beings and animals but also plants and even objects we usually classify as “inanimate,” have an “inner” or “psychological” being. The German philosopher and psychologist G. T. Fechner wrote:

I stood once on a hot summer's day beside a pool and contemplated a water-lily which had spread its leaves evenly over the water and with an open blossom was basking in the sunlight. How exceptionally fortunate, thought I, must this lily be which above basks in the sunlight and below is plunged in the water—if only it might be capable of feeling the sun and the bath. And

why not? I asked myself. It seemed to me that nature surely would not have built a creature so beautiful, and so carefully designed for such conditions, merely to be an object of idle observation. . . . I was inclined to think that nature had built it thus in order that all the pleasure which can be derived from bathing at once in sunlight and in water might be enjoyed by one creature in the fullest measure. (*Religion of a Scientist*, pp. 176–177)

To many readers this may seem to be merely charming poetry, but Fechner was writing in defense of a philosophical theory for which he argued with great passion and resourcefulness. “Where we see inorganic Nature seemingly dead,” wrote the American panpsychist Josiah Royce, “there is, in fact, conscious life, just as surely as there is any Being present in Nature at all” (*The World and the Individual*, second series, p. 240). “All motion of matter in space,” in the words of Hermann Lotze, “may be explained as a natural expression of the inner states of beings that seek or avoid one another with a feeling of their need. . . . The whole of the world of sense . . . is but the veil of an infinite realm of mental life” (*Microcosmus*, Vol. I, p. 363).

## PANPSYCHISM AND RELATED DOCTRINES

Although panpsychism seems incredible to most people at the present time, it has been endorsed in one way or another by many eminent thinkers in antiquity as well as in recent times. Among those who were either outright panpsychists or who inclined to a position of this kind, in addition to Fechner, Royce, and Lotze one may count Thales, Anaximenes, Empedocles, several of the Stoics, Plotinus and Simplicius; numerous Italian and German Renaissance philosophers (including Paracelsus, Girolamo Cardano, Bernardino Telesio, Giordano Bruno, and Tommaso Campanella); G. W. Leibniz, F. W. J. von Schelling, Arthur Schopenhauer, Antonio Rosmini, W. K. Clifford, Harald Høffding, C. B. Renouvier, Eduard von Hartmann, and Wilhelm Wundt; the German free-thinkers Ernst Haeckel, Wilhelm Bölsche, and Bruno Wille; C. A. Strong, Erich Adickes, Erich Becher, Alfred Fouillée, C. S. Peirce, and F. C. S. Schiller; and, in the twentieth century, A. N. Whitehead, Samuel Alexander, Bernardino Varisco, Paul Haeberlin, Aloys Wenzel, Charles Hartshorne, and the biologists Pierre Teilhard de Chardin, C. H. Waddington, Sewall Wright, and W. E. Agar.

Few panpsychists, writing in recent years, would make the claim that their position can be proven, but they do assert that the available evidence favors their theory or at the very least enables it to be a serious contender. According to Fechner, it is the best, clearest, most natural, and most beautiful account of the facts of the universe. According to Schiller, who was both a pragmatist and a panpsychist, the doctrine “renders the operation of things more comprehensible” and also enables us to “act upon them more successfully” (*Studies in Humanism*, p. 443). Similarly, Whitehead, after quoting a passage in which Francis Bacon declared his belief that “all bodies whatsoever, though they have no sense . . . yet have perception,” claims that this line of thought “expresses a more fundamental truth than do the materialistic concepts which were then being shaped as adequate for physics” (*Science and the Modern World*, p. 56). Agar, who was a follower of Whitehead’s, conceded that there can be “no coercive demonstration” of the truth or falsehood of panpsychism, but it “leads to a more consistent and satisfying world picture than any of the alternatives”; and, unlike these alternatives, panpsychism is not committed to the paradoxical view that “the mental factor . . . made its appearance out of the blue at some date in the world’s history” (*The Theory of the Living Organism*, pp. 109–110).

Modern panpsychists have been quite aware that their theory ran counter to what Fechner’s distinguished follower Friedrich Paulsen called “the obstinate dogmatism of popular opinion and of the physical conception of the universe” (*Introduction to Philosophy*, p. 93). This obstinacy they attributed to the prevalence of the “night-view” of the universe—an outlook natural in a mechanized civilization in which people are incapable of noticing and appreciating anything that cannot become the subject of measurement and calculation. In arguing for panpsychism, Fechner and Paulsen (among others) believed that they were counteracting a pernicious tendency in modern life, not merely defending a philosophical viewpoint. Fechner conceived of himself as “awakening a sleeping world” (*Religion of a Scientist*, p. 130) and frequently appealed to his readers to “meet nature with new eyes” (p. 211). Whether plants have souls is not, in the opinion of these writers, an idle or trivial question but on the contrary has a “broader bearing,” and its answer decides many other questions and indeed determines one’s “whole outlook upon nature” (Fechner, op. cit., p. 163). It is only by accepting panpsychism that a modern man (who finds it impossible to believe in the claims of traditional religion) can escape the distressing implications of materialism.

Unlike Fechner and Paulsen, Lotze supported the traditional religious doctrines of a personal, immaterial deity and a substantial, immortal soul; and hence he did not claim that we had to embrace panpsychism in order to avoid materialism. Lotze also repeatedly insisted, quite unlike Royce and Schiller, that we must not introduce panpsychism into science. Nevertheless he, too, greatly emphasized the emotional benefits accruing from the acceptance of panpsychism. Although science may and should set aside all reference to the “pervading animation of the universe,” the “aesthetic view of Nature may lawfully fill out the sum of what exists.” If we are panpsychists we no longer “look on one part of the cosmos as but a blind and lifeless instrument for the ends of another,” but, on the contrary, find “beneath the unruffled surface of matter, behind the rigid and regular repetitions of its working, ... the warmth of a hidden mental activity.” Lotze was particularly concerned to vindicate “the fullness of animated life” in such lowly things as “the dust trodden by our feet [and] the prosaic texture of the cloth that forms our clothing.” Dust, Lotze declares, is “dust only to him whom it inconveniences,” and he asks us to remember that human beings who are “confined” in a low social position, in which the outflow of intellectual energy is greatly impeded, are not by any means deprived of their “high destiny.” If in the case of such “oppressed fragments of humanity,” of “this dust of the spiritual world,” we may yet affirm a divine origin and a celestial goal, then we have far less reason to deny an inner life to physical dust particles; uncomely as these “may appear to us in their accumulations, they at least everywhere and without shortcoming perform the actions permitted to them by the universal order” (*Microcosmus*, Vol. I, pp. 361–363).

**HYLOZOISM.** Panpsychism is related to but not identical with hylozoism. “Hylozoism” is sometimes defined as the view that matter is “intrinsically” active and in this sense is primarily opposed to the view of philosophers, like Plato and George Berkeley, who asserted that matter is “essentially” inert or passive. More frequently, it refers to the theory that all objects in the universe are in some literal sense alive. Any panpsychist who endorses the usual view that mind implies life would automatically be a hylozoist in the latter sense, but the converse does not hold. In fact most panpsychists have been quite ready to have themselves labeled hylozoists, but there are some exceptions, of whom Schopenhauer is perhaps the most famous. According to Schopenhauer, all objects have an inner nature that he calls “will,” but although this will may be described as psychic or mental, it is not necessar-

ily a form of life. “I am the first,” Schopenhauer wrote, “who has asserted that a *will* must be attributed to all that is lifeless and inorganic. For, with me, the will is not, as has hitherto been assumed, an accident of cognition and therefore of life; but life itself is manifestation of will” (*On the Will in Nature*, p. 309).

William James is responsible for some terminological confusion that should be cleared up before we go any further. In several of his later writings James strongly supported a theory he stated in the following words: “there is a continuum of cosmic consciousness, against which our several minds plunge as into a mother-sea or reservoir. ... we with our lives are like islands in the sea, or like trees in the forest” (*Memories and Studies*, p. 204). Not only psychical research, he held, but also metaphysical philosophy and speculative biology are led in their own ways to look with favor on some such “panpsychist view of the universe as this.” Elsewhere he remarks that the evidence from normal and abnormal psychology, from religious experience and from psychical research combine to establish a “formidable probability in favor of a general view of the world almost identical with Fechner’s” (*Varieties of Religious Experience*, p. 311). It is true that Fechner held to a theory of a cosmic reservoir of consciousness, regarding God as the universal consciousness in which all lesser souls are contained, but it was not the acceptance of this theory that made him a panpsychist, and James himself was *not* a panpsychist. He nowhere maintained that plants and inanimate objects have an inner psychic life, and it is not easy to see how the reservoir theory by itself logically implies panpsychism.

**WORLD SOUL.** It should also be pointed out that the theory of the “world soul” is not identical with and does not necessarily follow from panpsychism. A number of panpsychists have in fact maintained the existence of a world soul, and they regarded it as a natural extension of panpsychism. Thus, Fechner in his *Zend-Avesta* (Vol. I, p. 179) concluded that “the earth is a creature ... , a unitary whole in form and substance, in purpose and effect ... and self-sufficient in its individuality.” It is related to our human body as “the whole tree is to a single twig, a permanent body to a perishable, small organ.” “Nothing,” in the words of Zeno the Stoic (as approvingly quoted by Cicero), that “is destitute itself of life and reason, can generate a being possessed of life and reason; but the world does generate beings possessed of life and reason; the world therefore is not itself destitute of life and reason” (*On the Nature of the Gods*, Bk. II, Sec. VIII). In a very similar vein Paulsen argues that Earth, since it “produces all living and animated beings and harbors them as parts

of its life,” may itself be plausibly regarded as “alive and animated.” Only the person who is “not open to the inner life of things” will find it difficult to regard Earth as a unitary organism with an inner life as well as a body (*Introduction to Philosophy*, p. 108). To demand to be shown the eyes and ears, the mouth and digestive system, the skin and hair, the arms and legs, the nervous system and the brain of Earth is quite improper. Unlike an animal, Earth does not need a mouth and a stomach because it does not have to take in substances from outside. An animal pursues its prey and in turn attempts to escape its pursuers, and hence it needs eyes and ears, but Earth is not a pursuer and is also not pursued. An animal needs a brain and nerves in order to regulate its movements in response to its environment, but Earth moves around without any such aid. Much like Fechner, Paulsen concludes that “it has regulated its relations to the external world in the most beautiful and becoming manner.” “Please do not,” he adds, slightly hurt by the irreverent objections of some critics, “please do not ask it to do what is contrary to its nature and cosmical position” (*ibid.*). This elevated idea of Earth soul has not won general acceptance among panpsychists. Charles Hartshorne, a twentieth-century panpsychist who, like Fechner, is a friend of religion, pays tribute to the “eloquence” of Fechner’s account but questions whether “the advances of science since his time have served to confirm” his view. While it may be plausible to regard an electron as “a rudimentary organism,” the larger systems that Fechner and Paulsen dealt with so enthusiastically “seem to contemporary knowledge rather too loosely integrated to be accepted as sentient subjects.” A tree, it seems plausible to argue, has less unity than one of its own cells, and, similarly, Earth has less unity than the animals which inhabit it (“Panpsychism,” p. 447). Hartshorne, as just observed, is a religious thinker, but there have also been atheistic and agnostic panpsychists, and there is no doubt that they would dismiss the theory of the world soul as quite absurd and as an illegitimate extension of panpsychism.

**DEGREES OF CONSCIOUSNESS.** There is one other terminological confusion against which we should be on guard. Rudolf Eisler, in the article on panpsychism in his *Wörterbuch der Philosophischen Begriffe*, first supplies the definition that we have adopted here and that is the one generally accepted. Later, however, he remarks that many panpsychists merely assert that all matter has a “disposition towards the psychological”—that is, that they ascribe to inorganic things no more than a “hypothetical” or low-grade mentality. Now, panpsychists have indeed generally emphasized that there are degrees of “mentality” or “soul

life” and that the mentality or psychic nature of inanimate objects is of an exceedingly simple order, but a low degree or level of mentality must be distinguished from “hypothetical mentality” or the capacity to become the subject of mental activities. To qualify as a panpsychist a person must claim that all bodies actually have an inner or psychological nature or aspect. That all matter is potentially the subject of mental activities or characteristics is something that many other philosophers, including not a few materialists, would concede. To say that a stone is made of elements which, when suitably combined, form an entity that thinks and feels is not the same thing as to say that the stone itself has an inner, psychological being.

Royce is a notable exception to the statement that panpsychists regard the psychic character of inorganic bodies as much lower than that of human beings or animals. He thought that the difference was mainly one of speed and that the “fluent” nature of the inner life of inorganic systems tends to go unnoticed because of its “very vast slowness.” To this he added, however, that slowness does not mean “a lower type of consciousness” (*The World and the Individual*, second series, pp. 226–227).

**NAIVE AND CRITICAL PANPSYCHISM.** Eisler distinguishes between “naive” and “critical” panpsychism—by the former he means the animism of primitive peoples and of children, by the latter he means panpsychist theories that are supported by arguments. In this article we are, of course, concerned exclusively with the “critical” or philosophical variety of panpsychism. Most critical panpsychists would probably endorse Agar’s judgment that although primitive animism was “in its analogical way of thinking basically sound,” it was also “full of errors” and “ludicrously mistaken in detail” (*The Theory of the Living Organism*, p. 109).

It should be observed that some philosophical panpsychists are not consistently “critical” in the sense just indicated. Thus, while offering elaborate arguments and conceding quite explicitly on numerous occasions that the inner psychic processes of plants and inanimate objects are not given to us in immediate experience but have to be inferred, both Schopenhauer and Fechner occasionally take the opposite position. In a remarkable passage, Schopenhauer tells us that if we consider various inanimate objects “attentively,” we shall observe (among many other things) the “strong and unceasing impulse with which the waters hurry to the ocean, [the] persistency with which the magnet turns ever to the North Pole, [the] readiness with which iron flies to the magnet,

[the] eagerness with which the electric poles seek to be reunited, and which, just like human desire, is increased by obstacles [as well as] the choice with which bodies repel and attract each other, combine and separate, when they are set free in a fluid state, and emancipated from the bonds of rigidity." Furthermore, if we attend to the way in which a load "hampers our body by its gravitation towards the earth," we shall "feel directly [that it] unceasingly presses and strains [our body] in pursuit of its one tendency." This passage is taken from the early first volume of *Die Welt als Wille und Vorstellung* (Bk. II, Sec. 23). His later work *Über den Willen in der Natur* consists largely of lists of scientific facts "proving" Schopenhauer's assorted philosophical theories, including his panpsychism. Here we are told to "look attentively at a torrent dashing headlong over rocks," whose "boisterous vehemence" can arise only from an "exertion of strength" (p. 308). As for the celestial bodies, if we observe them carefully we shall see that they "play with each other, betray mutual inclination, exchange as it were amorous glances, yet never allow themselves to come into rude contact" (p. 305). Fechner, a milder man than Schopenhauer and more interested in plants than in boisterous torrents or burdensome loads, records experiences in which "the very soul of the plant stood visibly before me," in which he "saw" not only a special "outward clarity" of the flowers but also "the inward light" that in all likelihood caused the outer appearance (op. cit., pp. 211–212).

To see what is at issue between panpsychists and their opponents, it is important to point out that passages such as these are aberrations. It may indeed be held that in addition to the more familiar properties, to which philosophers refer as the primary and secondary qualities, physical objects possess a further set of qualities that are not noticed by observers who lack certain gifts or a suitable training. Such a view need not be mystical and has been plausibly defended in the case of the so-called tertiary qualities, especially those of artistic productions and performances. However, the initial definitions of "soul," "psychic," and "inner," or of any of the other terms used by panpsychists in statements of their position, preclude them from adopting a position of this kind. The "soul," the "inner" nature of an object, its "mental side" is by definition—a definition to which the panpsychists subscribe—something private that only the object itself can experience or observe. Hence, even if one grants that panpsychists possess gifts of which other mortals are deprived, these cannot possibly be the means of directly perceiving the inner qualities or states of any object external to the observer. Moreover, the great majority of panpsychists, including Schopenhauer and Fechner, do

not, in their more considered presentations, claim any special faculty for themselves that the opponents of panpsychism supposedly lack. On the contrary, it is implied that, starting from certain generally accessible facts, sound reasoning will lead a person to a panpsychist conclusion.

## ARGUMENTS FOR PANPSYCHISM

The arguments for panpsychism may be conveniently grouped according to whether they presuppose the acceptance of a particular metaphysical system or some controversial epistemological theory or whether they are or purport to be of an empirical or inductive character. Some of the arguments of Leibniz and Royce are based on their respective versions of metaphysical idealism, and some of the arguments of Schopenhauer and Paulsen presuppose a Kantian theory of knowledge. It is impossible to evaluate any such arguments without getting involved in an appraisal of their particular metaphysical or epistemological framework, and we shall therefore confine our discussion to arguments of the other kind. It is perhaps worth noting in this connection that, especially since the mid-1800s, many panpsychists have regarded themselves as opponents of metaphysics, or, if they did not object to being labeled metaphysicians, they took care to add that theirs was an "inductive," not a speculative, variety of metaphysics. Fechner in particular prided himself on dispensing altogether with "a priori constructions," and he was a leading figure, along with von Hartmann and Wundt, in a movement to renounce any claim to a special philosophical method distinct from the method employed in the natural sciences. The only method that, on his view, could lead to a tenable theory about the universe as a whole was "generalization by induction and analogy, and the rational combination of the common elements gathered from different areas," as he observes in *Zend-Avesta*. Furthermore, even some of the panpsychists who were also speculative metaphysicians appealed to empirical considerations. They thought that panpsychism could be supported in different ways that were logically independent of one another. Royce was one of the philosophers who adopted this approach. Insisting that his "Idealistic Theory of Being ... furnishes a deep warrant" for panpsychism, he nevertheless regarded panpsychism as also resting on "a merely empirical basis" (op. cit., p. 213). "Wholly apart from any more metaphysical consideration of the deeper nature of Reality," certain empirical facts suggest panpsychism as the conclusion of "a rough induction." In this connection, the

theory should be treated as a “hypothesis for further testing” (ibid., pp. 223–224).

**GENETIC ARGUMENTS.** The arguments that have been most widely urged in defense of panpsychism, and which go back at least as far as Telesio and Campanella, rely, in one way or another, on the assumption that mental facts can be causally explained only in terms of other mental facts. Philosophers who have arrived at a parallelistic answer to the body-mind problem have been specially prone to endorse such arguments, but these can be stated independently of any commitment to parallelism. It is perhaps interesting to note in passing that many early champions of Darwinism (for example, Clifford in England and Haeckel and L. Büchner in Germany) were attracted by reasoning of this kind, although they were frequently repelled by the analogical arguments considered later in the present article. We shall here examine two such genetic arguments—one advanced by Paulsen, the other by a twentieth-century British scientist.

How, asks Paulsen, did soul life originate? Modern biology assumes, quite rightly in Paulsen’s opinion, that organic life had a beginning on Earth and that the “first creations” arose from inorganic matter. The question then arises how “psychic life” came into being. “Is the first feeling in the first protoplasmic particle something absolutely new, something that did not exist before in any form, of which not the slightest trace was to be found previously?” (*Introduction to Philosophy*, pp. 99–100). To suppose that the first feeling in the first protoplasmic particle was something “absolutely new” would, however, imply a “creation out of nothing,” which would be totally at variance with the basic (and well-founded) principles of science. You might as well, Paulsen remarks, ask the natural scientist “to believe that the protoplasmic particle itself was created out of nothing.” The natural scientist rightly assumes that natural bodies arise from preexisting elements. These enter into new and more complicated combinations, and as a result the bodies are capable of performing “new and astonishing functions.” Why does the natural scientist “not make the same natural assumption” in the case of the inner psychic processes as well? Why does he not say that “an inner life was already present in germ (*keimhaft*) in the elements, and that it developed into higher forms?”

It is not easy to appraise this line of reasoning because of the vagueness of the expression “absolutely new.” As Ernest Nagel and others have pointed out, it is frequently not at all clear whether two processes or occurrences are to be counted as different instances of the same

property or as different properties—whether they are or not usually depends on the purpose of the particular investigation. Furthermore, what may be “absolutely new,” in the sense of not being predictable from certain initial conditions in conjunction with a certain set of laws, may at the same time not be absolutely new in the sense of being predictable from these initial conditions together with a different set of laws. However, let us assume that in a given case all parties agree that if at a moment  $T_1$  the features of a system were of a certain kind and if at a subsequent moment  $T_2$  they were of a certain different kind, something “absolutely new” came into being at  $T_2$ . More specifically, let us assume that the conditions at  $T_1$  do not include any mental fact but that at  $T_2$  they include “the first feeling” in the first protoplasmic particle. Now, according to Paulsen’s argument, anybody who supposes that this is the kind of thing that actually happened—and a person who accepts certain scientific facts while rejecting panpsychism has to suppose that this is what happened—is committed to the view that something came from nothing. But to suppose that something came from nothing is unscientific and absurd.

There is a simple answer to this. By saying that something must always come from something and cannot come from nothing, we may mean either (1) that every phenomenon or event has a cause or (2) the scholastic principle that any property residing in an effect must also have been present in its cause. If we suppose that at time  $T_1$  there was no mental fact in the universe while at a later time  $T_2$  the first feeling occurred in a protoplasmic particle, we would indeed be violating proposition (2), but we would not at all be violating proposition (1). Yet if anything can here be regarded as “unscientific” or “absurd” it would be exceptions to (1). For reasons explained earlier, it is not easy to state (2) or its denial with any precision, but, in the most familiar sense of “new,” experience seems to show that there are any number of effects possessing new properties—properties not present in the cause. The very course of evolution, to which Paulsen and other proponents of the genetic argument appeal, provides a multitude of illustrations of this. At any rate, an opponent of panpsychism would deny proposition (2) and would insist that such a denial is in no way unempirical or unscientific. To assume the opposite without further ado would surely be to beg one of the basic questions at issue.

Let us now consider a more recent version of a genetic argument: “Something must go on in the simplest inanimate things,” writes the distinguished British geneticist C. H. Waddington, “which can be described in the same language as would be used to describe our self-

awareness” (*The Nature of Life*, p. 121). It is true, he continues, that we know nothing of its nature, but the conclusion is forced on us by the “demands of logic and the application of evolutionary theory” (p. 122). Waddington’s argument opens with the declaration that the phenomenon of self-awareness is a “basic mystery.” This is so because awareness “can never be constructed theoretically out of our present fundamental scientific concepts, since these contain no element which has any similarity in kind with self-consciousness.” But self-awareness undoubtedly exists, and hence we must infer that the mode we experience “evolved from simple forms which are experienced by non-human things.” It is not difficult to accept this conclusion as far as animals like dogs and cats are concerned. But, Waddington proceeds, we cannot stop there if we take the theory of evolution seriously. According to the initial premise it is inconceivable that self-awareness “originated from anything which did not share something in common with it and possessed only those qualities which can be objectively observed from outside.” Hence, we are forced to conclude that “even in the simplest inanimate things there is something which belongs to the same realm of being as self-awareness.” Waddington’s argument is not overtly based, as Paulsen’s was, on the contention that somebody who accepts evolution but rejects panpsychism is committed to the absurd proposition that something comes from nothing. According to Waddington such a person would be committed to the view that self-awareness is not a mystery—that is, that it is explicable in physical terms—and this Waddington takes to be plainly false.

In reply it should be pointed out that Waddington appears to use the word *explanation* in two very different senses in the course of his argument. Sometimes when we ask for the explanation of a phenomenon we are looking for an account of its makeup, of how its parts are related and how they work. We use the word *explanation* in this sense when we want to have the nature of a car or a clock or perhaps a human eye explained to us. At other times, and more frequently, in asking for the explanation of a phenomenon we are looking for its cause. It is not easy to see why awareness should be said to be a “mystery” just because it cannot, in the first sense of “explanation,” be explained in physical terms (this betrays a strange materialistic bias that regards a phenomenon as properly explicable, in the first sense, only if it is something material—one wonders why physical objects are not equally mysterious, since they cannot be explained in terms of predicates that are applicable only to mental states). But waiving this point—allowing, that is, that awareness cannot be adequately characterized by the kinds of predicates

usually applied to material objects and that this makes awareness incapable of explanation in the first of the two senses distinguished, none of this implies that awareness cannot be explained, in the second sense of the word, in terms of purely physical factors. Avoiding the word *explanation*, the point can be expressed very simply: Granting that awareness is not a physical phenomenon, it does not follow that it cannot be produced by conditions that are purely physical. When the matter is put in this way, it becomes clear that we are back to the difficulty besetting Paulsen’s form of the argument. Waddington’s argument does not, aside from the acceptance of the evolutionary theory, depend merely on the admission that awareness is not a physical phenomenon, that it “cannot be constructed” out of physical concepts: It also depends on the maxim that any property of the effect must also be present in the cause. We have already mentioned reasons for rejecting this principle, but perhaps it is worth adding that in the context of the body-mind relationship it seems particularly implausible. Brain tumors and other damage to the body, to give some very obvious examples, lead to all kinds of psychological states, but we do not for this reason refuse to regard them as explanations of the latter.

**ANALOGICAL ARGUMENTS.** The second set of arguments commonly employed by panpsychists, independently of any metaphysical system, purport to be of an analogical kind. Here the more systematic panpsychists usually proceed in two steps: The first consists in arguing that plants are in “essential” respects so much like animals that one cannot consistently attribute a psychic or soul life to animals but refuse it to plants; it is then maintained that the borderline between animate and inanimate objects is not sharp and that a careful examination of inanimate objects reveals them to have many impressive likenesses to animals and plants, indicating the existence of inner psychic being there also.

Plants manifest many of the same vital processes that are found in animals: nutrition, growth, reproduction, and many more. Like animals, plants are born and also die. Moreover, it is simply not true that plants lack the power of spontaneous movement that we observe in animals. “Does not the plant,” asks Paulsen, “turn its buds and leaves to the light, does it not send its roots where it finds nourishment, and its tendrils where it finds support? Does it not close up its petals at night or when it rains, and does it not open them in sunshine?” If there is so great a “correspondence” between the visible processes, why should there not be a similar correspondence in “the invisible processes”? (op. cit., pp. 96–97). If it is argued that these analogies are too vague and trifling, because

plants have neither a brain nor a nervous system, the answer is surely that there are animals that also lack brains and nervous systems. Fechner was particularly concerned to exhibit the weakness of this counterargument. He observes that if we remove the strings of a piano or a violin it becomes impossible to obtain any harmonic sounds from these instruments. If somebody concluded from this that the presence of strings is essential to the production of musical tones, he would be completely mistaken, because there are many instruments, like flutes and trombones, with which we can produce musical sounds although they have no strings; but this argument would be not one whit worse than that of the critic of panpsychism.

There are, to be sure, differences between plants and animals, and these a panpsychist has no wish to deny, but, according to Paulsen, they “may be conceived as indicating a difference in inner life also” rather than the absence of any inner processes. The differences indicate “that plants possess a peculiar inclination to receptivity and a decentralized extensity, whereas the psychical life of the animal shows more spontaneity and centralized intensity” (*ibid.*, p. 98). Fechner is even more specific and compares the difference in psychical life between animals and plants to the difference in the psychology of men and women. Elsewhere he compares the former difference to that between the emotions of travelers and those who are “homebodies,” between the pleasures associated with “running hither and thither” and those accompanying a “quiet and sedentary sphere of endeavor” (*Religion of a Scientist*, pp. 178–179). Paulsen adds, however, it does not really matter what we think about the details of the inner processes, since all such attempts at conceiving the nature of the psychic life of plants are “at best feeble.” It should be remembered that we do not really fare any better if we try to “interpret” the psychical life of animals, especially that of the lower species. We know very little, Paulsen remarks, “about the inner experiences of a jelly-fish or the feelings of a caterpillar or a butterfly.”

When we come to inanimate objects, Paulsen continues, the first thing to note is that organic and inorganic bodies must not be regarded as belonging to two separate worlds. There is constant interaction between them. They are composed of the same ingredients and acted on by the same forces. If this were all, however, the analogy would not be strong enough. It would be objected that unlike animals and plants, objects like stones are lifeless and rigid, that they lack all spontaneous activity. This opinion, Paulsen argues, is totally mistaken and is based on the Aristotelian-scholastic theory, taken over by material-

istic scientists of the eighteenth and nineteenth centuries, that matter is inherently and absolutely passive. This theory, whether in its original or in its modern atomistic form, is quite untenable. In fact a stone is not an “absolutely dead and rigid body” and devoid of “inner impulses.” Modern physics has discarded such a view. Its molecules and atoms are “forms of the greatest inner complexity and mobility.” Not only are the constituents of an apparently rigid object like a stone in continuous motion, but the entire system is “in constant interaction with its immediate surroundings as well as with the remotest system of fixed stars” (pp. 101–102). In the light of this it is not only not absurd but quite plausible to conclude that “corresponding to this wonderful play of physical forces and movements” there is a system of inner psychic processes “analogous to that which accompanies the working of the parts in an organic body.” We thus arrive, on the basis of scientific evidence, at a view substantially like that of Empedocles that “love and hate form the motive forces in all things”—not, to be sure, quite as we know them in ourselves, but nevertheless in a form that is “at bottom similar” to these human emotions.

It is natural to object to such arguments that the analogies are altogether inconclusive. It is true that there are certain similarities between, say, a stone and a human body, but there are also all kinds of differences. Paulsen assures us that the similarities are “essential,” but if “essential” here means that, as far as the inference to an inner psychic process is concerned, the similarities count and the differences do not, that they are relevant whereas the differences are irrelevant, one may well ask how Paulsen knows this. Surely no proposition has been or could have been established to the effect that inner physical movement is always and necessarily connected with psychic activity. Any such general proposition is precisely what the opponent of panpsychism would deny or question. Furthermore, leaving aside any discussion of whether those who regard matter as “active” and those who maintain it to be “passive” are engaging in a factual dispute (so that one party could be said to be right and the other wrong), it must be emphasized that in rejecting panpsychism one is in no way committed to the view that matter is devoid of “inner activity.” The view that matter has no inner psychic aspect in no way precludes the admission of inner physical processes such as those postulated by modern physical theory.

These criticisms, however, do not go far enough. They assume, what seems very doubtful, that the arguments under discussion are of a genuinely empirical

character. In this connection it is pertinent to raise the question what the universe would have to be like so that there would be no evidence for panpsychism, or, more strongly, so that the evidence would clearly favor the opposite position. We saw that Paulsen considered the fact that human bodies and inanimate objects are composed of the same elements to be evidence for his position. He also regarded the internal movements of the particles of apparently stationary objects as evidence of their inner life. But suppose that stones and human bodies were not composed of the same elements; would this constitute evidence against panpsychism or would it at least deprive panpsychism of evidence that is at present supporting it? Suppose that electrons were not buzzing inside the stone; would this show or would it be any kind of evidence for the view that the stone does not have a psychic life? From the writings of panpsychists it seems probable that the answer to these questions would be in the negative: If the elements of stones were quite different from those of human bodies, it might be an indication that the psychic processes in stones are even more different in detail from those of human beings, and if the internal constituents of the stones were not in constant motion it might indicate a more restful psychic life, but it would not indicate that no psychic life at all is going on. If this is an accurate presentation of the panpsychist position, it shows that the analogical arguments we have been considering are not genuinely empirical, that the facts pointed to are not, in any accepted sense, evidence for the conclusion. This is a far stronger criticism than the claim that the analogies are weak or the arguments inconclusive.

### IS PANPSYCHISM AN INTELLIGIBLE DOCTRINE?

Some contemporary philosophers who have given more thought to the conditions of meaningful discourse than was customary in previous times are inclined to dismiss panpsychism not as false or unproven but as unintelligible. Thus, in his *Philosophical Investigations* Ludwig Wittgenstein raises the question “Could one imagine a stone’s having consciousness?” and comments that if anyone can imagine this, it would merely amount to “image-mongery” (Sec. 390, p. 119 e). Such image-mongery, Wittgenstein seems to imply, would not show at all that in attributing consciousness to a stone one is making an intelligible statement. It would probably be pointless to try to “prove” that panpsychism is a meaningless doctrine. Any such attempt is liable to involve one in an elaborate and inconclusive defense of some controversial

meaning criterion. However, it may be of some interest to explain more fully, without intending to settle anything, why not a few contemporary philosophers would maintain that the panpsychists do not succeed in asserting any new facts and in the end merely urge certain pictures on us.

To this end let us first consider the following imaginary disputes about the “inner” nature of a tennis ball. *A* holds the common view that the ball is made of rubber and not of living tissue, while *B* holds the unusual opinion that if we were to examine the inside of the tennis ball under a powerful microscope we would find a brain, a nervous system, and other physiological structures usually associated with consciousness. Furthermore, *B* maintains that if we listened very attentively to what goes on while tennis balls are in their can we would hear one ball whispering to the other, “My brother, be careful—don’t let them hit you too hard; if you roll into a bush on the other side of the fence you may spend the rest of your days in blissful peace.” There is genuine empirical disagreement between *A* and *B* and, as far as we know, *A* would be right if the ball or balls in question are of the familiar kind. Let us next suppose that *C*, after reading Paulsen and Waddington, becomes converted to panpsychism and starts saying such things as “the tennis ball is not a mere body—it has an inner psychic life, it is moved by love and hate, although not love and hate quite as we know them in human beings.” To an uncritical outsider it may at first appear, chiefly because of the images one associates with the word *inner*, that *C*, like *B*, is asserting the existence of strange goings on inside the ball, never suspected by the ordinary man or the physicist. In fact, however, if *C* is a philosophical panpsychist, he will not expect to find a brain or a nervous system or any kind of living tissue inside the ball, and he will disclaim any such assertion. Nor will he expect that tennis balls whisper gentle warnings to one another when they are alone. If he should start serving less forcefully in order to avoid hurting the ball, a professional panpsychist would undoubtedly advise him not to be silly, explaining that although their lives are governed by love and hate, balls do not get hurt in any sense that need concern a sympathetic human being. In other words, *C* does not disagree with *A* about what would be found inside the ball or about the ball’s behavior while it is in the can, and he is also not treating the ball any differently from the way *A* does—or at any rate no different treatment is logically implied by his opinion that the ball has an inner psychic life. *B* really contradicts *A* and, at least in the case of the balls we all know, he is quite certainly mistaken. *C* is not mistaken, but one begins to wonder whether he is asserting any

facts not allowed for in the ordinary, nonpanpsychist view of the ball. A semantically sensitive observer might comment that ordinary people (and uncritical philosophers) are apt to suppose that they understand well enough what panpsychism asserts and that they proceed to dismiss it as silly or incredible (that is, as plainly false) because they regard panpsychism as a theory like *B*'s unusual opinion about the tennis ball. In fact, panpsychism is not like *B*'s opinion but like *C*'s, and the appropriate criticism seems to be not that it is a false theory but that one does not really know what, if anything, has been asserted.

SCHILLER. Let us now turn to the procedure of an actual panpsychist to see the full relevance of the preceding reflections. F. C. S. Schiller argued that inanimate objects, contrary to the usual opinion, take notice of other inanimate objects, as well as of human beings. "Inanimate objects," he wrote, "are responsive to each other and modify their behavior accordingly. A stone is not indifferent to other stones" (*Logic for Use*, p. 447). Nor are stones indifferent to human beings: "In a very real sense," he wrote elsewhere, "a stone must be said to know us and to respond to our manipulation" (*Studies in Humanism*, p. 443). It is "as true of stones as of men" that if you treat them differently they behave differently (*Logic for Use*, p. 447). It must be emphasized, however, that the responsiveness, the nonindifference, of stones is not quite what we mean when we talk about the responsiveness and nonindifference of human beings. How does a stone exhibit its nonindifference to other stones? Very simply: in being gravitationally attracted to them (*ibid.*). Nor are we "recognized" by the stone "in our whole nature." It does not "apprehend us as spiritual beings," but this does not mean that the stone takes no note whatever of our existence. "It is aware of us and affected by us on the plane on which its own existence is passed." In the physical world we and stones share, "'awareness' can apparently be shown by being hard and heavy and colored and space-filling, and so forth. And all these things the stone is and recognizes in other bodies" (*Studies in Humanism*, p. 442). The stone "faithfully exercises" all its physical functions: "it gravitates and resists pressure, and obstructs ether vibrations, etc., and makes itself respected as such a body. And it treats us as if of a like nature with itself, on the level of its understanding, i.e., as bodies to which it is attracted inversely as the square of the distance, moderately hard and capable of being hit." The stone does not indeed "know or care" whether a human being gets hurt by it; but in those operations that are of "interest" to the stone, as, for example, in house building, "it plays its part and

responds according to the measure of its capacity." What is true of stones, Schiller continues, is also true of atoms and electrons, if they really exist. Just as the stone responds only "after its fashion," so atoms and electrons also know us "after their fashion." They know us not as human beings but "as whirling mazes of atoms and electrons like themselves." We treat stones and atoms as "inanimate" because of "their immense spiritual remoteness from us" and "perhaps" also because of "our inability to understand them" (*ibid.*, pp. 442, 444).

Some of his readers, Schiller realizes, will "cry" that the views just reported amount to "sheer hylozoism," but he does not regard this as any reason for concern. "What," he answers, "if it is hylozoism or, still better, panpsychism, so long as it really brings out a genuine analogy," and this, he is convinced, it does. "The analogy is helpful so long as it really renders the operations of things more comprehensible to us, and interprets facts which had seemed mysterious" (*ibid.*, p. 443). Schiller illustrates his claim by considering the chemical phenomenon of catalytic action. It had "seemed mysterious" and "hard to understand" (presumably prior to the publication of Schiller's "humanistic" panpsychism), that two bodies *A* and *B* may have a strong affinity for each other and yet refuse to combine until the merest trace of a third substance *C* is introduced, which sets up an interaction between *A* and *B* without producing an alteration in *C* itself. But, asks Schiller, "is not this strangely suggestive of the idea that *A* and *B* did not know each other until they were introduced by *C*, and then liked each other so well that *C* was left out in the cold?" To this he adds—and here surely not even the most hostile critic would disagree—that "more such analogies and possibilities will probably be found if they are looked for." Nevertheless, panpsychism does not merely render the operation of things more comprehensible. It has a further virtue, to which Schiller alludes later in the same discussion: "The alien world which seemed so remote and so rigid to an inert contemplation, the reality which seemed so intractable to an aimless and fruitless speculation, grows plastic in this way to our intelligent manipulations" (*ibid.*, p. 444).

Perhaps the most striking features of Schiller's presentation are the constant modifications or retractions of what at first appear truly remarkable assertions. Inanimate objects are "responsive to each other," but not the way in which human beings or animals are—they are responsive in being gravitationally attracted by other inanimate objects. The stone is "aware of us," but not, of course, in the sense in which human beings are aware—it is aware on "*its* plane"; the stone "recognizes" other bod-

ies and is “interested” in operations such as house building, but “on the level of *its* understanding”; it “plays its part,” but “according to the measure of *its* capacity”; atoms and electrons know us no less than we know them, but “after *their* fashion.” It is not, perhaps, unfair to say that Schiller takes away with one hand what he gives with the other, and it may be questioned whether anything remains. When one is told that the stone is aware of us one reacts with astonishment and is apt to suppose that a statement has been made that contradicts what an ordinary nonpanpsychist believes; but this turns out to be more than doubtful since the stone’s awareness, on its plane, seems to consist simply in being hard, heavy, space-filling, and colored. The stone makes itself respected and is interested in operations like house building, but in its own fashion, and this consists in gravitating, resisting pressure, and all the usual characteristics of stones, which are not questioned by those who do not subscribe to panpsychism. Schiller plainly believed that the panpsychist asserts (if he has not in fact discovered) facts about stones and atoms that are denied by, or whose existence is unknown to, the ordinary person and the materialist. He evidently did not believe that it was just a question of using words in different senses. But, if so, what are the facts he asserts and his opponents deny? Schiller’s qualifications remind one of a song in the musical *Kiss Me, Kate* in which a lighthearted lady sings of her numerous and constantly changing amorous involvements, adding at the end of each verse, “But I’m always true to you, darling, in my fashion; yes, I’m always true to you, darling, in my way.” How does the stone’s awareness in its own way differ from what other people would refer to as absence of awareness?

**EMPIRICAL PRETENSIONS OF PANPSYCHISTS.** Even if one is disinclined to go so far as to dismiss panpsychism as meaningless, there is surely good reason to dispute the empirical and pragmatic pretensions of certain panpsychists. We saw that Royce regarded panpsychism (among other things) as a hypothesis “to be tested,” but unfortunately he did not tell us anything about the way or ways in which this was to be done. Royce did indeed guard himself by maintaining that the mental processes in physical systems occur over “extremely august” temporal spans (*The World and the Individual*, second series, p. 226), so that a human being would be unable to detect a process of this kind. However, making the fullest allowance for this qualification and granting ourselves or some imaginary observer the “august” time span required by Royce’s “hypothesis,” this would still not do, since

Royce omitted to inform us what such an observer should look for.

Schiller, it will be remembered, assured us that as a result of accepting panpsychism the previously “remote” and “rigid” reality “grows plastic ... to our manipulations.” But he did not explain how and where these happy transformations would take place. Is a bricklayer who has been converted to panpsychism going to lay bricks more efficiently? Does a tennis player’s game improve if he becomes a disciple of Schiller? No, but perhaps the chemist will find catalytic action more comprehensible, and “more such analogies and possibilities” will make other “intractable” processes less “mysterious.” Regrettably, the opinion that panpsychism makes any of these phenomena easier to understand is the result of a confusion that hinges on an ambiguity in “comprehensible” and related expressions. Sometimes we attempt to make phenomena or correlations of events more comprehensible. In this sense, a phenomenon (for example, a certain disease or a plane crash) is comprehended or understood if its cause is discovered, and a correlation or a law becomes comprehensible if it is subsumed under a wider law (if, for example, the administration of a certain drug has in many cases been followed by the cure of a given condition, the correlation becomes comprehensible if we determine what it is about the drug that has this effect; and this is another way of saying that we subsume the correlation under a law). But at other times when we talk about making something comprehensible, we are concerned with explaining the meaning of theories or statements, not with the explanation of phenomena or of correlations. Unlike the first, this kind of problem may be regarded as pedagogical, and here all kinds of analogies may be helpful that do not or need not shed any light on the causes of the phenomena dealt with in the statements we are trying to make more comprehensible. It cannot, of course, be denied that an analogy such as the one Schiller offers may well make catalysts more comprehensible in this pedagogical sense—it may, for example, help schoolchildren to understand what a chemist is talking about. It is equally clear that such an analogy does absolutely nothing to make catalytic action more comprehensible in the earlier sense we mentioned, and it was surely in this sense that Schiller claimed panpsychism to make things less mysterious and easier to understand. It is difficult to believe that either Schiller or any other champion of panpsychism would be satisfied to have the theory regarded as no more than a pedagogical device in the teaching of natural science.

### Bibliography

The fullest systematic defenses of panpsychism since the mid-1800s are found in the writings of Paulsen, Fechner, Lotze, and Royce. Paulsen's arguments are presented in his very influential *Einleitung in die Philosophie* (21st ed., Stuttgart and Berlin, 1909), translated by F. Thilly as *Introduction to Philosophy* (2nd American ed., New York, 1906, with a preface by William James). Fechner's main writings on the subject are *Nanna: oder über das Seelenleben der Pflanzen* (3rd ed., Leipzig, 1903) and *Zend-Avesta: oder über die Dinge des Jenseits* (2nd ed., Hamburg: L. Voss, 1906). There is an English translation of selections from Fechner's works by W. Lowrie titled *Religion of a Scientist* (New York: Pantheon, 1946). Fechner's ideas are discussed in some detail in G. Stanley Hall, *Founders of Modern Psychology* (New York: Appleton, 1912); G. F. Stout, *God and Nature*, edited by A. K. Stout (Cambridge, U.K., 1952); Otto Külpe, *Die Philosophie der Gegenwart in Deutschland* (Leipzig: Teubner, 1902), translated by M. L. Patrick and G. T. W. Patrick as *Philosophy of the Present in Germany* (London: G. Allen, 1913); and G. Murphy, "A Brief Interpretation of Fechner," in *Psyche* 7 (1926): 75–80. Although Wilhelm Wundt condemned Fechner's speculations about the souls of the stars and Earth as "a fantastic dream," he himself concluded that mental life can arise only out of conditions that are themselves mental (*System der Philosophie*, Leipzig, 1889). Lotze's defense of panpsychism is contained in Vol. I of *Mikrokosmos* (Leipzig, 1856–1864), translated by E. Hamilton and E. E. C. Jones as *Microcosmos* (New York, 1890). Royce's panpsychism is presented in Lecture V of *The World and the Individual*, second series (New York: Macmillan, 1901). The American neorealist W. P. Montague, a student of Royce, relates how he "jumped with almost tearful gratitude" at Royce's "hypothesis about the varying time-spans in nature." He regarded this "hypothesis" as "a new and challenging contribution to the great panpsychist tradition," as "a clear and great thought" that "might even be true" (*The Ways of Things*, London, 1940, p. 669). Montague referred to his own position as "animistic materialism," and he is sometimes classified as a panpsychist, but in fact it is

very doubtful whether his animism implies panpsychism as we have here defined it.

Little was said in this article about A. N. Whitehead, probably the most distinguished champion of panpsychism in the twentieth century, chiefly because his views on the subject could not have been discussed without consideration of other features of his difficult system. Whitehead would have disagreed with many other panpsychists about the "units" that are to be regarded as the bearers of psychic life. These, he held, are not stars or stones but the events out of which stars and stones are constituted and that Whitehead calls "occasions." His views are presented in *Science and the Modern World* (New York: Macmillan, 1925), *Process and Reality* (New York: Macmillan, 1929), and, most fully, in "Nature Alive," Lecture 8 of *Modes of Thought* (New York: Macmillan, 1938). Panpsychistic views strongly influenced by Whitehead are put forward in Charles Hartshorne, *Beyond Humanism* (Chicago: Willett Clark, 1937) and *Man's Vision of God* (Chicago: L. Willett Clark, 1941), and in W. E. Agar, *The Theory of the Living Organism* (Melbourne, 1943). Samuel Alexander, whose metaphysical position has many similarities to Whitehead's, also expresses views akin to panpsychism in his British Academy lecture "The Basis of Realism," reprinted in *Realism and the Background of Phenomenology* edited by R. M. Chisholm (Glencoe, IL: Free Press, 1960).

Of works by earlier panpsychists, special mention should be made of G. W. Leibniz, *Monadology* (various editions), and Arthur Schopenhauer, *Die Welt als Wille und Vorstellung*, 3 vols. (Leipzig, 1818), translated by R. B. Haldane and J. Kemp as *The World as Will and Idea* (London: Trubner, 1883), as well as his *Über den Willen in der Natur* (Frankfurt, 1836), translated by K. Hillebrand as *On the Will in Nature* (London, 1889).

Giordano Bruno's panpsychist views are presented in the second dialogue of *De la causa, Principio e uno*; for translations see Sidney Greenberg's *The Infinite in Giordano Bruno* (New York: King's Crown Press, 1950) and Jack Lindsay's version in *Cause, Principle and Unity* (New York: International, 1964). The works by Telesio and Campanella in which their panpsychism is expounded are not available in English. There is a very clear summary of their arguments in Harald Höffding, *A History of Modern Philosophy*, Vol. I (London, 1908). The texts of the pre-Socratics, some of whom were hylozoists rather than panpsychists, are available in English translation in G. S. Kirk and J. E. Raven, *The Presocratic Philosophers* (Cambridge, U.K.: Cambridge University Press, 1957). Because of his remarks about the "plastic nature in the universe" in *The True Intellectual System of the Universe*, Ralph Cudworth is described as a panpsychist in various reference works, but it is doubtful that this classification is accurate. Cudworth appears to have postulated the "plastic nature" for living things only and he should be labeled a "vitalist" in a sense in which this theory does not automatically imply panpsychism. C. B. Renouvier's panpsychism, which is in many ways similar to that of Leibniz, is expounded in several of his works, most fully in *La nouvelle monadologie* (Paris: A. Colin, 1899). Eduard von Hartmann advocates the view that even atoms possess an unconscious will in *Grundriss der Naturphilosophie*, Vol. II of *System der Philosophie im Grundriss* (Bad Sachsa im Harz, 1907). Benedict de Spinoza

and Henri Bergson were not listed as panpsychists in the text because there is some doubt as to how some of their remarks are to be interpreted. In Spinoza's case there is at least one passage (*Ethics*, Pt. II, Note 2, Prop. XIII) supporting such a classification. Similarly, some of the remarks in "Summary and Conclusions," in Bergson's *Matter and Memory* (London: Allen and Unwin, 1910), may be construed as an endorsement of panpsychism.

C. H. Waddington's genetic argument is presented in *The Nature of Life* (London: Allen and Unwin, 1961). W. K. Clifford advocates very similar arguments in his essays "Body and Mind" and "On the Nature of Things-in-Themselves," in *Lectures and Essays*, Vol. II (London, 1903). The American critical realist C. A. Strong also employs genetic arguments in support of panpsychism in *The Origin of Consciousness* (London: Macmillan, 1918). Sewall Wright, a distinguished contemporary biologist, defends panpsychism on scientific grounds in "Gene and Organism," in the *American Naturalist* 87 (1953). Hackel's views are found in *Natürliche Schöpfungsgeschichte* (4th ed., Berlin, 1892), translated by E. Ray Lankester as *The History of Creation* (London, 1892), and in *Zellseelen und Seelenzellen* (Leipzig, 1909). Panpsychism is also defended on the basis of an appeal to continuity in nature in Harald Høffding, *Outlines of Psychology* (London, 1919). Høffding, however, is rather more diffident than the other writers mentioned in this paragraph. Schiller's defenses of panpsychism are contained in his *Studies in Humanism* (London: Macmillan, 1907) and *Logic for Use* (London: G. Bell, 1929). There is a full discussion of William James's views on panpsychism and various related theories in W. T. Bush, "William James and Panpsychism," in *Columbia University Studies in the History of Ideas*, Vol. II (New York, 1925).

A defense of the scholastic doctrine that an effect cannot possess any perfection which is not found in its cause is contained in G. H. Joyce, *Principles of Natural Theology* (London: Longmans, Green, 1923), Ch. 3. The question of what may be meant by the claim that an effect contains a "new" property is discussed in Arthur O. Lovejoy, "The Meanings of 'Emergence' and Its Modes," in *Proceedings of the Sixth International Congress of Philosophy* (New York, 1927); Ernest Nagel, *The Structure of Science* (New York: Harcourt Brace, 1961); and Arthur Pap, *An Introduction to the Philosophy of Science* (New York: Free Press of Glencoe, 1962). Certain contemporary arguments about the alleged causal inexplicability of human actions, similar to the genetic arguments by Paulsen and Waddington, are examined in Bernard Berofsky, "Determinism and the Concept of a Person," in *Journal of Philosophy* 61 (1964): 461–475.

General surveys of panpsychism are found in A. Rau, *Der moderne Panpsychismus* (Berlin, 1901), and Charles Hartshorne, "Panpsychism," in *A History of Philosophical Systems*, edited by V. T. A. Ferm (New York: Philosophical Library, 1950). Almost all extended discussions of panpsychism occur in the works of writers who accept the theory or who are at least sympathetic to it. One of the few highly critical discussions is contained in Alois Riehl, *Zur Einführung in die Philosophie der Gegenwart* (Leipzig: Teubner, 1903). Eisler's article on panpsychism in his *Wörterbuch der Philosophische Begriffe* (4th ed., Berlin: E. S.

Mittler, 1929) contains a very elaborate list of panpsychists and their writings.

Paul Edwards (1967)

## PANTHEISM

"Pantheism" is a doctrine that usually occurs in a religious and philosophical context in which there are already tolerably clear conceptions of God and of the universe and the question has arisen how these two conceptions are related. It is, of course, easy to read pantheistic doctrines back into unsophisticated texts in which the concept of the divine remains unclarified, but it is wise to be skeptical about the value of such a reading. Some commentators have confidently ascribed pantheistic views to the Eleatics simply because they assert that what is, is one. But even if one considers Xenophanes, the most plausible candidate for such an ascription, it is clear that considerable care must be exercised. Thales and Anaximenes had some idea of objects in the world being infused with a divine power or substance that conferred life and movement. Xenophanes took over this idea and added to it a critique of Homeric and Hesiodic polytheism, attacking both their anthropomorphism and the immorality in which they involved the gods; his own consequent view of deity remains mysterious, however. Aristotle said that Xenophanes "with his eye on the whole world said that the One was god," but he also complained that Xenophanes "made nothing clear." It seems likely that Xenophanes, like other early Greek thinkers, did not distinguish clearly between asserting that an object was divine and asserting that a divine power informed the object's movement.

A failure by commentators themselves to observe this distinction makes it misleadingly easy to present both earlier pre-Socratic and later Stoic philosophers as recruits to the ranks of pantheism. But even Marcus Aurelius, the only notable thinker among them who can plausibly be represented as a pantheist, when he addressed the Universe itself as a deity did not clearly address it in the sense of all that is rather than in the sense of some principle of order that informs all that is.

## VEDIC PANTHEISM

As in Greek thought, the approach to pantheism in Indian thought is a systematic critique of polytheism. Although there are also conceptions of a god who reigns as the highest deity—Indra at one time held this position—what emerged with the growth of theological

reflection was the notion of Brahman. Brahman is the single, infinite reality, indefinable and unchanging, behind the illusory changing world of perceived material objects. The equation of plurality and change with imperfection is an assumption of the Vedanta teachings. From it there is drawn a proof of the illusory character of the material world, as well as of its imperfection. Were the material world real, it must, being neither self-existent nor eternal, have originated from Brahman. But if Brahman were such that from within it what is multifarious, changing, and therefore imperfect could arise, then Brahman would be imperfect. And what is imperfect cannot be Brahman.

We take the illusory for the real because our knowledge is itself tainted with imperfections. Our ordinary knowledge is such that knower and known, subject and object, are distinct. But to know Brahman would be for subject and object to become identical; it would be to attain a knowledge in which all distinctions were abolished and in which what is known would therefore be inexpressible. Two features of the pantheism of the Vedanta scholars deserve comment. The first is the affinity between their logical doctrines and those of F. H. Bradley, whose treatment of the realm of appearance is precisely parallel to the Vedanta treatment of the realm of illusion (*māyā*); Bradley's Absolute resembles Brahman chiefly in that both must be characterized negatively. As with Bradley's doctrine, the natural objection to Vedanta pantheism is to ask how, if Brahman is perfect and unchangeable, even the illusions of finitude, multiplicity, and change can have arisen. The Vedanta doctrine's answer is circular: Ignorance (lack of enlightenment) creates illusion. But it is, of course, illusion that fosters the many forms of ignorance.

Yet if the explanation of illusion is unsatisfactory, at least the cure for it is clear; the Vedanta doctrine is above all practical in its intentions. It will be noteworthy in the discussion of other and later pantheisms how often pantheism is linked to doctrines of mystical and contemplative practice. The separateness of the divine and the human, upon which monotheists insist, raises sharply the problem of how man can ever attain true unity with the divine. Those contemplative and mystical experiences, common to many religions, for whose description the language of a union between human and divine seems peculiarly appropriate—at least to those who have enjoyed these experiences—for that very reason create problems for a monotheistic theology, problems that have often been partly resolved by an approach to pantheistic formulations. It is at least plausible to argue that the

essence of the Vedanta doctrine lies in its elucidation of mystical experience rather than in any use of metaphysical argument for purely intellectual ends.

#### WESTERN PANTHEISM TO SPINOZA

The pantheism of the Vedanta argues that because God is All and One, what is many is therefore illusory and unreal. The characteristic pantheism and near pantheism of the European Middle Ages proceeded, by contrast, from the view that because God alone truly is, all that is must in some sense be God, or at least a manifestation of God. Insofar as this view implies a notion of true being at the top of a scale of degrees of being, its ancestry is Platonic or Neoplatonic. It would be difficult to call Neoplatonism itself pantheistic because although it views the material world as an emanation from the divine, the fallen and radically imperfect and undivine character of that world is always emphasized.

ERIGENA AND AVERROES. However, the translation of Neoplatonic themes of emanation into Christian terms by John Scotus Erigena (c. 810–c. 877) resulted in *De Divisione Naturae*, which was condemned as heretical precisely because of its break with monotheism. It might be argued that Erigena does not seem to be wholly pantheistic in that he did not treat every aspect of nature as part of the divine in the same way and to the same degree. This would be misleading, however, for on this criterion no thinker could ever be judged a pantheist.

According to Erigena the whole, *natura*, is composed of four species of being: that which creates and is not created, that which is created and creates, that which is created and does not create, and that which is not created and does not create. The first is God as creator; the last, God as that into which all created beings have returned. The second and third are the created universe, which is in process of passing from God in his first form to God in his last form. Erigena wrote as if each class of beings belongs to a different period in a historical unfolding, but he also treated this as a misleading but necessary form of expression. *Natura* is eternal; the whole process is eternally present; and everything is a *theophania*, a manifestation of God.

Pope Honorius III condemned *De Divisione Naturae* in 1225 as “pullulating with worms of heretical perversity,” and much earlier Erigena's other work had been described by the Council of Valence (855) as “Irish porridge” and “the devil's invention.” Clearly, part of what perturbed them was Erigena's ability to interpret in a pantheistic sense both the biblical doctrine of creation

and the biblical notion of a time when God shall be all in all.

A similar problem arose for the Islamic interpreter of Aristotle, Ibn Rushd (Averroes), whose discussions of the relation of human to divine intelligence aroused suspicion of pantheism and whose assertions of fidelity to the Qur'an did not save him from condemnation. A Christian Aristotelian such as Meister Eckhart, the Dominican mystic, was also condemned. Both Eckhart and Johannes Tauler spoke of God and man in terms of a mutual dependence that implies a fundamental unity including both. However, in every medieval case after Erigena the imputation of pantheism is at best inconclusive. Only since the sixteenth century has genuine pantheism become a recurrent European phenomena.

**BRUNO.** Giordano Bruno (1548–1600) was an explicitly anti-Christian pantheist. He conceived of God as the immanent cause or goal of nature, distinct from each finite particular only because he includes them all within his own being. The divine life that informs everything also informs the human mind and soul, and the soul is immortal because it is part of the divine. Since God is not distinct from the world, he can have no particular providential intentions. Since all events are equally ruled by divine law, miracles cannot occur. Whatever happens, happens in accordance with law, and our freedom consists in identifying ourselves with the course of things. The Bible, according to Bruno, insofar as it errs on these points, is simply false.

**BOEHME.** Jakob Boehme (1575–1624) was a shoemaker, a mystic, and a Lutheran whose wish to remain within the church was shown by the fact that to the end he received the sacraments. The pantheism of Erigena or Bruno was founded upon a view that the universe must necessarily be a single all-inclusive system if it is to be intelligible. Their pantheism derived from their ideal of explanation. Boehme, by contrast, claimed that he was merely recording what he has learned from an inward mystical illumination. He saw the foundation of all things in the divine *Ungrund*, in which the triad of Everything, Nothing, and the Divine Agony that results from their encounter produces out of itself a procession of less ultimate triads which constitute the natural and human world. Boehme made no distinction between nature and spirit, for he saw nature as entirely the manifestation of spirit. It is not at all clear in what sense the propositions that Boehme advanced can have been the record of vision; it is clear that both in claiming authority for his vision and in the

content of his doctrine he was bound to encounter, as he did, the condemnation of the Lutheran clergy.

**SPINOZA.** Benedict de Spinoza's pantheism had at least three sources: his ideal of human felicity, his concept of explanation, and his notion of the degrees of human knowledge. His explicit aim was to discover a good that would be independent of all the ordinary contingencies of chance and misfortune. Only that which is capable of completely filling and occupying the mind can be the supreme good in Spinoza's sense. The only knowledge that could satisfy these requirements would be the knowledge that the mind is part of the total system of nature and is at one with it when recognizing that everything is as it must be. Felicity is the knowledge of necessity, for if the mind can accept the necessity of its own place in the whole ordering of things, there will be room neither for rebellion nor for complaint. Thus, from the outset Spinoza's characterization of the supreme good required that his philosophy exhibit the whole universe as a single connected system.

So it is with his concept of explanation. To explain anything is to demonstrate that it cannot be other than it is. To demonstrate this entails laying bare the place of what is to be explained within a total system. Spinoza made no distinction between contingent causal connections and necessary logical connections. A deductive system in which every proposition follows from a set of initial axioms, postulates, and definitions mirrors the structure of the universe, in which every finite mode of existence exemplifies the pattern of order that derives from the single substance, *Deus, sive natura* (God, or nature). There can be only one substance, not a multiplicity of substances, for Spinoza so defined the notion of substance that the relation of a property to the substance of which it is a property is necessary, and therefore intelligible and explicable; however, the relation of one substance to another must be external and contingent, and therefore unintelligible and inexplicable. But for Spinoza it is unintelligible that what is unintelligible should be thought to exist. Hence, there can be only one substance; "God" and "Nature" could not be the names of two distinct and independent substances.

It follows that God cannot be said to be the creator of nature, except in a sense quite other than that of Christian or Jewish orthodoxy. Spinoza did distinguish between nature as active (*natura naturans*) and nature as passive product (*natura naturata*), and insofar as he identified God with nature as creative and self-sustaining rather than with nature as passive, he could speak of God as the

immanent cause of the world. But this is quite different from the orthodox conception of divine efficient causality. Also, in Spinoza's view, there can be no divine providential intentions for particular agents and there can be no miracles. What, then, of the Bible?

Spinoza regarded the Bible as an expression of truth in the only mode in which the ordinary, unreflective, irrational man is able to believe it or be guided by it. Such men need images, for their knowledge is of the confused kind that does not rise to the rational and scientific explanation of phenomena, let alone to that *scientia intuitiva* (intuitive knowledge) by which the mind grasps the whole necessity of things and becomes identical with the *infinita idea Dei* (infinite idea of God). Freed from all those passions that dominated his actions so long as he did not grasp them intellectually, man is moved only by a fully conscious awareness of his place in the whole system. It is this awareness that Spinoza also identified as the intellectual love of God.

In using theological language to characterize both nature and the good of human life, Spinoza was not concealing an ultimately materialistic and atheistic standpoint. He believed that all the key predicates by which divinity is ascribed apply to the entire system of things, for it is infinite, at once the uncaused *causa sui* and *causa omnium* (cause of itself and cause of everything) and eternal. Even if Spinoza's attitude to the Bible was that it veils the truth, he believed that it *is* the truth that it veils. He considered his doctrine basically identical with both that of the ancient Hebrew writers and that of St. Paul. This did not save him from condemnation by the synagogue in his lifetime, let alone from condemnation by the church afterward.

## GERMAN PANTHEISM

Erigena, Bruno, Boehme, Spinoza—each of these, no matter how much he may have made use of material drawn from earlier philosophical or religious writing, was a thinker who was independent of his specifically pantheist predecessors and who revived pantheism by his own critical reflections upon monotheism. It was only in the eighteenth century that something like a specifically pantheist tradition emerged. The word *pantheist* was first used in 1705 by John Toland in his *Socinianism truly stated*. Toland's hostile critic, J. Fay, used the word *pantheism* in 1709 and it speedily became common. With the increased questioning of Christianity, accompanied by an unwillingness to adopt atheistic positions, pantheism became an important doctrine, first for Johann Wolfgang von Goethe and Gotthold Ephraim Lessing, both of

whom were influenced by Spinoza, then for Friedrich Schleiermacher, and finally for Johann Gottlieb Fichte, Friedrich von Schelling, and Georg Wilhelm Friedrich Hegel.

**GOETHE AND LESSING.** Goethe's aim was to discover a mode of theological thinking, rather than a theology, with which he could embrace both what he took to be the pagan attitude to nature and the redemptive values of Christianity. Suspicious as he was of Christian asceticism, he also recognized a distinctive Christian understanding of human possibility, and his various utterances about Christianity cannot be rendered consistent even by the greatest scholarly ingenuity. In the formulas of pantheism, which he was able to interpret in the sense that he wished precisely because he failed to understand Spinoza correctly, Goethe found a theology that enabled him both to identify the divine with the natural and to separate them. The infinite creativity Goethe ascribed to nature is what he took to be divine; but while the seeds of a consistent doctrine can be discerned in this aspect of Goethe's writings, it would be wrong to deny that part of pantheism's attraction for him was that it seemed to license his will to be inconsistent.

Lessing, by contrast, was consistent. He found the kernel of truth in all religions in a neutral version of Spinozism, which allowed him to see Judaism, Christianity, and Islam as distorted versions of the same truth, distorted because they confuse the historical trappings with the metaphysical essence.

**SCHLEIERMACHER.** Schleiermacher's quite different preoccupation was to make religion acceptable to the cultured unbelievers of his own time. The core of religion, on his view, is the sense of absolute dependence; to that on which we are absolutely dependent he gave a variety of names and titles, speaking of God in both monotheistic and pantheistic terms. However, he committed himself to pantheism by asserting that it is the Totality that is divine.

**FICHTE.** It is clear from Goethe, Lessing, and Schleiermacher that Spinoza's writing had become a major text for philosophical theology, but for these writers he was an inspiration rather than a precise source. With the advent of German idealism, the attempt to criticize the deductive form of Spinoza's reasoning while preserving the pantheistic content became a major theme of German philosophy. Nowhere is this more evident than in Fichte's writing, in which God and the universe are identified because the world is nothing but the material through which the Ego realizes its infinite moral vocation, and the

divine is nothing but the moral order that includes both world and Ego. The divine cannot be personal and cannot have been the external creator of the world. Fichte poured scorn on the unintelligibility of the orthodox doctrine of creation *ex nihilo* (out of nothing). He distinguished sharply between the genuinely metaphysical and the merely historical elements in Christianity. It is the theology of the Johannine Gospel that he treated as the expression of the metaphysical, and to this he gave a pantheistic sense.

**SCHELLING AND HEGEL.** Schelling's pantheism was cruder than Fichte's—according to him, all distinctions disappear in the ultimate nature of things. The divine is identified with this ultimate distinctionless merging of nature and spirit, a unity more fundamental than any of the differences of the merely empirical world.

Hegel was subtler and more philosophically interesting than either Fichte or Schelling. Like Boehme and Schleiermacher, he remained within orthodox Protestant Christianity, claiming to be engaged in the interpretation rather than the revision of its dogmatic formulas. The Hegelian Absolute Idea preexists its finite manifestations logically but not temporally, and it receives its full embodiment only at the end of history, when it is incorporated in a social and moral order fully conscious of its own nature and of its place in history. This phase of self-consciousness is already reached at the level of thought in Hegel's *Logic*. But the Absolute Idea has no existence apart from or over and above its actual and possible manifestations in nature and history. Hence, the divine is the Totality.

After Hegel pantheism was less in vogue. The critique of Christianity became more radical, atheism became a more acceptable alternative, and Spinoza dominated the intellectual scene far less. In England a poetic pantheism appeared in Percy Bysshe Shelley and William Wordsworth, but in Shelley it coexisted with something much closer to atheism and in Wordsworth with a Christianity that displaced it. In any case, the intellectual resources of such a pantheism were so meager that it is not surprising that it did not survive in the nineteenth century.

### CRITICISMS OF PANTHEISM

Pantheism essentially involves two assertions: that everything that exists constitutes a unity and that this all-inclusive unity is divine. What could be meant by the assertion that everything that exists constitutes a unity? It is first and most clearly not a unity derived from membership of

the same class, the view that seems to have been taken by Boehme. "There is no class of all that is," wrote Aristotle. Why not? Because existence is not a genus. To say that something exists is not to classify it at all. When Boehme asserted that the universe includes both existence and nonexistence, he both anticipated a long tradition that culminated in Martin Heidegger and remained unintelligible. The notion of a unity that includes all that exists—or even all that exists and all that does not exist—is a notion devoid of content. What could be unitary in such an ostensible collection?

The unity might be of another kind, however. In Spinoza the unity of the universe is a logical unity, with every particular item deducible from the general nature of things. There is a single deductive web of explanation—there are not sciences; there is science. About such an alleged unity two points must be made. First, the contingent aspect of nature is entirely omitted. Even a total description of the universe in which every part of the description was logically related to some other part or parts (assuming for the moment such a description to be conceivable) would still leave us with the question whether the universe was as it was described; and if it was as it was described, this truth would be a contingent truth that could not be included in the description itself and that could stand in no internal conceptual relationship to the description. The fact of existence would remain irreducibly contingent. Second, the actual development of the sciences does not accord with Spinoza's ideal. The forms of explanation are not all the same; the logical structure of Darwinian evolutionary theory must be distinguished from the logical structure of quantum mechanics. Thus, the kind of unity ascribed by Spinoza to the universe seems to be lacking.

In Fichte and Hegel the unity ascribed to the universe is one of an overall purpose manifest in the pattern of events, as that pattern is discovered by the agent in his social and moral life. In order for this assertion to be meaningful it must be construed, at least in part, in empirical terms; in Fichte's case as a hypothesis about moral development, in Hegel's case as a hypothesis about historical development. Neither hypothesis appears to be vindicated by the facts.

Suppose, however, that a unity of some kind, inclusive of all that is, could be discovered. In virtue of what might the pantheist claim that it was divine? The infinity and the eternity of the universe have often been the predicates that seemed to entail its divinity, but the sense in which the universe is infinite and eternal is surely not that in which the traditional religions have ascribed these

predicates to a god. What is clear is that pantheism as a theology has a source, independent of its metaphysics, in a widespread capacity for awe and wonder in the face both of natural phenomena and of the apparent totality of things. It is at least in part because pantheist metaphysics provides a vocabulary that appears more adequate than any other for the expression of these emotions that pantheism has shown such historical capacity for survival. But this does not, of course, give any warrant for believing pantheism to be true.

## PANTHEISMUSSTREIT

*Pantheismusstreit* or the pantheism controversy, came to the attention of the public in 1785 when Friedrich Heinrich Jacobi published *Ueber die Lehre des Spinoza*, his correspondence with Moses Mendelssohn concerning Gotthold Ephraim Lessing’s late Spinozist phase. Other prominent writers, including Immanuel Kant, Johann Gottfried Herder, Johann Wolfgang von Goethe, Johann Kaspar Lavater, and Johann Georg Hamann, became involved in this dispute, which led to an objective reappraisal of Spinozism. The first important reaction to Benedict de Spinoza’s influence in Germany had been Gottfried Wilhelm Leibniz’s *Theodicy* (1710). At the time of the pantheism controversy, the distorted image of Spinoza, the “satanic atheist,” was definitely destroyed. This image had been created by Pierre Bayle and cultivated in Germany by Theophil Gottlieb Spitzel (1639–1691), Johann Christophorus Sturm (1635–1703), Johann Konrad Dippel (c. 1672–1734), and Christian K. Kortholt (1633–1694), whose *De Tribus Impostoribus Liber* (1680) had attacked Herbert of Cherbury, Thomas Hobbes, and Spinoza as “impostors.”

### INCEPTION OF THE CONTROVERSY

Jacobi’s book constituted one stage in the struggle waged by the supporters of Hamann (whose sentimentalist faith Jacobi attempted to combine with Kant’s critical philosophy) against the religious rationalism of the Berlin Enlightenment, whose proponents were grouped around Friedrich Christian Nicolai and the *Berlinische Monatsschrift*. In his *Golgotha und Scheblimini* (1784), Hamann had attacked the theistic rationalism of Mendelssohn’s *Jerusalem* (1783). A work prized by Kant, Herder, Mirabeau, and Christian Garve, *Jerusalem* was directed against state-imposed creeds and religions of revelation.

Jacobi’s hasty publication of his correspondence with Mendelssohn, too, was indirectly inspired by Hamann. The latter informed Jacobi on June 29, 1785, that the first part of Mendelssohn’s *Morgenstunden* was already being printed. Wrongly suspecting that Mendelssohn had mentioned their controversy over Lessing in this work, Jacobi committed a dual breach of trust. To his *Ueber die Lehre des Spinoza* he appended anonymously a fragment from Goethe’s unpublished “Prometheus” (1774) that Jacobi had shown Lessing during a conversation at Wolfenbüttel on July 7, 1780.

It was this conversation that served as the starting point and focus of the pantheism controversy. To the report of this conversation Jacobi added a digest of an

argument with Mendelssohn that had ensued from a report by Elise Reimarus (February 1783) to the effect that Mendelssohn was busy with a work on Lessing. Through her, Jacobi led Mendelssohn to believe that “Lessing had been a Spinozist” but had never admitted it to his friend Mendelssohn because the latter had never taken seriously a relevant hint concerning the Spinozist purport of Paragraph 73 of Lessing’s *Erziehung des Menschengeschlechts*. Mendelssohn, through Elise Reimarus, then addressed precise questions to Jacobi regarding the character of Lessing’s alleged Spinozism. He considered it unlikely that, one, Lessing had been a Spinozist and that, two, he would have remained silent about it to a friend of many years’ standing (Mendelssohn) while confiding it to the first stranger that had come along (Jacobi). Mendelssohn suggested courteously that perhaps Lessing, as was his nature, had made in jest certain paradoxical statements to Jacobi. However, if Jacobi could conclusively demonstrate Lessing’s Spinozism, then, Mendelssohn allowed, he would have to give precedence to the truth in the work he planned to write about his friend.

In his reply of November 4, 1783, Jacobi again gave details of his conversations with Lessing. But in so doing, he misjudged his own situation. It was obvious that Lessing, tired of hearing Spinoza treated “like a dead dog,” had been attempting to provoke Jacobi into a refutation of Spinozism. Jacobi, however, had declared himself helpless against the geometrical reasoning of Spinoza, which seemed unanswerable to him. Although he rejected Spinoza’s “fatalism” and the concept of a God who created without insight and without will, he could find no counterarguments. To this Lessing had replied, “I note that you would like to have your will free; I do not crave free will.” Lessing characterized the tendency to give thought the precedence over other life forces as a human prejudice. He asked Jacobi whether he thought he could derive the concept of an extramundane rationally creative deity from Leibniz. “I fear,” Lessing added, “that Leibniz himself was fundamentally a Spinozist.” He recalled “a passage in Leibniz where it is said of God that he himself is in a state of everlasting expansion and contraction, and that this constitutes the creation and existence of the world.” Hard-pressed by the logic of Lessing as well as that of Spinoza, which “admits of no cause of things separate from the world,” Jacobi saved himself by a leap into a sentimentalist faith in the God of Christianity who orders the world teleologically. With unconcealed irony, Lessing remarked that such a leap of faith ending up in a somersault was something he could no longer exact of his “old legs and heavy head.” Derisively, he professed to find

agreements with his own system even in Charles Bonnet’s *Palingénésie*, which Lavater—without the author’s permission—had translated and had dedicated to Mendelssohn in an ill-fated attempt at proselytizing. Lessing also claimed to discern “obvious Spinozism” in Frans Hemsterhuis’s *Aristée*. Jacobi himself believed he recognized in the disputed Paragraph 73 of Lessing’s *Erziehung des Menschengeschlechts* his Spinozist interpretation of Christ as reality (*natura naturata*) and of God as the infinite substance (*natura naturans*).

Seven months after his reply to Mendelssohn (June 1784), Jacobi learned from Elise Reimarus that Mendelssohn had put aside his *Lessing* “in order first to venture a round with the Spinozists or ‘all-in-one’rs.” In August of that year, Mendelssohn wrote his *Erinnerungen* and sent them to Jacobi without, however, publishing them at that time. (They first appeared in 1786 in *Moses Mendelssohn an die Freunde Lessings*, pp. 36–56). In the *Erinnerungen* Mendelssohn marshaled rationalistic arguments against Spinoza and again expressed his disbelief in Lessing’s Spinozism. He dealt sarcastically with Jacobi’s “honorable retreat under the flag of faith” as a device necessary for Christian philosophers; Mendelssohn’s own religion, on the other hand, allowed him to “raise doubts on grounds of reason” and did not dictate to him “any belief in eternal verities.” Mendelssohn left unanswered Jacobi’s *Lettre à M. Hemsterhuis*, a copy of which the author had sent him on September 5, 1784. But he notified his correspondent once again that pantheism would indeed come under discussion in the first part of the *Morgenstunden*, although their mutual correspondence would be disregarded. Mendelssohn requested that Jacobi delay publishing his “counterrecollections” until after the publication of the *Morgenstunden*.

Jacobi again sent Mendelssohn an exposition of Spinozism, in forty-four paragraphs, which ended in an enthusiastic identification of Christian faith, love, and—surprisingly—knowledge (in the sense of knowledge of nature). Mendelssohn, astonished at Jacobi’s proselytizing zeal, called on Reimarus to act as arbiter in the matter of the controversy over Lessing. Reimarus counseled silence about the whole affair so as not to dishonor the memory of Lessing. Still another exegesis of Spinozism by Jacobi in six paragraphs began with the traditional thesis: “Spinozism is atheism.”

Despite Mendelssohn’s renewed assurances to Elise Reimarus on May 24, 1785, that he would not make use of his correspondence with Jacobi, the latter with an utter lack of consideration published the letters on August 28, 1785. Jacobi’s account reads like an exorcism of the mag-

netic powers of Spinozism, whereas Mendelssohn's concern in the controversy was only to clear Lessing of the charge of Spinozism and to contrast his own religion of reason with Jacobi's visionary religion of sentiment, as well as to polemicize against Spinoza with Wolffian arguments. Mendelssohn's main proof for the existence of a rational God (in Part I of the *Morgenstunden*) was that all that is real must first be thought as real by some being, hence there exists an infinite intellect.

## RESULTS OF THE CONTROVERSY

The pantheism controversy spread to wider circles of German intellectual life with the anonymous publication in 1786 of *Die Resultate der Jacobi'schen und Mendelssohn'schen Philosophie* by Thomas W. Wizenman, a young follower of Hamann and a Pietist, who had been induced by Jacobi to read Spinoza. Wizenman, under the guise of a disinterested spectator, openly took Jacobi's side. As Kant later revealed it, Wizenman launched into an *argumentum ad hominem* against Mendelssohn, attempting to destroy deism with atheism, and atheism with deism. For the fideist Wizenman, it was impossible to demonstrate the existence or the nonexistence of God and his relationships to the world. He tried to define the concept of reason in such a fashion that the rationality of a belief in revealed religion would proceed from this definition, once historical evidence of the revelation was at hand.

Compelled by Wizenman's publication to express an opinion, Kant in "Was heisst: sich im Denken orientieren?" (*Berlinische Monatsschrift*, October 1786) rejected both Jacobi's sentimentalist faith and Mendelssohn's rationalist faith as subjective views that conceal in themselves the danger of fanaticism. As in the later *Critique of Judgment* (Paragraph 80), Kant declared that pantheism did not provide a teleological explanation of things, so in the *Monatsschrift* article he defended himself against the reproach that his *Critique of Pure Reason* had promoted Spinozism: "Spinozism speaks of thoughts that themselves think and thus of an accidental thing that still at the same time exists for itself as subject—a concept that is not to be found at all in the human understanding and cannot be brought into it." Kant disapproved of Mendelssohn's attempt to reduce the quarrel of freedom of will versus determinism to a matter of pure logomachy (*Einige Bemerkungen zu Jakobis Prüfung der Mendelssohnschen Morgenstunden*, Leipzig, 1786).

More important than the polemics of the pantheism controversy were its effects on Herder and Goethe and later on Friedrich Schleiermacher, Friedrich von

Schelling, and G. W. F. Hegel. Herder, in his five conversations titled *Gott* (1787), deplored Spinoza's terminological dependence on René Descartes, but he accepted Spinoza's concept of God, whom he regarded as the primal power from which all other powers derive. Thus in his own way he came close to the concept of the primal phenomenon that Goethe, as a metaphysical philosopher of nature, was seeking to investigate.

Goethe himself had reread Spinoza in January 1785 and had found in him the foundations for his own holistic or antimechanistic, anti-Newtonian concept of the universe. He had already, on June 4, 1785, objected to Jacobi: "You acknowledge the highest reality, which is the basis of Spinozism, on which all else rests, from which all else flows. He does not prove the Being of God, Being is God. And if for this reason others scold Spinoza for being an atheist, I should like to name him and praise him as *theissimum*, indeed, *christianissimum*." On October 21 of the same year, Goethe sharply attacked Jacobi's play on the word *believe* as the behavior of a "faith-sophist," admonished him to apply himself to "clarity and distinctness of expression," and admitted "that while by nature I do not share Spinoza's mode of conception, if I had to cite a book that, more than any I know, agrees most fully with my own conception, I should have to name the *Ethics*." On May 5, 1786, he expressed his disagreement with Jacobi:

I cling more and more firmly to the reverence for God of the atheist [Spinoza] ... and I cede to you [Christians] all that your religion enjoins and must enjoin ... When you say that one can only *believe* in God ... then I say to you that I lay great weight on *looking and seeing* and when Spinoza, speaking of *scientia intuitiva*, says *Hoc cognoscendi genus procedit ab adaequata idea essentiae formalis quorundam Dei attributorum ad adaequatam cognitionem essentiae rerum* [This manner of knowing moves from the adequate idea of the formal essence of some attributes of God to the adequate knowledge of the essence of things], these words give me courage to devote my entire life to the contemplation of the things that I can reach and of whose *essentia formali* I can hope to fashion an adequate idea

Just as Goethe, who, inspired by the pantheism controversy to make a study of Spinoza, became conscious of his own holism while reading the *Ethics*, so pantheism, thanks to its contact with Spinozism, progressed from its traditional manifestation as Neoplatonic emanation to a concept of evolution, which in Hegel's philosophy (and in

the twentieth century, that of Henri Bergson) entails the development of the Absolute in and with the world.

## PAPINI, GIOVANNI

(1881–1956)

Giovanni Papini, an Italian pragmatist philosopher and literary figure, was born in Florence into a family of modest means and had no formal education. Papini described himself in his *Un uomo finito* (Florence, 1913; translated by Virginia Page as *Failure; Un Uomo Finito*, New York, 1924), a book that was frankly and painfully biographical, as self-taught, urged on by an insatiable curiosity and a burning desire to investigate the various forms of knowledge. He quickly made a name for himself in Italian culture at the beginning of the twentieth century with his attack on the then prevailing positivist philosophy of Roberto Ardigò and his support of nationalistic tendencies and opposition to the ideals of democracy. He became a close friend of Giuseppe Prezzolini and other young writers who advocated doing away with the old oligarchies and giving a new impetus to the spiritual life of the country. The fruit of this collaboration was the birth in 1903 of *Leonardo*, a nonconformist review that published the most important contemporary thinkers. They chose Friedrich Nietzsche, Henri Bergson, William James, and F. C. S. Schiller as their exemplars and leaders, but the interests of the *Leonardo* group embraced the avant-garde currents in art and literature as well.

In his writings, later gathered together in a book titled *Pragmatismo* (Milan, 1913), Papini defined the essential aspects of his thought. His is a kind of magic pragmatism, markedly different from the logical and sci-

entific pragmatism of C. S. Peirce. This pragmatism rejects the positivists' agnosticism concerning issues that go beyond experience; that metaphysical problems lack meaning does not indicate a lack in our intellectual capabilities but rather how very human the nature of knowing is. Instead of striving for definitive explanations in the manner of the traditional philosophies, the pragmatist is concerned with the methods and instruments that aid in defining the various forms of knowledge and activity. He does not believe in absolute principles or immutable truths; neither does he stop at mere description and generalization of the facts of experience. His aim is to develop laws and predictions, with the sole purpose of increasing the power of man over nature. No metaphysical hypothesis, observed Papini, is more valuable than another, and none can be recognized as true. On the contrary, the pragmatist viewpoint is one of maximum freedom and advocates a plurality of attitudes. Papini's celebrated definition of pragmatism was praised and quoted by William James:

Pragmatism is a *corridor theory*, a corridor of a great hotel where there are 100 doors that open onto 100 rooms. In one there is a faldstool and a kneeling man who wants to regain his faith, in another a writing-desk and a man who wants to kill every metaphysic, in a third a laboratory and a man who wants to find new vantage points on the future. (*Pragmatismo*, p. 82)

Papini's *Leonardo* period, with neo-Hegelians such as Benedetto Croce and Giovanni Gentile aiding the attack on positivism, terminated in 1906. But this was only the beginning of a painful intellectual journey in which Papini sought, without success, to give form and coherence to his thought. He participated in the battle of ideas of *La voce*, directed by his friend Prezzolini; then he broke away and in 1911, in collaboration with Giovanni Amendola, directed a review with a strong moral bent, *L'anima*; and finally he founded *Lacerba*, an avant-garde journal violently opposed to the prevailing order of things. In the meantime, his literary output was enriched by numerous works, including *Il crepuscolo dei filosofi* (The twilight of the philosophers; Milan, 1906), *La cultura italiana* (Florence, 1906), written in collaboration with Prezzolini, and *L'altra metà* (The other half; Ancona, 1912). In addition to these books, a great number of articles testify to his zeal and his cultural interests. In this period Papini drew further away from the idealism gaining popularity in Italy, intensified his dissent with the school of Croce, and supported the futurist movement in accordance with his rebellion against traditional aesthetic rules.

Papini strongly favored Italian intervention in World War I because he saw the war as a decisive conflict between the old and the new. However, the war led him to a reassessment of Christian values and to embrace the works of the fathers of the church, and in particular those of St. Augustine. He regarded Augustine, to whom he devoted a book (*S. Agostino*, Florence, 1929), as a defender of the faith, an uncompromising polemicist, and an unsurpassable model of humanity reaching out toward the divine. Papini's activity did not diminish after his religious "conversion," but gradually became less and less concerned with philosophical matters, and concentrated instead on literary and scholarly subjects. Stricken by a disease that deprived him almost completely of the use of his senses but left his mind as active as ever, Papini bore up bravely until his death.

## PARACELSUS

(1493–1541)

Paracelsus was the pseudonym of Philippus Aureolus Theophrastus Bombastus (Baumastus) von Hohenheim, the reformer of medicine and pharmacology, chemist, philosopher, iconoclast, and writer. If he himself assumed this name, it could signify "higher than high," or "higher than Hohenheim," a jibe at his illegitimate paternal grandfather. Born in Einsiedeln, Switzerland, where his father practiced medicine, Paracelsus later lived at Villach in Carinthia (Austria), a center of mining, smelting, and alchemy—metal lores that were to occupy him for the rest of his life. From the age of fifteen his life was migratory. After medical studies at various German and Austrian universities, he seems to have completed his doctorate in 1515 at Ferrara under a faculty that was Scotist, Platonist, and humanist.

For the next eleven years, Paracelsus traveled throughout Europe, jeopardizing his authority as a physician by practicing surgery (then a craft, not a learned profession) in the army of Charles V and by experimental prescriptions. He visited spas, analyzed the waters, treated by hypnosis, and sometimes alleviated pain with laudanum. At Salzburg he narrowly escaped execution for participating in a peasants' revolt. When, in 1526, he settled at Strasbourg to establish himself in medical practice, he was famous as an object of superstitious distrust. But his spectacular cure of the printer Johann Froben quickly led to friendships with such men as Desiderius Erasmus and Oecolampadius and an appointment—against the will of the faculty—as medical lecturer at the University of Basel.

His eminence was short-lived. Lectures in German (rather than Latin), rejection of the canonical theory of Avicenna and Galen, denunciation of the apothecaries, and a public burning of the works of Avicenna were topped by the death of Froben. Those whose vested interests had been threatened tricked Paracelsus into behavior that could justify dismissal and arrest.

From 1528 until his death, his life was once again nomadic. Unkept promises and unstable patronage led him to Colmar, Nuremberg, Saint Gall, Villach, Vienna, and finally to Salzburg, where he died, probably of cancer, perhaps of metal poisoning.

Among his medical innovations were chemical urinalysis; a biochemical theory of digestion; chemical therapy; antiseptics of wounds; the use of laudanum, ether (without awareness of its anesthetic properties), and mercury for syphilis; and the combining of the apothecary's and surgeon's arts in the profession of medicine.

Paracelsus's numerous books are mostly variants on the theme of man (the microcosm) in relation to nature (the macrocosm). The most important are *Archidoxis* (c. 1524); the treatises on syphilis (c. 1529); *Opus Paramirum* (c. 1530); *Philosophia Sagax* (c. 1536); and *Labyrinthus Medicorum* (1538).

Paracelsian philosophy was both traditional and new. Its medieval elements are traceable to alchemy and Kabbalism, which are branches of a trunk rooted in Hellenistic Neoplatonism, the Corpus Hermeticum, and Gnosticism. These occult lores shared the concept of creation through corruption; the axiom "That which is above is one with that which is below"; belief in a bisexual, homogeneous, hylozoic universe; a cyclic theory of time; and an animism approximating pantheism.

A mystery religion of life rather than merely of gold, medieval alchemy employed Semitic and Greco-Roman
