mythology as a screen against the unenlightened and as a vehicle of private communication for adepts. Although Paracelsus counted himself an adept, he abandoned the tradition of reserve and discarded most of the mythological symbolism. Unlike his predecessors, he wrote to clarify. He explained that alchemy's real desideratum was the secret of life.

Like Kabbalists and alchemists, Paracelsus believed in the theory that decay is the beginning of all birth. Nature emerges through separations: First, prime matter separates out of ultimate matter (also called *Yliaster* or *Mysterium Magnum*), which is eternal and paradoxically immaterial. "The first was with God ... that is *ultima materia*; this *ultima materia* He made into *prime matter* ... that is a seed and the seed is the element of water [fluid]." God spins ultimate matter out of himself. This yields, by separation, the prime matter of individual objects, a watery matrix, perpetually spawning nature, perpetually resolvable back into ultimate matter. Human creativeness in art, alchemy, or pharmacology repeats the primal act. The human demiurge, like God, separates rather than combines.

The Paracelsian theory of time resembles that of Plotinus. Time is qualitative change: growth, transition—even fate. Given the basic concept of cyclic generation and decay, Paracelsian time would be for the material cosmos a cycle of becoming. But there are two orders of time: force time (within) and growing time (without). Like the Paracelsian concept of "prime matter" in relation to "ultimate matter," this theory of time is essentially dualist.

"Above" and "below" are substantially the same: "Heaven is man and man is heaven, and all men together are the one heaven," but microcosm and macrocosm are contained by membranes or partitions.

Paracelsus rejected the concept of humors as governed by planets and substituted a chemical theory of humors as properties: salt, sweet, bitter, and sour. He retained the medieval alchemistic variant of the four elements and a quintessence, the fifth element, that is life. He tended to treat fire as less elementary than the combustible principle, sulfur. Medieval alchemy had stressed the sexual polarity of two elements, fire (identified with the male principle) and water (identified with the female principle), and contrasted flame with flow and sulfur with mercury. Paracelsus reinterpreted these as principles rather than as elements and added a third principle, salt. These are properties or states—combustible, fluid or vaporous, and solid; each confers on matter its structure, corporality, and function. As constituents of ultimate

matter, these are absolutes; as components of nature, they are infinitely variable in all sensuously discernible properties. Every natural object has its own sulfur, salt, and mercury, as well as its own quintessence.

Absolute life comes from *Ens Seminis*, the cosmic protoplasm. *Ens Astrale* is to the microcosm (man) as the firmament is to the macrocosm (nature). It can sustain or poison from within, as a toxic atmosphere can poison sea water and fish. *Ens Veneni* is the poison from without. Nature lives by dying; life eats life. Man may eat the flesh of an animal whose food would poison him, but within every living body there is an alchemist that selects what is food for that body. *Ens Naturale* is the bodily harmony of the chemical humors. *Ens Spirituale* has its equivalent in what psychiatry calls the psyche. Against the common belief of his day, Paracelsus argued that madness was not demonic possession and that evil dreams were not intercourse with incubi or succubi. Mind produces diseases both in itself and its own body or in another mind or body through hypnosis, fetishism, or demonstrable ill will. Most diseases are positive evils, but there is *Ens Dei*, God's will, which no doctor can circumvent.

Although accused by Erasmus of dualist heresy because of the importance he gave primal matter and because he described illness as intrinsically evil, Paracelsus died in the Church of Rome, and his burial place became a shrine.

## PARACONSISTENT LOGICS

The driving thought of paraconsistency is that there are situations in which information, or legal, scientific, or philosophical principles (and so on) are inconsistent, but in which people want to draw conclusions in a sensible fashion. Clearly, if one uses a logical consequence relation in which contradictions imply everything—that is, in which  $A, \neg A \vdash B$ , for all  $A$  and  $B$ —this is not possible: a person would have to conclude everything (*triviality*). This motivates the definition of a paraconsistent logic. The principle of inference that contradictions entail everything is called *explosion* (or *ex falso quodlibet sequitur*). A paraconsistent logic is one in which explosion is not valid.

Paraconsistent logics are not new. As Aristotle (*An. Pr.* 63<sup>b</sup>31–64<sup>a</sup>16) points out, syllogistic is paraconsistent. The idea that explosion is a correct principle of inference seems to have arisen in the twelfth century, with the discovery of the following simple argument. Suppose that  $\neg A$ ; then  $\neg A \vee B$ . But now suppose that  $A$  as well. Then  $B$  follows by the disjunctive syllogism ( $A, \neg A \vee B \vdash B$ ). Explosion and the disjunctive syllogism had variable for-

tunes in later Medieval logic. A common move was to distinguish two notions of validity: one (*material*) for which they held; and one (*formal*) for which they do not. All this was forgotten after the Middle Ages. But since the early twentieth century, the hegemony of Frege/Russell (classical) logic, according to which explosion is valid, has ensured the orthodoxy of the principle.

Modern formal paraconsistent logics started to appear in the second half of the twentieth century. Amongst the earliest paraconsistent logics were those proposed by Stanisław Jaśkowski (1948) and Newton da Costa (1963). The paraconsistent possibilities of the relevant logic of Alan Anderson and Nuel Belnap (1960s) was also soon recognized. By the end of the twentieth century there were many paraconsistent logics with well-defined semantics and proof theories.

In the semantics of most paraconsistent logics, validity is defined in terms of the preservation of truth-in-an-interpretation. It must therefore be possible to have interpretations where  $A$  and  $\neg A$  are both true. There are several ways of achieving this end. One is to take truth to be truth-at-a-world in a world-semantics for modal logic (as in Jaśkowski's system  $D_2$ , "discussive logic"). In this case, the inference of adjunction ( $A, B \vdash A \& B$ ) will fail, giving rise to a nonadjunctive paraconsistent logic. Another possibility is to graft a non-truth-functional negation on to some positive logic (as in the da Costa  $C$ -systems). The truth value of  $\neg A$  is not determined by that of  $A$ ; both may then be true. This gives so-called "positive-plus" paraconsistent logics. A third possibility is to employ a many-valued logic in which some designated truth value,  $v$ , is a fixed point for negation. That is, if the value of  $A$  is  $v$ , the value of  $\neg A$  is also  $v$ .  $v$  may be the value *both true and false*, as in Graham Priest's *LP*, or the value 0.5 where the semantics has the real numbers between 0 and 1 as truth values. The way that negation is handled in relevant logic also has the same effect.

In nearly all paraconsistent logics, there are ways of recapturing the full force of classical reasoning. Thus, in discursive logic, if the premises are conjoined then they have all of their classical consequences. Da Costa suggested augmenting the language with an operator,  $\circ$ , such that, intuitively,  $A^\circ$  expresses the consistency of  $A$ . The classical negation of  $A$  can then be expressed by  $\neg A \& A^\circ$ . A different way was suggested by Diderik Batens. Consistency-ordering is defined on interpretations, such that classical interpretations (and only those) come out as the most consistent. A notion of validity is then defined according to which an inference is valid iff (meaning "if and only if") the conclusion holds in all those interpreta-

tions which are as consistent as possible, given only that the premises hold in them. This gives a nonmonotonic notion of consequence according to which the consequences of a consistent set of sentences are just their classical consequences. (Batens developed the idea into a whole family of nonmonotonic logics with interesting properties, Adaptive Logics.)

Paraconsistent logics have many applications. They can be used as the inference engine for a computational database, where the data may not be reliable, or used to analyze the reasoning of inconsistent theories in the history of science—such as the original infinitesimal calculus or Bohr’s theory of the atom. (The inconsistency of each of these was acknowledged in their times.) The same also holds true for the inconsistent but nontrivial theories that paraconsistent logic makes possible, including various mathematical theories. One can be interested in these because they have an intrinsically elegant structure, are instrumentally useful, and are good approximations to the truth. None of this requires one to suppose that the inconsistent theories may be true.

The view that some contradictions are true is dialeth(e)ism (a di/aletheia being a true statement of the form  $A \& \neg A$ ). Unless a dialetheist takes everything to be true (not an attractive view!), they also require a paraconsistent logic. Though there have been dialetheists—such as Hegel—in the history of European philosophy, dialetheism is a strongly heterodox view because it flies in the face of the Law of Noncontradiction. The construction of contemporary paraconsistent logics has given the view a new lease of life. In particular, beginning in the 1970s, it was advocated by Priest and Richard Sylvan (né Routley).

Modern dialetheists argue for their view by appealing to certain features of motion, inconsistent systems of norms, and various other considerations. A major appeal has always been to the paradoxes of self-reference, such as the Liar and Russell’s paradox (and related phenomena such as Gödel’s incompleteness theorem). The paradoxical arguments are what they appear to be: arguments establishing that certain contradictions are true. In particular, a dialetheist can subscribe to the principles which generate these paradoxes: the unrestricted *T*-schema for truth (“*A*” is true iff *A*) and the unrestricted comprehension principle for sets (for any condition, there is a set comprising all and only those things satisfying that condition). In particular, it is possible to construct inconsistent but nontrivial theories containing these principles. Not all paraconsistent logics are suitable for this enterprise, however. In this context, any logic which endorses

the principle of contraction ( $A \rightarrow (A \rightarrow B) \vdash A \rightarrow B$ ) gives rise to triviality, in the form of Curry paradoxes. Such logics include the da Costa *C* logics and the stronger relevant logics.

## PARADIGM-CASE ARGUMENT

“Paradigm-case argument” is a form of argument against philosophical skepticism found in contemporary analytic philosophy. It counters doubt about whether any of some class of things exists by attempting to point out paradigm cases, clear and indisputable instances. A distinguishing feature of the argument is the contention that certain facts about language entail the existence of paradigm cases. This claim, however, has been disputed in recent years, and the future status of the argument depends upon whether it can be upheld.

The paradigm-case argument has been used against a wide range of skeptical positions. A typical example is doubt about our ability to perceive directly material objects. Such doubt can be raised by reflection upon the physiological and physical facts about perception. For example, since seeing involves the transmission of light waves to our eyes and these waves are what immediately affects our eyes, it may appear that we are mistaken in thinking that we see objects. If anything, we should say that we see light waves. The fact that it takes a certain amount of time for light to travel from an object to our eyes lends support to this. How can we see something unless we see it as it is at the present moment? While considerations such as these show how skepticism can arise, one striking fact about the paradigm-case argument is that if it is valid, the skeptic can be refuted directly without the necessity of examining in detail the reasons behind his position.

The first step in the argument is to make the skepticism bear on particular cases. If we cannot perceive material objects, then, presumably, we cannot see the table we are working on or the pen with which we write. Next, a situation is sketched in which, ordinarily, no one would hesitate to affirm just the opposite. If the light is excellent, our eyes open, our sight unimpaired, the table directly before us, and so on, then we should ordinarily have no qualms about stating that we see a table.

The argument would be weak if it relied merely on the fact that people would ordinarily have no doubts in such situations, for it does not follow from this that they state the truth. But the argument claims something more for the kind of situations it describes. It holds that they are indisputably examples of seeing a table because of their relationship to the meaning of the expression “seeing a table.” Typically, this relationship is brought out by saying that such a situation is just what we call “seeing a table” or that it is just the sort of circumstances in which one might teach someone the meaning of the expression “seeing a table.” Generalizing and taking the strongest interpretation of the force of these remarks, one might ask: “If this *is* just what we call *X*, then in saying that it is *X*, how can we fail to state the truth? If this *is* a situation in which we might teach the meaning of *X*, then how can it fail to be a case of *X*?” In denying that anyone ever sees a table, the skeptic seems to be placed in the position of refusing to apply the expression “seeing a table” to the very situation to which that expression refers.

If the skeptic concedes that the situation presented is an instance of that which he doubted to exist, then he admits defeat. But if, despite what has been said, he will

not concede this, the final stage of the argument poses a dilemma. When the skeptic wonders whether we ever really see such things as tables, we naturally understand the words he uses in their usual sense. By “usual sense” is meant no more than what we should have understood by his words *see* and *table* if, instead, he were describing some scene he had witnessed. But how can his words be construed in this way when he refuses to use them of a typical situation in which their usual meaning might be taught and which is just what we ordinarily call “seeing a table”? On the other hand, if the skeptic claims some different or novel meaning for his words, the original shock of his skeptical conclusion is blunted. For in some special sense of the words, it may be true that we never see tables. In fact, what often happens is that the skeptical position maintains its plausibility only through an unnoticed fluctuation between the usual sense of the key expressions and some special sense. The paradigm-case argument may serve to bring out into the open the fact that an unusual meaning must be looked for.

#### FURTHER APPLICATIONS

Other examples of philosophical doubt to which the paradigm-case argument has been applied include skepticism about the validity of inductive reasoning, about man’s free will, about the possibility of knowledge concerning empirical facts generally, and about the reality of the past. In many cases these skeptical positions are founded entirely on a priori considerations, and their stand is not merely that, as a matter of fact, there are no instances of some class of things, but that, as a matter of logical necessity, there could not be any. Philosophers who have argued that we can never genuinely know anything about the empirical world, for example, have almost invariably thought such knowledge a logical impossibility. Their reason is often the supposed impossibility of complete verification of any empirical assertion about the world. But this they take to be a necessary truth following from the fact that there are an infinite number of possible observations and investigations relevant to any such assertion. Similarly, the impossibility of justifying inductive reasoning (that which goes from examined cases to a general conclusion or from past instances to a prediction) has been held on the grounds that there is a logical obstacle in the way of all attempts at justification.

Against such a priori skepticism the argument need not produce an actual paradigm case. The mere fact that a hypothetical case can be described is sufficient. This in part accounts for the fact that philosophers who have employed the argument in practice do not bother to

describe an actual occurrence. So, for example, one writer, in using the argument to refute skepticism about induction, asks us to imagine that “the observed confirmatory instances for the theory of gravitation were a million or ten million times as extensive as they now are” (Paul Edwards, “Bertrand Russell’s Doubts about Induction,” p. 65). By its very statement this is only a hypothetical case. But the skeptic about induction cannot admit that if this were to happen, we should *then* be justified in accepting the law of gravitation, because if justification were a logical impossibility, no paradigm case of justified inductive inference would even be conceivable.

But not all philosophical skepticism is completely a priori. Doubts about the human ability to choose among genuine alternatives is often supported, for example, by citing the success of the behavioral sciences and arguing that they will eventually be able to describe and predict human actions through causal laws. Here the philosopher appears to argue from empirical premises. But here, also, the descriptions of paradigm cases offered to the skeptic have usually been hypothetical. A writer, for example, who pointed to a marriage where there has been no pressure and the like placed on the two people as a paradigm case of choosing freely would not feel compelled to prove the existence of some actual marriage fitting this description.

The reason why a purely hypothetical instance can be given even where the skepticism is based on empirical premises is that there is a sense in which the skeptic does not deny the existence of paradigm cases. In this example he would not, for instance, dispute the frequent occurrence of the sort of marriage described. And he would be prepared to admit that in such cases the appearances are in favor of a free choice having been exercised. But, he thinks, the other considerations provided by his skeptical argument show that, in fact, it is doubtful or impossible that such an occurrence should be an instance of genuinely free choice. This is why the appeal to the connection between such situations and the meaning of, in this example, the expression “free choice” is the vital step in the paradigm-case argument. It is that which, if anything, shows that whatever the skeptical argument, these circumstances *must* be counted as instances of free choice.

## BACKGROUND

The idea that philosophy cannot cast doubt on the applications ordinarily made of everyday expressions is not a new one. It can be seen, for example, in George Berkeley’s refusal to draw skeptical consequences from his radical thesis that nothing exists apart from the mind. He did not

conclude that we are mistaken in talking of material objects such as trees and tables; instead, he attempted to show how his thesis could be used to analyze the meaning of statements about these things. Everyday language succeeds in saying something true about the world; the only question for him was, *What* does it say?

But what is perhaps novel is the erection of this idea into an explicit philosophical argument. And this is largely the product of what has been called the “revolution in philosophy,” which began in England shortly before World War II and which has subsequently dominated much of Anglo American philosophy. The possibility of defeating skepticism by reference to particular cases, however, was already present some time before this in the many essays on the subject, dating from the first decade of the twentieth century, by G. E. Moore.

G. E. MOORE. Moore thought of his opposition to skepticism in any form as a defense of common sense. The statements of common sense that he wished to defend were of two kinds: such context-free statements as “Earth has existed for many years” and such context-bound statements as “Here is a human hand” and “This is a pencil.” Moore held that he knew with certainty the truth of statements of both kinds. Any skeptical argument, therefore, which entailed that he did not or could not know them must be mistaken. To his critics this has seemed a strange sort of defense of common sense, for how can one defend a position merely by reaffirming it? In answering this, some writers have suggested that Moore was implicitly using the paradigm-case argument. While it is difficult to interpret Moore’s affirmation of context-free statements in this way, the suggestion is quite plausible, for example, when we find him attacking skepticism about the existence of material objects by holding up his hand and saying that it is quite certain that this is a human hand and that at least one material object therefore exists (“Proof of an External World,” pp. 145–146).

Moore himself, however, apparently saw his procedure in a different light. He thought of it as a challenge to the skeptic: Which is more certain, the (usually esoteric) premises of your argument or the commonsense statements that you are compelled to deny? Moore also pointed out that whereas the skeptic has an argument that leads to the denial of some commonsense statement, a counterargument can be constructed using the commonsense statement as a premise and the denial of the skeptical reasons as a conclusion. The question then seems to resolve into who has the more certain premises. And in this conflict common sense surely seems to be on

firmer ground. In an examination of four assumptions from which Bertrand Russell had drawn skeptical conclusions, for example, Moore ends by saying: “I cannot help answering: ‘It seems to me more certain that I *do* know that this is a pencil and that you are conscious, than that any single one of these four assumptions is true, let alone all four’” (“Four Forms of Scepticism,” p. 226). And at a much earlier time he wrote: “I think the fact that, if [David] Hume’s principles were true, I could not know of the existence of this pencil is a *reductio ad absurdum* of those principles” (*Some Main Problems of Philosophy*, p. 120).

In this interpretation of his procedure, Moore defends common sense as the more certainly true view of the world. The paradigm-case argument, in contrast, appeals to language to show that skepticism conflicts with the facts about the use of expressions needed to state it. Although Moore pointed to the importance of particular cases, it is necessary to look at the ideas that have subsequently come to the forefront of Anglo American philosophy to see why a connection with language should be thought relevant.

WITTGENSTEIN. Of central importance are the views of Ludwig Wittgenstein, whose work has heavily influenced many of those who have used the paradigm-case argument. (It is, however, debatable whether Wittgenstein himself employed the argument.) One of his central contentions, in opposition to his own earlier work, the *Tractatus Logico-Philosophicus*, was that while rules can be formulated for language, it is a mistake to view the particular uses of language as deriving their correctness from being in accord with rules. Rather, the fact that those who speak the language agree that *this* is the correct thing to say here and *that* incorrect there shows what the rules are. If anything, this agreement in judgment about particular cases is primitive. So, in the notes he dictated to some of his students in 1933–1934 (subsequently known as the *Blue Book*), Wittgenstein said, “It is part of the grammar of the word ‘chair’ that *this* is what we call ‘to sit on a chair.’” It would be a mistake to take it as a consequence of such remarks that if the users of a language agree in calling *this* an example of *X*, then, in the sense which the expression has in their language, this *must* be a case of *X*. Such a principle would indeed immediately yield the validity of the paradigm-case argument.

But there is an obvious objection that an example will illustrate. There was a time, perhaps, when all agreed in calling Earth flat, although it was not. They were in agreement, but they were all mistaken. This, however, is a

situation in which people were relying upon certain evidence that proved misleading. And in holding that there is a connection between the situations in which we should use a description and the meaning, or “grammar,” of the description, Wittgenstein was probably thinking of circumstances in which we are not relying on evidence. It was one of his important ideas that where it makes sense to speak of having evidence that something is so, it must be (logically) possible to get beyond mere evidence.

Thus, while we may sometimes have evidence that someone is sitting in a chair (from, for example, a report that he is), Wittgenstein would argue that when we are standing in a well-lit room looking at the person so seated, it would be a mistake to suppose we then have mere evidence. This idea runs directly counter to long traditions in philosophy. For philosophers, even those who are not skeptics, have most often held that one gets beyond evidence only in a very small class of statements—in general, only first-person, singular, present-tense assertions about one’s own mental life. It appears reasonably certain, however, that some such general claim as Wittgenstein’s must be substantiated before the paradigm-case argument can be declared valid, because a paradigm case of, for example, a free choice must be one in which there is *more* than just good evidence that a free choice has been made. Otherwise, the skeptical reasons may be sufficient to show that the evidence is misleading.

Whether Wittgenstein’s view, if correct, is sufficient to show the validity of the paradigm-case argument is another question. It will depend, for example, upon whether a situation in which we have got beyond mere evidence is also one in which we cannot be mistaken.

It is important to note that the idea that we must be able to get beyond evidence presupposes that we are dealing with a concept free from logical inconsistency. We cannot, for example, ever be confronted with a round square or a genuine trisection of an angle. But a priori skepticism is based on a “proof” that a certain concept could have no instantiation because there would be some inconsistency in supposing it did. The paradigm-case argument, if it is to be generally employed, may need a proof of its own that no expression in everyday use can turn out to designate a self-inconsistent idea. While this has sometimes been held, more needs to be said about it. It seems impossible that anyone should prove, for example, that the idea of a table is self-inconsistent, but it is not so implausible to suppose that someone might show that the idea of a time machine or of transmigration of souls, which are ordinary expressions in the sense intended, contain contradictions. And is it beyond doubt that the

concept of a free choice, for example, is logically irreproachable? Moreover, if it were to be demonstrated independently that no expression in ordinary language can designate a self-inconsistent idea, this would be sufficient by itself to discredit any a priori skepticism concerned with such expressions and would render the subsequent use of a paradigm-case argument superfluous.

There is a further difficulty in supposing Wittgenstein's view—that what we say in particular circumstances is determinant of what we mean—to entail the validity of the paradigm-case argument. This arises from the fact that particular cases can be related to the meaning of an expression without necessarily being paradigm cases.

This may be brought out by an illustration. Suppose someone doubts the existence of elephants. Very likely the surest way to convince him of his mistake would be to show him the elephants at a zoo or circus. That we call *these* elephants shows something about the meaning of the word *elephant*. If the skeptic about elephants sees no connection between what he has been shown and the existence of elephants, we have grounds for suspecting that he does not know what the word *elephant* means. But the connection need not be that having seen these things, he must admit that elephants exist. All he must admit is that these things have the appearance of elephants (see Wittgenstein, *Philosophical Investigations*, paragraph 354). If he maintains, for example, "These certainly look like elephants, but I am sure that they are in reality camels with false noses and padding," he has acknowledged a connection between what he has been shown and the meaning of the word *elephant*. His skepticism, however, remains.

At this time it is an open question whether the important general ideas about the connection of language to particular cases that have fostered the use of the paradigm-case argument also entail its validity.

## CRITICISM AND VARIATIONS

Critics of the paradigm-case argument have questioned the legitimacy of the move from "This is just what we call *X*" to "Thus, it is a genuine case of *X*." Some reasons for doubt about this transition have already been mentioned. It should be pointed out, however, that there are times when the transition is legitimate, although the paradigm-case argument can draw no comfort from this fact.

Suppose, for example, that someone doubted that there are any bachelors but admitted that there are

unmarried males of marriageable age. We might naturally say to him, "But this is just what we call 'being a bachelor.'" Here, however, the doubter has no reply (other than to question whether this *is* how the word is used) because *this* refers to a description that logically entails "being a bachelor." In the paradigm-case argument, however, especially where the case is actually pointed out instead of described, no such entailment is normally claimed.

If there is not an entailment, however, then there seems room for the skeptic to maneuver. How can one hold that no matter what the skeptic's reasons may be, he must admit *this* as an instance of what he doubted to exist? Faced with such difficulties, some proponents of the paradigm-case argument have placed restrictions on its use. They have said that it is valid only for expressions designating concepts that must be taught ostensively—that is, taught through examples. Philosophers have often held, for example, that color words can be taught only in this fashion. The usual reason given is that the concept of a particular color is simple and that its meaning cannot be captured by a verbal definition. Hence, it must be taught by pointing out things that are of that color. When the paradigm-case argument is confined to such concepts, a special reason is supplied for why there must be indisputable instances. If there were not (or had never been) any red objects, how could the concept get into the language?

The appeal to what must be taught ostensively is frequently presented as if it were merely an elucidation of the force of the paradigm-case argument. But it seems, instead, to be a separate and distinct form of argument. There is, for example, no need to describe or point out particular circumstances. The conclusion that there are instances of, for example, red objects is drawn directly from the premise that the concept can be taught only ostensively. There would, perhaps, be point in calling this form of argument by a different name.

**ARGUMENT FROM OSTENSIVE TEACHING.** Whether such an argument is valid against a skeptic will depend upon several questions that have yet to be conclusively answered. First, are there any concepts that can be taught only ostensively? Is it logically impossible for someone to have the concept of, for example, redness without having obtained it through ostensive teaching? Second, even if a concept must be taught through such methods, must there be exemplifications of the concept? It seems possible, for example, to teach someone the meaning of "is red" by using objects that merely appear to be red as long as this fact is concealed from the student. Third, even if

the answer in the above cases is affirmative, are the important concepts that give rise to skepticism of the required kind? Is the concept of choosing freely, for example, one that can be taught only by such methods?

Sometimes it is said that the paradigm-case argument need be confined only to those concepts that can be taught ostensively. When this is done, no conclusion can be immediately drawn about the existence of cases falling under the concept. The concept of a unicorn could be taught ostensively if only there were such a creature, but as things stand, it never has been. What, then, is the value of such a restriction? The idea seems to be that if a concept can be taught ostensively, then there must be conceivable circumstances, at any rate, in which something falls under the concept—those circumstances in which it could be taught in this fashion. Such an argument, in general, has force only against an a priori skeptic. But it is possible that the circumstances in which, it is claimed, the concept could be taught ostensively actually occur and that the skeptic may not wish to dispute their existence. It might be urged, for example, that the concept of acting freely can be taught ostensively in circumstances which the skeptic about freedom would have to admit do occur. Some of the same problems about ostensive teaching arise for this kind of argument as for the previous one.

**EVALUATIVE CONCEPTS.** Still another restriction on the use of the paradigm-case argument has been proposed by some writers. J. O. Urmson questions the legitimacy of applying it to evaluative expressions such as “good (inductive) reasons” (“Some Questions concerning Validity”). His point is that the use of evaluative expressions has a dimension that the use of purely classificatory expressions lacks. Evaluative expressions not only sort out things and situations but also signify approval or condemnation. The skeptic, therefore, may be willing to grant that there are differences between what we call, for example, “good inductive reasons” and “bad inductive reasons” and that he has said nothing to show that these differences are not exemplified. But he may question whether these differences support our approval of the one and our rejection of the other. Thus, to take Urmson’s analogy, he may grant a difference between what we call “good apples” and what we call “bad apples” but urge that our standards are faulty. How can pointing out that *this* is just what we call a “good apple,” he may ask, show that we would not do better to approve of some other kind?

**TWO SORTS OF SKEPTICISM.** Urmson’s point, if valid, appears to have many consequences. The dispute concerning whether we can exercise genuine freedom of

choice about our own actions does not seem on the surface to be a dispute involving evaluative concepts. Philosophers, however, have been particularly uneasy about the use of the paradigm-case argument in this area, in contrast, for example, to its employment against skepticism about the existence or perception of material objects. The explanation may be that there are two sorts of skepticism involved. It may be that the skeptic about human freedom is not, in fact, denying that many of the ordinary relevant expressions mark genuine distinctions but, rather, querying the purpose to which we put these distinctions. In contrast, the skeptic about the existence of material objects does appear to deny that there is, for example, a distinction between a material object and the mere appearance of one.

We contrast seeing material objects with seeing hallucinatory or imaginary objects. By describing circumstances in which we ordinarily are in no doubt about which member of these distinctions is present, the paradigm-case argument may be construed as pointing out that the everyday expressions do, after all, serve a function. The fact that we do make these contrasts in practice and, more importantly, that we generally agree in our judgments shows that some genuine distinction is being made. Moreover, the skeptic does not usually dispute the fact that we can independently reach agreement about particular cases. Thus, it might be said to him, “Whatever your arguments to show that we never see material objects, for example, after we have looked at them and debated them, there will still be that difference between what we have called ‘a real object’ and what we have called ‘hallucinations,’ ‘illusions,’ or ‘imaginary objects.’ We shall still need to mark that distinction and so return to our usual way of describing things.”

While this seems quite powerful against, for example, skepticism about the perception of material objects, the same sort of explanation of the paradigm-case argument is not so convincing when tried out on disputes about evaluative terms or the existence of genuinely free choices. The trouble may be that although the skeptic’s arguments cannot destroy the correctness of contrasting what we should call cases of freely choosing from those we should not, his argument may still destroy what we thought to be the point of making the distinction. To say that a choice was free often involves the ascription of responsibility and the possibility of praise and blame. We behave differently toward persons who have made a free choice than we do toward those who have been coerced. If we knew all our “choices” to be the product of prior conditioning or hereditary traits—a possibility that

appears often to generate skepticism about our freedom—would we still be on solid ground in behaving differently toward those who have made a “free choice”? Although we could continue to make the same distinctions we do now as far as classification goes, we might think that to call certain choices “free” would have a hollow ring.

Whatever the ultimate verdict on the paradigm-case argument as a refutation of skepticism, there can be no doubt that its use in recent philosophy has generated very important questions about the relationship of language to the world.

## PARAPSYCHOLOGY

Parapsychology is the modern name for what used to be called psychical research. The word is usually used in a narrow sense, as scientifically based research, but sometimes it is used more broadly to cover the whole range of the occult. The term *psi* is often used as a briefer equivalent. Psi phenomena are paranormal, that is, beyond the range of what is considered to be part of the ordinary world.

The Society for Psychical Research (SPR) was established in England in 1882 and is given credit for organizing systematic research in the English-speaking Western world. Many of its founders were distinguished intellectuals who were themselves spiritualists and interested in immortality. The American Society for Psychical Research was founded soon after. Though some of the earlier researchers did scientific studies, they more often conducted other kinds of investigations of psi, investigating ostensible cases of dramatic psi, and frequently working with mediums.

### THE MODERN SCIENTIFIC ERA

The modern scientific era in parapsychology is usually credited to Joseph Banks Rhine, who established the first university laboratory devoted exclusively to experimental research on psi. In 1957 Rhine and others organized the Parapsychological Association, which twenty years later became, over much opposition, an affiliate member of

the American Association for the Advancement of Science. Some parapsychologists, however, insist that the pursuit of psi by scientific methods is ill advised and advocate a return to the more traditional types of psychological research.

Parapsychologists work primarily on a common core of phenomena that include telepathy (mind-mind), clairvoyance (mind-matter, now called remote viewing), psychokinesis (PK; mental action on matter), precognition and retrocognition (direct awareness of future or past mental or material states), and often survival issues (disembodied existence and reincarnation). More specialized topics might include hauntings and apparitions, séances, poltergeists, dowsing, psychic healing, and near-death and out-of-the-body experiences, but probably not astrology, the Bermuda Triangle, UFOs, past-life regression, and alien abductions.

Psi research is commonly defined as the study of things and processes that go beyond the commonly accepted ways of interaction in the world. Parapsychology is unusual in that what it studies is defined primarily in negative terms. For example, extrasensory perception (ESP) is defined in terms of gathering information not by sensory means. Moreover, parapsychologists typically admit that they lack agreement on what psi is or how it operates, and some parapsychologists prefer to speak of their field as the study of a limited range of "anomalies," refusing to make positive claims that psi is an actual power of some sort.

### IMPLICATIONS OF PSI

Clearly, the existence of psi would have enormous implications for Western philosophy, not only by extending the range of commonly accepted ways of interacting with the world but also by reinforcing dualistic and idealistic worldviews that have hitherto supported their critiques of science on non-psi grounds, that is, on the alleged failure of the dominant materialist paradigm to allow proper room for consciousness, including qualia, volitions, intentions, and logical reasoning. If it were shown that psi exists, the foundations of modern Western metaphysics would be shaken, most would say, overthrown.

C. D. Broad (1953) formulated the issue in terms of what he called "the basic limiting principles" of Western thought, which he said were justified either by self-evidence or by overwhelming and uniformly favorable empirical evidence. These principles, abbreviated, are that causation always works forward by acting through a continuous chain of events linking cause and effect, that mind acts on matter only through its own brain, that

mental activity is dependent on the brain, and that knowledge is acquired only through present sensations or communications. It is clear that psi would challenge all these principles and thus threaten the Western worldview.

Judged in terms of these limiting principles, psi is not only *paranormal* but *antinormal*. Telepathy and clairvoyance imply that minds act directly on remote minds or material objects, bypassing the brain and violating the rule of continuous links in causation. PK would also violate that chain, providing mental action directly on remote objects, and both precognition and retrocognition would violate both forward causation and how knowledge is acquired. There is no question that psi is magical, judged by our basic limiting principles.

Some parapsychologists attempt to minimize the conflict between psi and the Western worldview by claiming that psi should be understood in terms of psychological laws rather than laws of physics by assimilating psi to such psychological connections as association or by pointing to altered states such as dream states or hypnosis that seem to facilitate psi production. They point out that psi fits in well with idealism, panpsychism, and typically Eastern philosophies that tend to understand nature in terms of mind rather than by understanding mind in terms of nature as in Western views. Also, some dualists point out that the mind-brain dualism itself violates the modern scientific paradigm and claim that ESP and PK (but not precognition) can be assimilated to mind-brain interaction, as an extended application of the powers that the mind uses to interact with its own brain (Dilley 1988).

### PROBLEMS IN PSI RESEARCH

Parapsychologists are hampered in their research by the lack of a common body of theory as well as by not knowing how to produce psi on demand or predict how it will behave once it occurs. Without any firm basis for understanding psi, it is difficult to test alternative hypotheses. Few believe that psi can be controlled consciously, and some believe that psi is actually resistant to demonstration, sometimes called the *shyness effect*. Moreover, successful psi production seems to be related to belief in psi. Even when psi is produced successfully, investigators do not know for sure whether psi is coming from the subjects of an experiment, from the experimenter, from defects in the experimental design, or even from fraud. Skeptics point to an additional problem about psi that arouses their suspicion, that psi does not seem to affect ordinary experiments in physics laboratories or enable psychics to win steadily at casinos.

Critics of psi research claim that replication requirements demanded by modern science have not yet been met and that experimenters have not yet devised protocols that will guarantee positive results and can be obtained by independent investigators. Defenders of psi sometimes accept this charge, but reply that the unpredictability of psi prevents replication in the strong sense and that multiple demonstrations of psi by well-run experiments should constitute acceptable scientific evidence. Psi researchers continue to try to understand psi in the hopes of learning how to control it but progress has been disappointing, considering that more than a century has passed since the founding of the SPR.

Parapsychologists are unanimous that psi is incompatible with present materialism. They accept a wide range of metaphysical theories. There are a few, a vigorous minority, who think that psi can be reconciled with current science by massive revisions in the concepts of Western science. They point to various modifications proposed by physicists that could result in fitting psi into a revised physics. As has been already mentioned, some parapsychologists have turned to idealism, panpsychism, or various kinds of Eastern philosophy that better accommodate psi.

By far the more prevalent view is that psi should be understood in terms of metaphysical dualism, that ESP and PK are just extraordinary extensions of the powers that the mind uses to interact with its own brain. Opinions are divided whether telepathy is a third power, using unconscious levels of mind to connect conscious minds, or whether so-called telepathic phenomena can be reduced to ordinary mind-brain interactions. Henri Bergson once suggested that minds might be potentially omniscient and able to influence every object in the universe, but that brains limit the activity of psi to what is biologically and socially more useful. Both Broad and H. H. Price have made use of this model to explain why psi occurs only seldom.

### CONTROVERSIES ABOUT PSI

Controversies over proper methods to be used in parapsychology also divide parapsychologists. Many parapsychologists believe that stories and anecdotes cannot be trusted and that the only reliable way to establish the existence of psi is by using the scientific method, while others believe that careful examination of anecdotes and other subjective reports can show the existence of psi and worry that the use of the scientific method stifles psi production.

Why cannot anecdotal evidence and the testimony of personal experience or the results of the kinds of investigations of early researchers be trusted? Such evidence has often turned out to be highly unreliable. Standards of evidence were often weak and many of even the strongest apparently evidential cases have been exposed as fraudulent or careless. It is commonly acknowledged that the history of psi research has been troubled by fraud, and some studies thought exceptionally thorough (such as those done by Samuel G. Soal) have been exposed as fraudulent. On the positive side, John Beloff (1993) presents a reasonably cautious survey of the case for psi, covering many important researchers and their subjects.

Those readers interested in the history of fraud should consult Paul Kurtz's *A Skeptic's Handbook of Parapsychology* (1985), which has ten chapters devoted to fraud, as well as George P. Hansen's "Deception by Subjects in Psi Research" (1990), which offers an extensive analysis of fraud. Faced with the problem of doubts about nonexperimental evidence, many parapsychologists have devoted themselves to gathering evidence for psi that will meet contemporary standards for scientific evidence and much has been accomplished since the 1990s.

## THE CASE FOR PSI

Does psi exist? Opinions are widely variant. Popular opinion polls indicate widespread belief in psi in the general population. A poll of parapsychologists attending a Parapsychological Association meeting showed more than a 90 percent favorable response to the claim that psi exists, and more than an 80 percent favorable response to precognition. A poll of college faculty in 1979 produced a wide gap between humanities and arts faculty and psychologists. More than two-thirds of arts and humanities faculty answered affirmatively that psi was an established fact, a proportion similar to that of the general population, but only one-third of psychologists held that opinion. A poll of elite scientists in 1984 showed that only 4 percent thought that ESP was an established fact, with 25 percent thinking that ESP was a likely possibility. A large number expressed no opinion, but 10 percent thought that ESP was an impossibility.

There is no consensus on the existence of psi. Even some parapsychologists have become discouraged, either leaving the field or continuing to function as parapsychologists even though they do not believe in psi. Western philosophers and psychologists tend to reject psi, believing that a combination of fraud, careless investigation, gullibility, and wishful thinking (such as the wish for immortality) can account for the continued belief in psi.

On the contrary, psi believers sometimes claim that skeptics reject psi because psi powers are intrinsically threatening and that the existence of psi would overthrow the reigning paradigm in Western thought. More cautious people on both sides claim that there are interesting cases that suggest psi and that there is evidence that supports the existence of psi, but that the case for psi is not yet conclusive.

However true it might be that earlier investigations failed to meet modern experimental standards, parapsychologists overwhelmingly claim that the available evidence is virtually conclusive and have claimed to provide evidence that meets even the most scrupulous standards. However, it is fair to say that the best that those recent experimental findings have provided is evidence of a low level of psi, that psi cannot yet be demonstrated on demand, and that psi still cannot be produced reliably or consistently by independent investigators.

However, for the first time in the history of psi research, it is possible that psi researchers can produce the kind of evidence that will be regarded by knowledgeable skeptics as constituting scientific evidence. In particular, there are three major lines of ongoing research efforts that prove interesting and that have been analyzed carefully by skeptics: studies using the Ganzfeld procedure, remote viewing experiments, and experiments involving efforts to affect random number generators. Many of the results of these studies are discussed by K. Ramakrishnan Rao (2001). Some of the skeptics most conversant with psi research have been impressed with these results but still have reservations. Interested persons should consult Ray Hyman and Charles Honorton (1986), Daryl J. Bem and Honorton (1994), and Hyman (1989). James E. Alcock (1990) presents a number of reservations about the scientific case for psi in general, including specific criticisms of remote viewing and random number generation studies. There is agreement on both sides that they need to be at least open to persuasion and that continuing studies are needed, especially studies done in independent laboratories. It should also be pointed out that studies subsequent to those referred to earlier have not been conclusive.

Many parapsychologists would argue that there is convincing evidence for psi in studies that seem to provide evidence for survival of bodily death. The best candidates for evidence are cited in the literature on "cross-correspondences" gathered by members of the SPR almost a century ago, and studies of well over two thousand putative "reincarnation cases." Gardner Murphy (1979) does a careful analysis of cross-

correspondences, and Stevenson (1987) cites some of the best cases for reincarnation. Hoyt L Edge et al. (1986) provide a careful presentation of issues related to survival. Paul Edwards (1996) offers one of the most comprehensive general attacks on reincarnation evidence, as well as on the character and competence of reincarnation scholars in general; however, be forewarned that he is known for his *ad hominem* attacks.

The cross-correspondences involved mediums whose trance writings and utterances were purported to be communicated by Frederic Myers, a classics scholar and one of the founders of the SPR, and by other deceased persons. The material lent itself to the interpretation that Myers was attempting to communicate to researchers, through different mediums who were separated by time and place, using bits of information and images that could be put together to provide a coherent set of references to the same classical myth. The case for survival was weakened by the fact that some of the participants were themselves classicists and might have inadvertently produced the data telepathically, and led some to prefer the “super-psi” hypothesis, so-named because the power of psi required to explain the phenomena surpasses any degree of psi that is reinforced by the experimental literature.

A recent development in survival research since the 1990s is the use of combination locks, set by believers who hope to use mediums to communicate the combinations that will open the locks. In one case so far, a lock has been opened by use of computer techniques, and survival researchers are putting their hopes on more sophisticated encryptions. As of 2005, no lock has been successfully opened by the proposed methods of disclosure.

## SOURCES OF PSI

Generally, Western philosophers have been skeptical of psi, but there have been many who have vigorously defended it. Prominent among them are Henri Bergson, Charlie Dunbar Broad, C. J. Ducasse, James Hyslop, William James, C. W. K. Mundle, H. H. Price, Robert Almeder, Robert Brier, Stephen E. Braude, Hoyt L. Edge, and David Ray Griffin. There have also been some defenders among psychologists, prominently John Beloff, Irvin Child, Alan Gauld, Harvey J. Irwin, Gardner Murphy, William McDougall, and Charles Tart. Among the knowledgeable skeptical psychologists are James E. Alcock, Ray Hyman, and Charles E. M. Hansel, as well as Susan Blackmore and Richard Wiseman, who are former pro-psi proponents. The best-known anti-psi philosophers who have worked on the psi literature are Paul

Edwards, Antony Flew, and Paul Kurtz. Also, the unclassifiable Martin Gardner is firmly among the unconvinced.

Besides the invaluable Proceedings of the SPR, there are a number of journals devoted entirely to psi phenomena, such as *Journal of Psychical Research*, *Journal of the American Society of Psychical Research*, *Journal of Parapsychology*, *European Journal of Parapsychology*, and *International Journal of Parapsychology*, all of which are reliable sources of the best in psi. Of note is the *Journal of Scientific Exploration*, which sometimes reports on psi topics and is generally pro-psi. The multidisciplinary *Journal of Consciousness Studies* sometimes gives coverage to psi and related issues. Two other journals deserve special mention: the nicely balanced but short-lived *Skeptical Zetetic* and the *Skeptical Inquirer*, which claims to maintain an open mind but is widely regarded as being openly hostile to psi in all of its forms. There are also journals, too numerous to mention, that are devoted to more limited phenomena usually included in parapsychology.

## PARETO, VILFREDO

(1848–1923)

Vilfredo Pareto, the Italian economist, sociologist, and philosopher, was born in Paris, where his father, the Marchese di Pareto, a supporter of Mazzini, was living as a refugee. In 1858 the family returned to Italy, where Pareto received a mixed mathematical and classical secondary education. In 1870 he graduated with a degree in engineering from the Turin Istituto Politecnico. He embarked on a career with the Italian railways and soon became a director. He was deeply, though ambivalently, influenced by his father's involvement in radical politics.

Throughout his life Pareto believed in the superiority of liberal free trade, but his disillusionment with the economic protectionism of the Italian government developed into a fierce hatred of the political and social side of liberal ideology, which he thought had resulted in indefensible economic policies. This hatred led Pareto into intemperate attacks on the government, which retaliated by banning his lectures, and Pareto was eventually forced to abandon his career in government service. At about this time he became acquainted with the mathematical economist Léon Walras, professor at Lausanne. In 1893 Pareto was appointed lecturer at Lausanne, and he succeeded to Walras's chair the following year. He lived in Switzerland for the rest of his life, eschewing political activity until Benito Mussolini's advent to power in 1922. The Fascists acknowledged a large debt to Pareto's writings and conferred numerous honors on him, but since he died after only one year of the Fascist regime, his considered attitude to it must be a matter of conjecture.

### LOGICAL AND NONLOGICAL CONDUCT

Pareto's social thought was largely conditioned by his reactions to contemporary political developments in Italy. He claimed to provide an impartial presentation and explanation of the facts of social existence without commitment to any particular sectional interest. In fact, however, his writings constitute a violently polemical defense of economic liberalism and political and social authoritarianism. This gulf between his professions and his practice is ironically in tune with his skepticism about the extent of men's understanding of their own behavior. In his economic writings, *Cours d'économie politique* (2 vols., Lausanne, 1896–1897) and *Manuel d'économie politique* (Paris, 1909), he tried to prove mathematically that the system of free trade provides maximum social benefit. In *Les systèmes socialistes*, (2 vols., Paris, 1902), he attempted to refute the claims of socialism that it provided a superior solution to economic problems. But if the logical case for economic liberalism was as overwhelming as it seemed to Pareto, he had to show why it was not generally practiced. This led him from economics to sociology and to the distinction between logical and nonlogical conduct, which constitutes one of his most distinctive contributions to sociological theory.

Pareto introduced this distinction in the course of a discussion of the nature of a scientific sociology. His conception of "logico-experimental" science was largely Baconian, and his methodological desiderata for a scientific sociology were that all its concepts should have

strictly controlled empirical reference; that all its theories should be subject to rigorous experimental or observational control; and that all its inferences should follow with strict logic from the data. He set himself to show how these norms should be applied in the sociological investigation of the ideas and systems of thought current in a given society, which, because they bear “the image of social activity,” are an important part of the sociologist’s data. Pareto thought it important not to accept such ideas and theories at their holders’ valuations but to ask two questions about them: (1) Are their explanatory claims justified by logico-experimental standards? (2) Why are they accepted, and what are the social consequences of this acceptance? The question of acceptance became particularly pressing for Pareto in the case of widely held theories that did not seem to measure up to logico-experimental criteria. He thus regarded the logical critique of sophistries as only a prolegomenon, although a necessary one, to the real problems of sociology.

Many of Pareto’s own criticisms of sophistries, especially of those committed by his political opponents, are extremely cogent and witty. However, his general account of the distinction between sound explanation and sophistry is less satisfactory. He held that an action was logical if it was performed by the agent with the intention of achieving an empirically identifiable end, if it actually tended to result in the achievement of that end, and if the agent had sound logico-experimental grounds for expecting this end to result. He designated as nonlogical any action that failed to measure up to any of these diverse criteria, and proceeded to classify what seemed the most characteristic ways in which this failure could occur.

Pareto regarded economic activity directed at maximizing profit, clearheaded Machiavellian political activity, and scientific work as the three most important types of logical conduct. But he left largely unasked most of the fundamental philosophical questions to which such an account gives rise. In particular, unlike his contemporary Émile Durkheim, he did not investigate the possibility that established forms of social behavior are themselves presupposed by the concepts most fundamental to his account—concepts such as “empirical reference,” “respect for logic,” and “setting oneself an end.” Pareto’s important insight, however, contained in his idea of “nonlogical conduct,” that there are many forms of activity concerning which it makes no sense to ask what reasons people have for performing them, could naturally have led to such an investigation, had Pareto been more of a philosopher and less of a brilliant political pamphleteer. His failure to press this line of inquiry impeded him from

maintaining a clear distinction between nonlogical and illogical actions, and what he claimed to be a dispassionate account of the nature of social life became a massive polemical indictment of alleged human folly. It is also one of the roots of his uncritical acceptance of science as the mother and guardian of logic, notwithstanding his repeated attacks on worshipers of “the Goddess Science.”

## RESIDUES AND DERIVATIONS

If the reasons offered by men for many of their own actions are not logically compelling, a different kind of explanation seems to be needed. To find this explanation Pareto undertook a wide-ranging, but unsystematic and biased, historical and comparative survey of human social behavior. In the course of it, he claimed to detect a contrast between kinds of conduct that constantly recur with very little variation and those that are highly diverse and changeable. The former he labeled “residues,” the latter “derivations.” The variable elements, or derivations, prove to be the theories with which people attempt to justify their residues. The alleged persistence of the same residue, even after the agent’s abandonment of the derivation that had been supposed to justify it, gave Pareto an additional reason for claiming that the derivation was not the real explanation of the existence of the residue.

This theory has obvious affinities with Karl Marx’s concept of “ideology,” with Sigmund Freud’s “rationalization” (although Pareto seems to have been ignorant of Freud’s work), and with Durkheim’s “collective sentiments.” Unlike these writers, however, Pareto offered no systematic account of why men have recourse to derivations, contenting himself with the observation that among the residues is to be found a tendency of men “to paint a varnish of logic over their conduct.”

The theory of residues is similarly incomplete. His most consistently held view seems to have been that the residues are constants and must be accepted as brute facts. At times he said that they were determined by certain congenital psychological “sentiments,” although he failed clearly to distinguish these from the residues themselves. Nor did he explain how sentiments differ from the “interests” that he supposed to underlie logical economic activities. At other times he suggested that residues change as a result of social conditions. “A number of traits observable in the Jews of our time, and which are ordinarily ascribed to race,” he wrote, “are mere manifestations of residues produced by long centuries of oppression.” Moreover, in his Machiavellian advice to statesmen to reinforce in their subjects those residues that are politically advantageous to themselves, by means of

propaganda in favor of suitable derivations, Pareto even implied that derivations could influence residues. Such difficulties stemmed largely from Pareto's failure to face the philosophical questions about the nature of logic that his theories should have led him to ask.

### ELITES AND THE CYCLE OF HISTORY

The two classes of residues most important for Pareto's sociological theory were combinations and persistence of aggregates. Men dominated by combinations are the innovating, risk-taking experimenters, the "foxes," linked by Pareto with the economic class of speculators. At the other extreme are the "lions," dominated by persistence of aggregates, wedded to the status quo and willing to use force in its defense. These are to be found among the *rentier* class. Pareto thought that all societies are ruled by elites, composed of those naturally most able in the various forms of social activity. The balance between combinations and persistence of aggregates in the elites and the lower social strata respectively determines the general character of a society. Inconsistently with his insistence on the nonlogical character of value judgments, Pareto thought there was an objective distinction between healthy and decadent social states, a distinction strongly influenced by his own attachment to free trade and political authoritarianism. Elites must be enterprising and innovative but also ready to use force in defense of their authority. However, the latter propensity tends to hinder the "circulation of the elites," leading to an accumulation of ability among the masses. Alternatively, the former tendency may degenerate into a flabby humanitarianism that weakens authority. In either case, a revolution results, leading to government by new elites. Pareto's belief in the constant repetition of this process led him to a cyclical view of history.

## PARFIT, DEREK

(1942–)

Derek Parfit is senior research fellow of All Souls College; a regular visiting professor at Harvard, New York University, and Rutgers; and a fellow of both the British Academy and the American Academy of Arts and Sciences.

Born in China and educated in England at the Dragon School and Eton, Parfit took his degree in modern history at Oxford University and later turned to philosophy. He is legendary as a mentor and for his acute monograph-length criticisms of manuscripts, as well as for his important contributions to ethics, practical reasoning, and metaphysics. Parfit is widely regarded as one of the most important contemporary philosophers.

Along with John Rawls's *A Theory of Justice*, Parfit's magnum opus, *Reasons and Persons*, helped turn ethics from a moribund and peripheral subject that largely focused on the meanings of moral terms into a vibrant and central philosophical topic. Brimming with ingenious examples, powerful arguments, and startling conclusions, it has significantly shaped the philosophical agenda, introducing into discussion a host of new topics, examples, and terminology.

In Part One, Parfit discusses the ways in which theories about morality and rationality can be self-defeating and also makes claims about rational irrationality, blameless wrongdoing, imperceptible harms and benefits, harmless torturers, and other mistakes in moral mathe-

matics. Part Two defends a theory of individual rationality, the Critical Present-aim Theory, which rejects both purely desire-based instrumental theories and a purely self-interested or egoistic theory. Parfit offers a new outlook on the old question of whether morality must lose out in a conflict with prudence or rational egoism. Parfit notes that rational egoism is a hybrid position, neutral with respect to time but partial with respect to persons. Correspondingly, it can be challenged from one direction by morality, which is neutral with respect to both persons and time, and from the other direction by a present-aim theory, which is partial with respect to both persons and time. Parfit suggests that rational egoism rests on an unstable middle ground that requires a firm distinction between persons and time that is metaphysically dubious. Of additional interest are Parfit's insights regarding the rationality of attitudes to time and time's passage.

In Part Three, Parfit propounds a reductionist account of personal identity, somewhat like the Buddhist *no-self view*. Appealing to a dazzling array of so-called puzzle cases involving hypothetical fission, fusion, and branch lines of different *selves* or *person-stages*, Parfit challenges widely held beliefs about the nature and importance of personal identity. Most assume that there is a *deep, further fact* that constitutes personal identity, a fact that must be all or nothing and that matters greatly in rational and moral deliberations. On Parfit's view, while the logic of identity is all or nothing, the relations that constitute personal identity over time are matters of degree, and sometimes there may be no answer to the question of whether a future self will be me. What matters in survival are physical and psychological continuities with the *right* kind of cause, where the right kind of cause, he provocatively suggests, might be any cause.

Part Four presents a host of puzzles and paradoxes regarding future generations. The Non-Identity Problem is raised by the fact that any choice between two social or economic policies will affect who it is who will later live. Even if one's choice between two such policies would greatly lower the quality of life of future generations, this choice may not be worse for any of the people who would later live since if one had chosen the other policy, these people would never have existed. Parfit here challenges the deeply held view that moral arguments should appeal to the interests of all of the affected people. Parfit argues that it is hard to avoid what he calls the Repugnant Conclusion, or the view that compared with the existence of billions of people whose quality of life is very high, it would be in itself better if there existed some much larger

number of people whose lives would be barely worth living. Parfit also presents the Mere Addition Paradox, in which various plausible assumptions are shown to lead to a contradiction. These arguments profoundly challenge deep beliefs about moral and practical reasoning.

At the time of the writing of this entry, Parfit was completing a second book *Climbing the Mountain* that will be about Kant's ethics, contractualism, and consequentialism. In discussing Kant's Formula of Humanity, Parfit argues that although one should not *regard* other people merely as a means, whether one is acting wrongly never depends on whether one is treating people merely as a means. Parfit defends Kant's claim that one must never treat people in ways to which they could not rationally consent. He then argues that if one revises Kant's Formula of Universal Law and appeals to a view about rationality and reasons that is not desire based but value based, Kant's formula can provide the best version of contractualism.

On the standard moral map, there are two main kinds of systematic moral theory. One kind is consequentialist, with utilitarian theories as the best-known examples. The other kind is Kantian theories and various forms of contractualism, which are often presented as the main systematic alternative to all forms of consequentialism. This map, Parfit argues, should be redrawn. Of the different ways of thinking about morality, it is Kantian and contractualist theories that do most to support consequentialism. Kantians, contractualists, and consequentialists ought to conclude that, in John Stuart Mill's metaphor, they have been climbing the same mountain on different sides.

Parfit also argues that Kantian and contractualist theories should take less ambitious forms. These theories should be presented not as accounts of wrongness or of moral reasoning but as claiming to describe a higher-level property that can make acts wrong, under which ordinary wrong-making properties can be subsumed. There are, moreover, several kinds of wrongness; and the most important questions are not about wrongness, but about reasons.

Parfit believes that the best way to respond to skepticism about the possibility of ethical progress is to make some. Perhaps as much as any philosopher in the last 100 years, he has done so.

## PARKER, THEODORE (1810–1860)

Theodore Parker, an American theologian and social reformer, was the grandson of Captain John Parker, who led the Lexington minutemen. Theodore Parker was born in Lexington, Massachusetts, and, except for scattered months of formal schooling during the winter, was almost entirely self-taught. Although unable to afford tuition, he was allowed to take the Harvard examinations,

and in 1834 he was admitted to the Harvard Divinity School. He was ordained minister of a small parish in West Roxbury, Massachusetts, in 1837. In 1845, after he had become a controversial figure and commanded a large audience, his supporters created the 28th Congregational Society in Boston and later rented the Boston Music Hall, where Parker preached to one of the largest congregations in the country. He became equally famous as a scholar, preacher, theologian, and reformer. Parker died in Florence, Italy.

In his religious thought Parker's radicalism was partly instinctive and partly the result of environmental influences. In an autobiographical essay completed just before his death, Parker remembered how he had been taught as a boy to respect the voice of conscience as the "voice of God in the soul of man" and encouraged to develop a spirit of free inquiry "in all directions." His religious upbringing was extremely liberal, and when he entered upon his formal theological studies, he had not only rejected the doctrine of the Trinity but was already suspicious of the validity of miracles and the "infallible, verbal inspiration of the whole Bible." Profiting by the encouragement of the liberal Unitarian professors at Harvard, he began an intensive study of the Bible that ultimately led him to a knowledge of twenty languages and did much to confirm his earlier suspicions regarding biblical authority.

As a young minister Parker was a great admirer of William Ellery Channing and Ralph Waldo Emerson. He responded to Emerson's Divinity School Address with enthusiasm and was an anonymous contributor to the polemical pamphlet war that followed.

Parker's own religious philosophy was strongly influenced by Immanuel Kant and by the critical studies of such biblical scholars as Wilhelm Martin DeWette and theologians such as David Friedrich Strauss and Ferdinand Christian Baur. Academic study and his own religious experience convinced him that the foundation of religion was based on "great primal intuitions of nature that depend on no logical process of demonstration." The three most important were the intuition of God, the intuition of morality, and the intuition of immortality. Basing his theology on these facts of consciousness, Parker emphasized the infinite perfection of God and the perfectibility of man.

His ideas first received wide publicity in 1841, when he delivered an ordination sermon titled "The Transient and the Permanent in Christianity." In this sermon Parker contrasted the transiency of theology and Scripture with the permanence of the great moral truths of Christianity,

truths that depended for their validity not on the authority of Christ but on the voice of God in the human heart. Parker spoke as a Unitarian minister, but the reception he received from organized Unitarianism was as wrathful as Channing's reception had been at the hands of the Calvinists twenty years earlier. As his more conservative followers faded away, Parker developed his radical ideas at greater length in a series of lectures he published in 1842 as *A Discourse of Matters Pertaining to Religion*. The following year he published his own edition and translation of DeWette's critical study of the Old Testament, *Beiträge zur Einleitung in das Alte Testament*.

Emerson referred to Parker as "our Savonarola," and Parker's essay on transcendentalism is one of the clearest expressions that we have of the American rejection of the empirical philosophy of the Enlightenment. Modern scholarship has established, however, that Parker's transcendentalism was not identical with Emerson's, for Parker relied less completely on intuition and more on the critical study of history and theology.

Parker's extraordinary capacity for sustained scholarly endeavor was almost matched by his capacity for action. The "Absolute Religion" he advocated required the application of religious truth to social problems, and Parker often preached on such subjects as crime, poverty, temperance, and prostitution. Long before the proponents of the social gospel, Parker recognized the power of organized evil in the world and sought to marshal religious sentiment against it. He was inevitably drawn into abolitionism. A friend of Wendell Phillips and William Lloyd Garrison, he helped to lead the resistance to the Fugitive Slave Law in Boston and was a supporter of John Brown before Harper's Ferry.

Parker traveled widely on lecture tours, making about one hundred appearances a year during the last decade of his life. His influence on the public mind was at its peak just before his death.

## PARMENIDES OF ELEA

(born c. 515 BCE)

Parmenides of Elea, the most original and important philosopher before Socrates, was born c. 515 BCE. He changed the course of Greek cosmology and had an even more important effect upon metaphysics and epistemology. He was the first to focus attention on the central problem of Greek metaphysics—What is the nature of real being?—and he established a frame of reference within which the discussion was to be conducted. The closely related problem of knowledge, which to a great extent dominated philosophy in the fifth and fourth centuries, was raised at once by his contrast between the Way of Truth and the Way of Seeming. His influence can be found in Empedocles, Anaxagoras, and the atomists; it is strong in most of Plato's work, particularly in the vitally important dialogues *Parmenides*, *Theaetetus*, and *Sophist*.

Plato in his dialogue *Parmenides* describes a meeting in Athens of Parmenides, Zeno, and Socrates. Parmenides was then about 65, Zeno about 40, and Socrates "very young." Though the meeting is probably fictitious, there is no reason why the ages should be unrealistic. Since Socrates died in 399, when he was about 70, and since he was old enough in Plato's dialogue to talk philosophy with Parmenides, the meeting would have to be dated about 450, making Parmenides' birth about 515. An alternative dating (Diogenes Laërtius, *Lives* IX, 23, probably from Apollodorus's *Chronica*) puts his birth about 25 years earlier, but this can be explained away.

Plato's remark (*Sophist* 242D) that the Eleatic school stems from Xenophanes is not to be taken seriously. Parmenides founded the school in the Phocaeen colony of Elea in southern Italy, and its only other noteworthy members were his pupils Zeno and Melissus (the tradition that the atomist Leucippus was from Elea is probably false).

### WRITINGS

The work of Parmenides is not extant as a whole. Plato and Aristotle quote a line or two; from later writers, par-

ticularly Sextus Empiricus and Simplicius, about 150 lines can be recovered. Parmenides wrote in hexameter verse. All the fragments seem to come from a single work, which may have been called *On Nature*; it is unlikely to have been very long, and the fragments may amount to as much as a third of the whole. The survival of a long consecutive passage of more than sixty lines (Fr. 8) is of the greatest importance; it is the earliest example of an extended philosophical argument.

The poem begins with a description of the poet's journey to the home of a goddess, who welcomes him kindly and tells him that he is to learn "both the unshakable heart of well-rounded Truth, and the beliefs of mortals, in which there is no true reliability" (Fr. 1). The rest of the poem consists of the speech of the goddess in which she fulfills these two promises.

The interpretation of Parmenides is thoroughly controversial, and a short article cannot do more than offer one possible account, with a brief mention of the more important and plausible variants. In the interests of brevity many expressions of doubt have been omitted.

## THE PROEM

Sextus Empiricus (*Adversus Mathematicos*, VII, 111ff.) quotes 32 lines that he asserts to be the beginning of Parmenides' *On Nature* (Fr. 1). The poet describes his journey in a chariot, drawn by mares that know the way and escorted by the Daughters of the Sun. The Sun Maidens come from the Halls of Night and unveil themselves when they come into daylight. There is a gateway on the paths of Night and Day, with great doors of which the goddess Justice holds the key. The Sun Maidens persuade Justice to open the gates for themselves and Parmenides, and they pass through. "The goddess" welcomes him kindly as a mortal man in divine company, shakes his hand, and sets his mind at rest by telling him that it is right and just that he should have taken this road. He must now learn both the truth and the unreliable beliefs of mortals.

Although few examples of contemporary poetry have survived for comparison, it is safe to say that this proem is a mixture of tradition and innovation. The "journey" of the poet is a literary figure closely paralleled in an ode by Pindar (*Olympian* 6). There, as for Parmenides, the journey is an image of the course of the song; the poet rides in a chariot, a gate has to be opened, the team knows the way, and the road is notably direct. The route followed by Parmenides' chariot, although straight and swift, is impossible to chart. The details are vague. What is clear is that the whole journey is nowhere on earth, but in the heavens, and that it begins in the

realm of darkness and ends in the realm of light. This imagery is confirmed by other indications—the escort of Sun Maidens and their unveiling.

It can hardly be doubted that the journey symbolizes progress from ignorance to knowledge on a heroic or even cosmic scale. The epic verse form signifies a deliberately heroic context, for earlier philosophers probably wrote in prose (though Parmenides may also have chosen verse as being more memorable). Parmenides' journey in search of knowledge must recall Odysseus's journey to Hades (*Odyssey* XI) to get directions from Teiresias to guide him on his way home. The location of Parmenides' journey recalls the magic regions of this part of the *Odyssey*, where in one place dawn follows immediately upon nightfall because "the ways of night and day are close together" (X, 86) and where in another place there is no daylight at all, since Night envelops everything (XI, 19). There may also be reminiscences of the journey of Phaethon in the chariot of the Sun.

Sextus, after quoting Fragment 1, gives a detailed allegorical interpretation of it, and in this he has been followed by some modern scholars. But this is wrong; it is impossible to trace a consistent allegory, and in any case detailed allegory was a later invention.

The identity of the goddess is puzzling. The wording of the proem itself suggests that she is the same as the goddess Justice who holds the keys of the gates; in a later fragment, however, she speaks of Justice in the third person (possibly even in Fr. 1.28; certainly in Fr. 8.14). It may be that Parmenides left the identification intentionally vague. Simplicius does not mention the goddess at all but introduces his quotations as if the first person referred to Parmenides himself. The Neoplatonists appear to have called her "the nymph Hypsipyle" (that is, High Gate; Proclus, "Commentary on the *Parmenides*" Book IV, Ch. 34).

It is probably wrong to say that in his proem Parmenides is setting himself up as a mystic or that he is claiming to have received a divine revelation. If mysticism entails some privileged access to truth through nonrational means, then Parmenides was no mystic. The fragments show that he argued for his conclusions; his goddess tells him to use his reason to assess her words (Fr. 7.5). A single visionary experience is ruled out by the opening of the proem, in which the tenses show that the journey is a repeated one—perhaps repeated every time the poem is recited. Unless the claim of every poet to be inspired by the Muses is itself a claim to a divine revelation, this seems to be an inappropriate description of Parmenides' experience.

At the time of its composition, the proem was probably understood as a claim that the poet had something of great importance to say. The course of his divinely inspired song was a path that led to the light of knowledge. By making Justice responsible for opening the gate for him, he claimed that this was a right and proper path for him to follow and, therefore, a path that led to truth. By putting the whole of his doctrine into the mouth of a goddess, he claimed objectivity for it; it was not beyond criticism, since the goddess instructed him to judge it by reason, but it was not to be regarded as a merely personal statement by Parmenides.

### THE THREE WAYS

The goddess begins by telling Parmenides what are the only possible ways of inquiry. She describes three ways, produces reasons for ruling out two of them, and insists on the remaining one as the only correct one.

First two ways are stated, each being defined by a conjunctive proposition. The first is “that it *is*, and cannot not be; this is the way of Persuasion, for she is the attendant of Truth.” The second is “that it *is not*, and must necessarily not be, this I tell you is a way of total ignorance” (Fr. 2).

The literal meaning of Parmenides’ Greek in these propositions is hard to see. The verb “to be” is used in the existential sense. He uses it in the third person present indicative without any subject expressed. Some interpreters say that there is no subject to be understood; however, without any subject the sentence is incomplete, and no doubt the impersonal subject “it” is to be regarded as contained in the verb, as it often is. What this “it” refers to has to be derived from the rest of the argument and will be discussed shortly.

Immediately after the statement of the first two ways, the second way is ruled out on the ground that it is impossible to know or to utter what does not exist: “Whatever is for thinking and saying *must* exist; for it can exist [literally, ‘is for being’], whereas nothing cannot” (Fr. 6). The line of thought seems to be that the object of thought *can* exist, and since “nothing” cannot exist, the object of thought cannot be nothing. But it must either exist or be nothing; hence, it *must* exist. The basic premises then are that “nothing” is nonexistent (presumably regarded as tautological) and that the object of thought *can* exist (that is, it is possible to think of something).

Parmenides makes it quite plain, by the use of inferential particles, that there *is* an argument in this passage (though this has been denied) along the lines described.

It is therefore legitimate to fill in the basic proposition of the Way of Truth (“it is”) from the grounds on which it is based. The unexpressed subject of this proposition must be “the object of thought or knowledge” (this is convincingly shown by G. E. L. Owen, “Eleatic Questions”). The Way of Truth will therefore show what can be said of a thing if it is to be a proper object of thought; the first step is to assert that it must *be*, that it should not *be* is unthinkable. Subsequently, the subject is referred to as τὸ ἐόν (“that which is,” “what is real,” “what exists”).

After ruling out the second way, the goddess continues with a warning against a third way, the way followed by mortal men, who wander about senselessly, knowing nothing and getting nowhere. Their characteristic error is that they have made up their minds that “to be and not to be is the same and not the same” (Fr. 6). The third way can be identified with “the beliefs of mortals” mentioned at the end of the proem and discussed in detail in the main body of Parmenides’ work, after the Way of Truth (this identification is often denied). Mortals treat existence and nonexistence as the same in that they attach them both to the same objects by supposing that things sometimes exist and sometimes do not (that is, that there is change) and by supposing that some things exist that contain less of being than others and therefore contain some nonexistence (that is, that there is difference). They treat them as not the same in that they suppose they have different meanings. The language in which the censured doctrine is expressed is reminiscent of Heraclitus, but Heraclitus is certainly not the only mortal who suffers from Parmenides’ lash here.

The third way is ruled out by pointing to an alleged contradiction in it. It asserts that “things that are not, are” (Fr. 7). From the arguments of the recommended way, described later, it would appear that what is objectionable in the third way is its assumption of intermediate degrees of existence, of things that exist at one time but not another, at one place but not another, or in one way but not another. Ordinary habits of speech and the data of sense perception would lead a man along this path; the goddess gives a warning to “judge by *reason* the hard-hitting refutation that I have uttered.”

### THE WAY OF TRUTH

The Way of Truth has now been shown by elimination to be the right way. The long Fragment 8 proceeds to make deductions from the basic proposition that “it” (the object of thought and knowledge if the analysis given above is correct) “exists and must exist.”

Its first property is that it is ungenerated and indestructible. It cannot have come into being out of what does not exist since what does not exist is absolutely unthinkable and since there would, moreover, be no explanation of why it grew out of nothing at one time rather than another. There is no growth of what exists (and no decay either, but Parmenides offers no separate argument for that); hence, “either it is or it is not” (Fr. 8.16)—and that decision has already been made. It *is*, as a whole, entirely.

Since there is no growth or decay of what exists Parmenides argues that no distinctions can be made within it. There are no degrees of being—differences of density, for instance; the whole is full of continuous being. What exists is single, indivisible, and homogeneous. Here Parmenides apparently moves from the temporal continuity of being to its spatial uniformity; in the same way Melissus, his pupil, argues for the absence of a beginning or end in time and then assumes the absence of a beginning or end in space (Melissus, Frs. 3–4).

Next follows an assertion that since there is no generation or destruction, there is no motion or change in what exists. This argument is expanded by Melissus (Fr. 7). Any form of change or rearrangement implies the destruction of a state of affairs that exists and the generation of one that does not exist. Thus, Parmenides concludes that what exists “remains the same, in the same ... held fast in the bonds of limit by the power of Necessity” (Fr. 8.29). It already is whatever it can be. Motion, as a species of change, is apparently denied by the same argument.

The last section of the Way of Truth is particularly difficult. Parmenides repeats his assertion that there is no not-being and there are no different degrees of being; what exists is equal to itself everywhere and reaches its limits everywhere. From this he concludes that it is “perfect from every angle, equally matched from the middle in every way, like the mass of a well-rounded ball” (Fr. 8.42–44). There is no agreement among modern scholars as to whether this is a literal assertion that what exists is a sphere (a view held by John Burnet and F. M. Cornford) or only a simile indicating that it is like a ball in some respect other than shape (a view held by H. Fränkel and Owen). The latter view seems more probable. Parmenides’ stress lies on the qualitative completeness, or perfection, of what exists, not on its spatial extension. The point of the simile might be put like this: As a ball is equally poised about its center so that it would make no difference which direction you took if you examined it

from the center outward, so what exists is all the same from any center.

## THE WAY OF SEEING

Having completed her account “about truth,” Parmenides’ goddess fulfills her promise to describe mortal beliefs. Only about forty lines survive from this part of the poem. The fundamental difference from the Way of Truth is made clear at the outset: Mortals give names to two forms, and that is where they are wrong, for what exists is single. They assume the existence of two opposites, Fire and Night, probably characterized in terms of sensible opposites such as hot–cold, light–dark, light–heavy, soft–hard. Using these two forms as elements, the Way of Seeming apparently offered a detailed account of the origin of the stars, sun, moon, earth and all the things on the earth “as far as the parts of animals” (Simplicius, *In de Caelo* 559.25), some embryology, sense perception, and doubtless other things. The details are unimportant (though Parmenides is credited with the first assertion that the morning star is identical with the evening star, according to Diogenes Laërtius, *Lives* IX, 23); the interesting and puzzling thing is that he should have added a cosmogony to the Way of Truth at all. Modern scholars differ about his intention.

Eduard Zeller took the cosmogony to be an account of the beliefs of Parmenides’ contemporaries; Burnet called it “a sketch of contemporary Pythagorean cosmology.” However, there is no evidence for this. Such a review would seem to be pointless, and in antiquity the cosmogony was recognized as Parmenides’ own. One can ignore the suggestion that it represents those of his early beliefs that were later superseded. The discussion now turns on this point: Is the Way of Seeming granted relative validity as a sort of second best, or is it wholly rejected? If it is wholly rejected, why did Parmenides write it?

Recently, the first view has been defended as follows by, for example, W. J. Verdenius, Gregory Vlastos, Hans Schwabl, and W. R. Chalmers. The goddess in the prologue promised that Parmenides would learn about mortal beliefs as well as truth and would hardly have done so if they had no validity at all. Unless the phenomenal world is granted some degree of reality, the philosopher himself, the learner of truth, appears to be condemned to nonexistence; however, the mind, described in physical terms in the Way of Seeming (Fr. 16), is the faculty that grasps what is real in the Way of Truth. Moreover, some of the language of the Way of Seeming deliberately echoes that of the Way of Truth. The two opposites, Fire and

Night, transgress the canons of truth by being distinguished from each other, but they are each described as self-identical and as containing no nonexistence, like the real being of the Way of Truth (Frs. 8.57–59, 9.4). Later writers in antiquity, notably Aristotle (*Metaphysics* A5, 986b27–34), took Parmenides to be yielding to the necessity of providing his own account of the phenomenal world. For reason, Aristotle said, there was just one being, but for sense perception more than one. Others have argued that the Way of Truth is the way an immortal looks at the world *sub specie aeternitatis*, whereas the Way of Seeming is the way mortals see the same world in time. Many variations on these themes have been suggested.

The contrary view, defended recently in differing forms by Owen, A. A. Long, and Leonardo Taran, has more justification in the text of Parmenides. The goddess makes it clear enough that the Way of Seeming is wholly unreliable (Frs. 1.30, 8.52) and that the Way of Truth leaves no room whatsoever for intermediate degrees of reality. The text itself contains a statement of the intention: “Thus no judgment of mortals can ever overtake you” (Fr. 8.61; the metaphor is from chariot racing). Although this is ambiguous, the likeliest sense is that Parmenides is equipped by the Way of Seeming to defeat any mortal opinion about the phenomenal world. All descriptions of the phenomenal world presuppose that difference is real, but the Way of Truth has shown that what exists is single and undifferentiated. The transition to the Way of Seeming is made by pointing to the fundamental mistake in assuming even the minimum of differentiation in reality—that is, in assuming that two forms of what exists can be distinguished (Fr. 8.53–54). Once this assumption is made, a plausible description of the phenomenal world can be offered, but anyone who has followed Parmenides thus far will recognize the fundamental fallacy in even the most plausible description. This explanation is more consistent with the later history of Eleaticism, for Zeno and Melissus showed no interest in positive cosmology.

## PARMENIDES AND GREEK PHILOSOPHY

There is general agreement that Parmenides followed the Milesians, Heraclitus, and Pythagoras and preceded Empedocles, Anaxagoras, and the atomists (the thesis of K. Reinhardt that Heraclitus answered Parmenides has been generally rejected). Ancient tradition credits him with a Pythagorean teacher, Ameinias (Diogenes Laërtius, *Lives* IX, 21). It is often said that the rigorous deductive

method of the Way of Truth was learned from the mathematicians, who at that time in Italy were likely to be Pythagoreans, but the truth is that too little is known of the mathematics of the time to allow this to be more than a guess.

In general, the relevance of Parmenides to earlier philosophy is fairly clear, though there is room for doubt about his attitude toward individual men. (Various scholars have found in the text attacks on Anaximander, Anaximenes, Heraclitus, and the Pythagorean school.) All previous systems had assumed the reality of change in the physical world and attempted to explain it. Thales, Anaximander, and Anaximenes held that the world evolved from a simpler state into a more complex one. Anaximander’s view was that different substances (“the opposites”) grew out of a primitive undifferentiated “indefinite”; Anaximenes gave a more precise description of the manner of differentiation and said that the original substance, air, turned into other substances by rarefaction and condensation. Heraclitus apparently abandoned the idea of an original simple state, asserting that everything in the world is always changing—“an ever-living fire.” In somewhat less materialistic language the Pythagoreans produced a cosmogony based on the imposition of limit upon the unlimited. Parmenides’ critique was equally damaging to all of these theories, since his argument, if accepted, condemned all difference as illusory.

It is often said that Parmenides’ attack on the reality of the physical world depends on his confusion of two senses of the verb “to be”—the existential and copulative. It cannot logically be true that a subject *is* and at the same time *is not* (existentially); from this Parmenides is supposed to have concluded that it cannot be true that a subject *is* black and at the same time *is not* white and hence that all differentiation is impossible. The surviving text does not bear this out. Parmenides’ premise (and his fundamental fallacy) was, rather, that “what is not” is absolutely unthinkable and unknowable. Every change would involve the passage of what is into what is not, and hence every attempt to describe a change would involve the use of an unintelligible expression, “what is not.”

The argument of the Way of Truth is metaphysical and would apply to any subject matter whatsoever; it is false to suppose that it applied only to Pythagorean cosmogony or only to the materialist cosmogonies of the Ionians. But that Parmenides’ primary intention was to criticize the earlier cosmogonists seems clear from the addition of the Way of Seeming to the Way of Truth. His own Real Being was certainly not a ball of matter, as Burnet and others thought. On the other hand, it was not

something to which spatial terms were wholly inapplicable. It filled the whole of space and thus was in some sense a competitor of other accounts of the cosmos. The main effects of his work, too, were on cosmology.

The error of Parmenides' ways was not seen immediately, perhaps not until Plato's *Sophist*. Their immediate effect was to produce theories that attempted to save the natural world from unreality without transgressing Parmenides' logical canons. In brief, they produced theories of elements. Empedocles envisaged a cosmos made of the four elements that were later made standard by Aristotle—earth, water, air, and fire. He satisfied some of Parmenides' criteria by making his elements unchangeable and homogeneous. What he refused to accept from Parmenides was that difference was impossible without diminution of reality; his four elements were asserted to be different from one another yet equally real. He explained apparent change as the rearrangement in space of the unchanging elements. Anaxagoras went further to meet Parmenides by asserting that all natural substances, not just a privileged four, were elementary and unchangeable. The atomists responded in a different way; they accepted that no qualitative difference is possible but rescued the phenomenal world by asserting that "what is not" exists in the form of void—that is, as empty space separating pieces of real being from each other. (The equation of void with "what is not" is sometimes attributed to Parmenides himself, but it was probably first made by his follower Melissus, who explicitly denied its existence in his Fragment 7.)

Plato inherited from Parmenides the belief that the object of knowledge must exist and must be found by the mind and not by the senses. He agreed that the object of knowledge is not something abstracted from the data of sense perception but a being of a different and superior order. He differed, however, in that he allowed the sensible world to have an intermediate status, as the object of "belief," rather than no status at all (*Republic* 477B and elsewhere). He differed more significantly, too, in that he reimported plurality into the real and knowable by distinguishing different senses of "not-being" (*Sophist* 237B ff. and 257B ff.).

David J. Furley (1967)

## PARMENIDES OF ELEA [ADDENDUM]

David Furley's original entry remains an exemplary introduction to Parmenides' thought. Since its publication, philosophers have focused on the character of the routes of inquiry that the goddess lays out in the poem, suggest-

ing different interpretations of the subjectless is (or *esti*), and of the nature of *to eon*, the subject of inquiry. In addition, scholars have continued to study the *Proem* (the opening lines of the poem) and the *Doxa* (the goddesses' statement of mortal opinion), but there is no consensus about either.

Newer studies emphasize the undoubted influences of Homer and Hesiod (fl. c. 800 BCE) as models for Parmenides' language and poetic images, while others recognize the continuity of Parmenides' thought with that of his predecessors. For example, Xenophanes of Colophon questions whether human knowledge is possible: In the absence of divine warrant or intercession, how can human beings of limited experience achieve genuine understanding? Parmenides' analysis of the unchanging nature of the object of genuine thought and inquiry, and his use of a goddess who nevertheless uses arguments and demands that her hearer evaluate her claims (DK 28 B7.5) can be seen as an attempt to defend the possibility of human knowledge and explore its limits. Some scholars suggest that this account of Parmenides is too rationalistic, but the consensus remains that he is part of a philosophical tradition that continues in Plato, Aristotle, and later Greek thought.

Reading Parmenides as exploring the nature of inquiry and the proper object of understanding and knowledge, many scholars are more willing to countenance forms of "to be" in Parmenides that are not primarily existential. Attention has been paid to predicative, veridical, and fused predicative-existential notions of being, and it is likely that some sort of hybrid account best captures Parmenides' meaning. What-is (*to eon*) must exist, but existence is not Parmenides' primary concern. Rather, the object of genuine thought must be or have an essence (predicative), and must be what is the case (veridical). What is not (or lacks an essence) cannot be real. As such it cannot be an object of understanding. Contrary to mortal thinkers, Parmenides denies that coming-to-be and other sorts of change are real or can be attributed to what is real. The arguments of fragment 8 show that only what is wholly of a single kind, unchangingly and perfectly what it is, can be real. Such an entity (*eon*) is a unity, admitting none of what is not, and so can be grasped completely by thought.

There is no doubt that Parmenides claims that what-is is one. The question is the sort of unity or monism to which Parmenides is committed. Some scholars challenge the interpretation (going back to Plato) that Parmenides advocated numerical monism in the same sense as Melissus of Samos, who asserted the reality of only one thing.

On the alternative account, although whatever there is must be one, more than one thing may be real. Stronger and weaker versions of this view have been taken. It can be argued that numerical pluralism is consistent with Parmenides' views of the unified nature of what-is, although Parmenides himself does not specify how many basic entities there are.

The role of the *Doxa* section of the poem remains a problem, especially if one follows many scholars in rejecting the view that mortals err by positing what does not exist or by supposing that there is a plurality of real things. There is no general agreement, and some modern interpretations accept the more traditional view, found in Furley's entry, that no cosmological account can be acceptable. Another suggestion is that, although the sensible world of change and becoming described in the *Doxa* is not the world of genuine reality, the cosmology of the *Doxa* nonetheless succeeds because it gives a true account and explanation of the unreal world of appearances. Or the *Doxa* might be intended as a lesson, offering a model cosmological account with a problem at its heart (the commitment to genuinely real opposite forms) that shows what must be avoided in an adequate account of how things are.

A further focus of study has been the positive importance of Parmenides' arguments for later philosophers (the later pre-Socratics and Sophists as well as Plato). This has led to a new appreciation of the Parmenidean basis for pluralistic and atomistic pre-Socratic theories and for the foundations of Plato's thought. In addition, scholars explore differences of theory and argument strategy among Parmenides, Zeno of Elea and Melissus, controverting the traditional interpretation that lumps them together as maintaining a single "Eleatic position."

Patricia Curd (2005)

## PASCAL, BLAISE (1623–1662)

Blaise Pascal was a French mathematician, physicist, inventor, philosopher, and theologian. He was born in Clermont in Auvergne, the son of a minor noble who was a government official. Pascal's mother died in 1626. In 1631 the family moved to Paris but fled in 1638 because of the father's opposition to the fiscal regulations of Richelieu. The next year Pascal's younger sister, Jacqueline, successfully acted in a children's play performed for Richelieu and thus gained a pardon for her father, who then became the royal tax commissioner at Rouen.

### MATHEMATICS AND PHYSICS

Pascal was a prodigy, privately educated by his father, who was an excellent mathematician. His father wanted his son to have a good humanistic background before he learned mathematics and science, but at the age of twelve, Pascal discovered by himself the principles of geometry. When his father realized this, he abandoned his original plan for his son's education and encouraged his mathematical development. While still a teenager, Pascal published important mathematical and scientific papers and was a young prodigy in the Parisian intellectual circles. His father and he became members of a scientific discussion group organized by Father Marin Mersenne. There he would have met a wide range of people, probably

including Thomas Hobbes, Descartes, and others. At sixteen, Pascal wrote his first major work, *Essai pour les coniques* (published in 1640), which his sister reported was "considered so great an intellectual achievement that people said that they had seen nothing as mighty since the time of Archimedes." In 1642 Pascal invented the calculating machine, originally designed to help his father in his tax work. This machine was one of the first applied achievements of the "new science." Pascal's writings on the calculating machine from 1645 to 1652 indicate the inordinate difficulties of putting theory into practice, the wide divergence between the levels of metallurgical and mathematical skill, and the monumental importance of this early contribution to the industrial revolution.

For the rest of his life Pascal continued to make major mathematical contributions in probability theory, number theory, and geometry. Although he gave up serious concern with mathematical problems after his religious conversion in 1654, a notable analysis of the nature of the cycloid grew out of a night's insomnia in 1658. Pascal's important work in the philosophy of mathematics, *L'esprit géométrique*, was probably written in 1657 and 1658 as a preface to a textbook in geometry for the Jansenist school at Port-Royal.

### THE VACUUM

In 1646 Pascal learned of Evangelista Torricelli's (1608–1647) experiment with a barometer, which involved placing a tube of mercury upside down in a bowl of mercury. Having successfully repeated the experiment, Pascal asked himself what kept some of the mercury suspended in the tube and what was in the space above the column of mercury in the tube. Many scientists believed that the pressure of the outside atmosphere was responsible for holding up the column of mercury, but they had no proof. All agreed that the space at the top of the tube contained some kind of rarefied and invisible matter; hence, no vacuum. In 1647 Pascal published *Expériences nouvelles touchant le vide*, a summary of a series of experiments with variously shaped and sized tubes and different liquids, in which he set forth the basic laws about how much water and how much mercury could be supported by air pressure and about how large a siphon had to be to function. He also sketched out the reasons why a genuine vacuum could and did exist above the column of mercury or other liquid supported in the barometer.

Father Estienne Noel, rector of the Collège de Clermont in Paris, challenged Pascal, insisting that nature abhors a vacuum and therefore would not allow one to exist; thus, the alleged empty space created in Pascal's

experiments actually contained a special kind of matter. Pascal's reply, in which he gave the conditions for judging a hypothesis, is one of the clearest statements on scientific method made during the seventeenth century. Pascal asserted that a hypothesis could be disproved if one could elicit either a contradiction or a conclusion counter to fact from the affirmation of the hypothesis. However, if all the facts fit the hypothesis or follow from it, this merely shows the hypothesis is probable or possible. "In order to show that a hypothesis is evident, it does not suffice that all the phenomena follow from it; instead, if it leads to something contrary to a single one of the phenomena, that suffices to establish its falsity." Pascal showed that Noel's and Aristotle's hypothesis that there is no vacuum is false because conclusions contrary to experimentally established facts follow from it, whereas his own theory of a genuine vacuum is a possible or probable explanation of the facts in question.

In 1648 Pascal's brother-in-law performed the experiment of carrying a barometer up a mountain. This established the change in the level of the column of mercury. Pascal checked the results at various heights on a church tower in Paris. He then declared that these results established

that Nature has no abhorrence of a vacuum, that she makes no effort to avoid it; that all the effects that are ascribed to this horror are due to the weight and pressure of air; ... and that, due to not knowing this, people have deliberately invented that imaginary horror of a vacuum, in order to account for them.

Combining his ingeniously derived experimental data with a clear analysis of the possible explanatory hypotheses, Pascal arrived at one of the major achievements of seventeenth-century science. His theory of the vacuum and air pressure played an important role in the development of the mechanical theory of nature and the elimination of some of nature's alleged occult qualities and personal characteristics. The preface to the *Traité du vide* (which is all that has survived of the *Traité*) contains a defense of the new science and a discussion of the nature of scientific progress. In the study of nature, Pascal insisted that respect for authority should not take precedence over reasoning or experience (in theology, however, he maintained that it should). The secrets of nature, he said, are hidden from us, and although it is always active, we do not always discover its effects. In the course of time, through experience and understanding, we come to learn more about the natural world. Hence, as more data are accumulated, we should expect to find previously

accepted hypotheses replaced by newer ones. Our conclusions about nature are always limited by the amount of experience gathered up to now. In time we seek for truths in terms of our experience and comprehension. What is sought for may be unchanging, but the results of the quest are the variable developments that constitute the history of science. Thus, there is no reason for preferring the ancient scientific views of Aristotle or anyone else to the latest achievements of scientific reasoning, based on the most recent data.

### PASCAL AND JANSENISM

Pascal's mathematical and scientific accomplishments are among the most important of his time, but his religious and philosophical views have overshadowed them. His writings in religion and philosophy grew out of his involvement with the Jansenist movement. In 1646, after his father was injured, two Jansenists came to take care of him. The whole family, including Blaise, became interested in and involved with this Catholic reform movement, with his sister Jacqueline, becoming a nun at Port-Royal de Paris. From 1652 to 1654, Pascal turned away from religious interests, spending his time mainly with libertine friends who were gamblers, womanizers, and probably freethinkers. Pascal often visited his sister at Port-Royal, indicating to her that he had a great contempt for the world and people but that he did not feel drawn to God. However, after a traumatic experience crossing the Pont Neuf in Paris during a storm, Pascal had a religious conversion. He recorded this religious experience in *Le Mémorial* as "certitude, certitude, feeling, joy, peace." A year later, in 1655, with the encouragement of his sister, he made his first retreat at Port-Royal-des-Champs. Thereafter, Pascal objected vehemently to the philosophy of Descartes, unfavorably contrasting the God of the philosophers—namely, Descartes's God—with the God of Abraham, Isaac, and Jacob.

In January 1655 Pascal went to Port-Royal-des-Champs, the order of the two Port-Royal convents, for a two-week retreat. There a famous discussion with the Jansenist theologian, Isaac Le Maistre de Saci, took place, published in the *Entretien avec M. de Saci*. This text indicates that Pascal had already formulated many of the views later developed in the *Pensées*. During the next several months, Pascal often visited the two Port-Royal convents. On one of these visits Pascal met Antoine Arnauld, the leading Jansenist philosopher and theologian, who was about to be condemned by the Sorbonne for his views. In *Lettres provinciales*, a series of eighteen letters published in 1656 and 1657, Pascal defended Arnauld and

satirized his Jesuit opponents and their theological and moral view. These letters, published under the pseudonym Louis de Montalte, were probably the cooperative work of Pascal, Arnauld, and Pierre Nicole, though they were principally by Pascal. One of the great French literary masterpieces, the *Lettres provinciales* mercilessly ridicules the casuistry of various Jesuit moralists for what Pascal considered their lax, inconsistent, and unchristian views and defends Jansenism against charges of heresy. The arguments of various sixteenth-century and seventeenth-century scholastics are torn apart, and the charges against the Jansenists rebutted in a dazzling display of wit, irony, abuse, argument, and literary brilliance. Nevertheless, the *Lettres provinciales* was placed on the Index in 1657, and shortly thereafter the Jansenist movement was condemned by the pope. In 1661 the schools at Port-Royal were closed, and the nuns and solitaires had to sign a submission to the church.

Until 1659 Pascal worked on a wide variety of subjects defending Jansenism, composing his *Écrits sur la grâce*, *De l'esprit géométrique*, *De l'art de persuader*, and the works on the cycloid and preparing his *Apologie de la religion chrétienne*, the unfinished work posthumously published as the *Pensées*. In 1659, seriously ill, Pascal practically stopped writing. In 1660 he was somewhat better and wrote his *Trois discours sur la condition des grands*. The next year, after the suppression of Jansenism and the death of Jacqueline, Pascal wrote his final work on Jansenism, *Écrit sur la signature du formulaire*, urging the Port-Royalists not to give in. He then withdrew from all further controversy. His last achievement, illustrating another side of his genius, was the invention of a large carriage with many seats and the inauguration of what was in effect the first bus line, carrying passengers from one part of Paris to another for a fixed fare. One of his motives was to gain money to give to the poor, because he had already disposed of almost all his worldly possessions. Much of his will is devoted to bequeathing portions of his bus revenues to various hospitals.

## PHILOSOPHY OF MATHEMATICS AND SCIENCE

Pascal left unpublished his two most important philosophical works, the *Pensées* and *De l'esprit géométrique*. *De l'esprit géométrique* was first published in the eighteenth century. In it Pascal dealt with the problem of the method for discovering truths. The ideal method, he declared, would be one which defined all of the terms employed and demonstrated all propositions from already established truths, but this is impossible, because

the basic terms to be defined presuppose others to explain their meaning, and the fundamental propositions to be proved presuppose still others. Thus, it is impossible to reach first terms and principles. Instead, we find primitive terms that admit of no further definitions that clarify them and principles that are so clear that nothing clearer can be found to aid in proving them. "From which it seems that men are naturally and unalterably powerless to deal with any science whatsoever in an absolutely perfected manner."

Given this state of affairs, geometrical procedure is the most perfect known to humankind—a balanced one in which those things that are clear and known to everyone are not defined and everything else is defined, and in which those propositions known by all are assumed and other propositions are derived from them. Pascal insisted that this did not mean either that human beings could know by natural means that the premises of geometry were really true or that the fundamental concepts were thoroughly understood. Rather, the geometrical method provided the greatest certitude attainable by use of our limited capacities. Essentially, it developed an axiomatic system in which, from primitive terms and axioms, a set of propositions could be logically derived. Such a set would be true if the axioms were true.

In the companion piece to *L'esprit géométrique*, *De l'art de persuader*, Pascal explained how we come to be convinced of first principles and of conclusions from them. Conclusions are explained via the geometrical method. The problem of first principles raises a basic point for Pascal's theory of knowledge that is developed in the *Pensées*. Our reason and understanding can only work out axiom systems. Because we cannot prove the first principles, we can always cast skeptical doubts upon their truths, no matter how certain they may appear to us at various times. We can overcome this constant tendency toward skepticism (which also occurs in scientific research, because we can never know the secrets of nature but only plausible and as yet unrefuted hypotheses about the world) only by recognizing that principles are gained through instinct and revelation. This recognition requires admitting the importance of feelings and of submission to God in the quest for truth.

## RELIGION

Pascal left the *Pensées* unfinished, with many notes of varying sizes pinned together. The first editors copied all the materials exactly as Pascal left them but published only those portions that they felt were completed, organizing them as they saw fit. Later editors assumed that the

*Pensées* was a collection of fragments, left in a disordered state by their author, and that each editor could arrange the fragments as he wished. Victor Cousin in 1842 pointed out that only selections of the *Pensées*, often somewhat embellished by the various editors, existed in print, and he urged a definitive edition based on the manuscripts in the Bibliothèque Nationale. One of these, the *Recueil original*, consists of the fragments in Pascal's own handwriting, pasted on large sheets of paper. For the next century editors used this manuscript for varying presentations of the text. In the 1930s and 1940s Zacharie Tourneur and Louis Lafuma established that the *Recueil* was pasted together after Pascal's death and that another manuscript, a copy by one of Pascal's relatives, represented the actual state of the work as organized and partially completed by the author. This led to Lafuma's definitive edition in 1952, which radically changed the order of the fragments, finally presenting the development of the themes in the *Pensées* as Pascal had intended them to be read.

**THE HUMAN CONDITION.** In the Lafuma edition the initial sections, "Order," "Vanity," "Misery," "Boredom," and "Causes of Effects," all portray the human condition by showing humankind's ways of dealing with and reacting to the ordinary world. The sixth and seventh sections turn to the core of humankind's philosophical problem—how to find truth and happiness. If humans are miserable, vain creatures, unable by their own resources to find first truths from which to derive others, they have to realize that "we know truth not only by reason but more so by the heart. It is in this latter way that we know first principles, and it is in vain that reason, which plays no part in this, tries to combat them" (Lafuma 1952, p. 110; Brunschvicg, p. 292). The principles of geometry are known instinctively by the heart, and reason employs these principles to establish theorems. Both heart and reason yield results that are certain, but by different routes, and it would be ridiculous to require proofs of the heart's instincts and intuitions or intuitive knowledge of what is proved. The inability of reason to establish first principles serves to humiliate reason but not to undermine our certainty. The realization of the limitations of reason helps us, Pascal declared, to recognize our wretchedness, and the greatness of humankind is that people alone are capable of such a recognition.

The climax of this attempt to show the ultimate non-rational foundation of our knowledge of first principles comes in the next section, "Contradictions." In a famous passage on skepticism (131 and 434) Pascal began by pointing out that the strongest contention of the

Pyrrhonists was that we have no assurance of the truth of any first principles apart from faith and revelation except that we feel them within us. This natural feeling is no convincing proof of their truth, because apart from faith we cannot tell whether humans were created by a good God, an evil demon, or by chance. The truth-value of the principles depends upon their source. Pascal then explored the depths of complete skepticism and showed that if one had no assurance or any principles, one could be certain of nothing; but at the same time one could not even become a complete skeptic.

What then will man do in this state? Will he doubt everything? Will he doubt whether he is awake? Whether he is being pinched, whether he is being burned, will he doubt that he doubts, will he doubt that he exists?

We cannot go so far as that; and I set it forth as a fact that there has never been a complete perfect Pyrrhonist. Nature sustains our feeble reason and prevents it from raving to that extent. ...

What kind of a chimera then is man? What novelty, what monster, what chaos, what subject of contradictions, what prodigy? Judge of all things, imbecile worm of the earth, depository of truth, sink of uncertainty and error, glory and scum of the world.

Who will unravel this tangle? Certainly it surpasses dogmatism and Pyrrhonism; and all human philosophy. ...

Nature confounds the Pyrrhonists and reason confounds the dogmatists. ...

Know then, proud man, what a paradox you are to yourself. Humble yourself, weak reason. Silence yourself, foolish nature, learn that man infinitely surpasses man, and hear from your master your real state which you do not know.

Hear God.

The problem of knowledge thus becomes, for Pascal, a religious one. Only through submission to God and through acceptance of his revelation can we gain completely certain knowledge. The greatest achievements in science and mathematics rest on a fundamental uncertainty, because the basic principles employed, known through instinct and intuition, are open to question. Skeptical probing can only reveal the human predicament in its fullest and prepare us to submit and accept a religious foundation of knowledge.

The *Pensées* then proceeds to show how humans try to avoid recognizing their situation through diversion and philosophy. Philosophy can only lead us continually to skepticism, from which we are saved by our own intuitive knowledge of truth. We seek for happiness but cannot find it apart from religion. Pascal then tried to show in the famous wager argument (418 and 233) that it is not unreasonable to believe in God. God, he argued, is infinitely incomprehensible to us. But either God exists or he does not exist, and we are unable to tell which alternative is true. However, both our present lives and our possible future lives may well be greatly affected by the alternative we accept. Hence, Pascal contended, because eternal life and happiness is a possible result of one choice (if God does exist) and because nothing is lost if we are wrong about the other choice (if God does not exist and we choose to believe that he does), then the reasonable gamble, given what may be at stake, is to choose the theistic alternative. The person who remains an unbeliever is taking an infinitely unreasonable risk just because he or she does not know which alternative is true. Pascal's dialectic in his religious apologetics prods people to realize that there is not enough evidence to confirm the religious hypothesis and not enough to reject it. So, a person in his or her fallen state chooses on moral characters rather than philosophical ones.

Pascal is not just presenting the problem of human knowledge in philosophical terms. As he once explained to his fellow members at Port-Royal, what he was working on as the culminating statement of his views was "an apology for the Christian religion." The *Pensées* are either this apology or reflect a good deal of its content or design. The skeptical problems and the skeptical attitude are part of the apologetic project. But Pascal does not see skepticism as leading to religious knowledge or religious truth, but more as neutralizing man's rational impulses. Pascal was not following the route of Michel Eyquem De Montaigne, Pierre Charron, and Francois de La Mothe Le Vayer. He was using their skeptical weapons to combat the dogmatists and to make the skeptics aware of the religious dimension. Pascal did not see skepticism as leading to the relaxed, tranquil view of the ancient Pyrrhonists, but rather to a sharpened and heightened desperation. The desire to know could not be satisfied by human rational faculties but there was a necessity to know.

What Pascal contributes to the skeptical discussion is what José Maia Neto (1995) has called the "Christianization of Pyrrhonism." The Christianization of Pyrrhonism is seen in Pascal's description of people's state without God. This state, theologically, is what has happened to

humankind in the Fall. Humans in this condition can find no security through reasoning or the use of their faculties, and they can unfortunately realize the desperation of their situation. They still have a glimmer or afterglow of the prelapsarian state of affairs but are unable to reach it. Pascal tried to show how belief can be achieved by curbing the passions, submitting to God, and using reason as a means of realizing that true religion is beyond reason and is known only through Jesus. We are suspended between two infinities, the infinitely small (the void) and the infinitely great (the Divine). Reason exposes our plight to us. Our desire for truth and happiness makes us see the futility of science, mathematics, and human philosophy as ways of finding the answers humans seeks.

**THE CHRISTIAN RELIGION.** The later sections of the *Pensées* are devoted to apologetics, arguing that the Christian religion is the true religion. From historical data, moral precepts, miracles, and the fulfillment of prophecies, Pascal argued that the Bible is the source of true religious knowledge. He contended that the Old Testament foretold Christ's coming and the Jewish rejection of him. Using the recently rediscovered Spanish anti-Semitic classic by Raymundus Martinus, *Pugio Fidei*, Pascal took material from many Jewish sources to claim that "God used the blindness of the Jewish people for the benefit of the elect" (469 and 577) and that "if the Jews had been completely converted by Jesus Christ, we would not have had any but suspect witnesses. And if they had been exterminated, we would not have had any at all" (592 and 750). The apologetic argument, Pascal admitted, was not logically decisive but only persuasive. The real problem was to *be* a Christian, and here reason could not help. Humans could submit, but they still desperately required God's Grace.

The prophecies, the miracles themselves, and the proofs of our religion are not of such a nature that it could be said they are absolutely convincing, but they are also of such a kind that it cannot be said that it would be unreasonable to believe them. Thus there is evidence and obscurity to enlighten some and confuse others, but the evidence is such that it surpasses or at least equals the evidence to the contrary, so that it is not reason that can determine men not to follow it, and thus this can only be as a result of lust or malice of heart...[so] that it appears that in those who follow it [religion], it is grace and not reason which makes them follow it, and that in

those who shun it, it is lust and not reason that makes them shun it. (835 and 564)

Pascal's views hardly constitute an organized system. Most of his works are fragmentary, and he apparently made no effort to put the fragments together. His career first as a mathematical prodigy, then as a student of physics and finally as a religious thinker made continuous intellectual development difficult. From the vantage point of his fideistic religious views his mathematical and scientific efforts appeared to him as of small significance. Throughout the *Pensées* Pascal tried to characterize the role and limits of mathematical and scientific achievements, in keeping with what he himself had accomplished. But his religious views were essentially antiphilosophical. Among philosophical views he found skepticism the most congenial insofar as it revealed most clearly "the misery of man without God" and prepared men for faith and grace.

Pascal's religious concerns have overshadowed his other contributions and as a result his impact has been mainly on thinkers concerned with religious subjects. In recent years Pascal has been studied seriously by existentialists because of his brilliant portrayal of the human condition, and he has often been compared with Kierkegaard, especially in terms of his antiphilosophical and fideistic statement of Christianity. Pascal's works on scientific method and the philosophy of mathematics have tended to be neglected, but in these areas he was one of the clearest and most advanced thinkers of his age. His many-sided genius and his unequalled command of the French language make him one of the most inspiring and thought-provoking of writers. Pascal fills a major place in the history of ideas both for his work in mathematics, physics, and philosophy of science and for his insights into human nature and his analysis of Christianity.

## PASTORE, VALENTINO ANNIBALE

(1868–1956)

Valentino Annibale Pastore, an Italian philosopher and logician, was born at Orbassano (Teramo), Italy. He educated himself in literary studies, and then obtained a degree in letters from the University of Turin, under Arturo Graf, with a thesis on *La vita delle forme letterarie* (The life of literary forms), which was published at Turin in 1892. Pastore then turned to philosophy and was influenced by Hegelianism through the teachings of Pasquale d'Ercole. At the same time he was influenced by such scientists as Friedrich Kiesow, A. Garbasso, and Giuseppe Peano. In 1903 he published in Turin his thesis in philosophy, *Sopra le teorie della scienza: logica, matematica, fisica* (On the theories of science: logic, mathematics, physics). In 1911 he began teaching theoretical philosophy at Turin, where he was full professor from 1921 until 1939 and where he instituted a laboratory of experimental logic.

Pastore's thesis was published in the same year in which Benedetto Croce's *La critica* appeared and in which irrationalism burst out in Italy in diverse forms—as a revolt against positivism, as a rebirth of idealism, as an expression of the “bankruptcy of science.” Having been educated in an environment in which Hegelianism was not ignored but was linked with the point of view of classical positivism, Pastore became aware of the impossibility of separating the sciences (mathematical and natural) from philosophy, or of substituting the sciences for philosophy. In the first case, if philosophy were severed from the conditions that render it possible and nourish it, it

would become empty and would wither; in the second case, the sciences themselves would eventually lose consciousness of their relationships, their fundamental rationale, and their methods and goals. Pastore therefore sought to assess the meaning of scientific knowledge and of its logical procedures.

Turning his attention to logical problems in particular, Pastore was at first drawn toward Bertrand Russell's thesis of the identity of logic and mathematics, as is shown in *Logica formale e dedotta dalla considerazione dei modelli meccanici* (Formal logic deduced by the consideration of mechanical models; Turin, 1906) and *Sillogismo e proporzione* (Syllogism and proportion; Turin, 1910). His principal work of this period, *Il problema della causalità, con particolare riguardo alla teoria del metodo sperimentale* (The problem of causality, with particular attention to the theory of experimental method; 2 vols., Turin, 1921), which deals with causality, shows his systematic effort to single out the mutual relationship between scientific investigation and philosophical research. Pastore examined three aspects of causality—experience, science, and philosophy—and distinguished and analyzed the idea of cause, the concept of the causal relation, and the principle of causality.

After 1922, Pastore's interests were still focused on scientific knowledge, but he clarified his conception of philosophy as the study of “pure thought,” as “not of that which is common to all particular systems, by being inherent in each one, but of that which results from all the particular systems, even though not being inherent in each one.” From this conception he evolved his idea of a “general logic” whose basis lies “outside of particular logical systems.” Around 1936, assisted by Ludovico Geymonat, he investigated the “logic of strengthening” as a “theory of primal systems,” that is, as a search for “the process of construction of the most elementary forms of thinking and of their relationships,” by means of a distinction between logic as logicity (general presystematic logic) and logic as a particular system, joining, as he himself said, “the deduction of the discourse (*D*) with the logical intuition of the universe (*U*.)” Pastore did not seek to reach a demonstration of intuitive principles, nor to propose an ontological intuition, but rather to establish the laws of the relationship between *D* and *U*, between the analysis of the discourse and a synthetic vision of the universe.

In the final phase of his work Pastore's concern with the sense of mystery became marked (“logic has always two allies at its side: sadness and mystery”). In the light of this concern he examined and discussed both the existen-

tialist movements and the historical materialism of Karl Marx and V. I. Lenin.

## PATER, WALTER HORATIO (1839–1894)

Walter Horatio Pater, an English essayist and critic, lived mainly in Oxford, where he read classics at Queens College and later became a fellow of Brasenose. He was a central figure of and inspiration for English fin de siècle art and art criticism and a profound influence on Oscar Wilde. He is of importance in philosophical aesthetics for his association with and championing of the *l'art pour l'art* doctrine of his age and for his insistence on "aesthetic criticism" of literature and the fine arts, stressing the subjective sensitivity of the critic and his power to paint evocative pictures of moments of intense experience in finely wrought, decorative prose. He is important in general philosophical history for his aphoristic but consistent statements that a relativist position was the only appropriate position for the modern temperament.

In the course of his career he proposed a highly personal conception of Platonism (*Plato and Platonism*, New York and London, 1893), playing down the immutable aspect of the theory of forms and emphasizing the imaginative sweep of Plato's more informal thinking. Pater maintained that moral values and moral standards were

relative to the achievements and conditions of an age. Although he was formerly a Christian, he did not believe that Christian revelation had a privileged status, and he stressed the anthropological interpretation and psychological significance of all religious ritual. His tendency to ethical relativism, his inclination to praise goodness for its beauty, and his attitude toward religion as an aesthetically satisfying experience without final commitment made him many enemies in Oxford. The Paterian temperament was identified with aestheticism, or the hedonistic enjoyment of the intensely lived moment of beauty, the "exquisite passion," regardless of formal and moral standpoints. He was blamed for much of the moral eccentricity and artistic preciousness and pretentiousness of his followers, who deliberately courted decadence. However, he himself led a rather carefully balanced, withdrawn life, to which the famous sentence from the conclusion to *The Renaissance*, "To live always with this hard, gemlike flame, to maintain this ecstasy, is success in life," can be applied only with some difficulty.

In his *Imaginary Portraits* (London, 1887), Pater developed the genre of imaginative presentation of personalities embodying certain philosophies of life. His novel, *Marius the Epicurean* (London, 1885), regarded by many as his major work, is one such imaginary portrait on a large scale, picturing the religious development of a highly civilized, aesthetically sensitive agnostic at the time of Marcus Aurelius and probably indicating Pater's own attitude toward religion.

Pater's importance for English letters might be said to lie largely in his having cultivated the essay form to a high level of competence combined with elegance, making a fine art out of deliberate abstention from judgment, out of tentativeness and the impressionistic recording of subjective states of mind. His best criticism occurs in the collection *The Renaissance*, in his essay on Samuel Taylor Coleridge in *Appreciations* (London, 1889), and in the essay on style (appended to *Appreciations*).

Pater understood the "historical method" to be the attempt to understand artistic phenomena in relation to the conditions that produced them and to commend them to the sympathetic imagination of the reader. Unlike Matthew Arnold, who had contrasted personal and historical assessment with the "real" assessment of art, Pater did not believe in any fully objective standards but only in the completely honest account of personal impressions against the background of historical relativity. While ostensibly agreeing with Arnold that one must see the object "as it really is," he insisted that this can be done only on the basis of knowing one's own impressions

“as they really are.” The critic needs a certain kind of temperament, the power of being deeply moved by the presence of beautiful objects. Pater acknowledged no distinction here between beautiful things in and apart from art. Yet he offered some fine insights into the autonomy and interdependence of the various arts, especially in the implications of his much-quoted passage from the essay “The School of Giorgione” in *The Renaissance*: “All art aspires constantly towards the condition of music.” In the preceding paragraph of the essay, Pater wrote that each art has “its own specific order of impressions, and an untranslatable charm.” Yet each art form, as art, needs the complete fusion of matter and form that music exemplifies in its purity.

## PATERNALISM

The term *paternalism* has long been in currency among moral and political philosophers, but its circulation became much wider, and its definitions much more precise, following the widely read debate over “the legal enforcement of morality” between Patrick Devlin (*The Enforcement of Morals*, 1965) and H. L. A. Hart (*Law, Liberty, and Morality*, 1963). Hart had endorsed the liberal

doctrine of J. S. Mill, that the only legitimate reason for state interference with the liberty of one person is to prevent him from harming other persons. Mill was especially emphatic in denying that the actor’s “own good, either physical or moral,” is ever an adequate reason for interference or criminal prohibition ([1859], 1985, p. 9). What Mill denied in this passage is precisely what came to be called “legal paternalism” in the writings of his followers, including Hart nearly a century later. Thus, paternalism was regarded as a thoroughly unacceptable view by nineteenth-century liberals.

### PHYSICAL AND MORAL

In his exchange with Devlin, however, Hart conceded that a certain amount of physical paternalism could be accepted by twentieth-century liberals, here departing from Mill who, he wrote, “carried his protests against paternalism to lengths that may now appear to us as fantastic” (Hart 1963, p. 32). He cited, for example, Mill’s criticism of restrictions on the sale of drugs. Devlin then responded by drawing a distinction between “physical paternalism,” which protects people from physical harm that could be caused by their own voluntary conduct, and “moral paternalism,” which offers similar protection against “moral harm” of the actor’s own causing. Devlin could see no consistent way in which the physical paternalist like Hart could avoid commitment to moral paternalism, for if it is the prevention of harm that justifies prohibition in the one case, why not use state power to prevent an equal amount of harm, though of a different kind, in the other case? Similarly, Devlin concluded, there is no relevant difference between criminalization meant to prevent moral harm and criminal prohibitions meant to “enforce the moral law as such.” The view that “enforcement of morality,” quite apart from harm prevention, is a valid reason for criminal prohibitions is widely called “legal moralism.” It is anathema to liberals.

One way in which liberals sometimes defend themselves from Devlin’s argument is by maintaining that Devlin’s moves from physical to moral harm and from preventing moral harm to “enforcing the moral law” do not follow logically. One liberal critic, Joel Feinberg (1986), even goes so far as to deny, in the teeth of the immense combined authority of Plato and Aristotle to the contrary, that “moral harm” is a coherent concept.

### HARD AND SOFT

A distinction is commonly made between hard (or strong) paternalism and soft (or weak) paternalism. Hard paternalism justifies the forcible prevention of some dan-

gerous but self-regarding activities even when those activities are done in a fully voluntary (i.e., free and informed) way. Soft paternalism, on the other hand, permits individuals or the state to prevent self-regarding dangerous behavior only when it is substantially nonvoluntary or when temporary intervention is necessary to establish whether it is voluntary or not.

Most soft paternalists are liberals strongly opposed to paternalism. Most of them, when they think of the paternalism they oppose, think of what is here called hard paternalism. Therefore they would prefer to go by the name of soft antipaternalists. The term *hard antipaternalism* could be reserved for the totally uncompromising liberal who would oppose interference even with some choices known to be involuntary, and with temporary compulsory intervention that is only for the purpose of determining whether the intended conduct truly is voluntary, and even with the imposition of compulsory education about risks or state-administered tests to assess the dangerous actor's understanding of the risks, with licenses required for self-regarding dangerous behavior, like mountain climbing. Clarity would be improved if philosophers would speak of paternalism only when what is meant is hard paternalism, justifying prohibition even of wholly voluntary self-regarding conduct, when dangerous. Then soft and hard antipaternalism would be the names of a moderate and extreme liberalism, respectively.

The controversy over paternalism in the criminal law is genuine and difficult. Those who are strongly opposed to paternalism find it not only mistaken but arrogant and demeaning. It is very difficult to reconcile it with even a minimal conception of personal autonomy (rightful self-government) when it proclaims that state officials may rightfully intervene even against my protests to "correct" my choices, and this on the ground that they know what is good for me better than I do myself. But if we reject paternalism altogether, we seem to fly in the face both of common sense and of long-established customs and laws. The state, for example, does not accept "consent" as a justification for mayhem or homicide. Similarly, the law of contracts will not validate certain agreements even though they are voluntary on both sides—when, for example, they are usurious or bigamous. One would be hard put to accept these traditional state-created disabilities without abandoning one's opposition to paternalism. But if we continue our adherence to paternalism, we may discover that in other areas paternalism justifies too much, the flat-out prohibition, for example, of whiskey, cigarettes, and fried foods, which tend to be bad for people too, whether they know it or not.

## MEDICAL CONTEXTS

Writers on medical ethics confront paternalism at every turn, often in human contexts that are less familiar to those whose interest is primarily focused on criminal law. Those characteristic social situations have led to some forms of ethical analysis supplementary to those that prevail among the critics and defenders of "legal paternalism." For example, not all of the moral problems raised by paternalism in medical settings are problems for legislators drafting mandatory rules or other governmental officials such as judges or police officers. Moreover, paternalism is not exclusively a criterion for the legitimacy of coercion. Sometimes what is at issue is some other practice that normally has high moral costs, most notably deception rather than coercion, as in false but comforting statements to frightened patients or the unacknowledged or mendacious use of placebos. Sometimes a medical provider may have to decide whether to tell a "white lie" to his patient, not for the sake of her health, but rather as a way of preventing her from experiencing intense despair in her final hours about a matter having no direct connection with medical treatment. In a hypothetical case invented by C. M. Culver and B. Gert (1976, p. 46), a woman on her deathbed asks her physician how her son is doing, and the doctor replies that he is doing well even though he knows that "the son has just been killed trying to escape from jail after having been indicted [a fact unknown to his mother] for multiple rape and murder." An opponent of (hard) paternalism would probably consider the doctor's mendacity to be a violation of the patient's autonomy. A medical paternalist would probably argue that the truthful alternative in this case would be cruel to the point of indecency. They might both be right.

## PROS AND CONS

Problems involving paternalism in medical contexts are quite diverse. They include not only truth-telling cases but also suicide attempts, requests for euthanasia, and the use of human volunteers in dangerous experiments. The paternalist position in these conflicts is that protecting volunteers or patients from harm and promoting their benefit should take precedence over respecting their autonomy by permitting them to act freely on their well-informed choices in matters that are almost exclusively self-regarding.

T. L. Beauchamp (1977) and Beauchamp and J. F. Childress (1979) in their influential works rejected hard paternalism nearly categorically, emphasizing that to overturn the deliberate choices of adult human beings

that affect only them, or only them clearly and directly, is to deny that their lives really belong to them. The apparent exceptions—cases in which commonsense morality would seem to justify interference with the patient's voluntary choice—invariably turn out to be cases in which that choice is not fully voluntary after all; that is, the patient or volunteer subject had not been adequately informed about the risks he would be accepting, or he was not perfectly free of coercive influences, or some other condition, such as infancy, drug intoxication, high fever, rage, or depression, had diminished his capacity to act rationally. To restrict his liberties in such circumstances, or to motivate him by telling him a lie, would be to interfere with actions that are not fully voluntary in the first place. To interfere with dangerous self-regarding but less-than-voluntary behavior can be justified by soft paternalism (that is by soft *and* hard antipaternalism). Another example illustrates the point. "If we see a normally calm person who we know has been experimenting with hard drugs, go into a sudden frenzy, and seize a butcher knife with the clear intention of cutting his own throat, then [of course!] we have the right to interfere. In so doing we will not be interfering with his real self or blocking his real will.... His drug-deluded self is not his 'real self,' and his frenzied desire is not his 'real choice,' so we may defend him against these internal threats to his autonomous self, which is quite another thing than throttling that autonomous self with external coercion" (Feinberg 1986, p. 14). Interference on this ground is no more paternalistic than interference designed to protect an individual from an attack by some berserk assailant. Paternalists have been quick to point out, however, that this example, and others like it, hardly fit the more usual examples of risky choice making.

Writing from the practical point of view, and a philosophical position more friendly to paternalism, Culver and Gert (1982), in response to Beauchamp, point out that many crucial questions remain for the soft antipaternalist analysis. Most of these stem from the vagueness of the distinction between voluntary and nonvoluntary. Culver and Gert remind us that voluntariness is usually a matter of degree with no conveniently placed bright lines to guide us. In this respect it resembles the concept of harm (which is also crucially involved in hard paternalists' calculations) and the degree of violation of a moral rule, like that forbidding telling lies, or that condemning coercion, and even the degree to which the overruled choices of, say, a patient, are purely self-regarding—another essential variable.

Culver and Gert, however, do not endorse the hard paternalistic position without limit. Rather, they hold that some (hard) paternalistic interventions are justified, and some are not, but reject the unqualified antipaternalism of Beauchamp and Childress, which denies that (hard) paternalistic prohibitions and interferences are ever justified, and the unqualified paternalism of many utilitarian writers, which holds that *all* paternalistic behavior is justified, except that which will be counterproductive in the long run.

## PATRIOTISM

The various current meanings of the term *patriotism* emerged during and after the early modern period. In the tradition of republicanism, patriotism is the citizens' commitment to or love for their shared political freedom and the institutions that sustain it. This commitment manifests itself in civic activity on behalf of the political commonwealth and its members. In this tradition, *patriotism* is often synonymous with *public spiritedness*. In the nineteenth century, patriotism was increasingly interpreted in a different, nationalist manner, and patriotism and nationalism are nowadays often equated.

An effective tool for mobilizing popular support for national policy, including military aggression and other forms of national aggrandizement, patriotism is often regarded as implying the glorification of war and imperialism. Opponents of such policies have also acted in the name of patriotism, however. Therefore, two preliminary questions require answers before any further discussion of the ethical implications of patriotism can proceed. First, the *patria*, the object of patriotic loyalty or activity, needs to be specified. According to some, this is the constellation of political institutions one finds oneself in. According to others, it is one's cultural or linguistic community (nation), one's country, the physical environment in which one was born or with which one identifies, or a combination of these. Accordingly, one can distinguish

between different kinds of patriotism, such as "constitutional patriotism" and "nationalist patriotism." Second, while all agree that patriotism is a certain attitude, there is disagreement as to its precise nature. If it is an attitude of loyalty, what does loyalty require? Does patriotism require a certain sentiment, such as love or enthusiasm? Or should it primarily be understood as a social practice, and if so, what type of practice?

The belief in the superiority of one's own *patria* and a concomitant disdain for others is not a necessary element of the concept of patriotism. Nor does patriotism require that one refrain from criticizing one's *patria*. Indeed, criticism of governmental policy is often presented as patriotic since it aims at improving the *patria*.

The contemporary philosophical discussion of patriotism focuses on its relation to cosmopolitanism, as one aspect of the more general debate about particularism and universalism. Many authors in the republican tradition have argued emphatically that patriotism and cosmopolitanism are compatible, even that patriotism is a step toward cosmopolitanism, as it widens the individual's scope of concern beyond that of the family and so prepares one for the wider community of humankind. Others, however, especially defenders of patriotism in the nationalist tradition (as well as many defenders of cosmopolitanism), have seen an irreconcilable tension between (nationalist) patriotism and cosmopolitanism, on the grounds that cosmopolitanism would (rightly or wrongly, depending on which side one is on) prohibit favoring one's own national group over the rest of humankind.

Any defense of patriotism should address the question where justified special care or commitment ends and unjust parochialism begins. Thus, the philosophical debate over patriotism takes place in the context of the debate over "special obligations." Here the question is whether patriotism is prohibited (e.g., as necessarily jingoistic, as violating a moral standard of impartiality), permissible (and if so, under what conditions), or a duty (e.g., as a necessary condition for a well-functioning polity, or as a special obligation toward one's fellow citizens). Clearly, the specific answer one gives to this question depends on both one's particular conception of patriotism and one's underlying moral theory.

## PATRISTIC PHILOSOPHY

“Patristic philosophy” is the term used to refer to the philosophical presuppositions, motifs, and structures in the writings of the early Christian apologists and Church Fathers. These writers were essentially theologians rather than philosophers, for their starting point lay in God and his self-revelation. Their use of philosophy can be divided into three periods: (1) the beginnings (roughly the first and second centuries CE), in which ideas derived from Platonism, Stoicism, and (to a lesser extent) Skepticism were employed chiefly for apologetic purposes, largely under the influence of Hellenistic Judaism; (2) the early Alexandrian period, during which Middle Platonism and Stoicism were dominant, especially in the thought of Clement and Origen; and (3) the development of Christian Neoplatonism, first under the influence of Porphyry and later under that of Proclus. The influence of Philo of Alexandria may have been felt during the first period and certainly was an important factor in the second.

### BEGINNINGS

**THE NEW TESTAMENT.** In the New Testament, as in the Apocrypha (for example, in the Wisdom of Solomon), there are ideas that are at least latently philosophical. As early as Paul’s first letter to the Corinthians (8:6), the Christian faith was being formulated with the use of prepositions that in Greek philosophy indicated causal relations. For Christians there was “one God the Father, from whom is everything and for whom are we, and one Lord Jesus Christ, through whom is everything and through whom are we.” The Father was thus represented as the first and final causes (see Romans 11:36, a doxology), the Lord as the instrumental cause. Such an analysis was presumably derived from Hellenistic Judaism; Philo spoke thus concerning God and the Logos. In Romans 1:19–21 Paul discussed the primal knowledge of God’s eternal power and deity, which he revealed by means of what he created. Men capable of receiving revelation knew God but turned away to worship the creation instead of the Creator (Romans 1:25; cf. Philo, *De Opifi-*

*cio Mundi*, Bk. 7). The theme of a revelation implicit in the structure of the created world is further developed in sermons ascribed to Paul in Acts 14:15–17 and 17:22–31 (the setting of the latter sermon contains reminiscences of the charges brought against Socrates and other philosophers at Athens), and in Colossians 1:15–20 the causal functions of Christ are further elaborated. The idea of the Logos, or creative Word of God, in John 1:1–14 is not necessarily philosophical either in its origin, which is probably not Philo, or in its expression. Later Christian theologians, however, interpreted it as philosophical, thus creating a bridge between Christianity and philosophy. These later theologians may perhaps have relied on Philo.

**SECOND-CENTURY CHRISTIANITY.** In the apocryphal *Preaching of Peter*, God is described by means of adjectives clearly philosophical in origin. God is uncontained, without needs, incomprehensible, eternal, imperishable, and invisible. These negative adjectives reflect ideas current not only in the Platonism of the time but also in Hellenistic Judaism. They are close to later Gnostic developments, and it has been suggested that both are derived from a rather fully developed doctrine of God current in early second-century Christianity. This view is confirmed by what Ignatius of Antioch (early second century) says of Christ as God and man: “the timeless, the invisible who for us was visible, the intangible, the impassible who for us was passible” (*Polycarpi* 3.2). Ignatius is obviously employing current language about God to describe Christ. About 140 the doctrine was more fully expressed in the *Apology* of Aristides (Ch. 1). God is the unmoved mover and ruler of the universe, for “everything that sets in motion is more powerful than what is moved, and what rules is more powerful than what is ruled.” God is eternal, without beginning (what begins also ends) or end (what ends is destructible); he is therefore ungenerated, uncreated, immutable, and immortal. He has no defects or needs; he is not contained or measurable but contains all; he is immobile (he could not move from one place to another); and he is positively Wisdom and wholly Mind. According to Philo and others, God has no name, form, or parts.

A problem arose when such negative attributes were combined with traditional Jewish and Christian ideas about God as the Creator active in history. Basilides, a Christian Gnostic, tried to avoid any kind of analogical statement by arguing that the doctrine of emanation would make God spiderlike, whereas the doctrine of creation would make him anthropomorphic. Basilides claimed instead that originally there was absolutely noth-

ing, and then the nonexistent God made, so to speak, a nonexistent universe out of the nonexistent. Like certain Middle Platonists, Basilides held that God was completely transcendent, since “the universe cannot speak of him or contain him in thought”; he cannot even be called ineffable.

Christian thinkers, however, were generally less audaciously speculative. The apologist Justin Martyr (c. 160) wrote an account of conversion from Platonic religious philosophy to Christian truth. Justin had experienced the teaching offered by Stoics, Peripatetics, Pythagoreans, and Platonists but had little insight into any but the last. While a novice in Platonism he encountered a Christian who—apparently with Peripatetic arguments—demolished his defenses of the innate immortality of the soul and its reminiscence of the eternal world. After his conversion Justin continued to quote from Plato’s dialogues (which in his view were partly based on the Old Testament), although his position was now fully eclectic: “Whatever has been said well by anyone belongs to us” (*Apologies*, Bk. 2, Ch. 13). He criticized the Stoic doctrines about fate and the *ekpyrosis* (destruction of the cosmos by fire) but expressed his admiration not only for Heraclitus and Socrates but also for the first-century Stoic moralist Musonius Rufus. Justin’s disciple Tatian was much less friendly to philosophers, although he tried to create a theology largely Platonic in inspiration. His incidental reference to “the God who suffered” suggests that at a crucial point he had to rely on paradox.

The writings of the later apologists show that philosophy continued to influence theology. In the *Legatio* of Athenagoras (c. 178), there is an important attempt to demonstrate the oneness of God and consequently an approach toward a doctrine of the Trinity. In another treatise the logical necessity of corporeal resurrection is upheld on grounds that are largely Peripatetic. About the same time, Theophilus of Antioch set forth the doctrine that God is known only through his activities, to which his attributes and appellations refer; God is without beginning because uncreated, immutable because immortal. The word *theos* is derived from verbs referring to his creative acts. His invisibility is explained by analogies to the soul, a pilot, the sun, and a king. God is not “contained” but is the locus of the universe. He is known only through his Logos, originally existing within him as reason (*endiathetos*), then expressed as word (*prophorikos*) at creation.

Philosophical ideas influenced not only the apologists but other Christians as well. Irenaeus of Lyons (c. 185) was no philosopher, but in five passages he accepted

a description of God originally derived from Xenophanes, “seeing entirely, knowing entirely, hearing entirely” (Fr. 24 in *Fragmente der Vorsokratiker*, edited by H. Diels and W. Kranz, 10th ed., Berlin, 1961) and amplified it, ascribing it both to “religious men” and to “the Scriptures.” In three instances he added the Platonic phrase “the source of all good things.”

During the crucial second century, then, Christian theologians generally shared their doctrine of God with Platonists. Their doctrine of the Logos resembled that of the Stoics, although Christian theologians believed in one Logos (as in Philo) rather than many. They used Skeptical arguments against the pagan gods. Their ethical teaching was often close to that of the Roman Stoa as represented by Musonius (and Epictetus). Like non-Christians of various schools, they tended to believe that there had once been a unified religious philosophy, Oriental in origin, from which later philosophers had deviated. This first philosophy, it was thought, had been based on the inspiration of the divine Logos or on borrowing from Moses, or on both. The views of the Christian theologians were thus close to the kind of Hellenistic Judaism represented by Philo. Few writers took up the philosophical problems presented by the Incarnation; several of them do not even mention Jesus.

## THE CHRISTIAN PLATONISTS OF ALEXANDRIA

In the cultural center of Alexandria, Christian philosophical theology came into its own, first in the writings of Clement of Alexandria (late second century) and later in the fuller treatment of Origen. The rather disdainful attitude of both writers toward “simpler believers” illustrates the tension between traditional and philosophical theology in their time. Philosophy was often viewed elsewhere as a seedbed of heresy; such was the case at Rome with Hippolytus and at Carthage with Tertullian, even though both these writers used philosophical definitions and arguments. Clement and Origen made use of the writings of Philo and other Hellenistic Jews, although both were directly acquainted with most of the works of Plato, some Middle Platonic writings, a few Aristotelian treatises, and a great deal of Stoic literature. Clement’s learning was both broader and more superficial than Origen’s. His philosophical ideas apparently developed away from the boldness of his semi-Gnostic *Hypotyposes* (now lost) toward the greater caution reflected in the *Stromata*, in which philosophy became the handmaid of a theology traditional in essence if not always in expression.

The principal points at which the influence of philosophy is obvious are the doctrine of transcendence of God and the ideal world, analysis of the divine nature of Christ, divine impassibility as a model for human conduct, and Platonic and Stoic ethical conceptions. Following Philo, Clement made use of the allegorical method in order to relate his theology to the Bible. He was the head of a private philosophical school, training pupils to become Christian Gnostics. In later times he was far less influential than Origen, head of an authorized church school first at Alexandria and later at Caesarea. The ideas of both teachers, however, continued to create theological ferment as late as the sixth century.

### LATER PATRISTIC PHILOSOPHY

We can hardly view Eusebius of Caesarea as a philosopher, but in the writings of the Cappadocian Fathers (especially Gregory of Nazianzus and Gregory of Nyssa) technical philosophical arguments are frequently adapted for theological use, as they are throughout the patristic period. During the fourth century the attack upon Christianity by Porphyry was largely forgotten (a new attack was produced by the emperor Julian), and the logical rigor of his eclectic Neoplatonism was viewed as supporting theology. Extensive quotations from Porphyry and his master Plotinus appear in Eusebius's writings as well as in the later treatise *Against Julian* by Cyril of Alexandria. Toward the end of the fourth century, a faintly Christianized Neoplatonism appeared in the West in the commentary on Plato's *Timaeus* by a certain Calcidius, who relied primarily on Porphyry. Before being baptized, Marius Victorinus had translated one of Porphyry's works into Latin; he made frequent use of Porphyry's teaching in his later treatises *On the Trinity*. Both Ambrose and Augustine were deeply influenced by Porphyry, whose writings paved the way for Augustine's conversion. In the late fifth century the ideal world of the Neoplatonist Proclus was Christianized in the influential writings ascribed to Dionysius the Areopagite.

## PATRIZI, FRANCESCO

(1529–1597)

Francesco Patrizi, also known as Patritius, was a vigorous defender of Platonism and an unremitting foe of Aristotelianism. He was versatile even for his time, being at once philosopher, mathematician, historian, soldier, and literary critic. Born in Dalmatia, he studied at Padua (Francesco Robertelli was a teacher-friend) and Venice. Having been an early and avid reader of Marsilio Ficino's *Theologia Platonica*, he turned from careers in business and in medicine to develop further his interest in Platonism.

After some years in France, Spain, and Cyprus in the service of various noblemen, Patrizi was in 1578 appointed by Duke Alfonso II as professor of Platonic philosophy at the University of Ferrara—which, with Florence and Pisa, was an important center of Platonism in Italy. In 1592 he was called to the University of Rome by Pope Clement VIII. He considered the privilege of expounding Platonism at Rome his crowning achievement, and he held that position until his death.

Although intellectual activity was his chief concern, Patrizi also showed interest in practical matters: He offered means for diverting a river threatening Ferrara, and presented plans for improving military strategy against the Turks and naval plans against the British.

In 1553 Patrizi's *Discorso* on types of poetic inspiration appeared, followed by his dialogues on history (1560). After visiting France, Spain, and Cyprus, he published *Discussiones Peripateticae* (1581), which violently attacked Aristotelianism. His achievement dates largely from his appointment at Ferrara, although correspondence with Telesio (1572) indicates an earlier interest in the study of nature. In *Della Poetica* (1586), he produced the first modern study of literary history, which also was an attack on Aristotle's *Poetics*. In 1587 there appeared several polemics defending his friend Orazio Ariosto against Torquato Tasso and Jacopo Mazzoni and uphold-

ing Patrizi's Platonic view of art as transcendental against their Aristotelian theory of poetry as imitation.

Patrizi's chief philosophical work, *Nova de Universis Philosophia* (1591), contained four parts: *Panaugia*, on light; *Panarchia*, on first principles; *Pampsychia*, on souls; and *Pancosmia*, on mathematics and natural science. Dedicated to Gregory XIV, who had been a fellow student at Padua, its aims were the linking of Christianity with the teachings of Zoroaster, Hermes, and Orpheus; the derivation of the world from God through emanation; and the insistence on a quantitative study of nature. His last work was *Paralleli Militari* (1594).

Patrizi's metaphysics of light is suggestive of Ibn Gabirol and Robert Grosseteste, and places him in the company of Geronimo Cardano and Bernardino Telesio. Defending the cognitive value of mathematics (as did Nicholas of Cusa), Patrizi helped to establish the subsequent priority of space over matter in the study of nature. His doctrines, fanciful yet impressive, failed (as did those of Giordano Bruno and Telesio), for want of an adequate method, to overthrow the well-entrenched Aristotelians. The decisive attack came only in the seventeenth century, when Galileo Galilei and others postulated a new physics of quantities that was related to astronomy and was based on experiments and calculations.

## PAULER, AKOS

(1876–1933)

The Hungarian philosopher Akos Pauler, son of an archivist and historian and grandson of a professor of law, grew up in an intellectual and bookish environment. Even before he matriculated, he published his first article in the scholarly journal *Bölcséleti Folyóirat* in 1893. It was a defense of metaphysics against positivism—metaphysics starts from what is given and goes back to that without which the given cannot be thought. This is, in germ, Pauler’s “reductive method” (as against induction and deduction), which became his main preoccupation in later life. However, influenced by his university professor Imre Pauer, he was first a positivist for about a decade. After obtaining his doctorate at Budapest in 1898, he spent a year at Leipzig and another at the Sorbonne. In 1902 Pauler became *Privatdozent* at Budapest and, in 1906, lecturer in ethics on the faculty of law at Pozsony (Bratislava). His departure from positivism seems to have started during this period, since his work on ethics published in 1907 at Budapest, *Az Etikai Megismerés*, is close to the Kantianism of Heinrich Rickert. In 1912 Pauler became professor of philosophy at Kolozsvár, and from 1915 he occupied the chair of philosophy at Budapest.

Most expositions of Pauler mention his division of philosophy into five parts—logic, ethics, metaphysics, aesthetics, and ideology—presented in the first seven paragraphs of his *Bevezetés a Filozofiába* (Introduction to philosophy; Budapest, 1920; revised 3rd ed., Budapest, 1933). However, it will be sufficient to discuss only his logic and metaphysics.

For Pauler, logic is the most important part of philosophy, which is not surprising in view of his broad notions of logic, the scope and nature of which can be seen from his four “laws of logic”—the law of identity: “Everything is identical only with itself,” from which follow the laws of contradiction and excluded middle; the law of connection: “Everything is connected with other things,” which includes the law of sufficient reason; the law of classification: “Everything can be classified,” which includes the *dictum de omni et nullo*; and the law of correlativeity: “There is nothing relative without an absolute.” Only the first three laws, in a slightly different version, are found in earlier works. The fourth law was added in the “Introduction to Philosophy.”

Pauler’s metaphysics is a combination of Aristotelian and Leibnizian elements, but by the end of his life it had moved toward Platonism and Neoplatonism. A substance is a center of self-activity based on intention or wish

(*vágy*); the body is a manifestation of this activity. The interaction of substances not only proves their plurality but also provides the unity of the world. Since all change is from potentiality to actuality, the whole world process is a self-realization and self-liberation. All substances strive toward the first principle of their development, the principle of self-liberation, which is the Absolute. Moreover, substances exist insofar as they strive toward the Absolute. At first, God was described as something other than the Absolute, but Pauler later developed this Absolute into a theistic concept. He also introduced the Platonic *anamnesis* and the Augustinian *illuminatio* into his theory of knowledge.

Toward the end of his life he seems to have identified his reductive method with the Platonic dialectic, and his reductive method ultimately leads us to the notion of Good. He also criticized Aristotle for having misunderstood Plato. According to Pauler, Aristotle was mistaken in assuming that the Ideas are in the field of reality. They are, in fact, in the field of validity; that is, we do not come to them in the search for new entities, but in the search for those presuppositions without which we cannot think validly. We do this not by induction or deduction but by reduction.

## PAULING, LINUS

(1901–1994)

Linus Pauling was a chemist, peace campaigner, and double Nobel Laureate who played a central role in two great unifying projects of twentieth-century science.

Born in Oregon, U.S.A., in 1901, Pauling worked his way through college, receiving a BS in chemistry from Oregon Agricultural College in 1922. There he read papers on valence by physical chemists G. N. Lewis and Irving Langmuir, sparking his interest in the theory of chemical structure and bonding. He moved to California Institute of Technology (Caltech) for doctoral work on X-ray studies of inorganic crystal structures and had published twelve papers by the time he graduated in 1925. In 1926 he traveled to Europe on a Guggenheim postdoctoral fellowship, visiting Munich and other centers of the new quantum mechanics. On his return from Europe, Pauling resumed his work on X-ray crystallography, developing what he later called his *chemical intuition* about possible crystal structures. He also set about applying quantum mechanics to chemistry. Simultaneously with physicist John Clarke Slater, he developed physicists Walter Heitler and Fritz London's 1927 work on the hydrogen molecule to explain the structure of polyatomic molecules. The resulting valence-bond approach to molecular quantum mechanics, which modeled observed molecular structures as *resonance hybrids* of classical structures, faced competition from the *molecular-orbital* approach. The early success of the valence-bond approach is largely due to Pauling's advocacy, his developing intuitive visual representations to accompany his theoretical work, and his publication of the enormously influential *Nature of the Chemical Bond* (1939), which brought together his many contributions to structural chemistry.

Despite this central role in unifying the sciences, Pauling was no reductionist. He regarded his application of quantum mechanics to chemistry as a synthesis of physical theory with independent principles of chemical structure.

Pauling's second great unifying project was the chemical understanding of biologically important molecules. From the 1930s onward, he applied the X-ray and electron-diffraction methods, used earlier on inorganic crystals, to the structure of peptides and proteins, including hemoglobin. Subsequently, Pauling studied the molecular basis of the immune system and identified the first molecular disease—sickle-cell anemia. Pauling's work was also influential in James Watson and Francis Crick's proposal of a double-helix structure for DNA in 1953, though Pauling denied having participated in a *race* to discover the structure of the molecule.

Pauling was a controversialist in science and in politics: Though he publicly defended Japanese internees, he supported U.S. entry in to the Second World War and was

active scientifically in the war effort, earning a Presidential Medal of Merit in 1948. During the cold war, however, he became increasingly involved in campaigning for nuclear disarmament and for a test-ban treaty on both political and scientific grounds. This, and his defense of blacklisted scientists, led to interest from the Federal Bureau of Investigation and the denial of a passport in the early 1950s. A passport was forthcoming, however, when Pauling was awarded the 1954 Nobel Prize in Chemistry for his work on the chemical bond and his contributions to the understanding of the structure of proteins. His political campaigning also earned him a second Nobel Prize (in Peace) in 1962.

Pauling left Caltech in 1964, partly as a result of his high political profile, spending the next decade at the Santa Barbara Center for the Study of Democratic Institutions (1964–1967), the University of California at San Diego (1967–1969), and Stanford University (1969–1973). On retirement from there, he cofounded the Linus Pauling Institute of Science and Medicine in Palo Alto, California, from where he continued his popular, though scientifically controversial, advocacy of high doses of vitamin C to improve health and to slow down aging. He remained active in research until nearly the end of his life.

## PAUL OF VENICE (1369–1429)

Paolo Nicoletto Veneto joined the Hermits of St. Augustine as a boy and later taught at the Augustinian convent and the University of Padua for most of his life. The

order's *Register* lists him at the *Studium* in Oxford from 1390 to 1393 where he studied theology but not logic, as often believed. Briefly, he served as prior general of the Augustinian order and later as ambassador to Cracow, Poland. In 1420, he was implicated in sedition against the Venetian Republic, was banished, and spent his last years in Siena and Perugia.

More than twenty works, extant in some 270 manuscripts, are attributed to him, but Paul's authorship of some of those works is questionable. His popular *Logica Parva* transmitted elementary Oxford logic to Italy. His *Lectura super librum Posteriorum Analyticorum* and *Summa Naturalium* were similarly important for conveying the Oxford style of scientific investigation to Italy. Judged by the number of manuscripts, other works had less influence, for example, *Lectura super librum de Anima*.

The *Logica Magna*, a gigantic work (200 folios) attributed to Paul, exists in only one manuscript and two fragments. This encyclopedic album covers most topics of scholastic logic that were disputed at Oxford in the last half of the fourteenth century. Its author undoubtedly took part in those debates that occurred while Paul was yet unborn or still a youth. With few exceptions, inconsistencies of doctrine, rules, and examples between *Logica Magna* and *Logica Parva*, as well as other factors, make it highly unlikely that they were written by the same person.

*Logica Parva* contains the core of scholastic logic that remained resilient against Humanist criticism well into the modern world. Focusing on logical form, it distinguishes between the logical signs (e.g., of affirmation/negation, of quantification, of conjunction, disjunction and implication) and nonlogical signs (ordinary nouns and verbs) of a language. Next, it gives inference rules (*consequentia*) keyed to the logical signs. Finally, it supports a truth-conditional concept of truth in which the truth of a sentence is decidable in virtue of its logical form. Material supposition serves as a quotational device within a meta language where any sentence of the object language can be quoted. Translation is understood as the substitution of one sentence for another in virtue of their common logical form and comparable nonlogical terms.

Paul of Venice organized and conveyed Oxford learning to Italy in the early fifteenth century. Humanists who urged a return to classical Latin usage and condemned the *barbari britanni* undoubtedly had works like his in mind, but few humanists read or understood them. Lorenzo Valla's *Dialectica* criticizes the *logica vetus* of Boethius but ignores the *logica moderna*. J. L. Vives rejects *sophismata* as a pedagogical method in *Adversus pseudo-*

*dialecticos* but retains Scholastic concepts under a neo-classical nomenclature in *De artibus*.

## PAULSEN, FRIEDRICH (1846–1908)

Friedrich Paulsen, a German philosopher and educational theorist, was born in the village of Langenhorn, Schleswig-Holstein, to a farming family descended from generations of seamen of the North Frisian Islands. In his

autobiography Paulsen described his early life in detail, attributing to it the firm moral character and concern for people that marked his later work in philosophy and education. After attending the Altona Gymnasium, he entered the university at Erlangen in 1867. The following year he went to the University of Berlin, where a reading of F. A. Lange's *History of Materialism* and participation in Adolf Trendelenburg's seminar on Aristotle induced him to abandon theology for philosophy. After studies in Berlin, Bonn, and Kiel, Paulsen taught at Berlin. The professorship of philosophy to which he later succeeded there was, due to his own interests and the needs of the university, expanded to include pedagogy.

Philosophy could not, for Paulsen, be detached from the moral and cultural issues of private and public life, and the needs of the general public determined both the language and the content of his teaching and writing. Although far from negligent of the critical problems of theoretical and practical philosophy, he always tested the validity of their solutions by common sense and the public well-being. His collection of essays and addresses *Zur Ethik und Politik* (1905) shows the range of his interests and his public concern. Although he was temperate and reasonable, his efforts to distinguish good from evil in contemporary political and social life subjected him to political attack and involved him in public controversy.

Although Paulsen influenced all levels of German education, his published works deal chiefly with German universities and preparatory schools. His *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (1885) pioneered in the history of higher education and aroused wide controversy, helping to effect a liberalization of preuniversity education.

Paulsen usually described his philosophical position as idealistic monism but sometimes described it as pantheism. Participating in the revival of Immanuel Kant and Aristotle in the second half of the nineteenth century, Paulsen found in both an epistemological realism, an emphasis upon practical reason over theoretical reason, and a teleological metaphysics. His own position was formulated in opposition to the two extremes of a rigid Christian orthodoxy and scientific materialism. Irrational supernaturalism and mechanistic naturalism are the enemies in his two textbooks, *System der Ethik* (1889) and *Einleitung in die Philosophie* (1892), and in his *Philosophia Militans* (Berlin, 1901). He rejected Christian supernaturalism because of its dualism in theoretical philosophy and its legalism and rigorism in practical philosophy. Materialism was discarded because its denial both

of human freedom and of the reality of purposes is offensive to man's ethical demands.

Paulsen's two textbooks were addressed not merely to students but to the thoughtful layman. Simply written with many concrete applications and references to contemporary ethical and social problems, they appeared in many editions in German and in translation and set a pattern for introductory textbooks and courses in philosophy for at least four decades. In them Paulsen formulated his method as (1) analysis of problems and the construction of possible solutions, (2) a survey of the historical development of philosophical thought on each problem, and (3) a choice of the solution most coherent with an inclusive world view.

This method brought Paulsen close to a pragmatic and personalistic viewpoint. In his ethics he supported a modern utilitarianism or eudaemonism that repudiated the hedonism of the British school, replacing it with the goal of human welfare and an objective perfection of the ends of life. The good life is thus grounded in the will, not in feeling. In determining the valid ends of conduct, the individual must be guided by the historical tradition, which may be trusted ultimately to destroy evil and to bring about the survival of the good. Book I of the *System*, devoted to such historical evaluation, is still a most useful introduction to the history of ethics. Paulsen stressed the distinctions between the ascetic ethical ideals of early Christianity and the humanism of classical Greece, but he regarded as necessary the modern effort to reconcile them.

Ethical thought involves the problems of evil, of freedom, and of God. Evil is justified in a monistic world, because by overcoming evil we find the way and the will to the good. Although human freedom is real, it is never a motiveless freedom of action. The psychological theory of freedom is correct in finding the ground of free action in the human will or in man's determining his conduct through deliberation and resolution. The metaphysical theory of freedom, which denies that there are causes of the will, must itself be denied. Morality, in its historical development of responsibility and a sense of duty, comes to require a higher will with a right to command and thus provides an argument for the existence of a deity who is also implicit in the evolutionary account of nature.

In such later ethical writings as the article "Ethik" in Paul Hinneberg's *Systematische Philosophie* (Berlin and Leipzig, 1907), Paulsen moved closer to G. W. F. Hegel by introducing an "objective will" as the manifestation in the social forms of life of a universal reason to which individual conscience is a cognitive response. Paulsen held

that the principles of ethics are rational in the sense that they arise from the conditions of life. They need not determine one's metaphysics, but teleological ethics demands an evolutionary teleology in which the purpose of nature is fulfilled in human reason.

Paulsen's *Introduction to Philosophy* was devoted to metaphysical and epistemological questions. In it he is led to monism by the Lotzean argument from finite interaction, by E. Hartmann's vitalism and energism, and by a creative vitalistic interpretation of evolution. His solution to the mind-body problem is a theory of panpsychistic parallelism, showing the influence of Benedict de Spinoza and Gustav Theodor Fechner. Mind and body are distinct aspects of a unified "All-One," a mental process of which history and nature are the two series of "modifications." This identity is affirmed of God in relationship to nature and to history. Science is limited to the phenomenalistic aspect of nature. Although God enters into interaction with lesser spirits, the concept of personality must be purged of its human limitations before it can be ascribed to God, who is to be thought of rather as a superpersonal source of energy and reason in nature and man.

## PAVLOV, IVAN PETROVICH

(1849–1936)

Ivan Petrovich Pavlov, the Russian physiologist and originator of conditioned-reflex method and theory, was born the eldest son of a priest in Riazan'. After home tutoring, church school, and theological seminary (where he read G. H. Lewes's *Physiology*), he entered the University of St. Petersburg, where I. F. Tsyon confirmed his physiological interests. At the Military Medical Academy, as assistant to Tsyon and later to S. P. Botkin, the experimental pharmacologist, he excelled in surgery and in experimental physiological research, which he continued in Botkin's laboratory after qualifying as an approved physician in 1879. In 1881 he married a fellow student, and despite desperate financial struggles, he received his MD in 1883 with a dissertation on the heart's innervation. With a traveling fellowship, he worked in Leipzig with Karl Ludwig and in Breslau with Rudolf Heidenhain; he returned to Botkin's laboratory in 1886 to continue research on nervous control of circulation and digestion. In 1888 he discovered the secretory nerves of the pancreas, and the following year he wrote on "sham feeding" and gastric "psychic secretion" (at sight of food).

In 1890 he became professor of pharmacology at the Military Medical Academy and director of the physiological department of the new Institute of Experimental Medicine donated by the prince of Oldenburg. In 1895 he was named professor of physiology at the Military Medical Academy, although the rector, Pashutin, delayed confirmation of the appointment till 1897. *The Work of the Digestive Glands* (1897), which reported the research that

won Pavlov the Nobel Prize in physiology in 1904, was widely translated. Next he investigated salivary “psychic” secretion, devising a neat surgical technique to enable collection and measurement of the saliva of dogs. Reflex salivation was measured upon ingestion (natural stimulus) and sight (“psychic” stimulus) of food, and also upon application, to hungry dogs before feeding, of artificial (“conditioned”) stimuli—visual, auditory, olfactory, and tactile. The “conditioned reflex”—a term coined by I. E. Tolochinov—was thus a simple unit of acquired behavior, as involuntary as salivation itself; its formation, persistence, and disappearance followed rules that Pavlov elucidated in meticulous experiment for more than thirty years, gradually constructing a neurophysiological theory of behavior and learning. Pavlov’s work attracted pupils and collaborators, produced a plentiful literature, and continued without significant interruption through World War I and the Russian Revolution.

A reflex theory of behavior accorded well with Marxist dialectical materialism, and Pavlov’s researches received governmental encouragement and financial support. Pavlov was never a Marxist or a communist; he resigned his professorship in 1924 in protest against anticlerical discrimination at the academy, but he continued to enjoy state support, including new laboratories, and official foreign-language publication; his research village, Koltushy, was even renamed Pavlovo. When conditioned-reflex theory was extended to human behavior, Pavlovian doctrine became the Soviet Union’s official “psychology,” basic to psychiatry, pedagogy, industrial research, and other fields ranging from criminal reeducation to space exploration.

Pavlov’s collected lectures appeared in English, French, and German translations in the 1920s, with a further volume, *Conditioned Reflexes and Psychiatry*, in 1941. He observed that a conditioned reflex might comprise excitation (secretory or motor) or inhibition, both processes located in the cerebral cortex. Concentration and irradiation of excitation, enabling discrimination and generalization of response, followed laws of induction, conceived as resembling ionic polarization, with excitation and inhibition spreading wavelike over a largely unspecialized cortex. Specialization occurred in the analyzers, or cortical receptor areas (visual, auditory, etc.), which sorted stimulus signals and regulated responses.

Pavlov found that for permanence a conditioned reflex required reinforcement with the unconditioned stimulus. Disturbance of an already established temporal or spatial pattern of stimuli, including excessive require-

ment of discrimination, produced disordered responses in the three successive phases of (a) equalization of response to all stimuli, (b) paradoxical responses, and (c) ultraparadoxical responses, involving reversal of positive and inhibitory responses. Ultimate derangement (“neurosis”) was behavioral breakdown in uncontrolled excitement or complete inhibition, depending upon the type of the nervous system. An increasing preponderance of inhibition was evident in the progression from (a) controlled activity, to (b) delayed activity, corresponding to deliberation or thought, to (c) hypnotic states with concentrated activity bounded by general inhibition, to (d) sleep considered as generalized inhibition. Nervous systems were classified as strong excitable, weak inhibitable, and two central “balanced” types, lively and stolid, analogous to the “Hippocratic temperaments,” choleric, melancholic, sanguine, and phlegmatic, respectively. Conditioned reflexes were most stable in the two more inhibited types of dog (and probably of humans).

From 1928 until his death Pavlov surveyed human psychology and psychiatry, drawing bold analogies between psychiatric syndromes and the reactions of dogs to experimental laboratory situations. Manic-depressive psychosis was viewed as an excitation-inhibition disorder and paranoia as a pathologically persistent excitatory process in a circumscribed cortical area. Later work by others has shown the value of conditioning theory for a “how” explanation and for an empirical treatment for certain phobias and compulsions, but Pavlov’s formulations, without direct experimental or adequate clinical basis, are subjective intuitions clothed in pseudophysiological vocabulary. His experimental observations were objective and sound, and his apparently prosaic method allowed repeatable exact measurement, although what else was being measured by measuring saliva remains unclear. When he wrote of “reflexes” of freedom and slavery in dogs and humans, or of an animal’s “strong” or “weak” cortex, or of ripples of excitation or inhibition, he failed to recognize the subjective nature of his interpretations. Insight was hindered by his premature oversimplification and an increasingly militant materialist monism.

Pavlov’s was the principal and most developed of the several physiopsychologies of his time. His priority was disputed by V. M. Bekhterev, a neurologist whose “reflexology” of “associated reflexes” was developed simultaneously although independently in the same academy; Pavlov undoubtedly published first, however. Pavlov yielded experimental priority to the American E. L. Thorndike and admitted the theoretical influence of I. M. Sechenov, a former professor of physiology in St. Peters-

burg, whom Pavlov styled “father of Russian physiology.” Sechenov’s *Reflexes of the Brain* (1863, in *Selected Physiological and Psychological Worts*, Moscow, 1952–1956) followed his studies in Berlin, where Wilhelm Griesinger taught a psychology of temperamental types and psychic reflexes that was philosophically based upon Arthur Schopenhauer and René Descartes (*Mental Pathology and Therapeutics*, Berlin, 1845 and 1861; translated by C. L. Robertson and J. Rutherford, London, 1867).

Pavlov’s influence continues paramount in Russia. Elsewhere it is an important component in behavior theory and therapy, but with a strong admixture of Bekhterev and John B. Watson in practical techniques and a preponderance of C. L. Hull’s learning theory in vocabulary.

## Bibliography

### WORKS BY PAVLOV

*The Work of the Digestive Glands*. Translated by W. H. Thompson. London, 1902.

*Conditioned Reflexes; an Investigation of the Physiological Activity of the Cerebral Cortex*. Translated and edited by G. V. Anrep. London: Oxford University Press, 1927; New York: Dover, 1960. The best English translation of the early papers.

*Lectures on Conditioned Reflexes*. Vol. I: *Twenty-five Years of Objective Study of the Higher Nervous Activity (Behavior) of Animals*. Translated and edited by W. Horsley Gantt, with G. Vollborth. New York: International, 1928. Vol. II: *Conditioned Reflexes and Psychiatry*. Translated and edited by W. Horsley Gantt. New York: International, 1941.

*Selected Work*. Translated by S. Belsky, edited by J. Gibbons under the supervision of K. S. Koshtoyants. Moscow: Foreign Languages, 1955.

*Experimental Psychology and Other Essays*. New York: Philosophical Library, 1957; London, 1958. A reprint of *Lectures on Conditioned Reflexes*, omitting Pavlov’s patriotic and political speeches.

*Essays in Psychology and Psychiatry*. New York, 1962. A selection from *Experimental Psychology and Other Essays* in paperback.

*Psychopathology and Psychiatry; Selected Works*. Compiled by Y. Popov and L. Rokhin, translated by D. Myshne and S. Belsky. Moscow: Foreign Languages, 1962.

*Conditioned Reflexes, Lectures on Conditioned Reflexes, and Selected Works* contain some of the same papers in different translations. *Lectures on Conditioned Reflexes* and *Selected Works* have some later “psychiatric” papers, and *Selected Works* has some early papers on circulation and digestion preceding Pavlov’s work on conditioned reflexes. *Psychopathology and Psychiatry* is selected entirely from his “psychiatric” work.

### WORKS ON PAVLOV

Asratyan, E. A. *I. P. Pavlov, His Life and Work*. English ed., Moscow: Foreign Languages, 1953. An early and approved biography.

Babkin, B. P. *Pavlov: A Biography*. Chicago: University of Chicago Press, 1949 and 1960; London: Gollancz, 1951.

Cuny, H. *Ivan Pavlov: The Man and His Theories*. London: Souvenir Press, 1964. Brief, semipopular outline of Pavlov’s life and work.

Frolov, Y. P. *Pavlov and His School—The Theory of Conditioned Reflexes*. Translated by C. P. Dutt. New York: Oxford University Press, 1937.

Gray, J. A., ed. and tr. *Pavlov’s Typology*. Oxford and New York: Pergamon Press, 1964. Includes a detailed authoritative survey of this field by B. M. Teplov.

Platonov, K. I. *The Word as a Physiological and Therapeutic Factor—The Theory and Practice of Psychotherapy according to I. P. Pavlov*. Translated by D. A. Myshne. Moscow: Foreign Languages, 1959. This work applying Pavlov’s teachings openly acknowledges a debt to Bekhterev’s.

*Scientific Session on the Physiological Teachings of I. P. Pavlov*. Moscow: Foreign Languages, 1951.

Simon, B., ed. *Psychology in the Soviet Union*. Stanford, CA: Stanford University Press, 1957.

Todes, P. *Ivan Pavlov: Exploring the Animal Machine*. New York: Oxford University Press, 2000.

Todes, P. *Pavlov’s Physiology Factory: Experiment, Interpretation, Laboratory Enterprise*. Baltimore, MD: Johns Hopkins University Press, 2002.

Wells, H. K. *Pavlov and Freud*. 2 vols. New York: International, 1956–1960; reprinted 1962.

## PEACE, WAR, AND PHILOSOPHY

Speculation about war and peace as conditions of interstate relations has tended to divide thinkers into two groups—those who regard war as inevitable, perhaps even desirable, and those who consider it an evil capable of being replaced by lasting peace through good will or improved social arrangements. The first group is sometimes described as “realist” and the second as “idealist,” but these terms have the drawback that such idealist philosophers (in the ontological sense) as Plato and Georg Wilhelm Friedrich Hegel often accept war as a permanent condition of human existence. It is therefore proposed here simply to call the first group “conservatives” and the second “abolitionists,” though a wide spectrum of opinion clearly exists within each subdivision.

## THE CONSERVATIVE TRADITION

**THE GREEKS.** Ancient Greek thought commonly accepted war between the city-states themselves and between Greeks and “barbarians” as part of the order of nature. The Greek gods were a warlike breed who had come to power after a brutal struggle with the Titans. Ares was one of their leading figures, but the goddess of peace, Irene, was merely a subordinate deity attendant on the great gods. A view of war widely prevalent in Greece was that of Heraclitus of Ephesus. War, Heraclitus taught, was the “father of all and king of all,” and it was through war that the present condition of humankind, some men free and some enslaved, had evolved. If strife between the warring elements in nature were abolished, nothing could exist; “all things,” according to Heraclitus, “come into being and pass away through strife.”

It was not until the later phases of the war between Athens and Sparta (431–404 BCE) that a pacifist note unusual in the Greek world was struck in such works as Euripides’ *The Trojan Women* (performed in 415 BCE) and Aristophanes’ *Lysistrata* (411 BCE). Even so, the conclusion drawn by Plato from the Peloponnesian War was that the state must be organized for violent survival in an unruly world. Plato’s *Republic* is, in effect, a design for a military community on the Spartan model. Plato does, however, distinguish between war among Greeks and war between Greeks and outsiders; the former, according to the *Republic*, is to be legally regulated whereas any excess is permissible in the latter.

**CHRISTIANITY AND NATURAL LAW.** The conservative acceptance of war as a fact of life was also basic to the intellectual attitudes of the Roman Republic and Empire and was sustained during the Middle Ages, when Catholic writers wrestled with the problem of the conditions on which ecclesiastical approval could be given to the wars of secular monarchs. St. Thomas Aquinas in *Summa Theologiae* (Question 40), while claiming that peace was the greatest aim toward which man should strive in fulfillment of his natural ends, nevertheless placed on monarchs the duty to defend the state. Similarly, Dante contended in *De Monarchia* that “peace was the target at which all shafts were sped” but that it was to be attained by the imposition of a world law, if necessary by force, issuing from a revived Roman Empire. The legacy of Christian teaching that had the most lasting influence, however, concerned the application of natural law, strongly tinged by Christian ethics, to the conduct of war.

The Spanish Jesuit theologian Francisco Suárez held that war is not intrinsically evil and that just wars may be

waged. Suárez defined three conditions of legitimate war. It must be waged by lawful authority—that is, by the supreme sovereign; the cause of making war must be just, and other means of achieving justice must be lacking; and war must be conducted and peace imposed with moderation. A similar view was taken by Hugo Grotius, who held that far from war’s being a breakdown of the law of nations, it is, in fact, a condition of life to which law is as applicable as it is to the conditions of peace. War, Grotius argued in his *De Iure Belli ac Pacis Libri Tres* (1625), should not be fought except for the enforcement of rights and, when fought, should be waged only within the bounds of law and good faith. This conception survives in the assumption behind such twentieth-century international organizations as the League of Nations and the United Nations that only wars fought on behalf of international interests, such as the maintenance of world peace, are just.

**THE ADVENT OF NATIONALISM.** In the era of European secular nationalism following the Renaissance the idea of war as a necessary or desirable institution strengthened. The Italian city-states of the Renaissance, whose diplomatic practice formed the model for the early European national states, were continually at war with one another; these were, however, limited conflicts that aroused no great indignation among philosophers. A typically acquiescent view of war was that of Sir Thomas More in his *Utopia* (1518). The Utopians have a pragmatic, not particularly heroic idea of war, which they regard as a normal event; war is to be fought as economically and safely as possible when one’s lands are invaded or one’s allies are oppressed.

A more profound view was that of the Florentine statesman and writer Niccolò Machiavelli. Like all conservatives, Machiavelli assumed that armed conflict was part of the human lot not because man was evil—Machiavelli was inclined to regard man as weak and stupid rather than evil—but because of the activity of malign fate (*fortuna*), which is always forcing man to arm himself against adversity. Machiavelli, unlike Heraclitus, held out no hope that war raised man to a higher plane; the prince is condemned to seek victory in war merely in order to survive in the hostile world. In peace a ruler should not sit with hands folded but should always be improving his state’s military power against the day of adversity.

At the same time the formation of great national states in England and France was forcing men to speculate on the justification of government, especially since the acceptance of the papacy as the ultimate and sacred

authority had been considerably weakened. The concept of a “state of nature” in which men exist without a common superior and in a state of internecine war was introduced to help explain the growth and functions of government. Thomas Hobbes explained in his *Leviathan* (1651) that war is not the act of fighting but the disposition *to fight* that exists where there is no common superior to ensure that violence shall not be permitted. Only through the establishment of a commonwealth—that is, a superior law-enforcing agency to which all men are subject—can peace and civilization be ensured. Hobbes did not regard the state of nature as a historical condition that had occurred in the past; he inferred that such would be man’s state if the commonwealth did not exist.

John Locke differed from Hobbes in holding that there were natural rights in the state of nature that it was government’s function, after its establishment, to protect; hence, war was not a universal condition in the state of nature but occurred only when force was exercised without right. For Locke there was an intrinsic difference between war waged for natural rights and war waged without this sanction. For Hobbes war in the state of nature, as well as war between sovereign states, could be neither right nor wrong since these categories exist only within the commonwealth. Benedict de Spinoza shared Hobbes’s view of the inevitability of war where men are without a common government, but, like Locke, he could not reconcile himself to the total absence of morality or law in the state of nature. The Hobbesian argument has nevertheless been of immense importance in shaping modern Western man’s attitude toward war and peace. It is that peace is the result of man’s determination, deriving from fear of death and the wish for what Hobbes called “commodious living,” to create an overriding government. Hobbes did not make clear whether he thought that man could sustain peace in his international relations, but it is clear that, unlike Locke, he considered that nothing short of a world state with a monopoly of power over the nations would suffice to ensure such peace.

Before the Napoleonic Wars, however, war, owing to its limited scale, could not be regarded as the decisive factor in the health or illness of nations. But with the Messianic fervor unleashed by the French Revolution, all Europe appeared to be caught up in revolt against the existing order, internal and external, and the expansion of national wealth showed for the first time the potentialities of nationalistic wars for good or evil. It was in the aftermath of the revolution that the more extreme conservative attitude toward war came into its own in certain countries and war began to be thought of as a positive

principle of national regeneration. Germany in particular fostered these views, possibly because that country entered the struggle for national ascendancy somewhat late so that its militarism was proportionately more intense.

Hegel is well known for his conception of history as a struggle of opposites from which a synthesis emerges that transcends the two original conflicting forces. For Hegel the national state was the means by which the Idea realized itself in history. Since the Idea can materialize itself only if the state is allowed to live out its predetermined functions, it follows that the individual’s life has no meaning except insofar as it serves the state’s ends and that no principle is left by which the relations between states can be subject to moral criteria. Hegel had no patience with the notion of a league of nations for the establishment of permanent peace because he believed war was the catalyst through which history unfolded its purpose. Man must accept war or stagnate.

Arthur Schopenhauer rejected Hegel’s idea of the state as the divine expression of justice. For him the state exists because there is injustice; the state is needed to protect man against the effects of his own egotism. In turn, man’s egotism and his generally evil nature are a reflection of the dissonances of the Will that for Schopenhauer lies behind the world’s realities. Under these conditions war is inevitable, but Schopenhauer, unlike Hegel, did not see war as a progressive factor in history but as a result of the immaturity and weakness of the masses and the love of luxury and power of their strong-willed leaders. Schopenhauer saw no hope of lasting peace.

**THE MILITARISTS.** Friedrich Nietzsche may be judged as an extreme representative of the romantic cult of war and as marking the transition to modern totalitarian militarism. Nietzsche was capable of deploring the wastefulness of war; however, in his fully mature writings, *Thus Spake Zarathustra* (1892) and *The Will to Power* (first published in 1901), he glorified war and the dangerous life. The phrase “a good war hallows every cause” (*Thus Spake Zarathustra*), may be taken as typical of this attitude. For Nietzsche’s supermen war is a natural activity, the supreme witness to their superior quality; they should never succumb to the “slave morality” of Christianity, with its accent on humility, submissiveness, and turning the other cheek.

In the teaching of Heinrich von Treitschke the functions of the state were unlimited, as was the individual’s duty to submit to its commands. The state’s first duty was to maintain its power in its relations with other states and

to maintain law within its own borders; its second duty was the conduct of war, the crucible in which the elements in a state's greatness are fused. The hope of a world state or permanent peace is vain; the Aryan race can only keep by the sword what it has won by the sword. Treitschke admitted that the cost of war had risen steeply and, hence, that wars should be shorter and less frequent. But this did not affect the basic axiom that war is the "one remedy for an ailing nation."

Treitschke's ideas were absorbed by the German military writer Friedrich von Bernhardi, who used them to foster the militantly nationalist mood in which Germany entered World War I. In *Germany and the Next War*, Bernhardi repeated the basic notions of Treitschke: War is the process by which the truly civilized nations express their strength and vitality, life is an unending struggle for survival, war is an instrument in biological evolution. And Bernhardi drew on other conservative writers: Heraclitus; Frederick the Great, whose writings represented war as bringing out man's finest qualities; and Karl von Clausewitz, who described the nation's place in the world as a function of the interplay between its national character and its military tradition.

The conservative-militarist tradition, with its racist overtones, was inherited by the German Nazi and Italian fascist writers of the interwar period, though these added little to the work of their forebears. More recently, the advent of nuclear weapons has made nonsense of the glorification of war, though belief in its inevitability is still not uncommon. Almost the only considerable section of contemporary opinion that believes that national survival after nuclear war is conceivable is that of the Chinese communists. Even they, however, are careful to insist that they would never initiate a nuclear war, and it is, moreover, a feature of all communist thought that the final global victory of communism will remove all cause of war. Communists therefore differ from the conservatives we have considered in that although they regard war as contingent (or perhaps inevitable) in a capitalist system, they have no doubt that permanent peace is attainable under communism.

## THE ABOLITIONISTS

**THE PREMODERN AGE.** As we have seen, the ancient Greeks (and the same may be said of the writers of the Roman world) were not distinguished for protests against war, though the Stoics of the Roman Empire preached a cosmopolitanism that assumed the oneness of all humankind, making war between its members an affront. When Stoicism was embraced by the Roman emperors,

however, it lost its pacifist element, and the same may be said for the early Christian doctrine of nonviolence. Also, during the Middle Ages the fact that the papacy was both the supreme fount of church doctrine and a temporal power of considerable military strength ruled out complete pacifism as a church doctrine.

The outstanding opponent of war during the Renaissance was the great humanist Desiderius Erasmus, though it is incorrect to speak of him as an absolute pacifist. In his *Anti-polemus, or the Plea of Reason, Religion and Humanity against War* (1510), Erasmus argued that every man's duty was to spare no pains to put an end to war. War was directly opposed to every purpose for which Erasmus conceived man to have been created; man is born not for destruction but for love, friendship, and service to his fellow men.

**PROJECTS FOR EUROPEAN PEACE.** During the seventeenth century speculation in Europe about the possibility of permanent peace began to develop, stimulated by growing international commerce and the desire to bind Europe together in a final effort to expel the Turks. This anti-Muslim aim had already figured prominently in the plan for the unification of Europe designed by Pierre Dubois in *De Recuperatione Terre Sancte* (1305–1307) and in the celebrated proposal for a federation of Christian princes that George of Poděbrad, king of Bohemia, had presented to his fellow monarchs in 1461. The seventeenth-century proposals were immensely varied, ranging from utterly Utopian ideas to some that might have achieved realization as limited international alliances. Some were limited to Western Europe, others included all Europe, and some embraced the whole Christian world. "The Grand Design" (1620–1635), probably compiled by the duke of Sully, the chief minister of Henry IV of France, and *Some Reasons for an European State* (1710) by John Bellers both proposed to divide Europe into provinces of roughly equal size under a common government. A few schemes, such as Emeric Crucé's *The New Cyneas, or Discourse of the Occasion and Means to Establish a General Peace and the Liberty of Commerce throughout the World* (1623), aimed at the formation of a single world state with all the races and religions under its jurisdiction. In these plans provision was generally made for some form of representative government. William Penn in *An Essay towards the Present and Future Peace of Europe* (1693) contemplated annual European parliaments; the Abbé de Saint-Pierre in *A Project for Settling an Everlasting Peace in Europe* (1713) preferred a perpetual congress in order to reflect the viewpoints of the states in his European federation; Crucé called for world assemblies. These

confederations were chiefly advocated as defenses of peace, though other aims were also mentioned; Henry IV and the duke of Sully, for instance, had in mind, besides European peace, wars against the Muscovites and Turks and the weakening of the Hapsburgs as the preliminary steps to uniting Europe under French hegemony.

In the eighteenth century these peace plans were given a new lease of life with the French and German Enlightenment. Jean-Jacques Rousseau took the peace project of the Abbé de Saint-Pierre and applied it to the Europe of his own day in *A Project of Perpetual Peace* (1761), with the insistence that unless the proposed central authority was powerful enough to overawe all the constituent states, the proposal would fail. Rousseau recommended the plan to governments on the ground that a single European authority strong enough to enforce peace would also ensure internal stability in the constituent states. He admitted, however, that governments were probably too shortsighted to appreciate the merits of the plan. A similar project of European confederation was that of Immanuel Kant, titled *Eternal Peace* (1795). Kant's recipe is notable for its claim that the maintenance of peace requires the achievement of constitutional government by the states.

**NINETEENTH-CENTURY PEACE MOVEMENTS.** The nineteenth century was even more prolific in its plans for organizing the nations to ensure peace. In Europe and the United States there arose strong unofficial peace movements that urged the creation of agencies for the arbitration of interstate differences and the equitable settlement of political issues, together with the strengthening and codification of international law. In the atmosphere of harmony that followed the Congress of Vienna the Great Powers of Europe met regularly to deal with threats to peace, while such functional organizations as the European river commissions and the Universal Postal Union (1875) dealt quietly with matters of practical concern to the nations. The hope of a permanent international assembly that might develop into a world legislature was held out at the Hague conferences of 1899 and 1907, and it seemed likely that the growing stake of nations in peaceful intercourse would soon render war obsolete.

The English utilitarians, such as Jeremy Bentham, James Mill, and John Stuart Mill, provided much of the theoretical background of the peace movements. They contended that war was an anachronistic encumbrance on a free society, benefiting no one but aristocrats and professional soldiers. Richard Cobden voiced the commercial classes' distaste for war in his pamphlet *Russia*

(1836). Herbert Spencer, an extreme exponent of laissez-faire society, denounced war in his *Social Statics* (1851) as an outcome of excessive government authority; with the functions of government reduced and individual liberty restored, all reason for war would disappear. This liberal, economic case for peace culminated in the striking claim by Norman Angell in *The Great Illusion* (1908) that war had become so destructive of all economic values that nations would never again engage in it.

**PACIFICISM AND INTERNATIONALISM.** World War I disastrously falsified Angell's prophecy; nevertheless, it reinforced the conviction of liberal-minded people that war was an absolute evil and that the creation of expedients to keep the peace, such as the League of Nations and collective security, was the most urgent task of the twentieth century. A strong cleavage now became apparent between absolute pacifists—for example, H. M. Swannick, Gerald Heard, Aldous Huxley—and those who supported “just” wars fought under the league's aegis—for example, Gilbert Murray, Lord Cecil of Chelwood, P. J. Noel-Baker. Few of the abolitionists, however, considered a world federation necessary to ensure permanent peace. John Dewey, for instance, argued in the 1920s that it would be sufficient for states to agree to declare war illegal and to prosecute countries that resorted to it as criminals.

The advent of World War II and the invention of nuclear weapons, followed by the failure of the great powers to act unanimously in the United Nations Security Council, raised the question whether the abolitionists' aim can be attained short of the total surrender of national sovereignty. One curious effect of the nuclear stalemate has been to drive many abolitionists into the somewhat conservative belief that peace must be kept by the maintenance of a military balance between the two world camps. Others, like John Strachey in *On the Prevention of War* (London, 1962), contend that the two superpowers must go beyond this and exercise a kind of condominium over the rest of the world.

The outstanding British philosopher Bertrand Russell continued to believe that the rational conviction of the utter futility of nuclear war can in itself maintain peace provided that the realities of thermonuclear war are widely enough publicized (*Common Sense and Nuclear Warfare*, London, 1959). As a long-term measure, however, Russell saw no alternative to a world state, which must in the first instance be imposed by one nation or group of nations; only after the world authority has been in power for a century or so will it feel confident enough

to base its power on consent rather than force (*New Hopes for a Changing World*, London, 1951, p. 77). It is not clear, however, whether Russell really wished to pay the price of global despotism in return for peace; elsewhere, he wrote that a new war would be preferable to a universal communist empire (Robert E. Egner and Lester E. Denonn, eds., *The Basic Writings of Bertrand Russell*, London, 1961, p. 691). Here, in essence, is the issue facing the abolitionist in the nuclear age; whether war is a greater or lesser evil than the imposition on himself and his nation of hostile values which the present anarchic world, with its attendant threat of war, allows him to keep at a distance.

- Vagts, Alfred. *A History of Militarism*. New York: Norton, 1937. Mainly a study of the ideas and practices of the eighteenth- and nineteenth-century European social movements that sought to make military men the dominant power in the state.

F. S. Northedge (1967)

## PEACE, WAR, AND PHILOSOPHY [ADDENDUM]

The nuclear threat that preoccupied Bertrand Russell receded into the background during the Vietnam War. After that war's end in 1975, the risk of a nuclear con-

frontation between the superpowers again became a major concern.

This issue came in for sustained moral analysis in Douglas Lackey's *Moral Principles and Nuclear Weapons* (1984) and Steven P. Lee's *Morality, Prudence, and Nuclear Weapons* (1993). But considerable philosophical interest focused more narrowly on so-called paradoxes of nuclear deterrence. Herman Kahn had spoken of "rationality of irrationality" strategies in *On Thermonuclear War* (1960). The question was whether it is rational to threaten to do the irrational (wage all-out nuclear war). The strategy of Mutual Assured Destruction (MAD) seemed to presuppose that it is, since it rested on the threat of massive retaliation in the event of a major nuclear first-strike. The moral version of the paradox, explored by Gregory S. Kavka in *Moral Paradoxes of Nuclear Deterrence* (1987), concerns whether it is moral to threaten to do the immoral (wage all-out nuclear war). This interest, and concern with the nuclear issue generally, waned with the end of the cold war following the collapse of the Soviet Union in the early 1990s.

Meanwhile, the 1960s saw a resurgence of interest in the just war theory, with both religious and secular attention to the doctrine extending into the twenty-first century. The religious approach had both Roman Catholic and Protestant advocates. Theologian Paul Ramsey set the tone for the Protestant approach in *War and the Christian Conscience: How Shall Modern War Be Conducted Justly?* (1961) and *The Just War: Force and Political Responsibility* (1968). The American Catholic Bishops detailed the Catholic position in their 1983 pastoral letter, *The Challenge of Peace: God's Promise and Our Responsibility*. An influential secular contribution appeared with political scientist Michael Walzer's *Just and Unjust Wars* (1977), in which a Hobbesian approach to political theory was adapted to the moral assessment of war. Philosophers quickly took up the issue of just war, particularly after the 1991 Persian Gulf War in which the United States under President George H. W. Bush expressly invoked the just war theory in defense of the U.S.-led war to drive Iraq out of Kuwait.

Just war theorists include both conservatives and abolitionists. Some regard war as virtually inevitable. They seek to ensure that it is undertaken only when justified and that its destructiveness is minimized. Others believe that war may eventually be done away with, but in the meantime, they believe, the moral criteria justifying resort to war and its conduct must be followed.

Set apart from just war theorists are pacifists, who believe that war, at least in the modern world, cannot be

justified morally. Duane L. Cady provides a conceptual analysis of pacifism in *From Warism to Pacifism: A Moral Continuum* (1989). While theoretically one could be a "just war pacifist," holding that the just war theory contains the correct criteria for morally assessing war but maintaining that those criteria are never in fact met, most pacifists believe that just war criteria are inadequate, and that even if they are satisfied, they do not suffice to justify war. In particular, they reject the resort to the principle of double effect that would justify the foreseeable killing of innocents so long as it is not intentional and other conditions are met.

With the resurgence of feminism in the 1960s, some feminist philosophers took up the issue of war. While rarely strict pacifists, they tended to be abolitionists and to argue that war is a manifestation of patriarchal society and can be done away with only with the transformation of that society into one of gender equality. In particular, many of them, such as Sara Ruddick in *Maternal Thinking: Toward a Politics of Peace* (1989), see the key to a new way of thinking about war and violence in the distinctive experiences of women, particularly in mothering and caregiving.

## RIGHTS AND SOVEREIGNTY

As the modern nation-state system began forming in the seventeenth century, the notion of the equality of states and their right to be free of interference in their internal affairs by other states eventually became the recognized (though not always honored) norm. The treatment of persons within a state's own borders was generally considered its own business. Toward the end of the twentieth century, there was wider acceptance of the idea that states could violate the sovereignty of other states if necessary to prevent crimes such as genocide and massacres of individuals within those states' borders. In the 1990s, genocide in Rwanda and so-called ethnic cleansing in the former Yugoslavia commanded particular attention in this regard. This presented philosophers and experts on international law with a challenge to show either that, properly understood, international law already allows such actions or that it could be modified to make room for them.

Thus, the world government that Russell proposed presents a challenge to state sovereignty from one direction, threatening to eliminate the plurality of independent sovereign states. The idea of unilateral military intervention for humanitarian reasons presents a challenge from a different direction, retaining the plurality of

states but making their sovereignty conditional upon their honoring of human rights.

Additionally, so-called low intensity conflicts and the rise of terrorism brought conceptual issues to the forefront. With the declared wars characteristic of the first half of the twentieth century receding into the past, even standard war itself, in the sense of vast armies arrayed against one another, may be phasing out. In its place, the twenty-first century is seeing terrorism, violence, guerrilla warfare, and flexible, far-reaching military actions, such as by the United States in Afghanistan and Iraq. Whether these represent new forms of war or a twenty-first-century substitute for war is a conceptual issue that philosophers and international lawyers have yet to decide. The challenge of peace, in any event, is to find nonviolent ways of dealing with the conflicts leading to these various forms of violence.

## PEANO, GIUSEPPE (1858–1932)

Giuseppe Peano, an Italian mathematician and logician, was a professor of mathematics at the University of Turin from 1890 to 1932 and also taught at the military academy in Turin from 1886 to 1901. In 1891 he founded the *Rivista di matematica*, which was later also published in French (*Revue de mathématique*) and in Interlingua (an international language developed from Latino sine flexione, an auxiliary language based on Latin), which Peano propounded in 1903. In 1898 Peano acquired a small printing establishment in Turin, and he soon became an accomplished printer; his skill seems to have been of help to him in the process of simplifying logico-mathematical symbolism.

Peano's contributions to mathematics include the first statement of vector calculus (*Elementi di calcolo geometrico*, Turin, 1891) and the first example of integration by successive approximations within the theory of ordinary differential equations; with the single hypothesis that the data were continuous he proved the existence of the integrals of such equations. He submitted to rigorous criticism the foundations of arithmetic, of projective geometry, and of the general theory of sets. Peano's postulates (1899) were a set of five postulates for the arithmetic of natural numbers that allowed arithmetic to be constructed as a hypothetical-deductive system. In 1882 Peano first arrived at the principle that rigorous language can be separated from ordinary language both within and without mathematics. As Bertrand Russell wrote, Peano's method "extended the region of mathematical precision

backwards towards regions which had been given over to philosophical disagreement” (“My Mental Development,” in *The Philosophy of Bertrand Russell*, Paul A. Schilpp, ed., Evanston, IL, 1951, p. 11).

In 1890 Peano introduced the use of iota and inverted iota to distinguish a one-member class from its member, which permitted him to overcome previous confusion between  $\in$  (“being a member of”),  $\supset$  (“contained in”), and  $=$  (“equal to”). In general, Peano showed the importance of distinguishing the properties of a class from those of the individuals of that class, a need shown, for example, by his “sophism” (actually, a parallogism): “Peter and Paul are apostles; the apostles are twelve; therefore Peter and Paul are twelve.”

Peano’s work in mathematical logic is to be found in his “Formulario completo,” which includes, among other items, the well-known *Formulaire de mathématiques*, a compendium of mathematics derived from a set of postulates by means of a new notation. The “Formulario,” in its encyclopedic, high-level approach, anticipated the thorough expositions of Bourbakism. In using a notation at least as rigorous as those of C. S. Peirce and Gottlob Frege, and more comprehensive and expedient than theirs, Peano’s work marked a transition from the old algebra of logic to contemporary methods. His notation is still partially in use, mainly through its adoption by Russell and A. N. Whitehead in *Principia Mathematica*.

After 1913 Peano ceased to follow developments in symbolic logic. He regarded as artificial Russell’s interpretation of numbers as classes of classes. Peano made several hints concerning the need for analyzing the relation of formal language to ordinary language, but he was not himself interested in undertaking such analysis. A philosophical interpretation of some of Peano’s techniques is to be found in the work of his pupil Giovanni Vailati, who pointed out the general importance of Peano’s discoveries concerning recursiveness, implicit definitions, and the theory of postulates. The “Formulario completo,” however, still offers suggestions for research.

## PEARSON, KARL

(1857–1936)

Karl Pearson, a British scientist and philosopher of science, was born in London. He studied mathematics at King’s College, Cambridge, where he became acquainted with James Clerk Maxwell, Sir George Stokes, and Isaac Todhunter and developed an interest in history, religion, and philosophy. He became a fellow of his college in 1880 and also studied law at Heidelberg and Berlin. Although he was called to the bar in 1881, he never practiced law. In 1884, at the age of twenty-seven, he was appointed to the chair of applied mathematics and mechanics at University College, London, a post that he held until 1911. For part of this time he also held a lectureship in geometry at Gresham College, London, where he developed his ideas in the philosophy of science for a popular audience. Through his friend Francis Galton he became interested in statistical problems in the biological sciences, helped to lay the foundations of modern statistical theory and biometry, and, in 1901, with Galton and Weldon, founded the journal *Biometrika*. In 1896 he was elected a fellow of the Royal Society and in 1911 he was appointed to the new chair of eugenics at University College. Pearson was an enthusiastic socialist and humanist. He retired in 1933 and died three years later.

Pearson published many scientific papers, as well as essays on most of the subjects in which he was interested. His philosophical work is contained mainly in *The Grammar of Science* (1892) and *The Ethic of Freethought* (1888), a collection of essays and lectures. He is usually regarded as an important early figure in modern positivism, but his contribution in this field has perhaps been overrated. Much of his work derives from that of Ernst Mach.

He accepted and developed Mach's sensationalist, antimetaphysical standpoint, but he was not afraid to talk with approval of "a sound idealism" replacing "the crude materialism" of earlier physics. His concern was to emphasize the social background of science and to urge that good citizenship demanded the application of the scientific habit of mind to everyday living. He appears to have regarded this as a large part of the justification of scientific activity, but he also held that science "justifies itself in its methods." Like Mach he dwelt on "the unity of science," which depends upon its method rather than upon its material. This method, based as it is upon verification, rules out metaphysics. The metaphysician is a poet, who does no harm so long as he is recognized as such, but he is often taken to be something more. According to Pearson, an acceptable moral theory is more likely to develop from the experiments of the biologist than from the speculations of the philosopher.

He saw scientific laws as brief formulas representing complex relationships between many phenomena. Their "discovery" is the work of a creative but disciplined imagination; they are products of the human mind. Following Lloyd Morgan, he said that an external object is a construct; that is, "a combination of immediate with past or stored sense-impressions." He asserted, mysteriously and unsatisfactorily, that the distinction between real objects and imaginary ones is that only the real objects depend upon immediate sense impressions.

A fundamental distinction in his work is that between perception, the "physical association" of stored sense impressions, and conception, their "mental association." This appears to mean that perception is merely the copresentation of impressions, while conception is the "recognition" of relations. But the physical and the psychological differ only in degree, not in kind, because both physics and psychology deal with relations between sense impressions, although from different standpoints. On the whole, human brains work in the same way, and thus one receives the same sense impressions and forms the same constructs as another. This ensures the universal validity of science. The field of study of the various sciences is, in fact, immediate sense impressions; these are the phenom-

ena that scientific laws relate, so that "the field of science is much more consciousness than an external world." The consciousness of others is established by an argument from analogy.

We tend to project our sense impressions and to regard them as existing externally to and independently of ourselves, but this is a mistake. The distinction between external and internal is arbitrary and no more than a practical convenience. It is based on distinguishing between classes of sense impressions, not between sense impressions and something else. We cannot assert the existence of causes of sense impressions, but Pearson wanted to leave open the possibility of such existents. He therefore used the term *sensation* in an unusual way: Sensation is "that of which the only knowable side is sense-impression." This is intended to express agnosticism about the causation of sense impressions while allowing him to say, "The outer world is for science a world of sensations, and sensation is known to us only as sense-impression."

Some scientific concepts are not of immediate sense impressions; for instance, atom and molecule. There are just two possibilities: Scientists may regard the atom as real and thus capable of being a direct sense impression, or as ideal and thus merely a "mental conception assisting them in formulating laws." In contrast, a metaphysical conception is of what is both real and independent of sense perception.

Pearson concluded that science is not explanatory but merely descriptive. For instance, Isaac Newton's law of gravitation is a description in the simplest possible terms of a wide range of phenomena; that is, of the "routine" of our perceptions. To talk of it as ruling nature is to confuse other senses of "law" with the scientific sense. Causal statements are records of regular sequences in past experience and cannot assert any necessity in them. Using Humean arguments, Pearson held that forces, because they are not discoverable in sense experience, cannot be regarded as causes. "Force" is but a name hiding our ignorance of the explanation of motion. The idea of necessity is appropriate only to relations between conceptions, not to relations between perceptions. Prediction and knowledge are possible only because we find repetition in our sense impressions. Even so, our knowledge is only probable and should, strictly speaking, be called "belief."

The whole of science involves the distinction between the perceptual and the conceptual. Scientific concepts generally are ideal limits of concepts originating in perception. This is especially obvious in the mathematical treatment of the world. Empirical space and time

are “modes of perception.” Space is “a mental expression for the fact that the perceptive faculty has separated coexisting sense impressions into groups of associated impressions”; time indicates “the progression of perceptions at a position in space.” Neither space nor time is infinite or infinitely divisible, since each must be limited by our powers of perception and discrimination. Conceptual space and time, and the space and time of mathematics, are idealizations of their empirical counterparts and do not suffer from their limitations.

The aim of science is to construct conceptual models of the universe, devices to assist us in describing the correlation and sequence of phenomena. The failure to recognize this has led scientists to accept definitions of force, mass, atom, and—in the biological sciences—life that are riddled with metaphysical obscurities. Much of Pearson’s philosophical writing consists in the empiricist elucidation of these fundamental concepts, in an attempt to remove these obscurities.

### Bibliography

Pearson’s main philosophical work is *The Grammar of Science* (London, 1892). The second edition (1900) contained two new chapters. The third (1911) contained only the first eight chapters (physical sciences) of the first two editions but had a new chapter on causation and a new final chapter on modern physical ideas, written largely by E. Cunningham. The Everyman edition (London, 1937) contains a more detailed account of the various editions.

Other works by Pearson are *The Ethic of Freethought, a Selection of Essays and Lectures* (London: Unwin, 1888; and London: A. and C. Black, 1901); *The Chances of Death and Other Studies in Evolution* (London: Arnold, 1897), a volume of essays and lectures; *National Life from the Standpoint of Science* (London: A. and C. Black, 1901); and *The Life, Letters and Labours of Francis Galton*, 3 vols. (Cambridge, U.K.: Cambridge University Press, 1914–1930).

Pearson edited and completed Isaac Todhunter, *A History of the Theory of Elasticity and of the Strength of Materials from Galilei to the Present Time*, 2 vols. Cambridge, U.K.: Cambridge University Press, 1886–1893), and W. K. Clifford, *Common Sense of the Exact Sciences* (New York: Appleton, 1885), for which he wrote the chapter “Position” and much of “Quantity” and “Motion.”

Works on Pearson include V. I. Lenin, *Materialism and Empirio-Criticism*, translated by A. Finchberg (Moscow, 1937); G. M. Morant, *A Bibliography of the Statistical and Other Writings of Karl Pearson* (London: Biometrika Office, University College, 1939); E. S. Pearson, “Karl Pearson, an Appreciation of Some Aspects of His Life and Work,” in

*Biometrika* 27 (1936): 193–257, and 29 (1937): 161–248; C. S. Peirce, *Collected Papers* (Cambridge, MA: Harvard University Press, 1931–1958), passim, but especially Vol. VIII, which contains a long review of *The Grammar of Science*; and G. U. Yule and L. N. G. Filon, “Karl Pearson,” in *Obituary Notices of Fellows of the Royal Society*, Vol. II (London, 1936–1938), pp. 73–110.

For reviews of *The Grammar of Science*, see those by C. G. K. (probably C. G. Knott) in *Nature* 46 (1892): 97–99, with replies by Pearson on pp. 199 and 247; by F. A. D. (of 2nd ed.) in *Nature* 62 (1900): 49–50; by E. A. Singer Jr. (of 2nd ed.) in *Philosophical Review* 9 (1900): 448–450; and an unsigned review in *Mind*, n.s., 1 (1892): 429–430.

There are numerous casual references to Pearson’s views in books on the philosophy of science but few detailed discussions.

*Peter Alexander (1967)*

## PECKHAM, JOHN

(c. 1225–1292)

John Peckham, or Pecham, the English philosopher and theologian, and defender of Augustinian doctrines, was born in Patcham, near Brighton, Sussex. Educated at the monastery at Lewes, he continued his studies at Oxford and Paris, and sometime during the 1250s he joined the Franciscan friars at Oxford. Subsequently he became a master of theology in Paris in 1269 and returned to Oxford in 1272. Peckham was provincial of the English Franciscans from 1275 to 1277 and then lectured at the papal court for two years. In 1279 he was appointed archbishop of Canterbury and held this office until his death.

Peckham’s philosophical career represents a concentrated effort to counteract the growing allegiance to Aristotle through a return to the thought of Augustine. There seems little doubt that he was motivated to take this stand by the Lenten sermons of St. Bonaventure, who in the late 1260s had alerted his friars to the growth of heterodox Aristotelianism—which was apparent, for example, in the work of Siger of Brabant. Peckham did not reject all philosophy that stemmed from Greek and Arabic sources—as a matter of fact, he systematically used Aristotelian terminology—but his approach was a highly selective use of non-Christian philosophers to the extent that their works could be made to harmonize with the thought of Augustine. Among the disciples of Peckham who perpetuated this attitude were Matthew of Acquasparta, Roger Marston, and, later, Vital du Four.

Peckham’s theory of knowledge shows the persistence of a special type of apriorism in the Franciscan school of this period. Clues to this apriorism are to be

found in the *Summa* of Alexander of Hales, which taught that the human intellect is incapable of a satisfactory a posteriori analysis of the first principles or of the most basic “perceptibles,” such as time and space. Similarly, Augustine said: “If we both see that which you say to be true, and both see that which I say to be true, where, I ask you, do we see it? Neither I in you, nor you in me, but both in the unchangeable Truth itself, which is above our minds” (*Confessions* XII.24). Peckham concludes that more is required for the operation of the intellect than mere sensation that “contacts” accidents but does not reach the essence of things.

Even granting the intellect’s power of abstracting essences, Peckham says that the mind does this either knowingly or unknowingly. If knowingly, then the mind knows before abstracting, and hence it is useless to abstract. If unknowingly, then the mind is at the mercy of chance and can hardly be called an intellect at all. Consequently, the intellect is not a passive Aristotelian *tabula rasa*, but a beam moving outward and casting its light on things. However, this explanation is not sufficient because in matters of intellectual knowledge, certitude, and evidence, man must be assisted by a divine illumination—a divine active intellect—in addition to his own human active intellect. This assistance by divine illumination is not a direct vision of God or an infusion of ideas. Rather, it is an assistance over and above that given by God as the conserving cause of all that exists. Its purpose is to guarantee necessity and certitude (considered irrevocably unobtainable through sensation) for our knowledge.

In the realm of natural theology, there was one key axiom that pervaded Franciscan philosophical circles in Peckham’s time—that creatures are entirely dependent upon the First Cause with regard both to the fact of existing and to their ability to act. From this it follows that whatever causal powers a creature may possess are ontologically delegated to it by the First Cause. The important corollary of this principle is that the First Cause can bypass the agency of the creature and intervene to produce the effect immediately. Peckham invokes this principle to some extent in the illumination theory of knowledge. He also uses it to defend the autonomous existibility of prime matter without any form against the contrary opinion of Thomas Aquinas.

Peckham also took rather strong exception to Thomas’s opinion that no single thing ever has more than one form. All medieval philosophers were agreed that the First Cause was pure form and that prime matter was completely formless. Against Thomas, Peckham and his confreres held that in each thing there are many forms, or

at least many grades of one form. The dispute soon fossilized into two schools—the Dominicans and the Franciscans—and as often as not their arguments generated more heat than light. In any case, Peckham held that in humanity there are several forms—vegetative, sensitive, and rational—in a gradated order that cooperates toward the good and unity of the being as a whole.

John Peckham’s career represents a sincere effort to perpetuate and to update the doctrines of Augustine. He suffered much distress as archbishop of Canterbury when, as a stubborn defender of Augustine, he incurred the wrath of the equally stubborn Dominican defenders of Thomas.

Many of the points that were merely hinted at in Peckham’s philosophy were taken up by his disciples and elaborated in full-length treatises. A final judgment of this English Franciscan must await the publication of many of his works that are still in manuscript.

## PEIRCE, CHARLES SANDERS (1839–1914)

Charles Sanders Peirce, the American philosopher, physicist, and mathematician and the founder of pragmatism, was born in Cambridge, Massachusetts. His father, Benjamin Peirce, was the leading American mathematician of the time and Perkins professor of mathematics and astronomy at Harvard. Young Charles was born and bred a scientist, and from his earliest years he showed great promise in mathematics and the physical sciences. He attended Harvard, graduated in 1859, and subsequently studied at the Lawrence Scientific School, from which he received his degree in chemistry *summa cum laude* in 1863.

During the next fifteen years, Peirce simultaneously pursued several distinct careers. He worked as an astronomer at the Harvard Observatory, where he did pioneer work in photometric research. He also worked as a physicist for the U.S. Coast and Geodetic Survey, of which his father was superintendent, and achieved some distinction for his discovery of hitherto undetected errors in pendulum experiments used to determine the force of gravity. And he worked, more or less privately, at philosophy and logic, steadily publishing works on these sub-

jects from 1866 on. By 1879 he had achieved sufficient stature in these last two fields to be appointed lecturer in logic at the newly organized Johns Hopkins University in Baltimore, Maryland. He remained at Johns Hopkins from 1879 until 1884, meanwhile continuing to work for the Coast and Geodetic Survey—a connection that he sustained until 1891. In 1887, after having inherited some money, he retired to Milford, Pennsylvania, where he lived in relative isolation until his death. Peirce was twice married—in 1862 to Harriet Melusina Fay, whom he divorced in 1883, and in 1883 to Juliette Froissy, who survived him. He had no children.

### PHILOSOPHICAL ORIENTATION

Peirce was a systematic philosopher of great breadth, and his writings cover almost all fields of philosophy. His greatest contributions were in the field of logic, but he wrote extensively on epistemology, scientific method, semiotics, metaphysics, cosmology, ontology, and mathematics, and less extensively on ethics, aesthetics, history, phenomenology, and religion. Since Peirce's views underwent considerable change as he grew older, it is not possible to speak of his philosophy as a single system: Rather, he formulated several systems, each of which represents a different phase in his development. These different systems, however, deal with the same problems and embody the same fundamental concept of philosophy.

Peirce came to philosophy as a student of Immanuel Kant, from whom he had acquired the architectonic theory of philosophy. In brief, this theory holds that the domain of knowledge can be so characterized that general assertions can be proven true of all possible knowledge; the theory also holds that it is the dependence of all knowledge upon logic that makes such a characterization possible. Accordingly, the doctrine holds that it is possible to derive from logic the fundamental categories and principles that form the basis of all that can ever be known. In formulating this theory, Kant assumed that logic was a completed, unchanging science. But Peirce was one of that group of men, including George Boole, Augustus De Morgan, Gottlob Frege, and others, who revolutionized logic and prepared the way for A. N. Whitehead and Bertrand Russell's *Principia Mathematica*. Hence, for Peirce, logic was a growing, changing subject, and as it changed, so, according to the architectonic theory, Peirce's philosophy had to change with it. Thus the major shifts in Peirce's system are correlated with his major discoveries in logic and reflect the modifications that he thought those discoveries entailed. In the following expo-

sition, Peirce's work will therefore be dealt with chronologically, and each system will be treated in order.

### THE FIRST SYSTEM, 1859–1861

Peirce's first system is a form of extreme post-Kantian idealism. The sources of this idealism are not known: Whether he evolved it himself or derived it from some other source, such as Emersonian transcendentalism, cannot now be determined. What is clear is that by 1857 he was seeking to combine the Transcendental Analytic with Platonic idealism.

**CATEGORIES.** From Kant's doctrine of the Transcendental Sciences, Peirce derived a threefold ontological classification of all there is into matter (the object of cosmology), mind (the object of psychology), and God (the object of theology). Peirce referred to these three categories as the *It* (the sense world), the *Thou* (the mental world), and the *I* (the abstract world), respectively; and it was from these pronouns that he subsequently derived the names *Firstness*, *Secondness*, and *Thirdness*, by which he usually called his categories.

Having divided all there is into these three categories, Peirce's problem was then to define the relations among them. Specifically, the problem of knowledge as it appears in the first system is how the ideas in the mind of God can be known by human minds. Peirce thought he had found the solution to this problem in the Kantian principle that all phenomena and all concepts—all that can be before the mind—are representations, for he understood this to imply that the ideas in the mind of God, which Peirce conceived as Platonic archetypes, are first given a material embodiment in the form of the objects of our experience and are then derived by us from those objects by abstraction. So Peirce took the Transcendental Analytic to be a description of this process: The synthesis in intuition is the synthesis of the divine idea (already present in an unconscious form within the soul) with "the matter of sensation" to form the empirical object which is also, by virtue of the divine idea, the transcendental object; and the concept is derived by abstraction from the object given in intuition. But when it came to explaining just how the Kantian categories served to effect so un-Kantian a synthesis as that demanded by his own semiotic idealism, Peirce found himself in grave difficulties, and after struggling with the problem for some time he was forced to conclude that the Kantian table of categories was simply inadequate.

### TRANSITIONAL PERIOD: STUDY OF LOGIC

According to the architectonic principle, the inadequacy of the table of categories implies the inadequacy of Kant's logical classification of propositions. In 1862, therefore, Peirce began the serious study of logic, and he naturally turned to the Scholastics for instruction. Although he began his study in the belief that the fundamental problem was the classification of propositions, he soon learned from John Duns Scotus that the classification of arguments, or forms of inference, was more fundamental, since the significance of propositions depends upon the role they play in inference. He was therefore led to investigate the irreducible forms of inference, and so to study Kant's famous paper "The Mistaken Subtlety of the Four Syllogistic Figures," in which Kant argued that all inference is reducible to Barbara or to a combination of Barbara and immediate inference. In the "Memoranda concerning the Aristotelian Syllogism," which he published in 1866, Peirce showed that Kant's argument is invalid, for the syllogism by which the reduction of the second and third figures is made is itself in the figure from which the reduction is being made. Peirce therefore concluded that the first three figures are irreducible. Moreover, Peirce noted that if the first figure is defined as the deduction of a conclusion from a major and a minor premise, then the second figure can be described as the inference of the major from the minor and conclusion and the third figure as the inference of the minor from the major and conclusion. Accordingly, Peirce held that the first figure is purely deductive, the second figure inductive, and the third figure hypothetical.

For Peirce this discovery had great importance. His previous belief in the existence of synthetic a priori propositions had rested on the two doctrines, derived from Kant, that all thought involves inference and that all inference is in Barbara. Granting these doctrines, it is clear that the major premises must be innate in the mind. But with the discovery of the role of hypothesis and induction, all synthetic propositions can be regarded as inferred, and so the problem shifts to the process of synthetic inference and to scientific inquiry.

At about the same time that he discovered the irreducibility of the three figures, Peirce made another important discovery in logic—namely, that the copula can be interpreted as the sign relation. This view, which was probably derived from the scholastic theory of supposition, enabled him to regard all propositions as instances of a single fundamental relation, and the analysis was quickly extended to inferences also by treating the

conclusion as a sign that is determined by the premises to represent the same state of affairs that they themselves represented. Such a result was thoroughly in line with Peirce's early semiotic idealism, and it meant that the fundamental logical relation from which the categories must be derived is signhood.

### THE SECOND SYSTEM, 1866–1870

In 1867 Peirce published a paper titled "On a New List of Categories," in which he attempted to solve the problem of relating his three ontological categories of mind, matter, and God.

**THE SIGN RELATION.** Starting from Kant's position that knowledge occurs only when the manifold is reduced to the unity of a proposition, Peirce asked what that unity consisted in. Since he conceived the proposition in subject-predicate form, this is equivalent to asking how the predicate is applied to the subject. On the basis of the reduction of the copula to signhood, Peirce argued that the predicate is applied to the subject by being made to stand for the same object for which the subject stands. Thus a proposition would be impossible without reference to some object. But how does the predicate come to stand for this object? Only, Peirce held, by being interpreted as standing for it by some interpreting representation, or mind, so that no proposition is possible unless such an interpretant also exists. And how does the mind make this interpretation? Only, Peirce held, by the sign's representing its object in some respect, that is, by referring to some attribute of the object. Hence, propositions would be impossible if there were no pure abstract attributes embodied in the object to form the basis of comparison among them. So his argument, in essence, was that all synthesis involves the sign relation, that the sign relation consists in a sign standing for something to someone in some respect, and therefore that unless there are things, minds, and abstractions, there is no knowledge. But since the pure abstract attribute is the Platonic Form in the mind of God, what Peirce was really arguing is that without his three ontological categories signhood would be impossible.

*Aspects of reference.* In the "New List," Peirce did not present his categories directly as ontological classes; rather, he began with the problem of unifying the manifold by joining the predicate to the subject through the sign relation and then analyzed signhood into the three aspects of reference: reference to abstraction, reference to an object, and reference to an interpretant. These three aspects are then made the basis for a systematic classifica-

tion of signs according to the prominence given to each reference, and this mode of classification is applied to terms, propositions, and arguments. In the case of arguments, Peirce rederived the division into hypothesis, induction, and deduction, thus presenting the three forms of syllogistic as consequences of his analysis of signs.

Logic, however, is not the only science of signs; indeed, it is but one of three, each of which studies a particular aspect of the subject. The first is speculative grammar, which studies the relation of signs to the abstraction; the second is logic, which investigates the relation of signs to their objects; and the third is speculative rhetoric, which investigates the reference of signs to their interpretants. Peirce could therefore derive his three ontological categories by abstraction from the three references of signs, but he had to show further how we can know the objects referred to and whether or not they are real. For these purposes he needed a theory of cognition and a theory of reality.

**COGNITION.** Peirce stated his new theories of cognition and reality in three articles published in 1868 in the *Journal of Speculative Philosophy*. These papers simply develop the implications of the "New List." Since the reference of a sign to its object is established by its being predicated of another sign which already refers to that object, and since the predication exists only because there is an interpreting sign that so interprets it, it is clear that the series of signs is doubly infinite. Peirce accepted this conclusion and asserted that there is neither a first nor a last cognition. While this doctrine appears bizarre, it has a clear purpose. What Peirce was trying to avoid was the classic dilemma of the empiricist who, having tracked cognition back to an original impression of sense, finds himself completely unable to prove the accuracy of that first impression.

Peirce held that if we examine what actually occurs in cognition, we find the process to be something like the following. In the flood of sensory stimuli that pours in upon us, we detect certain relations that lead us to segregate some stimuli and to interpret these as having a common referent. We do not know what the first such stimulus having that referent may have been, and the question is meaningless, since it is only after many stimuli have occurred that we note their relations. As experience progresses and we acquire more relevant stimuli, we further conceptualize this referent, and in time we acquire a progressively more and more complete and precise idea of it. But our knowledge is never fully complete, so that

this process of learning and inquiry is endless. It is true that once we have a relatively detailed concept of the referent, we assume that the object antedated our experience of it and in fact caused that experience; epistemologically, however, it is the experience that comes first and the notion of the object that comes later. The object, then, is a hypothesis designed to give coherence to our experience, and this hypothesis is derived by hypothetical and inductive reasoning; hence, the process of cognition can be fully described by the three forms of inference. Moreover, it follows that the object must be as we conceive it, since it is only as we conceive it that it is postulated at all, and therefore there can be no such thing as an incognizable cause of cognition, for the postulate that an object exists is warranted only by the coherence it gives to experience. Accordingly, whatever is, is cognizable.

**REALITY.** The above theory of cognition leads at once to a theory of reality. The object is real, Peirce held, only if as the number of cognitions goes to infinity, the concept of the object tends to a limiting form. It follows, therefore, that although the object is not independent of being thought (since it is only as it is thought that it exists at all), it is nevertheless independent of the thought of any particular man and represents what would be agreed upon by an ideal community of investigators if inquiry were to go on forever.

Many empiricists would agree with Peirce that if the object is real, then if inquiry does go on forever, our hypotheses will converge to a final true description. But few would follow him in holding that the object is real because inquiry converges. What Peirce was attempting to do in this instance was to propound a doctrine that was at once phenomenalistic and realistic. To do this, he had to give a phenomenal definition of reality that would compromise neither the inexhaustibility of the real nor the particularity of the phenomenal, and the infinite series of cognitions seemed to do just that. But could Peirce prove that the infinite series is convergent? In 1868 he thought he could do this by means of an argument that purported to show that the concept of a universe in which induction and hypothesis would not lead to agreement was self-contradictory. When he subsequently discovered that this argument was fallacious, his theory of reality had to be substantially revised.

**Universals.** Peirce's theory that reality consists in the convergence of inquiry led to a further consequence. For it follows that the real object must be as we conceive it to be, and since, as the "New List" showed, the predicate of a judgment is always general, it further follows that univer-

sals are real. On this basis Peirce declared himself a scholastic realist of the moderate, or Scotist, school. The claim is misleading, for whereas the scholastic doctrine rests on the assertion that the universal in the mind and the individual out of the mind have a common nature, Peirce's argument rests on the fact that no cognition is wholly determinate—that is, that there is no true individual, and that therefore everything is to some degree general. Peirce's "realism" was thoroughly idealistic throughout.

#### THE THIRD SYSTEM, 1870–1884

By 1870 Peirce had propounded, in outline at least, an architectonic philosophy based upon the principles that all cognition involves the sign relation; that the sign relation involves three classes of referents; and that these referents are real and can be adequately known by scientific inquiry. But this theory depended upon logical doctrines that Peirce was forced to abandon when he discovered the logic of relations.

*The logic of relations.* The first work on the new logic had been done by Augustus De Morgan, but little progress was made with the subject until Peirce entered the field in 1870. It was in this area that Peirce made his greatest contributions to logic, and it is no exaggeration to say that it was he who created the modern logic of relations. Philosophically these new discoveries in logic had important consequences, for the logic of relations forced Peirce to abandon the subject-predicate theory of the proposition that underlies the "New List," and so required that he overhaul his basic position. Probably the most notable revisions directly attributable to the new logic are the doctrines of pragmatism and the doubt-belief theory of inquiry.

**THE DOUBT-BELIEF THEORY OF INQUIRY.** Peirce formulated the doubt-belief theory in 1873, but it was first published in a series of six papers in *Popular Science Monthly* in 1877 and 1878. These papers do not constitute a rejection of the earlier theory of cognition; rather, they elaborate the earlier theory and set it in the context of biological evolution.

Any organism that is to survive, Peirce held, must develop habits of behavior that are adequate to satisfy its needs. Such habits are rules of behavior that prescribe how we should act under given conditions in order to achieve a particular experiential result. Now such habits, when thoroughly adopted, Peirce called beliefs. Since to possess beliefs is to know how to satisfy one's wants, belief is a pleasant state: Doubt, or the absence of belief, is an

unpleasant state, since one is then uncertain how to act and is unable to attain the desired goals. The organism will therefore seek to escape from doubt and to find belief. The process by which the organism goes from doubt to belief Peirce defined as inquiry. Clearly, there are various methods of inquiry, and the most satisfactory method will be that which leads most surely to the establishment of stable belief—that is, to beliefs that will stand in the long run.

**PRAGMATISM.** From the standpoint of the inquiring organism, a belief concerning a particular object is significant because it permits the organism to predict what experiences it will have if it acts toward the object in a given way. Recalling Kant's use of the term *pragmatic*, namely, "contingent belief, which yet forms the ground for the actual employment of means to certain actions, I entitle *pragmatic belief*" (*Critique of Pure Reason*, A 824, B 852), Peirce propounded what he called the pragmatic theory of meaning, which asserts that what the concept of an object means is simply the set of all habits involving that object. This doctrine involves a major change in Peirce's thinking, and one that is directly due to the logic of relations.

Prior to 1870, Peirce conceived the meaning of a term as the embodied abstraction that it connotes. The meaning of the concept of an object is therefore the same abstraction that is the essence of the object. But once relations were admitted as propositional constituents coordinate with quality, it became possible to conceive the object not only in terms of indwelling qualities but also in terms of relations among its states and with other objects—that is, in terms of its behavior. Accordingly, instead of regarding the behavior of the object as determined by its qualitative essence, the behavior itself may now be regarded as the essence. The meaning of the concept of an object may therefore be given by the set of laws completely specifying the behavior of the object under all conditions. These laws are conditional statements relating test conditions to phenomenal results, and such laws, considered as governing behavior, are habits relating action to experiential effects. Hence, the principle of pragmatism asserts that the concept of the object is synonymous with the set of all such conditionals. Since actual synonymy is asserted, it follows that the concept of a real object can be completely translated into phenomenal terms, but only, it should be noted, into dispositionally phenomenal terms—a point that was to cause Peirce considerable trouble.

**Pragmatism: A theory of meaning.** Pragmatism is Peirce's most famous philosophical doctrine, although it was made famous by William James rather than by Peirce. As Peirce defined it, pragmatism is purely a theory of meaning—not of truth. Moreover, it is a theory of meaning that combines two rather distinct emphases. First, Peirce intended pragmatism to be a principle of scientific definition. By permitting the translation of a concept into phenomenal results that are observable under stated test conditions, the principle legitimizes the use of theoretical constructs in science and thus does much to clarify the nature and status of scientific theory and proof. But when Peirce chose to call the doctrine pragmatism and insisted that the concept must be translatable into "practical effects," the choice of Kantian terminology was not accidental. Peirce was also stressing the utilitarian aspect of science and of all knowledge—that is, the fact that significance lies in the relation to ends desired. Peirce drew no distinction between these two aspects of pragmatism: For him they formed a single doctrine.

**Scientific method.** Taken together, pragmatism and the doubt-belief theory imply that the stable beliefs sought by inquiry are in fact the laws of science. The problem of finding the best method of inquiry therefore becomes that of the justification of scientific method, which in Peirce's terms means the justification of induction and hypothesis. Although Peirce formally presented this justification in terms of the operating characteristics of the procedures, he admitted that the relative frequency with which inductive and hypothetical inferences lead to the truth cannot be calculated; hence, our assurance that synthetic inference does ultimately lead to truth comes from the fact that inquiry will converge to a limiting result that is true by definition. Thus, in this instance Peirce admitted that the convergence of inquiry to a final opinion cannot be proven but must be assumed, and since his definition of reality rests upon the convergence of inquiry, this is equivalent to saying that the existence of the real is improvable and must be assumed. But even as an assumption the doctrine presents problems, for it amounts to saying that if inquiry were to go on forever it would converge, and thus involves fundamental questions concerning counterfactuals.

**Counterfactuals.** The problem of counterfactuals is central to Peirce's philosophy, and his failure to solve it was one of the chief reasons that his system of the 1870s had to be rejected. Pragmatism requires that the concept of a real object be wholly translatable into a set of conditionals relating test conditions to observations. But then it would seem that the concept of the real object is devoid

of content: That is, if the concept of the real object is synonymous with the set of conditionals, each of which is purely phenomenal, then the assertion of reality adds nothing to which a nominalist might object. Peirce, however, did not regard the concept of reality as vacuous; he argued that the conditionals are asserted to be true always, whether actually under test or not. The real, therefore, is a permanent possibility of sensation—not merely a series of sensations. But this leads directly to the counterfactual problem, or the equivalent problem of real possibility. Peirce's theory requires that there be real possible sensations—an assertion that is not only unprovable but pragmatically meaningless, since possible sensations are pragmatically equivalent to actual sensations. Thus, far from proving phenomenalism realistic, Peirce found his position reduced to a subjectivism that was the exact antithesis of the scholastic realism he had hoped to establish.

#### THE FOURTH SYSTEM, 1885–1914

During the years he spent at Johns Hopkins, Peirce was extremely productive in the field of logic. He further developed and extended the calculus of relations and applied it to problems in mathematics. He also clarified and revised his theory of synthetic inference, began the study of the Cantor set theory, and in 1885, with the help of his student, O. H. Mitchell, discovered quantification—a discovery in which Frege had anticipated him by six years. These new developments in logic, together with the rather serious difficulties in his own philosophical position that had become apparent by the end of the 1870s, led Peirce to attempt a radical reformulation of his position in 1885. This reformulation involved a complete revision of the categories, the theory of cognition, and the theory of reality.

**THE CATEGORIES.** In the 1885 version of the categories, Peirce distinguished sharply between their formal and material aspects. Formally considered, the categories (Firstness, Secondness, and Thirdness) are simply three classes of relations—monadic, dyadic, and triadic. Moreover, Peirce held that these classes are irreducible and that all higher relations (quartic, quintic, etc.) are reducible to some combination of these three. The irreducibility of monadic and dyadic relations is generally admitted. The irreducibility of triadic relations is argued on the ground that all combinatorial relations are triadic, since they involve a relation between two elements and a resulting whole. Granting this, it follows that triadic relations are irreducible, because analysis could only resolve them into components and a combinatorial relation, and that com-

binatorial relation would itself be triadic. But once the notions of element and combination are given, relations of more than three correlates are easily generated, and so all higher relations may be regarded as being constructed from the three basic types.

Among triadic relations Peirce distinguished pure and degenerate species. A pure triadic relation is one in which no two of the correlates would be related without the third. His example of such a relation is signhood, for the sign relates object and interpretant, the interpretant relates sign and object, and the object, by establishing the identity of the extensional domain, relates sign and interpretant. Since Peirce held that all thought is in the form of signs, it follows that all thought is irreducibly triadic, which is another way of stating the Kantian doctrine that all thought is synthetic.

Since a monadic relation is a one-place predicate, the material aspect of Firstness must be qualitative, and Peirce therefore called it quality; what he meant by this term in 1885, however, was not the embodied abstraction that he had described in 1867. Quality now refers not to a concept but to a phenomenal suchness that is the immediate, nonconceptual given of sensation. In the 1885 version, not the concept red, but that suchness of an object that leads us to classify it as red, is a quality.

Peirce called the material aspect of Secondness *haecceity*, a term derived from Duns Scotus's *haecceitas*, meaning "thisness." As experienced, haecceity is known as shock or brute resistance: Peirce described it as an immediately given, nonconceptual experience of dyadic opposition or "upagainstness." The fact that the experience implies the dynamic interaction of two things, and is therefore dyadic in structure, permits it to qualify as the material aspect of Secondness. For Duns Scotus, haecceity was the principle of individuation, and Peirce accepted this meaning: Only individual things have haecceity. It was apparently the discovery of quantification theory that led Peirce to this formulation, for in the variable of quantification theory he found a sign capable of referring directly to an object without describing it, and "thisness" was intended as that property of the object by virtue of which such a reference can be made.

The material aspect of Thirdness is less clearly defined than that of the other two categories. Peirce described it as combination, or mediation, where the latter term signifies either connection or means-ends relations among things. Signhood may also be regarded as part of the material aspect of Thirdness, and so too may generality, since the general constitutes a connection among particulars. Clearly, what Peirce was describing in

this instance has much less the character of the immediately given than is the case for the other two categories. The reason is that Peirce not only regarded all thought as triadic—he also regarded all pure triads as conceptual. The material aspect of Thirdness is therefore the experience of thought or rationality. One of Peirce’s problems was to explain just how so immaterial a thing can be perceived.

**COGNITION.** The revision of the categories raised some important problems in regard to cognition. Not only did Peirce have the problem of demonstrating how Thirdness can be perceived, but he also had the problem of explaining how quality and haecceity could be perceived. For in his earlier writings on cognition, Peirce had explicitly denied the existence of first impressions of sense of precisely the sort that he now introduced as the material aspects of his first two categories. Moreover, a further set of problems relating to cognition arose from the doubt-belief theory itself. For in that theory, logic, both deductive and synthetic, is treated as a method whereby an inquiring organism seeks belief. The status of logic, therefore, is that of a useful but contingent means to a sought end—contingent both upon our seeking this particular end, which is a characteristic of the present evolutionary state, and upon our choosing the most efficient of the several available means. Thus, in the doubt-belief theory, logic loses that necessary relation to all possible knowledge that is asserted by the architectonic theory and required to prove the universality of the categories.

*Classification of knowledge.* Throughout the 1890s Peirce labored at the problem of reconstructing the architectonic theory. Since the architectonic theory presupposes a classification of knowledge into two classes—logic, and all other knowledge—Peirce’s problem was to develop this classification so as to ensure the universality of the categories, while at the same time not contradicting his theory of inquiry. The final system of classification was not attained until 1902. In that system, Peirce divided knowledge into practical (or applied) and theoretical sciences, and then further subdivided the theoretical sciences into sciences of discovery and sciences of review (the latter merely summarizing the findings of the sciences of discovery). The major portion of the classification thus deals with the sciences of discovery. The classification is by presupposition.

The first science is mathematics, which Peirce regarded as presupposed by all others. Mathematics is divided into three branches: mathematics of logic, mathematics of discrete series, and mathematics of continua. It

is to the mathematics of logic that Peirce assigned the threefold classification of relations that constitutes the formal aspect of the categories. Next after (and presupposing) mathematics comes philosophy, which Peirce divided into phenomenology, normative science, and metaphysics. Phenomenology, which here appeared in Peirce’s writing for the first time, is defined as the study of all that can be before the mind, but in practice, it is devoted to proving that all phenomenal experience is resolvable into three factors, which are the material aspects of the three categories. Thus Peirce sought to show that his categories, in both their formal and material aspects, are presupposed by all other knowledge.

Normative science has three divisions: aesthetics, ethics, and logic. In this classification logic appears explicitly as the science of how we ought to reason in order to obtain our objectives—whatever they may be. Thus the contingent and utilitarian aspect of logic, first brought out by the doubt-belief theory, is here made central. But reasoning as we ought is only one aspect of acting as we ought, which is the proper subject of ethics: Hence, logic presupposes the science of ethics, or the science of how conduct should be regulated to attain our ends. But what our conduct ought to be depends on our aims, and these Peirce held to be the subject of aesthetics, which is the science of what is desirable in and of itself. Hence Peirce subscribed to an aesthetic theory of goodness and made the good and the beautiful coincide.

Following and presupposing philosophy is idioscopy, which Peirce subdivided into the physical and psychical sciences. Each division is further subdivided to yield what we would ordinarily regard as the physical, biological, and social sciences. All domains of science thus fall within the classification, and so depend upon the categories. The classification thus serves the purpose of preserving the architectonic while ensuring the normative role of logic.

*Perception.* Peirce’s determination to preserve both the universality and phenomenal observability of the categories as well as the normative character of logic is evident in the theory of percepts and perceptual judgments that he propounded at this time. According to Peirce, physiology and psychology tell us that our percepts are synthesized from the myriad neural stimuli that assail us from without. Of these neural stimuli themselves and of the process of synthesis we are entirely unaware; the earliest step in cognition of which we are at all conscious is the percept. But we cannot really be said to know the percept; what we know is a perceptual judgment, which is a proposition telling us what the nonlinguistic percept was. The perceptual judgment, such as “red patch here now,” is

a hypothesis that explains the percept, but it is a peculiar hypothesis, since it is immediate and indubitable. Even if the perceptual judgment is immediately followed by a contradictory perceptual judgment, still that second perceptual judgment relates to a later percept, and it remains indubitable that my first and now forever vanished percept was truly red. Perceptual judgments, therefore, form the real starting point in knowledge and must be taken as the ultimate evidence statements.

Peirce described the processes of synthesis that precede and lead to the perceptual judgment as unconscious inference. Their inferential character is defended, here as in his earlier writings, by an argument that identifies the psychological processes of association with the forms of inferences. But since these processes are unconscious, they are beyond our control and thus are not subject to logical criticism—for logical criticism, being normative, is applicable only to voluntary and controllable behavior. On the other hand, conscious inferences, such as the processes whereby we derive knowledge from the perceptual judgments, are thoroughly subject to logical criticism. Accordingly, Peirce could hold both that there is no first impression of sense and that the object (percept) is given to us by a synthesis in intuition. He could further hold that our knowledge has a definite starting point in propositions that give direct reports of phenomenal observation and that whatever is asserted in those judgments of perception must be accepted as given. Thus, in the theory of percepts and perceptual judgments, Peirce tried to reconcile his denial of first impressions with his doctrine of direct phenomenal contact with the world.

On the basis of this theory, Peirce held that the material aspects of all three categories are empirically observable. Quality and haecceity are argued to be directly observable aspects of the percept. But so, too, according to Peirce, is Thirdness, for what is asserted in the perceptual judgment is necessarily true, and the perceptual judgment, being a proposition, has a predicate that is general. Since the generality is given in the perceptual judgment, and since criticism cannot go behind the perceptual judgment, this generality must be regarded as given in perception, and hence as being observable. Thus, by phenomenological analysis, all the categories can be shown to be present in experience.

**REALITY.** In the course of his study of the logic of relations, Peirce noted that the analysis of certain relations leads to an infinite regress. Thus the relation “in the relation  $R$  to” must itself be related to its subjects by the same relation, for example, “in the relation ‘in the relation  $R$  to’

to,” and so on. Such relations, which can be analyzed only into relations of the same sort, Peirce called continuous relations, since they fit the definition of the continuum as that of which every part is of the same nature as the whole. They are, according to Peirce’s theory, pure triadic relations; therefore their irreducibility follows from the irreducibility of Thirdness. Moreover, since every relation must be related to its subjects by some such relation, Peirce drew the conclusion that all relations involve a continuous relation.

**Continua.** During the 1880s, Peirce had become acquainted with Georg Cantor’s work on set theory, which bears directly on the problem of continuity. Recognizing at once the great importance of Cantor’s work for both logic and mathematics, Peirce undertook the study of the foundations of mathematics and attempted to construct his own theory of cardinal and ordinal numbers. Peirce’s papers on this subject are highly technical, and only the briefest summary of them can be given here. In developing his theory of cardinal numbers, Peirce discovered a form of the paradox of the greatest cardinal. His efforts to solve this paradox led him to the erroneous conclusion that the series of transfinite cardinals is only countably infinite and has an upper limit that is the power of the linear continuum. It follows that if the continuum consisted of discrete elements, then there would exist a greatest cardinal, and to avoid this conclusion he held the continuum to be a “potential” set consisting of possible points. Accordingly, although subsets of any multitude may be actualized from the continuum, nevertheless, not all of the possible points are actualizable, since if they were, we should have a greatest cardinal and hence a contradiction. Peirce believed that by such arguments he had established that whatever is truly continuous involves unactualized possibility; hence the problem of the existence of real possibility, which he had found insoluble in the 1870s, was now reduced to that of the reality of continuity. Peirce used the arguments of Zeno in an attempt to prove that space and time must be truly continuous in his (Peirce’s) sense, and he went on to argue that continuous relations are truly continuous both intensively and extensively. In defining the continuum as that of which every part is the same sort as the whole, Peirce was brought to the conclusion that real relations, and so real laws, are in some sense continua.

**Synechism.** The doctrine that the world contains real continua Peirce called synechism. He regarded this as his most important philosophical doctrine and preferred to have his whole philosophy called by this name. He also asserted that it was a modern form of scholastic realism.

Scholastic or not, it is certainly realistic, for it holds that the external referents of true laws are real continua which, since they involve unactualized possibilities, contain real generality. To support this doctrine, Peirce had to define an ontology that would explain what those referents might be. Peirce was no stranger to such an enterprise. He began his work in philosophy in the 1850s, with the doctrine of the three ontological categories, and although he subsequently redefined the categories several times in less ontological fashion, he never forgot the question of what realities lay behind his categories. It is therefore not surprising that following the 1885 revision of the categories, Peirce returned to the problem of ontology, and this soon led him to propound an evolutionary cosmology.

**EVOLUTIONARY COSMOLOGY.** Peirce had several reasons for formulating an evolutionary cosmology in the 1890s. Not only did synechism require a clarification of his ontological commitments, but he was also impelled toward such a formulation by problems arising within the theory of cognition. First, the doubt-belief theory, by imbedding inquiry within an evolutionary context, made the utility of scientific method relative to a particular evolutionary adaptation, the permanence of which is by no means guaranteed and must therefore be investigated.

A second reason for Peirce's formulating an evolutionary cosmology in the 1890s springs from his doctrine of critical common sense. Like all students of scientific method, Peirce was perplexed by the problem of how we discover true hypotheses. Considering the infinity of possible false hypotheses, it is evident that not even Peirce's theory of synthetic inference could account for the remarkable frequency with which we do, in fact, find a true explanatory hypothesis. Utilizing the evolutionary doctrines current at the time (including the inheritance of acquired characteristics), Peirce argued that the human mind must possess some innate adaptation that enables us to guess the correct laws of nature more readily than pure chance would allow. Such an adaptation would mean that true hypotheses appear to us peculiarly simple and natural. According to Peirce, it follows, then, that judgments of common sense, conceived through the mechanism of the inheritance of acquired characteristics as quasi-instinctual beliefs that have been built up through centuries of experience, should have a greater probability of being true than have parvenu doctrines. But this probability is at best low, so that commonsense judgments cannot be accepted without critical analysis and careful test. Thus Peirce's doctrine of common sense is thoroughly critical: Common sense is to be regarded as a likely source of true hypotheses, but no hypothesis is to

be accepted without empirical validation. But in terms of the doubt-belief theory, this doctrine leads to a serious problem. Should the course of evolution alter significantly, our innate adaptation, which has proven so useful in the past, would become positively harmful, since it would direct us to seek explanations in terms of an adaptation that no longer obtains. Accordingly, it becomes a question of considerable moment to inquire what the future course of evolution will be.

*The continuous external referent.* In the doubt-belief theory, Peirce had formulated the principle that a law, which he conceived as governing the behavior of an organism, is a habit. Now a habit, considered as a psychological entity, is a connection among feeling states and actions, and this connection, Peirce held, must consist in an actual substantive continuity among them. Peirce based this assertion on a variety of arguments, including the felt continuity of mental phenomena (the impossibility of memory without continuous connection between past and present) and certain arguments drawn from the behavior of protoplasm under stimulation. It was therefore Peirce's doctrine that habit, considered as a psychological entity, is a continuum corresponding to a law that is conceived as governing behavior. To find continuous external referents for all laws, Peirce asserted that the universe is itself a living organism possessed of feelings and habits and that our laws of nature describe the habits of the universe. Thus, after 1885, the subjective idealism of Peirce's early writings became an extreme form of objective idealism.

*Knowledge, feeling, volition.* From the position that the universe is an organism, it follows that all our experience of the external world must be describable as experience of some state or behavior of this organism. But the possible forms of experience are defined by the material aspects of the categories, while Peirce took the possible components of mind to be defined by the traditional division into knowledge, volition, and feeling. He had already identified knowledge with belief-habit and made it the correspondent of law, or Thirdness. He now identified feeling as the correspondent of Firstness and volition as the correspondent of Secondness. But the doctrine asserts more than mere correspondence, for Peirce seeks to account for the fact that all our experience can be classified by the categories, and his explanation for this fact is that what is for the cosmic organism feeling, volition, and belief is experienced by the individual as Firstness, Secondness, and Thirdness.

*Chaos and order.* The habits created through inquiry are, objectively viewed, laws of behavior. What then,

according to Peirce, is doubt, or the absence of belief? In the state of doubt, there will be feeling, but no habit and no order—hence, objectively viewed, the state of doubt will appear as purely random or chance behavior. Thus, objective orderliness or randomness corresponds to states of the universe in which habit is either strong or weak. The irritation of doubt is redefined as an intense consciousness associated with states of unordered feeling; as order or habit increases, the intensity of consciousness declines until, in the case in which virtually complete regularity has been established, it is so low as to be all but undetectable. Mind that is so hidebound with habit we regard as dead matter.

When the doubt-belief theory is applied to the organic universe itself, the result is an evolutionary cosmology. In the beginning, Peirce held, there is nothing but an undifferentiated continuum of pure feeling wholly without order—a primal chaos. From this starting point, the universe evolves by means of the development of habits. We have here the typical Spencerian passage from homogeneity to heterogeneity, but without benefit of Herbert Spencer's mechanical model. In the course of time, the universe becomes ever more orderly—but at any given time its habits remain less than perfectly regular and there are still areas requiring the further fixation of belief.

This cosmology is the basis for Peirce's doctrine of tychism—that there is absolute chance in the universe. For as law is the objective manifestation of habit, so chance is the objective manifestation of lack of habit; hence the primal undifferentiated continuum of feeling is literally a world of pure chance. Evolution constantly diminishes the amount of objective chance in the universe, but only in the limit does it wholly disappear. At any given time, some chance remains, and the laws of nature are not yet wholly exact.

**Pragmatism and universal evolution.** The doubt-belief theory describes inquiry as an attempt to escape the irritation of doubt. But it is hardly proper to say that the universe seeks to escape from doubt, and some better motive is required. The state toward which the universe is evolving is, according to Peirce's theory, one of complete order. Since such a state involves the complete subjection of feeling and action to belief, Peirce regarded it as the realization of rationality in the concrete, or, in his terms, of "concrete reasonableness." But it is also a state of maximum beauty, for Peirce's aesthetic is a coherence theory of beauty. Accordingly, the normative theory of inquiry may be brought to bear in explaining the evolutionary process. The end sought is concrete reasonableness; the

means, supplied by ethics, is the regulation of conduct by this aim. In the area of inquiry, this implies the discovery of those laws necessary to regulate behavior. Thus pragmatism, or pragmaticism, as Peirce renamed his doctrine after 1905 in order to distinguish it from James's, also serves the cause of evolution, for in translating the concept into a set of habits we discover the practical effects of the object—that is, how our conduct is affected. It remains for scientific inquiry, then, to discover the truth or falsity of potential habits and hence to fix belief. Thus the course of universal evolution and our modes of inquiry must remain ever in harmony, for the objective logic of evolution is identical with the logic of discovery. All nature works by a common process to a common end, and the duty of the individual man is to aid that process by devoting himself to scientific inquiry.

## Bibliography

### WORKS BY PEIRCE

*The Collected Papers of Charles Sanders Peirce*, Vols. I–VI, edited by Charles Hartshorne and Paul Weiss, Cambridge, MA: Harvard University Press, 1931–1935; Vols. VII–VIII, edited by Arthur Burks, Cambridge, MA: Harvard University Press, 1958. This is the basic published collection of Peirce's writings. (The usual method of citation to these volumes is by volume number, followed by a decimal point and the paragraph number—for example, 3.456.)

*Charles S. Peirce's Letters to Lady Welby*. Edited by Irwin Leib. New Haven, CT: Whitlock's, 1953. These letters, written between 1903 and 1911, are largely devoted to the theory of signs and contain some of Peirce's best writings on that subject.

### WORKS ON PEIRCE

Buchler, Justus. *Charles Peirce's Empiricism*. New York: Harcourt Brace, 1939. An incisive study of Peirce's more empirical doctrines, with particular emphasis on pragmatism and common-sensism.

Fiebleman, James. *An Introduction to Peirce's Philosophy, Interpreted as a System*. New York: Harper, 1946. A broad but superficial survey.

Gallie, W. B. *Peirce and Pragmatism*. London: Penguin, 1952. A thoughtful book devoted chiefly to Peirce's pragmatism.

Goudge, Thomas A. *The Thought of C. S. Peirce*. Toronto: University of Toronto Press, 1950. Goudge holds that Peirce's work contains two contradictory positions, which he

- calls naturalism and transcendentalism. The book is an exposition of this thesis and of its implications.
- Lewis, Clarence I. *A Survey of Symbolic Logic*. Berkeley: University of California Press, 1918. Ch. 1, Sec. 7. This is still the best essay on Peirce's work in logic.
- Moore, Edward C., and Richard S. Robin, eds. *Studies in the Philosophy of Charles Sanders Peirce, Second Series*. Amherst: University of Massachusetts Press, 1964.
- Murphey, Murray G. *The Development of Peirce's Philosophy*. Cambridge, MA: Harvard University Press, 1961. An attempt to interpret Peirce's work chronologically and systematically through the architectonic principle.
- Thompson, Manley. *The Pragmatic Philosophy of C. S. Peirce*. Chicago: University of Chicago Press, 1953. A thoughtful and systematic study of Peirce's pragmatism and related problems.
- Weiss, Paul. "Charles Sanders Peirce." In *Dictionary of American Biography*. New York, 1934. Vol. XIV. A very fine biographical article on Peirce.
- Wiener, Philip, and Frederic Harold Young, eds. *Studies in the Philosophy of Charles Sanders Peirce*. Cambridge, MA: Harvard University Press, 1952. This collection of essays on Peirce's philosophy is extremely uneven: it contains some excellent articles and some very poor ones. The papers by Savan, Thompson, Fisch and Cope, and Weiss are particularly good.

*Murray G. Murphey (1967)*

## PEIRCE, CHARLES SANDERS [ADDENDUM]

Charles Sanders Peirce, one of America's most original philosophers, produced a body of work remarkable for its scope and enduring relevance. For many years Peirce's principal contributions to mainstream philosophy were in logic and philosophy of science, but changes in the philosophic terrain since 1967 have brought new areas of his thought to prominence. The resurgence of interest in pragmatism, due in large measure to its promotion by Richard Rorty, and the adoption of Peirce by the Frankfurt School as the philosopher who may hold the key to the problem of modernity, have brought attention to Peirce's unique brand of pragmatism and to his philosophy of signs. Outside of philosophy, the active interdisciplinary field of semiotics that began in Chicago with Charles Morris acknowledges Peirce as the founder of modern sign theory.

Peirce was a late child of the enlightenment, a staunch believer in the universal applicability of mathematics and in the continuous growth of knowledge through sustained inquiry. He was a diligent student of the history of science and understood that the advancement of knowledge is crucially linked to nondeductive

(inductive and abductive) reasoning and shared experimental methods. He was convinced that a prerequisite for successful experimentation is an external world resistant to actions arising from misconceptions of it. These views led Peirce to an anti-Cartesian epistemology rooted in perceptual experience and committed to fallibilism and the repudiation of deductive foundationalism. Peirce generalized his view of the advancement of science to all forms of learning from experience, and he concluded that all meaningful conceptions are necessarily related to experiential expectations (conceived consequences). This is the epistemological motivation for his meaning-focused pragmatism (pragmaticism).

Sometimes Peirce is said to have equated truth with settled belief, but that applies only when belief is settled as the result of a steadfast application of scientific method. Other methods for overcoming doubt and settling belief, such as the a priori method or the methods of tenacity and authority, while not without some advantages, do not provide grounds for confidence that truth will be reached. Even the sustained application of scientific method can never issue in a guarantee that inquiry has "stormed the citadel of truth." Truth is always relative to propositions and is, therefore, grounded in the conventionality of symbolism (for propositions can only be expressed symbolically). The true represents the real precisely insofar as inquiry forces beliefs to yield to the dictates of an independent reality, but the "correspondence" of truth and reality that is hoped for at the end of inquiry is at best an ideal limit; we can never be certain that we have reached the truth. This is Peirce's fallibilism. It is typical of Peirce's philosophy that truth and reality are correlates in a triadic relation, where the mediating relate involves a community of inquirers (interpreters).

Peirce believed that the key to intelligence of any kind is sign action (which is always goal directed), and he formulated an elaborate semiotic theory to facilitate the analysis and classification of signs. Peirce's division of signs into icons, indexes, and symbols is his best-known semiotic bequest—although his distinction between tones, tokens, and types is also widely used—but these are only two of many triads that permeate his philosophy. Peirce held that minds are sign systems and thoughts are sign actions, and it is not too far-fetched to say that the mission of his semiotic is similar to that of modern-day cognitive science. Peirce's epistemological shift from a focus on ideas to signs marks him as a forerunner, if not a founder, of philosophy's so-called linguistic turn and, also, of the modern—and postmodern—emphasis on textualism. Peirce's triadic theory of signs distinguishes

semiotics from semiology, a generally dyadic theory of signs stemming from the work of Ferdinand de Saussure. Recently there have been attempts to reconcile these two approaches.

Current interest in Peirce's thought extends over most of philosophy. Peirce's graphical logic (his existential graphs) is used as a basis for computational linguistics. The recent move away from logicism has led to renewed interest in Peirce's philosophy of logic, according to which logic is not the epistemic foundation for mathematics. The rehabilitation of systematic and speculative thought has attracted attention to Peirce's evolutionary cosmology, which holds that the principal constituents of the universe are chance, law, and habit formation. Peirce insisted that change is really operative in nature (his tychism), that continuity, in general, prevails (his synechism), and that love or sympathy has a real influence on the course of events (his agapism). He contributed America's most original and thoroughgoing phenomenology (his phaneroscopy), and he advanced unique views on religion and on the significance of sentiment and instinct. He stressed the importance of the existent and the individual while, at the same time, admiring the ideal and insisting that rationality is rooted in the social. Peirce's intellectual legacy is a rich system of thought that helps organize and unify a broad array of issues in modern philosophy.

## PELAGIUS AND PELAGIANISM

Pelagius was a spiritual adviser to Christian aristocrats in Rome around the turn of the fifth century CE. In a commentary on the Pauline epistles, a treatise *On Nature*, and other writings, he sought to bolster Christian asceticism by opposing Manichaean determinism and affirming human capacity to progress toward moral perfection. His moral character and theological insights attracted followers who defended and developed his teachings.

Opposition to Pelagius and his followers began to intensify after Alaric's sack of Rome forced them to emigrate. In 411 one of Pelagius's protégées, Caelestius, sought ordination to the priesthood in Carthage and instead was condemned for his views on the nature and effect of Adam's sin. In his defense, Caelestius appealed to the teachings of a priest named Rufinus, whom Caelestius had heard oppose the notion of inherited sin. Pelagius himself traveled quickly through North Africa to Palestine where his teaching aroused Jerome's ire. In 415 Pelagius was called to defend himself before the bishop of Jerusalem and again before an episcopal synod at Diospolis, both of which acquitted him.

Indignant at these acquittals, Augustine—who had already written several anti-Pelagian treatises—led the literary and ecclesiastical attack on Pelagianism. Following conciliar, papal, and imperial condemnations in 418, Pelagius and Caelestius largely disappear from the historical record. Nineteen Italian bishops refused to subscribe to the papal proscription; among them was Julian of Eclanum, who wrote several lengthy polemical treatises, fragments of which survive embedded in Augustine's refutations. The judgment that Pelagian teachings were heretical was upheld by the ecumenical council at Ephesus in 431.

Modern scholarship has emphasized the importance of distinguishing between Pelagianism as a historical movement and Pelagianism as a theological system, the latter caricaturing the former. From the viewpoint of Christian orthodoxy, Pelagianism has often been construed as the heretical mirror image of Augustine's theology. Whereas Augustine defended established practices and doctrines such as infant baptism and original sin, Pelagianism controverted these and other traditions with novel heretical teachings that have been characterized as naturalistic, Stoic, and even godless. The theological tradition also canonized Augustine's characterization of Pelagians as *enemies of grace*, thereby implying that they deliberately denied grace, or at least reduced it to God's provision of the law and free will. Moreover, Pelagianism is accused of vainly overemphasizing the capacity of human free will. According to Augustine's full-blown predestinarian scheme, even the faith with which fallen human beings respond to God's gracious offer of salvation is itself a gift from God, given to some and withheld from others. As the opposite, Pelagianism implies an overconfidence that human nature is uncorrupt and possesses sufficient resources to attain moral perfection and eternal salvation solely by its own efforts without assistance from God's grace.

Like any caricature, this portrait of Pelagianism contains true features but distorts them by exaggerating some details and omitting others. The identification and subsequent scholarly analysis of additional Pelagian writings have revealed that Pelagian tenets are more nuanced than the prevailing stereotype suggests. Pelagius and his followers did not intentionally oppose Christian orthodoxy. Quite the contrary, they not only contrasted their teachings with the heresies of Arianism, Manichaeism, Origenism, and Jovinian, but also hurled countercharges of novelty and heterodoxy back at their opponents. As an historical movement, Pelagianism encompassed a diverse group of individuals who differed on a number of practical and theological issues but united in opposition to moral laxity and theological determinism. The defining characteristic of Pelagianism was not a negative denial of grace but, rather, the positive affirmation that it was possible (at least theoretically) for human beings to live sinlessly. If human beings *ought* to avoid sin—and most Pelagians considered this proposition a scriptural imperative—then human beings must be *able* to avoid sin.

Philosophical questions about freedom, responsibility, and justice were prominent in the Pelagian controversy but always in relation to theological concerns. For example, both Pelagius and Augustine strove to balance human free will and divine grace. Pelagius affirmed grace not only as God's creation of human free will and God's revelation through the law and through Christ, but also as the remission of sins in baptism and even as a constant help to free will, although Augustine dismissed the sincerity of the latter conception. Conversely, Augustine affirmed free will but apart from grace limited its scope in fallen humanity to choosing among evils. While Augustine accused his opponents of emphasizing free will to the extent that they denied any role for God's active grace, the Pelagians argued that Augustine's understanding of grace amounted to a determinism that eliminated free will.

The Pelagians defined sin as an act of will, not a substantial defect of nature; hence sin must be avoidable, and conversely that which cannot be avoided cannot be sin. Thus, when human beings choose to sin, they bear moral responsibility for their own actions and cannot blame God, the Devil, or even a vitiated nature. Consequently, the Pelagians understood the effect of Adam's sin as imitation of sinful habits rather than inheritance of a sinful nature, and most of them affirmed infant baptism, denying only that its function was to cleanse the newborn of inherited sin. Moreover, they argued that the inevitability and substantiality of original sin made God responsible for evil. For Julian, Augustine's teaching that the guilt of

Adam's sin was transmitted to each human being at conception also implied that marriage and reproduction were tainted by evil, therein betraying Augustine's lingering affinity with Manichaeism.

Finally, both sides in the Pelagian controversy refused to embrace theological positions that appeared to impugn divine justice. If sin were unavoidable, the Pelagians argued, it would be unjust for God to demand sinlessness and then to condemn human beings for sinning. Similarly, they saw injustice in the notion that God would condemn infants not for acts of their own volition but merely for inherited sin. Indeed, any god who would impute to one person the sins of another would be unjust. Augustine countered that a just God could not abide the suffering of infants unless these miseries were somehow deserved as a result of original sin, which rendered all humanity liable to God's just condemnation. Augustine posited that even God's sovereign choice to save some and not others, though an inscrutable mystery, could not be unjust.

## Bibliography

### WORKS BY PELAGIUS

- De divina lege.* In "Patrologia Latina." Vol. 30, cols. 106–116, edited by J. P. Migne, Paris: 1865 (included here among works falsely attributed to Jerome).
- De natura.* Fragments collected in "Pelagius' Schrift *De natura*: Rekonstruktion und Analyse." Winrich A. Löhr. *Recherches augustiniennes* 31 (1999): 235–294.
- De virginitate.* In *Sulpicii Severi Libri qui supersunt*, edited by C. Halm. "Corpus Scriptorum Ecclesiasticorum Latinorum," Vol. 1, 225–250. Vindobonae: C. Geroldi filium, 1866 (included here with the works of Sulpicius Severus).
- De vita Christiana.* In "Patrologia Latina." Vol. 40, cols. 1031–1046, edited by J. P. Migne, Paris: 1887 (here attributed to Augustine).
- Epistola ad Celantiam.* In *Sancti Eusebii Hieronymi Epistulae*, edited by Isidorus Hilberg. "Corpus Scriptorum Ecclesiasticorum Latinorum," Vol. 56.1, 329–356. Vindobonae: Verlag der Österreichischen Akademie der Wissenschaften, 1996 (here attributed to Jerome).
- Epistola ad Demetriadem.* In "Patrologia Latina." Vol. 30, cols. 16–46, edited by J. P. Migne, Paris: 1865 (included here among works falsely attributed to Jerome).
- Expositiones XIII Epistularum Pauli.* In *Pelagius's Expositions of Thirteen Epistles of St. Paul*, edited by Alexander Souter. Cambridge, U.K.: Cambridge University Press, 1922–1931 (Latin edition and commentary; 3 vols.).

*Libellus fidei.* In "Patrologia Latina." Vol. 48, cols. 488–491, edited by J. P. Migne. Paris: 1862.

### OTHER PELAGIAN WRITINGS

- Bohlin, Torgny. *Die Théologie des Pelagius und ihre Genesis.* Uppsala University Arsskrift 9. Uppsala: A.-B. Lundequist, 1957.
- Caelestius. *Liber de 13 capitula.* Fragments collected in *Rom und Pelagius: Die theologische Position der Römischen Bishöfe im pelagianischen Streit in den Jahren 411–432*, edited by Otto Wermelinger, 297–299. Stuttgart: Anton Hiersemann, 1975.
- Caspari, C. P., ed. *Briefe, Abhandlungen, und Predigten aus den zwei letzten Jahrhunderten des kirchlichen Alterthums und dem Anfang des Mittelalters.* (1890). Reprinted Brussels: Culture and Civilization, 1964 (Latin edition of six works by an anonymous Pelagian, with commentary).
- Julian of Eclanum. *Ad Florum.* Fragments embedded in Augustine's *Contra Julianum opus imperfectum*, Books I–III, *Sancti Aureli Augustini Opera*, Sec. 8, Part. 4, edited by E. Kalinka and M. Zelzer. "Corpus Scriptorum Ecclesiasticorum Latinorum." Vol. 85.1. Vindobonae: Hoelder-Pichler-Tempsky, 1974; and Books IV–VI, "Patrologia Latina," Vol. 45, edited by J. P. Migne. Paris: 1865.
- Julian of Eclanum. *Iuliani Aeclanensis. Expositio libri Iob; Tractatus prophetarum Osee, Iohel et Amos; accedunt operum deperditorum fragmenta post Albertum Bruckner denuo collecta aucta ordinate.* "Corpus Christianorum." Series Latina, Vol. 88, edited by Lucas De Coninck. Turnholt: Brepols, 1977 (Latin edition of two exegetical works and collected fragments of Julian's other writings).
- Rufinus. *Liber de fide.* In *Rufini presbyteri Liber de fide: A Critical Text and Translation with Introduction and Commentary*, edited by Mary W. Miller. Washington, DC: Catholic University of America Press, 1964.
- Fragments of Caelestius's *Definitiones* and Pelagius's *Pro libero arbitrio*, *Eclogarum*, and *Epistola ad Innocentium* are collected in "Patrologia Latina," Vol. 48, col. 255–698, edited by J. P. Migne. Paris: 1862 (also includes a discussion of Pelagianism).
- ### SECONDARY STUDIES
- Bonner, Gerald. *Augustine and Modern Research on Pelagianism.* Villanova: PA: Villanova University Press, 1972. Good overview of influential scholarship and its conclusions.
- Bonner, Gerald. "Pelagianism and Augustine." *Augustinian Studies* 23 (1992): pp. 33–51, and 24 (1993): pp. 27–47. Updated summary and observations on trends in Pelagian research.

## PERCEPTION

The term *perception* may be used generally for mental apprehension, but in philosophy it is now normally restricted to sense perception—to the discovery, by means of the senses, of the existence and properties of the external world. Philosophers have been concerned with the analysis of perception—that is, the study of its nature and of the processes involved in it—and with its epistemological value—that is, how far, if at all, it can be regarded as a source of knowledge about the world. Their answers to these closely interrelated questions have been formulated in various theories: the commonsense theory and other kinds of direct realism, the representative or causal theory, critical realism, the sense-datum theory, and phenomenism. This entry will be devoted to the main features of perception that underlie the various theories and that have raised philosophical problems and controversy. It will discuss both the initial evidence that may be analyzed without recourse to scientific findings and the causal and psychological process revealed by scientific investigation.

## INITIAL EVIDENCE AND ANALYSIS

**REFLECTIVE EXAMINATION.** As percipients we are all familiar with perception, and so the first evidence should come from reflection on our own experience. The following points may thus be made about perception.

First, it is awareness of the external world—of material objects, to use a technical term for physical objects in general, animals, plants, and human beings insofar as they are perceptible (their bodies, in fact). The main characteristics of such objects are that they are external, independent of the percipient, and public, meaning that many people can perceive them at once. Perception, in being the awareness of such objects, may be contrasted with imagery, bodily sensations, or having dreams.

Second, perception is, or seems to be, intuitive—immediate and normally undoubting, a direct face-to-face confrontation with the object in sight or a direct contact in touch. Nor are we normally conscious of any processes of reasoning or interpretation in it. On the rare occasions when we reason or we have doubts about what an object is, the reasoning or doubts are about the identity or character of something already perceived—for instance, a rectangular red object or something white on the hillside.

Third, perception is variable in quality and accuracy; we may fail to notice something, to see clearly, to hear distinctly, and so forth. Three types of variation may be involved: variations in attention, in what we notice or discriminate; variations in quality or distinctness (for instance, where there is nearsightedness or fog); and variations in liability to err—we may misidentify what we perceive or mistake its qualities.

Fourth, perception nevertheless normally gives us knowledge of material objects and properties. With a few fairly obvious tests, like touching and looking closely, or using the evidence of other percipients, we can establish certainty or else correct the first sight or hearing.

Fifth, perception often issues in some judgment or assertion (to others or perhaps only to oneself)—for example, "There is a green fly on the roses" or "Here's the milkman"—but it may not.

**ILLUSIONS.** Illusions, comprising illusions proper, hallucinations, and cases of the relativity of perception, have traditionally been the most important origin of the major problems of perception. The two main claims of the argument from illusion are (1) illusions show that perception is never absolutely certain, that tests are never final, and (2) the appearances we are aware of in illusions, especially

hallucinations, cannot be identified with the real properties of objects and must therefore be private objects of awareness, or *sensa* (indeed, all perception involves awareness of *sensa* that in correct, or veridical, perception belong to the object or correspond to its properties).

The first claim was long thought to rule out perceiving as a source of knowledge; instead, one had to turn to pure reason, or rational intuition, which was held to provide mathematical knowledge. But, since the absolute certainty of mathematics came to be generally ascribed to its ultimately analytic, or even tautological, character, the tendency now would be to stress the negligibility of the possibility of error in tested perception and to use a different standard of certainty and knowledge concerning matters of fact, one that allows perceptual statements to qualify.

The second claim, concerning the existence of *sensa*, is vital in that almost all theories of perception either found their analyses on it (as does the sense-datum theory) or seek to controvert it or explain it away (as does commonsense realism). The seeds of this conflict already lie in the results of the reflective examination. Insofar as perceiving seems to vary in quality and accuracy, it is easy to say that in illusions we merely see the object looking different from what it is. But if perception is a direct intuitive confrontation, the illusory appearance must be a genuine existent, perceived as it really is, a *sensum* in fact; “looking different from what it is” must be interpreted as “presenting *sensa* different from the standard ones.” In any case, some phenomena—for example, the integration of hallucinatory images with a perceived background—are difficult to explain without supposing awareness of private *sensa* in all perception, and almost all the phenomena require scientific and psychological findings for their full explanation, thus pointing beyond this initial evidence.

#### PERCEPTUAL CONSCIOUSNESS AND PERCEIVING.

The occurrence of illusions may lead to ambiguity in the use of *perceive* and allied terms. Thus, in double vision a man may be conscious of two bottles where there is only one. Do we say “He perceived two bottles” or “He perceived one bottle”? Each alternative has been adopted philosophically, and to avoid ambiguity, it is safer to distinguish (1) “*X* is perceptually conscious of *Y*” from (2) “*Y* is present to *X*’s senses (or light from it is acting on his sense organs)” and use “*X* perceives *Y*” only when both are meant.

This recommendation is claimed to have the further advantage of enabling us to discuss as perceptual con-

sciousness the state of mind (or mental act) occurring in both veridical perceiving and illusions. Perceptual consciousness of, for example, a dagger might occur when only a stick was present or even, as in Macbeth’s case, when nothing was there. The notion of such consciousness as a common factor in perceiving a real dagger, in having hallucinations of one, and in mistaking something else for one fits in best with dualist theories, such as the sense-datum theory (especially H. H. Price’s version) or critical realism, since it suggests that the contents of such consciousness differ from the external object perceived. Direct realists are suspicious of it; for them having hallucinations is something (imagery, perhaps) quite different from normal perception, even if confused with it, whereas in illusions they want to stress that one is perceiving the real object present—seeing a stick *as* a dagger or the round table *as* elliptical.

But even if perceiving a round table as round or in perspective as elliptical is taken as immediate confrontation needing no further analysis, seeing a stick as a dagger (or a piece of wax as a tomato or a bush in a fog as a man) can hardly be equally simple and immediate. In such cases and in hallucinations one has to admit that one seems to see an object quite different from that present to the senses. This can fairly be described as perceptual consciousness of the (ostensible) object (dagger, wax, or man) and distinguished in analysis from actually perceiving an object (dagger, wax, or man). And in view of the subjective similarity it is but a short step to suppose that perceptual consciousness of *X* also occurs in perceiving *X* as *X*, the difference between illusory and veridical perception of an *X* lying not in this common consciousness but in whether *X* is present and acting on the sense organs. Any philosophy of perception should analyze this perceptual consciousness and explain how it may occur without the presence of the corresponding object.

**ANALYSES OF PERCEPTUAL CONSCIOUSNESS.** Three major analyses are integral parts of the theories of perception mentioned above. First is the traditional notion that perceiving—that is, perceptual consciousness—is the interpretation of sensations as properties of external objects. Second, the sense-datum theory claims that perceptual consciousness is taking for granted that the sense datum one is sensing belongs to a material object. Third, the analysis of the critical realists, though stated as an analysis of perceiving, amounts to saying that perceptual consciousness is taking an intuited datum or character complex to characterize an external object.

The essential difficulty in these three analyses is that they contradict introspective evidence by splitting up perceptual consciousness into the awareness of some private data, recognizable by analysis as such, and the act of interpreting them as, or taking them to be, objects or object properties. In experience there is no such core of sensing or intuiting data distinguishable from the consciousness of a material object, even if only subsequently; still less is there any passage of the mind from awareness of sensation as such to object perception. And if some critical realists are less liable to this difficulty because they do not treat their data or character complexes as existents readily distinguishable from material objects, they do this only at the expense of obscurity or disagreement as to what the data are. Attempts at a remedy must be postponed until the psychological processes in perception are considered.

A fourth analysis is the idealist claim that all perceiving is judging, which is really an analysis of perceptual consciousness but is easier to follow if stated in terms of perceiving. It is that perceiving (perceptual consciousness) consists in making a judgment, which has an implicit sensory basis, about the real existence of an object or property. Thus, perceiving a tomato on a plate or perceiving that the dog has hurt its leg are the sensorily grounded judgments “There is a tomato on a plate” or “The dog has hurt its leg.” The “perceiving that” description of a perception (for example, “He saw that the dog was hurt”) certainly seems to suggest judgment, though the form may be misleading and may only be for emphasis of the feature noticed. But the main reasons for this analysis are (a) that perceiving is true (veridical) or false (erroneous) and only judgments or assertions can be true or false and (b) that perception is more than just sense experience, for we identify and interpret what is given (that is, it involves inference from implicit data, and the conclusion of such an inference must be a judgment).

One may object that truth characterizes what is asserted, not the asserting—the judgments, in the sense of propositions, to which perceiving may lead, but not the act of perceiving itself. Perceiving may be proper, correct, clear, or accurate, but not true or false. Many other things we do may be done correctly and be liable to errors without being forms of judging, such as playing the piano, playing games, tying knots. False judgment is not the only form of error. Also, the idealist doctrine that all perceiving is judging is open to the general objection to the first three analyses above, particularly because the nature of the implicit data or sensory grounds is very obscure. Attempts to elucidate it—for example, Brand Blan-

shard’s—turn them into *sensa*. Furthermore, the term *judgment* suggests something intellectual, explicit, and considered, with consciousness of the evidence for the assertion—conditions inappropriate to much perception. Also, we may correct a faulty judgment on learning the truth, but such knowledge does not enable us to correct illusory perceptions; we still see the mirage, and the railroad tracks still appear to meet in the distance.

Fifth, there is a causal analysis of perceptual consciousness—namely, that it is inferring that one’s *sensa* are caused by an external object. This may be associated with representative realism but is not essential to it; representative realism’s main thesis is that the *sensa* and the consciousness are externally caused by objects that the *sensa* “represent.” One may accept this thesis along with any of the analyses of perceptual consciousness—the causal inference it involves is subsequent to the perceiving, and so is a claim about perception. The difficulties of supposing that perceptual consciousness *consists in* such an inference from effect to cause are that (a) we are not conscious of such an inference; (b) if we started only with private *sensa*, any inference to external causes would be too difficult and complex to be automatic and unconscious—it would *have* to be conscious; and (c) it leads to paradoxes, such as that children, being ignorant of the supposed causation of perception, cannot therefore perceive or be perceptually conscious of anything.

**CONCEPTUAL ANALYSIS OF PERCEIVING.** A rather different approach to perceiving is adopted by those who advocate conceptual analysis—that is, a close study of the ordinary meaning (or use) of expressions. This analysis is naturally associated with commonsense realism, for ordinary language tends to reflect ordinary views on perception or at least what once were such views. Such analysis, however, may well indicate features of perception that are not normally realized and so supplement or even correct reflective examination of an introspective kind.

Much attention along these lines has been directed to the categorization or classification of perceiving. Previous philosophers have referred to perception in various ways: as an act, even an operation, as a process, and as a mental state. None of these is satisfactory. “Act,” at least as activity or operation, suggests listening or watching rather than just hearing or seeing; “state” and “process” suggest something long-term, and “process,” like “activity,” suggests something open to public observation—yet whereas one may observe *X* looking at *Y* one cannot observe *X* seeing *Y*. (One can perhaps claim that the best description of perception is “mental act,” which would put per-

ceiving in a special category with realizing, noticing, deciding and so on, but mental acts as such are suspect to these philosophers.) One suggestion is that perceiving is simply having an experience, but this neglects the active side of recognizing and identifying involved in it. A more popular suggestion is that perceiving is a skill or art, or, rather, since seeing *X* or hearing *Y* occur at a definite time, perceiving is the exercise of a skill.

Oddly enough, the evidence for this is not linguistic. We may speak of a skilled observer, one who can direct and coordinate a series of perceptions, but not a skilled perceiver; we do not say that *X* is an expert at the art of seeing or hearing things. Rather, this suggestion is based on the fact that perceiving can be improved by learning and experience, so that one recognizes things easily, avoids mistakes, or can make allowances for such factors as distance. Although this may occur to one on reflection, however, its full and precise extent has been established only by psychological investigation. As soon as one seeks out this and other psychological evidence about perceiving or even asks how one learns by and exploits experience in perceiving, one is carried far beyond language and conceptual analysis to a scientific study of the subject. Also, to maintain that perceiving is the exercise of a skill brings one back to the suggestion that it is an operation or activity.

More striking perhaps was the earlier claim of Gilbert Ryle that “perceiving” is an achievement verb, like “finding” or “winning,” and indicates the scoring of an investigational success. This means that perceiving is not an activity or process, though it may be the successful termination of the activity of looking for something; it is instantaneous, not something that takes time or can be observed. Ryle’s aim was to attack representative realism and its associated dualisms of mind and body, *sensa* and object, by claiming that (*a*) perceiving, usually thought to be a private mental activity because it is not an overt one, is not an activity at all and thus provides no evidence of a mental world and that (*b*) since it is not a process, perceiving is not the final stage or effect of a process, particularly not of the causal process from object to person. Hence, there is no need to suppose that science proves that perceiving is awareness of private *sensa*.

These are not very convincing arguments. As to the first, winning or scoring involves some activity such as kicking a ball. Likewise, perceiving involves experiences of colors or sounds and the psychological processes discussed below; these are normally claimed to be mental. The second is a non sequitur—instantaneous success may be the end and result of a causal process. Thus, scoring

and finding may be observed and may be the result of a process or series of activities; other conditions may also be required but do not rule out their being effects. More generally, if perceiving is an achievement, what are misperception, illusion, failure to see properly, a casual glance? An analysis of perceiving must take these into account and not apply only to veridical perception. Ryle also failed to show how perceiving is related to the causal processes representative realism emphasizes. Thus, if instantaneous, perceiving can no longer be the relation across time and space that direct realism would need to claim in view of the factually verified time lag, the time taken by the causal transmission from a distant object. Indeed, contrary to Ryle’s intention, a dualist interpretation of his claim is possible. Perceptual consciousness is instantaneous; when it is also successful, that is, when its content corresponds to the properties of the object causing it, it is perceiving; when unsuccessful, it is misperception or illusion.

## THE CAUSAL PROCESSES IN PERCEPTION

**THE CAUSAL CHAINS.** The causal processes involved in perception form causal chains from the external object to the percipient’s brain. In sight a complex system of light waves, sometimes emitted by the object but normally a differential reflection of light from the object’s surface, travels from the object to the percipient’s eyes. This system is diversified in intensity and wavelength according to the shape, brightness, and color of the object surface and, on striking the eyes, is focused so that an image of the object is cast (upside down) on each retina. Each retina has a mosaic of more than 120 million receptors, which are activated by the light cast on them in this image. The light causes chemical changes in the receptors; these changes, in turn, cause electrical impulses to pass along the nerve fibers that lead from the receptors to one of the two visual receiving areas of the brain. The impulses set up activity there and in certain other association areas; this done, the person then sees the object. More than one million such fibers form the optic nerve from each eye, and each fiber consists of a succession of cells that are made to conduct by a chain reaction; the resultant impulses can be picked up and reproduced on a cathode-ray tube.

In hearing, a pattern of sound waves is emitted or reflected from the object and strikes the eardrum; this causes vibrations to be transmitted through a series of bones to the liquid filling in the inner ear, thereby setting up vibrations in the basilar membrane of the cochlea

according to the frequency (waves per second, corresponding to pitch) and intensity of the sound. The receptors in the cochlea then transmit electrical impulses along the nerve fibers to another receiving area in the brain. (These impulses are not at the frequency of the incoming sound.)

In smell and taste there is a chemical stimulation of receptors in the nose and tongue by particles of the substance perceived, and the receptors, in turn, send neural impulses to another area of the brain. For touch, the brain is linked to receptors all over the skin, some of which respond to the pressure of direct contact with the object, some to heat, and some to cold (or, rather, to rate of change in skin temperature). Other receptors in the skin and the body respond to a wide range of stimuli by transmitting to the brain impulses that ultimately cause a sensation of pain. There are also other senses—for example, a kinesthetic sense by which receptors in the muscles send impulses to the brain so that the position of the limbs is sensed or unconscious adjustments are made to guide and make efficient voluntary movement. There are also receptors in the vestibule and semicircular canals behind the ear that assist balance and give us information about head position.

The chain process (object-[waves]-receptor-nerve impulses-brain activity) is a necessary condition of perception of an external object, for if it is interrupted by damage to the sense organ, no perception occurs. It is not a fully sufficient condition in that other areas of the brain must be suitably active so that the person is conscious and minimally attentive—that is, not wholly absorbed in thought. The interesting question is whether or how far the chain process is necessary and sufficient for perceptual consciousness of an object, granted conditions of consciousness and attention. At least the brain activity is clearly necessary, but theoretically one might insert stimulation at some point on the chain and thus cause experiences the same as those that would normally be attributed to the external object. This apparently happens naturally in illusions and hallucinations, including phantom limbs, and electrical stimulation of the appropriate areas of the brain may cause sensations of color, smell, or touch. (The sensations are not like the contents of perceptual consciousness of objects, but this difference may be due to the comparative crudity of the artificial stimulation by an electrode; also, activity in the association areas is necessary for normal perception.) Thus, it seems probable that suitable activity in the nervous system is a necessary and sufficient condition of perceptual consciousness, though it may be that some kind of external

stimulation, even one quite unlike the object perceived, is required to trigger it.

**TIME LAG.** Causal processes take time. In the case of distant objects this is marked. Thus, because sound waves travel much more slowly than light waves, the flash of some distant gunfire or explosion may be seen appreciably before the sound is heard. Even at its great speed light takes eight minutes to reach us from the sun and four years and four months from the nearest star. Consequently, we may well be “seeing” a star long after it has disintegrated, for the perceptual consciousness occurs at approximately the time of the arrival of the star’s light on Earth. But as time is required for the sense organ to be activated and for the nerve impulses to travel to and spread in the brain, there is a slight but variable time lag in all perception; an accurate estimate is not possible but the delay is probably of the order of one-tenth of a second for nearby objects.

**UNIFORMITY OF NERVE IMPULSES.** One surprising fact is that the nerve impulses are of a similar type for all the senses. All that travels along any nerve from any receptor to the brain is a sequence of such impulses varying normally between 10 and 100 per second. The frequency variation is, in fact, a mark of intensity; the stronger the stimulus, the more impulses per second. Consequently, what distinguishes causation of an experience of sound from that of smell or an experience of a high pitched sound from that of a low one is not the impulse itself but the connections of the nerve fibers excited and conducting—where they start in the sense organ and where they end in the brain. (Though if one imagines a cross section across a bundle of nerve fibers, the pattern of some conducting and some not conducting can be regarded as a changing code.) Thus, excitation by nerve impulses of one tiny portion of the brain results in awareness of a loud shrill sound, excitation of another in awareness of a blue line. Various areas of the body are mapped in the brain, a group of receptors (or sometimes an individual receptor) in the skin and tissues corresponding to each point in the cerebral receiving area. Similarly, the retinal image is reproduced point by point in the brain, though with each half reproduced in a separate area, duplicated there, and distorted. Again, a strip of brain tissue is activated at different points according to the frequency of the sounds heard, as if it were a keyboard.

**COMPLEXITIES.** There are nevertheless many complexities in the system, only a few of which we can mention

here. The nerve connections are intricate, with feedback fibers from the brain to the incoming sensory fibers and cross connections between the sensory fibers; in the grouping of receptors and in the brain there is summation—several nerves join one that conducts only when all or most of them do. (In fact, neurologists constantly use such terms as *selecting*, *integrating*, *summing*, and *coding*.)

Binocular vision involves retinal disparity (a slight difference in the images cast on the two retinas) and the operation of two visual receiving areas reached by crossed-over nerve fibers so connected that the left-hand receiving area receives the signals coming from the right half of each retina and the right-hand area receives those of the left half. As a result we somehow normally see one object with depth and solidity rather than two two-dimensional ones.

Constant small eye movements are necessary for vision, with a shifting of the retinal image and of the resultant pattern of impulses in the fibers of the optic nerve, yet the object is seen as steady.

Most of the impulses reaching the brain from the eye come from a small portion of the retina (the fovea) that has relatively many receptors giving great distinctness; for exact vision the image is focused on the fovea by eye movement.

Color vision is particularly complex, and its mechanism is disputed. All the colors we know can be produced by suitable mixtures of red (long-wave), green (medium-wave), and blue (short-wave) light. White light can be formed by an appropriate combination of three colors or even of two widely separated ones. (Light, or “spectral” colors, mix differently from paint colors.) The simplest theory is that there are receptors in the eye reacting to each primary light color (red, green, and blue) and the brain, by summing the three color inputs, is enabled to cause the final color sensation. Thus, grass looks green because it absorbs red and blue light but reflects green, and a buttercup is yellow because it absorbs blue but reflects green and red, which combine to produce yellow. There are many difficulties in this theory. For instance, no receptors for blue can be positively located in the eye, only for red and green ones; the light from a green surface actually contains a mixture of wave lengths, with green predominating; the light wave lengths cover the spectrum of all the colors of the rainbow; the brightness and purity of the color also affect its hue. A final theory must therefore be very complicated.

The auditory receiving area gets impulses from both ears. This enables us to locate the source of a sound. If a sound is to the left, then sound waves reaching the left ear differ in phase (that is, timing of the wave crests) and in intensity from those reaching the right ear. The brain apparently combines the different inputs so that the location is done unconsciously and we just hear the sound as if it came from a certain direction.

**LIMITATIONS OF THE SENSES.** Radiant energy is known to range from short cosmic rays to long radio waves, but the eye responds only to visual light, which is a narrow band occupying about one-seventieth of the whole range. Even then we cannot distinguish light of different polarizations, as bees and birds apparently can, or see very small objects or fine structures. Similarly, in hearing we can distinguish only waves between 20 and 20,000 cycles per second; dogs, cats and rats can hear higher notes. Our sense of smell is obviously very inefficient compared with that of most other animals. Hence, though we can extend our range of observation by microscopes, infrared or X-ray photographs, radiotelescopes, and so on, it is clear that our senses themselves are very limited as a direct source of knowledge of the external world.

**THE CAUSAL ARGUMENT.** The causal argument maintains that the existence and character of these causal processes refute direct realism and force the adoption of a dualist position. Perception of an external object cannot be the direct contact or immediate confrontation it seems to be, since it requires this causal chain from object to the percipient’s brain and is prevented if that is interrupted—for instance, if the optic nerve is cut or one of the small bones in the ear does not move properly. In this sense directness or immediacy must mean no intermediary and no possibility of interruption. The causal chain suggests that perceptual consciousness and its objects are generated, or brought into being, by the causal process, presumably by its last stage, the brain activity. In other words, insofar as perceptual consciousness is intuitive, it is awareness of some content or object quite distinct from the external object.

This suggestion is supported by various points. First, the time lag—perceptual consciousness may occur after the external object has disappeared or moved, so its content cannot be identified with the object. Second, the possibility of perceptual consciousness without any external object at all or without one at all similar seems confirmed by the production of sensations by stimulation of the cerebral cortex and seems actualized in hallucinations.

Third, the enormous complexity involved shows that the subjective simplicity of perception is illusory, at least insofar as a relation to an external object is concerned. Fourth, illusions and the relativity of perception are often explicable in terms of the causal processes. Unless the contents of perceptual consciousness are generated and conditioned by the causal process, one has to attribute bizarre and contradictory properties to the external object. Fifth, the simplicity and uniformity of nervous impulses show that they cannot transmit all the various secondary qualities that make up objects as we know them. These qualities must thus characterize contents of consciousness generated by the causal process. (This point is supported by such other limitations as the purely mechanical transmission through the bones of the ear.) Hence, it follows from the fourth and fifth points that one must abandon the other assumption of direct realism—that even when we are not perceiving them, objects continue to exist with the exact qualities we normally observe in them.

There is a good deal of resistance to these conclusions. One obstacle is that they seem to require a self-refuting type of representative realism. This fear is unjustified. It must also be noted that granted the dualist conclusion that the causal process generates the sensory experience whose content is (numerically) different from the external object, the nature of that experience and its content is still open. It may be that the awareness is of *sensa*, or it may be a full-fledged perceptual consciousness of percepts or ostensible objects. One is not even forced to adopt a mind-body dualism, though it is normally thought that *sensa* or percepts are mental. One might claim that though apparently distinct objects, they are in fact only the contents of sense experience, not existing apart from the sensing of them (adverbial analysis), and that they and the brain activity are two aspects of the reaction of the organism or person as a whole. This would mean that *sensa* are only a correlated aspect of brain activity, not effects of it, though still conditioned by the rest of the chain. In this way one might bypass one of the notorious difficulties of ordinary dualism—the unique and obscure causal relation supposed to exist between material brain and immaterial mind.

Sometimes, however, the opposition takes the form of denying the relevance of the scientific evidence to philosophy; it tells us only what the causes of perceiving are, not what perceiving itself is. Philosophers must investigate the latter and leave the causal processes to the scientist. But scientists normally hold that these processes require the adoption of representative realism, thus giv-

ing them philosophical relevance; also, those philosophers who wish to concentrate on the nature of perception alone usually come up with some answer (the sense-datum analysis or a view that perceiving is the exercise of a skill or an investigational success) that is compatible with or even supports a dualist interpretation of the causal processes. But, above all, to achieve full understanding of anything so vital as perception, one must consider its causes and conditions, particularly as their study has traditionally been claimed to transform our concepts of perceiving itself and of our knowledge of the external world.

### THE PSYCHOLOGICAL PROCESSES

It is clear from experimental psychology that perceptual consciousness involves a whole range of adjustments and selective or quasi-interpretative processes. The main evidence for this lies in differences between what psychologists often call the phenomenal properties of an object (those we are perceptually conscious of) and its stimulus properties. In this context the stimulus is the pattern of light rays from the object striking the eye, of sound waves striking the ear, or of heat or pressure from touching the object. The stimulus properties are those that we should observe in the stimulus (such as shape, color, pitch) could we observe it directly and in itself. This is difficult to achieve, and in fact the evidence of cameras, tape recorders, and other instruments is used, plus knowledge of the nature of the object and reasoning from the laws of perspective or of physics generally. The difference between the two kinds of property is presumed to be the result of modifications by the perceiver.

**ATTENTION AND SELECTION.** It is a simple fact of experience that the quality and accuracy of perception vary with our attention. We often look inattentively and fail to notice pronounced features of a scene, yet we may carefully observe and thus notice unexpected details—a mark on the wallpaper, a printer's error, a wrong note in a recorded symphony. From the evidence of other people, from photographs, and from other means there may be no doubt that these features appeared all the time in the stimulus properties even when we were unconscious of them. Besides confirming this, psychologists have shown how greatly what we do or do not notice depends on habits of attention or interests, on often unconscious "priming" or "set." A mother will hear her baby cry but not notice much louder noises; an architect may notice features of buildings, and a boy notices makes of cars, both being oblivious to much else. Thus, perceptual consciousness is very selective, and this selection is usually

largely unconscious, though voluntary attention can greatly modify it. One special case of voluntary attention is of importance—"perceptual reduction" or "phenomenological observation," where we concentrate on the sensible qualities of what we perceive and not, as is usual, on the identification of the object concerned. An artist must do this when he has to paint a scene, and this kind of observation may reveal all sorts of previously unnoticed details of color, shape, and so on. It is open to question whether this kind of reduction reveals an element present in all perception—namely, sensing—or whether, and this is more plausible, it is simply a special kind of perception of external objects not found in normal perceiving.

**ERRORS AND ENRICHMENT.** Some errors in perception can be attributed to psychological factors—misidentifications because of careless observation, seeing what one expects to see rather than what is actually present, thinking that one hears the expected visitor coming when no one is there, and the like. These point to a common characteristic of perception and one apparent only when it goes wrong—the enrichment of perception by imagery and thought. Many psychological experiments have been concerned with this. For example, vague or ambiguous stimuli (pictures or sounds) are presented to different groups of people who see or hear them as definite objects or words, and the direction in which they are thus unconsciously supplemented or altered can be shown to be caused by suggestion or by the interests, emotional state, or physical state of the person. Another kind of case is the divergence between several eyewitnesses' accounts of an incident, which may all differ from a filmed record. Again, blind spots or other visual defects are often not apparent to the subject, who unconsciously fills in the gap (this happens to us all if we look with one eye, for there is a blind spot where the optic nerve leaves the retina). Extreme cases are hallucinations where the apparition is integrated with the background or casts shadows. Unnoticed supplementation by imagery, which is admittedly private and mental, seems strong evidence for the dualist claim that the contents of perceptual consciousness are similarly private and must be distinguished from object properties.

**LEARNING AND CUES.** Our perception is clearly affected by learning and experience. Identification and discrimination afford obvious examples; one can learn to identify objects seen or photographed from unusual angles, to detect animals in natural camouflage, to distinguish different birds' songs. Driving a car involves perceptions of distance and relative speeds, perceptions that

are acquired by experience. Psychological investigation has shown the role of learning to be far greater than this. Perception of spatial relations generally depends to a large extent on learning (normally unconscious and in childhood) to harmonize sight and touch and to use various cues. This is shown by various experiments, such as those with distorted rooms or inverted spectacles, and by the evidence of blind men who recover their sight. Among the various cues used for perception of distance and of solidity are shadows, aerial and linear perspective, parallax (or relative movement), and the interposition of objects. These assist binocular vision and enable us to see depth even with one eye.

**FIGURE-GROUND AND GESTALT.** In perception our immediate consciousness is of an organized or structured whole. Some shape or feature stands out and is seen as the figure against a background, and if discrete units such as dots are presented, we see them as grouped or patterned in some way. This characteristic of experience has been particularly stressed by Gestalt psychologists, who produced much experimental evidence to show that we see wholes or structures (Gestalten, literally, "forms") and that perception develops by discriminating these in and from a background and not by synthesis of atomic elements or point sensations first perceived separately. Such organization of the visual field, though little affected by learning, is nevertheless largely the result of processes in the percipient himself. The clearest evidence of this comes from the reversals, or "alternating illusions," where the stimulus (picture or succession of sounds) is constant but is perceived differently at different times; thus, sometimes one pattern or shape stands out as the figure, sometimes another. Examples are the goblet that may appear as two faces in profile, Edwin Boring's wife-mother-in-law figure, Ludwig Wittgenstein's duck-rabbit, and the staircase that seems to be seen now from above, now from below.

**PERCEPTION OF MOTION.** Perception of motion was closely investigated by the Gestalt psychologists, who drew attention to the Phi phenomenon, which is the impression of movement between adjacent stationary stimuli that are activated in succession. This underlies the consciousness of movement on a motion picture or television screen and is used in illuminated advertisements in which if groups of lights are successively switched on for a brief time, one is perceptually conscious of a moving figure or even of words moving along. Intermittent illumination may also make moving objects appear stationary. Thus, when illuminated by the flashing light of a

stroboscope, a moving crank in a machine may, if the flashing is properly adjusted, be seen as stationary and examined for defects; if there is a slight maladjustment of the flashing, it may seem to rotate slowly backward like the wheels of coaches in Western films. There is a clear distinction in these cases between the properties of the stimulus and the contents of consciousness. Figure-ground effects also occur in movement perception, such as when the moon seems to sail through the clouds or when one's stationary train seems to move if an adjacent one starts.

**OBJECT CONSTANCY.** The widespread phenomenon of object constancy in perception differs from the above in that the phenomenal properties of an object tend to remain constant or nearly so even though the stimulus properties vary considerably. Thus, when we look at a round object—for example, a dish—from an angle, it often still looks round and not elliptical, although by the laws of perspective the stimulus (light-ray pattern) or retinal image is elliptical, as would appear on a photograph taken from the percipient's viewpoint. (This causes complication in stating the argument from illusion and perspective realism.) Only if the angle is very marked does the dish look elliptical. ("Look" here refers to the sensible quality, not to what we judge to be the object's shape.) Similarly with size, brightness, and color—a man looks much the same size at ten yards' distance as at five even though the image cast on the retina is half as high in the former case; a white patch in the shade reflects less light than a dark one in bright sunlight, but it still looks white; a white patch in a yellowish light still looks white although it is reflecting yellowish light (one may be surprised by color photographs taken in the evening, for the camera cannot adapt itself to the yellower light).

In general, over a range of varied stimuli we tend to see something corresponding to the property of the object or at least some compromise between this and the stimulus property. Experiments show that this constancy depends not on knowledge of the object but on the visibility of its background, for if the background is cut off by a screen so that only the object is visible, constancy does not hold and the stimulus property is seen. It is as though we made unconscious allowance for distance, angle of sight, and illumination as revealed by the whole scene. But this is not a learned or intelligent adjustment; children and even chickens or fish apparently see things with constancy, though to some extent it can be counteracted by adopting a stimulus attitude (trying to see the stimulus property).

**PHILOSOPHICAL SIGNIFICANCE.** The existence of these many complex processes that underlie perceptual consciousness and affect its content reinforces the causal argument by making even more incredible the direct-realist notion of perceiving as a straightforward direct confrontation with the actual properties of objects. If perception were a simple intuitive awareness of such properties, there would be no place in it for variations in quality; for the effects of interests, priming, and learning; and for the use of cues for enrichment by or integration with supplementary imagery, for constancy adjustments (especially where they produce a compromise between object and stimulus properties), for changing figure-ground effects, or for the Phi phenomenon.

The range of these processes is far greater than that which would be compatible with the usual analyses of perceptual consciousness—namely, that it is the interpretation of sensations (or inference from implicit grounds) or the taking for granted that a sensed datum belongs to an object. These views were mainly influenced by the possibility of error in perception, particularly in identification, although they took some account of the use of cues and of the role of learning. But they seem inadequate to cover the part played by attention and unconscious selection or by such organization adjustments as figure-ground, grouping, object constancy, or the Phi phenomenon, whereas some of the imaginative supplementation goes far beyond what can be called interpreting a datum. It is sometimes claimed that these adjustments are interpretations. But this is implausible, for they seem little affected by learning and are not intelligent since lower animals make them. Nor can many of the illusions or adjustments be overcome by knowledge of the facts or by conscious interpretation; where some counteraction is possible, as in object constancy, it is very difficult, and for most people the presence or absence of screens in experiments is compelling in its effect.

The final objection to such analyses concerns the alleged pure sensory data; interpreting or taking for granted, insofar as we are aware of it, is of something we are conscious of as distinct and external and which is thus already the effect of many of these processes. Normally, however, perceptual consciousness seems intuitive—that is, without interpretation and quite unanalyzable; except in perceptual reduction its content almost always consists of ostensible objects. All the same, psychological evidence shows that there is a range of subjective processes. The only answer seems to be a genetic hypothesis, not an analysis into elements. Perceptual consciousness is introspectively a whole but must be supposed to be a product

of a range of selective, supplementary, integrative or organizational, and quasi-interpretative processes acting on a supposed basic sentience. But—and this is the point—both processes and sentience are unconscious and so may plausibly be regarded as cerebral activities or adjustments of the nervous system. However, since we cannot as yet give any precise neurological statement of these processes, we have to describe them as if they were conscious, basing the description on the difference between the input to the senses and the finished product, but this product (perceptual consciousness) does not reveal within itself the processes that may be supposed to form it.

The suggestion that perceptual consciousness is the product of many unconscious processes is controversial, and any general conclusions about perception are bound to be personal. Hence, the main attention in this entry has been on the facts that have to be taken into account in any fully adequate view of perception, and the reader is also referred to the statement of the various theories here and in other related entries. In this way one has the material for assessing the general view here adopted—namely, that the causal and psychological processes essential to perception, as well as its liability to illusion, require abandonment of direct realism for a dualist position. One must distinguish perceptual consciousness, whose content or objects are subjective and private to the percipient, from perception that occurs when this perceptual consciousness is caused by an external object with properties corresponding to its content. But one must not confuse this dualism with the traditional representative realism, which is only a variant of it, some form of critical realism being superior; the sense-datum theory's dualism of sense data and objects (perceptual consciousness is not thus analyzable, and its content consists of ostensible material objects); or the Cartesian mind-body dualism (it is possible also to adapt this view of perception to a double-aspect account of mind and body).

## Bibliography

### GENERAL INTRODUCTIONS

Perception is discussed, though usually less extensively than in the related entries in this encyclopedia, by most introductory books on philosophy. For example, see Bertrand Russell, *Problems of Philosophy* (London: Williams and Norgate, 1912) and *Outline of Philosophy* (London: Allen and Unwin, 1927); Charles Harold Whiteley, *Introduction to Metaphysics* (London, 1955); John Hospers,

*Introduction to Philosophical Analysis* (New York: Prentice-Hall, 1953; London: Routledge and Paul, 1956); and Arthur Pap, *Elements of Analytic Philosophy* (New York: Macmillan, 1949). A clear and useful outline with emphasis on the associated epistemological problems is A. J. Ayer's *The Problem of Knowledge* (London: Macmillan, 1956). A more detailed introductory treatment is given by R. J. Hirst, *The Problems of Perception* (London: Allen and Unwin, 1959), Chs. I–VI; the later chapters of this book develop a more advanced treatment of perceptual consciousness and the scientific evidence on the lines adumbrated here.

### PERCEPTUAL CONSCIOUSNESS

For analyses of perception in the sense of perceptual consciousness, see H. H. Price, *Perception* (London: Methuen, 1954) on the sense-datum theory; Durant Drake and others, *Essays in Critical Realism* (London: Macmillan, 1920), and Roy Wood Sellars, *The Philosophy of Physical Realism* (New York: Macmillan, 1932), on critical realism; Brand Blanshard, *The Nature of Thought*, Vol. I (London: Allen and Unwin, 1939), on idealism; and Roderick M. Chisholm, *Perceiving: A Philosophical Study* (Ithaca, NY: Cornell University Press, 1957), which is a causal analysis with a general consideration of perceiving and epistemological questions. Roderick Firth, "Sense-Data and the Percept Theory," in *Mind* 58 (232) (1949): 434–465, and 59 (233) (1950): 35–36, is critical of any such analyses.

### CONCEPTUAL ANALYSIS

For the approach by conceptual analysis see "On Seeing and Hearing" by Winston H. F. Barnes, "Identification and Existence" by Stuart Hampshire, and "Sensation" by Gilbert Ryle in *Contemporary British Philosophy*, Vol. III, edited by H. D. Lewis (London: Allen and Unwin, 1956); Gilbert Ryle, *The Concept of Mind* (London: Hutchinson, 1949), Ch. 7, and *Dilemmas* (Cambridge, U.K.: Cambridge University Press, 1954); Anthony M. Quinton, "The Problem of Perception," in *Mind* 64 (253) (1955): 28–51; and D. W. Hamlyn's discussion of psychological theories, *The Psychology of Perception* (London: Routledge and Paul, 1957). John Langshaw Austin's *Sense and Sensibilia* (Oxford: Clarendon Press, 1962) is an outstanding defense of common sense against the argument from illusion, but unfortunately he does not discuss the scientific evidence. Another direct-realist study is D. M. Armstrong's *Perception and the Physical World* (New York: Humanities Press, 1961).

### SCIENTIFIC BACKGROUND

Useful elementary accounts of the causal and psychological processes are given in such textbooks as Ernest Ropiequet Hilgard, *Introduction to Psychology* (New York: Harcourt Brace, 1953); David Krech and Richard Stanley Crutchfield, *Elements of Psychology*, 3rd ed. (New York: Knopf, 1962); and Robert Sessions Woodworth and D. G. Marquis, *Psychology* (New York: Holt, 1947; London: Methuen, 1949). Rather more detail, with a philosophical discussion as well, is given in George McCreath Wyburn, Ralph William Pickford, and R. J. Hirst, *Human Senses and Perception* (Edinburgh: Oliver and Boyd, 1964). Two significant but unconventional psychological books that raise philosophical questions of interest to the advanced student are James Jerome Gibson, *The Perception of the Visual World* (Boston: Houghton Mifflin, 1950), and Friedrich August von Hayek,

*The Sensory Order* (Chicago: University of Chicago Press, 1952; London: Routledge, 1953).

#### INTERPRETATIONS OF SCIENTIFIC EVIDENCE

See the works by Price, Chisholm, Hirst and the critical realists mentioned above and Arthur O. Lovejoy, *The Revolt against Dualism* (La Salle, IL: Open Court, 1930), also a critical realist. C. D. Broad's *Perception, Physics and Reality* (Cambridge, U.K.: Cambridge University Press, 1914) and *Scientific Thought* (London: Kegan Paul, 1923), sense-datum analyses, are very technical at times. William Pepperell Montague, *The Ways of Knowing* (New York: Macmillan, 1925), gives a general comparison of the different realist (and other) views. See also the more sophisticated types of representative realism—namely, John Raymond Smythies, *Analysis of Perception* (London: Routledge and Paul, 1956), or Bertrand Russell, *Analysis of Matter* (London: Kegan Paul, 1927) and *Human Knowledge* (London: Allen and Unwin, 1948). Of Russell's two books, the first is often difficult, and the second is more for the general reader.

## PERCEPTION, CONTEMPORARY VIEWS

Philosophical accounts of perception aim to give a coherent and systematic account of the nature of our sensory experiences. Philosophical accounts differ from scientific ones, which aim at explaining how the specific mechanisms of perception work. Philosophers are interested in general features that are common to anything that we might reasonably call perception, abstracting away from the specific mechanisms by which we perceive the world. Contemporary theorists of perception have proposed theories aimed at addressing a number of questions about perception, including the following: What accounts for the distinctive feel of our sensory experiences? Is perception a representational state with specific content (like desires and beliefs)? Is perception a "direct" awareness of the world? How does perception make possible beliefs and thoughts about the world? How do perceptions serve as reasons for belief, making possible knowledge of the world?

#### APPEARANCE, REALITY, AND PHENOMENAL CHARACTER

One main source of philosophical puzzlement that has persisted since ancient times is the distinction between appearance and reality. To see the distinction, consider an example in which you see a ripe tomato sitting on a well-lit table. Assuming your eyesight is good, the tomato will appear a certain way to you; for example, it may appear red and round. This is a case of what we will call veridical perception. The tomato appears red and round to you, and in reality it is that way. It is, of course, also possible to misperceive, in which case the way things appear will not match the way they are. For example, if the tomato is in unusual lighting, it might appear to be purple rather than red. Likewise, if you are wearing shape-distorting glasses, the tomato might appear to be tall and skinny rather than short and plump, as it really is. These are cases of illusion, which involve objects appearing to you to have properties other than the ones that they have in reality. A second kind of misperception, distinct from illusion, is hallucination. Hallucinations are experiences in which it appears to you as if an object with certain properties is present, when in reality you are not in perceptual contact with any such object. For example, it might appear to you as if there is a red and round tomato before you when in fact there is no object there at all.

One problem that the possibility of misperception raises is epistemic and has to do with whether we are able

to know things about the world. Skeptics about knowledge of the external world have held that, in order for you to have knowledge of the world, you must be able to rule out the possibility that you are now misperceiving. But, these skeptics claim, there are certain possibilities of radical misperception that you cannot properly rule out—for example, you can't rule out the possibility that you are right now dreaming, or the possibility that you are really a brain in a vat being fed experiences as of the external world by an evil superscientist who is directly stimulating your brain. Defenders of the common sense idea that we have perceptual knowledge attempt to reply to the skeptic's challenge.

As we will see, the possibility of misperception also provides a challenge for metaphysical accounts of the nature of perceptual appearances. The challenge arises in part because giving a theory of the nature of appearances requires accounting for what is sometimes called the phenomenal character of experience, or, more simply, the phenomenology of experience. The phenomenal character of a cognitive episode is, in Thomas Nagel's famous phrase, "what it is like" to undergo it. A feature unique to conscious states is that there is something it is like to be in them. There is, for example, a way it is like for one to see a tomato.

The phenomenal character of perceptual experiences seems to be a crucial part of what distinguishes such experiences from other conscious mental events such as occurrent thoughts, desires, and beliefs. For example, what it is like for you to think about a tomato that is in front of you with your eyes closed will be very different from what it is like to open your eyes and *see* the tomato. Seeing a tomato has a sensory, visual phenomenology that merely thinking about a tomato lacks. Although nonperceptual mental states like beliefs and desires arguably have a phenomenal character (for example, there is presumably something it is like for you to think about mathematical sums while in a sensory-deprivation tank with no perceptual experience at all), the phenomenal character of perceptual awareness is distinctive.

It may be that not all perceptions are conscious and so have a phenomenal character. It is common in psychology to distinguish between unconscious and conscious perceptions, and there is a growing psychological literature suggesting that much of the perceptual information that guides our actions is not conscious. (A good introduction to the psychological evidence is in Melvin Goodale's *Sight Unseen*.) It is a question of considerable philosophical interest what unconscious perception is and how to distinguish it from conscious perception.

Nevertheless, we will focus here on theories of perception that seek to give an account of conscious perceptual experience.

There are several aspects of the phenomenal character of perceptual experience that philosophers have thought need to be reflected in a philosophical account of perception. First, there are differences in phenomenal character at the level of the different sense modalities. For example, what it is like to see a tomato is different from what it is like to taste, touch, or smell it. Each mode of perceptual awareness—vision, taste, touch, smell, and audition—has its own distinctive sensory phenomenal character.

Second, there are similarities and differences in phenomenal character at the level of experiences within a sensory modality. For example, a tomato might appear to be red, another might appear to be green, and a third might appear to be very similar in color to the red one. Philosophers are also interested in the way that experiences from different perspectives give rise to differences in phenomenal character, even when there is no change in the way objects appear to be. For example, looking at the tomato from different angles or from nearer or farther away yields differences in the appearances, even though all of these experiences are arguably veridical perceptions and there is no change in the way the object appears to be. When viewed from close up, the tomato in a meaningful sense "appears larger" than when one looks at it from afar. Or, to take another example, it may be that part of the surface of a tomato "appears white" owing to the way the light is reflecting off its surface, even though in another sense the tomato appears uniformly red. These observations suggest a distinction between what we will call constant and perspectival modes of appearance talk. In the constant mode, saying that "an object appears so-and-so" implies that if you are not subject to an illusion, then the object *is* so-and-so. But this is not the case in the perspectival mode; it can be the case that "an object appears so-and-so" and that you are not subject to an illusion, while *not* being the case that the object really is so-and-so. For example, when you see the highlight on the tomato, it is correct to say that patch of the tomato "appears white" in the perspectival sense of appearance talk, but also correct to say that it "appears (to be) red" in the constant mode.

Since what we want in an account of perceptual experience is an account of perceptual consciousness, a correct theory of sense perception must be phenomenally adequate; it must do justice to the phenomenal character of experience.

## ARGUMENTS FROM ILLUSION

A problem that divides philosophers of perception is how to account for the phenomenal character of experience while at the same time explaining the possibility of misperception. To see how the problem arises, consider a theory of perceptual experience that some philosophers have dubbed Naive Realism. As its name suggests, Naive Realism tries to take what is seen as a prereflective account of perception and use it as a philosophical theory of perception. According to them, perceptual consciousness is, in its fundamental nature, a relation of direct awareness between a perceiver and public objects and their properties. Moreover, it is these properties and objects of which one is aware that explain the phenomenal character of experience. Consider again our case of a tomato's visually appearing to you to be red and round. What explains the phenomenology of such an experience? The Naive Realist thinks that common sense is clear about what explains this: It is the tomato itself and the qualities of it presented to awareness that constitute what it is like to see the tomato. To explain what it is like to have a perceptual experience, we simply need to describe the objects that appear to you and their properties of which you are aware.

One challenge for Naive Realism is to explain differences in the phenomenal character of appearances described in the perspectival mode. For example, we saw that in the perspectival mode it is correct to say that the tomato viewed from afar appears smaller than when viewed from close up. Yet in both viewings of the tomato, it seems reasonable to suppose that you veridically perceive the size of the tomato, a property of the tomato that does not change. (This is why it is correct to say in the constant mode that whether the tomato is viewed from up close or from afar it appears to be the same size, say, roughly the size of your closed fist.) It seems, then, that what explains the difference in phenomenal character of these two viewings is not a property of the tomato, as the Naive Realist supposes.

Perhaps an even more difficult problem for the Naive Realist arises from the possibility of misperception. When you see the ripe tomato and your experience is veridical, you are in a perceptual state that we can describe by saying that "it appears to you as if there is something red and round before you." But it seems entirely possible for the very same type of state described in this way (complete with its distinctive phenomenal character) to occur as part of illusory or hallucinatory experience. For example, if you were wearing shape- and color-distorting glasses, it might be that what is in reality a tall, oblong, purple thing

looks to you just like a plump, red tomato. This illusory experience might have the same phenomenal character as your veridical perception of a red, round tomato. The problem for the Naive Realist is that it *cannot be* in this case that the real color and shape properties of the thing you are seeing are what explain what it is like to see the object. The thing you are seeing is tall and purple, whereas your experience is as of something red and round.

The possibility of hallucination raises an exactly similar problem for Naive Realists. Consider a case in which you have a hallucination of a tomato when there is not one anywhere nearby. To fill out the case a bit, we might imagine that a futuristic superscientist stimulates your visual cortex in just the same way that it is stimulated when you see a tomato and thereby produces in you an experience that is every bit as vivid as a veridical perception of a tomato. If this were the case, it obviously can't be true that what explains the phenomenal character of your experience is a direct awareness of a real tomato that is red and round. In the case as described, there is not even a tomato there!

Although we have been focusing on specific visual examples involving seeing tomatoes, there is nothing special about our choice of examples. For *any* veridical perception that we could describe as one in which "it perceptually appears to you as if such-and-such is the case," it seems possible for you to be in a state with the very same phenomenal character that is an illusion or a hallucination. The problem for the Naive Realist is that they don't have the resources to explain the phenomenal character of these states, since their account at best only explains the phenomenal character of veridical perceptions.

The considerations here are related to a family of arguments that were commonly referred to in the twentieth century as "the argument from illusion." As might be apparent from our discussion, we can actually distinguish among arguments from perspective, illusion, and hallucination, depending on which of these phenomena is under consideration. Further on we will consider how different theorists propose to answer these problems, including responses on behalf of those who want to defend Naive Realism from the objections.

## SENSE-DATA THEORY

One historically important answer to the problems of perspective, illusion, and hallucination is that of the Sense-Data Theory. The theory is not as commonly held among contemporary theorists as it was among philoso-

phers in the early twentieth century (such as G. E. Moore, H. H. Price, and C. D. Broad), but it still has a few defenders today (for example, Howard Robinson). According to Sense-Data Theorists, perception involves an immediate awareness of mental “Sense-Data,” which are taken to be objects such that awareness of them fully determines their existence and nature.

Its proponents offer the Sense-Data Theory as the best explanation of the perspectival character of appearances, and of the possibility of misperception. Consider again our example of seeing the tomato. We saw that one challenge to Naive Realists is to answer questions about the perspectival character of appearances like this one: Why is it that looking at a tomato up close results in an experience that can be described in the perspectival mode as one in which the tomato appears larger than it does when you are standing far away from it? The Sense-Data Theorist will answer that this is because in the former case you are aware of a sense datum that *really is* larger than the sense datum you are aware of when you look at the tomato from afar. An advocate of the arguments from illusion and hallucination against Naive Realist might also ask this question: How is it, then, that a state with a single phenomenal character—for example, a state in which it seems to you as if there is a red, round tomato before you—could occur either in a veridical perception or in a hallucination or in an illusion? The Sense-Data Theorist’s answer is that the veridical perception, illusion, and hallucination all involve your being directly aware of sense data with the same properties, for example, sense data that are red and round.

According to the Sense-Data Theory, one is aware of objects and properties in the world only indirectly, in virtue of a more direct awareness of sense data and their properties. One challenge for the Sense-Data Theorist is to explain how sense data must be related to the world in order for one to perceive the world (albeit indirectly). For example, a Sense-Data Theorist owes us an answer to the following question: What makes it the case when you veridically perceive a tomato that being directly aware of a red, round sense datum counts as perceiving the real-world tomato? One possible reply would be that in order to perceive the tomato, you must be aware of a sense datum that has properties that resemble (or are isomorphic to) the properties of the tomato in the world. But this cannot be quite right. You can perceive a tomato even when your experience is a radical illusion such that you misperceive all of the tomatoes properties.

For example, if you look at the tomato through shape and color distorting lenses, the sense datum of which you

are aware will not match the tomato in any of its shape or color properties (for example, the sense datum might be purple and tall while the tomato is short and red). But it might still be true that you see the tomato, even though you misperceive its properties. A second reply on behalf of the Sense-Data Theorist might be that you see the tomato if and only if the tomato causes the sense data of which you are aware. This proposal faces the problem that there are many different causes of the sense datum that don’t count as things that you see. For example, the image on your retina is one of the causes of your perceptual experience (and its properties even seem to resemble the qualities of the sense data of which you are aware). But you do not see the images on your retina. Only eye doctors who are looking inside your eyes see retinal images. It seems that an object must cause an experience in the “right way” in order for the subject to perceive the object. It is a difficult problem, though, to say what this right way is.

Sense-data theories have been subject to many other objections. Arguments from illusion to the existence of sense-data theories have been criticized on grounds that they illicitly rely on a general principle of the following form: If it appears to you as if something has a certain property, then you are aware of something that really does have that property. Relying on this claim is sometimes referred to as the “sense-datum fallacy.” The assumption has been thought to lead to absurd conclusions, like the conclusion that when an antique vase appears ancient and cracked to me, there is a sense datum that really is ancient and cracked. However, this conclusion might be blocked by restricting the properties mentioned in the principle to perceptible properties, such as color and shape. Moreover, the arguments from illusion, hallucination, and perspective should perhaps best be thought of as inferences to the best explanation. On this way of construing the arguments, the Sense-Data Theorist claims that postulating sense data offers the best explanation of the possibility of phenomenally identical illusions and hallucinations, and offers the best account of the perspectival nature of experience.

Other common objections to Sense-Data Theory allege that the view leads to skepticism, setting up a problematic epistemic “veil of perception” between the world and us, or that sense data are not scientifically respectable because they do not seem to be the sorts of things that fit easily into a physical picture of the world. In recent years, perhaps the most common objection to sense-data theories arises from a point about the phenomenal character of experience. Philosophers such as Gilbert Harman (1990/1997) and Michael Tye (1995) have claimed that

there is a tension between Sense-Data Theory and what is sometimes metaphorically referred to as the “transparent” or “diaphanous” nature of experience. The idea that experience is transparent is the idea that perception, and in particular visual perception, seems on the face of it to be a direct presentation of objects and properties as they are in themselves, and does not seem to involve an awareness of subjective properties and objects that represent objects in the world, as the Sense-Data Theory suggests. In perception, it is argued, we seem to be aware only of public properties and objects. For example, philosophers who think experience is transparent will say that when you see the tomato and reflect on your experience, the only properties that you will seem to be aware of are the public properties of the tomato. As rendered by the transparency metaphor, experience doesn’t seem to be an opaque object that we know to be related in some way to the external world, as we might expect if the Sense-Data Theory were true; rather, experience seems “transparent,” and the world and its properties (metaphorically speaking) *shine* through it.

### INTENTIONALIST THEORIES

Philosophers such as Gilbert Harman (1990/1997), Michael Tye (1995), and Fred Dretske (1995), have suggested that by treating experience as an intentional state we can account for the transparency of experience while agreeing with the Sense-Data Theorist that there is a common kind of state involved in veridical perception that could also occur in illusion or hallucination. Intentional states are those with representational contents that can be correct or incorrect. A familiar example is belief. To believe that there is a tomato on the table, for example, is to be in a state that has a representational content—namely the content *There is a tomato on the table*. This content can be correct or incorrect depending on whether there is in fact a tomato on the table.

Intentionalists claim that experience is like belief in being a state that represents the world as being some way or other, and they hold that the representational content of experience fully explains its phenomenal character. (Sometimes this claim of Intentionalists is put in terms of what is called a “supervenience claim”: phenomenal properties supervene on intentional content, i.e., there can be no change in phenomenal qualities without a change in the intentional content of experience.) When it appears to you as if there is a tomato before you, for instance, you are in a state that represents certain properties typical of tomatoes (for example, being round, red, and so on). According to Intentionalists, the way in which

the world is represented explains the phenomenal character of the experience. Moreover, the same experience could occur in a misperception. The experience is correct if there really is a tomato with those properties before me. It is illusory if there is an object there, but it isn’t red or round. The experience is hallucinatory if there is no object there at all.

Intentionalists accommodate the transparency of perceptual experience by claiming that, even though perceptual experience involves a state that represents, introspection is open only to the properties and objects represented by the experience, all of which are taken by Intentionalist theorists to be external properties and objects. The way objects are represented in perceptual experiences is consequently not like the way in which objects are represented when one looks at a photograph of them. When one looks at a photograph of one’s grandmother, one is aware of some of the features on the film in virtue of which the photograph represents Grandma (for example, the colors and shapes on the surface of the film). Perceptual experience is more like conceptual thought, at least thoughts that do not employ mental imagery. When one thinks about one’s grandmother (supposing one doesn’t use a bit of mental imagery to do so), one is not aware of the properties in virtue of which one’s thought is about one’s grandmother. One is simply aware of the represented object, one’s grandmother. Likewise, according to Intentionalists, when one *sees* one’s grandmother, one is not aware of the properties in virtue of which one’s experience is representing grandmother; one is only aware of what is represented—Grandmother and her properties.

Some early versions of Intentionalism claimed that perception is not merely *similar* to belief, it is in fact a kind of belief. (This was, for example, David Armstrong’s view in his book *Perception and the Physical World* [1961]) However, such a view faces serious objections. A noncontroversial way of showing that experiences are not beliefs is to note that experiences are not revisable in light of counterevidence in the way that beliefs are. For example, one might believe that one’s current experience is illusory or hallucinatory. If one has good enough reason to believe this, one can fail to believe the evidence of one’s senses, even though the perceptual experience, complete with its phenomenal character, will remain intact.

A related question that arises for those who hold that perception is not a kind of belief is whether experience is like belief insofar as it essentially involves a deployment of concepts. Some philosophers of perception have propped up Conceptualism, the view that every sensory ele-

ment of perception involves an exercise of concepts by the perceiver. Conceptualism is often held on the ground that the only way that a state can serve as a reason for belief is if the state is conceptual through and through. Conceptualism is defended in this way by Bill Brewer (1999) and John McDowell (1994), although both argue for the position in the context of defending Disjunctivism (a view explained below) rather than Intentionalism. Some theorists object to Conceptualism on the grounds that animals or small children can perceive the world even though they lack concepts that would allow them to form beliefs about the world. Others object to Conceptualism on the grounds that the fine-grained phenomenal character of experience suggests that experience has “nonconceptual content.” These philosophers suggest that the complexity and specificity of the properties and objects that you see in a single glance outstrip your conceptual capacity to form conceptual thoughts about these objects and properties.

Several potential objections to Intentionalist theories have been raised in the philosophical literature. One challenge for Intentionalists is the same as a challenge raised above for Sense-Data Theorists, namely to give an account as to how an object must be related to perceptual experience in order for the experience to be a perception of the object. It has seemed to most Intentionalists that the answer to this question involves an object’s causing the experience in “the right sort of way.” (For example, your experience as of a tomato must be caused in the right way by a tomato in order for you to see a tomato.) But it is difficult to say what this “right sort of way” is.

Quite a few philosophers have objected that Intentionalism lacks the resources to explain what is distinctively sensory about the phenomenal character of experiences. This general objection is pressed in a variety of ways. Some philosophers (such as Christopher Peacocke 2001) have challenged Intentionalists to provide an account of facts about appearances described in the perspectival mode, such as the way the tomato appears smaller when one moves further away from it. Other theorists attack the alleged transparency of experience by citing examples of what they claim are experiences that do not seem to be about public objects or properties. In some examples of perceptual experience, these philosophers claim, we seem to be aware of objects or properties that are essentially private and depend on our awareness of them. Proposed examples include experiences involving afterimages, double vision, blurred vision, and the “inner light show” that one experiences when one shuts one’s eyes tightly.

Still other philosophers have objected that Intentionalists cannot explain the difference in phenomenal character between perception and other intentional states such as thinking. Earlier it was suggested that the phenomenal character of seeing a tomato is very different from merely thinking about the tomato. But both seem to be intentional states, and it seems that they might have the very same content—for example, the content *There is a red and round tomato on the table*. A challenge for the Intentionalist is to explain the difference between these two states. Some Intentionalists have suggested that the difference can be explained because perceptual experience is nonconceptual and plays a distinctive role in relation to beliefs and desires. A related challenge for Intentionalists is to distinguish between the phenomenal character of experiences in different modalities. For example, one can both feel the roundness of a tomato and also see the roundness. These states both represent the same property, the roundness of the tomato, so the Intentionalist might seem to be committed to thinking that the phenomenal character is the same. But of course the phenomenal character of the states is quite different.

Those who find the foregoing objections to Intentionalism compelling might still hold on to the idea that perception is an intentional state and that the content of the state *in part* explains the phenomenal character of experience. They will hold, however, that something in addition to the intentional content is required in order to account for the distinctively sensory phenomenal character of experience. Some philosophers (for example, Timothy Crane 1992) have suggested that in order to explain the phenomenal character of experience fully, we need to appeal not only to intentional contents but also to *modes of presentation* of those contents. For example, to explain the phenomenal character of your seeing the tomato we need to mention not only that you are in a state with the content that there is a red tomato before you, but also that this content is presented *visually*, rather than, say, *tactilely*. Others, such as Ned Block, suggest that we need to appeal to nonintentional properties of experience, sometimes called “qualia” in order to fully account for the phenomenal character of experience. This alternative is, in fact, consistent with the Sense-Data Theory. It is possible to develop a view according to which the perception of the tomato has an intentional content (for example, the content *There is something red and round before you*) that partly explains the phenomenal character of the experience, while also arguing for the need to postulate an awareness of a mental sense datum with certain properties in order to give a complete explanation of the phenomenal character of experience. (This seems to be a

view held by Christopher Peacocke in his book *Sense and Content*, though he speaks of awareness of “visual fields” rather than sense data.)

## DISJUNCTIVISM

In recent years there has been a resurgence of attempts to defend Naive Realism by giving what is called a disjunctive account of experiences. Disjunctivists challenge the claim that for any veridical perceptual state of a subject (seeing a ripe tomato, for example), an event of the very same kind, individuated by its phenomenal character, could occur in a misperception. As stated earlier, one can describe the state of seeing the tomato as one in which “it appears to you as if there is something red and round before you,” and this state can occur either in veridical perception, illusion, or hallucination. According to Disjunctivists, the state that we describe in this way is not a unified kind. The most that can be said about it is that this it is *either* (1) a state in which you are veridically perceiving a red and round tomato (in which case you are directly aware of the tomato and its properties) *or* (2) a state in which you are having a hallucination or an illusion that is indistinguishable from a veridical perception as of a tomato.

One might complain that so far, this is no theory at all, but at best a promise of one. The theory does not tell us anything, for example, about the phenomenal character of hallucinatory experiences. Disjunctivists, one might think, owe us an account of the phenomenal character of the “bad” side of the disjunct that involves hallucinatory experience. Many Disjunctivists resist the call to give a robust account of the phenomenal character of hallucinatory experience. For instance, Michael Martin, in “The Limits of Self Awareness” 2004, gives a purely epistemic characterization of hallucination. According to him, the most that can be said about the nature of hallucination is that it is indistinguishable from a genuine perception. For example, in the case where an advanced neuroscientist stimulates your visual cortex in exactly the way it is stimulated when you veridically perceive a tomato, Martin will say that the most fundamental thing we can say to explain the nature of this state is that this is a state such that you can’t know purely on the basis of the experience that it isn’t a genuine perception of a tomato. Many theorists, though, will think that the obvious explanation as to *why* your hallucination of a tomato can’t be distinguished from a veridical perception is that the hallucination has a phenomenal character of a kind that requires a substantive metaphysical explanation—for example, the sort of

explanation that Sense-Data Theorists and Intentionalists give.

Other Disjunctivists have made some tentative proposals for what accounts for the phenomenal character of hallucinatory states. Harold Langsam (1997), for example, says that it is possible to develop a theory according to which it is the physical regions of space around the subject where the object appears to be that are the relations of hallucination, and William Alston (1999) has suggested in passing that hallucination may involve an awareness of mental images. Such theorists face what might seem to be embarrassing questions that challenge their theoretical disunity. Given that their account of hallucinatory states fully explains the phenomenal character of experience, why not apply that same explanation to the case of veridical perception? Isn’t it explanatory profligacy to rely on a disjunctive account when a unified one is available?

In response, Disjunctivists might counter that the explanatory cost of having an ununified view is well worth paying because alternative accounts of perception are subject to fatal flaws. In fact, a typical strategy of Disjunctivists has been to try to show that alternative theories of perception face insurmountable difficulties, leading to skepticism or making it mysterious how it is possible to think about the external world, or failing to do justice to the phenomenal character of experience.

## PERFECTION

The concept of "perfection" has two closely allied and often overlapping meanings. First, it means "completeness," "wholeness," or "integrity": *X* is perfect when he (or it) is free from all deficiencies. Second, it means the achievement of an end or a goal. This meaning emerges most clearly from the connection between the Greek words *teleios* ("perfect") and *telos* ("end" or "goal"). An entity is perfect (to use Aristotelian terms) when it has achieved its goal by actualizing its potentialities and realizing its specific form. Bringing these two meanings together, one would say that a thing is complete or entire when it has fulfilled its nature and thereby reached its

"end." The concept is best examined first under its religious, and second under its moral, aspect.

### DIVINE PERFECTION

It has not always been believed that God (or, more generally, "the divine") is perfect. Thus, the deities of the Homeric pantheon were both ontologically and morally deficient. They differed from men only in being "deathless" (*athanatoi*). But in Christian theology the perfection of God has always been affirmed by orthodox writers. In St. Anselm's celebrated definition, God is *id quo nihil maius cogitari possit* ("that than which nothing greater can be conceived"). St. Thomas Aquinas later maintained that since God is self-existent, he must be infinite (or limitless) in intelligence, goodness, and power. He also claimed, in the fourth of his five Ways, to prove the existence of God as absolute perfection from the limited degrees of perfection in creatures. Thomists hold that by the "analogy of proportionality" we can attribute to God "in a more eminent way" (*eminentiori modo*) every "pure" perfection that exists in creatures (that is, every perfection that is capable of preexisting in an infinitely spiritual degree).

Those who hold this view of God's infinity must face two questions that have continually perplexed Christian philosophers. First, can we intelligibly assert that all perfections coexist infinitely in a single being? Thus, can God be both infinitely just and infinitely merciful? Second, if God is both infinitely powerful and infinitely good, how can we explain the presence of evil in the world?

### MORAL PERFECTION

Ever since men began to reflect on the moral life, they have been aware of some perfect ideal of character and conduct toward which they must strive. Thus, in the Greco-Roman world the Stoics wrote copiously of the "perfect" (*teleios*) man. In their view perfection consisted in the subjugation of the passions to reason (*logos*) in a state of "self-sufficiency" (*autarkeia*). Sometimes they regarded moral virtue as the imitation of divine perfection, and sometimes they held out a human figure (especially Socrates) as the model of excellence; but more often they wrote abstractly of their ideal "wise man."

There can be no doubt that Jesus required moral perfection of those who would follow him. Thus, in the Sermon on the Mount, he told his disciples, "You, therefore, must be perfect, as your heavenly Father is perfect" (Matthew 5:48). In saying this Jesus reaffirmed the Old Testament, in which the Jews, as the people of the covenant, are required to be perfect (or "holy") by obedi-

ence to the law (*Torah*) which embodies God's will and reflects his character. The above-mentioned verses (Matthew 5:38–47) show that love, especially love of one's enemies, is the element in divine perfection that disciples are to imitate. Jesus' moral perfectionism was further expressed in his demands for complete inward purity (Matthew 5:21–22, 27–28) and self-renunciation (Mark 8:34–38).

Inevitably, theologians have affirmed that moral perfection is the goal of the Christian life. In the New Testament epistles perfection has three main characteristics. First, the norm of perfection is Christ himself, as the Incarnation of God. Second, the essence of perfection is love—the divine love revealed in Christ and made available to believers through the Spirit. Thus, St. Paul, having listed several virtues, wrote, “And above all these put on love, which is the bond of perfectness” (Colossians 3:14). Third, perfection is corporate. Thus, the author of Ephesians looks forward to the time when “we all attain to the unity of the faith and of the knowledge of the Son of God, to perfect manhood, to the measure of the stature of the fulness of Christ” (4:13). Postbiblical theologians (for example, St. Augustine and Thomas Aquinas) continued to give primacy to love, by which all the natural virtues are supernaturally perfected.

Two comments on this Christian scheme are relevant. First, as early as St. Ambrose there emerged a distinction between the basic “precepts” according to which all Christians were expected to live and the “counsels of perfection” that only a few (“the religious”) could follow. This distinction, which persisted throughout the Middle Ages, was based on such texts as Matthew 19:16–22 and could be plausibly represented as an attempt to combine adherence to Christ's absolute demands with a realistic attitude toward the spiritual capacities of the average Christian in a secular occupation. But it was rejected by the Reformers, and with special vehemence by Martin Luther.

Second, although some Christians have held that it is possible to achieve perfection (that is, sinlessness) in this life, the majority have held that the strength of original sin makes this impossible. Moreover, many biblical texts (particularly I John 1:8–10) imply the Lutheran view that all Christians remain throughout their mortal lives *simul justi et peccatores* (“at the same time justified and sinners”). From a purely philosophical standpoint Immanuel Kant held that since the moral law requires holiness, and since we cannot achieve it in this life, we must postulate another life in which an infinite progress

toward it will be possible (*Critique of Practical Reason*, translated by T. K. Abbott, London, 1909, p. 218).

Finally, if we take human perfection in its widest sense to mean an ideal that satisfies man's deepest needs or fulfills his “true” being, we can see clear points of similarity between Christian and non-Christian systems. Thus, although humanists, Buddhists, and Christians have in common many virtues that they regard as normative, they put them in differing contexts. These virtues are practiced by the humanist as self-sufficient ends, by the Buddhist as means of entrance to nirvana, and by the Christian as both the outcome of present faith in God and a preparation for a future vision of him “face to face.”

## PERFECTION, DEGREES OF

See *Degrees of Perfection, Argument for the Existence of God*

## PERFORMATIVE THEORY OF TRUTH

Until relatively recently, it was taken for granted by all philosophers who wrote on the subject of truth, regardless of their differences on other matters, that words such as *true* and *false* were descriptive expressions. This presupposition has been challenged by P. F. Strawson, who developed the theory that “true” is primarily used as a performative expression. A performative utterance may be understood by considering a paradigm case: “I promise.” To say “I promise” is not to make a statement about my promising but simply to promise. To use a performative expression is not to make a statement but to perform

an action. Strawson, in his essay "Truth," holds that to say that a statement is true is not to make a statement about a statement but to perform the act of agreeing with, accepting, or endorsing a statement. When one says "It's true that it's raining," one asserts no more than "It's raining." The function of "It's true that" is to agree with, accept, or endorse the statement that it's raining.

Strawson's performative analysis of "true" was conceived as a supplement to F. P. Ramsey's assertive redundancy, or "No Truth," theory of truth. Ramsey claimed that to say that a proposition is true means no more than to assert the proposition itself. "It is true that Caesar was murdered" means no more than "Caesar was murdered." "It is false that Caesar was murdered" means no more than "Caesar was not murdered." According to this view, "true" has no independent assertive meaning, and the traditional notion of truth as a property or relation is misguided. Ramsey suggested that "true" is used for purposes of emphasis or style, or to indicate the position of a statement in an argument.

### CRITICISM OF SEMANTIC THEORY

Strawson set himself the positive task of explaining the use of "true" in ordinary language and criticizing the metalinguistic or semantic theory of truth, which has an affinity with Ramsey's view. Philosophers such as Rudolf Carnap, who hold the metalinguistic position, agree with Ramsey that to say that an assertion is true is not to make a further assertion. However, these philosophers claim that truth is a metalinguistic property of sentences, which means that to say that a statement is true is to make a statement about a sentence of a given language. According to this thesis, the statement that it's true that it's raining should, strictly speaking, be written: "'It's raining' is true in English."

Strawson argues that translation practice shows the metalinguistic thesis to be false. He points out that a translator would not handle a truth declaration as if it were a sentence description. Consider the manner in which a translator would handle a case where it is perfectly clear that one really is speaking about an English sentence:

- (1) "It's raining" is a grammatical English sentence.

Suppose a translator wanted to translate (1) into a different language. He would retain the constituent "It's raining" in its original English, in order to show that (1) is a description of an English sentence. But consider

- (2) It's true that it's raining.

There would be no hesitation in translating the whole statement, including the constituent "It's raining." This shows that (2) is not, as the metalinguistic thesis claims, a description of an English sentence. Hence, "true" is not a metalinguistic predicate.

Philosophers who maintain that "true" is a descriptive expression have been misled by grammatical form. "True" is a grammatical predicate, but it is not used to talk about anything. Strawson compares "true" with "Ditto." *A* makes an assertion. *B* says "Ditto." Insofar as *B* talks about or asserts anything, he talks about or asserts what *A* talked about or asserted. *A*'s assertion is the occasion for the use of "Ditto," but because "Ditto" is not composed of a grammatical subject and predicate, one is not tempted to think that in uttering "Ditto" *B* is making an additional statement.

The parallel with "Ditto" illuminates the tie between statements and "true." The making of a statement is the occasion for, but not the subject of, a truth declaration. "True" has no statement-making role. To say that a statement is true is to perform the act of agreeing with, accepting, endorsing, admitting, confirming, or granting that statement. Such expressions as "I grant ...," "I confirm ...," and "Yes" are perfectly capable of substituting for "The statement is true."

### EXPRESSIVE USE OF "TRUE"

While Strawson emphasizes the performative role of "true," he also calls attention to another kind of use, which he calls expressive. This use is often found in sentences beginning "So, it's true that ...," "Is it true that ...," and "If it's true that ...." In these utterances, "true" functions like the adverb "really," to express surprise, doubt, astonishment, or disbelief. However, "true" has only an expressive function in these utterances. It does not contribute, in either its expressive or its performative role, to the assertive meaning of what is said. Thus Strawson's thesis remains compatible with Ramsey's view. "True" does not change the assertive meaning of a statement. It has no statement-making role.

### RESOLUTION OF "LIAR" PARADOX

The performative analysis of a truth declaration enabled Strawson to offer an original resolution of a well-known paradox that arises when one says:

- (3) What I am now saying is false.

If (3) is true, then it is false; and if it is false, then it is true. Hence, we arrive at a paradox whose resolution has been one of the achievements of the metalinguistic analy-

sis of “true.” According to this analysis, (3) is read in the following manner:

(3a) The object-language statement I am making now is false.

Since (3a) no longer refers to itself, the contradictory consequences disappear. Strawson dispenses with the metalinguistic solution and dissolves the paradox in a manner consistent with his own analysis of “true.” To utter (3) is like saying “Ditto” when no one has spoken. It is not to make a statement but, rather, to produce a pointless utterance. Since (3) is not a statement, it is not a statement that implies its own denial. Hence, the paradox disappears without the necessity for metalinguistic machinery.

### OBJECTIONS TO STRAWSON'S ANALYSIS

Strawson does not distinguish a truth declaration from such expressions as “I grant ...,” “I accept ...,” “I concede ...,” “I admit ...,” “I insist ...,” “Yes ...,” or “Ditto.” It should be noted, however, that there are differences between using these expressions and saying that a statement is true. Expressions such as “I grant ...,” “I concede ...,” “I accept ...,” “I admit ...,” and “I insist ...” suggest a “me versus you” background. They underline the act performed as *mine*. This is not the role of “That’s true.” Moreover, one should distinguish between expressions like “Yes,” which simply register bare assent, and “The statement is true.” If asked whether I agree with Smith’s statement, I may say, “Yes, but my opinion isn’t worth very much; I haven’t studied the evidence.” However, to say “His statement is *true*, but my opinion isn’t worth very much; I haven’t studied the evidence” sounds unnatural. “True,” unlike “Yes,” has the force of adequate evidence.

**GEACH’S CRITICISM.** P. T. Geach offered the following criticism of Strawson’s analysis of “true” (“Ascriptivism,” p. 233). Consider arguments of this pattern.

If  $x$  is true, then  $p$ ;  
 $x$  is true;  
*Ergo*  $p$ .

Strawson claims that the second premise, “ $x$  is true,” should be analyzed as an agreeing performance. However, it cannot be claimed that in the hypothetical premise “If  $x$  is true, then  $p$ ,” the constituent “ $x$  is true” is an agreeing performance. If I say, “If  $x$  is true, then  $p$ ,” I am not agreeing with or accepting  $x$ . Hence, the explanation of “true” in the hypothetical premise must differ from its explanation in the second categorical premise. However, if the

explanation of “true” changes from one premise to another, the argument would be invalid, since the fallacy of equivocation has been committed. However, the argument is clearly valid. Hence, Strawson’s analysis of “true,” which implies that a different explanation is required for occurrences of “true” in hypothetical and categorical statements, must be wrong.

Geach’s criticism, however, appears to rest on a misunderstanding of the behavior of performatives in logical arguments. Take a clear case of a performative, “I promise to help you.” Now consider the following argument.

If I promise to help you, then I’m a fool; I promise to help you; *Ergo* I’m a fool.

There is a performative occurrence of “I promise” in the second premise, but not in the first. When I say, “If I promise to help you, then I’m a fool,” I am not promising to help you. Hence, the use of “I promise” in the first hypothetical premise requires an explanation that differs from the explanation of “I promise” in the second hypothetical premise, yet the argument remains perfectly valid. A fallacy of equivocation is not committed simply because an expression has a performative use in one premise of a logical argument and a nonperformative use in another.

Occurrences of “true” in hypotheticals do not fit a performative analysis, but it must be remembered that while Strawson emphasizes the performative use, he does not claim that this is the whole story. The nonperformative use of “true” in hypothetical statements may be considered to fall under what Strawson calls the expressive use. What is the difference between the following statements?

- (4) If Khrushchev’s statement is true, there are no missile bases in Cuba.
- (5) Khrushchev’s statement implies there are no missile bases in Cuba.

While (4) and (5) have the same assertive meaning, (4) suggests that Khrushchev’s statement is in doubt. Hence “true” in (4) contributes only to the expressive quality of the statement. Since “true” in (4) has only an expressive function, but not a statement-making role, (4) does not constitute an exception to Strawson’s analysis.

**“BLIND” USES OF “TRUE.”** An interesting challenge to Strawson’s position is found in “blind” uses of “true.” This use of “true” is exemplified when a person applies “true” to a statement without knowing what the statement is. For example, suppose a man says, “Everything the pope says is true.” Presumably he does not know every state-

ment the pope has made. It cannot, therefore, be claimed that he is making the statements made by the pope. One cannot substitute the pope's statements for "Everything the pope says is true" without a change in meaning. Hence, "Everything the pope says is true" does not, as Strawson claims, have the same assertive meaning as the pope's statements. The notion, which Strawson takes over from Ramsey, that a truth declaration has the same assertive meaning as the statement dubbed true, does not hold for blind uses of "true."

It may be argued that the speaker is blindly endorsing all the pope's statements. In that case, "Everything the pope says is true" would be analyzed as a performative use of "true" which falls outside the range of Ramsey's thesis. But this analysis could not be maintained for blind uses like "I hope that what Jones says will be true." The speaker is plainly not endorsing what Jones will say. Moreover, since "true" in this case does not function like the adverb "really," it cannot be maintained that "I hope that what Jones will say is true" exemplifies an expressive use of "true" either. Hence, neither Strawson's nor Ramsey's position seems to hold up for blind uses of "true."

Strawson, however, has analyzed blind uses of "true" in what he takes to be a Ramsey-like method. In his later paper, "A Problem about Truth—A Reply to Mr. Warnock," Strawson shifts from his original position and grants that "at least part of what anyone does who says that a statement is true is to make a statement about a statement" (p. 69). This is a departure from his earlier view that "true" has no statement-making role. For the blind truth declaration "Everything the pope says is true," Strawson would offer the following Ramsey-like paraphrase: "Things are as the pope says they are." According to Strawson, this paraphrase is a statement about the pope's statements, but it also conforms to the spirit of Ramsey's view. Presumably, Strawson considers this analysis to be a Ramsey-like analysis because "true" is eliminated from the paraphrase. It must be remembered, however, that Ramsey held "true" to be eliminable because "true" is a "superfluous addition" to a statement ("Facts and Propositions," p. 17). Hence, one can always substitute *P* for "*P* is true" without loss of assertive meaning. While Strawson has eliminated "true" from "Everything the pope says is true" in the paraphrase "Things are as the pope says they are," he has not fulfilled Ramsey's claim that "true" is superfluous. A philosopher who holds the correspondence theory of truth can also eliminate "true" by substituting "Everything the pope says corresponds to the facts" for "Everything the pope says is true." However, this surely would not be a Ramsey-type elimi-

nation. Since "true" is not a superfluous addition to a blind truth declaration, it does not seem that blind uses can be paraphrased in the spirit of Ramsey.

## PERFORMATIVE UTTERANCES

At the beginning of *How to Do Things with Words* (1962), John Langshaw Austin challenged the common assumption that “the business of [a declarative sentence] can only be to ‘describe’ some state of affairs, or to ‘state some fact’” (p. 1). Obviously, that is not the business of interrogative and imperative sentences, but Austin argued that even certain declarative sentences are typically used to do something other than make statements. For example, an employer can fire someone by saying “You’re fired,” and an employee can quit by saying “I quit.” In uttering such a sentence, one is not merely saying what one is doing, one is actually doing it. Such a sentence has a remarkable property: To utter it is (typically) to perform an act of the very sort named by its main verb.

It does seem remarkable that you can do something just by saying what you are doing. Most types of acts are not like that. You cannot stand on your head by saying that you are standing on your head, and you cannot convince someone that you love them by saying that you are convincing them that you love them. Yet in the right circumstances you can fire someone or quit a job just by uttering the right sort of sentence. How is this possible, and what sorts of acts can be performed in this way? Does this phenomenon of *performativity* require a special explanation, perhaps involving some kind of convention, or it is just a special case of something more general?

### EXPLICIT PERFORMATIVE UTTERANCES

Austin (1961) dubbed *performative* such verbs as “promise,” “apologize,” “request,” “fire,” and “quit.” Performative sentences are generally in the first-person singular with their main, performative verb in the simple present tense, active voice. So, for example, you can promise to attend by saying “I promise to attend” (but not by saying “I promised to attend” or “She promises to attend”), and you can apologize by saying “I apologize” (but not by saying “I apologized” or “She apologizes”). The word “hereby” may be inserted before the performative verb, thereby indicating that this utterance is the vehicle of the performance of the act named by the verb. Some performative sentences are in the first-person plural (“We guarantee your safety”), the second-person singular or plural (“You are advised to get vaccinated”), or the impersonal passive (“Smoking is prohibited.”) Occasionally the performative verb is in the present progressive, as in “I’m warning you to stay away” and “I’m asking you for the last

time to clean up your room.” Because utterances of performative sentences are characteristically performances of acts of the very sort named by their main verbs, Austin called them “explicit performative utterances,” or simply “performatives.”

Notice that such acts as promising, apologizing, and requesting, which Austin called “illocutionary acts,” can be performed without using a performative sentence, hence without making explicit what one is doing. For example, one can promise by saying “You can count on me to ...,” apologize by saying “I’m sorry,” and request by saying “I’d like you to ...” This raises the question whether performativity, although involving the use of a special sort of sentence, requires a special explanation. In this regard note also that performative sentences do not have to be used performatively and obviously are not so used when they are embedded in larger linguistic contexts. For example, saying “If I promise to take you to the play, will you quit nagging me?” is not to make a promise, and saying “I apologize only if I feel guilty” is not to apologize.

### PERFORMATIVES AND CONVENTIONS

It is generally accepted that linguistic meaning is a matter of convention. So to that extent every utterance is conventional, insofar it is made with linguistic means. However, it might seem, as it did to Austin, that performatives are conventional in a more specific way and that this explains their performativity. If so, then, for example, an utterance of “I promise to ...” amounts to a promise because, and only because, there is a convention, or what John Searle (1969) called a “constitutive rule,” to the effect that an utterance of such a sentence counts as a promise. That is, roughly, it counts as such only because it is generally recognized to count as such. This view seems plausible as regards certain institution-bound performatives, where a specific form of words is designated, and often required, for the performance of an act of a certain sort. For instance, uttering the words “I pronounce you husband and wife” counts (in the requisite circumstances) as the act of marrying a couple; uttering “The jury finds the defendant guilty” counts as finding the defendant guilty (convicting the defendant); and uttering “(I) double” counts as doubling in bridge. Indeed, in institutional contexts there are often designated expressions that, though not performative in form, have the same effect, such as an umpire’s “Out,” a legislator’s “Nay,” or a judge’s “Overruled.” Of course, these specialized performatives and other designated forms of words have to be uttered by the appropriate person in the appropriate circumstances, but

the relevant convention provides for this. Not just anyone can adjourn a meeting, sentence a convicted criminal, or christen a ship, and not just under any circumstances (with his “doctrine of the Infelicities” Austin classified the various ways in which such utterances can go wrong as “flaws,” “hitches,” and “abuses” [1962, pp. 12–38]). So it does seem that in institutional cases performativity is a matter of convention: A certain person’s uttering a certain form of words in a certain context plays a certain official role because, and only because, it is generally recognized as so doing.

However, as P. F. Strawson (1964) contended, Austin was overly impressed with institution-bound cases. In such cases there are specific, socially recognized circumstances in which a person with specific, socially recognized authority may perform an act of a certain sort by uttering words of a certain form in order to effect, or officially affect, institutional states of affairs (see Bach and Harnish 1979, ch. 6). Ordinary performative utterances, on the other hand, are not bound to particular institutional contexts. Like most illocutionary acts, Strawson argued, they involve an intention not to conform to an institutional convention but to communicate something to an audience. An utterance counts as a promise, an apology, or a request because, and only because, the speaker intends it to count as such and the audience, recognizing that intention, regards it as such. To be sure, it is only under certain circumstances that a speaker will make such an utterance with such an intention and his audience will so regard it, but this is not in virtue of any convention.

It might be suggested, as it was by Jerrold Katz (1977), that performativity is explained not by social conventions but by linguistic ones. Perhaps there is some distinctive feature of the meaning of performative verbs that explains how one can perform an act of the very sort named by the verb by uttering a performative sentence containing that verb. However, this suggestion loses its plausibility when one takes into account a range of linguistic data beyond the simple performatives considered so far. In particular, there are what Bruce Fraser (1975) called “hedged performatives,” which philosophers have largely overlooked, such as “I can promise you . . .,” “I must ask you . . .,” and “I would like to invite you . . .” Utterances of such sentences standardly have performative effect, but the meanings of the sentences themselves are not inherently performative. This is clear because without contradicting myself I could say “I can promise you, but I won’t,” “I must ask you, but if I did, my wife would never forgive me,” or “I would like to invite you,

but I can’t.” In each of these cases I would not be performing an act of the type in question but would merely be telling you that I am able to promise, that I am required to ask you, or that I would like to invite you. In addition, there are other sorts of sentences that, unlike hedged performatives, do not even contain performative verbs but which are standardly used in the same kind of way: “It would be nice if you . . .” to request, “Why don’t you . . .?” to advise, “Do you know . . .?” to ask for information, “I’m sorry” to apologize, and “I wouldn’t do that” to warn. Clearly these standard uses are not predictable from their linguistic meanings alone.

The variety of forms of sentences that are standardly used to perform acts of the same types as those accomplished by explicit performative utterances suggests that performativity is not a matter of convention, whether social or linguistic. Performativity requires no special explanation. Rather, its explanation belongs to the general theory of speech acts (see Searle 1989 and Bach and Harnish 1992 for two contrasting accounts). Performative sentences are just one kind among various kinds of sentences that are standardly used to perform types of illocutionary acts not predictable from their meanings alone (see Bach and Harnish 1979, ch. 10). Performativity is a pragmatic phenomenon not a semantic one, a matter of language use rather than linguistic meaning. The standardization of performative and other forms of sentences for uses not predictable from their meanings does not show that they are governed by special conventions but merely that there is a practice of using sentences of certain forms in certain ways. The claim that they are conventional falsely entails that an utterance of a certain form of words would not have the force it has unless it is generally recognized to count as such. The claim that they are merely standardized for these special uses requires something less. Standardization merely streamlines the inference the hearer must make to identify the speech act being performed; it creates the illusion of conventionality where there is really but a pragmatic regularity. (For further discussion of these issues, see Reimer 1995, Bach 1995, and Harnish 1997).

## PERFORMATIVES AND STATEMENTS

When introducing the notion of performatives, Austin contrasted them with utterances like “I state that . . .,” “I claim that . . .,” and “I predict that . . .” These explicit *constatives* are like utterances of ordinary declarative sentences in that they “describe some state of affairs, or to state some fact,” which Austin denied that performatives do. Yet he came to realize that explicit constatives are rel-

evantly similar to explicit performatives: Their main verbs also make explicit the type of act being performed. After all, an assertion or a prediction is made with “I assert ...” or “I predict ...” in just the same way that a promise or a request is made with “I promise...” or “I request ...” Accordingly, what makes explicit performatives distinctive is not what the speaker does but that the speaker makes explicit what he or she is doing.

Austin also came to realize that what can be done explicitly without a performative can also be done without making explicit the type of act being performed. In the latter part of *How to Do Things with Words* he developed the distinction between *locutionary* and *illocutionary* acts, which effectively superseded the distinction between constative and performative utterances. Locutionary acts are acts of saying something, and illocutionary acts are performed in the act of saying something. This distinction applies not only to promises, requests, and apologies, but also to statements and the like (Austin retained the term “constative” for them).

For example, in uttering “I promise to be there” and thereby explicitly saying that one promises to be there or in uttering merely “I will be there” and thereby just saying that one will be there, one can promise to be there. Similarly, in uttering “I state that Mars has two moons” and thereby explicitly saying that one states that Mars has two moons or in uttering merely “Mars has two moons” and thereby just saying that Mars has two moons, one can state that Mars has two moons. Note that stating is distinct from saying. In the right circumstances, one might say that Mars has two moons but state, albeit figuratively, that a certain belligerent person has two obsequious functionaries. In general, a speaker need not make explicit what he or she is doing in order to do it. Explicit performatives do have a distinctive self-referential character, but that does not mean that their illocutionary force requires special explanation. Indeed, if the successful “performance of an illocutionary act involves the securing of uptake” (Austin 1962, p. 116), then if anything it should be easier for an explicit performative to succeed, precisely because the speaker is saying what he or she is doing.

One remaining question concerns whether performatives are statements too (see Bach 1975), contrary to Austin’s insistence that making explicit “is not the same as stating or describing” (1962, p. 61). When he introduced the category of explicit performative utterances, he claimed that even though they are utterances of declarative sentences, they are not cases of making statements and are not descriptive. However, this does not seem

right, for the simple reason that the verbs in performative sentences can be modified, as in “I gladly promise ...,” “I sincerely apologize ...,” and “I reluctantly request ...” This strongly suggests that a speaker of such a sentence would be making a statement. The speaker would be describing himself or herself, as promising gladly, apologizing sincerely, or requesting reluctantly.

Performatives have even been described as “self-verifying” (originally by Lemmon 1962 and more recently by Johansson 2003). Clearly they are self-referential, in that if one utters a performative sentence and uses it performatively, one is making explicit what one is thereby doing. But to describe them as self-verifying is to claim that they make themselves true. This seems right, but notice that a performative is not self-verifying in the way that an utterance of, for example, “I am speaking” or “I am alive” is self-verifying. It is not the bare fact of the utterance that, given its content, makes it true. Suppose I utter “I hereby apologize” and thereby apologize. It is true that I am thereby apologizing, but what makes this true is that I am using the sentence to perform the illocutionary act of apologizing. In that way, it is self-verifying.

Does this self-referential, self-verifying character help explain performativity, is it just a curious feature of explicit performative utterances, or what? As Searle (1989) has argued, the performativity of performative utterances does not depend on their being self-verifying. That gets things backwards: they are self-verifying statements because of their performativity. However, as Kent Bach and Robert Harnish (1992) have argued, their character as statements plays a key role in the speaker’s being able to communicate to his audience what he is doing, precisely because he is using a performative to make explicit what he is doing.

## PERGAMUM, SCHOOL OF

See *Neoplatonism*

## PERIPATETICS

The original meaning of the word *peripatos* was "a covered walking place." The house that Theophrastus provided for the school of Aristotle contained such a *peripatos*. This yielded a proper name for the school itself—the Peripatos—and its members came to be known as "those from the Peripatos" or "Peripatetics." This derivation should be preferred to that previously current, according to which the term "Peripatetic" referred to a method of teaching while walking about, known to have been used by Protagoras, for example, and assumed to have been adopted by Aristotle. Although this view goes back to Hermippus at the end of the third century BCE, it is now generally regarded as a mistaken inference, based on nothing more than the name itself.

The history of the Peripatetics can be divided into two periods—that immediately following the death of Aristotle and that following the revival of interest in Aristotelian studies resulting from the edition of the treatises by Andronicus of Rhodes in the time of Marcus Tullius Cicero or a little later. When Theophrastus became president of the school in the year before Aristotle's death, he continued to show an interest in virtually the whole range of Aristotelian studies. But whereas it is now generally supposed that Aristotle retained a keen interest in metaphysical questions to the end of his life, it was the shift of emphasis away from Platonic otherworldliness to the phenomena of the world around us, a subject also found in Aristotle, which seems to have attracted Theophrastus most. Strato, Theophrastus's successor, made important developments in physical theory, transforming Aristotle's doctrine into a fairly full-blooded materialism. But after Strato's death about 269 BCE, his successors became almost exclusively concerned with questions about the content of the good life and the way to reach it, with questions of rhetoric, and with the distinctively Hellenistic interest in anecdote, gossip, and scandal. Many of the specifically Aristotelian doctrines were abandoned, and the school had become very much the same as a number of others in Athens by the end of the second century BCE.

The reasons for this disintegration are uncertain. It may be that the concentration of interest upon empirical questions discouraged speculation. Empiricism as such, however, has interested philosophers intensely at other periods of history. Some have supposed that the disintegration was part of a philosophic failure of nerve characteristic of the Hellenistic age as a whole. But this view of the Hellenistic age is probably incorrect, and in any case such a failure of nerve clearly applied less to Stoics, Epicureans, and Skeptics of the period than it did to the Peripatetics. Thus, their fate would remain unexplained.

It may be that the history of the Aristotelian writings had something to do with what happened to the Peripatetics. According to the well-known story, on Theophrastus' death his copies of Aristotle's writings went to Neleus of Scepsis in the Troad (Asia Minor). In one extreme view this meant that the Peripatetics in Athens thereafter had access only to the published works of Aristotle—namely, the dialogues. In fact, there seem to have been copies of at least some of the treatises available in Alexandria, in Rhodes, and probably in Athens throughout the Hellenistic period. They do not appear to have been much studied in the Peripatos, however, where knowledge of Aristotle came primarily from the writings of Theophrastus when not from the dialogues. Indeed, in

a sense the school of Aristotle might more correctly be called the school of Theophrastus. The weakness of its links with Aristotle's own thought may explain its relative failure in philosophy.

Andronicus of Rhodes wrote a special study on the order of Aristotle's works and published an edition of the treatises in the order in which they have survived to us. His edition is the source of all subsequent ones. Andronicus is sometimes dated as early as 70 BCE, but as Cicero never refers to his edition, it may not have been published until after Cicero's death in 43 BCE. Andronicus initiated a revival in Aristotelian studies, and the Peripatos flourished at least down to the time of Alexander of Aphrodisias (about 200 CE). Among those influenced by this revival were the geographer Ptolemy and the physician Galen. Alexander wrote important commentaries on the main Aristotelian treatises, and the tradition of writing such commentaries continued into the Byzantine period through such scholars as Themistius, Ammonius, and Simplicius, who must be classed as Platonists rather than as Aristotelians. All the commentators treated Aristotle's writings as a systematic corpus, and from the start all were influenced in varying degrees by both Stoic and Platonist doctrines.

The general approach, apart from certain unintended distortions, was intensely conservative. From time to time modifications of interest were proposed, however. The successor of Andronicus, Boëthius of Sidon (who is not to be confused with the earlier Stoic of the same name), rejected the doctrine that the universal is prior by nature to the particular and would not grant to form the title of primary substance. In so doing, he took a big step in the direction of medieval nominalism. The pseudo-Aristotelian treatise *De Mundo* is often regarded as a product of this period. It culminates in a theology in which a transcendent deity maintains order in the cosmos by the exercise of an undefined power, and in a general way the work has affinities with both Stoic writers like Posidonius and Neoplatonists. It seems, however, to imitate the Aristotle of the dialogues rather than the treatises, and it may antedate the edition of Andronicus.

## PERRY, RALPH BARTON

(1876–1957)

Ralph Barton Perry, the American realist philosopher, was born in Poultney, Vermont. He attended Princeton University, where he received his B.A. in 1896; he received his M.A. from Harvard in 1897 and his Ph.D. in 1899. For a brief period he taught at Williams and Smith colleges. From 1902 to 1946 he taught at Harvard, where, after 1930, he was the Edgar Pierce professor of philosophy. He was Hyde lecturer at various French universities during the year 1921–1922. In 1920 he was elected president of the eastern division of the American Philosophical Association, and he served as Gifford lecturer from 1946 to 1948.

Perry was the author of some two hundred essays and two dozen books, in addition to countless lectures and letters to newspapers, and he was considered the chief living authority on William James. Perry believed that a comprehensiveness of view is philosophy's contribution to human wisdom; in his own work he willingly risked inaccuracy to range over every province of science, art, philosophy, and religion. He insisted on the merit of this venture, insofar as it was an attempt to achieve systematic unity in a field that would otherwise be divided between experts who were unaware of one another's achievements.

### REACTION AGAINST IDEALISM

As an early polemicist against idealism, Perry claimed that the relationship of the world to the mind is an accidental or subordinate aspect of the world. He argued that the relationship of knowing the world is not like the relationship of owning an object. An object owned becomes

in a sense a part of the owner, whereas the world, although it lends itself to being known, does not thereby become entirely a part of the knower. It is not exhaustively defined by the relationship of being known. This claim became one of the basic tenets of what Perry and five other young American philosophers formulated as New Realism in their cooperative volume *New Realism* (1912). They argued that the world is real and independent of mind, and that it is directly present or “immanent” to the mind in knowledge and consciousness. Together these tenets formed their “cardinal principle”—the “independence of the immanent.”

In his article “The Ego-centric Predicament” (1910), Perry had shown how this “predicament” had been used illicitly to argue for idealism. The idealist argument begins with the predicament that “it is impossible for me to discover anything which is, when I discover it, undiscovered by me,” and concludes that “it is impossible to discover anything that is not thought.” The idealist, Perry claimed, has confused the statement that “everything which is known, is *known*” with the claim that “everything which *is*, is known.” Perry maintained that the predicament was simply methodological: the extent to which knowledge conditions any situation in which it is present cannot be discovered by the simple and conclusive method of direct elimination.

Perry did not deny that this predicament presents a real difficulty, but he did deny that it argues either for idealism or realism. He never suggested what could be done to overcome the difficulty, but he did not think there were other than methodological implications in it. Instead, Perry argued that the objects of knowledge and experience are independent of egocentricity. “Independence” here refers not to a particular kind of relation but rather to the absence of one. Perry defined it as nondependence. The independent object may be related or not, provided that it is not related in the way the dependent object is. The independent object can be related to consciousness, or mind, but not be dependent on that relationship for its existence.

However, as Perry developed his position (in *Present Philosophical Tendencies*, 1925), it turned out that independent objects of knowledge are not the real independent objects of the commonsense world but “neutral entities” indifferent to both the subjective and the physical (or objective) relations in experience. They do not exist in any place; they exist only in the logical sense, as either a class or members of a class. They are therefore preeminently independent of consciousness. The propositions of logic and mathematics are typical of such enti-

ties, and Perry contended that analysis of such propositions reveals neither a knowing relation nor reference to a knower.

In taking this position, Perry had adopted James’s neutral monism, and although he eventually abandoned it, he continued to describe his own philosophy as, among other things, “neutralism.” Perry’s move away from neutral monism and New Realism is best seen in his two works on value theory, *General Theory of Value* (1926) and *Realms of Value* (1954). The first work sets forth Perry’s theory of the generic nature of value, while the second details the varieties and types of this value as they appear in the major human institutions, or “realms of value.”

## THEORY OF VALUE

Believing that value was neither unanalyzable nor purely emotive, Perry formulated his well-known definition, “Any object, whatever it be, acquires value when any interest, whatever it be, is taken in it.” Value is that which attaches to any object of any interest. Interest is defined as that which is characteristic of the motor-affective life, namely, instinct, desire, feeling, will, and all their states, acts, and attitudes. A thing is an object of interest when its being expected induces actions that anticipate its realization or nonrealization. Interested action is thus actively selective, tentative, instrumental, prospective, and fallible.

According to Perry, this theory did not conflict with the “independence of the immanent,” because the latter, being restricted to knowledge, did not demand that values be conceived as independent. Yet Perry’s theory included a cognitive element in all value or interest. Cognition gives the interest its object, Perry said, and the character of the object of interest is essentially the same as that of the object of cognition. The “mediating judgment” in interest and cognition is expectation and belief, and without belief there would be no basis for truth and error. All interest is characterized by expectancy, but it differs from cognition in that it also includes being for or against, favoring or disfavoring, the expected. Since both interest and cognition have this element of expecting something and being prepared to cope with it, expectancy is the key to understanding both.

Because expectancy looks forward and does not disclose itself except through a train of subsequent events, the object of interest and of cognition can be conceived of only as an ideal or “problematic” object, possessing the ambiguity or dual possibility of truth and error. This object is “internal” to the act or cognition and must be distinguished from its “external” referent, that which con-

firms or fails to confirm the expectation of the problematic object. Expectation is the meaning of an object.

Perry pointed out that during the process by which a sensory stimulus leads to an eventual sense perception, not only muscles and nerves, but attitudes, meanings, and interpretations are oriented toward the stimulus. Thus, when the ear is assailed by a stimulus, the organism listens toward the source and acts, or prepares to act, both upon that source and upon its context. At this point a conversion takes place: one hears the sound there and then perceives it as a bell having further characteristics. Thus, a stimulus touches off a reaction, and then the stimulus is superseded by thought, which now has an object, although the original stimulus has ceased to exist. The stimulus has been converted into an object; the sound has been converted into a bell, or in other words, into what it means, what is expected of it. This is the “perceptual object,” that part of the total surrounding field to which the organism alerts itself, embracing what is expected of the sensory object.

This object is characterized both by meaning—that is, by what the organism expects of it—and by being part of the surroundings. When Perry went on to describe its status further, his monistic bias became apparent. He maintained that if the ideal object is not somehow present in nature, it would be impossible to affirm that nature is as it is “represented” in the finished product of scientific inquiry. If the logical and mathematical structures of knowledge are to be true of nature, they must be *in* nature; the laws of nature reign in the realm of nature and not in the realm of natural science, which discovers them.

**MORAL VALUE.** Having offered his theory of value, Perry went on to show in what sense we can say one value is “better” or “worse” than another. This too, he thought, called for a definition—that is, a descriptive account of the meaning of “better” and “worse.” For Perry, that meant a description of those conditions that would enable us to say with justification that one object of an interest was better (or worse) than another.

The key to this problem of value was integration or harmony of interests. To integrate or harmonize interests is to remove from them such qualities as independence, irrelevance, dissimilarity, opposition, indifference, antagonism, or incompatibility. Harmony in place of conflict is Perry’s *summum bonum*. Morality takes the conflict of interests as its point of departure. What Perry called the moralization of life—the harmonizing of interests for the sake of the interests harmonized—is effected through “reflective agreement” between the personal and the

social will. “Harmonious happiness” is justified by its provision for the several interests that it harmonizes. Ought and obligation, then, are not moral ultimates but are justified by the good end.

That Perry’s moral criterion was an absolute in an otherwise nonabsolutistic theory did not occur to him. However, he did assert that the criterion must agree with human nature and the circumstances of human life in such a way that men can adopt it and be governed by it. It must also possess qualifications for being accepted in lieu of other standards. Perry thought his concept of harmony, in its appeal to each knower’s will, did possess universality because it embraced all interests—that is, that it was to some extent applicable to everybody’s interest.

The adequacy of Perry’s theory rests therefore on his assumption that for all men “better” signifies a greater inclusiveness and harmony of values. Perry was by no means unaware of the need for social arrangements that would render the interests of individuals mutually innocent and cooperative. Almost half of his books were devoted to some aspect of this problem, and they were often written in response to the problems facing his country at the time. He brought to all of them his standard of harmonious happiness, or reflective agreement, a “creed of inclusiveness” that excluded only hatred and personal aggrandizement.

## PERSISTENCE

Smith is reading an open book that was shut this morning. At least it certainly seems like the same book he placed closed on his nightstand and opened to read this evening. But, then again, nothing can be both shut and not shut, Smith’s book being included among those things that cannot violate G.W. Leibniz’s law. So, no matter that common sense dictates that Smith’s shut book did not blink out of existence to be instantaneously replaced by an open book, perhaps it is a different book after all.

Very roughly, that is the start of the problem of persistence—an initial worry about how an object can persist through a change in its properties. It is a problem that may seem easily dismissed until we identify its source in some of our basic metaphysical commitments and recognize the costs that accompany any way of addressing it. The understanding of the problem of persistence expressed below was developed alongside and informed by Sally Haslanger’s work (Haslanger 2003).

### THE INITIAL WORRY

We can sharpen the initial worry about books and other ordinary objects that persist through change by noting

that it emerges from the conjunction of three core metaphysical theses.

#### THREE CORE METAPHYSICAL THESES

CONSISTENCY: Nothing can have incompatible properties.

CHANGE: Change involves incompatible properties.

PERSISTENCE: Objects persist through change.

The core theses express firmly held intuitions that most metaphysicians would agree are central to a coherent theory of how ordinary things—books, rocks, Smith, and even ourselves—exist and persist in the world. But, a commitment to any two of the theses seems to implicitly deny the remainder. Suppose PERSISTENCE and CHANGE are true, that some objects persist through change that involves incompatible properties. For instance, consider the book that Smith removed from his nightstand to read that was shut, and though open now, remains the same book. If we also assume CONSISTENCY is true, then nothing can have the incompatible properties of being shut and being open (given that a book is open if, and only if, it is not shut). Thus, it seems that the shut book from Smith’s nightstand must be distinct from the open book in his hands. But that denies that the book persisted in the first place.

A careful reader will note that the contradiction was not precisely forced; nevertheless there is a significant tension that at least threatens contradiction. One strategy for responding to this worry is to bypass it by rejecting CONSISTENCY, PERSISTENCE, or CHANGE. A second strategy is to resolve the tension by first identifying its source and then clarifying or modifying our ideas to remove that source.

### DISMISSING THE INITIAL WORRY

There are three options in pursuing the straightforward strategy of dismissing the initial worry about persistence by denying one of the core theses, none of which is promising. First, we might contend that something can both have and not have a property (forfeiting CONSISTENCY). However, such a move entails rejecting the law of noncontradiction, Aristotle’s “most certain of all principles” according to which “the same attribute cannot at the same time belong and not belong to the same subject in the same respect” (Barnes 1984. Aristotle’s *Metaphysics* IV.3.1005b1.17). But, countenancing contradictions to find a noncontradictory account of persistence makes no sense (though someone like Donald Baxter, 2001, might disagree). Indeed, such a drastic step may allow for something to both have and not have the property of persisting.

Second, we might adopt the position that change either does not happen or does not involve incompatible properties (forfeiting CHANGE). Here, we could deny

change altogether, perhaps accepting Parmenides's picture of a static, monolithic reality in which "what is is ungenerable and imperishable, a whole of a single kind, and unshaking and complete" (Curd 1998, p. 68). Or, we could hold that change occurs without involving incompatible properties. But change just does involve either something being *F* and something becoming not-*F*, or something being not-*F* and something becoming *F*. Sacrificing our minimal metaphysical commitments about how change works amounts to change nihilism. This strategy avoids contradiction at a very high metaphysical cost.

Finally, we could argue that nothing persists (forfeiting **PERSISTENCE**). Heraclitus told us: "You could not step twice into the same rivers; for other waters are ever flowing on to you" (EpistemeLinks.com 2005, Heraclitus of Ephesus, *On the Universe*, fragment 41). We might go along with him, agreeing that: "Nothing endures but change," giving us a metaphysics that does not include persisting objects, but merely flowing processes (EpistemeLinks.com 2005, Diogenes Laertius, *Lives of Eminent Philosophers*, Bk. IX, sec. 8). Such persistence nihilism is again a move at odds with strong intuitions and a range of metaphysical theories.

Thus, the strategy of dismissing one of the core theses leaves us without an intuitively tenable account of how ordinary things—Smith, books, rocks—exist and persist in the world. This motivates the search for an account of persistence that genuinely addresses the worry by reconciling the core theses.

## FINDING THE SOURCE

The second way of dealing with the initial worry is to get much clearer about the source of the problem and then seek remedies by revising our ideas in a way that avoids the problem by attacking the source directly. Our understanding of **CONSISTENCY** needs to remain intact unless we allow contradictions, which is off the table here. However, **CHANGE** and **PERSISTENCE** leave room for interpretation. For instance, they leave open what counts as persistence, change, and incompatible properties being involved in change.

Modifying our understandings of these phenomena can ease the tension among the core theses. In our everyday understanding of the world, we assume that persisting objects survive the gain and loss of some simply instantiated properties. The following three aspects of this understanding are central to grasping why philosophical issues arise with persistence.

**CHANGE AS ALTERATION.** An object alters by gaining or losing properties. More precisely, an object alters if, and only if, it is numerically identical to objects that have different properties at different times. In our everyday understanding of the world, objects change by altering, and plenty of ordinary objects alter. Smith's book that was shut and Smith's book that is open is a single book that has the properties of being shut and open at different times. When Smith opened his book, the shut book did not wink out of existence exactly when an open book happened to blink into existence right into his hands. Rather, Smith's book was shut and then open—it altered as Smith turned to his bookmarked page.

**PERSISTENCE AS SURVIVAL.** An object survives if it has more than a momentary existence. More precisely, an object survives if, and only if, it is numerically identical to something that exists at a different time. In our everyday understanding of the world, objects persist by surviving, and plenty of ordinary objects survive. Consider the book Smith placed on his nightstand last evening that went untouched until this evening, and the book he removed from his nightstand this evening. The book that Smith put down last evening is the very same book that he picked up this evening. Although a day older, it is numerically identical to the book Smith read the prior evening—it survived the day spent on his nightstand.

**INVOLVING INCOMPATIBLE PROPERTIES AS JUST HAVING INCOMPATIBLE PROPERTIES.** An object just has a property if, and only if, it simply instantiates (*Fx*) that property. That is, an object just has a property if, and only if, no extrinsic facts are relevant to the truth of the proposition that the object has that property. In our everyday understanding, ordinary objects just have incompatible properties sometimes, regardless of how the rest of the world is. David Lewis brings out the intuitiveness of this when he writes: "When I sit I'm bent, when I stand I'm straight. When I change my shape, that isn't a matter of my changing relationships to other things, or my relationship to other changing things. I do the changing, all by myself. Or so it seems" (Lewis 1999, p. 187).

Like Lewis being straight, with respect to Smith's book, we tacitly hold that nothing beyond his book matters to its being shut—that there is a primitive, non-relational bond between the book and the property of being shut. If it is not open, Smith's book just has the property of being shut, regardless of its relation to the nightstand it rests upon at 7:00 a.m. We can capture these key aspects of our everyday understanding in terms of how objects persist through change with three additional theses.

## THREE EVERYDAY METAPHYSICAL THESES

**ALTERATION:** If an object changes, then the object existing before the change and the numerically identical object existing after the change are the proper subjects of the incompatible properties involved in the change.

**SURVIVAL:** If an object persists through change, then the object existing before the change is numerically identical to the one existing after the change.

**ATEMPORAL INSTANTIATION:** If an object is the proper subject of a property, then (i) the object has that property, and (ii) facts about time and tense are irrelevant to the truth of the proposition that the object has that property.

**ALTERATION** constrains how things change. **SURVIVAL** constrains how things persist. **ATEMPORAL INSTANTIATION** constrains how incompatible properties are involved in change. Making our everyday understanding explicit is useful because it allows us to see that: (1) This understanding conjoined with the three core theses forces a contradiction; and (2) reconciling the core theses requires denying or revising some part of our everyday understanding. The following argument demonstrates both points. In it, we suppose that Smith opens the book that had been resting shut on his nightstand.

## AN ARGUMENT AGAINST OUR EVERYDAY UNDERSTANDING

What follows are three assumptions about the book that capture the three core metaphysical theses: (1) It is not the case that the book is shut and the book is open (captures **CONSISTENCY**); (2) the book persists through change (captures **PERSISTENCE**); (3) the book changes in a way that involves the incompatible properties of being shut and being open (captures **CHANGE**).

The following steps draw on the three everyday metaphysical theses: (4) The book existing before the change is numerically identical to the book existing after the change (**SURVIVAL** and step two); (5) the book is the proper subject of being shut and being open (**ALTERATION**, steps three and four); (6) the book is shut and the book is open (**ATEMPORAL INSTANTIATION** and step five). From these six steps, a contradiction arises as steps (1) and (6) cannot both be true. One can conclude, then, that given the truth of the core metaphysical theses, something within the everyday metaphysical theses is false.

This argument can be run for any ordinary object that persists through change. Thus, to address, rather than dismiss, the initial worry, one of the three everyday theses must be revised or forfeited. The problem is to do so while striking a balance between respecting our intu-

itions and achieving philosophical success. Such is the strategy of three broad approaches to persistence below. Each blocks step (6) in its own way and thereby achieves a consistent view. But, given the nature of the problem demonstrated above, each solution will obviously face trade-offs in terms of intuitive appeal.

## ADDRESSING THE WORRY

Perdurantism, exdurantism, and endurantism are each accounts of persistence that retain a commitment to the core metaphysical theses, but give up part of our everyday understanding of how things such as Smith, books, and rocks persist and change in our world. The first two accounts are built on a metaphysics of temporal parts, whereas the third depends on a metaphysics of enduring things.

**METAPHYSICS OF TEMPORAL PARTS AND PERSISTENCE** Ordinary objects have spatial parts. Perhaps they also have modal parts, dependent parts, abstract parts, or logical parts, among others. The metaphysics of temporal parts (MTP) leaves that open. The particular claim MTP makes is that objects have temporal parts. These temporal parts, time slices, or stages exist only at a moment. So, on a view consistent with MTP, multiple momentary book stages could exist—a shut-book stage, a distinct open-book stage, and so on. Perdurantism and exdurantism rely on the temporal stages of MTP to explain the persistence of ordinary objects.

*Perdurantism* Perdurantists take change over time to be analogous to change over space. Just as color changes across the surface of a canvas when different spatial parts of the canvas have incompatible colors, so the color of a lemon changes across the time as it ripens when different temporal parts—a distinct green stage and a distinct yellow stage—have incompatible colors. In both cases, change consists in distinct parts of an object having incompatible properties.

On this view, ordinary objects are space-time worms composed of distinct momentary stages. So, just like a taut rope extends through space, it also extends through time. For, as a fusion of its temporal stages, it has parts in the past, present, and future. An object that is a space-time worm is only partially present at any one moment because its different stages exist at different times.

The perdurantist ontology makes the three core and two everyday metaphysical theses co-realizable. An object changes when distinct stages of a single space-time worm just have the incompatible properties involved in change

(CHANGE and ATEMPORAL INSTANTIATION). It survives a change in virtue of the space-time worm that exists at the times that its distinct stages exist (PERSISTENCE and SURVIVAL). And, because distinct stages bear the incompatible properties rather than a single object, there is no one thing that has incompatible properties (CONSISTENCY).

For instance, Smith's book changes because its stages just have the incompatible properties of being shut and being open. The book survives this change because it is numerically identical to the space-time worm constituted by its stages. Finally, no contradiction arises because distinct stages of the book have the incompatible properties, rather than Smith's book as a whole.

However, perdurantism requires us to sacrifice change as alteration. ALTERATION entails that change occurs only if one and the same thing has a property and then lacks the property. It entails that the book changes only if it and something numerically identical to it have the incompatible properties of being open and shut. But, perdurantists hold that distinct proper parts of a space-time worm book bear the incompatible properties—the shut-book stage and the open-book stage. So, there is no one thing that has incompatible properties—indeed that is how perdurantism avoids contradiction. By blocking step (5) in the argument above, perdurantists also block (6). Yet, in gaining a coherent account of persistence, perdurantists accept an account on which change is merely a succession of momentary stages that have incompatible properties.

**Exdurantism** Exdurantists or stage theorists take identity over time to be analogous to identity between possible worlds. To see this, assume that an actual sill-length window swag could be a floor-length swag in virtue of a floor-length counterpart in some possible world. Analogously, exdurantists assume that Smith's now open book was shut in virtue of a closed book counterpart resting on his nightstand in the past. In both cases, distinct objects (the sill-length swag and its floor-length counterpart, the present open book and its earlier shut counterpart) have incompatible properties.

On this view, an ordinary object is a single momentary stage that extends through space, but not through time, and that has temporal counterpart stages. Any object that is a single stage is wholly present at exactly and only the moment it exists.

The exdurantist ontology makes the three core and one everyday metaphysical theses co-realizable. An object changes when it and a counterpart stage just have the incompatible properties involved in change (CHANGE and ATEMPORAL INSTANTIATION). It persists when it and its tem-

poral counterpart exist at different times (PERSISTENCE). And, because distinct stages bear the incompatible properties rather than a single object, there is no one thing that has incompatible properties (CONSISTENCY).

For instance, the change in Smith's book involves incompatible properties because his book just has the property of being open and a counterpart stage just has the property of being shut. Smith's book persists through this change in virtue of standing in a counterpart relation to a stage from a different time in the actual world. Finally, because no single thing is open and is shut (rather, distinct stages are), no contradiction arises.

Notice that according to exdurantism, the object that changes and persists just has one of the incompatible properties—Smith's book, the entire book, just is open. In contrast, according to perdurantism the object that changes and persists never just has either of the incompatible properties—Smith's book is never just open or shut. Exdurantism thus fares a bit better intuitively on this point, for when we look at Smith and see him reading an open book, we think his book is open, not some other object that is merely part of his book.

However, exdurantism pays for this metaphysical perk elsewhere. Exdurance precludes the possibility of persistence as survival, for no ordinary objects survive. SURVIVAL entails that a persisting object exist both before and after it changes. It entails that if Smith's book persists, then the shut book on the nightstand is numerically identical to the open book in Smith's hands. But, exdurantists maintain that no book is numerically identical to both the earlier open stage and the later shut stage. At best, a persisting object continues (in some sense) in virtue of a succession of distinct momentary stages bearing the relevant counterpart relations to each other. But, an earlier and a later stage in such a succession are no more one and the same object than the first and third links in a five-link chain are one and the same link. Thus, given the ontology in which ordinary objects are all momentary stages, nothing exists that could survive change.

Moreover, because it shares the strategy of using MTP to explain persistence with perdurantism, exdurantism also forfeits ALTERATION. As above, there is no one object that loses one property and gains another. Instead, distinct objects bear the incompatible properties—Smith's open book and a shut stage to which it stands in a counterpart relation. But, the costs of exdurantism do return a benefit—giving up both SURVIVAL and ALTERATION blocks both (4) and (5) without which (6) does not follow. Of course, to recoup these costs, exdurantists may try to retain some form of ALTERATION or SURVIVAL by revising our notion of

existence. They could hold momentary stages derivatively exist across time in virtue of counterpart relations to other stages that exist at different times. Clearly, the burden of proof would fall on an exdurantist to prove that derivative existence *just is* existence.

To sum up, both perdurantists and exdurantists endorse MTP. They maintain a commitment to the three core theses by using temporal parts to bypass the contradiction that arises by simply predicating incompatible properties to a single object. Both approaches conflict with change as alteration—so neither can hold simply that the book is open and the book is shut, rather distinct stages have these properties. Ultimately, though, the views differ in metaphysical costs. Perdurantists may maintain that persisting objects survive change because they attribute incompatible properties to different parts of a single space-time worm. Exdurantists must deny SURVIVAL because they attribute incompatible properties to distinct ordinary objects.

**METAPHYSICS OF ENDURING THINGS AND PERSISTENCE** According to the metaphysics of enduring things (MET), some objects endure. To claim that some objects endure is to claim that in some cases a numerically identical object is wholly present at different times. This claim states the minimal metaphysical commitments that distinguish the ontologies of MET from MTP.

MET and MTP agree that ordinary objects have spatial parts, and that they may have modal parts, dependent parts, abstract parts, or logical parts, among others. MET also leaves open whether any objects have temporal parts.

However, although it permits stages, MET requires the existence of some objects that fall outside the ontologies of perdurantists or exdurantists. For, an enduring object is wholly present at different times and neither a space-time worm nor a single momentary stage can be wholly present at different times.

Endurantism relies on MET's enduring objects to explain how ordinary objects can be altered and survive change. These objects are the key resource that perdurantism and exdurantism lack by being grounded in MTP.

**Endurantism** Endurantists hold that ordinary objects persist through change by enduring. In doing so, they take identity over time to be numerical identity between objects wholly present at different times. They take change over time to be the instantiation of incompatible properties by numerically identical objects at different times. So, arguably they hold the most intuitive understanding of change over time as a phenomenon that

is nothing more than one and the same object gaining and losing properties across time.

On a basic endurantist view, ordinary objects are enduring things. For example, an endurantist would hold that as an ordinary object, a book is not constituted by stages because it is wholly present at different moments. Thus, an ordinary, enduring book would be distinct from any sort of space-time worm or single momentary stage or counterpart stage that may or may not also exist.

The endurantist ontology makes the three core and two everyday metaphysical theses co-realizable. An object changes by altering because, in some sense, it has the incompatible properties involved in change (CHANGE and ALTERATION). It survives a change in virtue of the single enduring object that has those properties in some sense at different times (PERSISTENCE and SURVIVAL). Finally, although a wholly present ordinary object in some sense has incompatible properties, it does not just have those properties. Rather, facts external to an ordinary object concerning time or tense mediate the instantiation of incompatible properties. There are a variety of ways to mediate the instantiation. For instance, given a pair of incompatible properties and an object that has them in some sense, an endurantist could hold that the object has one property now and had the other property earlier. With various forms of mediated instantiation, the endurantist avoids contradiction (CONSISTENCY).

For instance, Smith's book changes because it has incompatible properties in some sense—his book is open but that very book was shut. Smith's book survives this change in virtue of being numerically identical to the book at the time it is open and the book at the time it was shut. Finally, because no single thing is open and is shut (rather, the book is open and was shut), the position remains consistent.

The important move of adopting temporally mediated property instantiation—instantiation mediated by time or tense—allows endurantists to hold that an ordinary object can be wholly present both before and after a change in spite of its having incompatible properties. This is why the view allows for the survival and alteration of objects so easily.

However, endurantism faces its own metaphysical cost—it requires us to give up the idea that an object just has the properties in virtue of which it changes. ATEMPORAL INSTANTIATION entails that there be a primitive bond unmediated by time or tense between the object and the relevant properties. Perdurantists and exdurantists preserve this bond because on their views distinct objects

just have the incompatible properties. MTP allows them to say, without contradiction, that one book stage just is open and a distinct book stage just is shut ( $Fx$  and  $not-Fy$ ). In contrast, without stages as a resource, to preserve that bond the endurantist would have to say that the book just is open and that the book just is shut ( $Fx$  and  $not-Fx$ )—a flat contradiction. Instead, the view of change involving objects just having incompatible properties is replaced by one in which objects have incompatible properties in some sense mediated by time or tense ( $F$  is  $x$  and  $F$  was  $not-x$ ). This is how endurantism directly blocks step (6) in the argument above.

In contrast to the sacrifices of the MTP theorists that include losing robust notions of survival and alteration, giving up primitive instantiation in favor of mediated instantiation may be appealing. But there are repercussions.

First, temporal concerns intuitively seem irrelevant to whether an object has those intrinsic properties in virtue of which it can change. Smith's green eyes, the position of his nightstand, and, likewise, the time of day all seem to be matters outside of the metaphysical status of Smith's book in terms of whether it is open or shut.

Second, those concerned about Bradley's regress may worry about relying on mediated property instantiation to explain persistence. Some take the position that primitive bonds are required to block the regress. The endurantist strategy rules out the possibility of such bonds holding between persisting objects and the properties involved in change.

Third, it obscures how the properties involved in change are incompatible. An enduring object has the properties of being  $F$  and not being  $F$  involved in change in a way that does not generate contradiction because, in some sense, they can be co-instantiated. For instance, if Smith's book is shut-in-the-morning and open-in-the-evening, this looks no more problematic than Smith's book being rectangular and red. Thus, with any kind of mediated instantiation, the endurantist will need to explain the incompatibility of the relevant properties. For, without incompatibility between the properties, change itself becomes questionable.

Various strands of endurantism handle these worries more or less well, depending in large part on how they mediate property instantiation. Possible methods include: time indexed properties ( $x$  is  $F$ -at- $t$ ), time relative predicate relations ( $x$  is-at- $t$   $F$ ), relations with times as arguments ( $x$  is  $F$  at  $t$ ), adverbial accounts ( $x$  is  $F$   $t$ -ly), temporal context sensitivity (obtains at  $t$  ( $x$  is  $F$ )), and tense ( $x$  was  $F$ ).

## CONCLUSION

Perdurantism, exdurantism, and endurantism share the virtue of allowing us to maintain a commitment to the core theses of **CONSISTENCY**, **PERSISTENCE**, and **CHANGE**. Each does so by offering an account of persistence through change on which no single object just has the incompatible properties involved in change—whether it is because distinct objects just have those properties or a single object has them in a mediated way. Though they differ in particular metaphysical costs and benefits, this common feature is why they succeed in addressing rather than dismissing the initial worries with persistence.

At this point, the real problem with persistence is not deciding whether things persist—but rather explaining how they persist. The challenge today is to choose well among the metaphysical costs of reconciling the core theses so as to yield a coherent, useful theory that still respects our intuitions. The heart of the current persistence debate revolves around which view does the best job. Thus, it is worth remarking very briefly on three metaphysical concerns that provide, or seem to provide, reasons for favoring one approach to persistence over another.

First is the metaphysics of time. Eternalism, presentism, and the growing block view are among the main alternative accounts of the nature of time. Their different commitments regarding the reality of times make these views incompatible. The eternalist claims that all times exist, the presentist argues that only the present exists, and the growing block theorist holds that the past and the present exist, but not the future. The truth of eternalism or presentism or the growing block view would help choose between accounts of persistence if, as some have suggested, MTP entails either eternalism or the growing block view, or MET entails presentism. However, recent work on persistence suggests that MTP or MET can incorporate eternalism, presentism, or the growing block view, though perhaps not with equal ease.

Second is a concern with how propositions about the past, present, and future have truth values. At issue, is whether the *is* of predication is irreducibly tensed (serious tensing) or the *is* is timeless (surface tensing) in the logical structure of propositions. Some have thought this issue will help decide among approaches to persistence because they believe that endurantists must use serious tensing. However, though endurantists must use some form of mediated property instantiation, it need not be a form that depends on tensing.

Third is an issue about how temporary intrinsic properties must be instantiated. Intuitively, an intrinsic

property of an object is one that the object has simply by virtue of being itself. Temporary intrinsics are intrinsic properties that an object has only temporarily. Above, being bent and being straight are temporary intrinsic properties of Lewis. Real change occurs when an object has, in some sense, incompatible temporary intrinsic properties at different times. Thus, any tenable account of persistence will need to explain how objects have temporary intrinsic properties.

Now, many hold the view that there must be a primitive bond between an object and its temporary intrinsic properties, that objects just have them. If so, then endurantism is not a viable account of persistence. For, endurantism achieves consistency only by insisting on some form of mediated property instantiation. However, among the many forms of mediated property instantiation, some mesh better than others with our intuitions and theoretical commitments regarding temporary intrinsics. So there is room for endurantists to come up with a reasonable account of temporary intrinsics when they devise an alternative to [ATEMPORAL INSTANTIATION](#).

## PERSONAL IDENTITY

One of the commonest of daily experiences is that of recognizing our friends. A less common, though still fairly familiar, experience is the decision that a certain person is

or is not the person he claims to be. The problem of personal identity is that of clarifying the principles behind these indispensable processes of reidentification. To reidentify someone is to say or imply that in spite of a lapse of time and the changes it may have wrought, the person before us now is the same as the person we knew before. When are we justified in saying such a thing, and when are we not?

### THE BASIC PROBLEMS

Some philosophers have said that we are never justified, because sameness and change are, in themselves, incompatible. They have argued that it is almost paradoxical to say that something has changed and yet is still the same. There is nothing special about the case of persons in this connection, except, of course, that we might, as persons ourselves, be expected to be more concerned about this case or to have access to some of the facts needed to deal with it. One set of such facts is the private set of thoughts, feelings, and images that each of us has, and such philosophers as David Hume have emphasized how constant and rapid are the changes in them with which our identity has to contend. The problem generated by this alleged paradox will be referred to as the problem of the unity of a person through change or, more briefly, as the problem of unity.

Most discussions of personal identity, however, have taken it for granted that sameness and change are, at least, often compatible and have concentrated on the conditions under which reidentification of persons can take place. What enables us to say, in spite of the changes wrought by time, that person *A*, before us now, *is* the person *B* whom we formerly knew and that person *C*, also before us now, is not?

The problem of the conditions for reidentifying persons should be distinguished from the problem of individuating persons. To individuate among a class of beings is to pick out one from another; to reidentify a member of a class of beings is to recognize him as the same as someone known at an earlier time. It is, of course, unlikely that these two notions can be kept separate, since, on the one hand, one has to be able to pick out a being from among his contemporaries before one is able to identify him with a past member of his class (which, in turn, had to be picked out) and since, on the other hand, it is hard to see how a being that exists in our world of time and change can be picked out, at least in the deeper sense of being recognized, without being picked out as a being with a certain history. It is not accidental that the word *identify* can sometimes mean the one procedure

and sometimes the other. This article will be concerned directly only with the problem of the reidentification of persons, which will be called the problem of criteria.

It has had two main competing answers. One is that the criterion of the identity of a person is the identity of the body that he has—that it is either a necessary or a sufficient condition of saying correctly that this person before us is Smith that the body this person before us has is the body that Smith had. The other answer is that the criterion of the identity of a person is the set of memories he has—that it is either a necessary or a sufficient condition of saying correctly that this person before us is Smith that he should have memories of doing Smith's actions or of having Smith's experiences.

It is clear that in practice we settle problems of identification in both ways. But we can still ask of each one whether it is necessary or sufficient; we can ask whether each is independent of the other; and we can ask whether one is more fundamental than the other. It is in connection with these questions that we find what are usually called puzzle cases. These are stories, sometimes true but usually imaginary, which are thought to contain *prima facie* conflicts between the two criteria. In deciding how the conflict is to be resolved, it is thought that we show the order of priority of the two criteria. For instance, there are the cases of ostensible "bodily transfer," like that of the cobbler and the prince mentioned by John Locke. In this story what physically seems to be a cobbler wakes one morning with all the apparent memories of a prince, with no knowledge of shoe mending, and with disgust at his present sordid surroundings. We might make the story harder by imagining that at the same time what looks like the prince wakes up in the royal palace with cobbler memories. In a story like this, persons seem to recall actions and events associated with a body other than the one they now have. Should we say that they are the persons their supposed memories suggest they are or the persons they physically seem to be? To decide this entails deciding on the relative importance of the two criteria of identity.

## RELATED ISSUES

The two problems I have distinguished are bound to and do overlap in the literature. The difficulty and importance of the question of personal identity, however, are greatly increased by the fact that it lies at the point of intersection of several major lines of philosophical inquiry.

**INFLUENCE OF DUALISM.** The problem of personal identity has traditionally been raised in a dualist context. Those who have discussed it have been greatly influenced by the picture of a person as composed of two entities—body and mind—which are only contingently related to each other. This has restricted the problem of unity so that it has become the problem of how one can be justified in attributing unity to the mind. This looks much harder than the problem in its more comprehensive form, since the thoughts, feelings, and images a person has are far less stable than is his body and since it is, to say the least, not easy to find what Hume calls "the bond that unites" them. Failing to find it, a philosopher may resort to a doctrine of spiritual substance and say that within each person there is some central component that preserves his identity because it never changes as his thoughts and feelings do; the philosopher must then decide whether this component can be detected by introspection or is unknowable. If he rejects this doctrine, as Hume did, he may give way to complete skepticism about identity.

**SELF-KNOWLEDGE.** The second issue with which the problem is involved is the relation between the knowledge a person has of himself and the knowledge that others have of him. There are a great many facts about a person that others can learn, it is often said, only by inference but to which he himself seems to have direct and privileged access. The usual examples are facts about his present thoughts, feelings, and intentions. But it looks as though something similar may be true about the past. Although others may have to ascertain whether I am a certain previously known person or did a certain past action by reference to external records or to my observable appearance, I seem to know this directly, in memory. This bears on the puzzle stories. It seems absurd, if we imagine ourselves as one of the participants in these tales, to suggest that someone else might know better than we who we are. If this is really absurd, the puzzles have to be settled in favor of memory; if it is not, we have to explain our natural tendency to want to settle them this way.

**IMMORTALITY.** A third connected issue is the possibility of survival. If the unity of a person is necessarily connected with the continuance of his body through time, then it is logically impossible for a person to survive the death of his body. If bodily identity is a necessary criterion of personal identity, then even if it could be shown that some nonphysical characteristics of a person continued after his bodily death, the person himself would not have been shown to have survived any more than (to use

Antony Flew's example) he would have been if it had been possible to preserve his appendix in a bottle. On the other hand, if bodily identity is not a necessary criterion of personal identity, perhaps bodily death is merely one major event in a person's history and not the end of him. And if the fundamental criterion of identity is memory, it would seem to follow that a person might be known, at least to himself, to have survived death because he continued to have memories in his disembodied state.

**MORAL CONSIDERATIONS.** The concept of a person has moral connections. Problems of reidentification arise in practice largely when we have to decide questions of right or responsibility, such as right to inheritances or responsibility for crimes. Identity is a necessary though not a sufficient condition of someone's being accorded rights or being made to shoulder penalties. This applies in the afterlife, too. Only if beings who exist after our death can be identified with us can they rightly be held heirs to our merit or blame. A theory of personal identity must take this fact properly into account.

### THE "SELF"

One result of these wider connections has been an unfortunate technical restriction on the language in which personal identity has come to be discussed. It has been referred to as the problem of the self. This word is sometimes used to mean the whole series of a person's inner mental states and sometimes, more restrictedly, the spiritual substance to which the philosopher says they belong. The use of the word *self*, however, has the effect of confining the question to the unity of the mind and of preventing the answer from relying on the temporal persistence of the body. This has made the unity problem seem intractable, especially when the fleetingness of mental images, feelings, and the like is contrasted with the temporal persistence their owner needs in order even to engage in the relatively lengthy processes of dreaming, reasoning, or scrutinizing the external world. This article therefore avoids a terminology that has ruled out one line of solution ab initio by making it impossible to endow the owner of mental processes with physical characteristics.

By far the most important classical discussions are those of Locke and Hume, and it is therefore useful to begin consideration of the problem of personal identity by reference to their attempts to solve it.

### LOCKE

**INCOMPLETENESS OF THE CONCEPT OF IDENTITY.** Locke began his discussion of identity in Chapter 27 of

the *Essay concerning Human Understanding* by pointing out a vital fact that others, including Hume, have since neglected. The concept of identity has to be joined to some substantive notion like that of a tree or a person in order to have any use at all. What makes us say that a given entity is the same depends on what sort of entity it is. This implies an answer to the unity problem—an entity of any sort can remain the same throughout its changes provided that the changes that take place in it are characteristic of entities of that sort and are allowed for in their concept. Over the years a tree can double its size and remain the same tree since this sort of change is characteristic of trees and is allowed for in the concept of a tree. It cannot, however, sprout wings and fly or burn to ashes and still remain a tree, for changes of these kinds are not allowed for. This being so, no hidden substance is necessary for the retention of its identity since there is no need of the unchanging character that this is said to provide. The same is true, presumably, of persons, and all that seems to remain is the much harder question of what changes are allowed for in this concept—the problem of the criteria of identity. Locke characteristically failed, however, to follow through the implications of his own insight. Although he saw the inutility of the concept of substance, he still retained it and led himself into some confusions.

These confusions are partly engendered by his apparent assumption that it is possible to find one single criterion of identity for each sort of being. Our concepts are not as tidy as this. When the assumption is brought to bear on the very untidy concept of a person, the result is a distortion of the concept's logical character. This takes the form of a supposed distinction between "person" and "man."

**"MAN" AND "PERSON."** A man, according to Locke, is a certain sort of living organism whose identity depends on its biological organization. On the other hand, he defined a person as "a thinking intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing, in different times and places; which it does only by that consciousness which is inseparable from thinking and essential to it." Further, "as far as this consciousness can be extended backwards to any past action or thought, so far reaches the identity of that person." To sever the two notions in this way is a radical departure from ordinary usage, in which the two words are often interchangeable. Locke admitted this, without, however, seeing that the admission conceded that his account must be inaccurate as a description of the two "ideas." Of course, there is a point in the division; behind

it lies the recognition that there are two criteria of identity for persons. This Locke tried to accommodate to his belief that for each sort of entity there is one criterion only, by arguing that there are two distinct concepts, each of which has its own unique criterion, rather than one concept with two criteria. But Locke was not trying merely to be tidy; more important is the motive supplied in his claim that “person” is what he called a “forensic” term. A person is a morally responsible agent. It is clear that to establish by physical evidence that the man before us in the dock is the one who did the deed is not sufficient to show that he should suffer the penalty (though it is surely sufficient to show that no one else should, unless he instigated or compelled the deed). Locke wanted to mark this fact by a special restriction on the notion of a person, so that to state that someone is the same person who did the deed is to imply accountability without room for more (or much more) dispute. He thought it obvious that what makes people accountable for their actions is their ability to recognize them as their own. This seems to mean two things: first, an awareness of what one is doing when one is doing it and, second, an ability to remember having done it. Hence, he said that the criterion for the identity of persons, as distinct from men, is consciousness, a concept intended to embrace both awareness and memory. The fact that the same *man* is before us does not mean that the same person is, since the *man* may not be conscious of having done the deed in question and if the *man* is not conscious of having done it, then the *person* did *not* do it. Here Locke brought in the puzzle cases:

Should the soul of a prince, carrying with it the consciousness of the prince’s past life, enter and inform the body of a cobbler, as soon as deserted by his own soul, everyone sees he would be the same *person* with the prince, accountable only for the prince’s actions.... Had I the same consciousness that I saw the ark and Noah’s flood, as that I saw an overflowing of the Thames last winter, I could no more doubt that I who write this now, that saw the Thames overflowed last winter, and that viewed the flood at the general deluge, was the same *self* ... than that I who write this am the same *myself* now whilst I write ... that I was yesterday.

Locke was misconstruing the facts to which he draws our attention. Even granting that only persons are accountable, persons are still men (for men are accountable). We may be morally right in making the memory of crimes a condition for punishment, but memory does not thereby become the sole criterion of identity, for physical

presence at the crime is also a condition of responsibility for it. Both the criteria are used together, and the most Locke has shown is that the satisfaction of only one is not, for moral purposes, enough; he has not shown that each serves a different concept. One is tempted to sever them only because of the puzzle stories. These, however, do not represent the conditions under which our concepts have been evolved but, rather, imaginary new conditions that might force us into the decision to change them. As things now stand, we have one complex concept, represented variously by words like “person,” “man,” or “human being” and embedded in the specific notions of cobbler, prince, beggar, or thief. This concept has two complementary criteria of identity. If we allow ourselves to be forced to say that there are two concepts, each with one criterion, we are saying that our criteria here and now allow us to hold that the memory of a crime, even without physical presence, is enough to establish responsibility for it.

There is a possible Lockean reply to this. It is to say that when a person remembers his deeds but clearly does not have the body that performed those deeds, the deeds can nevertheless still be his because he may have done them in a previous body and have inherited another since. The same person will then no longer be the same man. This cannot be evaluated until we have considered the puzzle cases at some length. For the present let us turn to Locke’s attempt to make memory the single necessary and sufficient criterion of personal identity. If this attempt is successful, his treatment of the puzzles is made highly plausible; if not, it becomes highly suspect.

**IDENTITY AS MEMORY.** That there is a big difficulty in the problem of identity as memory was clear to Joseph Butler and has recently been very skillfully argued by Antony Flew. Locke wished to say that Smith is the same person who did or witnessed *X* if, and only if, Smith has the memory of doing or witnessing *X*. But this is unclear. The verb *remember* and its cognates have a strong and a weak sense. In the strong sense, to say that someone remembers something is to imply the correctness of his recollection (at least in all but minor details). To say in this idiom that someone’s recollection is erroneous is to say that he does not really remember, but only seems to. In the weak sense, to say someone remembers something is merely to say that he sincerely claims to remember it (in the strong sense). In the weak sense, memories can be mistaken. Now, it is clear that even though we do pay special attention to what people claim to remember when settling questions of identity, the fact that someone claims to remember doing or witnessing something does

not show that he did it or witnessed it. Even though sincere, he might be mistaken. Thus, to say that Smith is the same person if he has the memory of *X* must, it seems, mean that he has to remember *X* in the strong sense of “remember.” But here a twofold difficulty arises.

How are we to decide between a genuine and an apparent memory in any given case? The candidate’s inner conviction is unreliable. We seem to have to resort to more than the memory claims themselves. And the critical evidence would seem to have to be evidence of the person’s physical presence at the scenes he describes. This suggests that the memory criterion is not self-sufficient, as Locke says it is, for in order to know that it is satisfied on a given occasion, we seem to have to use the bodily criterion first.

Apart from this it is much too stringent to restrict personal identity to cases where a person can actually recall his past actions or experiences. People forget. Therefore, we must alter our wording. Smith, we have to say, is the same person who did or witnessed *X* if, and only if, he could remember it. But what does “could” mean here? Taken in a practical sense, it seems too strong, for this would imply that if Smith did do or witness *X*, there is some actual set of procedures that, if we applied them, would enable him to recall it. But this may not be so; even psychoanalysts fail. If, on the other hand, “could” is not given this sort of sense, it is hard to see what its use here contributes, unless it is merely another way of saying that Smith is the one who did or witnessed *X* if, and only if, he is the person to whom the application of procedures designed to induce recollection is appropriate. Unfortunately, this is either straightforwardly untrue (since before we discovered who did or saw *X*, it would be appropriate to apply such procedures to all likely candidates, not just to Smith) or merely a concealed way of saying that Smith is actually the person who did it, so that *no one other than he could* remember it. Thus, the concept of memory seems, in this argument, to presuppose that of personal identity, rather than the reverse.

These arguments show that Locke was mistaken in trying to define personal identity in terms of memory because such a definition is necessarily circular. In at least this sense Butler was correct when he said that memory presupposes, and does not constitute, personal identity. Some philosophers have gone on to say that memory is not a criterion of identity for persons at all, since, they say, we cannot know whether someone’s apparent memories are real without knowing by physical means that he is the person who was involved in the events he recalls. But this, it will be argued later, is also a self-defeating

move. For the present it can be seen that Locke was undoubtedly wrong in holding that memory could be the *sole* criterion of identity for persons.

**SPIRITUAL SUBSTANCE.** A great deal of the argument of Locke’s chapter is designed to reconcile his preference for memory with his doctrine of spiritual substance. The doctrine of spiritual substance is inherited from his view that some doctrine of substance is necessary to account for the fact that the qualities of an object cohere. This is presumably intended to account for their exhibiting a permanent ownership through time, as well as their belonging together in one region of space. Yet Locke denied that we have any knowledge of what substance is like, since our knowledge is restricted to the qualities of things. In the case of persons the doctrine is one of spiritual rather than material substance (whatever the difference between two unknowns may be). But it is clear that nothing whose character is totally unknown can be detectable by the senses or by introspection, so that the doctrine of substance, as Locke held it, cannot provide any answer to the problem of criteria. No one could be said to be applying a concept on the basis of facts to which he has no access. An intractable problem now arises. Granting for the moment that memory is the sole criterion of identity, what is the relation between this fact and that of the existence of the underlying substance? Is it not possible that the application of the memory criterion might lead us to ascribe identity when this was not metaphysically backed by the continuance of one substance? If this should happen, would we have made a mistake?

The most straightforward answer is the paradoxical one of saying that the memory criterion is merely a guide for making identity judgments and that their ultimate metaphysical justification must forever elude us—which would mean that we could never be more than roughly sure we were punishing the right people for crimes. Locke sought to soften this by two devices. One was to sever “substance” and “person” in the same way that he severed “man” and “person” and to insist that only persons are bearers of responsibility, the concept of substance being obscure and irrelevant. The difficulty with this is that it leaves the doctrine of substance without any connection to those entities whose unity it was supposed to explain. The other device was to say that it is the “more probable opinion” that the consciousness that makes for personal identity is “annexed to” one immaterial substance rather than a plurality and to found the faith in its not being otherwise on the goodness of the Deity “who, as far as the happiness or misery of any of his sensible creatures is

concerned in it, will not, by a fatal error of theirs, transfer from one to another that consciousness which draws reward or punishment with it.”

But these are no more than devices and have to be used only if we represent the identity of persons as composed of one kind of fact yet recognized through another. For Locke himself, in his early comments on the varying criteria of identity for objects of different kinds, has provided us with a demonstration of the total inutility of the doctrines of substance. We do not need them to account for our ascriptions of identity through change; these rest upon our noticing characteristic patterns of sequence in things. But these patterns do not just supply the criteria for ascribing continuance. They are also the reasons for our doing so at all. In other words, the answer to the unity question lies in the same facts that yield the answer to the criteria question. The invention of substance was intended to explain a practice whose explanation Locke had himself provided in another way. That he did not draw the moral and altogether abandon this invention may in part be the result of his having inherited it from others and in part the result of the incompleteness of his account of the criteria of personal identity.

In Locke, then, we find: one answer to the unity problem in terms of substance and another in terms of the objects' characteristic patterns of change, which renders the first answer unnecessary; a clear recognition of the connection between problems of practical identification and moral responsibility, which is exaggerated to the point of caricature by the separation of the concepts of a person and a man; an unambiguous claim for the priority of the memory criterion of identity for persons, which seems on superficial examination to lead to circularities; and an introduction of the puzzle cases to force a decision in favor of the last claim. With the lessons of Locke's insights and errors behind us, we turn to Hume.

## HUME

In Hume's famous section on personal identity (*Treatise of Human Nature*, Book I, Part IV, Sec. 6), we find a treatment of the topic that is, as would be expected, more polished and consistent than that of Locke. But since it is also radically defective, its very tidiness makes it less fertile. It has had a baffling effect on generations of readers because of Hume's ability to destroy metaphysical palliative solutions to problems without uncovering the confusions that give rise to them. This, in turn, issues in a paralyzing skepticism that rendered Hume even less capable than Locke of reaching a clear understanding of the conceptual structure he examines.

Hume began by attacking the spiritual-substance solution to the problem of unity, as it appears in the claim that there is a unique and simple “self” that each person is able to detect within himself. He argued with effective simplicity that he was unable to detect it in himself. He was accordingly forced to conclude that the belief in personal identity, since it lacks this justification, is erroneous. People are “nothing but a bundle or collection of different perceptions” in a constant state of change—for perceptions are all that Hume *could* detect in himself. In this situation all that a philosopher can do is examine how it is that men (himself included) “suppose ourselves possessed of an invariable and uninterrupted existence through the whole course of our lives.” This psychological objective Hume tried to attain by uncovering a basic conceptual confusion that he claimed we all fall into. We fail, he said, to distinguish properly between two things—the “idea of an object, that remains invariable and uninterrupted thro' a supposed variation of time” (which is the prototype of identity) and the “idea of several different objects existing in succession, and connected together by a close relation” (which is as good an example as any other of diversity). We confuse these two ideas because of the mental laziness that makes us content with their superficial similarity. Strictly (“to an accurate view”), change destroys identity, but we are easily beguiled into overlooking that change has occurred. Once launched upon this convenient path of error, the mind is led further and further along it by certain recurring facts—it is easier for us to overlook than notice gradual changes, changes that are characteristic of certain objects, and changes that occur according to certain smooth and regular patterns, and so we choose to overlook them. Everyone is prone to this error, which therefore acquires the dubious sanction of custom. Sooner or later, however, philosophers arrive on the scene and notice the recurrent paradox in which men have thus involved their thinking. They see both that we do ascribe identity to changing things and that we have no apparent ground for doing this. The result is that since they cannot *find* such a ground, they *invent* one. Hence, the metaphysical fancies of substance and the self. But these are hollow solutions; there is no discernible bond uniting a person, though there are sufficient interrelationships between his thoughts, feelings, and memories to explain why we erroneously ascribe unity to him. Hume had no consolation to offer us in this alleged predicament other than his usual one: Even though philosophical constructions cannot justify custom, philosophical criticism cannot dislodge it. For philosophical reasonings have power only in the study, not at the backgammon table.

SAMENESS AND CHANGE. Given the premise that Hume shared with the philosophers of substance, his conclusions follow only too clearly. This premise is that there is indeed a paradox in ascribing both change and identity to the same subject, since to ascribe change is to deny that we *have* the same subject. To agree to this is to deny that there can be any genuine solution to the problem of unity and to show that even a substance solution is at best a palliative—and a misleading one. But this is a very odd premise to concede without a battle. It has the extreme, language-destroying consequence that no predicates that cannot be simultaneously ascribed to one subject can be ascribed to a subject at two different times. If it is a mere matter of custom that we violate this principle, at least the custom is indispensable. Surely, much argument is needed to show that the custom is paradoxical and the principle necessary. And there is very little argument in Hume to this effect. His account of the fundamental confusion he claimed to have detected is made plausible only by its vagueness. It looks reasonable to say there is a contrast between one continuing object and a succession of related objects, but this is so only if “object” is tacitly replaced by the same noun in each case. There is a contrast between one continuing note and a succession of related notes (and who would confuse one with the other?) but not between one continuing tune and a succession of related notes. It is by means of the second sort of arrangement, not the first, that we incorporate change into our language. In order to understand the unreality of the contrast that Hume was foisting upon himself, one has merely to recall Locke’s principle that “same” is an incomplete term that functions only in conjunction with substantives. There are some conjunctions that would yield the contrast—“same note” and “succession of different notes” is obviously one. It is equally obvious that “same tune” and “succession of different notes” is not one. Thus, Hume was wrong to look for the source of the contrast, when it does exist, in the concepts of identity and diversity considered alone. The concepts do not operate alone and yield his conflict only in those cases where they are joined with the right substantives. In most cases it does not exist, because most substantive concepts (including that of a person) are designed to incorporate changes.

There is, of course, one sense of the words *same* and *identical* in which sameness and change are incompatible. This is the sense of “same” in which, if applied to two distinct things, it means “alike” and, if applied to one thing at different times, it means “unaltered.” This we might call the comparative sense of the word. It is to be distinguished from the numerical sense, in which two things

said to be the same are said not to be two, but one. Clearly, one thing cannot be said to be both changed and the same if the comparative sense is intended, but this is not the sense we intend when we wonder whether we are entitled to consider someone the same throughout changes. Once this is noted, we can easily see that there is no need to assume that “to an accurate view” an object has to be the same in the comparative sense to remain the same in the numerical sense. If this is missed, a sense of paradox will be only too easy to sustain.

On the other hand, our concepts do not allow all kinds of change indiscriminately. How much is allowed depends on the concept in question. A man can change in more ways before he is destroyed than a chair can. To know what alterations are and are not allowed is to know, among other things, what the criteria of identity are for the class of entities grouped under the concept in question. These matters may not always be easy to settle precisely. We may not be in a position to say whether we have the same things on certain occasions. When the roof is removed, does the house still exist, or are we left with something else? If the walls are torn down and rebuilt, do we have the same house or another? Sometimes the only answer at such a point is a decision on the scope of the concept. But for general purposes usage over the years has provided us with rough and ready conventions that (this is a truism) language-users know.

Hume was aware of this fact, but the logic of his position forced him to misrepresent it. Instead of presenting us with some general indications of the sorts of change that tend to be allowed under concepts (changes that are gradual, small, functionally absorbable into the whole, and so on), he claimed to present us with the factors which, in his view, beguile us most regularly into the habit of ignoring the changes taking place in objects right under our noses. But these factors (which do not at all conceal the changing character of our world from us) are the same ones that appear without this disguise in a correct account of the situation. It is from a detailed knowledge of the very facts he outlined that we derive the criteria for those very identity judgments that he declared to be always unjustified. This is not the first or last time a philosopher has drawn our attention to facts supposed to support one theory when they in fact support another.

Similar considerations apply to what Hume said about the creation of substance doctrines. It is probably true that philosophers have invented these in order to answer the unity problem, and it is, of course, a merit in Hume that he saw that there is no independent evidence for the truth of such doctrines. But he did not see that the

primary objection to them is not that they cannot be shown to be true, but that they are unnecessary. They are invoked to soften a paradox that does not exist. There is no contradiction between saying a thing or person has changed and remains that same thing or person if the changes are characteristic of that sort of thing or of persons. If there is no paradox here, there is no need of any metaphysical postulate to conceal it. If Hume had seen this, he would not have tried to render more palatable the skepticism to which he was led by rejecting the doctrine of substance, for such skepticism could arise only if the doctrine were thought to be both false *and* necessary. But it is only false. The substantialists do not vindicate the ordinary language-user, and Hume does not convict him. Both have misdescribed what he is doing.

PERSONS. In the specific comments that Hume made about the identity of persons, he was clearly working, as was Locke, in the restricted framework in which “person” means “mind.” Only thus can we read his statement that people are nothing but bundles of perceptions. The restriction makes him exaggerate for skeptical purposes the discontinuity he claimed to have discovered in the life histories of persons—a discontinuity that does not exist if we include the history of each person’s body as well as that of his mind.

But this error hides a deeper one. There is a curious unreality about Hume’s discussion of whether we can observe any real bond between the perceptions of a person. This question cannot, of course, be raised unless we can already distinguish between one person and another. Hume, that is to say, was asking whether there is any uniting bond among those perceptions that belong to one person. But why should this question puzzle him if he can already distinguish between those perceptions that belong to one person and those that belong to another? It is at least likely that those features of persons that enable us to distinguish one from another (to individuate) at any one time should also enable us to reidentify people after lapses of time. Yet these features are, and have to be, largely physical ones. For each of us can have (or perceive) only his own perceptions, and without the recognition of the bodies of others, there would be no question of the ownership of perceptions other than one’s own ever arising (or, therefore, of the ownership of one’s own). In asking his question, Hume was assuming that the perceptions persons are alleged to consist of are somehow known to be in parallel strings, so that the only question remaining is what unites those perceptions that belong on any one string. But if, as he saw, there is no clear psychical factor uniting them, it might still be true

that whatever determines their belonging to a particular string also serves to join them together along it. And this, after all, is part of what the body does. His puzzle arises in the form that baffled him only if we first differentiate persons from one another on the basis of their bodies and then, forgetting that we have done it this way, look for some substitute for this principle among the contents of the mind. The principle that the question throws into doubt has to be assumed for the question to be raised.

In Hume, therefore, we find a dismissal of metaphysical construction and an awareness of the general characteristics of the complex facts out of which we forge our criteria of identity. These, however, are rendered completely sterile by the skeptical use to which Hume had to put them. The skepticism is, in turn, the result of a rationalistic oversimplification of the notion of identity that prevented Hume from discovering the muddle at the heart of the unity puzzle and of the dualistic framework of thought within which he worked.

### SOME INTERIM CONCLUSIONS

We can now draw some conclusions from this investigation of the two main classical discussions of self-identity. The first is that the problem of the unity of persons is a spurious problem that rests upon two errors concerning the idea of identity. One of the errors is the failure to take enough note of the distinction between comparative and numerical identity. The other is the failure to note that the concept of numerical identity works in harness with substantive class concepts that provide those who know how to employ them with rules for making correct identity judgments on entities within their classes.

The second conclusion is that the concept of spiritual substance is not only unverifiable (as Hume saw) but also unnecessary (as Locke saw and Hume did not).

The third conclusion is that the unity problem has acquired a specious appearance of difficulty because of a tacit restriction placed by philosophers on the concept of a person. Since only the psychical components of the person are considered, a picture of change and discontinuity is conjured up that makes the fictitious contrast between identity and change seem even more alarming.

This leads naturally into the fourth conclusion—that it is salutary to remind ourselves that our actual concept of a person is of a psychophysical being. Hence, talk of the criteria of identity for purely psychical beings is not talk of the concept of a person that we actually have. How far they would differ has yet to be decided, but we must at least begin by asking what the actual criteria for embod-

ied human beings are. Here we must bear in mind the apparent circularity of the view that memory is the sole criterion for the identity of human beings. The examination of Locke suggested that in order to apply it some covert reference to the identity of the body has to be made. We must first examine this suggestion with some care.

We shall begin by trying to clarify further the notion of a criterion. It will then be argued that the bodily criterion of identity is in certain important ways more fundamental than the memory criterion in present discourse, although memory is still properly called a criterion in spite of Locke's failure. It could not, however, be the sole criterion. We shall finally consider the puzzles and argue that although they present us with some difficult conceptual decisions, they would not *necessitate* a change of convention in favor of memory, although this is a *possible* response to them. An attempt will be made to show that the response, if made, is innocuous, so that the puzzles are devoid of the wide implications philosophers have thought them to have.

## CRITERIA

Thus far, two things have been meant in calling bodily identity and memory criteria of personal identity. One is that it is by reference to one or the other of these facts about people that questions of identity are usually settled. The other is that practical knowledge of how to settle these questions in these ways is a necessary part of having the concept of a person. More needs to be said than this.

There are two areas where the notion of a criterion has been of special concern in recent philosophy. One is the problem of the knowledge of the mental life of other persons. It has been said by some, following Ludwig Wittgenstein, that we can have this knowledge because people's behavior is able to supply us with criteria for saying correctly that they have certain mental states. The other is the problem of the relationship between judgments of fact and evaluative judgments. It has been said by J. O. Urmson, R. M. Hare, and others that certain facts about things or people serve as criteria for evaluating them as good or bad. In both these cases the relationship the word *criterion* names is thought to be tighter than an inductive one and yet looser than a deductive one. In this discussion the word will not be used in this sense, since the relationship between bodily identity and memory, on the one hand, and personal identity, on the other, seems to be closer than this; it seems, in fact, to be straightforwardly deductive. In the discussion of Locke we saw that saying someone remembers something in the strong

sense entails that it forms a part of his life history. It is now claimed that if a person before us has the body that Smith used to have, it follows that he is Smith.

Two comments are necessary. First, this does not commit us to any view about how we know that the criteria are satisfied. To explain how we discover that this man really remembers or really has Smith's body, it might be necessary to use the notion of a criterion in some other, weaker sense—to say, for example, that a certain accumulation of evidence left no more room for reasonable doubt on the matter. But this is another issue. Second, an objection has to be countered. It might be objected that if the relationship between memory or bodily identity and personal identity is deductive, then the criteria are sterile and unusable. For, the argument might go, if either of these facts entailed that this was the same person, we would have to know independently who it was before we could be sure the criterion was satisfied. (This is the objection mentioned in the case of Locke.) This is not a genuine difficulty, but it is instructive. The reason for introducing it can only be the doctrine that if one proposition, *P*, entails another, *Q*, then it is impossible to know *P* without first knowing *Q*. But this is only a dogma that has to be tested against the facts, which do not bear it out.

The difficulty can teach us, however, that the standard objection to Locke is too simple. Even though the fact that memory entails personal identity prevents us from defining one in terms of the other without a circle, it is still possible that we may sometimes know that a person remembers without having previously checked on his identity. If this were not so, then memory could not serve as a criterion, for it is an additional part of the notion of a criterion, as all philosophers have used the term, that it can be applied. I shall shortly argue that this knowledge is possible.

**BODILY IDENTITY.** Some philosophers have said that the bodily criterion is not a criterion at all because there are some occasions in which we find human bodies that are not persons—that is, dead bodies or bodies that are biologically alive but incapable of exhibiting personality. But my thesis is that bodily identity is a sufficient criterion for reidentifying persons and by hypothesis these are not persons. If we are asking whether *X* before us, who is a person, is the same as Smith whom we once knew, who was a person, it is a sufficient condition of an affirmative answer to know that *X*'s body is Smith's body.

A more serious-looking argument against bodily identity comes from the puzzles. It might be said that

when we use the bodily criterion, we are covertly assuming that there has not been any bodily transfer. This raises an important point of method: How are the puzzles to be treated? We shall treat them as cases of proposed conceptual innovation, as if those who invent them do so to make us imagine circumstances that would force us to change our conceptual habits and rely on one criterion alone, even though we now use two. I have argued that in using two criteria, we have not faced the sorts of problems the puzzles present. If this is right, then no proviso against them can be embodied in our present thinking, even covertly. (If anyone considers that such contingencies *are* already provided for, then what is said below about the puzzles can probably be transposed into the key needed to examine his view of what sort of provision we make.)

There are several ways in which the bodily criterion is more fundamental than the memory criterion. In the present thesis these statements should seem like truisms.

Although both criteria are sufficient, only bodily identity is necessary. “This is the person who fired the shot” is entailed equally by “This person has the body of the person who fired the shot” and “This person remembers firing the shot”; but although the third statement entails the first statement, it does not entail the second.

The bodily criterion is more extensive. It is a matter of chance that men remember the tracts of their lives that they do remember rather than those that they do not, and we can apply the memory criterion only when there are memories to use. But in a clear sense the bodily criterion can always be used, for the body is present whenever the person is.

The bodily criterion is more varied. There are more ways in which we can determine whether a person is physically the same as someone than there are ways of determining whether his recollections are genuine. There are blood tests, fingerprints, photographs, the testimony of witnesses, and much else. Of course, a candidate’s memory claims can be used to support this evidence, just as physical evidence can be used to support memory claims. The resort to physical tests when the memory claims are in doubt, however, is much more nearly inevitable than the resort to memory claims when physical evidence is inconclusive, since there are so many ways of adding to the physical evidence and it is free from the nagging thought that there is more than one way of coming by information about the past.

These examples are enough to show that we should regard overconfident readings of the puzzle cases with

some suspicion, since the normal order of priority between our criteria is not what these readings suggest that it is.

MEMORY. It has already been suggested that even though Locke was mistaken in thinking that he could define personal identity in terms of memory, it does not follow that he was wrong to think of memory as a genuine criterion of personal identity. It might be possible to know that someone remembered without first ascertaining in another way who he is. But if this is possible, it has to coexist with the fact that when men’s memory claims are in doubt, decision hinges for the most part on physical tests.

One way of trying to relate these two is to say that when we accept a memory claim unchecked, as we often do, we are relying on an inductive connection between the memory claims of a person and the events he refers to. We have found, that is, that this man’s memory claims are usually true or, perhaps, that most people’s are usually true. We now accept his word on this basis. Sydney Shoemaker has argued persuasively that this is too simple. He has claimed that it is a logical truth that memory claims are usually true, not an inductive one. Following are his arguments: (1) If someone frequently said with sincerity that he remembered events that did not occur, we would be justified in concluding that he did not know how to use the word *remember*. (2) If a child learning the language were to behave in this way with the word *remember* or one of its cognates, we would tell him that he had not learned how to use it. (3) If we were translating an unknown language and were inclined to translate certain expressions in it as memory expressions, our decision whether to do so would have to hinge in part upon the truth or falsity of the statements beginning with those expressions; if they were generally false, we could not translate them in this way.

If these arguments are accepted, it should probably be added that in order to understand memory claims at all, we must be able to recognize cases of genuine memory, so that there must be *some* such cases and also that just as lies and false promises must be in the minority to succeed, so must insincere or mistaken memory claims. These arguments appear enough to refute any generalized skepticism about memory, unless the skeptic is prepared to deny that our language has those features on which these arguments depend—that its users are generally successful in communicating by means of it and that it is learned and not instinctive. We shall not investigate how far it is correct to regard something established by this

sort of argument as a “necessary truth.” Although the arguments do depend upon features of language that might be argued to be contingent ones, it is still clear that the conclusions are not straightforwardly inductive, and for this reason I shall allow the label to stick.

It is, then, a necessary truth that memory claims are usually true, from which it follows that they can usually be relied upon in practice. But this does not tell us whether any given memory claim is true. The situation here is, rather, that we are justified in accepting someone’s memory claims unless there is some reason to doubt them. Only when there is such a reason do we need to check them. It is this that enables memory to serve as a criterion of identity.

But this is a far cry from Locke’s theory that memory is the sole criterion. The very facts that show it to be a criterion at all show that it could not be the only one. We must be able to use the distinction between true and false memory claims (even to learn memory language), and this means we must have at our disposal a way or ways of checking the claims that are made. This implies, of course, that we must be able to discover whether the speaker was, indeed, present at that which he describes. Thus, the availability of the bodily criterion of identity is a necessary condition of our having made the distinction between genuine and false memories, even though it often must, from our previous arguments, be in order not to resort to it but to accept memory claims at their face value. Memory is thus a criterion of identity, but it is absurd to suggest it could be the only one, for without the ability to use another we would lack the ability to use it.

This bears out the view that the bodily criterion is more fundamental. There are arguments in Shoemaker, however, which suggest that just as the memory criterion depends on the bodily criterion in the way we have seen, a similar dependence exists the other way. There is a dependence the other way, but it is not a parallel one. The dependence is one found in all cognitive procedures. Unless people had memories, they could not know past facts. If they did not know past facts, they could not know past facts about themselves or other persons, for we have to depend on either our own recollections or those of other witnesses to learn about the past of a human body. At some point memory testimony has to be accepted without further question, and to accept someone’s testimony is to accept that he was indeed a witness to some past event. This is true and supplies us with one more argument to show that memory claims must usually be correct, but it does not establish parity between the two criteria because it does not show that in dealing with a

problem of reidentification, it is impossible in theory to dispense with the memory claims of the candidate himself. This is possible, however, and is one of the reasons for the greater importance of the bodily criterion.

In spite of this many philosophers have accorded memory greater weight than the bodily criterion. This seems to be a result of what I shall call the “internality” of memory. In remembering, a person seems to have direct, rather than inferential, access to his own past, to know past facts about himself from the inside. This view of memory is reinforced by the fact that most people would admit to having quasi-perceptual experiences in the form of mental imagery when they remember. Most readers unhesitatingly follow the writers of bodily-transfer stories in assuming them to be intelligible—for how could someone who had systematic recollections of this kind be proved wrong about his own identity by outsiders?

This attitude is not shaken as much as it should be by the fact that in ordinary unsystematic cases we frequently find that even the most vivid recollections are illusory. This is presumably because of the traditional picture of memory as some sort of introspective contemplation of imagery. But what brings memory into the public arena and enables us to use it as a criterion of identity is not this or that sort of private experience but the claims made as a result of it. Indeed, the memory claims of those who deny having memory images are as negotiable in common speech as those of the rest of us. If someone were to claim that he remembered an event and if we were able to determine that he had indeed witnessed it, could give us correct information about it, and could not have come by this information through later research or hearsay, there could be no doubt that he did remember it. The presence or absence, vividness or faintness, of his private images would be of no interest.

It is nevertheless characteristic that when people remember, they have images. If it were not, it is hard to see how the traditional picture of memory could have gained currency. It is true that memory claims are corrigible public claims to knowledge about the past and true that those who make them usually seem to have memory images. It is the first claim that explains why memory has the status it has as a criterion of personal identity. It is the second claim that helps us to understand why some have thought it more fundamental a criterion than it is. For although the subject’s unique possession of his images does not confer immunity on the claims he makes, it may have much to do with the fact that he makes them. And it is easy to imagine cases where someone has such experiences and makes the memory claims that they character-

istically engender only to find out afterward that these claims are unfounded. This is common enough. It is an easy extension of this to imagine situations in which the events described by such a person did in fact take place, but in the presence of a human body other than the one he has. We then have a typical philosopher's puzzle case. In such a situation characteristic image-laden experiences might take place, and the customary memory claims might be uttered, yet the contextual conditions surrounding correct memory claims would not exist. To allow in some such cases that the speaker really does remember is to change the meaning of this word, but the characteristic intimacy and feeling of conviction that such inner experiences engender might hide this fact from those imagining such examples.

### BODILY TRANSFER

It is now time to look at the puzzles. There are, however, a great variety of these, and without deliberate restriction it is impossible to produce any example of the intricate conceptual decisions involved in them. We shall accordingly leave aside puzzle stories of persons who seem to vanish and reappear or who seem to be reincarnations of someone dead and keep to the case of apparent bodily transfer. What is said here is probably comparable to what could be said in these other cases.

Let us take a story in which the servants in a royal palace waken a person who looks as if he is the prince but who evinces complete bewilderment at his surroundings, utters memory claims befitting a cobbler, is astonished on looking into the mirror, and so on. At the same time a man who looks as if he is the cobbler produces princely reactions and memory claims and demands to be returned to the royal palace. What should we say?

B. A. O. Williams has pointed out that the puzzle cases are harder to state in detail than is usually thought. Are we really able to imagine a person with the cobbler's memories (which will include some acquired skills and personality traits) and the prince's body? I shall ignore this complication, though in fact it tends to support what I shall argue to be the best solution.

The first thing to notice about such a puzzle is that it is puzzling. We are torn two ways over it, as we would expect to be if we have two criteria in apparent conflict. On reflection, however, it is more puzzling because if what I have said above is correct, the bodily criterion is the more fundamental of the two, so that the priorities in present practice would lead one to expect that the puzzle should be settled in its favor. Yet those such as Locke, who invent these stories, take it for granted that our tempta-

tions are to settle it in favor of memory. And as far as their judgment of the temptations of most readers goes, they seem to be right. Any answer to the puzzle must take both sides of this paradox into account and try to reconcile them.

**PRIORITY OF BODILY CRITERION.** Let us first consider the recommendation that our cobbler-prince episode should make us abandon the bodily criterion in favor of the memory criterion.

Put in this bald way, the proposal is absurd. We have already seen reason to say that memory could not be the sole criterion for the identity of persons because using it requires the availability of another. But this, although true, is far too brusque a reaction to the puzzle, which could be used to argue a more modest proposal—to *weaken* the bodily criterion in certain circumstances.

The advocate of bodily transfer could begin his case by making certain admissions and could then say that they do not destroy the case for it. The admissions would be these.

First, in order to set up any case at all, we have to have someone who now makes memory claims that fit a body other than the one he now has. This requires that he should be reidentifiable as the same throughout the period during which he utters the claims. The claims have to be systematic in the circumstances, so the period has to be considerable. For such reidentification the criterion of bodily identity would be necessary.

Second, in order to set up any case at all, we have to know that there was actually a person in the past about whose life these memory claims seem to be accurate reports and that all the claims fit the life history of the *same* person in the past, who *was* the person the claimant now says he *is*. This can be known only if in the past we were able to reidentify that person over the period of his life. This requires the past availability of the bodily criterion.

But when these admissions are made, the advocate of bodily transfer need go no further; he can hold his ground here and say that bodily transfer is still possible. If we had a case where the memory claims of the man who seemed to be the cobbler systematically fitted the past of the prince and vice versa, these claims could be checked up on in detail. And they would be found, *ex hypothesi*, to fit a past human body; the only difference from normal would be that the body that they fitted was not the body uttering them. Yet the past of the body uttering them would itself be taken care of by a systematic set of memory claims now uttered by that body which they

did fit. In such circumstances it surely would be wholly natural to say that the two men had exchanged bodies.

In spite of much recent writing on the puzzles, there seems to be no satisfactory demonstration that the change in convention that would follow on our saying a transfer had occurred would lead to absurdities. It is therefore a possibility. If we make this decision, we would be forced to so weaken the bodily criterion that we were entitled to infer from its being the same body to its being the same person only if there were no (systematic) memory claims which pointed to its being another person. This would place the two criteria in a position of relative parity, for the memory criterion would hold in normal circumstances subject to bodily checks and the bodily criterion would hold except in those abnormal cases where there were detailed and systematic memory claims that conflicted with the normal reading of the bodily evidence.

Having allowed this, we must now emphasize two things. One is that other readings of these cases could be made, as will shortly be argued. The other is that even the adoption of the bodily-transfer reading of them does not have the exciting implications most have thought.

We have already seen that it lends no support to the view that memory either is or ever could be the sole criterion of identity for persons.

It also does nothing to support the suggestion that people could exist with no bodies at all or to give concrete meaning to the common picture of bodily transfer as someone's *going out of* one body *into* another.

Transfer cases, even if allowed, could only be exceptional. If they were not, we would have a world in which the procedures for applying memory concepts would be much more complex than they now are, and virtually impossible to learn. I do not think we could come to learn memory language if the basic use of the word *remember* were one in which it could refer not only to the past of the body uttering it but also to the past of another body (which, in turn, it could be allowed to "fit" only if it were certain that there were no other systematic memory claims to fit the same period available from that body itself). A concept as epistemologically fundamental as that of memory has to be more easily come by than it would be in this sort of world. But granted that it is simpler and has been learned in more straightforward ways, as at present, then it could be stretched to subsequently cover the exceptional cases.

The conclusion is, therefore, that although the logical possibility of bodily transfer has to be admitted, the

implications are small and the wisdom of this particular change in our conventions is not self-evident.

**ABANDONING THE MEMORY CRITERION.** We shall now consider the reverse suggestion—that in the face of such a puzzle we abandon the memory criterion and keep the bodily criterion.

It is not immediately obvious what could be meant by this. If it means that we should ignore the memory claims of candidates for reidentification, this is something we could do in any case; the point at issue is the status of those claims when they are considered. If it means that we should reject memory claims that clash with the bodily facts, then this is something we do already and no change in conventions is implied in it. It must mean that we disallow the inference from "He remembers *X*" to "*X* formed part of his life history." But the difficulty here is that in order even to gather the bodily facts, we need to learn about the pasts of others, we have to use either our own memories or those of witnesses, and checks on one set of memories, as we saw earlier, require reliance on other sets. So a change of convention here must allow for the continuance of this reliance.

It seems possible to allow for it in only one way—to continue to say that memory claims are generally correct accounts of past actions or events but to add that these actions or events may have formed part of the life of a person other than the one now making memory claims about them. People, in other words, would be allowed to recall events in the lives of others. Two comments may be made here.

For reasons that would parallel those in the previous section, it seems that cases where people *did* recall events in the lives of others would have to be rare.

Suppose that in spite of his protestations *X* was just admitted to be the prince because he has the prince's body. He now says, "But I remember mending the shoes last night." Suppose *X* finally gives in and concedes that he must be the prince although it is still agreed on all sides that the cobbler did mend the shoes last night. *X* cannot just say, "Oh, I really remember the cobbler's mending the shoes, not myself." This will not do because it fails to distinguish between the new, special case in which one person remembers the deeds of another without having done them (or even having been present) and the familiar case in which one person remembers another's deeds through having witnessed those deeds. It is the second case that would be conveyed by a sentence like "I remember the cobbler's mending the shoes." I am not sure how far this difficulty could be removed by ver-

bal adjustment, but it is at the minimum an inconvenience under the new convention.

The conclusion is as before.

**DENIAL THAT ONE CRITERION IS SATISFIED.** There would thus seem to be two possible alternative conceptual changes that we could make, each of which would weaken a familiar inference and each of which would be awkward, though not demonstrably impossible. As a matter of fact, however, we already have at our disposal a much simpler device for dealing with such puzzles. Instead of pretending to abandon or to alter one criterion, we can refuse to allow that one of them is satisfied. This need not be thought of as merely a temporary device. If we were to come across odd examples of pieces of iron that did not obey the lodestone but seemed otherwise to satisfy tests for being iron, we could postpone conceptual change for some time by insisting either that the tests had not been properly administered or that it was not really a lodestone. Such moves would become irrational only if maintained in the face of repeated examples. It is hard to admit that the point of irrationality could ever be reached in the present case.

There are clearly only two moves of this sort here. We can deny that it is really the same body, on the grounds that the memory claims it utters fit another, or we can deny that it is really the case that the speaker remembers, because it was not the body before us that was present. Note that neither move involves denying a criterion as the term is being used here. It merely involves refusing to accept that one criterion is satisfied in those cases where accepting that both were satisfied would land us in direct contradiction. There seem to be insuperable obstacles in adopting the first move. For one thing, it would require us, in the case of human bodies, to adopt standards of reidentification that differ from those we accept in the case of all other physical objects. (And if we disregarded this and insisted on behavioral or memory criteria for the identity of human bodies, we would destroy the distinction between a human body and a person.) For another, we would find ourselves led straight into an absurdity. Note again that we are retaining the bodily criterion while making this move. If what is known to be spatiotemporally continuous with the prince's body utters cobblerlike memory claims and if for this reason we say that it is not really the prince's body, we are not able to go on to say that it is, instead, the cobbler's body; for, by hypothesis, it is not spatiotemporally continuous with the cobbler's body and is therefore *not* the same physical object as that body. Thus, it is nobody's body at all, which is absurd.

Hence, we are not able to make the move of denying that it is the body it seems to be. But there is nothing to prevent us from making the other move—of saying that unless the bodily facts at least coincide with the memory claims a person utters, then these claims are false, however closely they fit the past of someone else. This would merely be the determined application to special cases of a procedure we now follow.

We could not, of course, stop there, for we would have to explain how the person came to forget his own past and have so much accurate information about another's. Heroic hypotheses of retrocognitive clairvoyance would have to be brought forward to deal with such strange things. Such hypotheses would have to explain how it was that a person could have information about someone else's past in a manner so phenomenologically similar to the way in which he normally remembered his own. But no greater heroism would be called for here than would be called for by accepting that one person could exchange bodies or memories with another—for the second idea would require much the same sort of hypothesis as the one I have mentioned, and the first would make it puzzling that people should remember their own pasts. Of course, each would introduce a difficult conceptual change.

**PUZZLE CASES BECOMING COMMON.** But would we not be forced into a conceptual change if such cases became common? For once, the complexities of our problem make it easier to deal with and enable us to give a negative answer. This can be understood from two sides. It has already been argued that either of the possible conceptual changes would require that the cases of bodily transfer or memory exchange be rare; otherwise, we would not have the memory concepts we do have. Yet in order even to state the problem, we must use memory concepts. From the other side, we have to remember that if we were to adopt the device recommended, then in cases like the one in our story we would say of the characters not that they remembered but that they "retrocognized." If such a convention were adopted, however, it would become the appropriate language for the persons to use in such situations. For what makes our problem is what makes the memory criterion possible—the occurrence of memory claims. These are made in public memory language. If the public language changed so that the inappropriateness of a standardly worded memory claim for such circumstances became generally recognized, then the persons themselves, on discovering that the bodily facts did not fit, would not say that they remembered but that they "retrocognized." Thus, by the time the cases

became common, they would cease to exist in the logically puzzling form, because they would cease to be heralded by claims to remember. Pieces of iron do not talk; people are different, and the very data of the puzzles would change if the cases occurred frequently.

**PRIMACY OF MEMORY.** The solution has now to contend with the fact that we do feel a genuine compulsion to read these puzzle stories in some way that favors memory and to say that the claimant himself must know who he is better than others ever could. There are two reasons for this compulsion. One derives from the internality of memory, the other from psychophysical dualism.

On the internality of memory it is enough to repeat that although it is people's public memory claims that relate to decisions about their identity, such claims seem to be made for the most part when people have had characteristic image-laden experiences. Many philosophers consider these to be more closely related to the logic of remembering than they really are, and since the privacy of imagery places reports of it in an epistemologically privileged position, this privilege is erroneously thought to extend to memory claims—overlooking the fact that memory claims are not reports of imagery. When a person imagines himself being involved in a puzzle story, he supplies himself with vivid and systematic imagery to occasion memory claims that do not fit his present body, and he forgets that the persistence and vividness of the memory could not override the impact of the public physical checks that are a necessary part of the conventions governing memory claims.

As for the theoretical dualism that lies behind so many arguments about personal identity, it has here been argued that however we read them, the puzzles do nothing to support dualism. But the investigation of them has been conditioned in many cases by dualist preconceptions.

Shoemaker correctly remarked that the concept of bodily transfer is compatible with a behavioristic view of the mind, for one might mean, when saying that the cobbler and prince had exchanged bodies, that in the case of each person his distinctive behavior patterns (including his memory claims and behavior) were to be found in a body other than the one in which they used to be found. This is true, but if this solution to the puzzles were urged upon us in conjunction with an overtly behaviorist view of personality, it seems plain that there would be no special obviousness in or compulsion toward this solution as opposed to the others, even though it would still be a possible one. The reason that we all feel some degree of com-

pulsion toward accepting the bodily-transfer solution is that dualist preconceptions intrude themselves when we investigate the stories. It is taken for granted that we have an independently clear concept, with recognized criteria of identity, of a soul, spirit, or mind, which can be thought of as having a purely contingent relationship to the body, which it may abandon in favor of another body. (Locke's phraseology in introducing the puzzle is to the point: "Should the soul of a prince ... enter and inform the body of a cobbler...?") The only available criterion for such a purely psychical being is presumably memory, but we have already seen that it cannot be self-sufficient in the way it would have to be for us to conceive such an entity independently. Yet this is necessary to justify otherwise vacuous talk about such an entity's entering one body, leaving another, and the rest. Anyone feeling impelled to read the puzzles in favor of memory is probably making covert use of this illegitimate picture.

An important objection could now be raised. It might be said that even though much reflection has been infused with a dualist theory, this is a linguistic fact of life that philosophers must accept without complaint, for all language-users, not just philosophers, tend to be dualists. Thus, all language-users, if faced with the puzzles, would tend to opt for the memory solution. If so, how can a philosopher cavil at this solution? For what we *should* say is usually to be determined by a decision as to what we *would* say.

This raises the difficult general question of how to react to a misleading theory that has filtered into ordinary discourse. In the present case we could argue as follows. Philosophers such as Gilbert Ryle have exposed many errors and confusions in traditional dualism. But they have spoiled their own case by representing themselves as champions of the common man against the professional philosopher. It is easy enough to show that nonphilosophers are dualists, too. However, the common man is a dualist in the same sense in which the philosopher is one—when he interprets his own thinking about mental qualities and conduct. What the antidualist arguments show is that laymen misconstrue in their interpretative moments the utterances and thoughts that they engage in in their day-to-day existence. (We could say that all of us are occasionally philosophers, when we think about our ordinary mental concepts, but most of us are bad philosophers because we misinterpret them.) These common theoretical misconstructions, though inconsistent with our daily use of such concepts, are usually harmless because of the merciful logical dispensation that allows us to make good sense with our concepts while talking non-

sense about them. Occasionally, however, the prolonged continuance of the misguided theory can infect the practice. One such occasion is the present one, where the tacit appeal to the illegitimate concept of an independently identifiable psychical entity exerts a compulsion upon the reader of a puzzle story to interpret that story as a case of bodily transfer. Here it seems legitimate to replace bad theory by better and to argue against taking this solution for granted. The memory solution the dualist reading implies is at best one competitor among others, and one is led to think it is required only by our use of concepts on more normal occasions if one has misunderstood those occasions.

## CONCLUSIONS

Of the two problems distinguished at the outset, this article has tried to show that the first, the unity problem, is spurious, since the paradox on which it rests is only apparent. The criteria problem admits of no such clear-cut solution, since it is clear on examination that both the bodily criterion and the memory criterion are ineluctable components of our concept of a person. The bodily criterion is more fundamental, but the memory criterion is, in its own way, indispensable because of the basic epistemological status of memory itself. This is one of the many facets of the irreducibly psychophysical nature of persons. One important result of this conclusion is that it is absurd to consider memory as the sole necessary or sufficient condition of identity. Thus, it would not even seem possible to construct a coherent concept of an independently identifiable bodiless person of whose identity memory would be the sole criterion. It would seem to follow that disembodied survival is logically absurd. It is impossible to decide here whether the doctrine of bodily resurrection fares better. Our examination shows that the puzzle stories can at most embody situations in which the relationships between the two criteria could be altered by conceptual decision. They could not embody situations in which either could be abandoned in favor of the other.

## Bibliography

The literature devoted explicitly to the problem of personal identity is fairly small, but the amount that is devoted to related questions is immense. These works were made direct use of in the article: John Locke, *Essay concerning Human*

*Understanding*, edited by Campbell Fraser (Oxford: Clarendon Press, 1894), Book 2, Ch. 27; David Hume, *A Treatise of Human Nature*, edited by L. A. Selby-Bigge (Oxford: Clarendon Press, 1896), Book I, Part 4, Sec. 6; Joseph Butler, "Of Personal Identity," appendix to *The Analogy of Religion*, edited by W. E. Gladstone (Oxford, 1897), Vol. I, pp. 385ff.; Antony Flew, "Locke and the Problem of Personal Identity," *Philosophy* 26 (1951): 53–68; Terence Penelhum, "Hume on Personal Identity," *Philosophical Review* 64 (1955): 571–589, and "Personal Identity, Memory, and Survival," *Journal of Philosophy*, 56 (1959): 882–903; B. A. O. Williams, "Personal Identity and Individuation," *PAS* 57 (1956–1957): 229ff.; Sydney Shoemaker, "Personal Identity and Memory," *Journal of Philosophy* 56 (1959): 868–882.

The most important classical discussion that is not discussed in this article is Thomas Reid, *Essays on the Intellectual Powers of Man* (Edinburgh, 1785), Essay III, especially Chs. 4 and 6. Reid has some admirable criticisms of Locke, but he is too wedded to the concept of substance to see that Locke's departures from common conceptual practice are not remedied by the use of it.

Another classic discussion is Immanuel Kant, *Critique of Pure Reason*, translated by Norman Kemp Smith (London: Macmillan, 1929), pp. 341ff.

There are some recent books whose discussions repay close study. See C. D. Broad, *The Mind and Its Place in Nature* (London, 1937), Sec. E, pp. 553ff. For stimulating arguments in favor of the notion of a substantial self, see C. A. Campbell, *On Selfhood and Godhood* (London: Allen and Unwin, 1957). Risieri Frondizi, *The Nature of the Self* (New Haven, CT: Yale University Press, 1953), contains interesting discussions of Locke and Hume, but its positive discussion seems to be vitiated by the restrictions of the terminology in its title. P. A. Minkus, *Philosophy of the Person* (Oxford: Blackwell, 1960), is obscure to a degree but has the only extended discussion of Reid. See also Sydney Shoemaker, *Self-Knowledge and Self-Identity* (Ithaca, NY: Cornell University Press, 1963), and his entry "Memory" in this encyclopedia.

The following articles take positions that radically differ from the arguments of the present article. H. P. Grice, "Personal Identity," *Mind* 50 (1941): 330–350, argues that the "self" is a logical construction consisting of experiences linked conceptually by memory. An authoritative presentation of the Kantian thesis that perceptual acts require a persisting subject or owner is found in H. J. Paton, "Self-Identity," in his *In Defence of Reason* (London, 1951). J. R. Jones, "The Self in Sensory Cognition," *Mind* 58 (1949): 40–61, attempts to dispense with the notion of a subject of perceptual acts. This paper generated an exchange on the concept of the self between its author and Antony Flew; see Antony Flew, "Selves," *Mind* 58 (1949): 355–358, and J. R. Jones, "Selves: A Reply to Mr. Flew," *Mind* 59 (1950): 233–236. This article has not been able to deal with the detail of the arguments presented in these papers but would hold that each in its own way is handicapped by the restrictions placed on the discussion of personal identity by Hume and by the use of the terminology of the "self." On the perplexities surrounding the notion of a purely mental subject, rather than the psychophysical person, as the owner of mental acts and events, see Ch. 6 of Gilbert Ryle's *The Concept of the*

*Mind* (London: Hutchinson, 1949), and Ch. 3 of P. F. Strawson's *Individuals* (London: Methuen, 1959). Both of these books have strongly influenced this article.

Other helpful recent treatments are C. B. Martin, *Religious Belief* (Ithaca, NY: Cornell University Press, 1959), Ch. 6, and A. M. Quinton, "The Soul," *Journal of Philosophy* 59 (1962): 393–409.

## PERSONAL IDENTITY [ADDENDUM]

At the center of the debate about personal identity since the 1970s has been the work of Derek Parfit, whose ideas, first published in his article "Personal Identity" (1971) and then extended and elaborated in his monumental *Reasons and Persons* (1984, part 3), revitalized and to some extent transformed the topic. The following discussion explains how this has come about and relates Parfit's ideas to those of other influential writers on personal identity from the 1960s on, in particular Bernard Arthur Owen Williams (1973), Sydney Shoemaker (1970, 1985, 1999), Robert Nozick (1981), Roderick M. Chisholm (1976), David Wiggins (1967, 1980, 1996), and Richard G. Swinburne (1973–1974). Since the 1990s the debate about personal identity has come to be focused on the correctness of the animalist view, the view that we are animals and that our identity conditions are entirely biological. This view is defended by a number of authors including Paul F. Snowdon (1991), Peter van Inwagen (1990), and Eric T. Olson (1997). Once again, a knowledge of Parfit's views is essential to understanding the arrival of animalism on the philosophical scene and assessing the plausibility of the animalist's position.

### THE REDUPLICATION ARGUMENT

The starting point for the development of Parfit's ideas was provided by Williams in "Personal Identity and Individuation" (1973), in which he puts forward his famous reduplication argument, intended as an objection to any account of personal identity that entailed the possibility of reincarnation. Any such account, he argues, would have to make personal identity consist in psychological links between the later reincarnation claimant and the original person. But no such account could rule out the possibility of a situation in which there were two equally good "candidates" for identity with an earlier person, two people bearing just the same psychological links to the earlier person. But since two people cannot be identical

with one person, no such account can provide a sufficient condition of personal identity.

A consensus quickly emerged, however, among other writers on personal identity, that the significance of Williams's argument was greater than he had seen. Though Williams himself remained recalcitrant, others saw that his argument consequently challenged, not just any account of personal identity that allowed for such possibilities as reincarnation, which involves a radical separation of personal identity from bodily identity, but any account of personal identity that proposed as a sufficient condition of personal identity a conceivably duplicable relation—that is, a relation that could conceivably take a one-many form. The result of this was to focus attention on the principle underlying Williams's argument, called the "only x and y rule" by Wiggins (1967, 1980) in his discussion of the reduplication argument, which emphasized the generality of the argument. The correct formulation of this principle is difficult, but roughly speaking it asserts that the question whether later x is the same person as earlier y can depend only on facts about x and y and the relationship between them, and no facts about any other individuals can be relevant to whether x is y. Otherwise put, what this principle asserts is that whether later x is identical with earlier y can depend only on the intrinsic relationship between them; it cannot be determined extrinsically.

### RESPONSES TO THE REDUPLICATION ARGUMENT

One way to respond to the reduplication argument while retaining the only x and y rule is to question the logic of the argument. According to Williams in a reduplication situation the rival candidates for identity with the original person must be new existents, identical neither with him or her nor with one another. But it is possible, as argued by several writers, including John Perry (1972) and David Lewis (1976), to reject this description of the reduplication situation. It must be accepted that the post-fission rivals are distinct people, but it is possible, according to these philosophers, to reject the view that they are new existents; rather, they have existed all along, but have only become spatially distinct with the fission. There are various versions of this view. Their common element is the multiple occupancy thesis, that what makes it the case that two people existing at one time are two may be facts about what is the case at other times. This implies that we cannot know for certain how many people exist at a certain time without knowing the future.

This response to Williams allows the retention of an account of personal identity, which allows the possibility of reincarnation, while accepting the only *x* and *y* rule. However, a simpler, and more popular, response to Williams is simply to reject the only *x* and *y* rule and to elaborate an account of personal identity that explicitly packs into its sufficient condition the constraint that *x* is identical with *y* only if there is no third candidate *z* who can be considered a better or equally good candidate for identity with *y*. Such an account of personal identity, in terms of psychological continuity, is elaborated by Shoemaker in “Persons and Their Pasts” (1970), in which he also fashions the important concept of quasi memory as a way of responding to the objection that a vicious circle must be involved in explaining personal identity in terms of, possibly among other things, memory. Another sophisticated development of the best candidate approach is contained in Nozick’s *Philosophical Explanations* (1981).

### IDENTITY AND SURVIVAL

But the straightforward rejection of the only *x* and *y* rule is implausible, unless some account of its attractiveness is given. It is at this point that Parfit’s ideas become relevant. In response to Williams’s argument Parfit (1971, 1984) proposes that identity does not matter in survival. What does matter is a relation of psychological connectedness-cum-continuity that does conform to the only *x* and *y* rule, but it seems plausible that identity obeys the only *x* and *y* rule only because we mistakenly identify this relation with identity.

The contention that identity does not matter in survival, which is Parfit’s most discussed claim, is one component of the reductionist view of personal identity he recommends, according to which facts about personal identity are not facts over and above other facts, as facts about nations are not facts over and above facts about people and their relations. Another component is that there need be no answer to a question of personal identity: Personal identity may in some cases be indeterminate. In addition, Parfit holds that there are no facts about personal identity other than facts about mental states, their relations to one another, and their relations to physical bodies and the happenings therein. Persons are not “separately existing” entities, and a complete description of reality could be wholly impersonal.

Of these three components of the reductionist view the first is the most obscure. What Parfit means by it, however, is that we do not have among our basic concerns a desire for our own continued existence and well-being.

Insofar as we are concerned about these our concern is derivative from a concern for those future people (in the actual world, contingently, ourselves) linked by certain relations of psychological continuity and connectedness to ourselves as we are now. It is because we do not appreciate that this is the structure of our basic concerns that we are tempted to think that the only *x* and *y* rule is correct. The contention that personal identity may be indeterminate is a more straightforward claim. What Parfit has in mind is that in at least some of the puzzle cases described in the literature on personal identity our concepts, suited as they are in the first place to our actual circumstances, have no determinate application. Whether such indeterminacy is to be regarded as due merely to vagueness in language or to vagueness in the world is, however, a debatable point (for the argument that it must be regarded as due merely to vagueness in language, see Evans 1978). Parfit’s third contention, that facts about personal identity are nothing over and above facts about the relations of mental states, indicates the Humean influence on his views.

### RESPONSES TO PARFIT

Opponents of the reductionist view are described by Parfit as nonreductionists or as proponents of the simple view. According to this view personal identity is an unanalyzable datum. One such nonreductionist is Chisholm (1976), whose work is perhaps the most careful working out of such a view in the literature. Chisholm defends the simple view as the development of the views on personal identity by Bishop Butler (1897) and Thomas Reid (1941). Personal identity is what it is and not another thing, and it is identity in a strict and philosophical sense. Another philosopher who defends the simple view, and does so in conscious opposition to Parfit, is Swinburne (1973–1974). Swinburne emphasizes in particular the difficulty of making sense of the idea that one’s own personal identity may be indeterminate and in doing so draws on arguments from Williams (1970).

These philosophers reject the whole Parfitian reductionist package. But the elements of the package are, arguably, separable. Or, at least, so some philosophers think. Thus, Shoemaker (1985) rejects the Parfitian claim that persons are reducible to their experiences in any sort of Humean way but accepts both that identity does not matter in survival and that personal identity can be indeterminate. Again, Lewis (1976) rejects Parfit’s claim that identity does not matter in survival and the best candidate approach that it supports, while accepting that personal identity can be indeterminate.

Parfit's reductionist thesis about personal identity is not easy to assess or respond to. But, just as no philosopher writing on personal identity can afford to ignore the work of John Locke or David Hume, the same is true for Parfit. It can now be said that no other philosopher of the last century has had such an impact on the debate about personal identity. And Parfit's influence continues to affect the twenty-first-century debate, most notably by indicating how there is philosophical space for the animalist position.

## ANIMALISM

The animalist thesis is that we—you and I and any other readers of this entry—are animals of a certain kind, that is, human beings, members of the species *Homo sapiens*. The thesis is not that all persons are animals. The possibility of persons that are not animals, but gods, angels, or inorganic robots is allowed. But the animalist does insist that we are human animals and as such have the persistence conditions of human animals. The second claim made by the animalist is that such persistence conditions involve no form of psychological continuity whatsoever and are entirely biological (a compromise position defended by Wiggins [1996] and McDowell [1997] is that we are animals, but our persistence conditions are neither wholly psychological nor wholly biological).

According to the animalist, then, things of different kinds can be persons, and the persistence conditions of an entity that is a person will depend on the kind of person it is. Hence, there are no necessary and sufficient conditions for personal identity as such, as sought for by the proponents of the psychological continuity approach. In that sense, there is no problem of personal identity. *Person* does not name a sort of substance but is merely a functional term, like *genius* or *prophet*, and is applicable to any thing with certain capacities (thought and reflective self-consciousness).

The main objection to the animalist thesis is that it does not accord with the intuition that transplantation of a cerebrum from one head to another with consequent transference of psychology (as in Shoemaker's Brown-Brownson case [1970]) will preserve the identity of the person. It is the transplant intuition that makes plausible—independently of a dualist metaphysics—psychological continuity accounts of personal identity.

The animalist, however, has a response to this argument. And it is at this point that Parfit's ideas become relevant. The transplant intuition is mistaken, the animalist can say (Olson 1997), and only seems to be attractive to us because the cerebrum recipient (Brownson) is the

Parfitian survivor of the cerebrum donor (Brown) (for example, stands to the former in those relations of psychological continuity and connectedness that constitute what matters in survival), and we mistakenly believe that identity is what matters in survival. So we are led to believe that the cerebrum recipient is the same person as the cerebrum donor. Indeed, it may even be correct to say that the cerebrum recipient is the same person as the cerebrum donor, because we may use the phrase *same person* in ordinary speech not to express strict identity but to only imply Parfitian survival (Olson 1997).

## DIFFICULTIES FOR ANIMALISM

The animalists can explain away the attractiveness of the transplant intuition in this way, of course, only if they endorse Parfit's thesis that identity is not what matters in survival. Moreover, since Parfit's thesis is controversial, the animalists must either endorse Parfit's own argument for it, or substitute another if they are to employ it with intellectual integrity. However, Parfit's own argument for his thesis, which appeals to cases of reduplication, involves rejection of the only *x* and *y* rule and the acceptance of a best candidate account of personal identity. But it seems difficult to accept that for natural biological organisms like human beings the only *x* and *y* rule must be rejected and a best candidate account endorsed.

However this may be, animalism has thus brought us back to the debate over the reduplication argument initiated by Williams (1973) and further explored by Lewis (1976) and Shoemaker (1970).

Shoemaker (1999) also points out that to reject the transplant in the way just described the animalist must in fact make a more radical divide between what matters and personal identity than Parfit himself. For it is consistent with Parfit's thesis that if a future person is my Parfitian survivor then he is literally identical with me unless fission or fusion or some other circumstance obtains, which precludes literal identity on logical grounds. But to explain the transplant intuition away by appeal to the distinction between what matters and personal identity, the animalist must reject this proposition. Again, the animalist must reject the proposition that if I exist at a future time I am then one of my present self's Parfitian survivors.

## THE TOO MANY MINDS OBJECTION

These are difficulties for the animalists. However, their contention is that their opponents have still greater difficulties. The chief positive argument for their position given by animalists is the Too Many Minds Objection or,

as Olson (1997) calls it, the Problem of the Thinking Animal (see also Snowdon 1991).

The basic structure of the Too Many Minds Objection is straightforward. If I am not a human animal, then as I sit here writing this so does another thinking intelligent being with reason and reflection. For human animals are surely thinking things and if the human animal I presently coincide with (but am not identical with) lacks what it takes to think, then so do I (we share our brain, nervous system, and whole past history since I can satisfy Locke's definition of a person). So, if animalism is false, there are at least two rational beings within my skin, a person and an animal, and I am never alone. But the animal I share my skin with is not a person—there are not two persons here (so Locke's definition is wrong). However, since it shares the entire material basis for my thinking, it shares my thoughts, so it thinks that it is a person. But then how do I know that I am the person and not the animal thinking wrongly that I am a person (no doubt I have my reasons, but so does my animal, and since it is not a person, they must be insufficient)?

The defense of the animalist position is thus that to reject it involves an absurdly inflated ontology (I am never alone) and an outrageous skepticism (I cannot ever know that I am a person). And, if that were not enough, its rejection also undermines the formulation of the very problem its opponents seek to solve, since human animals are rational, intelligent beings, that is, Lockean persons, and yet must be denied to be persons in the sense the debate concerns. So whatever answer the opponent of animalism gives to the question of personal identity, it cannot be an answer to the Lockean question it was originally advertised as an answer to. In fact, there can be no answer to that question.

Three responses to this argument exist. The first is to say that we are human animals, but that our persistence conditions are partly psychological, so that the transplant intuition can be endorsed (Wiggins 1996, McDowell 1997). The second response is to deny that human animals can think (Shoemaker 1999) because a certain sort of persistence condition is necessary for being a thinker. The third response is to accept that human animals think and that we are never alone, but to deny that this involves the absurdities or the loss of the problem of personal identity that the animalist suggests. The concept of a person relevant to the debate, it has to be said, is not that which Locke explicitly defines, but that of the self, the object of first-person reference, and a distinction is needed between the concept of the thinker of "I"-thoughts (which applies both to the person and the ani-

mal, and the object of self-reference (which applies only to the person) (Noonan 1998).

## CONCLUSION

Which, if any, of these responses to the Too Many Minds Objection can be accepted is a matter of current controversy. But even if they are all rejected, the animalist still faces challenges.

One of the most powerful is that the animalist's position is itself vulnerable to the Too Many Minds Objection. One way of arguing this is to defend (with Shoemaker 1999) the contention that the animalist must recognize something that coincides throughout its life with the animal, but outlasts it, the entity Shoemaker calls its "corpse to be." Another way of arguing that the animalist faces the Too Many Minds Objection is to suggest that he or she cannot, but must, accommodate indeterminacy in human personal identity over time without acknowledging coinciding thinkers unless he or she can hold that such indeterminacy is in the world rather than in language.

Whether or not these ways of arguing for the vulnerability of animalism to the Too Many Minds Objection are ultimately acceptable, it is clear that at the beginning of the twenty-first century the debate over personal identity is as lively and unsettled as ever. It is also becoming evident that its final resolution must turn on wider issues of ontology and philosophical logic.

## PERSONALISM

"Personalism" is a philosophical perspective or system for which person is the ontological ultimate and for which personality is thus the fundamental explanatory principle. Explicitly developed in the twentieth century, personalism in its historical antecedents and its dominant themes has close affiliations with and affinities to other (mainly idealist) systems that are not strictly personalist. This article will concentrate on American personalism, although the movement is not only American; there are and have been advocates of personalism or closely related positions in Europe, Great Britain, Latin America, and the Orient.

### BACKGROUND OF THE TERM

The term *person* comes from the Latin word *persona*, meaning mask and/or actor. It came to refer to a role and to a man's dignity in relation to other men. This usage is reinforced by theological language for which *persona* is the Latin equivalent of the Greek *hypostasis* (standing

under) and for which both *persona* and *hypostasis* are closely related to *ousia* (substance). These associations foreshadow the ultimacy that personalism attaches to personality, both in value (a person is identified with his dignity) and in being (person is substance). On this basis we can understand the importance that personalists have attached to Ancius Manlius Severinus Boethius's definition of person as an individual substance of a rational nature (*Persona est naturae rationalis individua substantia*). The effect of the modern critique of the concept of substance on the definition of person will be considered later.

In comparison with *persona*, the term *personalism* is relatively recent. Walt Whitman and Bronson Alcott both used the term in the 1860s; early in the twentieth century it was adopted and applied more systematically. In France, Charles Renouvier wrote *Le personalisme* in 1903; in Germany, William Stern developed critical personalism in *Person und Sache* (1906). In the United States, Mary Whiton Calkins began to use the term in 1907 and Borden Parker Bowne adopted it the following year. Bowne said of himself, "I am a Personalist, the first of the clan in any thorough-going sense." About this time, personal idealism established itself in England. Shortly thereafter, Neo-Scholastic (and hence, more realistic) versions of personalism emerged, especially in France.

### HISTORICAL ANTECEDENTS

The historical antecedents of these personalistic philosophies are so pervasive and for the most part so well-known that they need not be discussed in detail here. A. C. Knudson supplies abundant historical background in *The Philosophy of Personalism* (1927). In general, personalism has been decisively influenced by both the Greek metaphysical and the biblical religious motifs of the dominant Western theological tradition. With the notable exception of J. M. E. McTaggart's atheistic personalism, personalism in virtually all its forms has been integrally connected with theism. Nevertheless, it has usually considered itself a system defensible on philosophical grounds and not one based merely on theological presuppositions.

Recognition of the dominant historical influences on personalism would not, therefore, be complete without mention of several modern philosophers. Following René Descartes, the primacy and indubitableness of personal experience and its identification as mental substance have exercised a decisive influence on nearly all forms of personalism. The Cartesian principle is apparent in Edgar Sheffield Brightman's definition: "A person ... is a com-

plex unity of consciousness, which identifies itself with its past self in memory, determines itself by its freedom, is purposive and value-seeking, private yet communicating, and potentially rational” (in *A History of Philosophical Systems*, edited by V. Ferm, p. 341).

Gottfried Wilhelm Leibniz is sometimes spoken of as the founder of personalism. His doctrine that all reality is composed of monads (psychic entities) without remainder and that monads are essentially centers of activity has been particularly influential on idealistic personalists of pluralistic and panpsychistic types.

The influence of George Berkeley converged with that of Leibniz in providing an impetus to idealistic personalism. Material substance is reinterpreted as the “language” of the Divine Person. Further reinforcement for this theme is found in Immanuel Kant’s doctrines of the phenomenality of the sense world and the primacy of the practical reason. It is only in the personal world of the practical (moral) reason that one has access to the noumenal. This Kantian direction has had enormous influence on what might be called ethical personalism.

G. W. F. Hegel was the single most important influence in the development of absolute idealism (absolutistic personalism). His emphasis on dialectical movement toward wholeness, on the concrete universal, and on the ultimacy of spirit has had a decided influence on other forms of idealistic personalism, notably that of Brightman.

One thinker who does not compare with the foregoing figures in eminence deserves to be mentioned because of his influence on such American personalists as Bowne and G. T. Ladd. He is Hermann Lotze, whose main work is *Mikrokosmos* (1856–1858).

## TYPES OF PERSONALISM

In characterizing more precisely the systematic position of personalism, it will be helpful to distinguish two major forms: realistic personalism and idealistic personalism. The former can best be understood in the context of supernaturalism or traditional metaphysical realism, and the latter in terms of metaphysical idealism.

**REALISTIC PERSONALISM.** For realistic personalists, personality is the fundamental being. That is, ultimate reality is a spiritual, supernatural being. There is also, however, a natural order of nonmental being, which although created by God is not intrinsically spiritual or personal. Many Neo-Scholastics, for example J. Maritain, E. Gilson, and E. Mounier, identify themselves as person-

alists in the realistic sense. In fact, realistic personalism has been developing with remarkable vitality both in Europe and America in conjunction with the resurgence of Catholic theological thought. There are, however, some realistic personalists who do not stand in the scholastic tradition; among them may be mentioned N. Berdyaev, J. B. Pratt, D. C. Macintosh, Georgia Harkness, and A. C. Garnett.

**IDEALISTIC PERSONALISM.** Excluding Platonism and Kantianism, there are three main types of idealism: absolute idealism, panpsychistic idealism, and personal (pluralistic) idealism. Although there are no neat lines of demarcation separating these types, oversimplification can in this case be illuminating.

(1) Absolute idealism (or absolutistic personalism) is the view that reality is one absolute mind, spirit, or person. All finite beings, however otherwise designated (for example, as physical things, logical entities, or human beings), literally participate in this absolute being; they *are* ontologically by virtue of their being manifestations or activities of the absolute mind. Since this is so distinctive a philosophical tradition, it receives full treatment elsewhere. Representative thinkers who have either had influence on or association with other personalistic positions are Edward Caird, T. H. Green, Josiah Royce, A. E. Taylor, Mary W. Calkins, and W. E. Hocking. With reservations, C. A. Campbell, Brand Blanshard, Paul Tillich, and Gabriel Marcel may also be included here.

Absolute idealism has not commended itself to personal idealism, which, in opposing complete immanence or monism, is closer to realistic personalism and related theistic positions.

(2) For panpsychistic idealism, Leibniz’s monadology is the paradigm. Reality is a hierarchy of psychic beings (monads) determined by the degree of consciousness possessed by any monad. The supreme monad (God) has created all other monads in preestablished harmony. Panpsychism has been developed in various ways by James Ward, F. R. Tennant, H. W. Carr, A. N. Whitehead, and Charles Hartshorne.

In many respects, panpsychistic idealism may be considered to be continuous with personal idealism. Although personal idealists do not deny the possibility that there are more grades of self or mind than the human and the divine, they tend to believe that panpsychists have not adequately resolved the tension between pluralistic and monistic strains in their position.

(3) Personal idealism is usually considered the most typical form of personalism. It is idealistic: all reality is

personal. It is pluralistic: reality is a society of persons. It is theistic: God is the ultimate person and, as such, is the ground of all being and the creator of finite persons. Henceforth *personalism* will be used to mean personal idealism.

### SYSTEMATIC THEMES

Among the first generation of American exponents of personalism the most significant were George Holmes Howison (1834–1916) and Borden Parker Bowne (1847–1910).

In the 1860s Howison was a member of the St. Louis Philosophical Society. The discussion of Hegelian idealism, to which this group devoted so much of its time, led Howison to reject what he considered the submerging of the finite individual in the Absolute.

His basic metaphysical position is stated categorically: “All existence is either (1) the existence of *minds*, or (2) the existence of *the items and order of their experience*; all the existences known as ‘material’ consisting in certain of these experiences, with an order organized by the self-active forms of consciousness that in their unity constitute the substantial being of a mind, in distinction from its phenomenal life” (in J. W. Buckham and G. M. Stratton, eds., *George Holmes Howison*, p. 128). Howison’s unswerving pluralism led him not only to reject pantheism but also to deny creation. “These many minds ... have no origin at all—no source in *time* whatever. There is nothing at all, prior to them, out of which their being arises... . They simply *are*, and together constitute the eternal order” (ibid., p. 129). Howison’s “eternal republic” is reminiscent of Royce’s community.

Bowne taught philosophy at Boston University from 1876 until his death. Berkeley, Kant, and Lotze were the major influences on his thought. Like Howison, Bowne was a pluralistic idealist, but unlike Howison, he was explicitly theistic. The Divine Person is not only the creator of finite selves or persons but is also the “world ground,” whose “self-directing intelligent agency” shows itself in the order and continuity of the phenomenal world.

Bowne’s famous chapter in *Personalism* on “The Failure of Impersonalism” expresses his basic polemic against Hegelian absolutism, Herbert Spencer’s evolutionism, associationism, and materialism. At the same time, he fought just as hard against fundamentalism and dogmatic supernaturalism. Through his influence on many generations of students at the Boston University School of The-

ology, he contributed decisively to liberalizing the leadership of the Methodist Church.

Three of Bowne’s students were the leading exponents of personalism in the period following World War I. Albert C. Knudson (1873–1953) continued the personalist tradition in theological context at Boston University School of Theology. Ralph Tyler Flewelling (1871–1960) developed the School of Philosophy of the University of Southern California and also founded and edited the journal the *Personalist*.

Edgar Sheffield Brightman (1884–1953), the most important of Bowne’s students, taught at Boston University from 1919 until his death. Brightman, a creative and original thinker, developed a comprehensive and coherent personalistic system.

Brightman espoused an epistemological dualism of “the shining present” (or “situation-experienced”) and “the illuminating absent” (or “situation-believed-in”). Immediate experience is the inescapable starting point, but experience always refers beyond itself (self-transcendence). The possibility of reference is found in the activity of the mind in knowing; the adequacy of reference is determined by the criterion of coherence. Maximum coherence in interpreting experience is maximum truth. In his emphasis on the tentativeness and testing of hypotheses, Brightman is empirical; in his emphasis on system and inclusive order, he is rationalistic.

In metaphysics, Brightman maintained that “everything that exists [or subsists] is in, of, or for a mind on some level.” He defined personalism as “the hypothesis that all being is either a personal experient (a complex unity of consciousness) or some phase or aspect of one or more such experients” (*Person and Reality*, p. 135). The natural world is understood as an order within or as a function of the mind of God. Finite persons are created by the uncreated Person. Human persons are, therefore, centers of intrinsic value.

Brightman might be called a value empiricist. His *Moral Laws* (1933), which has not received the attention it deserves, works out an impressive ethical theory. In his philosophy of religion values have a central place. The value dimension of human experience provides the evidence of a religious dimension of reality. Hence, generically, God is the source and conserver of values.

The most distinctive aspect of Brightman’s thought is his revision of the traditional idea of God. He argued that if we are to take personality seriously as the basic explanatory model, then we must accept a temporalist view of God. If God is personal, he is omnitemporal, not

timeless. Brightman also argued that the traditional conception of divine omnipotence could not be maintained without seriously qualifying the divine goodness. His penetrating consideration of evil, suffering, and death led him to conclude that the will of God is limited by nonrational conditions (the Given) within the divine nature that are neither created nor approved by that will. God maintains constant and growing—although never complete—control of the Given. Some personalists, including L. Harold DeWolf, prefer to follow Bowne's more traditional view of God's eternity and omnipotence. Others, like Peter A. Bertocci, find in Brightman's revisions the conditions of an intelligible and cogent theism.

### CURRENT DEVELOPMENTS

In recent years, personalism may seem to have been eclipsed by the rise of existential and analytic philosophies. However, many of the doctrines and motifs of personalism have been or are being appropriated and elaborated by other positions. Existentialism and the phenomenological movement have turned to the exploration of personal existence in ways that will be gratifying to most personalists. This movement should be particularly fruitful for personalists since it grapples in new ways with the relation of the body to the person, a problem that has caused a long-standing ambiguity in personalistic thought. Both realistic and idealistic personalists have stumbled over this problem. Phenomenological investigations may therefore provide an impetus for new conceptions of personality.

The analytic concentration on language also contributes to an improved understanding of personal symbolizing and communication, and the renewed interest in philosophy of mind, stimulated by recent psychological theories, again provides material that is important in the development of personalist thought. Personalists would seem to have an advantage in being willing to risk a systematic conception of the total person that would combine surface experience (sense) and depth dimension (value).

Among the large number of Brightman's students who have been developing various facets of personalistic thought, the best known is Bertocci, Brightman's successor as Borden Parker Bowne professor of philosophy at Boston University. Other contemporary personalists also continue to demonstrate that personalism can be a viable alternative among persistent philosophical perspectives.

## PERSONS

### INTRODUCTION

This entry is on personhood and the general philosophical question that will be treated is: What is a person? Common use of the term *person* makes reference to adult human beings. Typical examples of sentences in which this term is used are: “Descartes is the person most

responsible for inaugurating the Modern Period in Western thought”; “No person can be President of the United States unless he/she was born in the United States”; and “Human fetuses may be considered persons.” As the controversial last example should make clear, the term person is not used exclusively to refer to adult human beings. In much of the literature on persons, the term is used in a non-species-specific way. Many authors take *human being* to be a term of biology and leave the definition to science. Given that, here is a restatement of the initial question: What must a being be like to be a person?

There are many categories into which the term person fits. People refer to social persons, moral persons, metaphysical persons, legal persons, religious persons, and so on. While no one category of personhood can be considered the correct category, philosophers have tended to concentrate on either the metaphysical or the moral aspects of personhood. After a few words on the other categories, the metaphysical and moral notions of person will be the primary focus of the present entry.

The principal use of the concept of a person in the Christian community is that of God’s personhood. This comes out most clearly in the tradition where the Holy Trinity is referred to as “three persons in one God.” Although the concept of the Holy Trinity defies comprehension for many, one of the ideas spawned by this is that there is some way humans are like God, which is that they are both persons. Aquinas affirms that the term person applies to God as well as to human beings, though it does not apply in the same way. His definition of person is “a subsistent individual of a rational nature” (Aquinas 1945, p. 290). As applied to humans, Aquinas takes his lead from the use of person as one who is dignified, of high standing (in the community). He says that each individual of a rational nature is a person. However, since the dignity of God is greater than every other dignity, therefore, person applies preeminently to God. It is perhaps obvious that Aquinas is applying cultural as well as metaphysical attributes in his definition of the term.

As used in the legal sense, person refers to any being, object, or organization that has standing before the law. Perhaps the most enlightening example in the literature of law is that corporations are persons in the legal sense. This is because corporations have legal rights and responsibilities (some have also argued that corporations should be considered moral persons with moral rights and responsibilities). Legal rights would include equal protection, freedom of the press, due process, and so on, all of which can certainly be applied to corporations. Some

legal findings have not, however, extended full personhood to corporations, denying the following: pleading the Fifth Amendment in order to avoid self-incrimination, and Fourth Amendment rights of protection of persons.

Other interesting cases in the *legal persons* category are those of the fetus and the newborn. While these beings are protected under the law and, therefore, may be claimed to be legal persons, many philosophers have taken the position that fetuses are not persons in the moral sense of this term. Michael Tooley (1983) has argued that late-term fetuses and even newborns are not persons in the moral sense of this term. Tooley takes the side of caution here with newborns and says that since our knowledge of their development is limited, we need to agree on some cut-off point or other; he settles for a week, after which we can with clear conscience consider the newborn a person.

The social person is not so clearly defined, it seems, as persons of the other categories. The general framework for someone being a person in the social sense is for that being/person to be recognized as a person by those who are recognized as persons within the social community. Here, thoughts run to some of the ideas of Richard Rorty (1979, 1982), who takes the view that persons will be decided upon and not discovered. This is a provocative, and for some a rather radical, view, leaning toward relativism (though this is denied by Rorty) because if someone or some group in a society is judged by the society to be nonpersons, and if personhood is a matter of decision and not discovery, then said someone or the members of said group are, in fact, simply not persons. Ultimately, Rorty's position is that the concept of personhood is something that has been, and is still being, worked out in the *conversation* that is the history of the world.

## METAPHYSICAL CONSIDERATIONS

This section is devoted to the metaphysical aspects of the concept of personhood.

**CONDITIONS FOR PERSONHOOD.** Over the centuries, necessary and sufficient conditions for personhood have been laid out by various philosophers. John Locke is usually the starting place for any serious philosophical study of the concept of personhood because he seems to be the first to make explicit what he meant by the term. He writes that a person "is a thinking intelligent Being, that has reason and reflection, and can consider it self as it self, the same thinking thing in different times and places; which it does by that consciousness, which is inseparable from thinking, and as it seems to me essential

to it." (Locke 1975, p. 335) Although Locke is here working on the idea of personal identity, there are at least three important concepts he introduces that would seem indispensable conditions of personhood proper, namely, reason, a first-person perspective, and consciousness. These characteristics of personhood arise in virtually all of the literature on the topic.

There is also the sense in which Locke uses person as a legal (forensic) term that may be useful to consider. Again, Locke is working on the issue of personal identity; however, what he says is important for thinking about persons in both the metaphysical and moral senses of the term. He writes:

*Person*, as I take it, is the name for this *self*. Where-ever a Man finds, what he calls *himself*, there I think another may say is the same *Person*. It is a Forensic Term appropriating Actions and their Merit; and so belongs only to intelligent Agents capable of a Law, and Happiness and Misery. This personality extends it *self* beyond present Existence to what is past, only by consciousness, whereby it becomes concerned and accountable.

(LOCKE 1975, p. 346)

While it can easily be seen that Locke is here referring to concern and accountability in the legal sense, the reference to happiness and misery may naturally lead one to contemplate what it means to be a person in the moral sense of the term. The section "Moral Considerations" herein will be devoted to this discussion.

**P. F. STRAWSON'S THEORY OF PERSON.** What was at one time *the* dominant paradigm on persons is the British philosopher P. F. Strawson's theory. While there are moral overtones, his is primarily a metaphysical theory. He gives the following definition: "the concept of a type of entity such that *both* predicates ascribing states of consciousness *and* predicates ascribing corporeal characteristics, a physical situation, etc., are equally applicable to a single individual of that single type" (Strawson 1963, pp. 101–102).

Strawson argues that a person is not some sort of compound of two different kinds of substance: (1) a pure consciousness/ego, and (2) a corporeal entity. These exist together in one being, according to Strawson. He is doubtful that there could even be such a thing as a pure consciousness existing on its own, devoid of any connection with a "physical situation." When he says that a person is not an "animated body" or an "embodied anima," he is here speaking to the idea that person refers to an

individual who must be analyzed as a unified individual of whom both types of predicates can be ascribed.

The predicates referred to here are as follows: *M-predicates*, on the one hand, are applicable to material bodies, to which there is no question of applying states of consciousness. Examples are: “is in the park,” “is blue,” “is flat.” *P-predicates*, on the other hand, are all other predicates ascribed to persons. These are various, says Strawson. His examples are: “is smiling,” “is going for a walk,” “is in pain,” “thinking hard,” “believes in God” (Strawson 1963, pp. 104).

It is interesting to note that some P-predicates imply the having of consciousness by the subject of reference. Strawson’s example is *posted a letter*. One consequence of this is that, theoretically, there are ways to tell when to ascribe P-predicates to others as well as to oneself. That is, there will often be indicators of the presence of P-predicates. What are they? One cannot just argue from one’s own case. Strawson holds that one can ascribe a P-predicate to oneself only if one can apply it to others. On many occasions, one ascribes P-predicates to others on the basis of observing their behavior. He is not saying that others’ behavior is a *sign* that P-predicates may be ascribed but, rather, that the criteria of observed behavior is logically adequate for the ascription of P-predicates. Further, some P-predicates one ascribes to oneself are not ascribed by using self-observation. This would seem to call into question the adequacy of Strawson’s criteria for ascribing P-predicates in which he says that the same criteria for ascribing P-predicates to others must be/is adequate for ascribing P-predicates to oneself.

His conclusion on this point is that the character of P-predicates is such that one uses behavior criteria for ascribing to others and both behavior and nonbehavior criteria for ascribing to oneself. For him, to have the concept of a person is to be a “self-ascriber” as well as an “other-ascriber” of P-predicates.

**THE CONSTITUTION VIEW.** Lynne Rudder Baker is a leading proponent of this theory of personhood. In her closely argued book *Persons and Bodies* (2000), Baker tells us that while persons are constituted by their body, a person and a person’s body are not identical. Her definition of *constitution* amounts to this: Where  $x$  constitutes  $y$  at time  $t$ ,  $x$ , and  $y$  must be spatially coincident;  $x$  must be in a circumstance where  $y$ ’s primary-kind property can be realized (where a primary-kind property is the property or characteristic an individual has by virtue of the kind of thing it is; for example: Secretariat’s primary-kind property is that of being a horse); it is necessary that if any-

thing ( $z$ ) has some property at  $t$  that is  $z$ ’s primary-kind property and if  $z$  is in a favorable circumstance to have  $y$ ’s primary-kind property, then there is some individual  $u$  such that  $u$  has  $y$ ’s primary-kind property at  $t$  and  $u$  is spatially coincident with  $z$  at  $t$ ; it is possible that:  $x$  exists at  $t$  and there is no individual  $w$  such that  $w$  at  $t$  has  $y$ ’s primary-kind property and is spatially coincident with  $x$ ;  $y$  being immaterial implies that  $x$  is immaterial. Recall here that Baker is setting up her definition of what it means to be a person and hence has in mind (at least) what is usually taken as a clear example of a person, to wit, the adult human being, with a physical body.

A principal theme in Baker is that of the nonidentity of the person and the person’s body. She draws an analogy between a thing and that of which it is constituted, and a person and that which a person is constituted, by using the example of Michelangelo’s work of art *David* and the material of which it is constituted. Baker claims that the marble (called Piece) is not identical with *David*. Part of the argument runs as follows: If *David* and Piece are identical, then there is no property had by one and not had by the other. Piece has the property of being able to exist in a world without art whereas *David* (having as its primary-kind property that of being a statue, a work of art) does not have this property. Hence, constitution does not entail identity. (This is a very lean version of Baker’s argument and the reader is advised to study the longer work for important details.)

This much said, Baker goes on to distinguish the person from the person’s body (as that of which the person is constituted). Her argument hinges on the fact that the body (*qua* body) fails to possess what can be called the person-making property, that is, possession of a *first-person perspective*. The first-person perspective quite simply is the perspective by which one is/becomes conscious of oneself as oneself. Baker distinguishes two grades of the first-person perspective. An example of the *weak grade* would be referenced by someone uttering “I am 6 foot, 2 inches tall.” The person (P) who utters this sentence is thought to have the ability to distinguish P from others. However, this is only half of what a full-on first-person perspective can be, according to Baker. If P utters the sentence “I wish I were 6 foot, 2 inches tall,” this indicates that P sees not only that P is distinct from others, but also that P sees P as P. Following Castañeda, Baker uses the asterisk/star on the pronoun indicating first-person perspective to indicate as much. Hence, the sentence uttered would be written as “I wish I\* were 6 foot, 2 inches tall.”

To restate the important conclusion, the upshot of all of this is that since a person's body cannot take the first-person perspective, and since a person is a being who does or has the capacity to take the first-person perspective, a person's body and a person are not identical.

According to Baker, the first-person perspective underlies all versions of what it means to be a person, which rely on self-consciousness as the person-making characteristic. One example of a self-consciousness-based theory of personhood is one that Tooley (1983) writes about. On his interpretation, a being is self-consciousness to the extent that it is in possession of a concept of a self as a continuing subject of experiences and other mental states, is such an entity itself, and believes that it is itself such an entity. Tooley's important analysis of this, and other concepts, will be treated in the next section because Tooley's program revolves around the concept of personhood in the moral sense.

**OTHER SUGGESTED CONDITIONS FOR PERSONHOOD.** One of the most widely considered conditions for personhood is freedom of the will. A unique and pivotal contribution to this subject comes from Harry Frankfurt (1971), who argues that freedom of the will, in the guise of what he calls "second-order volitions," is a sufficient condition for personhood.

Consider an individual who smokes a pipe and is addicted to pipe smoking. A "first-order desire" here might be the bare desire for the sensation of filling one's lungs with smoke from the tobacco burning inside the pipe bowl. There may also be other, associated first-order desires, such as the desire for sensing the aroma present when one is filling the bowl; the feeling and taste of the pipe stem on one's lips, teeth and tongue; and so on. This bare, first-order desire to smoke can take the propositional form "R desires to *x*."

A "second-order desire" is to be construed as a desire referring to the first-order desire. For example, where R desires to smoke but also has the desire to not desire to smoke (say, for health reasons), the desire to not desire to smoke is a second-order desire. In a situation where R experiences both desires but is moved by and acts on the second-order desire, Frankfurt says that R's second-order desire is the *effective* desire. Frankfurt understands this as R wanting R's second-order desire to be R's will. In this case, where the second-order desire comes to be R's will, Frankfurt terms this a "second-order *volition*," which he says is a sufficient condition for personhood. In Frankfurt's terms, a "wanton" (W) is someone who doesn't care about W's will, which is clearly not the case for R. Wan-

tons have first-order desires but are not persons because they have no second-order volitions (albeit it is possible that they have second-order desires). Freedom of the will amounts simply to making one's second-order volition(s) one's will.

A chief benefit, according to Frankfurt, of this interpretation of freedom of the will is that it implies moral responsibility for the actions that R takes when acting on R's second-order volitions. Where R has the will R wants to have, and acts on this will, R is taken to be morally responsible for the actions R commits.

Another important contributor to the literature on persons is Daniel Dennett, who makes a distinction between metaphysical persons ("roughly, the notion of an intelligent, conscious, feeling agent") and moral persons ("roughly, the notion of an agent who is accountable, who has both rights and responsibilities") (Dennett 1976, p. 176). Though Dennett focuses for the most part on the conditions for metaphysical personhood, he does say that the concept of a person is "inescapably normative." Shy of drawing the conclusion that *the* set of necessary and sufficient conditions for personhood will never be fully articulated, he does lend some voice to a few of the conditions he considers necessary.

The six conditions Dennett delineates are: consciousness (being the subject of intentional predicates); rationality; being the object of a certain attitude (having a *personal* attitude taken toward one); the ability to reciprocate this attitude; verbal communication; self-consciousness. According to Dennett, to be rational is just to be Intentional, and to be Intentional is just to be the object of a certain attitude. These three conditions, says Dennett, are themselves necessary, though not sufficient, for the ability to reciprocate the personal attitude, which is itself necessary but not sufficient for the capacity for verbal communication, which is itself a necessary, though not sufficient, condition for self-consciousness, which is itself a necessary condition for moral personhood.

Some would say Dennett's last word is overly skeptical. Not only does he not believe the set of sufficient conditions for personhood will ever be known, and not only are the chosen conditions in some sense arbitrary, and not only is it sometimes impossible to recognize just who are persons, when problems of moral responsibility arise, "we cannot even tell in our own cases if we are persons."

## MORAL CONSIDERATIONS

This section is devoted to the moral aspects of the concept of personhood. One important aspect of the topic of

personhood is the use of person in a moral sense. The central question, that is, What is a person? can be translated into the question, What must a being be like to have moral rights (and moral responsibilities)? Setting off “and moral responsibilities” in parentheses here is meant to highlight the problem of assigning moral responsibilities to such beings as human infants; many, if not all, nonhuman animals; and perhaps those humans who are, say, in the late stages of Alzheimer’s disease. While there are many who argue that these *persons* have moral rights, there is scant literature proclaiming their having moral responsibilities. This suggests a further question about moral personhood, to wit, whether a person can be the bearer of rights but not responsibilities.

**MICHAEL TOOLEY’S THEORY.** Tooley writes: “The question of what beings it is seriously wrong to destroy is one of the central questions of ethics.” The question covers human as well as nonhuman beings. It applies to human fetuses, newborns, the mentally/cognitively challenged, the criminally insane, sociopaths, and those in the throes of diseases that impair brain activity. It also covers dogs, cats, giraffes, dolphins, whales, chimpanzees, gorillas, trout, sharks, trees, birds, and alligators. The question is distinctly *not* kind-, type-, or species-specific.

While the final goal in Tooley’s work on the concept of personhood appears to be discovering whether abortion and infanticide are morally permissible, his work is distinctively metaphysical. He seems to believe that a person may be defined as a being who possesses at least moral rights (and perhaps moral responsibilities), and he sees that the analysis of these concepts requires laying out the concepts closely associated with these. However, Tooley has certain other questions in mind as he analyzes various conditions for personhood. Take the example of *rationality* as a suggested condition for personhood. He asks whether a being could rightly be thought a person who lacked the capacity for rationality. On the heels of this is the pointed question about whether it would be seriously wrong to destroy a being who was rational (staying with the example). It is this question that places his work squarely in the area of the moral aspects of personhood rather than the metaphysical. Or, if one prefers, any analysis of the moral aspects of personhood will automatically require metaphysical analysis as well.

Tooley runs through many of the suggested conditions for personhood, analyzing them in terms of whether they are necessary and/or sufficient conditions. Four of these suggestions are that a person is: (1) a subject of nonmomentary interests; (2) an entity that pos-

sesses rationality; (3) an entity that is capable of action; (4) an entity that possesses self-consciousness.

A brief sketch of Tooley’s treatment of these conditions is as follows: As a subject of nonmomentary interests, an individual will have the capacity for a host of desires, the total set being in some sense “unified.” While Tooley is not identifying interests with desires, he is making the case that desires may be inferred from interests. This is as it should be when interpreting interests in such a way that the subject can be said to *be interested*, as in “Don is interested in astronomy.” However, it is more difficult to make sense of the idea of interests here when the meaning of *interest* has to do with what is in an individual’s benefit, as characterized by the sentence “As an astronomer, it would be in Don’s interest to study mathematics.” While the former meaning of interest, allowing the inference to desires, would not seem to have the relevant moral sense, Tooley brings in moral significance by associating this concept of interest with the representation of the item of interest in consciousness. In the end, Tooley says that persons may be identified with “entities that have desires that are interrelated in such a way that the entities can be viewed as subjects of nonmomentary interests.”

As to whether a being in possession of rationality is a person, Tooley takes the view that the relevant sort of rationality to be discussed has to do with what is called *agency*, where an agent is an enduring substance of a mental nature, with the capacity for deliberative reason-based action. Rightly claiming that there is little disagreement that this sort of rationality is insufficient for personhood, he argues that neither is it necessary. Though Tooley does not believe it plausible that rationality necessitates personhood, he does allow that any being who is rational and possesses nonmomentary interests is a person. Even the addition of a relevant form of free will, or the capacity for rational deliberation, is not enough to make rationality itself a necessary condition for personhood.

Tooley’s third suggested condition for personhood is that of having the capacity for action. The name for anyone capable of action is *agent*, and Tooley claims there is little disagreement whether being an agent is a sufficient condition for being a person; it is. It is not, however, a necessary condition, according to Tooley. One important concern he brings up here is that if agency involves what is called a libertarian free will, then if universal determinism should turn out to be true, even normal adult human beings would not be persons. Tooley’s reasoning on this is that even if it should be the case that all events are deter-

mined, that fact would not lead to the conclusion that it is not seriously wrong to destroy a normal adult human being. But now, on an account of agency that does not necessarily involve the possession of free will, Tooley presumes that the agent will possess nonmomentary interests. Since these sorts of interests have already been argued to be unnecessary to confer personhood, adding these to agency will not have the result of necessitating personhood on an agent so characterized.

The last suggested condition for personhood analyzed by Tooley is self-consciousness, which he argues is neither necessary nor sufficient for personhood. It is not necessary because there could be an individual who was aware of a continuing self but not in possession of this awareness *qua* individual continuing self. Self-consciousness is not a sufficient condition, according to Tooley, because it is conceivable that some individual may well be self-conscious but not be a subject of either momentary or continuing interests. For all this, however, it appears that Tooley would agree with the general consensus that it would be seriously wrong to destroy such an individual.

**OTHER AREAS, OTHER CONCERNS.** The area of medical ethics has produced by far the greatest amount of work on the concept of personhood. And within this field, the question of the status of the fetus has generated the most debate. The issue here is whether or not a fetus is a person in the moral sense of that term, that is, whether the fetus has a right to life. As is clear, this is but one issue in the abortion debate; yet it has generated as many books and papers as any topic in contemporary moral philosophy. The question of the moral status of the fetus characteristically revolves around discussions as to whether the fetus possesses any of the suggested conditions for personhood. Early term fetuses, whose brains have not developed sufficiently for, say, consciousness and rationality, are widely agreed to be nonpersons (with the notable exception that the religious contingent—specifically Roman Catholics—will not accept this conclusion, arguing that a fetus is a person from the moment of conception). A great controversy still surrounds mid- and late-term fetuses because it is simply unclear what their capacities are, and it appears an important question whether these individuals are more or less like nonhuman animals usually denied personhood.

Another interesting debate centers on the fetus being a *potential* person. The issue is whether a being who is going to be a person in the natural course of events should be treated as a person prior to becoming what it

will be. One of the considerations that makes this question so significant is that there seems to be little relevant difference between a very-late-term fetus and a newborn infant. If such a fetus is not a person, that is, fails to possess self-consciousness, rationality, free will, and so on, then it would appear that the newborn is not, either. But this conclusion is one very few people have been willing to draw. (Tooley's work on potential personhood, in *Abortion and Infanticide*, is crucial reading.) A significant point made by some people on this topic is that the infant, upon birth, becomes a member of the specific community into which it is born whereas the fetus is not yet a member. It is somehow thought that having seen, held, and fed the infant are *attachment factors* leading to the community seeing the infant as a person. Such is not the case with even a late-term fetus.

Another question one can ask is whether people who commit heinous crimes lose their status as persons in the moral sense. This sort of case brings out clearly a distinction between the legal and moral senses of the concept of personhood. Under the law, a murderer/rapist can, in certain circumstances, retain the right to life (that is, not be sentenced to death). One argument many opponents of the death penalty have used is the following: premise 1: the individual sentenced to death under the law has a moral right to life, premise 2: no law can abridge a moral right, conclusion: the death penalty violates an individual's moral right to life. It is easy to see how this argument might be run if one accepts the conditions for personhood outlined above, to wit, self-consciousness, rationality, the ability for complex communication, free will, and so on. The committing of atrocious crimes would not appear incompatible with the agent possessing these characteristics.

However, if other necessary conditions are added to the list, such as the concern for others and respect for persons, it is more difficult to see how anyone could commit such crimes and at the same time maintain this person also had respect for others. Where the moral sense of person is defined as "a being with moral rights and responsibilities," the way would be open to argue that the death penalty *is* morally permissible. From this perspective, the conditions of personhood have significant practical impact.

Finally, the issue of animal rights has become one of the most widely debated issues of our time. Opponents argue, to a person, that nonhuman animals are nonpersons, though no one this writer is aware of argues that therefore we can treat nonhuman animals anyway we want (such as causing unnecessary pain). Proponents

*sometimes* argue that many nonhuman animals display characteristics matching a fair number of the suggested conditions for personhood. For example, some will say the neighbor's dog is conscious, displays rational behavior, can engage in fairly complex communication, and has a large measure of free will. This is to say that these animals possess very important characteristics thought to be relevant for designating adult humans as persons. Unless people will assent to some form of speciesism, they say, people must admit that these animals need to be treated as persons. This is at least sufficient, it is believed, to make it seriously wrong to harm the animal.

An interesting topic in animal rights, where the concern is whether nonhuman animals are, or should be, considered persons, is the question whether persons, in the moral sense, are beings who do have both moral rights as well as moral responsibilities. It is never argued that the neighbor's dog has moral responsibilities. This being the case, proponents of animal rights are never proponents of animal responsibilities. Even if there are cases where a person seemingly has a right without there existing a corresponding responsibility, it remains an open question whether these cases speak to the essential issues regarding the questions of personhood.

## PERSPECTIVE REALISM

See *Realism*

## PESSIMISM AND OPTIMISM

"Pessimism" and its opposite, "optimism," are only secondarily philosophical theories or convictions; primarily they are personal opinions or attitudes, often widely prevalent, about the relative evil or goodness of the world or of men's experience of the world. As such they vary with the temperaments and value experiences of individuals, and with cultural situations far more than with philosophical traditions.

Both pessimism and optimism in the above sense may be reactions to experiences that vary in scope and content. Four types of reactions or judgments may be distinguished: (1) psychological or anthropological (involving judgments about the dominance of evil or good in one's own experience or in human experience generally); (2) physicalistic (judging the physical world to be dominantly evil or good); (3) historicistic (based on appraisals of the evil or goodness of a historical or cultural period or of the forces and institutions that determine history); and

(4) universal, or cosmic (involving judgments about the dominance of evil or good in the universe as a whole).

Since the issue of the goodness or evil of human life involves belief in beneficent or malevolent forces upon which man's well-being is dependent, optimism and pessimism are prominent aspects of religious beliefs, and these beliefs may involve many or all of the above types of judgments.

Philosophical pessimism and optimism result from the critical analysis and clarification of judgments of the dominance of good or evil, an evaluation of the experiences upon which these judgments are based, and the presentation of reasons to justify or refute such statements. There is widespread doubt whether the terms *optimism* and *pessimism* are sufficiently precise for philosophical purposes and also whether optimistic and pessimistic beliefs are philosophically justifiable. This article will be concerned chiefly with philosophical formulations and arguments for optimism and pessimism with some reference to their manifestations in religion.

Optimistic and pessimistic attitudes and theories are much older than the terms used to describe them. The term *optimisme* was first used in the Jesuit journal *Mémoires de Trévoux* in 1737 to designate Gottfried Wilhelm Leibniz's doctrine (which appears in his *Théodicée* and in other of his philosophical writings) that this is the best of all possible worlds. Leibniz himself used the term *optimum* in a technical sense that applied to the unique maximal or minimal instance of an infinite class of possibilities, and he held that this principle of the optimum was applied by God in the creation of the world. *Optimisme* was admitted by the French Academy to its dictionary in 1762. The first known appearance of the term *optimism* in English was in 1759, also in reference to the system of Leibniz. *Pessimism* came into general use only in the nineteenth century, although its first known appearance in English was in 1795 in one of Samuel Taylor Coleridge's letters.

The superlative form of the Latin adjectives *optimus* and *pessimus* is not generally justified by any form of philosophical optimism or pessimism. It is true that Leibniz defended an optimal position in the formula "the best of all possible worlds," but this use of the superlative did not prevent his acknowledging the existence of much evil—indeed, the necessity of evil in all finite existence. Similarly, Arthur Schopenhauer affirmed that this is the worst of all possible worlds, but his chief philosophic concern was with finding a way of salvation from the evil of the world through art, a morality of sympathy, and philosophic and religious contemplation. The most thor-

oughgoing philosophical pessimist of the nineteenth century, Eduard von Hartmann, held that this is the best of all possible worlds; yet evil necessarily outweighs good in it, and it would be better if there were no world at all.

The philosophical issues might better have been served by the comparative forms “meliorism” and “pejorism” (“betterism” and “worsism”). Although the verb forms “meliorate” and “pejorate” did appear in the sixteenth and seventeenth centuries, respectively, “pejorism” has found no acceptance, while “meliorism” has been used, following William James, to express the view that although the world is a mixture of good and evil, it can be bettered by man’s moral efforts to improve it.

### RELIGIOUS AND PHILOSOPHICAL ISSUES

Optimism and pessimism are thus relative terms; the former theory undertakes to give philosophical reasons for assuming that in whatever horizon or context is involved, good preponderates over evil, while the latter theory attempts to show that evil preponderates over good. The arguments in each case may be efforts to generalize from experiences of good and evil, or they may, and usually do, also involve a priori factors, basic definitions, and theological or metaphysical doctrines.

**EMPIRICISM AND RATIONALISM.** A primary consideration in discussing optimism and pessimism is the definition and criteria of good and evil. Empiricists have generally adopted a hedonistic definition of good, and hedonism has frequently ended in pessimism: The universe seems not to be constituted to provide man with more pleasure than pain. But it has proved difficult to reduce normative judgments of value to the psychological measures of pleasure and pain, joy and sorrow, or satisfaction and dissatisfaction. Other criteria are also involved—for example, the conservation or destruction of life, the progress or decay of cultural institutions and values, human freedom and bondage (in various senses), and the just control of power.

While empiricism shows an inclination toward pessimism (and skepticism), rationalism operates with normative principles that have an affinity with affirmations of the identity of reality and goodness. Nevertheless, exponents of hedonism are driven to recognize qualitative distinctions between pleasures and pains and the complex interplay of pleasures and pains that makes possible greater goods, while beneath the most rational and optimistic systems of modern thought lurks the shadow of fear, if not of despair. Leibniz wrote during a period of

devastating European wars and intended his thought to serve as the foundation for a European culture that would protect Europe against the threat of a new barbarism. Voltaire, Edward Gibbon, and Pierre Maupertuis expressed the same fears, and in America, Benjamin Franklin, Thomas Jefferson, Alexander Hamilton, and John Adams had forebodings of the dangers of revolution and the collapse into barbarism that might follow a failure to establish a sound political order.

**RELIGION.** Religion involves both optimistic and pessimistic aspects. Since the essence of religion is salvation from evil, an optimistic element is essential to it; yet not all individuals or groups are saved. The magical component in religion is optimistic, since it promises success in the achievement of desired values; yet the failure of religious rites or prayers is common enough to support pessimism. Salvation is postponed to a future life, and the present world is viewed as a vale of tears, or as the historical conflict between good and evil, or as a source of desires to be resisted, or as an illusory order that possesses no substance. Yet in all religion there is also a joyous world-affirming element that expresses itself in community life and mystical or prophetic exaltation. Eschatological religions combine pessimism about a temporal world that is destined to end with joyous optimism about the new life that will follow.

**METAPHYSICS.** If hedonistic criteria of good and evil are a common source of pessimism, those systems of thought that hold to an ultimate identity of existence and value are the mainstay of optimism. Two philosophical convictions in particular have supported optimistic convictions in Western thought. One rests upon the Platonic and Aristotelian ideal of the perfectibility of man. It regards all the powers of man as capable of control and harmonization (without great resistance from senses and impulses). The other is metaphysical but has the same sources. Regarding the universe as a hierarchy of being and goodness, ordered from infinite perfection though all levels of particularization to the total formlessness of matter, or mere potentiality, it finds all evil and error to consist in a negation or privation of being.

Other traditions also have a bearing upon optimism and pessimism. Efforts to interpret the universe as normatively indifferent (traditional materialism, for example) usually end in pessimism. Dualisms of various kinds, on the other hand, whether they distinguish between cosmic powers of good and evil or between a real order of value and a phenomenal order of fact, tend to end in optimism.

SCIENCE. Finally, natural science has presented considerations that affect the problem of optimism and pessimism. Fires, earthquakes, floods, storms, diseases, and, ultimately, death have always been regarded as evil because they interfere with human purposes and hopes. But the theory of natural selection and the second law of thermodynamics, which has been held to imply an end to the universe at a finite time in the future, have put the issue of the destructiveness of natural powers, animate and inanimate, on a more objective basis by casting serious doubts upon the possibility and the goodness of evolution and progress.

## HISTORY OF PESSIMISM AND OPTIMISM

RELIGIOUS PESSIMISM. Religion is relevant to the problem of optimism and pessimism insofar as it offers salvation to men, evokes attitudes of world-affirmation and world-renunciation, and involves beliefs about the place of man and his hopes in the world. In this sense Schopenhauer was justified in calling religion the metaphysics of the people. Most religions combine a certain joyous response to divine grace with a sense of anguish and guilt at man's failures. Most advanced religions reflect a deeply rooted intuition of natural and historical evils and of the human limitations to which man is subject.

*Indian thought.* When the Brahmanic tradition in India emerged from the earlier Vedic religious forms, it partly concealed an underlying pessimism with the doctrine of maya—namely, that the world in which man suffers is a world of illusion, and release follows from recognizing this and the supplementary truth that man's true nature is one with the Brahman. This Brahmanic tradition was supplemented by a popular polytheistic religion that combined an easy tolerance of the diversity of natural delights and griefs with a singleness of purpose in carrying out those disciplines (whether physical, moral, intellectual, or mystical) that assure the self of its ultimate release and redemption. The fatalistic doctrine of the eternal cycle of rebirth, together with the doctrine of karma, intensifies a mood of pessimism, since this cosmic law of justice sentences most men to relive the deceptions of life again and again.

This element of pessimism implicit in Hinduism became the driving force of Buddhism in its various forms. The fourfold truth revealed to Gautama under the bo tree begins with the misery of human existence, caused by desire, and offers as salvation only the renunciation of desire and the attainment of that state of negation which is the highest bliss.

*Western religions.* As the Eastern religions show, the religious source of pessimism is to be found in the emergence of man's self-consciousness at a level at which he feels his isolation and estrangement in a world in which sickness, suffering, and death interfere with, and ultimately nullify, his hopes for a desired future. This mood showed itself in early Babylonian and Egyptian literature, as well as in the Hebrew Scriptures and in the Greek conception of life as being lived in the shadow of a fate (*moira*) from which death itself fails to offer a complete escape. Homer, although generally healthy-minded, judged that "there is nothing more wretched than man, of all things that breathe and are" (*Iliad* XXIV, 446ff.), and Sophocles wrote, in *Oedipus at Colonus*, "Not to be born is the most to be desired; but having seen the light, the next best is to go whence one came as soon as may be." In the Old Testament, the books of Job and Ecclesiastes reflect the same struggle with the meaninglessness of life.

However, the Judeo-Christian tradition is generally regarded as being optimistic. It applied a theistic view of Providence first to the history of a "chosen people" and then more universally to the moral interpretation of human history and of divine justice. The meaning of history is the redemption of God's people and, more generally, the Kingdom of God or the Reign of Grace. Moreover, although the Hebrews had only a vague conception of life after death, Christianity offered the assurance of a blessed life—an assurance based neither upon a concept of strict justice, as in karma, nor upon works, but on divine Grace.

However, much Christian eschatology has condemned the present world to destruction and the people in it to judgment and condemnation. The division of people into saints and sinners has often comforted those conscious of their sainthood but has not generally strengthened the ideal of a great community of love. Doctrines of original sin and predestination of the damned, of apocalyptic horrors terminating history, and of the complete alienation of man from the world (the despair of life) have been a part of the Christian tradition and have been revived in our own time, when the consciousness of guilt and of alienation has been reinforced by the secular study of modern man.

Thus, most religion, in different contexts, emphasizes both good and evil in man, the universe, and history.

ANCIENT PHILOSOPHICAL VIEWS. The Greeks, whose thought turned about the polarities of matter and form, impulse and reason, power and justice, freedom and order, and the transient and the permanent in experience,

came to conclusions that have influenced all later discussions of the problem of good and evil in Western culture. When Friedrich Nietzsche condemned Socrates for making the Apollonian mood supreme in Greek art and thought, he attributed to him a type of serene intellectualistic optimism that has formed much of Western culture, particularly through its elaboration and systematization by Plato and Aristotle, who by ultimately identifying existence and value and supporting the ideal of rational perfectibility provided the philosophical grounds for Western optimism. But Plato was not so one-sidedly optimistic as Neoplatonism later became. The *Republic*, for instance, recognizes the possibility for man and society to attain justice and happiness, but it imposes harsh conditions for their attainment and is pessimistic about their ever being achieved by more than a select few.

In Hellenistic and Roman thought the nature of evil was a persistent problem that was shared by Epicureans, Stoics, Skeptics, and eclectics. Skepticism is often regarded as the intellectualistic counterpart of pessimism, but it has also often been the basis for an optimistic fideism. Although Epicureans and Stoics answered the question of the nature of evil differently, both the qualified hedonism of the one and the rejection of all external goods and emphasis upon self-sufficiency of the other tended to support a cultured tranquillity of contented, sometimes even grateful, acceptance. Both denied the evil of death, and the Stoics denied the evil of pain as well. While the Stoics relied upon determinism, and the Epicureans upon indeterminism, both denied that the gods were in any way connected with, or cognizant of, man's good. From Plutarch's *De Stoicorum Repugnantiis* (first century CE) to Vanini's *Amphitheatrum Aeternae Providentiae* (1615), the Stoics were charged with attributing evil to divine Providence, while the Epicureans grounded their conception of the contentment of the wise man upon his freedom from interference by the gods.

The decline and fall of Rome brought to consciousness a new dimension of pessimism—the despair evoked by the collapse of a historical order that had claimed eternity and universality. The relativity of good and evil to historical change provided the individual with a mode of adjustment to the evils of social and institutional decline. St. Augustine's great adaptation of Platonism to a Christian solution to this problem has been the source not only of most later religious optimism, but also of the great theodicies of the West, from the medieval and Renaissance Platonists to Leibniz and G. W. F. Hegel.

**EARLY MODERN VIEWS.** The Middle Ages have often been regarded as having been clouded with pessimism (they provided Hegel with the cultural type that he described as “the unhappy consciousness”), while the Renaissance and seventeenth century have been regarded as comparatively optimistic, culminating in baroque exuberance. But recent scholarship views the medieval and Renaissance periods as a cultural continuity moving toward “modernity.” In the face of a deep concern for the physical, social, and moral evils of Europe, intellects in both periods were engaged in a concerted effort to lay a rational Christian foundation for human happiness and harmony. While the political and social conditions varied, and the ideal of transformation changed from an eschatological revolution to continuous progress, Greek and Roman intellectual traditions continued to limit the philosophical effort to synthesize science, moral rationalism, and religious faith. Science and technology, nationalism, new ideals of individual freedom and toleration, and contact with new lands and cultures shifted and enlarged the scope of inquiry and intensified the problems, but the differences between Peter Abelard, Thomas Aquinas, John Duns Scotus, and William of Ockham on the one hand, and René Descartes, Benedict de Spinoza, Francis Bacon, and John Locke on the other are far more superficial than the continuity of their problems and their tradition.

Seventeenth-century discussions of the dominance of good or evil were affected by the new perspectives on human life that evolved in the Renaissance—notably, the emphasis upon individualism; the conflict about the nature of human freedom; the problem of the control of political power, which resulted from the collapse of the medieval synthesis and the multiplication of small states; and the ideal of a rule of reason, strengthened by the successful combination of mathematics and experimentation in the scientific mastery of nature.

*Developments in psychology.* The discussion of optimism and pessimism was affected by two developments in psychological thought: Galen's doctrine of the four humors was applied to man's reactions to good and evil, and there was a wide recognition of the role of the affections and appetites in human life. A comparison of Albrecht Dürer's famous engraving of Melancholia (1514) with Robert Burton's *Anatomy of Melancholy* (1621) is revealing. In Dürer's time the dominance of the melancholy humor was held to be the source of contemplation and therefore of mathematical and other forms of learning; Burton treated melancholia as pathological and analyzed its types, causes, and cures. Unfortunately, there is no work analogous to Burton's erudite essay that deals

with the dominance of the opposing humor, the sanguinary. But the use of the humors to explain pessimism and optimism initiated a long tradition of distinctions that includes the Earl of Shaftesbury's and Jean-Jacques Rousseau's theories of the natural affections, the *Weltschmerz* and *Weltfreude* of the German romantics, and after Schopenhauer, the psychoanalytic classifications of Sigmund Freud and Alfred Adler and the psychological typologies of worldviews by William James, Wilhelm Dilthey, Max Scheler, and others.

A closely related trend was the growing recognition of the role of the affections in determining human attitudes and conduct. The third book of Luis Vives's work on the mind (*De Anima et Vita Libri Tres*, 1538) was an important source for later attempts by such thinkers as Descartes, Spinoza, and Thomas Hobbes to explain human actions in terms of feeling and desires. In Hobbes the result was a pessimistic theory of human nature; in Michel Eyquem de Montaigne, Blaise Pascal, and thinkers of the libertine tradition, it was a relativization of human ends that undermined the absoluteness of goods and evils; but in the thinking of Vives himself and in the rationalistic tradition of the seventeenth century (for example, Descartes, Spinoza, and Leibniz), an idealistic optimism resulted from the doctrine that the affections are docile and readily moldable into socially constructive attitudes.

**Politics and history.** The problem of power (particularly political power) and its responsiveness to reason was a second noteworthy development affecting the estimation of good and evil. Machiavelli had formulated the fundamental theory of a *raison d'état* in a way that provided pragmatic support for the principle of the divine right of rulers. The series of disastrous wars that swept over Europe, however, intensified a mood of eschatological expectation and heightened the fear or hope of revolution and an overthrow of the existing order. The transfer of the eschatological hope from an afterlife to the temporal world, and the resulting faith in human progress, were the result primarily of the increase of scientific and technological knowledge and the wider expansion of faith in reason. Hobbes entirely restricted his realistic definition of justice as the power of the strongest to the limits of the present historical order, thus secularizing St. Augustine's pessimistic appraisal of the City of Man and providing a modern ancestry for pessimistic interpretations of history.

**Rationalism.** From the metaphysical point of view, however, the rationalistic tradition of the seventeenth century may be regarded as optimistic; it constituted an effort to bring the real into harmony with the ideal or the

normative. This effort concentrated on the law of nature and on the individual's relation to the absolute source of power and wisdom. In Descartes, human passions are regarded as supporting the ideal of *generosité* and *honnêteté*; in Spinoza, actuality is generalized into possibility, and passive affections are shown to be imperfect but corrigible through active affections; in Leibniz, truths of fact are held to be grounded in truths of reason, if we could only completely analyze the former. This optimistic doctrine of reality is supported in these thinkers by the conviction that evil is finitude or limitation and that as our ideas move from confusedness, indistinctness, and inadequacy toward clarity, distinctness, and adequacy, the goodness of the world and of our life is brought to light in an absolutely convincing way. Not all thinkers, of course, accepted this optimistic metaphysical resolution of the problem. Pascal was driven by his perception of the finiteness of man and the terror in which this finiteness involves him to a philosophy in which the heart, not the intellect, provides knowledge about ultimate reality. Pierre Bayle had recourse to a combination of skepticism and Manichaeism, while Locke was attracted on the one hand to libertinism, pluralism, and toleration, and on the other hand to arguments for faith in a determining divine Providence.

**LEIBNIZ AND THE ENLIGHTENMENT.** Gottfried Wilhelm Leibniz (1646–1716) is generally regarded as the outstanding modern philosophical optimist. His *Théodicée* (1710) is a prolonged argument for the rationality of Christian faith, the reasonableness of creation, and the view that this is the best of all possible worlds. The argument of this work is supported by a large body of writings that aimed at a *philosophia perennis* (a synthesis of the truth in all of the classical systems of thought) as well as a harmonious ordering of scientific, philosophical, and theological truth. This philosophical system, in turn, was intended to serve as the ethical basis for the great Leibnizian projects for engaging the leaders of Europe in the restoration of peace through the advancement of science and technology, the reform of the law, the perfection of logical and mathematical tools of learning and a universal encyclopedia, the reuniting of the churches, and the Christian conquest of the pagan parts of the world. Thus, Leibniz's optimism, although grounded on one of the most remarkable philosophical systems of Western thought, was also ideological; it aimed at concerted action in a variety of related fields, and in this sense it presupposed a deep sensitivity to the existing evils that were to be overcome.

In general, Leibniz's argument is that the man of good will (*homo honestatis*) should find his greatest happiness ("toute la joie dont un mortel est capable") in the recognition that in spite of its glaring evils this is the best of all possible worlds, because its creation involved the fullest possible realization of the divine attributes. He should also recognize that there prevails in the world a divine harmony that requires evil not only for the full manifestation of the infinite greatness of the world's Creator but also in order that this evil may contribute to a greater good than would otherwise be possible. The conception of evil involved in this argument combines three theories: the privative theory (supported by Leibniz's essentialist metaphysics) that the complete notion or law of every individual monadic series is a finite combination (erected by God) of its own simple perfections; a legalistic moral theory somewhat inconsistent with this, according to which justice requires retribution for man's sins and compensation for man's suffering; and an aesthetic theory that finds limited evil necessary (like the dark parts of a painting) for the perception of a more complete and inclusive good. Leibniz's defense of God is brilliant, and the many editions through which his *Théodicée* passed in the original French and in Latin and German translations produced an extensive following on the Continent and even in England, where it may have influenced the optimistic thought of Lord Bolingbroke, Alexander Pope, and others. Yet his argument is defective, most notably in his failure successfully to reconcile human freedom and responsibility with the determinism of the divine creation, and in his general inclination to explain what is in terms of what ought to be. Many readers have agreed with Jean Guitton (*Pascal et Leibniz*, Paris, 1951, p. 121) that "one would have to change very little to transform this supreme joy (in the supreme goodness of things) into a radical despair."

**Deism.** The optimism of the eighteenth century, influenced by Leibniz's defense of God rather than by his more subtle metaphysics, was deistic, and much of its thought followed the five creedal points of Lord Herbert of Cherbury, who asserted an instinctive faith in the law of nature that dictates belief in one God, a divine order of justice, a moral imperative, individual immortality subject to a system of rewards and punishments, and a condemnation of "enthusiasm" as divisive and disruptive of true religion. The spirit of deism was activistic, sometimes revolutionary, and intent upon scientific progress and the dissipation of superstition. In this sense it was optimistic.

**Maupertuis.** The eighteenth century was also the breeding ground of modern pessimism. Voltaire's shocked reaction to the Lisbon earthquake and his satirical attack on the Leibnizian formula in *Candide* stimulated the change in mood, but even more significant was the influence of Pierre-Louis Moreau de Maupertuis (1698–1759), to whom both the utilitarian Jeremy Bentham and the philosophical pessimist Eduard von Hartmann were indebted for their conception of a "balance of pain and pleasure." In his *Essai de philosophie morale* (1749), Maupertuis proposed a measure of good and evil in terms of *plaisir* and *peine*. (The French terms, their English equivalents *pleasure* and *pain*, and the German words *Lust* and *Unlust* have somewhat different psychological connotations that must here be ignored.) Maupertuis defined these terms functionally: *Plaisir* is any "perception" that the soul prefers to experience rather than not to experience; *peine* is the opposite. An examination of life in terms of moments of pleasure and pain, Maupertuis concluded, shows in a frightening way how preponderant pain is. Life is a constant wish to change one's perceptions in order to achieve fulfillment and to see the intervening times destroyed (*anéantir*). But if God were to abolish these intervening periods from even the longest life, only a few hours would remain. "In the usual life the sum of evil is greater than the sum of well-being."

**KANT.** If the optimism of the Enlightenment found the goodness of creation revealed both in nature and in historical progress, the decline of this tradition and the growth of a new pessimism grounded in the romantic movement may be traced in the thought of Immanuel Kant. The *Versuch einiger Betrachtungen über den Optimismus*, written in 1759, argued for the Leibnizian "best of all possible worlds" in two steps: first, there must be one possible world that is the best, and second, it is necessary that this existing world is that best of all possible worlds. Kant urged the faith that each human being, recognizing "that the whole is the best and everything is good for the sake of the whole," should find his small place in this world. But in his critical period, after 1781, he found the fact of evil decisive in invalidating the Teleological Argument and recognized a "radical evil" in man that prevents him from exercising the good will and doing his duty. In the short paper of 1785, *Muthmasslicher Anfang der Menschengeschichte*, Kant could only advise maintaining one's courage in the face of life's tribulations.

**ROMANTICISM AND IDEALISM.** The shift in attitude noted above deepened into the pronounced pessimism of the romantics, many of whose writings reflect a feeling of

overwhelming anguish at man's situation in the world. Johann Wolfgang von Goethe's early works (especially the *Sorrows of Young Werther*) reveal this *Weltschmerz*, as do the works of Heinrich Heine, Lord Byron, and Giacomo Leopardi. However, the German idealist philosophers struggled against it through various forms of voluntarism—a voluntarism that encompassed the cosmos in Johann Gottlieb Fichte, was involved in history through great individuals in Hegel, and developed into a theory of emerging personal creativity in the context of chaos in Schelling's philosophy of freedom. Thus, Eduard von Hartmann and Olga Plümacher were unjust to the influence of this *Weltschmerz* when they excluded it from consideration as a form of philosophical pessimism. In a real sense it anticipated, and was the historical forerunner of, the twentieth-century irrationalist philosophies and philosophies of despair.

**SCHOPENHAUER AND VON HARTMANN.** The greatest philosophical protagonist of the pessimistic tradition is, of course, Arthur Schopenhauer (1788–1860), who gave expression to it in the context of the Kantian distinction between a phenomenal nature and a real intelligible world in which the moral will and an interpersonal society of willing beings are primary. Schopenhauer interpreted the realm of phenomena as “illusory” and as the result of human conceptualization; the real world is irrational will-to-live, known intuitively through man's perception of his own nature. To discover this world is to recognize the ultimate and inescapable evil of existence.

Man's life, Schopenhauer held, is permanently condemned to be in bondage to the will-to-live. As the Indian thinkers discovered, the essential nature of every human life is desire, and this desire is never stilled, since even its satisfaction results in increased desire or ennui. The world as will, therefore, is unmitigated evil; good is illusory, but man, by his very nature as an intelligent, feeling animal, and facing inevitable death, is driven beyond this illusion to discover his own plight. This is therefore the worst of all possible worlds, since there is no good in it. The only escape is through renouncing will, but only the great artists, thinkers, and prophets are capable of doing this—and only in a finite and impermanent degree. There is, however, an ethics involved in this pessimism; it is the ethics of sympathy and amelioration of the suffering of one's fellows.

**Von Hartmann.** Eduard von Hartmann found Schopenhauer's pessimism to be the ultimate expression of a romantic *Weltschmerz* in which a sense of guilt over the quest for pleasure was implicit. Although he adhered

generally to Schopenhauer's metaphysics (supplementing the will, however, with a parallel order of ideas, both will and ideas having their seat in the unconscious), he modified his own theory of conflict in nature by stressing the purposiveness of every individualized act of will. He also rejected the Darwinian theory of change through struggle and survival in favor of a theory of evolutionary creativity in which new forms arise in the germplasm of the old. In contrast to Schopenhauer's pessimism, von Hartmann claimed that his was a “powerful, energetic pessimism, filled with the joy of action,” whose historical antecedent is to be found in Kant, not Maupertuis. This is not the worst of all possible worlds; the logical element (that is, the ideas) ensures that the world is a best possible world. Yet it would be better if there were no world at all, and this is in truth the end to which the universal will, spatialized, and individualized through the particularizations of intellect, is driving—the total negation of all will through the fulfillment of its purposes.

Although von Hartmann argued that his metaphysical system of the unconscious would be valid without his pessimism, it is apparent that the converse is not the case: his pessimism rests directly upon his metaphysics of the unconscious. Yet he supported his pessimism by a comprehensive examination of empirical arguments from neurology, psychology, and the history of culture. The optimistic illusion takes form in three stages: the belief first, that happiness is attainable in the present world; second, that there will be a future otherworldly life in which the good will be attained; and third, that the surplus of happiness will be achieved sometime in this world's future history. The transition from each stage of optimism to the next already involves a surrender of hope. Von Hartmann's refutation of optimism is not merely negative but consists of a constructive argument for three corresponding levels of pessimism, which he labeled empirical, transcendental, and metaphysical respectively. Transcendental pessimism involves the denial of life after death, a conclusion von Hartmann undertook to prove through a metaphysical argument for the inseparability of body and mind. Metaphysical pessimism is supported a priori by the inevitability of misery in a world of will individuated by ideas and by the total lack of feeling of the will after all existents have ceased to be. It is also shown, however, by the finiteness and ultimate failure of all the values of human life—particularly the ethical, religious, and aesthetic values.

It is in his argument for empirical or eudemonistic pessimism that von Hartmann showed his greatest skill in penetrating human motives and the interaction between

pleasure and displeasure in human action. Twelve arguments, cumulative in force, were offered for the preponderance of pain over pleasure. On the simplest level, the growing fatigue induced by nervous processes diminishes the effort to retain pleasures, and as the fatigue grows, it increases the resistance to pleasure. Moreover, most pleasure is merely the negative kind that results from the cessation of positive unpleasantness or pain; thus, it can in no way equal the unpleasantness that it terminates. Displeasure coerces consciousness in a way that pleasure cannot, since pleasure must consciously be sought and discovered and occurs only when there is conscious motivation or desire for it. In shared experiences of pleasure the sense of solidarity and sympathy may momentarily intensify that pleasure, but this intense pleasure is correspondingly sooner exhausted than unintensified pleasure. In shared suffering or displeasure this sympathetic response may also occur, but it is overbalanced by callous and egoistic reactions. Moreover, history shows that as cultures advance in sensitivity and refinement, this overbalance of suffering increases proportionally. Such arguments, von Hartmann held, conclusively establish an excess of *Unlust* that confirms eudemonistic pessimism.

In his late work on the history and foundation of pessimism (2nd ed., 1892), von Hartmann modified his theory through an analysis of the different measures of value (*Wertmassstäbe*), of which pleasure is only one, the others being purposiveness, beauty, morality, and religiosity. These independent measures of value in themselves point to an optimistic view of life. Thus, he now called his thought a “eudemonological pessimism” but a “teleologico-evolutionary optimism”; yet the new measures are themselves not unmixt with the subjective feeling dimension, so that we must conclude that the overall balance of pleasure in the world is negative.

*Von Hartmann's influence.* Unlike Schopenhauer's pessimism, which was slow in gaining acceptance, von Hartmann's *Die Philosophie des Unbewussten* (Berlin, 1869; 9th ed. translated by W. C. Coupland as *The Philosophy of the Unconscious*, 3 vols., London, 1884) met with an immediate favorable response because of the changing intellectual and cultural mood of the last half of the century. The worst effects of the industrial revolution had become too conspicuous to be overlooked; colonialism involved nations in guilt; utopian reforms frequently ended in disillusionment; socialism shifted from its philanthropic to its “scientific” stage (von Hartmann himself was one of the early critics of social democracy); Darwinism intensified the perception of suffering and struggle in animate nature; and the romantic mood collapsed into a

new naturalism according to which man was held in bondage to social forces and unconscious powers beyond his control. Novelists such as Charles Dickens, whose early works radiated Mr. Pickwick's cheerful vision of life, turned to the wretchedness of life and the irreducible evil of actual educational, penal, and political systems. Nathaniel Hawthorne and Herman Melville in America and Thomas Hardy in England reflected different aspects of this pessimistic movement, which mounted in strength until it developed into the fin de siècle mood of disillusionment, mortification, and decadence described and criticized by Cesare Lombroso, Max Nordau, and others.

Several of von Hartmann's followers carried his pessimism to the limit of nihilism. Julius Bahnsen (1830–1881) analyzed the “dominance of the offended spirit” (*das angekränkelte Gemüth*) that is split by hate, malcontent, and horror, and Philipp Mainländer (pseudonym of Philipp Batz, 1841–1876) pushed pessimism to its ultimate conclusion in total annihilation. In his *Philosophie der Erlösung* (2 vols., Berlin, 1876–1886) Mainländer held that the will to annihilation (*Vernichtungswille*) is included in the nature of every individual being, inorganic as well as organic, and that the ethics of the individual is egoistic and implies virginity and suicide as means of world salvation (that is, annihilation).

Von Hartmann's pessimism, although more critical and balanced than Schopenhauer's, also received extensive philosophical criticism. James Sully in England, Johannes Volkelt, Johannes Rehmke, Hermann Lotze, and Gustav Fechner in Germany, the spiritualists in France, and William James and others in America replied in terms of a more positive voluntarism or a more positive theory of value, thus laying the basis for a restoration of constructive liberalism in the twentieth century.

NIETZSCHE. The influence of Schopenhauer upon Friedrich Nietzsche was described by the latter in detail and is well known. He agreed with Schopenhauer's view that life is filled with suffering and a preponderance of evil, but rejected his ethics of resignation and of sympathy that was based upon it, as he also came to reject the metaphysical doctrine of will upon which it rested. Instead, Nietzsche's doctrine of the Dionysian man, or the superman, demanded a vigorous affirmation of life and power that would transcend both the “weakness doctrines of optimism” and tragedy as “the art of metaphysical comfort.” In his “Versuch einer Selbstkritik” (1886; English translation in *The Philosophy of Nietzsche*, Modern Library edition, New York, pp. 934–946) Nietzsche corrected his earlier romantic reliance upon the ideal of

“a pessimism of strength” that he found in Greek tragedy (*The Birth of Tragedy*), replacing it with an affirmation of man’s powers of joyous creativity—the “laughter of Zarathustra.” Although Nietzsche’s ideal of a life “beyond good and evil” is ambiguous and easy to misread, he clearly transcended traditional conceptions of pessimism and optimism, pressing from the conceptual to the realm of personal living and valuing. His superman is a mixture of the rejection of accepted contemporary values, a rigorous discipline of the self in loneliness, and the joy of creativity and the hope of a new aristocracy of creative individuals.

Nietzsche’s criticism of modern culture as nihilistic is beyond pessimism in the same sense that his ethics is beyond good and evil. Abstract theories of the balance of good and evil fall far short of reflecting the plight and the opportunity of modern man, upon whose will to power the civilization of the future must rest.

**SANTAYANA AND FREUD.** Two thinkers who differed greatly in their theoretical and practical approaches to human problems, George Santayana and Sigmund Freud, developed pessimistic theories that were similar in important respects to the pessimism of Schopenhauer. (Freud arrived at his pessimism independently and did not read Schopenhauer until late in life.)

Santayana found in metaphysical matter what Schopenhauer found in will—the ultimate ground of all permanence, power, and life and therefore the ultimate ground of the tragedy that is involved in man’s efforts to live the life of reason and spirit. Through concrete personal vision Santayana transcended the old debate between optimism and pessimism. Unlike Nietzsche, he found his personal resolution of the problem of evil not in the egocentric ideal of the superman but in an ideal of stoic acceptance and self-sufficiency.

In Freud’s work the libido and, later, the id play a role similar to that of the will in Schopenhauer’s system. The failure to gratify the impulses emanating from the id produces basic dislocations in the “libido economy” and thus leads to suffering and illness. In *Das Unbehagen in der Kultur* (Vienna, 1930 [1929]; translated by Joan Riviere as *Civilization and Its Discontents*, London, 1930) Freud traces human suffering to three sources—the superior power of nature, the decay and death of our own bodies, and the shortcomings of social relations and institutions. Of these, the first two are insurmountable, and the third inevitably results in unhappiness and alienation from man’s culture. Moral judgments are merely “the effort to support illusions with argument.” The illusory world of

subjective imagination and thought sometimes offers successful sublimations and corrections, but the ultimate way to soundness can be found only (if at all) by a return to the natural and cultural roots of our being through psychoanalytical techniques. In an earlier work, *Die Zukunft einer Illusion* (Vienna, 1927; translated by W. D. Robson-Scott as *The Future of an Illusion*, London and New York, 1928), Freud held out much hope for this ideal through the elimination of religion, which he saw as likely to accompany the progress of science.

**THE TWENTIETH CENTURY.** In the twentieth century, with its dislocation and destruction of human life and values, the tremendous potentialities of its technological advances, its moral and cultural uncertainties, and its rifts in the texture of human society, the problem of optimism and pessimism shifted from an attempt to determine the relative goodness and badness of the world to an attempt to face the plight of modern man—his situation and his powers and resources for achieving good. This is a shift from conceptual modes of assessing the goodness of man, nature, and the universe to cautious nominalistic and phenomenological analysis of the individual.

It is true that a moralistic optimism has found strong defense and influence through the work of William James and John Dewey, while Alfred North Whitehead and others have offered metaphysical support of rationality, creativity, and the discovery of values in general. On the other hand, Bertrand Russell, in “A Free Man’s Worship” (1903), gave moving expression to a naturalistic pessimism that regards man’s existence in an indifferent universe as brief and without meaning, yet exhorts him to resist these natural powers with all the force of a living and vigorous faith in himself and in the powers of man. More commonly, the prevailing temper is to ignore the natural order as being neutral toward good and evil, and to show concern rather for the human person as a self-conscious being cast in a given historical situation. Man’s natural environment, which John Dewey (in agreement with Hegel) found to be an aspect of the situation in which man is to achieve his freedom, is now taken by many as an aspect of the situation into which man is “thrown,” but which he transcends in his capacity as insular self-consciousness, will, decision maker, or confronter of the divine.

Existentialism is the final expression of the inverted romantic spirit that began with Schopenhauer. Rousseau’s attack on civilization is broadened and shifted: it is not just civilization that debases man; the entire situation in which *Dasein* finds itself forces upon it

a sense of aloneness, alienation, and despair. But this is not pessimism; conceptual theory is irrelevant. The person's response must be "existential," taking the form of a blind affirmation of will or a surrender to a confrontation (whether with Christ or communism). Such a response is beyond optimism as well. According to the existentialist, no theory of the goodness of the world is relevant, but only unreasoning hope. Although the works of Martin Heidegger and Jean-Paul Sartre are replete with themes that evoke reactions of pessimism and optimism, they significantly avoid raising the old issues concerning the relative predominance of good and evil in the world. Gabriel Marcel has eloquently made the distinction between optimism and hope in *Homo Viator* (Paris, 1944, Ch. 2). The more completely irrationalistic followers of the existentialist movement (Jean Genêt, for example) push this rejection of the traditional philosophical issue further into an ultimate reversal of good and evil and a doctrine of redemption through evil.

Although optimism and pessimism are terms that are useful in expressing fundamental human attitudes toward the universe or toward certain aspects of it, they have an ambiguity and relativity that makes them useless for a valid philosophical analysis. The question of the relative amounts of good or evil in human life and its environment is too involved to be resolved with existing philosophical tools. The dominant movements in contemporary philosophy prefer to describe and analyze the human situation more carefully in order to achieve greater understanding of the elements involved in it. That this must be done in cooperation with psychology and the natural and social sciences seems obvious; yet there are distinctively philosophical issues involved (some of which are very old) that are receiving more fruitful analysis with recent philosophical techniques. Until the basic concepts involved in a philosophical anthropology have received such analysis, the terms *optimism* and *pessimism* might wisely be avoided.

Among analytic philosophies, the empirical and positivistic trend that brushes aside all metaphysical and ethical issues as unphilosophical offers little help in this undertaking, although the old issue of a pleasure-pain balance may be regarded as an important attempt to meet analytical and empirical requirements of method. On the other hand, contemporary linguistic analysis is seeking firm ground for some of the ethical and axiological terms upon which discussions of good and evil must be based. But the analytic movement has been cautious in moving toward the metaphysical decisions upon which the resolution of these complex problems depend. It may be con-

jectured that when the present interest in analytic and phenomenological exploration develops into a bolder metaphysical phase, the terms *optimism* and *pessimism* may survive as descriptions of dominant human attitudes, but they may be superseded as philosophical theories by more adequate and more complex conceptual formulations of the meaning of human life and history.

## PESTALOZZI, JOHANN HEINRICH

(1746–1827)

Johann Heinrich Pestalozzi was a Swiss educator whose views profoundly affected the history and philosophy of education. Pestalozzi's father, a clergyman in Zürich, then the most lively center of awakening German culture and literature, died when his son was six years old. Pestalozzi's profound piety, the desire to love and to be loved, his compassion for suffering—and his extreme sensitivity and awkwardness in dealing with the practical affairs of life—were due largely to the exclusive upbringing of his pious mother.

After graduating from the Collegium Humanitatis (a secondary school), he turned to agriculture and experimented at his newly acquired farm, the Neuhoof, with a

school for the children of the neighboring farmers that was to combine elementary education with practical work. The Neuhoof enterprise was a failure, financially as well as educationally, but it brought him the insights that determined his later educational, social, and religious theory and practice. These insights are jotted down in aphoristic style in *Die Abendstunde eines Einsiedlers* (Evening hour of a hermit; 1780), one of those astounding works of sudden illumination which we sometimes find in the lives of men of rare genius.

As a young man, Pestalozzi sympathized with a liberal student movement which was considered subversive by the patrician government of Zürich. He also sympathized actively with the Swiss and French revolutions at the end of the eighteenth century but was soon disappointed in the development of both.

In 1789 he took over the education of the desolate children of the town of Stans, which had been the scene of a battle between the French and the Swiss and had been badly ransacked by the French victors. Later he founded schools at Burgdorf and Münchenbuchsee, and finally at Iverdon on the shore of the Lake of Neuchâtel, attracting increasingly the attention of reform-minded men and women all over Europe. "Pestalozzianism," as a method of education that emphasized the importance of individual differences and the stimulation of the child's self-activity as against mere rote learning, was transferred also to the United States and resulted, about 1860, in a thorough reorganization of its elementary schools.

Like John Amos Comenius (whom he mentions, without being influenced by him), Pestalozzi was able to fuse his Christ-centered piety with a romantic concept of nature. First impressed by Jean-Jacques Rousseau, whose ideas he later rejected, he used the term *nature* as synonymous with all that is genuine, authentic, and free from artificiality. He regarded it as the function of education, as of all other social activities, to find the "organic" or "elemental" principles by which the inherent talent of every person could be developed to his fullest individuality, or to his "truth." His concept of truth, therefore, does not aim at logical universality; rather, it is, to use a modern term, *existential*.

A person can be educated toward maturity only if he has been allowed to sense in his earliest infancy and under the care of his mother and his family the vital element in all human relations, altruistic love. And he can safely pass over to his next developmental stage only if he has fully mastered the experiences and tasks of the preceding stage, if the whole of his personality has been formed by the "education of the heart, the hand and the

mind,” if the things he has learned have become really his own and have aroused a sense of commitment, and if, finally, he discovers the vertical line, his personal relation to God, without which all relations between man and man, man and nature, and man and knowledge remain empty and meaningless.

According to Pestalozzi, it is the curse of modern civilization that its hasty and primarily verbal education does not give man enough time for the process of *Anschaung*, a term perhaps best translated as “internalized apperception,” or as dwelling on the meaning and challenge of an impression. Thus modern civilization leads a person more and more away from his deeper self into a tangle of self-perceptions, of useless, if not dangerous, knowledge, and of false ambitions, which will make him unhappy.

As in many similar cases, Pestalozzi’s fame as an educator has prevented the scholarly world from recognizing the full scope and depth of his interests. Besides a few and often inadequate accounts, little attention has been paid to Pestalozzi as a man of passionate concern for social justice and for new forms of religious education which were intentionally prevented by corrupt ecclesiastical institutions.

Nor has his essay “Meine Nachforschungen über den Gang der Natur in der Entwicklung des Menschengeschlechtes” (On the path of nature in the history of mankind) received sufficient attention, although it is profounder and more realistic than the contemplations on human progress by the Marquis de Condorcet, Anne Robert Jacques Turgot, and other philosophers of the Enlightenment. According to Pestalozzi, the development of the human race is reflected in the life of every person. Each of us has in himself the primitive, the social, and the ethical human. Injustice, therefore, will remain, although we may profit from the experiences of earlier generations. But the state of moral freedom will be achieved by only a few chosen individuals, and they (in this sentence he refers to his own life) will hardly find a niche in the house of humankind.

## PETER AUREOL

(c. 1275/1280–1322)

Peter Aureol (or Petrus Aureolus, Petrus Aureoli, Peter Oriole, etc.), the French Franciscan philosopher and theologian called “Doctor Facundus,” was born near Gourdon, Lot, between 1275 and 1280 and died in 1322. He entered the Franciscan order before 1300, probably at Gourdon, and was assigned to the province of Aquitaine. In 1304, Peter was at Paris, but whether he studied under John Duns Scotus is uncertain. His first work was *Tractatus de Paupertate* (1311). In 1312 he was lector at the *studium generale* at Bologna, where he composed his only purely philosophical work, the unfinished *Tractatus de Principiis Naturae* in four books. From 1314 to 1315, as lector at Toulouse, he wrote the original and influential tract *De Conceptione B. M. V.* and the *Repercussorium* against certain opponents of the tract. From 1313 to 1316, probably also at Toulouse, he composed his extensive *Scriptum Super I Sententiarum*, dedicated to John XXII. At the Chapter General of Naples in 1316, Peter was nominated to lecture on the *Sentences* at Paris. The newly elected general of the order, Michael of Cesena, who had just finished his own *Sentences* at Paris, gave his consent as required although Peter openly opposed him. Peter lectured at Paris from 1316 to 1318; his *Reportata*, formerly called “the first redaction,” is now believed to belong to this period. In a letter dated July 14, 1318, John XXII asked the chancellor of Paris to grant Peter the licentiate.

Peter is later mentioned (November 13, 1318) as among the master regents. For the next two years he taught Scripture at Paris while composing his often-published *Compendium Sensus Litteralis Totius Scripturae* (1319). At the end of 1320, Peter became provincial of Aquitaine but was nominated archbishop of Aix and consecrated by the pope himself in 1321. He died either at Avignon or at Aix.

Although Peter's doctrines have never been thoroughly studied, he has long been regarded as a highly critical thinker who often discarded as useless philosophical theories of his time—for example, he rejected contemporary opinions on the cosmic influence of the intelligences. In particular, he criticized many theories of Thomas Wylton and Hervaeus Natalis. He often attacked Duns Scotus, yet he also frequently followed and defended him.

Peter's own philosophical system is characterized by skeptical and empirical traits. In epistemology he supported a form of conceptualism—a doctrine midway between the realism of the great Scholastics and the nominalism of William of Ockham—in which the intelligible species is not merely the *medium quo* but itself the immediate object of our knowledge. Universal concepts have some psychic reality but no objective foundation; any principle of individuation is thus rendered superfluous. Knowledge of the individual, because of its high degree of clarity and truth, is to be preferred to knowledge of the universal. In keeping with the principle of economy often called Ockham's razor, the constitutive elements of beings are to be limited, so that without extremely cogent reasons we should not accept a plurality of "realities" in a thing. In other philosophical fields Peter had many theories of his own. He defended the existence of neutral propositions, neither true nor false, and this led him to think that God cannot know with certainty future contingent events. Peter emphasized that man's knowledge of God is largely dependent upon the psychological dispositions of the individual; moreover, ontologically there is no common ground of being between men and God. In cosmology Peter had his own opinions on the plurality of forms, the notion of an infinite, the subjectivity of time, and the meaning of movement. He thus bears witness to the fact that there was no dogmatic uniformity in medieval Scholasticism.

## Bibliography

Peter's *Tractatus de Paupertate* was edited in *Firmamenta Trium Ordinum B. P. N. Francisci* (Paris, 1511), Part IV, folio 116r–129r. The *Tractatus de Principiis Naturae* is preserved only in manuscript. *De Conceptione B. M. V.* and the *Repercussorium* were edited at Quaracchi, Italy, in 1904. The *Sententiarum* was edited in Rome in 1516; the critical edition by E. M. Buytaert, in 2 vols. (to date), (St. Bonaventure, NY, 1953–1956), includes the prologue and Book 1 (Distinctions 1–8), and the difficult question of the double redaction of the *Sentences* is discussed in the introduction. The *Reportata* was edited in 2 vols. (Rome, 1596–1605). The *Compendium* was edited by P. Seeboeck (Quaracchi, 1896). Peter's other works include *Compendiosa Expositio Evangelis Joannis*, Friedrich Stegmüller, ed., in *Franziskanische Studien* 33 (1951): 207–219; *Recommendatio et Divisio S. Scripturae; Commentariorum in Isiam*; one *Quodlibet* (1320) of 16 questions (edited Rome, 1605); and unedited questions and sermons.

## PETER AUREOL [ADDENDUM]

Peter Aureol (Petrus Aureolus, Petrus Aureoli, Peter Auriol, Peter Oriole), French Franciscan philosopher and theologian called "Doctor Facundus," was born near Gourdon, Lot. He entered the Franciscan order before 1300 and was assigned to the province of Aquitaine. In 1304, Aureol was at Paris, but whether he studied under

John Duns Scotus there is uncertain. His first work was *Tractatus de Paupertate* (1311). In 1312 he was lector at the studium generale at Bologna where he composed his only purely philosophical work, the unfinished *Tractatus de Principiis Naturae*. From 1314 to 1316, as lector at Toulouse, he wrote the original and influential tract *De Conceptione B. M. V.* and the *Repercussorium* against certain opponents of the tract. Probably in his Bologna and Toulouse period, Aureol was composing his extensive *Scriptum super Primum Sententiarum*; the work was substantially completed by late 1316 and dedicated to Pope John XXII. At the Chapter General of Naples in 1316, Aureol was nominated to lecture on the *Sentences* at Paris. The newly elected general of the order, Michael of Cesena, who had just finished his own *Sentences* at Paris, gave his consent as required, even though Aureol had openly opposed him.

Aureol lectured at Paris from 1316 to 1318; several extant commentaries on books I–IV of the *Sentences* are probably related to the lectures held in this period, but the relationship between the various versions is still not entirely clear [see, though, Nielsen (2002) and Schabel (2000)]. In a letter dated July 14, 1318, John XXII asked the chancellor of Paris to grant Aureol the licentiate. Aureol is later mentioned (November 13, 1318) as among the regent masters. For the next two years, he taught Scripture at Paris while composing his often-published *Compendium Sensus Litteralis Totius Scripturae* (1319) and holding at least one Quodlibetal disputation (1320). At the end of 1320, Aureol became provincial of Aquitaine but was nominated archbishop of Aix-en-Provence and was consecrated by the pope himself in 1321. He died either at Avignon or Aix.

Aureol is a perceptive critic of the views of earlier thinkers, frequently using the thought of Thomas Aquinas, Henry of Ghent, and Duns Scotus, to name but a few, as a springboard for arriving at his own opinion on the matter at hand. Aureol's views are often innovative, and some of them provoked heated reaction from contemporaries such as Hervaeus Natalis and Thomas Wylton, as well as important later thinkers such as William of Ockham, Gregory of Rimini, and John Capreolus. Aureol's thought influenced the scholastic discussion into the seventeenth century.

Aureol holds that there is no principle of individuation since only individuals exist in extramental reality. This is the foundation of Aureol's conceptualism inasmuch as it entails that all universality is a product of mental activity. Thus, Aureol rejects both the strict realism of Plato and the more moderate realism of the thir-

teenth century. Nevertheless, Aureol insists that our universal concepts have direct foundations in the really existing individuals in the world. All individuals have certain essential features; these features are proper to the individual (they are in no way universal), yet essential features in individuals of the same natural kind (e.g., rationality in each human being) are so similar that they cause any intellect to form the same universal concept. Which universal concept an individual someone actually forms (e.g., genus or species) depends on how closely that person wills to focus the intellect on the object of cognition. Concepts for Aureol are the products of intellectual acts, and, in one of his most idiosyncratic views, he argues that this product is numerically identical with the object of cognition, merely in another *mode of being* which Aureol calls *apparent* or *intentional* being (the being the object has in virtue of its being perceived). Aureol argues along similar lines for sense perception, and behind these views is his belief in the fundamental activity of cognitive powers: They place the object of cognition in another mode of being.

Aureol wants to ensure that his philosophical and theological explanations do not jeopardize human free will, and this comes to light in his ideas on predestination and particularly on future contingents and divine foreknowledge. In the latter areas, Aureol holds that future-tensed propositions can be neither determinately true nor determinately false but have to be neutral with regard to truth–value because otherwise everything would be determined and there would be no free will. Moreover, since for Aureol immutability is equivalent to necessity, if God knows in a determinate fashion future events as future, this knowledge will be subject to God's immutability, and hence it, and the events it describes, would be necessary. Thus, Aureol claims that God understands the future, not as future, but *indistantly* and as abstracted from all time. Aureol's view was revived at the University of Leuven in the fifteenth century and created a European-wide debate of such gravity that in 1474 the pope condemned aspects of the view.

In his epistemology, Aureol stresses the psychological experience of perception. Thus, in his interpretation of the important later-medieval distinction between intuitive and abstractive cognition, the difference between these two ways in which cognitive faculties form representations is phenomenological: Intuitive cognition appears as clear and immediate (like sight) while abstractive cognition appears discursive and mediate (like imagination). This same emphasis on psychology is found in Aureol's ideas on the foundation of knowledge, proposi-

tions known through themselves (*propositiones per se notae*): For Aureol, these propositions are characterized by being known suddenly (i.e., imperceptibly quickly) and without the aid of a teacher.

In metaphysics, Aureol adopts Duns Scotus's view that the concept of being is univocal between God and creatures and between substance and accident, but he modifies it to avoid some of the problems he sees with Duns Scotus's ideas. For Aureol, the concept of being is a totally indeterminate concept having no explicit content of its own; any intellectual acquaintance, no matter how weak, can be the basis for the formation of the concept of being. This position in turn had consequences for Aureol's view of metaphysics as a science since he holds that the subject of metaphysics is being as such. Aureol's pronounced voluntarism is in line with the Franciscan tradition, as is his view that theology is a practical (as opposed to a speculative) science, but his description of theology as *declarative* (as opposed to deductive or scientific) is quite unusual. Aureol also has distinctive views on the categories (especially on relations), on the ontology of accidents, and on infinity.

*Tractatus de Paupertate* (1311) was printed in *Firmamenta Trium Ordinum B. P. N. Francisci*, Part IV, Paris, 1511, fols. 116r–129r. *Tractatus de Principiis Naturae* (1312) is preserved only in manuscript. *De Conceptione B. M. V.* and the *Repercussorium* (1314–1316) were printed at Quaracchi, Italy, 1904 (*Bibliotheca Franciscana Scholastica medii aevi*, 3). *Scriptum super Primum Sententiarum* (1316) was printed in Rome, 1596; E. M. Buytaert published two volumes of a superior edition comprising the Prologue and Book 1 (Distinctions 1–8), St. Bonaventure, NY: 1952–1956. *Compendium Sensus Litteralis Totius Scripturae* (1319) was edited by P. Seeboeck in Quaracchi, 1896. Versions of books II–IV of *Sentences* commentary, along with *Quodlibet* (1320) of sixteen questions, were published in two volumes in Rome, 1605. Other works include *Compendiosa Expositio Evangelii Joannis*, edited by Friedrich Stegmüller, in *Franziskanische Studien*, Vol. 33, 1951, 207–219; *Recommendatio et Divisio S. Scripturae*; and unedited questions and sermons.

## PETER DAMIAN

(1007–1072)

Peter Damian, one of the greatest churchmen of the eleventh century, was born in Ravenna. After studying and teaching the liberal arts in several Italian cities, he joined a community of hermits at Fonte Avellana, near Gubbio, in Umbria (c. 1035), and became prior about 1040. He was soon called from the monastic life, however, to become an active leader in the growing movement of ecclesiastical reform. He became cardinal bishop of Ostia in 1057 and was sent on papal missions to Milan (1059), France and Florence (1063), Germany (1069), and Ravenna (1072). He died at Faenza.

Damian's attitude toward the humanistic culture of his time was ambiguous. Although he was a fine Latin stylist in both prose and verse, and a master of argument, he nevertheless belittled both grammar and dialectic. He argued, for example, that the study of grammar had begun badly when the devil taught Adam and Eve to decline *deus* in the plural (Genesis 3:5, "Ye shall be as gods"). As for dialectic, it could be nothing more than the "handmaid" (*ancilla*) of theology, and its usefulness even in that office was strictly limited.

The ascetic tradition of disdain for the world (*contemptus saeculi*), stemming from early Christian opposi-

tion to the naturalism and hedonism of pagan culture, dominated Damian's life and his pastoral care of others. His hostility to literary and logical studies was rooted in the conviction that the true purpose of human existence is to be found in the contemplation of God. Because he believed that religious communities should be nurseries of contemplatives, he was especially critical of the pursuit of secular studies by monks.

The intellectual conflicts of the age confirmed Damian in his opposition to dialectic. Theologians skilled in elementary Aristotelian logic were applying their analytical methods to major Christian doctrines, with more or less destructive results. While some defenders of orthodoxy responded to this challenge by attempting to formulate a rational apologetic for Catholic dogma, others (including Damian) were convinced that the pretensions of the dialecticians must be countered by unequivocal condemnation.

Peter Damian's most radical critique of human reason appeared in his major theological work, *De Divina Omnipotentia*. Here he argues not only that Christian dogma, being based on divine revelation, is beyond the range of rational demonstration but also that the norms of human rationality need not apply to the content of dogma. Indeed, his fundamental theological principle excluded any reasonable assurance that human experience as a whole could be orderly and intelligible. For Damian, the entire created order depends simply on the omnipotent will of God, which can even alter the course of past history.

## PETER LOMBARD

(c. 1095–1160)

Peter Lombard, the theologian and bishop of Paris, was born at Lumellogno, Lombardy. He was elected bishop in 1159 and died the next year in Paris.

Born of a Longobard family (hence his "surname"), Peter probably studied at Bologna. He went to France about 1134, first to Rheims and then to Paris, where he soon became a teacher at the school of Notre Dame. By 1142 he was known as a "celebrated theologian," and in the same year Gerhoh of Reichersberg mentions his gloss on St. Paul, which had been preceded by a commentary on the Psalms (both works were soon adopted as the standard Scripture gloss). His fame rests chiefly on his *Book of Sentences* (*Libri Quatuor Sententiarum*), finished in 1157 or 1158.

### THE "SENTENCES"

The fruit of Peter Lombard's patristic studies, scholastic lectures, and long familiarity with theological literature and problems was the *Book of Sentences*. After a classical prologue, it treats of the Trinity and the divine attributes, of creation and sin, of the Incarnation and the life of grace and virtues, of the sacraments and Last Things. It seems to have received certain retouching and additions at the hands of the author before it was published in final form. Since it surpassed all other *summae* of the twelfth century in clarity of thought and didactic practicality, as well as in the range of its subject matter, it soon acquired great popularity. After 1222, when Alexander of Hales used it as the basis of his own theological course, it obtained official standing at Paris and other medieval universities; all candidates in theology were required to comment on it as preparation for the doctorate.

The work is basically a compilation, with numerous citations of the "sentences" of the Fathers and generous and often literal borrowings from near contemporaries: Anselm of Laon, Peter Abelard's *Theology*, the anonymous *Summa Sententiarum*, Hugh of St. Victor's *De*

*Sacramentis Fidei Christianae*, the *Decretum* of Gratian, and the *Glossa Ordinaria*. Not all Peter Lombard's opinions found acceptance: Lists of his positions not commonly accepted abound in medieval manuscripts. However, this did not lessen the work's influence in shaping scholastic method and thought for four or more centuries. Scholastic theology flourished within the framework of the *Sentences* but also suffered from the defects and limitations of this work. Because Peter Lombard failed to treat certain questions, such as the nature and constitution of the church, the role of Christ's resurrection in the economy of salvation, and certain other aspects of Christology, these subjects were not developed in the scholastic period.

### THE SCHOLASTIC METHOD

Despite his overt criticism of dialectics, Peter Lombard was largely responsible for introducing the scholastic method into the schools. Anselm of Laon (d. 1117) and his school had begun a more systematic approach to the questions of theology as a result of the growth of dialectics in the eleventh century. This approach was perfected by Peter Abelard, whose *Theologia Scholarium* is a reasoned study of theological doctrine, and whose *Sic et Non* is a vast assemblage of scriptural, patristic, and canonical material used in arguing for and against specific questions. In the prologue of the latter work, Abelard proposed principles for the reconciliation of opposing texts by semantic analysis, the authentication of texts, possible changes of opinion on the part of an author, and so on. Although critical of Abelard on many doctrinal positions, Peter Lombard was thoroughly influenced by his method of contrasting authorities and arguments, interpreting their meaning, analyzing words, and drawing conclusions. As this method passed to the great Scholastics of the thirteenth through fifteenth centuries, it eventually led to the neglect of Scripture as the core of theological studies. Roger Bacon was to complain in 1267 that a "fourth sin" of contemporary theologians was their use of a *Summa magistralis*, the *Sentences*, in place of the Bible as the text of the faculty of theology.

### DOCTRINES

To dismiss Peter Lombard, as some authors have done, as primarily an unoriginal compiler almost completely lacking any philosophical foundations, and of historical importance only through the popularity his work attained, is not exactly a just judgment. Certainly Peter did not possess the deep speculative mind of, for example, his contemporary Gilbert of Poitiers or the dialectical

keenness of Abelard. He made no pretense of being a philosopher, whatever he may have known of philosophical tradition. Rather, his work seems consciously to exclude the speculations of philosophy and to be primarily, if not exclusively, a work of theology based on Scripture and the doctrines of the Church Fathers. Peter Lombard was undoubtedly a compiler, yet a compiler who was master of his sources and of his own thought. Often enough, his doctrinal importance emerges only when his teachings are examined against the background of his times.

On the nature of God, for example, Peter Lombard is much more precise than the anonymous *Summa Sententiarum*. While the latter is inclined to speak of the divine essence or substance, the *Sentences*, following Augustine, makes it clear that, properly speaking, "substance" should not be predicated of the divine nature because it carries the connotation of accidents; rather, "essence," in the sense of absolute and total "beingness," or subsistent "being" (*esse*), is the proper name of God. From this Peter Lombard deduces the corollary that immutability is primary among the divine attributes. From God's immutability follows his simplicity, in marked contrast to the multiplicity which in one form or another characterizes all created beings. If other attributes are predicated of God—that he is strong or wise or just—these imply no division, composition, or distinction which would militate against his absolute self-identity. Hence, while God knows all things in one perfect, unchanging act of knowledge, things do not thereby exist in God in such a way that they share his essence. Here, however, Peter Lombard provides but the barest minimum on a question that was to receive much attention in the late thirteenth and early fourteenth centuries, the being of intelligibles.

When the creation of the world is considered in the first pages of Book II, Peter seems to react against the loquacity and daring speculation of some contemporary theologians in explaining Genesis; to all appearances, he deliberately avoids the teachings of the School of Chartres and follows Augustine's exegesis of the hexameron (through the *Glossa Ordinaria*), the *Summa Sententiarum*, and Hugh of St. Victor. His thought hesitates between the literal interpretation of the six days and the possibility of a simultaneous creation; although inclined to hold to the letter of the Scripture, Peter Lombard leaves the way open to the position that creation was a single act and that matter later developed according to the capacities implanted in it. Far less attention is given to the nature of man and the soul than to the purpose of man's creation and his dignity as the image of God. With a cer-

tain vehemence Peter insists on creation rather than emanation or traducianism to explain the origin of the soul. The powers of soul on the levels of sense, reason, and free will are considered almost exclusively in their relation to divine grace.

The same disregard for philosophical questions characterizes Peter's moral doctrine, which is based far less on simply rational standards of human nature or of law than on man's natural dignity as the image of God, the supernatural gift of grace, and the indwelling of the Spirit. Unlike Abelard, whose moral doctrine is man-centered in the Aristotelian tradition, Peter Lombard proposes an ethic based on God, with likeness to God as the goal of ethics and human life. If, as a theologian, he emphasizes man's absolute need of grace for virtuous acts, he lays equal stress on man's ability, under grace, to do good despite the weaknesses of human nature. The result is a moral doctrine that is far more positive than negative in character, an ethic of dignity.

### Bibliography

#### WORKS BY PETER LOMBARD

"Gloss on the Psalms" (c. 1135–1137) may be found in *Patrologia Latina*, edited by J. P. Migne (Paris, 1844–1864), Vol. 191, pp. 55–1296; "Gloss on the Epistles of St. Paul" (1139–1141), *ibid.*, pp. 1297–1696 and Vol. 192, pp. 9–520. Some twenty-nine sermons published under the name of Hildebert of Lavardin are contained in *Patrologia Latina*, Vol. 171, pp. 339–964. The *Libri Sententiarum* is available in many old editions; a critical edition was published at Quaracchi (Florence) in 1916, and a new edition was prepared by Editiones Collegii S. Bonaventurae, Rome, in 1971–1981.

#### WORKS ON PETER LOMBARD

Among the important articles in *Miscellanea Lombardiana* (Novara: Istituto Geografico De Agostini, 1957) are L. Ott, "Pietro Lombardo: Personalità e opera," pp. 11–23; S. Vanni Rovighi, "Pier Lombardo e la filosofia medioevale," pp. 25–32; R. Busa, "La filosofia di Pier Lombardo," pp. 33–44; Stanley J. Curtis, "Peter Lombard, a Pioneer in Educational Method," pp. 265–273; and A. Gambaro, "Piero Lombardo e la civiltà del suo secolo," pp. 391–402.

Many articles of interest also appeared in the now defunct review *Pier Lombardo* between 1957 and 1962. Among them are E. Bertola, "La dottrina della creazione nel *Liber Sententiarum* di Piero Lombardo" 1 (1) (1957): 27–44; E. Bertola, "La dottrina lombardiana dell'anima nella storia delle dottrine psicologiche del XII secolo" 3 (1) (1959): 3–18. G. De Lorenzi, "La filosofia di Pier Lombardo nei

Quattro Libri delle Sentenze" 4 (1960): 19–34; C. Fabro, "Attualità di Pietro Lombardo," *ibid.*, 61–73; and I. Brady, "A New Edition of the Book of Sentences" 5 (3 and 4) (1961): 1–8. The Brady article is a sort of prospectus of the forthcoming Quaracchi edition of the *Sentences*. All of *Miscellanea* and *Pier Lombardo* are of interest.

## PETER LOMBARD [ADDENDUM]

Although Father Ignatius C. Brady's entry from the first edition remains authoritative, significant progress has since been made in research on Peter Lombard. Most importantly, the new edition of the *Book of Sentences* to which Brady referred has become available in two volumes (Brady 1971–1981). Each of the two volumes contains an introduction, with detailed treatment of Lombard's life and works.

Brady's original entry requires two factual corrections. The first concerns the *Summa Sententiarum*, an important source of the *Book of Sentences*. This *Summa Sententiarum* has been identified as the work of Otto of Lucca—an identification that Brady himself accepted in a later publication (see Gastaldelli 1980, Brady 1986). Secondly, due to Lombard's indebtedness to the *Summa Sententiarum*, it now appears likely that he studied at Lucca, rather than at Bologna.

Brady spoke of the need to study Lombard against the background of his times, so that it might become possible to understand the superiority of the *Book of Sentences* by comparison with similar twelfth-century works. This task is addressed by Colish (1994).

The *Book of Sentences* was one of the most influential texts in medieval philosophy and theology. For recent research on the tradition of commentaries on the *Sentences*, see Evans (2002). Finally, for a concise introduction to the *Sentences*, see Rosemann (2004).

## PETER OF SPAIN

(13th century)

Many medieval authors are referred to by the name of Peter of Spain. One Peter of Spain is the author of a standard textbook on logic, *Tractatus* (Tracts), a work that became widely known as *Summule logicales* (Sum of logic) by *magistri Petri Hispani* and that would enjoy great renown in Europe for centuries to come. This work is typical of the manuals that gradually started to emerge within the context of twelfth- and thirteenth-century teaching practices.

With regard to the identity of this Peter of Spain, matters are rather complicated. Already in the Middle Ages there existed two traditions. One ascribed the *Tractatus* to a member of the Dominican Order (Black Friars), the other to the Portuguese secular priest who in 1276 became pope under the name of John XXI. The latter identification was favored until the latest research, done in the late 1990s, showed that most likely the author of the *Tractatus* was not John XXI but a Spanish Dominican, whose identity still remains unknown.

The *Tractatus* are believed to have been written between 1230 and 1245. Another work that has been attributed to the same author is on syncategorematic words (*Syncategoreumata*), probably written some time between 1235 and 1245. Besides these two introductory tracts on logic, there are other works written by a Peter of Spain, namely, a famous medical work titled *Thesaurus pauperum* and fourteen other works on medicine. A Peter of Spain also wrote *Scientia libri de anima* and commentaries on Aristotle's *De anima*, *De morte et vita*, and *De sensu et sensato*, as well as commentaries on works by Dionysius the Pseudo-Areopagite. In the manuscripts all these works are ascribed to Pope John XXI. In the late twelfth century another Peter of Spain (in modern times called Petrus Hispanus non-papa) compiled a textbook on grammar, *Summa "Absoluta cuiuslibet"*.

The author of the tracts on logic appears to be particularly interested in matters of ontology, in dealing with which he takes a realistic approach. Every common noun signifies a universal nature and can stand for anything sharing that nature. In sentences of the form A is B, in which A and B are common nouns, the copula *is* signifies some composition that includes the extremes (subject and predicate) A and B, and always expresses a qualified mode of being (*esse quodammodo*). Such a composition usually applies to a state of affairs possessing being in the absolute sense (*esse simpliciter*), as in "Man is an animal," but if the subject refers to a fictitious entity, for example, in "A chimera is a nonbeing," being should be understood as being in a qualified sense (*ens quodammodo*).

In the first example the expression *man*, in line with Peter's ontological stand, stands for the universal nature of manhood. Therefore, the expression is necessarily true, even if no man exists. Logical necessity, then, is based on ontological necessity, or, in other words, the necessity of propositions is founded on the necessity of the things spoken about. Necessity is associated with different types of things, like the relationships between certain concepts (such as genera and species) signifying them. Another type of necessity is found in mathematical entities. In logical argument it is important to distinguish sharply between (timeless) necessary being and being-at-a-certain-time. So an inference like "A man is necessarily an animal; therefore Socrates (who is a man) is necessarily an animal" is not valid, because a transition is made from necessary being to a being at a certain time. For Peter, the notion of necessity ultimately refers to a necessary state of affairs in reality, something that is, and must always be, the case.

Peter's account of the use of the consequential "if" in which he explains consequence in terms of causality, shows a similar connection between language and the domain of reality. Like the majority of his contemporaries, Peter has to deal with the famous question "whether from the impossible anything follows" (*utrum ex impossibili sequatur quidlibet*). According to him, the notion of impossibility can be taken in two ways, namely, either (1) absolute impossibility, which amounts to being-nothing, or (2) an impossible state of affairs, the objective content, that is, of expressions containing incompatible concepts, like in "A man is an ass." Indeed, from the latter type of impossibility something (but not anything) can follow, for example, the true conclusion "Therefore a man is an animal." From absolute impossibilities, such as the one present in "You know that you are a stone," nothing can be correctly inferred, and so any-

thing follows. To be able to make a correct inference, the antecedent should be a “something” (*res*), not a “nothing.”

## PETRARCH

(1304–1374)

Petrarch, or Francesco Petrarca, the Italian humanist, poet, and scholar, was born in Arezzo into an exiled Florentine family. He was taken to Avignon in 1312, and there he spent most of his life until 1353, except for a period as a student of law at Montpellier and Bologna and several long journeys to Italy. After 1353 he lived in Italy, mainly in Milan, Venice, and Padua; he died in Arquà near Padua. Petrarch held several ecclesiastical benefices and also enjoyed the patronage of the Colonna and the Visconti.

Petrarch’s fame rests first on his Italian poems and second on his work as a scholar and Latin writer. His

Latin writings include poems, orations, invectives, historical works, a large body of letters, and a few moral treatises. Among the treatises we may mention especially *De Remediis Utriusque Fortunae* (On the remedies of good and bad fortune; 1366), *De Secretis Conflictu Curarum Mearum*, better known as *Secretum* (On the secret conflict of my worries; completed before 1358), *De Vita Solitaria* (On the solitary life; 1356), and *De Sui Ipsius et Multorum Ignorantia* (On his own and many other people’s ignorance; 1367).

Petrarch was no philosopher in the technical sense, and even his treatises on moral subjects are loosely written and lack a firm structure or method. Much of his thought consists of tendencies and aspirations rather than of developed ideas or doctrines, and it is inextricably linked with his learning, reading, tastes, and feelings. Nevertheless, it would be wrong to underestimate Petrarch’s impact on the history of Western thought. He was the first great representative of Renaissance humanism, if not its founder; as a poet, scholar, and personality, he had a vast reputation during his lifetime and for several subsequent centuries. In many ways he set the pattern for the taste, outlook, and range of interests that determined the thought of Renaissance humanism down to the sixteenth century. Petrarch was regarded, by himself and by his contemporaries, not only as a poet, orator, and historian but also as a moral philosopher, and many of his attitudes were to receive from some of his successors the intellectual and philosophical substance which they seem to lack in Petrarch’s own work.

One important aspect of Petrarch’s thought that was to be developed by many later humanists was his hostility toward Scholasticism—that is, the university learning of the later Middle Ages. He attacked astrology as well as logic and jurisprudence and dedicated entire works to criticizing the physicians and the Aristotelian philosophers. These attacks, though sweeping and suggestive, are highly personal and subjective and rarely enter into specific issues or arguments. When Petrarch rejects the authority of Aristotle or of his Arabic commentator Averroes, he does so from personal dislike, not from objective grounds; when he criticizes such theories as the eternity of the world, the attainment of perfect happiness during the present life, or the so-called theory of the double truth (that is, of the separate validity of Aristotelian philosophy and of Christian theology), his main argument is that these doctrines are contrary to the Christian religion.

Yet the positive value that Petrarch opposed to medieval science was neither a new science nor mere religious faith but the study of classical antiquity. All his life

Petrarch was an avid reader of the ancient Latin writers; he copied, collected, and annotated their works and tried to correct their texts and appropriate their style and ideas. He felt a strong nostalgia for the political greatness of the Roman Republic and Empire, and the hope to restore this greatness was the central political idea that guided him in his dealings with the pope and the emperor, with the Roman revolutionary Cola di Rienzo, and with the various Italian governments of his time.

Of the ancient Latin writers, Cicero and Seneca were among Petrarch's favorites. His polemic against dialectic and other branches of scholastic learning and his emphasis on moral problems seem to be modeled after the more moderate skepticism which Seneca expresses in his *Moral Epistles* with reference to the subtle dialectic of the older Stoics. To Seneca, Petrarch owes his taste for moral declamation and the Stoic notions that appear in his writings—the conflict between virtue and fortune, the contrast between reason and the four basic passions, and the close link between virtue and happiness. Even greater is Petrarch's enthusiasm for Cicero, to whom he owes the form of the dialogue and much of his information on Greek philosophy. We might even say that Petrarch and other humanists owe to their imitation of Cicero and Seneca not only the elegance of their style, but also the elusive and at times superficial manner of their reasoning.

Petrarch could not fail to notice the numerous references to Greek sources in the writings of his favorite Roman authors. He made an attempt to learn Greek, and although he did not progress far enough to read the ancient Greek writers in the original, his awareness of Greek philosophy and literature did affect his outlook and orientation. He owned a Greek manuscript of Plato and read the *Timaeus* and *Phaedo*, which were available to him in Latin translations. He also gathered information on Plato in Cicero and other Roman authors and cited some Platonic doctrines. However, more important than these occasional references to specific theories is Petrarch's general conviction that Plato was the greatest of all philosophers, greater than Aristotle, who had been the chief authority of the later medieval thinkers. "Plato is praised by the greater men, whereas Aristotle is praised by the greater number." In his *Triumph of Fame*, Petrarch places Plato before Aristotle, and his lines appear to be a conscious correction of the praise Dante had given to the "master of those who know." Petrarch's Platonism was a program rather than a doctrine, but it pointed the way to later humanist translations of Plato and to the Platonist thought of the Florentine Academy.

Petrarch assigned second place to Aristotle, but he was far from holding him in contempt. He knew especially Aristotle's *Ethics*, and he repeatedly suggested that the original Aristotle may be superior to his medieval translators and commentators. Petrarch thus pointed the way to a new attitude toward Aristotle that was to take shape in the fifteenth and sixteenth centuries. Aristotle was to be studied in the original Greek text and in the company of other Greek philosophers and writers; his medieval Latin translations were to be replaced by new humanist translations, and his medieval Arabic and Latin commentators were to give way to the ancient Greek commentators and to those modern Renaissance interpreters who were able to read and understand Aristotle in his original text. Thus, Petrarch was the prophet of Renaissance Aristotelianism, as he had been of Renaissance Platonism.

Although Petrarch opposed the classical authors to the medieval tradition, he was by no means completely detached from his immediate past. Christian faith and piety occupy a central position in his thought and writings, and there is no reason to doubt his sincerity. Whenever a conflict between religion and ancient philosophy might arise, he is ready to stand by the teachings of the former. The *Secretum*, in which Petrarch subjects his most intimate feelings and actions to religious scrutiny, is a thoroughly Christian work, and his treatise *De Remediis Utriusque Fortunae* is equally Christian, even specifically medieval. His treatise *De Otio Religioso* (On the leisure of the monks) belongs to the ascetic tradition, and even Petrarch's polemic against Scholasticism in the name of a genuine and simple religion continues or resumes that strand of medieval religious thought which found expression in Peter Damian and St. Bernard. In his treatise on his ignorance, Petrarch goes so far as to oppose his own piety to the supposedly irreligious views of his scholastic opponents. This shows that it was at least possible to reject Scholasticism and remain a convinced Christian, and to reconcile classical learning with religious faith.

In accordance with this attitude, Petrarch liked to read the early Christian writers, especially the Church Fathers, along with the pagan classics but without the company of the scholastic theologians. His favorite Christian author was St. Augustine, who occupies a position of unique importance in his thought and work. Aside from numerous quotations scattered in Petrarch's writings, it is sufficient to mention two notable instances. Petrarch's *Secretum* takes the form of a dialogue between the author and St. Augustine, who thus assumes the role of a spiritual guide or of the author's conscience. And in the

famous letter in which Petrarch describes climbing Mont Ventoux, he expresses his feelings by a quotation on which his eyes chanced to fall in his copy of Augustine's *Confessions*: "And men go to admire the high mountains, the vast floods of the sea, the huge streams of the rivers, the circumference of the ocean, and the revolutions of the stars—and desert themselves" (*Confessions* x, 8, 15).

Besides these and a few other general attitudes, there is at least one theoretical problem on which Petrarch formulates views akin to those of many later humanists. He keeps asserting that man and his problems should be the main object and concern of thought and philosophy. This is also the justification he gives for his emphasis on moral philosophy, and when he criticizes the scholastic science of his Aristotelian opponents, it is chiefly on the grounds that they raise useless questions and forget the most important problem, the human soul. This is also the gist of the words with which Petrarch describes his feelings when he had reached the top of Mont Ventoux. The words are Petrarch's, and they express his own ideas, but they are characteristically interwoven with quotations from Augustine and Seneca.

Petrarch expresses for the first time that emphasis on man which was to receive eloquent developments in the treatises of later humanists and to be given a metaphysical and cosmological foundation in the works of Marsilio Ficino and Giovanni Pico della Mirandola. This is the reason that the humanists were to adopt the name "humanities" (*studia humanitatis*) for their studies—to indicate their significance for man and his problems. Yet behind Petrarch's tendency to set moral doctrine against natural science, there are also echoes of Seneca and St. Augustine and of Cicero's statement that Socrates had brought philosophy down from heaven to Earth. When Petrarch speaks of man and his soul, he refers at the same time to the blessed life and eternal salvation, adding a distinctly Christian overtone to his moral and human preoccupation. He thus comes to link the knowledge of man and the knowledge of God in a distinctly Augustinian fashion and also to discuss an important problem of scholastic philosophy that had its root in Augustine: the question of whether the will or the intellect is superior. In discussing this scholastic problem, Petrarch follows the Augustinian tradition, as other humanists and Platonists were to do after him, in deciding the question in favor of the will.

Petrarch, the great poet, writer, and scholar, is clearly an ambiguous and transitional figure when judged by his role in the history of philosophical thought. His thought consists in aspirations rather than developed ideas, but

these aspirations were developed by later thinkers and were eventually transformed into more elaborate ideas. His intellectual program may be summed up in the formula that he uses once in the treatise on his ignorance: Platonic wisdom, Christian dogma, Ciceronian eloquence. His classical culture, his Christian faith, and his attack against Scholasticism all have a personal, and in a way modern, quality. At the same time everything he says is pervaded by his classical sources and often by residual traces of medieval thought. In this respect, as in many others, Petrarch is a typical representative of his age and of the humanist movement. He did not merely anticipate later Renaissance developments because he was unusually talented or perceptive; he also had an active share in bringing them about, because of the enormous prestige he enjoyed among his contemporaries and immediate successors.

## Bibliography

### WORKS BY PETRARCH

Petrarch's Italian poems have been printed in numerous editions and translations; see also Roberto Weiss, *Un inedito Petrarcesco* (Rome, 1950). Of the *Edizione nazionale* of his collected works only six volumes have appeared, containing his poem *Africa*, a part of his letters—*Le familiari*, edited by V. Rossi and U. Bosco, 4 vols. (Florence: Sansoni, 1933–1942)—and the *Rerum Memorandarum Libri*, edited by Giuseppe Billanovich (Florence: Sansoni, 1943). See also K. Burdach, *Aus Petrarca's aeltestem deutschen Schuelerkreise* (Berlin, 1929); *Petrarca's "Buch ohne Namen" und die päpstliche Kurie*, edited by P. Piur (Halle, Germany: Niemeyer, 1925); and *Petrarca's Briefwechsel mit deutschen Zeitgenossen*, edited by P. Piur (Berlin: Weidmann, 1933).

The collection of *Prose*, edited by G. Martellotti et al. (Milan and Naples, 1955), contains the *Secretum*, *De Vita Solitaria*, and selections from the invectives and other treatises. *Le traité De Sui Ipsius et Multorum Ignorantia*, edited by L. M. Capelli (Paris, 1906), is the only complete modern edition of this important treatise. For many other Latin works of Petrarch the old edition of his works, *Opera* (Basel, 1581), must still be used. See also *Scritti inediti*, edited by A. Hortis (Trieste, 1874).

English translations are available for the *Secret*, translated by William H. Draper (London, 1911); *The Life of Solitude*, translated by Jacob Zeitlin (Urbana, IL, 1924); *On His Own Ignorance*, translated by H. Nachod, who added the letter on

the ascent of Mont Ventoux and excellent notes, in *The Renaissance Philosophy of Man*, edited by Ernst Cassirer, Paul Oskar Kristeller, and John H. Randall Jr. (Chicago: University of Chicago Press, 1948), pp. 36–133; the *Testament*, translated by Theodor E. Mommsen (Ithaca, NY, 1957); and for many letters—*Petrarch, the First Modern Scholar and Man of Letters*, 2nd ed., translated by James Harvey Robinson (New York, 1907), *Petrarch's Letters to Classical Authors*, translated by Mario E. Cosenza (Chicago: University of Chicago Press, 1910), and *Petrarch at Vacluse*, translated by Ernest H. Wilkins (Chicago: University of Chicago Press, 1958).

#### WORKS ON PETRARCH

From the vast literature on Petrarch only a few works can be mentioned; for a bibliography, see N. Sapegno, *Il trecento* (Milan, 1948). For Petrarch's life and works see Edward H. R. Tatham, *Francesco Petrarca*, 2 vols. (London, 1925–1926); U. Bosco, *Petrarca* (Turin, 1946); Morris Bishop, *Petrarch and His World* (Bloomington: Indiana University Press, 1963); and, above all, numerous books and articles by Ernest H. Wilkins: *Studies in the Life and Works of Petrarch* (Cambridge, MA: Mediaeval Academy of America, 1955), *Petrarch's Eight Years in Milan* (Cambridge, MA: Mediaeval Academy of America, 1958), *Petrarch's Later Years* (Cambridge, MA: Mediaeval Academy of America, 1959), *Petrarch's Correspondence* (Padua, 1960), and *Life of Petrarch* (Chicago: University of Chicago, 1961).

For Petrarch as a scholar see Pierre de Nolhac, *Pétrarque et l'humanisme*, 2 vols., 2nd ed. (Paris, 1907), and “de Patrum et Medii Aevi Scriptorum Codicibus in Bibliotheca Petrarcae Olim Collectis,” in *Revue des bibliothèques* 2 (1892): 241–279; numerous studies by Giuseppe Billanovich, especially *Petrarca letterato*, Vol. I, *Lo scrittoio del Petrarca* (Rome, 1947), and “Petrarch and the Textual Tradition of Livy,” in *Journal of the Warburg and Courtauld Institutes* 14 (1951): 137–208. See also J. H. Whitfield, *Petrarch and the Renaissance* (Oxford: Blackwell, 1943).

For Petrarch's political thought see Theodor E. Mommsen, *Medieval and Renaissance Studies*, edited by Eugene F. Rice (Ithaca, NY: Cornell University Press, 1959); Aldo S. Bernardo, *Petrarch, Scipio and the Africa* (Baltimore: Johns Hopkins Press, 1962); Jules Alan Wein, *Petrarch's Politics* (unpublished thesis, Columbia University, 1960); and Mario E. Cosenza, *Petrarch and the Revolution of Cola di Rienzo* (Chicago, 1913).

For Petrarch's religious and philosophical ideas see Armando Carlini, *Il pensiero filosofico religioso di Francesco Petrarca* (Iesi, Italy, 1904); Elena Razzoli, *Agostinismo e religiosità del Petrarca* (Milan, 1937); P. P. Gerosa, *L'umanesimo agostiniano del Petrarca* (Turin, 1927); K. Heitmann, *Fortuna und Virtus* (Cologne, 1958); William Granger Ryan, *Humanism and Religion in Petrarch* (unpublished thesis, Columbia University, 1950); and N. Iliescu, *Il canzoniere petrarchesco e Sant'Agostino* (Rome, 1962).

*Paul Oskar Kristeller (1967)*

## PETRONIEVIĆ, BRANISLAV (1875–1954)

Branislav Petroniević, a Yugoslav philosopher and paleontologist, was born in Sovljak, Serbia. He taught as a professor of philosophy at the University of Belgrade and was a member of the Serbian Academy of Science and Arts. In paleontology, Petroniević was the first to distinguish between the genera *Archaeopteryx* and *Archaeornis*; he also discovered new characteristics of the genera *Tritylodon* and *Moeritherium*.

Petroniević systematically treated many problems, both in pure philosophy and in scientific methodology. He considered himself a “born metaphysician” and devoted himself to constructing his own metaphysical system. But, although original, it grew out of the nineteenth-century empirical metaphysics of Hermann Lotze, Eduard von Hartmann, and Petroniević's teacher, Johannes Volkelt.

Petroniević's epistemological theory of empiriorationalism claimed that all contents of consciousness are absolutely real in the same sense as things per se. Thus there can be no absolute or immanent or transcendental illusion. Petroniević rejected phenomenalism also, specifically Immanuel Kant's. He claimed that an analysis of directly given empirical contents of consciousness shows that there are qualitatively simple evidences of experience, the “givenness of something”—the givenness of simple sensuous qualities as basic correlates of the laws of thought. Thought and being are identical, and apodictic knowledge of being itself is possible.

In his main philosophical work, *Principien der Metaphysik*, Petroniević claimed that the basic task of metaphysics is to explain the structure of the “world of multitude, diversity, and change” as the “pre-evidence” of the directly given empirical and transcendental reality. According to Petroniević, the world is a manifold of “discrete points of being” and of quality, of will, and so on. The world as a manifold is possible only because the real points of being are separated by real “acts of negation,” which determine the qualities of being and without which being would be absolutely homogeneous. Petroniević regarded the principle of negation as “the absolute principle of the world,” of both being and thought; only on the basis of this principle can the diversity and multiplicity of the world be deduced and explained. On similar grounds Petroniević considered the principle of sufficient reason the fundamental law of true knowledge.

Petroniević synthesized Benedict de Spinoza's monism and Gottfried Wilhelm Leibniz's monadological pluralism in his monopluralism. His original and pro-

found “hypermetaphysical” teachings on the origin and development of the qualitative and quantitative manifoldness of the world have yet to be studied and evaluated. His views on real space and real time, which he regarded as *discreta* rather than *abstract continua*, deserve special attention. He constructed a new geometry of real discrete space.

Petroniević’s view was essentially idealistic, since he held that absolutely unconscious atoms are impossible and that the soul, which is immortal, is a conscious monad.

Petroniević upheld an ethical theory of transcendental optimism and free will. He devoted a number of studies to aesthetics, particularly in the work of the Yugoslav poet Petar II Petrović-Njegoš and of Lev Tolstoy.

Among his most notable contributions to the logical foundations of mathematics are his work on typical geometries, on the problem of the finitude or infinitude of space, the three-bodies problem, on differential quotients, and on mathematical induction. In psychology he developed theories about the observation of the transparent and on the depth and observation of compound colors. In the history of science his most notable works were on the methodology of Isaac Newton’s discovery of the law of gravitation, on Johann Gottfried Galle’s and Urbain-Jean-Joseph Leverrier’s discovery of Neptune, and on Dmitri Mendeleev’s discovery of the periodic system of elements.

## PETROVIĆ-NJEGOŠ, PETAR (1813–1851)

Petar Petrović-Njegoš, Prince Petar II of Montenegro, was born in the village of Njegusi near Cetinje. As the government of Montenegro was then a theocracy, Njegoš, who ruled from 1830 to 1851, had to act as high priest, much against his own views and wishes. He was religious by conviction, but opposed to any religious fanaticism or formalities. By setting up a number of civil and cultural institutions, he transformed Montenegro from a tribal to a modern state.

Njegoš was one of the greatest Yugoslav poets. His principal works are *Slobodijada* (Ode to liberty), *Gorski Vijenac* (The mountain wreath), *Luča Mikrokozma* (The ray of the microcosm), *Ščepan Mali* (Schepan the small), and a number of minor poems, the best of which is the reflective poem *Misao* (The thought). His main themes were man’s destiny, marked by struggle and suffering, and freedom, which he understood as partly the struggle for national liberty. The elaboration of these themes led Njegoš to many philosophical thoughts and meditations. Being predominantly a poet, he presented these thoughts in poetic images and visions. The philosophical conception implicit in these images is a Platonic dualism. God and matter are coeternal. Mind and body are opposed principles both ontologically and axiologically. Mind originates in heaven, whereas body belongs to the “realm of decay.” The body is “the physical shackles of the soul”; passions “lay man below the beast,” whereas mind makes him “equal to immortals.” In *Luča Mikrokozma* Njegoš interpreted the union of mind and body as a consequence of sin and the Fall. The first man, Adam, was once pure spirit, but he joined Satan in his rebellion against God, although he soon repented. He was then “clad in a body” and cast upon Earth, which was created by God as a place of expiation after man’s sin. Thus, Njegoš’s Adam, unlike John Milton’s or the Adam of official church doctrine, sinned prior to his bodily creation.

*Luča Mikrokozma* can be seen as providing metaphysical and religious reasons for the inevitability of suffering. *Gorski Vijenac* is a mighty hymn to the national struggle for liberation and to the struggle against evil in general. To justify this struggle Njegoš elaborated a dynamic and basically dialectical conception of the world. The world is made up of opposed and dangerous forces at permanent war. Through this struggle, order emerges out of chaotic disorder, and spiritual power triumphs over great confusion. Struggle and suffering are not mere evils but have a positive, creative aspect as well. The spark appears only

after the flint is struck hard, and the soul that has endured temptations “nourishes the body with internal fire.” Heroism is the master of evil, and human life has an aim only if it contributes to the realization of liberty, honor, and dignity. Njegoš’s ethics were essentially derived from his people and, in turn, had a powerful influence on them in all the trying moments of their history.

## PETZOLDT, JOSEPH

(1862–1929)

Joseph Petzoldt, a German empiriocritical philosopher, was born at Altenburg and taught mathematics and natural science at a Gymnasium in Spandau. In 1904 he became *Privatdozent* at the Technische Hochschule in Berlin-Charlottenburg, and in 1922 he was named associate professor. For a number of years he was chairman of the Gesellschaft für positivistische Philosophie.

Petzoldt was indebted to Ernst Mach’s positivism, to the immanence philosophy of Wilhelm Schuppe, and above all to the empiriocriticism of Richard Avenarius. Petzoldt presented Avenarius’s difficult philosophy in a popular form and developed it independently. For example, he offered a psychological explanation of the “narrowness,” and therewith the unity, of consciousness; he tried to demonstrate the unlimited validity of psychophysical parallelism; and he analyzed ethical and aesthetic values and proposed a theory of the ethical and aesthetic permanence, or maximum stability, of humankind. According to this theory, all evolutionary processes end in states of permanence. Hence, human evolution is also heading toward a state of complete stability and toward the marking out of defining forms of

permanence, that is, of invariably repeatable, fixed components of mental acts. The most basic feature of all the goals of our thought and creative work is permanence or durability—the realization of ever recurrent, repeatedly used ways of acting and the establishment of enduring forms amidst the profusion of particular configurations. An example of this is the tendency of thought toward stability, the striving for a stable conceptual system.

Petzoldt called his philosophy a “relativistic positivism.” According to this view, both causality and substantiality are untenable and unnecessary categories, and the difference between the mental and the physical reduces to a difference in the “mode of interpretation.” Petzoldt, like Avenarius, held that the concept of cause should be replaced by the mathematical concept to functional dependence, or uniqueness of coordination. According to Petzoldt, the causal relation is fully exhausted in a “law of uniqueness,” which holds that for every process, the elements that exclusively determine it should be specified. Because there is thus nothing in the real world corresponding to the “animistic” concept of cause, this concept should be eliminated. The demand for a causal explanation that goes beyond the complete and simplest description of processes rests on misunderstandings; such an explanation is in principle unrealizable and is therefore meaningless.

The concept of substance, according to Petzoldt, originates from a need for stability in thinking. There are no absolute substances but only relatively constant complexes of sensory qualities. Since all properties hold good only relative to a subject, the idea of an absolute, nonrelative being should be discarded, and with it the category of substance. There is no “world-in-itself”; there is only a “world-for-us,” whose elements are sensations, even though “things” are to be thought of as “continuing to exist” even when we do not perceive them. The world-for-us is apprehended as being mental insofar as it is perceived and as being physical insofar as it is known as a correlation of elements. That which is ultimately “given” is thus neither mental nor physical, neither immaterial nor material, neither “internal” nor “external,” neither thing-in-itself nor phenomenon. These antitheses are merely relatively valid limiting concepts, intelligible only in their interrelation: they are formed only subsequent to, and on the basis of, the primordial unitary experience. Petzoldt’s conception resembled Bertrand Russell’s neutral monism.

Petzoldt’s philosophy culminated in an evolutionary naturalism. “Man is not a permanence type, but an organism in a state of very active development; yet, like all

other organisms and like self-developing systems generally, he is headed toward a form of permanence” (*Einführung in die Philosophie der reinen Erfahrung* [Introduction to the philosophy of pure experience], Vol. 2, p. 3). Just as organic evolution tends toward the production of permanence states and “man’s brain approaches more and more a form of permanence,” the spiritual and intellectual evolution of man likewise tends to permanence states. We strive for the completion of science, for the perfection of social institutions and customs by a progressive adjustment of national and social differences, and for the fulfillment of art through “emphasis on the typical and essential in the phenomena.”

The goal of ethics is that in all that we do and think we help to realize the future permanence state that flows from the nature of man and his environment (p. 206). This is the state of maximum utilization of powers, and hence of maximum stability, toward which all evolution strives. Each of us must risk everything “in order to perfect his personality in accordance with the nature and extent of his abilities and to place himself entirely at the service of human society” (p. 212).

## PFÄNDER, ALEXANDER (1871–1941)

Alexander Pfänder, a German philosopher and phenomenologist, was born in Iserlohn. In 1891 he began his studies at the University of Munich, where he came under the influence of Theodor Lipps. With the publication of the *Phänomenologie des Wollens: Eine psychologische Analyse* (Phenomenology of willing: a psychological

analysis; 1900) he joined the philosophical faculty in Munich, where he remained for the rest of his life. In 1904 he came into contact with Edmund Husserl. Though the two of them had much in common in their phenomenological orientation and accordingly had great respect for each other, Pfänder was the leader of the phenomenological circle in Munich, which was distinct from the one that Husserl led in Göttingen and later in Freiburg. Under Pfänder’s influence, the Munich phenomenologists were especially wary of the transcendental turn and its concomitant idealism that Husserl put forward in his *Ideas Pertaining to a Pure Phenomenology and Phenomenological Philosophy* (1913). In Pfänder’s later years, in which he suffered from protracted ill health, he worked toward the development of an understanding psychology and elaborated on his concept of phenomenology and phenomenological philosophy in his lectures. His most outstanding contributions, however, are to be found in his specialized treatment of volitional, emotional, and intellectual phenomena.

Pfänder had embarked on phenomenological investigations already in the late nineteenth century, before the publication of Husserl’s *Logical Investigations* (1900–1901). The fruit of these investigations, namely *Phenomenology of Willing*, is thus a noteworthy achievement as a phenomenological work that came about independently of Husserl. Here, Pfänder is concerned with volitional phenomena in particular, but the work encompasses important considerations of method. The method that Pfänder employs is explicitly a descriptive one and thereby excludes any attempt to explain the phenomena under consideration in terms of cause and effect. At the same time this descriptive method avoids the sort of metaphysical speculation about willing such as what had been put forward by Arthur Schopenhauer in the nineteenth century. It is also important to note that Pfänder’s phenomenology is not an introspective endeavor of the sort in which Lipps was engaged. His insistence that introspection is in fact retrospection is rather reminiscent of Franz Brentano, as is Pfänder’s description of phenomena by means of an analysis into elements. His emphasis on the experienced ego throughout his analyses, however, is no doubt an aspect of his phenomenology that he drew from Lipps.

According to Pfänder volition always involves not only a presentation of the willed object but also an attention relief in which the object is made prominent against the background of others. Moreover, “willing” is used in a broad sense to designate striving, but also in a narrower sense that is closer to the one of ordinary language. While

he does not dismiss the possibility of pleasure as the goal of willing, he does not find this to be the case in all instances of willing. Moreover, his analyses of willing are guided by the observation that one can will only that which one believes to be possible. Accordingly, the experience of the volitional sphere involves considerations of other aspects of consciousness.

In 1913 and 1916 Pfänder turned his attention to the emotional rather than the volitional sphere of mental life, albeit with the conviction that the two are closely related. The articles that he published in these years for Husserl's phenomenological *Yearbook* are particularly concerned with sentiments (*Gesinnungen*) insofar as they are directed toward persons, places, animals, and so on, either positively or negatively, as when one speaks of someone being "well disposed" or "ill disposed" toward this or that. When there occurs a stirring of sentiment, this is an actual as opposed to a virtual or habitual sentiment. In each case the sentiment is something between a subject and an object and involves a centrifugal direction and streaming from the subject to the object. Moreover, the sentiment is either friendly or hostile toward the object in question. Sentiments can also be divided into genuine and spurious ones. The latter are exemplified by how one is disposed toward the characters in a theatrical performance. The rich array of analyses Pfänder employs in his investigations of sentiments was meant to be a contribution to the foundation of ethics and pedagogy.

Pfänder's *Logik* (Logic; 1921) should not be read as a logic textbook and certainly not as a logic in the technical sense that prevails in the current understanding of this term. Still, this work is of considerable interest as a philosophy of logic. Though his analyses of volitional and emotional phenomena are by and large focused on the acts of willing and feelings, *Logic* is primarily concerned with the correlates of intellectual acts. Pfänder calls these correlates thoughts (*Gedanken*), which are comparable to the meanings (*Bedeutungen*) that Husserl identifies as the subject matter of pure logic in the *Logical Investigations*, except that Pfänder conceives of thoughts as products of thinking. Moreover, Pfänder acknowledges not only special correlates of thinking but also a host of other objective correlates that are produced in a social context. In this sense *Logic*, like the works of other Munich phenomenologists (especially Adolf Reinach), opens up a new domain in the objective sphere for phenomenological investigation. Logic, Pfänder maintains, is particularly concerned with a class of thoughts known as judgments (*Urteile*). These are peculiar insofar as they involve a claim to truth and refer to states of affairs (*Sachverhalte*),

which are made focal in Pfänder's reflections on rules of inference as well as on the laws of identity, noncontradiction, the excluded middle, and sufficient reason.

## PHANTASIA

The Greek word *phantasia* is usually translated "imagination." However, in Greek thought the word always retains a connection with the verb *phainomai*, "I appear." It can be used to refer both to the psychological capacity to receive, interpret, and even produce appearances and to those appearances themselves.

Plato has little to say about *phantasia* as such, although in *Sophist* 264a he describes it as "a blend of perception and judgement (*doxa*)." Elsewhere, in *Timaeus* 70eff., in a strange passage that locates parts of the soul in particular parts of the body, he describes the liver as functioning like a mirror that reflects images coming from the rational part of the soul, suggesting a link between imagination, dreams, and inspired prophecy.

Aristotle gives *phantasia* a specific place in his psychology, between perception and thought. In *De anima* 3.3 he offers an account of *phantasia* that includes mental images, dreams, and hallucinations. For Aristotle *phantasia* is based on sense-perception and plays a crucial role in animal movement and desire, as he explains in *De anima* 3.9 and in the *De motu animalium*.

In Hellenistic philosophy the term *phantasia* is most commonly used to refer not to the capacity to receive or interpret appearances but to those appearances them-

selves. Both the Epicureans and the Stoics use the word to refer to the impressions we receive through our senses. The Stoics developed a distinctive theory of the *katalēptikē phantasia* or “cognitive impression,” an impression that was self-evidently certain and therefore, they believed, offered, the criterion of truth and a secure basis for knowledge.

In later Greek thought the concept of *phantasia* is developed in a number of different ways. Literary critics, such as Longinus in *On the Sublime* 15.1, used it of a writer’s capacity to visualize what he is describing and to recreate such visualization in the audience. In the second century CE, Philostratus, rather unusually, contrasts *phantasia* with *mimesis*, distinguishing between the ability of a sculptor like Phidias to portray gods he had never seen and the technique of copying, or imitation, employed by lesser artists. The link between imagination, dreams, and inspired prophecy suggested in Plato’s *Timaeus* was developed by a number of later thinkers such as Plutarch (*De Pythiae oraculis* 397c, *De defectu oraculorum* 431bff.), Synesius (*De insomniis* chs. 4, 5, and 6) and Iamblichus (*De mysteriis* 3.2.3 and 3.14).

The Neoplatonists took over Aristotle’s concept of *phantasia* along with the rest of his psychology but developed it in ways of their own. Plotinus in *Ennead* 4.3.30–31 suggests that there are two “image-making powers,” one that receives images from sense-perception, and one that receives images from the intellect. The idea that imagination can receive images from the intellect is used by later Neoplatonists in connection with mathematics. Proclus, for example, in his commentary on Euclid, expounds the idea that when we are doing geometry, the figures about which we are thinking are “projections” in the imagination of innate intelligible principles.

## PHENOMENALISM

Most philosophers have been led by the argument from illusion, by the causal argument, or by the introspective analysis advocated in the sense-datum theory to conclude that our immediate awareness in perception is not, as direct, or commonsense, realism claims, of material objects (of distinct, external physical entities perceptible by different persons at once) but of *sensa* (private, transitory, probably mental existents that may also be called sensations, sense data, ideas, representations, or impressions). Once this position is adopted, a serious difficulty arises concerning the nature and status of material objects. Representative realism claims that they exist external to us and cause the *sensa* or representations that correspond to them. The notorious difficulty of this view is that if all our direct awareness is concerned with the alleged effects, or *sensa*, how do we ever find out that material objects exist as their causes or what characteristics they possess? The theory seems to make material objects unobserved, and indeed unintelligible, causes of our perception. Although representative realism, especially in modern versions, tries to deal with this difficulty, it is still widely felt to be unsatisfactory. Therefore, alternative attempts have been made to deal with the problem of the nature of material objects. One such approach, which may loosely be called phenomenalist, is to reduce material objects to *sensa*, that is, to explain them as consisting solely of *sensa* or as being primarily groups or patterns of them. This approach results in slightly varying views, and when the term *phenomenalism* is used, reference is very often intended only to what we here call linguistic phenomenalism.

To introduce these variants of phenomenalism, we may consider one central problem that faces any attempt to reduce material objects to *sensa*, namely, the fragmentariness of perception. Any material object is believed to exist for long periods when it is not observed—for example, the furniture in an empty room, the beams in the roof, and so on—and some objects, such as rocks in Antarctica or under the ocean, may never have been observed. Yet when they are not observed, material objects cause no *sensa*, have no *sensa* belonging to them or constituting them. Hence, if material objects are reduced to actual *sensa* and consist only of them, they must cease to exist when unobserved, and those never observed must never have existed. Worse still, the material objects in a room must apparently come into and go out of existence as one looks at or away from them—the blinking of a human eye can destroy or create them. This seems such an intolerable paradox that George Berkeley,

though tempted to say that material objects are simply collections of ideas, had to introduce God as their continuing basis or cause. True phenomenalism, however, can no more allow unobserved divine causes than unobserved material ones.

### PROBLEM OF FRAGMENTARINESS

Several approaches to the problem of fragmentariness may be taken.

**HUME.** One might accept fragmentary existence, though saying it is no insuperable paradox: Objects are no more than groups or patterns of *sensa*, but owing to the regularity with which the same or similar series of *sensa* occur, we imaginatively fill in the gaps and falsely suppose that continuously enduring objects exist. This was David Hume's official view. One may say that just as a tune may bridge various pauses when no sound occurs and thus be a pattern of sounds with intervening gaps, so an object may be a group or pattern of *sensa* and gaps. Nevertheless, the theory is incredible and is only on the fringe of the phenomenalist group of theories. For one thing, it is difficult to see why *sensa* recur in groups or patterns if nothing exists in between; the existence of some continuous basis or focus of them seems a far simpler and more plausible hypothesis than what would be a series of unexplained coincidences.

**SENSIBILIA.** Hume himself toyed with the supposition that impressions might exist unobserved—that the gaps might be filled with unsensed *sensa*—and if H. H. Price is right, Hume should have developed this as his official theory. Such a development was explicitly formulated by Bertrand Russell in his *Mysticism and Logic*, where he gave the name “sensibilia” (singular, *sensibile*) to these “objects that have the same metaphysical and physical status as sense-data without necessarily being data to any mind.” Russell regarded sensibilia as the ultimate constituents of matter; thus, objects consist of systems of sensed sensibilia (that is, *sensa*) and unsensed ones.

However, he soon abandoned this position, which seems untenable on two main grounds. First, it cannot explain the causal processes in perceiving. How does the sensing of sensibilia bring *sensa* into being? The evidence of the causal processes and of the conditioning of perception by the state of the nervous system and sense organs suggests that *sensa* are “generated,” that is, brought into being, by events in the brain; this seems incompatible with the view that they existed as sensibilia before they were sensed. Second, what evidence is there of the exist-

tence or the nature of sensibilia? One cannot observe that such entities fill gaps between actual *sensa*; they are just as obscure and hypothetical as the unobserved material objects of representative realism and, in fact, introduce the very difficulty that they were intended to avoid.

**FACTUAL PHENOMENALISM.** Factual phenomenalism attempts to fill the gap between actual *sensa* with possible ones by defining material objects as groups of actual and possible *sensa*. This view was originated by J. S. Mill, who held that matter consists of “groups of permanent possibilities of sensation.” Unfortunately, this theory also leaves quite obscure what possible *sensa* could be and adds the further implausibility that the gap-filling entities are purely possibilities and not actualities at all. If taken strictly, this should mean that nothing actually fills the gaps. To say that something, for instance, an accident, is possible implies that it is not actual, though it might be claimed that a possible *X* is an actual *Y*; for instance, the possible winner of a race is an actual horse, in which case once again matter will consist largely of unknown and unobservable entities. The view is also open to many of the objections to phenomenalism stated below.

**LINGUISTIC PHENOMENALISM.** Linguistic phenomenalism sees the basic problem before it in a different light, as one not of stating the constituents of matter but of elucidating the concept of a material object, of defining it in terms of *sensa*; and it seeks to achieve this not by formal definition but by a “definition in use,” that is, by providing translations of statements about material objects into equivalent sets of statements about *sensa*. Thus, it is intended to show that what is meant by talking about tables, chairs, or similar objects can be expressed solely by talking about *sensa*; sometimes this is expressed by saying that material objects are logical constructions out of *sensa*. The underlying position is, in essence, that of Hume—that all we know to exist are *sensa* occurring in various patterns or sequences—but one main difference lies in the claim that these regular relationships between *sensa* are not something to be supplemented by imagination but are actually what we indirectly refer to by talking of material objects. Such objects are in fact coordinating concepts, devices that enable us to group and correlate our sense experiences, to identify and to refer to patterns in them.

The other main difference from Hume's position is in the linguistic presentation, the attempt to elucidate the concept by translation into a set of equivalent statements. This is in accordance with the linguistic approach contemporary with the heyday of phenomenalism, and it was

held that statements about material objects and statements about *sensa* are simply two different ways of describing the same set of facts (facts that really concern sense experiences, their patterns and sequences). However, the sets of *sensum* statements not only are translations but also have a special form. Insofar as the object is observed, they are all categorical, but when it is unobserved, they are hypothetical. Thus, “I see a book on the table” is equivalent to “I have *sensa XYZ*,” where *XYZ* might stand for “of a rectangular, red, solid-seeming shape on a flat brown expanse.” However, “There is a book on the table in the next room” is equivalent to “If you were in the next room, you would have *sensa XYZ*.” This introduces the notion of possibility that was not in Hume and that factual phenomenalism expresses so implausibly. It has the great advantage of expressing the possibility of *sensa* in the hypothetical form of the statement without suggesting that possible *sensa* are somehow constituents, perhaps the sole ones, of actual objects. Also of interest is that this approach was anticipated but not developed by Berkeley (*Principles*, Sees. 3 and 58), and occurs in places in J. S. Mill.

The result is an ingenious theory that transforms the problem of producing a viable alternative to representative realism. If successful, it would be an enormous theoretical economy; it would enable the facts of experience to be accounted for solely in terms of one type of existent, *sensa*, without any need to go beyond them and postulate other orders of material existence behind them. Indeed, it could further claim to be neutral between the *sense-datum* and adverbial analyses of sensing, for one could, as Alfred Jules Ayer did, translate material-object statements into statements about “sense contents,” a term used to describe how we sense but not to refer to separate entities.

This version of phenomenalism achieved great popularity from about 1930 to 1950, particularly because it was associated with (1) logical positivism and operationalism, the meaning of material-object statements being held to lie in their mode of verification, that is, in the *sensum* statements that verify them; (2) Russell’s analysis of abstract terms, for instance, that space is not an entity but a logical construction out of observations and measurements; (3) a way of dealing with unobserved entities in physics, namely, that electron statements are equivalent to, are logical constructions out of, sets of statements about physicists’ observations. However, in the last two cases the data for the construction are *prima-facie* observations of material objects, and the construction is thus at a different level. Furthermore, the third case gains plausibility from the fact that electrons are

agreed to be unobservable; but no such unobservability belongs to tables and chairs.

## DIFFICULTIES IN PHENOMENALISM

Because of its merits, linguistic phenomenalism became the dominant version of phenomenalism (so much so that the qualification “linguistic” may seem pedantic). All the same, many difficulties soon appeared in it and defied ingenious, almost desperately ingenious, attempts to deal with them. Further, the theory presupposed that our direct awareness is entirely of private *sensa*; consequently, it has suffered from the recent revival in direct realism. Without questioning that presupposition, we shall now consider the general difficulties in the theory.

**LACK OF EQUIVALENCE.** The original aim of linguistic phenomenalism was to give a fully equivalent translation of a material-object statement into sets of *sensum* statements, thus proving that it meant no more than is meant by a series of such statements. For various reasons this seems impossible. In the first place, according to the basic supposition of the *sense-datum* theory that is shared by phenomenalism, there is a different *sensum* for every different look, sound, feel, or other appearance of a material object. When a dish looks elliptical, one *sensum* belonging to it is obtained; when it looks round, another one is obtained; when it is felt, yet another; and so on. When one considers all the different points of view from which the dish can be seen and can look different, and then adds all the variations possible for the other senses and for other conditions of lighting and such, it would seem that the number of *sensa* belonging to the dish, and therefore the number of *sensum* statements necessary to produce a full analysis or translation of “There is a dish on the table,” would be very great. Sometimes it is said that the number would be infinite because the different points of view are infinite in number; but this is dubious, for owing to object constancy, a slight change in point of view would not necessarily mean a different *sensum*.

At any rate, the list of *sensum* statements would have to be far longer than can be achieved in practice. Furthermore, if the analysis is really to be adequate, it must be systematic: The sets of *sensum* statements must be so ordered as to show something of the patterns or correlations that justify the material-object concept; but far from doing this, phenomenologists usually give up after one or two of the *sensum* statements have been formulated.

Equivalence has also been denied on the ground of difference in form. The original material-object statement is a categorical one, clearly stating that something

actually exists. However, the translation is a series of hypothetical statements, and even when the apodoses of these describe experiences, their normal function seems to be either to avoid asserting actual existence (or occurrence) or to convey something quite different, such as a promise or a warning—"If you touch that, you will get burned." Indeed, "If you go to the next room, you will see a book on the table" may function as a request or a suggestion that the person go there. Worse still, in the counterfactual statements that form the translation offered about past events, actual existence is denied by implication. Thus, "Pterodactyls lived in the Mesozoic era" would probably be translated "If an observer had been present in the Mesozoic era, he would have had pterodactyl-like *sensa*." However, there was no observer at that time—in fact, no human beings at all—and no *sensa* as we know them. Thus, the assertion of actual existence is replaced in the alleged translation by assertions about what might have happened but did not.

Another bar to the claim of equivalence is that there is not full mutual entailment of original and translation. On the one hand, there might be some illusion or hallucination in which the *sensum* statements would be true and the material-object statement false: All the red book-like *sensa* might be present, and yet the object might be a box covered and shaped to look and feel like a book. This can, no doubt, be ruled out in practice by getting enough *sensa*, especially those resulting from such tests as opening the book, but it is doubtful how far results of such tests are really part of the meaning of the material-object statement and are therefore true features of the translation. On the other hand, the material-object statement might be true and the sensory ones false. There might be a book on the table, and yet you might not get *sensa* of it—the light might fail, you might be taken ill suddenly or be careless and inattentive, the book might be covered by other objects, and so on. There is a large range of conditions that would have to be stated to ensure the truth of the *sensum* statement. This is particularly true if the object is a small one: "There is a needle in this haystack." If you looked, would you get the needlelike *sensa*?

**IMPURITY OF ANALYSIS.** A troublesome practical difficulty facing phenomenologists is that it is impossible to specify more than a few *sensa* without recourse to material-object language (and not always then). Since in considering a book, the formula "sensa of a rectangular, red, solid-seeming shape on a flat brown expanse" would not differentiate the book from, say, a chocolate box, the temptation is to say "a red, rectangular, booklike *sensum*." But then one no longer has a translation, and the analysis

is impure; it is like saying that in French *cheval* means an animal of a *cheval*-like nature. Most phenomenologists succumb to this temptation and blame it on the poverty of language, which was designed for speaking about material objects; they say, not very convincingly, that they could invent a proper terminology for describing *sensa* accurately but that it would take too long.

Another type of impurity in phenomenological analyses lies in the protases of the hypotheticals, where reference is normally made to observers and landmarks, for example, "If you go to the next room, you will get *sensa XYZ*." Even if only your body is a material object, you are at least not a *sensum*; and similarly, the room is physical and material. Thus, such a hypothetical statement is not a pure *sensum* statement. Even giving directions by compass points, for example, "If you look north . . .," would seem to involve some dependence on material objects, such as the sun or a compass. Ayer suggested an ingenious way out of this difficulty: Instead of mentioning the observer and others, you describe the available *sensa* of the room or location, thus getting "Given *sensa ABC*, then *sensa XYZ* are obtainable," where *ABC* are "interior-of-roomlike *sensa*" and *XYZ* are "booklike *sensa*." (This also slightly mitigates the difficulty about standing conditions mentioned with respect to mutual entailment: If roomlike visual data are given, at least there is light enough to see large objects.) But once again, specifying the roomlike data without mentioning the room, though perhaps theoretically possible, presents great practical difficulties that no one has tried to surmount. Nevertheless, this second impurity problem has at least been reduced to the first one.

**PUBLICITY AND PERSISTENCE OF OBJECTS.** In view of the great difficulties facing any attempt at a fully equivalent and pure translation, the phenomenologist may modify his aims. He may say that by producing a few sentences of the translation and by using such short cuts as "booklike *sensa*" he can show the form a full analysis would take; he can give a schema or blueprint of it sufficient to show that a material-object statement really means no more than a set of *sensum* statements and to reveal the kind of relation between *sensa* that justifies the material-object concept. Others would argue that this is to abandon the real aim of phenomenology: Unless one produces a fully equivalent translation, one cannot be sure that there is not some characteristic of material objects that cannot be rendered in terms of *sensa*. This objection is supported by drawing attention to several features of the ordinary concept of a material object that seem particularly resistant to phenomenologist analysis.

The first of these are the publicity of material objects (the fact that many people can perceive them at once) and their persistence or relative durability. *Sensa* are private and transitory, so how can statements about them convey the meaning of statements about objects? A phenomenalist answer would be that all we mean or are entitled to mean by saying that an object is perceived by two people at the same time is that they simultaneously sense similar *sensa*. This can be formulated as: Observer *A* has *sensa XYZ* at time *t*; observer *B* has *sensa X'Y'Z'* also at time *t*; and both sets of *sensa* are located similarly with respect to other background *sensa*. The analysis can be supported by saying that when *B* senses visual and tactile data describable as data of his touching the object, then *A* gets visual data describable as data of *B* touching it. As to the persistence of objects, all this amounts to is that sequences of similar data recur. In development of this point, Hume claimed that it involves constancy (recurrence of the same data each time you look) and coherence (sequences of data changing in an orderly manner); Ayer, however, put most emphasis on the recurrence of reversible series of data, as when you look round the room and then back again.

But these answers are inadequate for the following reasons.

- (1) They make the analysis impure by reference to observers: The whole point in the publicity of material objects is that two observers have similar *sensa*, as opposed to a case of double vision, where one person has two sets of *sensa*; in the persistence of material objects it is that one observer has the recurrent or reversible series of *sensa*. (Actually, the best evidence of persistence would be that *A* sees the object during the gaps in *B*'s observation of it, for which mention of observers is clearly essential.)
- (2) A more fundamental objection is that the assertion of the publicity and persistence of material objects is meant to convey more than the assertion of sets of *sensa*: One is maintaining, first, that a public object exists as the focus of two persons' perceptions and, second, that such an object continues to exist during the gaps between series of perceptions. ("Focus" here means either a common object of both perceptions, as in direct realism, or the common cause of the different *sensa*, as in representative realism.) It might be objected that this is simply putting forward an alternative to phenomenalism, but it seems fair to say that something like this realist claim is what we mean

by a material object. Without the notion of focus or continuant, the agreement of different people's *sensa* or the recurrent sequences of one person's *sensa* are incredible series of coincidences. Why, for example, are such agreements so common in perception of objects but so rare in pains or dreams or imagery? Surely because there is something besides the sense experiences responsible for the agreement, namely, a common object or cause.

- (3) Furthermore, the fragmentariness of our perception of an object is closely correlated with our own actions, as are Ayer's reversible series. If *sensa* of a table are replaced by *sensa* of the view outside the window, we must have moved our head and have looked out of the window; if we get *sensa* of the interior of the room after an hour's gap, we must have dozed off or have gone out and returned. This seems to show that the *sensa* are caused by continuing objects, the room and furniture; since the fragmentariness of our observation of these objects is explained by our actions, we do not have to assume that the objects are fragmentary as well—indeed, if they were, we should find them and their *sensa* appearing and disappearing without any action on our part, like the Cheshire Cat in *Alice in Wonderland*.

**CAUSAL PROPERTIES AND PROCESSES.** Any material object is thought to possess and to exercise many causal properties (its various powers to affect other objects by heat, propulsion, impact, pressure, chemical or electrical properties), and the concept of such an object may be claimed to involve them. They are so important that for many philosophers (for example, Price) they form the main stumbling block to the acceptance of phenomenalism, at least of the factual kind. Not only are these causal properties regularly exercised when the object is unobserved (fire still boils the water when the cook is not looking, beams still support the floor and roof even when quite hidden, and so on) but the properties and processes involved in the causation of perception—the events in the eyes and nerves of percipients—are also rarely if ever observed, and then only by scientists with special equipment. Thus, one may often perceive or experience the effects of unobserved causal properties; hence, actual *sensa* may be causally dependent on what are only possible ones—which is absurd.

Followers of linguistic phenomenalism may claim to avoid this. The observed movement of the hands of a

clock caused by unseen works inside it, for example, is not a case of actual *sensa* due to possible ones. What one should say, rather, is that *sensa* of hands moving are sensed, and if one were to get *sensa* of the back of a clock with the cover removed, one would get *sensa* of cog wheels and shafts moving; or, more generally, given *sensa* of the effect, then if certain other *sensa* occur, *sensa* of the cause would also occur— $S_e$ , and if  $S_x$ , then  $S_c$ . It must be noted that such an analysis presupposes the Humean, or regularity, view of causation, in which all that a causal relation amounts to is that the “effect” has been observed regularly to follow the “cause” ( $C$  causes  $E$  means whenever  $C$ , then  $E$ )—any conviction that the effect is brought about by some force in the cause that compels it to happen is mere superstition or is to be explained psychologically as the projection of our feeling of expectancy. However, this analysis will not satisfy those who maintain other theories of causation.

But even granting the regularity view, there is a special difficulty for phenomenalism. Presumably the “ifs” in the phenomenalist analyses are equivalent to “whenever” and themselves state regularities; whenever the floor board is taken up, one sees the beams supporting the floor. Hence, if causal relationship means no more than regularity or constant conjunction, the formula “ $S_e$ , and if  $S_x$ , then  $S_c$ ” amounts to “ $S_e$ , and whenever  $S_x$ , then  $S_c$ ” or “ $S_e$ , and  $S_x$  causes  $S_c$ .” However, this expresses a causal relationship different from the original one; it concerns  $X$  and  $C$  rather than  $C$  and  $E$ , and, more important, expresses a relation between *sensa*, suggesting that one lot of *sensa* causes another. Indeed, this last conclusion must follow if nothing but sensory experiences exist. Thus, “The beam supports the floor” becomes “If (whenever) you have under-floor *sensa*, you have beam *sensa*,” and hence, “Under-floor *sensa* cause beam *sensa*”—which is far from the original. (This point applies with greater force to the causation of perceptions; the causal properties of the percipient’s nervous system must be expressed in terms of the *sensa* of some other person entirely—namely, the physiologist, who can observe them.)

It has been objected that all this is unfair; the causal language belongs only to material-object language, and causal relations are between material objects and events, while in the *sensum* language and analysis they are expressed as equivalent correlations. However, according to the regularity view of causation there is no reason why the relevant *sensa*, which are events and are regularly correlated, should not be causally connected. Hence, the difficulty illustrated by “under-floor *sensa* cause beam *sensa*” still stands; it suggests that causal connections are

more than relations of *sensa*, and thus that phenomenalism is false.

Quite apart from this special difficulty, the proposed analyses of causal properties are open to the general difficulties of the phenomenalist account of the existence of objects. There is a similar impurity, particularly with respect to the causation of sense experiences, analysis of which involves reference to different observers. Equivalent translation is even more clearly ruled out: Since causal properties involve other objects as well as the object analyzed, they are more complex than such simple, sensible ones as color or shape and thus require a longer and more intricate set of *sensum* statements for their analysis. They also produce their effect only when a whole range of standing conditions holds, for instance, the spring will not drive the clock if the bearings are clogged with dirt. All these conditions would have to be specified for the mutual entailment of a causal material-object statement and a set of *sensum* statements.

## Bibliography

### STATEMENTS AND DEFENSES

- In addition to Hume’s own writings, of special interest are attempts to modernize and improve on Hume: Henry Habberley Price, *Hume’s Theory of the External World* (Oxford: Clarendon Press, 1940), and Alfred Jules Ayer, *The Foundations of Empirical Knowledge* (New York: Macmillan, 1940).
- On sensibillism, see Bertrand Russell, *Mysticism and Logic* (London: Allen and Unwin, 1918), and Price’s *Hume’s Theory of the External World*. Russell’s theory developed from the phenomenalistic views he put forward in *Our Knowledge of the External World* (London: Allen and Unwin, 1914), which were criticized by C. D. Broad in “Phenomenalism,” in *PAS* 15 (1914–1915): 227–251.
- Factual phenomenalism is expounded by John Stuart Mill in *An Examination of Sir William Hamilton’s Philosophy* (London, 1872), Ch. 11 and appendix to Ch. 12. H. H. Price, *Perception* (London: Methuen, 1932), is sympathetic, though Price finally abandons factual phenomenalism. For allied views, see Karl Pearson, *The Grammar of Science*, 3rd ed. (London: A. and C. Black, 1911), or Ernst Mach, *Contributions to the Analysis of Sensations* (Chicago, 1897; London, 1900).
- Linguistic phenomenalism, including criticisms of earlier variations, may be found in A. J. Ayer, *The Foundations of Empirical Knowledge* (see above), and “Phenomenalism,” in *PAS* 47 (1946–1947): 163–196, reprinted in his *Philosophical Essays* (London: Macmillan, 1952); however, his views in *The Problem of Knowledge* (London: Macmillan, 1956) involve some recantation. Also useful is D. G. C. MacNabb, “Phenomenalism,” in *PAS* 41 (1940–1941): 67–90. Compare the sophisticated version by Clarence Irving Lewis in his *Analysis of Knowledge and Valuation* (La Salle, IL: Open

Court, 1947)—comments on this in Roderick M. Chisholm, “The Problem of Empiricism,” in *Journal of Philosophy* 45 (19) (1948): 512–517; a reply by Lewis, *ibid.*, 517–524—and Roderick Firth, “Radical Empiricism and Perceptual Relativity,” in *Philosophical Review* 59 (1950): 164–183 and 319–331.

#### GENERAL CRITICISMS AND DISCUSSIONS

Introductory surveys are given by John Hospers, *Introduction to Philosophical Analysis* (New York: Prentice-Hall, 1953; London: Routledge and Paul, 1956), and Charles Harold Whiteley, *Introduction to Metaphysics* (London, 1955). There is a general discussion by A. C. Ewing, R. I. Aaron, and D. G. C. MacNabb in the symposium “The Causal Argument for Physical Objects,” in *PAS*, Supp. 19 (1945): 32–100.

More advanced and definitely critical are Rodney Julian Hirst, *The Problems of Perception* (London: Allen and Unwin, 1959); Alfred Cyril Ewing, *Idealism, a Critical Survey* (London: Methuen, 1934); David Malet Armstrong, *Perception and the Physical World* (London: Routledge and Kegan Paul, 1961); J. J. C. Smart, *Philosophy and Scientific Realism* (New York: Humanities Press, 1963); Wilfrid Sellars, *Science, Perception and Reality* (New York: Humanities Press, 1963), Ch. 3; Richard Bevan Braithwaite, “Propositions about Material Objects,” in *PAS* 38 (1937–1938): 269–290; R. I. Aaron, “How May Phenomenalism Be Refuted?” in *PAS* 39 (1938–1939): 167–184; George Frederick Stout, “Phenomenalism,” *ibid.*, 1–18; Isaiah Berlin, “Empirical Propositions and Hypothetical Statements,” in *Mind* 59 (235) (1950): 289–312; W. F. R. Hardie, “The Paradox of Phenomenalism,” in *PAS* 46 (1945–1946): 127–154; and Paul Marhenke, “Phenomenalism,” in *Philosophical Analysis*, edited by Max Black (Ithaca, NY: Cornell University Press, 1950).

## PHENOMENOLOGICAL PSYCHOLOGY

“Phenomenological psychology” departs from empirical psychology by suspending naturalistic assumptions about human consciousness and by adopting a unique method, namely the phenomenological reduction, as a means of access to consciousness. Furthermore, its aim as a science is to reveal essential features of consciousness, eidetic structures, that hold for consciousness in general. Within the reduction, the focus can either be mundane, that is, directed to the mental as a region within itself, or transcendental, that is, directed to consciousness as the unique region within which all other forms of objectivity are constituted. When phenomenological psychology proceeds as an eidetic science, any results it may obtain will hold for any possible existing consciousness, but it cannot make any assertions about which of the possibilities it identifies are instantiated factually, since it must suspend all judgments about empirical facts. Phenomenological psychology reveals that mental life is intentional and at bottom temporal, and that it constitutes itself as a complicated, yet unified web of intentional relationships. This has led it to be closely associated with Gestalt theories. The task of phenomenological psychology is to reveal the various strata of mental life including both its active and passive elements, to exhibit the essential relationships among them, and to show how the complex and abstract levels are constituted out of simpler and more basic simple elements of consciousness.

In his contribution on phenomenology composed for the *Encyclopaedia Britannica* in 1928, Edmund Husserl introduced phenomenological psychology as a propaedeutic to transcendental phenomenology in general. Through the investigation of pure subjective consciousness, its forms and genesis, along with those of its correlative intentional objects, phenomenological psychology can provide the material for transcendental phenomenology. Phenomenological psychology makes clear that the starting point for phenomenology is consciousness as it presents itself to pure reflection. However, tran-

scendental phenomenology proceeds one step further by bracketing out any necessary relationship to consciousness as a worldly phenomenon belonging to humans or any other animate beings, and by investigating the very nature of consciousness in general. Transcendental phenomenology is thus nothing other than a consequence of the universal epoché that belongs to the meaning of the transcendental question concerning the ultimate basis for cognition and its objects in general. From this perspective, the instantiation of consciousness in human and other animals is merely one example that can provide the point of departure for a change in attitude that leads to the notion of a pure transcendental consciousness in which all intentionalities, including the intention of oneself as an existing individual consciousness, are constituted.

## PHENOMENOLOGY

"Phenomenology" is a term that has been used in as many widely varying senses in modern philosophy as has the term that names the subject matter of this science, "phenomena."

Johann Heinrich Lambert, a German philosopher contemporary with Immanuel Kant, first spoke of a discipline that he called "phenomenology" in his *Neues Organon* (Leipzig, 1764). He took "phenomenon" to refer to the illusory features of human experience and hence defined phenomenology as the "theory of illusion." Kant himself used "phenomenology" only twice, but he gave a new and broader sense to "phenomenon" that, in turn, resulted in a redefinition of "phenomenology." Kant distinguished objects and events as they appear in our experience from objects and events as they are in themselves, independently of the forms imposed on them by our cognitive faculties. The former he called "phenomena"; the latter, "noumena," or "things-in-themselves." All we can ever know, Kant thought, are phenomena.

The next generation of philosophers, notably G. W. F. Hegel, was at great pains to show that this was a mistake. Hegel's first major work, *Phenomenology of the Spirit* (1807), traced the development of Spirit (or Mind) through various stages, in which it apprehends itself as phenomenon, to the point of full development, where it is aware of itself as it is in itself—as noumenon. Phenomenology is the science in which we come to know mind as it is in itself through the study of the ways in which it appears to us.

In the middle of the nineteenth century, the definition of "phenomenon" was further extended until it became synonymous with "fact" or "whatever is observed to be the case." As a consequence, "phenomenology" acquired the meaning that it possesses most frequently in contemporary uses—a purely descriptive study of any given subject matter. In this sense, Sir William Hamilton, in his *Lectures on Metaphysics* (1858), spoke of phenomenology as a purely descriptive study of mind. Similar was Eduard von Hartmann's use of the word in the title of his book *Phenomenology of Moral Consciousness* (1878), which had as its task a complete description of moral consciousness. When the American philosopher C. S. Peirce used the term *phenomenology*, he had in mind not only a descriptive study of all that is observed to be real but also of whatever is before the mind—perceptions of the real, illusory perceptions, imaginations, or dreams. It was the task of phenomenology to develop a list of categories embracing whatever can be included in the widest possible meaning of "to be." Peirce introduced this sense of the term in 1902.

The changes described so far are all due to extensions of the meaning of "phenomenon," but phenomenology, the science of phenomena in these different senses, remained one field of study among others, having a rela-

tion to philosophy as a whole comparable to those of logic, ethics, and aesthetics. Frequently it was recommended as a descriptive study that was to precede any attempt to provide explanations of the phenomena. But since Edmund Husserl employed the term in the early 1900s, it has become the name of a way of doing philosophy—by using the phenomenological method. For the phenomenologists, who regard their method as the only correct way of proceeding in philosophy, phenomenology is therefore the best and perhaps the only legitimate way of philosophizing today. For other philosophers, phenomenology is one school or movement in philosophy today. At the same time, however, the older sense of the term persists. “Phenomenology” is therefore used in two distinct senses. In its wider sense it refers to any descriptive study of a given subject. In the narrower sense it is the name of a philosophical movement. This entry will deal with phenomenology in the second sense.

### THE MOVEMENT AND ITS ORIGINS

“Phenomenology” became the name of a school of philosophy whose first members were found in several German universities in the years before World War I, notably at Göttingen and Munich. Between 1913 and 1930 this group published a series of volumes of phenomenological studies titled *Jahrbuch für Philosophie und phänomenologische Forschung*, whose editor in chief was Husserl, the most original and most influential thinker of the group. Most of the better-known members of the phenomenological movement—Moritz Geiger, Alexander Pfänder, Max Scheler, and Oscar Becker—were coeditors, at least for a time. Martin Heidegger was another coeditor, but he cannot be counted among the phenomenologists without serious qualifications. Other major figures in the movement were Adolf Reinach and Hedwig Conrad-Martius.

The contributions to the *Jahrbuch* ranged from Husserl’s writings about the foundations of phenomenology, to essays in the philosophy of mind and Scheler’s major work on ethics, to pieces on the nature of analytic judgments and the paradoxes in set theory. As the interests of the various phenomenologists differed, so did their conceptions of phenomenology. These disagreements emerged only gradually, as Husserl developed the theory of the phenomenological method further and encountered a progressively more critical reception among his fellow phenomenologists. At the outset, there was general agreement that phenomenology was to be descriptive and that it was to describe phenomena by means of direct awareness (*Anschauung*). It is best to

begin to clarify these terms by showing what they could, but do not, mean.

### DESCRIPTION

The terms *descriptive*, *phenomenon*, and *direct awareness* all suggest that phenomenology is here used in its wider sense as a purely descriptive science of observable phenomena. But this wider sense of the term does not include what for the phenomenologists is the most important feature of phenomenology—that it is a non-empirical science. From the very beginnings of the phenomenological movement, when the conception of phenomenology was otherwise still quite vague, there was general agreement that phenomenology does not describe empirically observable matters of fact. Insisting on this, the early phenomenologists took a stand in opposition to philosophical views then in vogue.

Kant had distinguished three kinds of statements: empirical statements, statements true by definition (which he called “analytic”), and a third kind that he called “synthetic a priori.” After being temporarily eclipsed by the German idealism of the early nineteenth century, Kant found many vigorous adherents in the later decades of that century. But there were also many philosophers who found Kant’s account of the third type of statement—the statements that are neither empirical nor analytic—profoundly unsatisfactory and who, instead of attempting to supply an alternative account, rejected the tripartite classification altogether. This was done, for instance, by the German positivists Ernst Mach and Richard Avenarius, who insisted that there are no nonempirical statements that are not analytic. Of equal, if not greater, importance were those philosophers who regarded all statements as empirical. Analytic statements seemed to them clearly to rest on “the artful manipulation of language” (Mill’s phrase), and they thought it therefore implausible that the statements of logic and/or mathematics should be analytic, that they should be true, and, more important, that they should be applicable to objects of everyday experience and science merely by virtue of an arbitrary choice of definitions. Accordingly, John Stuart Mill in England and Christoph Sigwart in Germany, among others, sought to show that statements in logic and mathematics are no less empirical than statements in the sciences.

In the case of logic, the most plausible argument for such a view begins with the observation that logic deals with correct and incorrect thinking. Thinking is a mental or psychological activity and must, therefore, be studied in psychology just as any other mental or psychological

activity. It seems to follow, then, that logic is either a special field within empirical psychology or a practical discipline whose theoretical foundations are supplied by empirical psychology. In the former case, the relation of logic to psychology is comparable to that of learning theory or abnormal psychology to psychology as a whole. In the latter view, logic is related to psychology as surveying is to geometry or accounting to arithmetic.

**OPPOSITION TO PSYCHOLOGISM.** The phenomenologists were not the first to question the identification of logical with psychological statements—a view they called “psychologism.” But while some other philosophers had approached the issue by distinguishing logic from psychology in terms of the distinction between theoretical and practical disciplines, the phenomenologists attacked the identification of logical with psychological statements on the grounds that the latter are empirical statements and the former are not. The most sustained and painstaking critique of psychologism is contained in the first volume of Husserl’s *Logische Untersuchungen* (Logical Investigations; Halle, 1900–1901), and the arguments in that book served as a first rallying point for phenomenologists.

Husserl’s attack on psychologism had a special edge to it because his *Philosophie der Arithmetik* (Philosophy of Arithmetic; Vol. I, Halle, 1891; the projected second volume was never published) had been a frankly psychologistic account of arithmetic. His change of heart was in part occasioned by a controversy with the German mathematician and philosopher of mathematics Gottlob Frege, in which Frege had insisted that a sharp line be drawn between psychological statements, on the one hand, and logical and/or mathematical ones, on the other.

Husserl devoted an entire book to the detailed examination and refutation of every variety of psychologistic doctrine, taking careful account of each view and trying to show its inadequacy. Underlying all his arguments, however, were a few general principles to which he appealed again and again in the course of his discussion:

- (1) Psychology deals with facts; therefore its statements are empirical. It has not, until now, produced any precise scientific laws, and its generalizations are vague. The rules of logic, on the other hand, are precise. Hence, psychological generalizations can neither be identical with logical laws nor be premises from which they may be derived.
- (2) Empirical statements are probable, at best, for there is always a real possibility that further evi-

dence will show them to be false. Logical truths are necessary truths. A logical principle such as *modus ponens* (“Given that ‘If  $p$ , then  $q$ ’ is true and that ‘ $p$ ’ is true, ‘ $q$ ’ is true”) is not probable; it is necessarily valid.

- (3) Closely connected with (1) and (2) is the argument that empirical generalizations rest on induction; they are derived from a number of individual cases. This is not true of logical rules.

Both (2) and (3) are supported by pointing out that where there is a conflict between a logical principle and an empirical generalization, the logical principle will always emerge victorious because necessary truth is not to be refuted by a probable statement and logical truth cannot be shown to be false by an inductive generalization.

- (4) The empirical generalizations of psychology produce, at best, causal laws, and logical principles are not causal laws. Premises and conclusions of an argument are not related as cause and effect; the truth of a conclusion is not the effect of the truth of the premises. Causal relations hold between events, and events happen at definite times in definite places. But the premises of an argument do not “happen,” nor does the conclusion; they are either true or false. In a valid argument the truth of the conclusion “follows” from the premises; it is not the effect of events called premises.
- (5) Empirical laws imply matters of fact; logical rules do not. Since empirical laws are, presumably, derived from the observation of particulars, the existence of such particulars in some place and at some time can be inferred from the truth of the empirical law. *Modus ponens*, on the other hand, does not imply that there exists, in a particular place and at a particular time, a pair of statements of the form “If  $p$ , then  $q$ ” and “ $p$ .” Nor are any corresponding facts implied by any other logical law. This point is sometimes stated in a phrase, borrowed from Gottfried Wilhelm Leibniz, that empirical laws are true only for this actual world; logical laws are true “for all possible worlds.”

The upshot of these arguments is that logical and empirical statements differ in kind. Logical statements are precise, necessarily true, and not derived inductively from particulars. They are, or give rise to, logical rules, not causal laws, and they do not imply matters of fact. Empirical statements, on the other hand, are vague, probably

(but not necessarily) true, and based on inductive generalizations. They are, or give rise to, causal laws and imply the existence of matters of fact. Quite clearly, in the refutation of psychologism, the decisive argument, for Husserl, consisted in showing that there are two kinds of statements: empirical and nonempirical. Phenomenological statements are to be nonempirical.

To deny that phenomenological statements are empirical is to deny that their truth or falsity depends on sensory observation. But if not on sensory observation, on what does their truth depend? Some philosophers might be inclined to say that phenomenological statements are analytic. Insofar as only those statements are analytic that are true by virtue of explicit definition of terms, phenomenologists deny that their statements are analytic. We shall have abundant evidence that they are right in this, for phenomenological statements are not true by virtue of stipulation of meaning. But insofar as “analytic” is used in some other sense, it is not helpful either to assert or to deny that phenomenological statements are analytic; the meaning of the term *analytic* is much debated in contemporary philosophy and has therefore become extremely obscure. It is more profitable to ask the phenomenologists about the truth conditions of their statements. Their preliminary answer to this question consists in introducing the term *phenomenon* by saying that phenomenological statements are true if they accurately describe phenomena. This answer, however, remains merely a verbal maneuver unless *phenomenon* can be shown to have a clear and definite meaning.

## PHENOMENA

We have seen that *phenomenon* is a technical philosophical term that different philosophers have used in very different senses. The phenomenologists sometimes say that “phenomenon” is their name for whatever appears to us in “immediate experience.” By “immediate experience” they do not mean sensory observations that have not been interpreted or classified under general concepts (“raw sense data”). Like many other contemporary philosophers, the phenomenologists are not at all sure that there are for us any sensory observations that are not interpreted or classified under general concepts. The appeal to phenomena or to immediate experience is therefore not an appeal to simple, uninterpreted data of sensory experience. Furthermore, the appeal to phenomena does not presuppose the existence of a special class of objects called “phenomena.” The phenomenologists do not claim to have discovered that besides all the kinds of entities found in this world (physical objects, thoughts,

numbers, feelings, poems, etc.) there is one other class, phenomena. Any object is a phenomenon if looked at or considered in a particular way. This particular way of looking at all kinds of objects is recommended in the slogan “Zu den Sachen!”

Literally translated, this slogan means “To the things!” where “things” must be taken in the widest possible sense to embrace all possible kinds of objects. Like other slogans, moreover, this one gains its force from having more than one meaning. If a German says to someone, “Zur Sache!” he is exhorting him, as we would say, “to get down to business.” “Zu den Sachen!” admonishes one to get down to the proper business of the philosopher by examining and describing all kinds of objects in the particular way that reveals them as phenomena.

This explication of “phenomenon” is, so far, circular. To clarify what is meant by that term, we must therefore explain what alternative ways of doing philosophy are excluded by telling us to examine and describe phenomena. We must explain the polemical import of the slogan “Zu den Sachen!” Once this is done, we must pursue the concept of phenomenon further by attempting to clarify the nature of the examination and description that shows all kinds of objects as phenomena.

**OPPOSITION TO REDUCTIONISM.** The polemical import of “Zu den Sachen!” is readily made clear. In it the phenomenologists expressed their opposition to all reductionism, or, as Reinach called them, “nothing-but philosophies.” Such philosophies are couched in sentences like “Logical laws are nothing but psychological laws,” “Moral laws are nothing but the expressions of the mores of a given society,” and “Aesthetic judgments are nothing but expressions of personal taste.” To oppose all views of this sort would seem dogmatic. Some “nothing-but” statements may be false, but perhaps others are true; and one would think that each would have to be examined on its merits rather than be rejected summarily as an example of reductionism. However, the phenomenologists did not attack these “nothing-but” views on the grounds that they are false but on the grounds that the philosophers who held them, held them for the wrong kinds of reasons.

Psychologism, which is just one example of reductionism, did not assert that logical laws are nothing but psychological laws in the light of a thorough examination of the nature of logical laws that proved that they are identical with psychological ones. If someone challenged the psychologistic philosopher’s views, he was not invited to examine for himself the nature of logical laws and to

discover that they did not differ from those in psychology. Instead, he was given an argument from which it followed that logical laws “must” be psychological ones. Psychologistic assertions about logical and psychological laws do not result from an examination of laws in logic and psychology but are the logical consequences of certain more general assumptions. These assumptions themselves are not examined but are taken as self-evident.

Reductionism as attacked by the phenomenologist is the outcome of accepting certain statements that have not been examined carefully. If the implications of these assumptions are shown to conflict with facts about the world, the reductionist does not, the phenomenologists say, reexamine his original assumptions. Instead, he redefines the terms used to describe the facts about the world in such a way that the contradictions between these descriptions of facts and the implications of the original assumptions disappear. The redefinitions necessitated by the conflict between assumptions and facts are expressed in the “nothing-but” statements.

**Opposition to phenomenalism.** An example of a specific reductionist view attacked by the phenomenologists will clarify the process. David Hume’s empiricism was attacked for its phenomenalism, that is, for its view that physical objects, as well as human beings, are no more than collections of their observable properties. (“Phenomenology” must not be confused with “phenomenalism.”) “Observable properties” in this context refers exclusively to sensory qualities like shape, color, sound, etc. This view of Hume’s did not issue from a careful examination of the nature of physical objects. Instead, it was a product of his psychological theories about the origin and meaning of concepts and words. Hume held that all concepts are either derived directly from sensory experience or are complex collections of such concepts. He regarded it as a consequence of this view that all concepts refer either to sensory qualities like shape, color, and sound or to complex collections of these. He also thought that all nouns are the names of concepts. It follows from this that all nouns naming physical objects refer to concepts that can be completely analyzed into simple concepts referring to sensory qualities. Hence physical objects—what is named by physical object nouns—are no more than complex collections of sensory qualities. However, this view is not supported by a careful examination of physical objects themselves but follows from, and hence “must” be true in the light of, Hume’s psychology and views on the meanings of words.

**Opposition to psychological atomism.** Another target of the antireductionist polemic was the then popular

attempt by philosophical psychologists like Wilhelm Wundt to define consciousness as a set of contents—sensations, feelings, affects—on which operations—association and apperception—are performed. This view was not the product of careful examination and description of the series of phenomena that we call consciousness but was a logical consequence of more general assumptions about the world. It missed, the phenomenologists maintained, the essential characteristic of consciousness that they, following Franz Brentano, called “intentionality.”

**Opposition to scientism.** Also objectionable was the so-called scientism of the positivists Mach and Avenarius. Scientism regarded scientific statements as premises in philosophical arguments such that the truth of statements in philosophy depends on the truth of scientific statements. This view was a direct consequence of two assumptions: that all statements are either empirical or analytic, and that all empirical statements are, at least ideally, statements in science. Given these assumptions, there is a choice between restricting philosophy to the practice of logic, in which statements are often thought to be analytic, or saying that philosophical truths are empirical. If we choose the latter alternative, philosophical statements “must” have scientific premises.

But this conclusion, phenomenologists held, was drawn without paying careful attention to actual and possible functions of philosophy, which, they held, is independent of science. In this they were not motivated by any hostility toward science; on the contrary, their aim was to establish philosophy as a “rigorous science” by means of the phenomenological method. Husserl had discussed this aim at some length in his article “Philosophie als strenge Wissenschaft” (“Philosophy as Rigorous Science,” in *Logos*, Vol. I, 1910–1911, 289–341). This phenomenological and rigorously scientific philosophy was expected to provide the foundations for the existing sciences by providing clear explications of the concepts that the sciences use but do not themselves explicate. For instance, the definition of number, in which Reinach was interested, was considered a task for phenomenology. Husserl was concerned with clarifying epistemological terms such as *meaning* and *truth*. So conceived, phenomenology had to be independent of the existing sciences because it was to explicate the concepts and procedures presupposed by them. To consider philosophy a branch or subsidiary of existing science was one more example of “nothing-but” philosophy.

**Presuppositionless inquiry.** Here it must be asked whether philosophers must not make certain assumptions. We cannot, it would seem, show that all statements

are true by reference to the truth of other statements; some we must merely assume to be true. But phenomenologists are unconvinced by this sort of argumentation. Statements in phenomenology are not true because certain other statements are true; they are true because they describe the phenomena correctly. In order to achieve true description, the phenomenologist must resist the temptation to make assumptions and, afterward, to define his terms in such a way as to make the descriptions of facts consistent with the assumptions and what must be inferred from them. The phenomenologist does not frame theories; he merely examines and then describes phenomena as they present themselves to his unprejudiced view. Having no theoretical commitment and only one practical one—to examine all phenomena carefully and to take none of them as familiar or understood until they have been carefully explicated and described—the phenomenologist says that his science is descriptive and that it is presuppositionless.

This obviously does not mean that at any given time the phenomenologist may not be operating with certain unexamined assumptions—this can always happen. The claim of presuppositionlessness expresses the resolution to eschew all unexamined assumptions and the belief that such assumptions are unnecessary; No statement must be taken as true without examination. Phenomenology does not need any true but unexamined premises; the truth of all its premises can be tested by examining the phenomena.

This sheds some light on the second, affirmative sense of the slogan “Zu den Sachen!”—an exhortation to examine phenomena and to make them the sole touchstone of the truth of philosophical statements. But the precise import of this exhortation remains unclear until the meaning of “phenomenon” has been explicated, so this is a pressing question. It is also a question fraught with particular difficulties. Phenomena, as was stated, are those aspects of objects of every kind that are revealed by a particular way of looking at objects. The phenomenal aspects of objects are not revealed by ordinary empirical observation but only by looking at them as phenomena. The meaning of “phenomenon,” on the other hand, cannot merely be stipulated in analytic statements. Hence, explications of “phenomenon” must result from using the phenomenological method and must be couched in phenomenological statements. But what these statements are cannot be made clear until it is clear what a phenomenon is, nor do we know what the phenomenological method is until we know what a phenomenon is.

“METHODOLOGICAL CIRCLE.” The entire phenomenological enterprise is involved in a circle that can be called the “methodological circle.” This methodological circle does not differ formally from the circle involved in any kind of logical investigation where the rules of inference, for instance, which the completed investigation hopes to formulate and justify must be employed during the course of the investigation itself so that its result, the logical rules, is the product of the application of the rules to themselves. The existence of this circle does not prove that logic is an impossible or unjustifiable discipline, nor does its presence in phenomenology support an analogous argument against it.

The occurrence of this circle should, however, put one on his guard against taking for completed analyses statements made by phenomenologists that are, in fact, merely gropings toward and anticipations of what phenomenology, its method, and the completed theory of method will be like in some indefinitely remote future. Phenomenology does not exist as a set of doctrines but at best as a method—and this method is to be developed by applying phenomenology to itself. Hence, even the phenomenological method is still in the process of being clarified, properly described, and elaborated; it is, at least to date, quite incomplete.

Husserl liked to refer to himself as a “perpetual beginner,” an expression that meant several things to him. In one of its senses, it expressed what was just said about phenomenology: It is a method that can only be progressively developed by applying it to itself. Accordingly, most of Husserl’s published works are discussions of the phenomenological method. This has sometimes been taken as a symptom of an excessive fondness for writing manifestoes, but discussions of phenomenological method are not of the nature of manifestoes prior to doing phenomenology, nor are they propaedeutics. Only while doing phenomenology can we clarify its method. To write about it was, in Husserl’s case, to do phenomenology.

## THE INTUITION OF ESSENCES

The preceding discussion has brought to light three properties of phenomenological statements:

- (1) Phenomenological statements are nonempirical.
- (2) Phenomenological statements are descriptive.
- (3) Phenomenological statements describe phenomena.

These leave the task of making clear what phenomena are, a matter of disagreement among phenomenologists:

Most of the schisms within the phenomenological movement originate in disagreements about the set of conditions necessary for anything to be a phenomenon. We shall examine a variety of conditions proposed, beginning with the most simple and proceeding to more complex sets as the simpler ones turn out to be incomplete. The criterion of completeness for this set of necessary conditions is that any set of conditions required for anything to be a phenomenon must at least be consistent with the first requirement for phenomenological statements—that they be nonempirical. Hence, the set of conditions laid down for anything to be a phenomenon must clearly rule out any possibility that phenomena can be described in empirical statements.

The simplest specification of phenomenon, given by some early phenomenologists, contains only two conditions:

- (1) Phenomena are essences.
- (2) Phenomena are intuited.

The reason for identifying phenomena with essences is instructive. As we saw, it was claimed that there are some entities by virtue of which statements in phenomenology are said to be true or false. These entities (or phenomena) are not particular observable objects by reference to which empirical statements are confirmed or disconfirmed. Instead, the phenomenologists say, they are the necessary and invariant features of objects. Phenomenology explicates those features of any given object without which it could not truly be said to be the object that it is. These most general, necessary, and invariant features of objects have been called “essences” by other philosophers, and, following that terminological tradition, the phenomenologists also talk about essences.

Many philosophers in the past have held that statements about essences are empirical statements, arrived at by comparison of many examples of a type of object and extracting from the descriptions of all these examples the common features by means of some kind of generalization. Such a process has often been called abstraction. Abstract statements, since they are logically dependent on empirical descriptions of particular cases, are themselves empirical statements. Phenomenological statements, on the other hand, are, for the reasons given, not empirical statements. Hence, phenomenological statements are not reached by abstraction. They are, phenomenologists say, derived from a scrutiny of particular cases by seeing, intuition, or intuition of essences (*Wesensschau*).

The identification of phenomena as essences brings us one step closer to the goal of clarifying the particular

way of looking at objects that reveals objects as phenomena. It turns out to be a species of intuition. Phenomenology is a form of intuitionism and has, accordingly, acquired the ill repute of all intuitionisms of being no more than a veiled refusal to provide evidence for one's philosophical statements. But sometimes such a refusal can be justified. Intuitionism is objectionable only if the philosopher is not willing to argue either about the nature of his intuition or about the justification for appealing to it in this case—if his appeal to intuition is merely intended to terminate philosophical debate. The phenomenologists' appeal to intuition is not of this kind. Hence more can, and must, be said about intuition.

Intuition seems to be a psychological term. Its German counterpart, *Anschauung*, often means no more than “seeing.” The objects of seeing, in its ordinary sense, are empirical objects. Essences are not empirical objects, so they cannot be seen in any ordinary sense of that term. Hence, intuition must be seeing of some extraordinary kind. One might suggest that the phenomenologists claim to have discovered one more human cognitive faculty than had been known before, but such a discovery of an actual human faculty would have to be couched in empirical statements. Phenomenologists do not make empirical statements, so they cannot claim—nor do they—to discover previously unknown cognitive faculties.

The point of introducing intuition is not psychological but epistemological. To appeal to intuition is not to make a psychological statement about the causal origins of certain statements but an epistemological one about the sort of evidence that will be relevant to them. To say that we know essences by intuition is to say, negatively, that the truth or falsity of statements about essences is not dependent on the truth about empirical statements.

The appeal to intuition makes another positive, epistemological point: Our acquaintance with essences possesses an epistemological feature also possessed by our sensory acquaintance with empirical objects. This logical feature is sometimes described by saying that what we see is described in self-validating statements. A statement, “*P*,” about particular objects is self-validating if the strongest evidence that we can adduce for it is a statement like “I have seen that *P*” or “I have observed that *P*.” We cannot, therefore, claim that “*P*” is true because there is some other true statement, “*Q*,” from which “*P*” can be inferred and that is not equivalent to “*P*.” Statements about essences are self-validating in the same sense. Given any statement, “*E*,” of the form “\_\_\_\_\_ is the essence of \_\_\_\_\_,” we cannot claim that “*E*” is true because

there is some other true statement, “*F*,” which is not equivalent to “*E*” and from which we can infer “*E*.” Of course, some statements about the existence of particular objects may be deducible from other statements, and it is similarly true that some statements about essences may be deducible from other statements. But such a deduction does not provide stronger evidence for statements about empirical existence or about essences than do self-validating statements.

Phenomenological statements are not derived by means of abstraction from particular statements, since, if they were so derived, they would not be self-validating. But they are not the only self-validating statements; empirical statements are also self-validating. An adequate account of phenomena must state more than that phenomena are revealed in the intuition of essences; it must specify this intuition to clarify in what respects it differs from the simple seeing of objects of sensory observation.

#### BRACKETING EXISTENCE: FREE IMAGINATIVE VARIATION OF EXAMPLES

In the light of the problem about the meaning of intuition, the reason for introducing a further condition defining “phenomenon” becomes clearer. This condition is not accepted by all phenomenologists but was regarded as necessary by Husserl, Pfänder, Reinach, and Scheler. We are in a position, they said, to describe objects as phenomena only after we have “bracketed existence” or “suspended our belief in the existence of objects.” Husserl calls this the “phenomenological epoche” or the “phenomenological reduction.” *Epoche* was borrowed from the Skeptics, but Husserl’s use of it differed from theirs.

These references to “bracketing” or “suspending belief in existence,” together with the talk about essences, led to the view that phenomenology is a kind of essentialism and, as such, is diametrically opposed to existentialism. There is no room here to bring out all the confusions that produced this fairly common interpretation; suffice it to say that the phenomenological epoche is not achieved by resolving to make no more statements about existence or what exists. To bracket existence is not to eliminate existence in general or existing entities in particular from the list of possible objects for phenomenological study.

In the light of Husserl’s repeated insistence on the close similarities between his phenomenology and René Descartes’s methodical doubt, the phrase “suspending belief in the existence of objects” is often taken as a

description of Cartesian doubt. But this is a misunderstanding, for Husserl insisted on distinguishing suspending belief in existence from doubting existence. This distinction cannot, therefore, be simply ignored.

Suppose a young woman states that she has direct evidence that she is terribly attractive to red-haired men. Her statement is not derived from a psychological law about the preferences of red-haired men or from a physiological one about their exceptional susceptibility to her figure and coloring. Her statement, a direct inductive generalization, is the result of her own experiences with red-haired men and tells us something about many or all of the members of the class of red-haired men. Besides all being red-haired and male, they have one further property: They cannot resist the charms of this young woman. In order to substantiate such a statement, she would have to cite cases of a number of red-haired men who at various times, under various circumstances, have given indubitable proof of their devotion. Two things are important here: that the red-haired men really exist and that their devotion to her is real. The truth of the inductive generalization depends at least on those two conditions. On the other hand, if the generalizations are correct, it follows that there exist (or existed) several red-haired men in this particular condition. If, however, the red-haired men do not exist or if their attachment is a figment of this young woman’s imagination, then the general statement is false (unless evidence of a different kind can be found).

The story of this young woman was told in order to exemplify the relation of empirical generalizations to particular empirical statements—of “I am irresistible to red-haired men” to, for instance, “A red-haired matinee idol in New York committed suicide over me,” and of both of these to the facts of the case. These relations were exemplified with an imaginary example, for it is quite unimportant that I do not know any young woman of this description. Where a description serves as an example in this sense (*example* is an ambiguous word), it is quite irrelevant whether the object described exists or not. If, on the contrary, I am interested in making a general statement about objects observed, it makes all the difference in the world whether the particular objects covered in my generalization exist and exist as described.

This is one sense of “bracketing existence.” When existence has been bracketed in this sense, the descriptions of objects or situations do not serve as premises for an inductive generalization (or an abstraction), but as examples. But “example” is used in several senses. Sometimes it is used to designate one instance of an empirical generalization, but this is not the sense used here. At

other times, examples serve a merely pedagogical function. I might have told my story about the young woman merely to provide a concrete illustration of abstract truth about empirical generalizations, in order to make the abstract statement easier to understand. In a third sense—“example” is used in phenomenology in this sense—the example both serves as an illustration and has evidential functions. In that case, the truth of the statement about empirical generalizations depends on the accuracy of the description of the example. I claim that my general statement is true because the description of the particular example is accurate, but how do I know whether a description is accurate so that it can have evidential force as an example? Since we have bracketed existence, I cannot say that the description is accurate because the case described has actually been observed to exist in a particular place and at a particular time, for examples need not be actual existents.

In order to understand this sense of bracketing existence, we must be able to answer two questions: (1) When can the description of an example rightly be said to be accurate? (2) How is a phenomenological statement to be derived from an example?

In this context Husserl talked about a procedure that he called “free imaginative variation,” comparable to what Anglo American philosophers call the method of “counter-examples.” Here we describe an example and then transform the description by adding or deleting one of the predicates contained in the description. With each addition or deletion, we ask whether the amended description can still be said to describe an example of the same kind of object as that which the example originally described was said to exemplify. Sometimes we shall have to say that if we add this predicate to the description or take that one away, what is then described is an example of a different kind of object from that exemplified by the original example. At other times the additions or deletions will not affect the essential features of the kind of object exemplified by the different examples.

In this way we discover the necessary and invariant features of a given kind of thing that the example must possess in order to be an example of that kind of thing. We also discover which features are accidental and hence irrelevant to the question whether this object, as described, is or is not an example of a certain kind of thing. What we discover is what phenomenologists call the “essence” of objects.

For example, let us suppose that we meet someone who does not have the usual five senses but only three: sight, touch, and hearing. We might be perplexed, but we

should still call him a person. The same would hold if he had three more senses than normal persons. But suppose we met someone who looked like a person but seemed to be deaf and blind, and without any tactile, olfactory, or gustatory sensations. He would still be regarded as a person, although as a seriously defective one. But suppose further that we find that this creature looks like a human being except that it has no sense organs at all. Would he nonetheless be called a person? No. An animal? No. A plant? Not really. We have no word in our language for such a being. We would not know what to say about it.

Here we have varied in imagination an example of a person with reference to one predicate, “possessing sense organs.” We find that in order for anything to be a person, it must have sense organs of some kind; there is an essential (necessary and invariant) relation between “person” and “possessing sense organs.” The results of free imaginative variation are statements of such essential connections. Since statements about phenomena are one kind of statement about essences (and vice versa), the statements resulting from this procedure are phenomenological statements.

“EPISTEMOLOGICAL CIRCLE.” Phenomenological statements are made while existence is and remains bracketed. If true, they are so not because they describe something that we have directly observed. Nor are they true because they are warranted by a series of observations of particular objects or events. Hence, they do not imply the past or present existence of particular objects in just the way in which empirical generalizations imply it. All that is asserted in the phenomenological statement is that if any being is an example of a person, then it must have sense organs. We are, therefore, making an assertion about the necessary relations of properties: Whatever has the property of being a person must also possess the property of having sense organs.

This is the method of free imaginative variation. It would seem to provide an answer to the second question raised earlier—how a phenomenological statement is to be derived from an example. But the same procedure can also be said to provide an answer to the first question, how we decide whether an example is described accurately—whether the description contains all the essential predicates so that the thing described may rightly be said to be an example of a certain kind of object. For, once we have made clear the invariant features of the sort of thing exemplified, we are in a position to say whether the example contains all those necessary features. But to use free imaginative variation to answer both questions is, of

course, circular; we derive the phenomenological statement from any given example by means of free imaginative variation and then confirm that the original example was accurately described because it possesses the invariant features expressed in the phenomenological statement. It would seem that we need an independent criterion for deciding the accuracy of the description of any given example, but there is no discussion of such an independent test in the writings of the phenomenologists. The phenomenological method appears, therefore, to be circular in a second sense that might be called the “epistemological circle.”

Phenomenology, as we saw, is circular because it clarifies its own method while using it (the methodological circle); it is also circular, we see now, because it confirms its statements by reference to examples and then attests the accuracy of the descriptions of these examples by reference to the statements derived from them (the epistemological circle). We must now show that what we claimed earlier for the methodological circle—that its presence cannot be construed as an argument against phenomenology—is true for the epistemological circle as well. This will be argued for by an examination of a second sense of “bracketing existence.” In this second sense, “bracketing existence” refers to the transition from non-reflective to reflective thinking.

#### BRACKETING EXISTENCE: PHENOMENOLOGY AND REFLECTION

In free imaginative variation we ask ourselves about any given property of an example, “Is this a necessary feature for being a such and such? Is that?” For our answer we do not appeal to empirical observation. Neither do we give an answer simply by deciding to regard some particular feature as essential. We do not define our terms arbitrarily; instead, with each variation, we ask ourselves whether the example described could still be recognizable as an example of the same sort of thing as that exemplified before. We ask ourselves what features an object must have in order to be recognized as an example of a certain kind of object. What we discover are necessary conditions for recognizing a certain kind of thing.

But recognition presupposes previous acquaintance. I cannot recognize someone whom I meet for the first time, unless I have seen pictures of him or have been given his description or perhaps dreamed of him before. But if we can recognize only what we know already, then we must already know the necessary features of the objects that we are able to recognize. In that case, there would seem to be no need to bracket existence and to

vary the examples freely in imagination in order to discover their essential features, since the entire procedure presupposes that we know these essential features all along.

The resolution of this difficulty comes when we consider that the word *know* has two radically different senses, which some English philosophers have called, respectively, “knowing how” and “knowing that.” The latter refers to knowledge expressed in statements. To “know that” something is the case is to be able to put what is known into words. I can show that I know a person by describing his looks; however, it is of course also possible that I should know a person and yet be quite unable to give any sort of adequate description of his looks. It is often very difficult to give a good description of those persons whom we know very well. I know them, not in the sense that I can describe them but that I could recognize them anywhere. I can pick them out of a crowd without hesitation. I can identify them by their voice or their walk, although I might be hard put either to describe in words or to imitate them. This second kind of knowledge is “knowing how”; in the example, I know how to recognize a person.

These two kinds of knowledge are independent of each other. It is not a necessary condition for being able to do something, such as recognize someone, that I should be able to *say* that he is a person of a certain description. Conversely, it is not necessary that I should be able to do a certain kind of action, such as ride a bicycle, in order to be able to give a detailed and accurate description of riding a bicycle. It is, furthermore, possible that for certain kinds of knowing how there is no corresponding knowledge that.

Of some performances I can say: This time I did it right; last time I did it badly. Therefore, I possess criteria for proper performance. If asked what these criteria are, I may not be able to put them into words, but I know them in the sense that I use them and, in many cases, I can, upon reflection, state what they are. I have then, by means of reflection, produced knowledge that \_\_\_\_\_ corresponding to the knowledge how \_\_\_\_\_ which I possessed all along. This is what happens when I vary an example freely in imagination: I am always able to discriminate between the thing that I would recognize as a certain object and the thing that I would either take as a different kind of object or about which I would not know what to say. But only upon reflection can I verbalize the criteria implicit in such a recognition by stating the essential features of any given kind of object.

**REFLECTIVE THINKING.** When I vary examples freely in imagination, I reflect about the criteria implicit in my ability to recognize examples of the given sort of object; I now put into words the criteria that previously were merely implicit in my performances. This description of the two sides of the process called “bracketing existence” accords perfectly with Husserl’s explanations of it. Phenomenology, he stated, is a reflective enterprise. In its reflection it brings to light what was previously “anonymous” or “latent” in our “performances” (*Leistungen*). But phenomenological reflection is a very special kind of reflection. In phenomenology we do not reflect about facts (“Did I see right? Was that really Jones lying in the gutter?”) or about specific actions (“Should I have lectured Jones on the evils of drink?”). Phenomenological reflection does not produce any factual statements, nor does it employ factual statements as premises or as the starting points of reflection. In phenomenology we reflect about examples, in the sense explained; the result of such a reflection is not a factual statement or an empirical generalization but a statement about the necessary conditions for any object’s being an example of the sort of thing considered in our reflection.

“Bracketing existence” and the other phrases applied in this context are used ambiguously. Why did Husserl fail to distinguish these two senses? We have already uncovered one source of this ambiguity by showing that we can employ the method of free imaginative variation of an arbitrarily chosen example in order to clarify the essential feature of any object only if we reflect about the example. Hence, treating a given case merely as an example (bracketing in the first sense) presupposes that we have made the transition from nonreflective to reflective thinking (bracketing in the second sense). Although the two kinds of bracketing are distinct, they must occur together.

But there is a second source of the ambiguous use of all these phrases. “Bracketing existence” and “suspending our belief in the existence” of an object seem to be particularly apt in describing important features of the transition from nonreflective to reflective thinking. Reflection involves questioning—more specifically, questioning something that I believed before or regarded as properly done. When I reflect, I ask, “Was that really Jones in the gutter?” or “Should I have helped him up?” Such questioning requires awareness that there are questions to be asked in this situation and that they are not pointless. Before I can reflectively question my earlier belief that it was Jones whom I saw lying in the gutter, I must be open to the possibility that it was not Jones. Hence, as I begin to reflect, I suspend my belief in the existence of Jones in

that condition in that place, or I put his existence in brackets. “Bracketing” in this sense means that I become aware of the possibility that something which I believed to exist does not exist as I thought it did, that a statement which I considered true is not, or that some act which I considered right when I did it might have been wrong. Once I have become aware of that possibility, I am ready to reflect.

The insight that phenomenological statements are the product of reflection resolves the methodological and the epistemological circles. The methodological circle arises because the method must be used to clarify what the method itself consists of. It seems, therefore, that we can use the method only if we know what it consists of, but we can know what it consists of only if we have already used it. Therefore it would seem that we can never get started. But since phenomenology is reflective, it does not presuppose knowledge that the phenomenological method consists of certain procedures; it only presupposes that we know how to use it (to reflect about the essential features of arbitrarily chosen examples), even if we cannot describe it. Such a description is not a necessary condition for using the method, so there is no problem here.

The epistemological circle is resolved in a similar manner. In the method of free imaginative variation, it seemed that we could know that a given phenomenological statement, “*P*,” is true only if we know that the description, “*E*” of the corresponding example is accurate. But we can know that “*E*” is accurate only if we know that “*P*” is true. Hence, it would seem that we cannot know either that “*P*” is true or that “*E*” is accurate. But phenomenological reflection begins with my being able to recognize the example described in “*E*.” I know that I describe the example accurately to the extent that I recognize the object in my description of it. Both the accuracy of “*E*” and the truth of “*P*” are tested by the criteria implicit in my ability to recognize the object. Hence, there is no difficulty in this case either.

**NONEMPIRICAL STATUS OF PHENOMENA.** In the search for a complete definition of phenomenon we have now discovered three conditions defining phenomena: (1) phenomena are essences, (2) phenomena are intuited, (3) phenomena are revealed by bracketing existence. The third requirement is twofold: Phenomena are known only upon reflection of a specific sort, namely, reflection about the essential features of arbitrarily chosen examples. Once again the question must be raised whether this definition of phenomena is complete. The criterion of

completeness used earlier was that a definition of “phenomenon” is complete only if it is consistent with the first of the three requirements for phenomenological statements—that they are nonempirical. We must ask, therefore, whether phenomena as defined can be described in empirical statements or whether our definition has ruled out that possibility.

It may seem obvious that the definition of phenomenon is complete by this criterion because it seems impossible that phenomena as defined—as being revealed only by bracketing existence—could be described in empirical statements, for statements about phenomena are not statements about single, observed particulars or about series of such single, observed particulars. They are, rather, statements about the necessary relations between the properties of some example of a certain kind of thing in which we do not consider whether the description of our example refers to an actually existing object.

But can we really conclude from this fact, namely, that no observation of actually existent objects is consulted in phenomenological reflection, that the truth of phenomenological statements is independent of the truth of empirical observation statements? We must distinguish between the description of the process by which we arrive at phenomenological statements and the logical conditions that these statements must fulfill in order to be true. The former merely describes how I discover certain statements, but it reveals nothing about the truth conditions of my statements. It is said, for instance, that some Greek geometers discovered certain statements about plane figures by measuring and weighing actual plane figures of tin. They arrived at their statements by means of observations; they were able to make certain statements in geometry after observing actual physical objects, but their statements are no more empirically true (or false) than are the same statements when they appear as theorems in Euclid’s *Elements*.

This example presents a case in which statements whose truth or falsity is independent of empirical observation are discovered through empirical observations. It is possible that statements about phenomena constitute a converse case where empirical statements are discovered without explicitly consulting observation of sensory particulars. For instance, it was stated in the preceding section that the phenomenologist does not necessarily consult actual observations when he describes phenomena; his example may be purely imaginary. But it is possible that the statements that he is thus able to make are nevertheless empirical statements. All that was said was

that the making of a phenomenological statement is not immediately preceded by observations of existent objects.

Perhaps, however, this is not necessary, since we know the necessary conditions for anything to be an example of a certain kind of thing because we have observed examples of this kind of thing many times and have, as it were, performed an unconscious induction all along. If this is true, then phenomenological statements may still be empirical statements. That they are not empirical statements has not been proved by stating that they are not discovered by means of explicit and deliberate observation of existing objects. The description of “bracketing existence” and of the subsequent reflection has revealed something about the method of discovering statements in phenomenology, but it has not shown that the statement so discovered may not nevertheless be empirical in the sense of being either verifiable by reference to observations of particulars or confirmable or at least refutable by reference to such observations.

There is reason to suspect that the phenomenologists who required that existence be bracketed in phenomenology thought that this requirement assured them that the statements so discovered would not be empirical in any of the senses mentioned. But, as has been shown, they have no such assurance. Hence, they can have no assurance that what is discovered once we have bracketed existence is a phenomenon, in the sense of being the referent of a nonempirical statement. We need further argument to show that bracketing existence does reveal phenomena in the required sense, in all or at least in some cases. Some of the phenomenologists, notably Husserl, have brought forward a number of considerations that provide the arguments needed here. These considerations can best be approached by considering intentionality.

## INTENTIONALITY

It was said earlier that reflection undertaken after we have bracketed existence yields, if successful, descriptions of activities that we perform with ease in everyday life but are not able at the same time to describe. Concerning such activities we also know when they miscarry, when they are performed incorrectly or in an improper context, or when someone mistakes such an activity for a different one. We possess criteria for correct and appropriate performance and identification of such activities but are, ordinarily, unable to formulate them. Reflection subject to bracketing of existence yields formulations of these criteria. The phenomenologists regarded all statements resulting from such reflection as nonempirical, but there is no ground for thinking that this is true. These phe-

nomenologists also believed that all the activities that are reflectively described and clarified after bracketing existence are intentional activities. This view can also be shown to be open to objections, but from these two doubtful assertions we can extract a more defensible characterization of phenomena than the one reached so far. So far three necessary conditions for phenomena have been listed: (1) They must be essences that are (2) intuited (3) as the result of the exemplary reflection that requires bracketing existence. We now add a fourth condition, namely, that statements about phenomena must be limited to statements about intentional acts.

The noun *intentionality* does not refer to a thing (as does, for instance, *sodality*) but to the state of an entity—the state of being intentional. Although Husserl used *intentional* in all kinds of contexts, in its primary sense it is an adjective modifying “act”; being intentional is a characteristic of acts. In this employment, “intentional” has an ordinary meaning as a synonym for “deliberate” or “done on purpose,” and a philosophical meaning different from, although related to, its ordinary, nonphilosophical meaning. The philosophical use of the term dates back to scholastic philosophy. Later, it completely disappeared from the philosophical vocabulary until it was reintroduced in 1874 by the Austrian philosopher Franz Brentano. Husserl, a student of Brentano’s, gives credit to Brentano for reintroducing intentionality into philosophical discussion but adds that intentionality became a fruitful philosophical concept only in phenomenology.

Intentional acts have four aspects, and there are four distinct questions we can ask about them. The sentence “Luther thought that the devil was in his cell” is the complete description of an intentional act. We can ask who is performing an intentional act, and the answer consists of a proper name (“Luther”). It could also be a personal pronoun (“I” or “we”) or a definite description (“the father of the Reformation”). We can, in the second place, ask what this person is doing, and the answer will consist of the inflected form of a verb (“thinks,” “thought”). The third question concerns the intentional object of the act, what the act is about. In the example, Luther is thinking about the devil. Finally, we can ask in what manner or under what description the intentional object is object of the act; in the example, what is Luther thinking about the devil? “The devil is in my cell.”

The intentional act, having four elements, is a tetradic relation. So, for instance, is the relation described in the sentence “I place the book on the table.” Here also there are four elements: the subject or agent (myself), my action (placing), what I place (the book), and the table on

which I place it. There is, however, an important difference between the two cases. The second statement is false unless there is a table on which I place the book. If the statement as a whole is true, the final of the four terms in the tetradic relation must also exist. It would be self-contradictory to say “I place the book on the table ... but there is no table.”

We can therefore infer the existence of the table from the truth of the statement “I place the book on the table.” This is not so in the case of intentional acts. If it is true that Luther thought that the devil was in his cell, it is not therefore true that the devil exists, let alone that he was in Luther’s cell. Luther might have had hallucinations; he might have been the victim of religious madness; or he might have been drunk. All three of these are situations in which we are inclined to see things that are not there or to believe that things exist which in fact do not. Nor can we conclude from the truth of the original sentence that the devil does not exist or was not in Luther’s cell. The same holds of whatever is thought or believed to be the case. A belief that my wallet was stolen or that there are leprechauns does not allow the inference that there was a thief who stole my wallet or that there are leprechauns. The same is true of perceiving, of hoping, expecting, doubting, fearing, and all similar activities. The truth of a statement describing someone’s intentional act does not allow the inference of either the existence or the nonexistence of what the act is about. This distinguishes intentional acts and their four elements from genuine tetradic relations, where the existence of all four elements can be inferred from the truth of a description of the relation.

**THE NONINFERENCE CRITERION.** The usual discussion of Husserl’s doctrine of intentionality presents intentionality as (1) the defining characteristic of consciousness in the ordinary sense of that term, which (2) consists in the fact that all consciousness is consciousness of something. The first point is false; the latter is true but trivial. It merely asserts that to be conscious is to be related to something. But I am also related to something if, for instance, I own property. In that case I am the owner of something. But being the owner of something is not an intentional act because the existence of the object owned can be inferred from the fact that I own it. The existence or nonexistence of the object of the intentional act, however, cannot be inferred from the true description of that act. (We shall call this the “noninference criterion”). This, rather than merely being related to an object, is the property of intentional acts that distinguishes them from all other kinds of tetradic relations. Hence, it is a defining characteristic.

Two examples will show that intentionality is not the exclusive property of consciousness. Consider the sentences “Luther threw an inkwell in order to injure the devil” and “The rat pushes the lever in order to obtain food.” Both sentences express tetradic relations: the agent (Luther, the rat), what he does (throwing, pushing), what he does it with (the inkwell, the lever), and the object of the activity (injuring the devil, obtaining food). It may be said that these are not intentional acts because the object in each case is not what the act is about but is, rather, an aim or a purpose. The acts described in these two sentences are intentional in the ordinary sense of being purposive, but according to the noninference criterion, they are also intentional in the philosophical sense because we cannot infer from the first sentence that the devil was injured and hence we cannot infer that the devil exists or does not exist, nor can we infer from the second that food was obtained by pushing the lever.

The acts described in the two sentences are not acts of consciousness or mental acts in the traditional sense. Throwing and pushing have traditionally been regarded as physical acts, but they differ according to the purpose served. When throwing something at a person in order to injure, one throws differently (much harder, for instance) than when one throws someone a cigarette in order to be helpful. Although physical, both of these acts are intentional in the philosophical sense. Hence intentionality is not, as Brentano thought and Husserl thought at certain times, the defining characteristic of consciousness in the ordinary sense. Husserl became aware of this and redefined “consciousness,” in his later writings, by extending the term beyond its ordinary meaning to apply not only to mental acts but also to all kinds of activities, even to those usually regarded as physical, as long as they are intentional. Here intentionality became the defining characteristic of consciousness because this was how consciousness was defined. Husserl would perhaps not have wanted to apply “consciousness” to the behavior of animals, but his views on this point are not well known.

**Inference.** The verb “to infer” is used in a variety of senses in English, so it must be made clear in what sense it is used in the formulation of the noninference criterion. Suppose I see my foot as it sticks out unshod from my trouser leg and I say, “There’s my foot.” If someone asks me why I think that my foot is there (exists), I answer, “Because I see it” (or “Because I see something that looks like my foot”). In a loose sense of *infer*, I may be said to infer the existence of my foot from the fact that I see it. In this sense of *infer*, therefore, the correct description of an intentional act (“I see what looks like

my foot”) allows me to infer the existence of what I see (my foot). But this is inference in a loose sense. The conclusion does not follow necessarily from the premises. It is possible that the premise should be true and the conclusion false, as happens, for instance, when I am having hallucinations. There I see what looks like my foot, but the foot is not there. Common examples of this are the so-called phantom feelings—an amputee feels his foot long after it has been amputated. It is true that he feels his foot, but it is false that his foot is there. But if I say that I know my foot is under the table because I feel it, the inference (in the loose sense) is correct.

The sense of “to infer” used in the noninference criterion is stricter. In this sense we say that something is inferred from a premise or set of premises if the falsity of the conclusion is incompatible with the truth of the premise(s). In this sense it was said earlier that we can infer from the truth of “I place the book on the table” that there is a table. It would be self-contradictory to say “I place the book on the table ... but there is no table” and to claim that both parts of this compound statement are true. It is in this stringent sense of “to infer” that the noninference criterion denies that we can infer the existence of the object of the intentional act from a true description of the act itself. The noninference criterion does not deny that feeling my foot, for instance, is often sufficient ground for saying that my foot is there. But it does deny that my foot must exist necessarily if I feel it. Intentional acts differ from other tetradic relations in that it is not inconsistent in the case of intentional acts to deny the existence of the final term of the four-term relation and to assert that the relation is described truly, but it is inconsistent to do this in the case of all nonintentional four-term relations.

**Criterion is nonempirical.** It is now easy to show that a statement of the noninference criterion is a nonempirical statement in the sense that no empirical statement can show it to be false. In this sense mathematical statements are nonempirical—no measurement of angles or lines in a triangle can show that geometrical statements about triangles are false. If there does appear to be a conflict between actual measurements and measurements predicted on the basis of certain geometrical propositions, we do not reject the geometrical proposition underlying our prediction; rather, we conclude that the measurements are false. The reason for this is, of course, that the procedures used in measuring presuppose the truth of the pertinent statements in geometry. In order to show that the statement of the noninference criterion is false, there must be at least one intentional act in which the

existence of what the act is about or aims at follows with necessity from a true description of the act. But philosophers agree that no necessary relations are observed, or can be inferred from observations, so no statement about a necessary relation can be an empirical statement. Hence, the case needed to refute the noninference criterion cannot be described in empirical statements. It follows that the statement of the noninference criterion, not being refutable by means of an empirical statement, is not itself an empirical statement.

**INTENTIONALITY AS A PHENOMENON.** The statement of the noninference criterion satisfies the fourth condition laid down for phenomena: It is a statement about intentional acts. It is easy to show that it also satisfies the other three conditions for phenomena: (1) The preceding analysis consisted of reflection subject to bracketing of existence. (2) It brought to light certain essential features of intentional acts. (3) The truth of the statements rests on intuition, in the sense discussed earlier. Intentionality is, therefore, not only one mark of phenomena but is also itself a phenomenon. It has also been shown that the description of this phenomenon contains at least one nonempirical statement, namely, the noninference criterion. There is, then, at least one statement about phenomena, as now defined, that is nonempirical. This suggests that the four conditions for phenomena constitute a complete definition. However, the four conditions for phenomena are not sufficient for a complete definition, so a fifth condition must be added—that, with respect to intentional acts, phenomena serve as criteria of coherence.

### CRITERIA OF COHERENCE

Intentional acts are of two kinds; they are either purposive or about something. Purposive acts may be said to be adequate to their intentional object if the means chosen accomplish their purpose. Acts that are about some intentional object may be said to be adequate if what is believed or asserted about an object is really true, if what is questioned is questionable, if what is doubted is doubtful. Whether a given purpose is pursued correctly by using certain means depends on the nature of the purpose and of the means chosen, and on the way the means are used. Whether Luther throws the inkwell correctly at the devil depends on the weight of the inkwell, the distance between him and the devil, and how he throws. There are correct and incorrect ways of throwing inkwells or anything else. Which ways are correct and which are not is a matter of empirical fact, to be discovered by empirical study. Hence, rules about correct performance

of this kind of intentional act are empirical rules. Similarly, it is in many cases an empirical question whether my beliefs are true, whether what I question is questionable, or whether what I doubt is doubtful. It can be shown that at least some of these rules satisfy all four defining conditions for phenomena; hence, they can be regarded as statements about phenomena, as defined so far. This, in turn, shows that the four conditions laid down do not constitute a complete definition of “phenomenon,” for phenomena, under this definition, are capable of being described in empirical statements. We need a fifth condition.

The following consideration will yield the required fifth condition for a complete definition of “phenomenon.” Before we can ask whether any given intentional act is correctly performed—whether it is adequate to its intentional object—we must be certain that what we are asking about is a genuine intentional act. Since intentional acts have four elements—the subject (or agent), the action, the intentional object, and either the means used or what is asserted about the intentional object—we need certain rules to determine which subject can be combined with what actions, which intentional objects, and which means or assertions to form coherent intentional acts. Not just any member of each of these four classes of elements can be combined with any other to form a coherent and intelligible intentional act.

**COHERENCE AND INTELLIGIBILITY.** The meanings of “coherent” and “intelligible” are best indicated by examples of their opposites, intentional acts that are incoherent or unintelligible. Purposive acts are not coherent and not intelligible (they “make no sense”), for instance, where the action and the means used are inappropriate to the intentional object. Someone might have said to Luther that it made no sense to throw anything at the devil because the devil is not a person but merely a symbol of evil. Not being a person, the devil has no body—and hence no location—and therefore cannot be made the target of any physical missile. A different case of an incoherent purposive act is that in which the means are inappropriate to the action. “Killing a person with kindness” is a metaphorical expression precisely because it literally makes no sense; the means chosen for killing a person are utterly inappropriate. They are not inappropriate merely in the sense that someone might try to use kindness as a murder weapon and discover that it does not do the job. It is not at all clear how one would proceed literally to try to kill someone with kindness. “Killing a person with kindness” is therefore not an intelligible or coherent intentional act. Similar incoherences can be

found in the other relations among the four elements of intentional acts.

Corresponding incoherences appear in intentional acts that are about something. If what I believe about something is utterly inappropriate to its intentional object, such as “The Pythagorean theorem is mellifluous and sweet-smelling,” there is no way of telling or even of finding out whether the statement is true. Asserting this sentence is not an intelligible intentional act, and hence the assertion is neither true nor false. Similar incoherences can occur between the action (for instance, “I predict”) and its intentional object (for instance, some past event) or what is being predicted (that something happened yesterday).

So far the notions of coherence and incoherence, of intelligibility and unintelligibility, have been exhibited within single intentional acts. Husserl pointed out that there is also coherence and intelligibility of series of acts.

Suppose that Luther, rage suffusing his face, threw an inkwell at the devil with all his might and the very next moment rushed up to him, saying, “My dear fellow, I am so sorry. How very clumsy of me. Here, let me help you.” This would be very surprising because the first action seemed clearly intended to injure, the second to placate. The change between the two is unmistakable and can be described by saying that the second act has a different intentional object from the first. As juxtaposed, the two acts make no sense because they seem to be members of two incompatible series of acts. The first act seems part of a series intended to enrage or injure the devil, and the second seems part of a different series aimed at mollifying the devil. The first action clearly leads to the expectation of another angry action. The second one disappoints that expectation, so the two actions make no sense, although each by itself makes sense. As single acts they are intelligible or coherent, but they do not make sense when they come in the above order. No one can understand what Luther is up to. We know what a man is up to if we understand a sequence of his actions and have correct expectations about what he is going to do next. If our expectations are disappointed, we may conclude that the agent has changed his mind or that we did not understand him to begin with. We understand or do not understand what someone is up to if his purposive actions form a coherent or incoherent series, respectively.

All this is true irrespective of whether the series of acts is performed well or badly. Hence, there are two sets of rules governing series of acts that correspond to the two sorts of rules governing individual acts: those which govern the coherence of act series and those which gov-

ern the adequacy of the act series to its collective purpose. What a man is up to in a series of acts can be inferred only from the sequence of acts performed. But not all sequences of acts are coherent. There are, therefore, rules about intentional acts determining the conditions for coherence of any series of intentional acts. Only if a series is coherent corresponding to the rules governing coherence can the question whether the actions and the means chosen are adequate to the aim pursued in the whole series be answered in the light of the relevant facts. Empirical statements about the adequacy of actions and means to their collective end are to be distinguished from statements about the coherence of such collections of acts.

It is not necessary to cite more examples to show that a series of acts which are about something are coherent or incoherent, intelligible or unintelligible, in analogous ways. A single act of belief, assertion, or questioning may be perfectly coherent and intelligible by itself but may be entirely out of context with what precedes or follows, and it is not understood what this person, in this act, is talking about, what he is trying to say.

**HORIZON.** Husserl used the term *horizon* to refer to the relations of coherence and incoherence of intentional acts. *Horizon* was not intended to refer to the place where sky and earth meet but to the edge of the perceptual field, which moves and changes with movements of the head or of the entire body. The horizon metaphor suggests that as the edge of the perceptual field (the horizon) leads us to expect a continuation of what lies before us, so any given intentional act suggests further acts that would be continuous or coherent with it. What is said in one act or done in one purposive action leads one to expect a second assertion or a second action continuous with the first. The second statement is continuous with the first if it is about the same object as the first; if in the second action one is up to the same thing as in the first, the two are continuous. I know what you are talking about or what you are up to when I know what sort of thing you will say or do next.

The horizon metaphor also implies that these relations between intentional acts are necessary conditions for any act being intentional, just as it is a necessary condition for the existence of a perceptual field that it have a horizon. Something is an act of asserting, for instance, if and only if I can repeat what I said in another way; if I can amplify, clarify, explain what I said; or if I can confuse, muddle up, and utterly obfuscate what my assertions are about. It is impossible that an intentional act should be

without horizons, that is, unrelated to any other intentional act.

*Criteria of coherence.* As the horizons of the perceptual field are to some degree indefinite, so are the horizons of intentional acts. I cannot infer from any given assertion or activity of yours that you will next assert one particular statement or do some particular action and no other. When I see a church steeple on the horizon, I know that, when I come closer, I will not see a hippopotamus at its base. But there is definitely a point in coming closer to discover what the church or the building that resembled a church from a distance looks like.

Similarly, there is a point in listening to you to find out what your next statement is going to be or in watching what you are going to do. If I understand what you are talking about or what you are up to, I have some idea of what you are going to say or do next. I know the minimum conditions for your next statement and action; I know the limits beyond which your next action will not be continuous with the last or your next statement will not be about the same object as the last. Horizons are the necessary conditions for any series of assertions or activities to be intelligible. Different kinds of intentional acts have different kinds of horizons. Linguistic acts are related in terms of their meaning; purposive activities, by reference to the purpose. It is the task of phenomenology to clarify the different sorts of horizons (conditions for intelligibility) and to put into words what the horizons of individual examples of each kind of act are. Husserl called the clarification and formulation of horizons “intentional analysis.” The results of such intentional analyses are statements of the criteria for the coherence of intentional act series.

Having understood what Husserl meant by “horizon” and that there are criteria for the coherence of single acts corresponding to the horizons in act series, we have found the fifth condition defining “phenomenon.” Statements about phenomena must, besides satisfying the first four conditions, be about the criteria of coherence of single intentional acts or of sequences of intentional acts. When we look at any object as a phenomenon, we are trying to discover the criteria for coherence of those intentional acts in which the object (or its name or description) can figure.

#### ARE PHENOMENOLOGICAL STATEMENTS A PRIORI?

Traditionally philosophers have called statements “a priori” if they are (1) nonempirical and (2) necessarily true. Phenomenologists have always held that their statements

are a priori. The two parts of this claim must be examined separately.

It has been shown that phenomenologists agree that their statements are nonempirical, although they disagree about the description of phenomena. Some phenomenologists were content to describe them as essences intuited, but others regarded this as insufficient and added that phenomenological descriptions must be preceded by bracketing existence. But bracketing existence also turned out to be an inadequate guarantee that phenomenological statements are nonempirical. Therefore some members of the phenomenological movement, notably Husserl, added further requirements for statements about phenomena. The preceding discussion can be summarized by stating the five conditions that any statement must satisfy if it is to be a statement about phenomena:

- (1) It must be about essences.
- (2) It must be self-validating (intuitive).
- (3) It must be the result of bracketing existence.
- (4) It must be about intentional acts.
- (5) It must lay down the criteria of coherence (or intelligibility) of intentional acts.

We must now, once again, ask: Are statements of this kind nonempirical?

**THE SENSES OF EMPIRICAL.** The above question is not easy to answer because the term *empirical* has several meanings. We must examine some of them.

Statements asserting particular matters of fact, such as “There is a fire burning in the fireplace,” are true if observation shows them to be true and false if observation shows them to be false (for instance, that the fire has gone out). They are empirical because one observation will show them to be true or false.

General statements, such as “Continuous nervous tension produces high blood pressure,” are neither confirmed nor refuted by one observation or even by a few observations but only by a series of carefully controlled observations. This case concerns generalizations about observable connections.

There is a further sense of “empirical” that applies to statements about objects which are in principle nonobservable, such as “ideal gases” or “perfectly elastic bodies.” Such entities cannot be observed because they do not exist, and hence we cannot frame empirical statements about them in either the particular or the general sense of “empirical.” These entities, which cannot be described in observation statements, are instead defined in a series of

statements constituting a scientific theory. From such a theory statements can be deduced that can be tested by reference to direct experience. If observation shows the deduced statements to be false, we must reject the theory, and hence our theoretical statements about the unobservable entities are indirectly refuted by observation. These statements are therefore, in this indirect way, empirical because observations can serve to show them to be false.

**PHENOMENOLOGICAL STATEMENTS.** Phenomenological statements, as described in the preceding sections, are not empirical in the first two senses of the term. They are not empirical in the first sense because they are never statements about individual existing intentional acts but only about the criteria governing types of acts; only particular statements are empirical in the first sense. Empirical in the second sense are generalizations derived by induction from a series of observations of particulars. Such inductive generalizations presuppose that we know what particulars belong to the class of objects to be observed. If we want to make a generalization about the relation between nervous tension and high blood pressure, we must have a very precise idea of what must count as examples of nervous tension and what blood pressure counts as “high” blood pressure. Similarly, we cannot inductively arrive at statements about intentional acts unless we are already able to differentiate a coherent intentional act from an incoherent collection of each of the four kinds of elements of intentional acts.

The same applies to generalizations about coherent series of intentional acts. Nothing said by the phenomenologists should exclude the possibility of framing empirical (in the general sense) statements about intentional acts. All that is argued is that the criteria of coherence of individual acts as well as of series of acts are presupposed and therefore are not established by such inductive generalizations. Therefore, statements formulating these criteria cannot themselves be empirical generalizations.

It is undoubtedly a task for phenomenology to differentiate the different senses of “empirical,” that is, to describe the different kinds of intentional acts involved in what we call experience and the criteria of coherence belonging to each kind of act. Oddly enough, the phenomenologists so far have barely begun to undertake such an examination, and hence their conviction that statements about phenomena, as now defined, are non-empirical is not supported by adequate phenomenological analyses. This important shortcoming in the theory of

the phenomenological method is all the more serious because there are good reasons for thinking that there is one perfectly good sense of the words *experience* and *empirical* in which statements about phenomena, as defined, are empirical.

**EMPIRICAL PHENOMENA STATEMENTS.** In a scientific theory, the terms are defined in relation to one another in such a way that if we alter the definition of one term, the definitions of some of the other terms are also changed. The effect of such a set of interrelated definitions is to limit the contexts in which these terms may be applied. A set of phenomenological statements has a similar function; it limits the contexts in which given intentional acts may be performed. The limits imposed on these intentional acts in the phenomenological statements are interrelated as the definitions in a theory are. If we alter the limits of one intentional act, those of other acts are also changed. History and ethnology provide many examples of such changes.

Among the Trobriand Islanders, for instance, successful gardening requires the use of magic. Before seedlings are planted, a spell must be spoken over them. It is very important that the magician’s mouth be as close as possible to the seedlings, for otherwise some of the power of the spell will be dissipated. The power of the spell resides not in the sound waves produced by the magician but in the meaning of the terms used, something that we would not regard as a physical phenomenon. Yet the power of the magical words is here treated as if it were a physical force that varies with the distance from the object it affects. It is clear that the Trobriander does not draw a distinction between the physical and the mental, so it makes perfect sense for him to say something that makes no sense to us—that the spell must be spoken as close as possible to the seedlings in order to be effective. He imposes different limits on his intentional acts—what makes literal sense to him is to us at best symptomatic of the confusions of the “primitive” mind—and these various limits are interrelated. We can formulate them in a set of phenomenological statements that we regard as false and he regards as true. This example shows the analogy between the limitations imposed on theoretical terms by their implicit definitions in a scientific theory and the mutual limitations imposed on intentional acts and expressed in phenomenological statements.

Statements in a scientific theory limit the application of the terms. If the limits imposed allow the use of the terms in false factual statements, these limits must be

altered; the theory is invalid. In analogous ways phenomenological statements may be invalidated by experience. Phenomenological statements express the limits imposed on intentional acts, and if these limits are such that we cannot distinguish true factual statements from false ones, the limits must be altered; the phenomenological statements are invalid.

In order to make true generalizations about gardening and distinguish them from false ones, we need a clear notion of causation. Causal relations as discussed in science exist only between spatiotemporally contiguous events, and this implies that only spatiotemporally located events can be either causes or effects. A clear notion of causal relations, therefore, presupposes a clear distinction between events that are and those that are not spatiotemporally located, or between physical and mental events. Where such a distinction is not drawn, no clear understanding of causal relations is possible. The Trobriander does not differentiate physical events from mental events (and forces); hence he cannot clearly differentiate causal relations from noncausal relations. As a result, he cannot make general statements about gardening that are always true or always false as tested by the information available to us. They may, of course, be always true (or false) tested by what he knows. His generalizations are about classes containing very heterogeneous types of relations, both causal and noncausal. Statements about the causal are true under very different conditions from statements about the noncausal, so his generalizations are sometimes true and sometimes false, and he does not have the vocabulary necessary to reformulate them in such a way that they are always true or always false. This shows that the Trobriander's lack of scientific information about biology is not accidental. It is impossible for him to do natural science because his language lacks the requisite distinctions. Scientific statements cannot be made in his language, which is clear proof that it is inadequate and that the phenomenological statements describing his linguistic acts as well as the nonlinguistic ones, such as those associated with garden magic, are therefore invalid.

This argument as stated is not conclusive, but it can be strengthened to make a rather formidable case for holding that the phenomenologists are mistaken in their claim that their statements about phenomena are nonempirical in all senses of that term. This conclusion shows that the question asked at the very outset—what are the truth conditions of phenomenological statements—remains unanswered. In the preceding a good deal has been said about these truth conditions, but it has

been shown that that answer is incomplete. The phenomenologists' account of their method not only lacks a complete theory of experience in its different forms but also a complete theory of truth, at least as that term applies to the statements in phenomenology.

**THE SENSES OF "NECESSARY."** The second aspect of a priori statements is their necessity. A priori statements are necessary because they are nonempirical; if they are true at all, they are true independently of facts about the world. Even if all the statements about this world that are now true were false, and if, therefore, our world were very different from what it is now the a priori statements would still be true. They are true whatever happens to be the case in the world. Hence we may say that, if true at all, they must be true regardless of any facts. For this reason the term *necessary* has often been explicated as "true for all possible worlds." A different world from ours is one whose description requires factual statements to be true that are false of our world. Since necessary statements are true whatever factual statements may or may not be true, they are true for all possible worlds. A statement is necessary, therefore, to the extent that its truth is logically independent of the truth or falsity of empirical statements. It follows that there are different senses of "necessity" to correspond to the different senses of "empirical." There are, therefore, also different senses of "a priori." Hence, phenomenological statements are clearly a priori insofar as they are not empirical in the first two senses of that term. But phenomenological statements are empirical in a third sense and are therefore not a priori in that sense of "a priori" that contrasts with this third sense of "empirical."

**NECESSARY PHENOMENA STATEMENTS.** In the sense explained, statements are necessary if they are *true* necessarily. But if statements about phenomena are a priori—necessarily true *and* nonempirical—they are necessary in a second sense: Their truth is a necessary condition for any empirical statement to be capable of being either true or false. An empirical statement can be either true or false only if it is meaningful, and that depends on the coherence of the intentional act and of the intentional act series in which it is asserted. But as was seen, the coherence of such acts and act series is presupposed by any question about the adequacy of intentional acts to their intentional objects. Hence the statements that lay down the criteria for coherence of all kinds of intentional acts, including acts of asserting, must be true if we are to be able to decide whether any given intentional act is adequate to its intentional object—for instance, whether an assertion is

true or a purposive action is successful. Insofar as phenomenological statements are a priori, they are, therefore, necessary in this second sense; they are presuppositions for the adequacy or inadequacy of any intentional act to its intentional object. The truth of phenomenological statements is logically prior to the truth or falsity of all empirical statements and to the correctness of all purposive actions.

## CONTEMPORARY PHENOMENOLOGY

Political events in Europe and the shifting winds of doctrine caused the phenomenological movement to lose much of its original momentum after Husserl's death in 1938. The best-known twentieth-century philosophers who used the term *phenomenology* in descriptions of their own work were Martin Heidegger in Germany and Jean-Paul Sartre and Maurice Merleau-Ponty in France. All three used the term *phenomenology* in appreciably different senses from the phenomenologists previously discussed.

**HEIDEGGER.** Heidegger was a student of Husserl's and at one time was a coeditor of the *Jahrbuch*. In that journal (Vol. 8, 1927) appeared his first major work, *Sein und Zeit* (translated by J. Macquarrie and E. Robinson as *Being and Time*, New York, 1962). The phenomenologists so far discussed all agreed that it is the task of phenomenology reflectively to bring to light the criteria implicit in the intentional acts we perform in everyday life, in which we act in, get to know about, and learn to master that everyday world which Husserl christened the *Lebenswelt* ("world in which we live"). The emphasis here is on putting into words what is commonly and familiarly done without one's knowing how to describe accurately what he is doing. Heidegger also regarded phenomenology as a sort of reflection but not a reflection designed to put into words what is familiar in performance.

On the contrary, Heidegger's brand of phenomenology tried to open the way back to what had, he thought, become completely unfamiliar, what he calls *Sein* (being). He recognized that "being" had become a philosophically empty word. Hence we cannot gain a better understanding of being by reflecting only about the world insofar as it is familiar to us, for in that world "being" has become almost meaningless; there are very few contexts in which it makes sense to talk about "being." Thus, reflection about the criteria of intelligibility, which we use now, will not reveal much about being. Rather than reflect on these criteria, Heidegger proposes to ask why "being" has become almost meaningless to us. But since a question is

intelligible only to the extent that we can specify the sort of answer we expect, and since an answer to Heidegger's question would require a language in which "being" is meaningful, even an intelligible formulation of his question involves him in the attempt to re-create a very different language, in which "being," far from being an empty word, is the richest and most important concept. This language, he believed, is the language used by the pre-Socratic philosophers. Heidegger's phenomenology thus led him into an enterprise utterly unfamiliar to the other phenomenologists, the attempt to develop a new philosophical language by re-creating that of the pre-Socratic philosophers.

**SARTRE.** Sartre's major work, *L'être et le néant* (Paris, 1943; translated by H. E. Barnes as *Being and Nothingness*, New York, 1957), bears the subtitle *An Essay in Phenomenological Ontology*. The work does not, however, contain any explicit discussion of phenomenology, nor did Sartre explain his conception of phenomenology at length in any other work. More than once he differentiated phenomenology from science by saying that phenomenology makes statements about essences; science, about facts. In one long essay, "La transcendance de l'égo" (*Recherches Philosophiques*, Vol. 6, 1936–1937; translated by F. Williams and R. Kirkpatrick and published in book form as *The Transcendence of the Ego*, New York, 1958), he takes sharp issue with Husserl's transcendental phenomenology, particularly with the claim that in phenomenology we discover that there is a transcendental ego.

It would seem, then, that Sartre was a phenomenologist who, like many others, adopts the descriptive approach to essences but refuses to follow Husserl in his later developments of the theory of the phenomenological method. But Sartre differs radically insofar as he was not averse to constructing philosophical theories. His major work is an example of constructive philosophy in precisely that sense in which phenomenologists attacked it in their polemic against reductionism. Sartre's conception of phenomenology is no clearer if we look at his actual practice of the method than if we consider his sparse statements about it. If Sartre practiced phenomenology at all, the term as used by him and as applicable to his procedures has a different meaning from the one explicated in this discussion.

**MERLEAU-PONTY.** Merleau-Ponty's major work bears the title *Phénoménologie de la perception* (Paris, 1945; translated by Colin Smith as *Phenomenology of Perception*, London, 1962). Unlike Sartre, he includes an introduction devoted to a clarification of "phenomenology."

The clear and explicit result of this discussion is that Merleau-Ponty has interpreted the notion of phenomenology in a sense rather different from that subscribed to wholly or partly by members of the phenomenological movement, as well as from that used by either Heidegger or Sartre.

These three philosophers used “phenomenology” in appreciably different ways from those in which it has been used by the phenomenologists discussed. To be sure, there were also radical and profound disagreements among the latter about the nature and presuppositions of the phenomenological method, but they regarded these differences as different results arrived at by applying the same method. In this sense these philosophers—Husserl, Pfänder, Geiger, Becker, and Reinach, among others—can be regarded as belonging to one school of philosophy. All of them shared certain common views at the outset, and they believed that they were using the same method. But Heidegger, Sartre, and Merleau-Ponty began doing their respective brands of phenomenology by explaining what they considered phenomenology to be and how their conception differed from that of Husserl. They did not begin with the same common views, as did the earlier phenomenologists; and they did not regard their method as identical with that of Husserl and the other phenomenologists. For this reason they do not belong to the same school of philosophy.

## Bibliography

### ORIGINAL WORKS IN GERMAN

- Husserl, Edmund. *Husserliana*. Vol. I: *Cartesianische Meditationen*. The Hague: Nijhoff, 1950. The shortest, though not always easy, introduction to Husserl's mature conception of phenomenology.
- Husserl, Edmund. *Husserliana*. Vol. VI: *Die Krisis der europäischen Wissenschaften und die transzendente Phänomenologie*. The Hague: Nijhoff, 1954. A very late work of Husserl's; introduces the important notion of the *Lebenswelt*, the world of everyday life.
- Husserl, Edmund. *Husserliana*. Vols. VII and VIII: *Erste Philosophie*. The Hague: Nijhoff, 1956–1959. Husserl's lectures on the history of philosophy and phenomenology; more accessible than many of his other writings.
- Husserl, Edmund et al., eds. *Jahrbuch für Philosophie und phänomenologische Forschung*. 11 vols. Halle: Niemeyer, 1913–1930. Contains representative writings of all the major phenomenologists.

Reinach, Adolf. “Über Phänomenologie.” In his *Gesammelte Schriften*, edited by Hedwig Conrad-Martius. Munich, 1921. A brief and very lucid statement of an early conception of phenomenology.

### ORIGINAL WORKS IN TRANSLATION

- Husserl, Edmund. *Cartesian Meditations*. Translated by Dorion Cairns. The Hague: Nijhoff, 1960.
- Husserl, Edmund. *The Idea of Phenomenology*. Translated by William P. Alston and George Nakhnikian. The Hague: Nijhoff, 1964. Translates a series of lectures given in 1907 in which the transcendental-phenomenological reduction is introduced.
- Husserl, Edmund. *Ideas*. Translated by W. R. Boyce Gibson. New York: Macmillan, 1931; New York: Collier, 1963.
- Husserl, Edmund. “Phenomenology.” Translated by C. V. Solomon. In *Encyclopaedia Britannica*, 14th ed., Vol. XVII, 699–702. 1927.
- Husserl, Edmund. *Phenomenology and the Crisis of Philosophy: Philosophy as Science and Philosophy and the Crisis of European Man*. Translated with notes and introduction by Quentin Lauer. New York: Harper, 1965. Contains a long essay, published in 1910, in which Husserl provides an expanded version of his earlier polemics against psychologism. This book also translates portions of Husserl's late work, *Krisis*.

### BOOKS ON PHENOMENOLOGY

- Bachelard, Suzanne. *La logique de Husserl*. Paris, 1951. A lucid and detailed discussion of Husserl's *Formale und Transcendentale Logik* (1929).
- Berger, Gaston. *Le cogito dans la philosophie de Husserl*. Paris: Aubier, 1941. One of the earliest and still one of the best monographs on one aspect of Husserl's thought.
- Brand, Gerd. *Welt, Ich und Zeit*. The Hague: Nijhoff, 1955. Attempts a summary of Husserlian phenomenology on the basis of unpublished manuscripts. Rather general but often illuminating.
- Brentano, F. *Psychology from an Empirical Standpoint*. Translated by A. C. Rancurello, D. B. Terrel, and L. L. McAlister; edited by L. L. McAlister. London: Routledge, 1969.
- Cooper, D. E. *Heidegger*. London: Claridge Press, 1996.
- Derrida, Jacques. *Speech and Phenomena*. Translated by Gayatri Chakravorty Spivak. Baltimore: Johns Hopkins Press, 1976.
- Dreyfus, H. L. *Being-in-the-World: A Commentary on Heidegger's Being and Time, Division I*. Cambridge, MA: MIT Press, 1991.
- Farber, Marvin, ed. *Philosophical Essays in Memory of Edmund Husserl*. Cambridge, MA: Harvard University Press for University of Buffalo, 1940. A collection of stimulating and sometimes informative essays on different aspects of Husserl's work.
- Heidegger, M. *Being and Time*. Translated by J. Macquarrie and E. Robinson. London: SCM Press, 1962.
- Merleau-Ponty, M. *Phenomenology of Perception*. Translated by C. Smith. London: Routledge and Kegan Paul, 1981.
- Mohanty, J. N. *Edmund Husserl's Theory of Meaning*. The Hague: Nijhoff, 1964. An interesting discussion of Husserl's early work in the light of the treatment given the same questions by Bertrand Russell, G. E. Moore, and others.

- Mohanty, J. N. *Transcendental Phenomenology: An Analytic Account*. Oxford: Blackwell, 1989.

## PHENOMENOLOGY [ADDENDUM]

The development of "phenomenology" is a consequence of the interpretation of the texts of the major figures, especially Edmund Husserl, and of independent phenomenological research. Quite often, the two projects have gone hand in hand. One major factor in the development of phenomenology during the period under review has been the ongoing publication of the *Nachlass* of the major figures (*Husserliana*, Martin Heidegger's *Gesamtausgabe*, as well as Maurice Merleau-Ponty's lectures). Another is the continuing conversation with analytic philosophy in the English-speaking countries, with structuralism and deconstructionism in France, and with hermeneutics, critical theory, and the tradition of German idealism in Germany.

One major starting point in the conversation with analytic philosophy has been Dagfinn Føllesdal's (1969) paper, which argues that Husserl's concept of Noema is a generalization of the Fregean notion of *Sinn*. Both the *Sinn* and the Noema are abstract entities, to be distinguished from the object toward which an intentional act may be directed. While the historical claim underlying this thesis—namely, that Gottlob Frege's was a major influence on the development of Husserl's thinking around the turn of the twentieth century—has been challenged (e.g., by Jitendra N. Mohanty), the systematic thesis of Føllesdal (as opposed to Aron Gurwitsch's thesis, that the Noema is the perceived object qua perceived and the object intended is but a system of noemata), has been influential.

Jaakko Hintikka developed another aspect of Husserl's theory of intentionality by construing the Noema as a function from possible worlds to individuals in those worlds. The resources of the semantics of Frege and of possible worlds have been pulled together to interpret Husserl in the work of David Smith and Ronald McIntyre. Mohanty and Frederick Seebom have cautioned against reducing the intentional thesis of Husserl to an extensional thesis of possible worlds and have emphasized the need for a theory of constitution of possible worlds, if the latter are not to be posited in a naively ontological thesis. Still others, notably R. Sokolowski and Daniel Bell, have questioned the validity of ascribing to Husserl a Fregean-type theory. Sokolowski takes the Husserlian Noema to be identical with the object (with the proviso "as intended"), and Bell reads Husserlian *Gegenstand* to be a component of the intentional act and so quite unlike the Fregean reference.

From another perspective, John Searle has found the Husserlian intentionality thesis useful for his own work but goes beyond Husserl by appropriating, from Heidegger via Hubert Dreyfus, the idea of Background of skills and practices, and more recently by developing a theory of we-intentionality that is irreducible to I-intentionalities (reminiscent of the Hegelian *Geist* as well as of a thesis advanced by David Carr). This last discussion connects with the way phenomenology has related itself to cognitive science. Jerry Fodor's methodological solipsism has been related by Dreyfus to Husserl's, while Searle's emphasis on Background clearly falls on the Heideggerean side of the divide.

The tension between Husserlian phenomenology and hermeneutics lies in that the former is concerned with consciousness, its contents and structures, the latter with the individual's ontological relatedness to his world

and to others. This issue becomes, Is interpretation to be construed as the gift of a transcendental ego, or is it to be construed as an ontological feature of the mode of being of *Dasein*? Hans-Georg Gadamer's theory of interpretation develops the latter alternative, while Paul Ricoeur comes closest to mediating between Husserlian thinking, especially of the *Logical Investigations*, and an ontologically construed hermeneutics. We must also recall Ricoeur's work on metaphor, in which, going beyond the traditional rhetorical and semantic theories of analytic philosophy, Ricoeur integrates them in such a manner as permits the poetic and disclosive dimension of language to emerge. Ricoeur's researches have also sought to mediate between time (the most radical subjectivity) and narrative (by which reality is redescribed, as by metaphors) and reestablish a certain reciprocity between them.

The most influential critique of classical phenomenology is offered by Jacques Derrida. While it is more common to look upon Derrida's work as refuting Husserl's transcendental phenomenology, it is also possible to maintain that Derrida's work is a further radicalization of Husserl's genetic phenomenology, an alleged result of which is the demonstration that constitution involves a perpetual deferral and difference, also that a radicalization of Husserl's concept of horizontal character of intentionality would call into question all fixity and univocity of meanings, and that possibilities of nonfulfillment of intention are necessarily inherent in all intentionality. But those who ascribe to Husserl a metaphysics of presence fall into the opposite trap of reifying "absence." As Sokolowski has shown, Husserl's thinking rather exhibits a mutual involvement of presence and absence.

Of those from analytic philosophy who have pursued some kind of phenomenology, mention must be made of Castañeda's rich phenomenology of indexical reference and of "I" thought. In the latter context, he distinguishes between the ground floor of empirical I-guise and successive phases of transcendental I-guises, among all of which there is a sameness that is yet not strict identity.

In the United States there is a continuing tendency, inaugurated by Dreyfus and Richard Rorty, to see in Heidegger a pragmatist philosopher, whereby clearly Heidegger's ontological concern with the meaning of being and the historical concern with the historicity of understanding of Being are either underplayed or sought to be altogether set aside. While it was at first usual to look upon Heidegger as an antisience thinker, now—largely owing to the work of C. F. von Weizsäcker, J. Kockelmans, and Patrick Heelan—one has come to realize that Heidegger's

thinking could form the basis for an understanding and appreciation of science and technology. In general, phenomenological thinking about science has exhibited three distinct features: First, following Husserl in the *Crisis*, some have attempted to reestablish the proper connection between science and lifeworld. The most important work on this front is due to J. Mittelstrass. Second, following also Husserl's work in the *Crisis*, but more inspired by Heideggerean thought about historicity of *Dasein* as also by Thomas Kuhn's work on history of science, some have looked upon science as a historical accomplishment marked by epochal changes, epistemological breaks, shifts of paradigm—thereby rejecting the prevailing obsession with the logical structure of scientific theories and also the reigning prejudice in favor of a naively realistic and positivist theory of science. But within phenomenology itself, this time following Husserl's original concern, there is also a continuing concern with the nature and structure of logic and mathematics as theories and with the origin of such theories, their relation to practice and also to the lifeworld, on the one hand, and the transcendental, thinking ego on the other.

Heelan has developed the view, using the conceptual resources of Husserl, Heidegger, and Merleau-Ponty, that scientific observation, like all perception, is hermeneutical. Hermeneutical phenomenology of science focuses, in his view, not so much on theory as on experimental phenomena. Heelan defends a sort of realism called by him hermeneutic or horizontal realism as opposed to the instrumentalism of some phenomenologists. Thus, according to Heelan, in particle physics many phenomena have actual existence only within the context of the measurement processes. Kockelmans emphasizes what he regards as the ontological aspect of science: he draws attention to the role of "objectifying thematization," which lies at the root of every scientific activity. In this latter concept he brings together Husserl's idea of "thematization" and Heidegger's idea that a certain fundamental understanding of being makes possible science, philosophy, and technology. Although Kockelmans accepts the Kuhnian thesis of epochs in the history of science, he nevertheless holds that history of science is guided by an ideal of reason and that each new paradigm is necessarily a historical synthesis.

From its inception phenomenology had a special relation of love and hate toward psychology; at a later phase, it developed a special interest in history. With regard to psychology, there has been a long tradition of original work in what is known as phenomenological psychology. To the period under review belong some

works of Medard Boss, Aron Gurwitsch, Hermann Minkowski, and Ricoeur. Boss has applied his Heideggerian conception of *Daseinsanalytik* to such contexts as sexual perversion, dream, and psychosomatic illness. Drawing upon his work on lived space and lived time, Minkowski studies how these can undergo modifications in psychoses, schizophrenia, manic-depression and hallucinations. Gurwitsch's *Marginal Consciousness*, posthumously published, continues the work done in *The Field of Consciousness*. However, for research in descriptive psychology, possibly the most important results are to be found in Edward Casey's two books on imagining and remembering. This research has opened out new fields of investigation. For example, in his work on remembering, Casey explores a number of neglected, nonrepresentational forms of remembering, including body memory and place memory, reminiscing and commemorating.

In the phenomenology of history, a brief reference may be made to the important work done by Ricoeur, who seeks to mediate between lived time and cosmic time. The past is irrevocably gone, and our access to it across the historical distance is made possible by creative imagination. Here fiction, by its quasi-historical character, comes to our help. History is not a totality, an absolute mediation. Nevertheless, there is a search for meaning, which is open-ended without a Hegelian *Aufhebung*. The idea of one history is a Kantian-type regulative idea.

## PHILODEMUS

(c. 110–c. 40 BCE)

Philodemus of Gadara was an Epicurean philosopher and epigrammatic poet of the first century BCE. Born in Gadara in Palestine, he was taught philosophy in Athens by the head of the Epicurean school Zeno of Sidon (c.150–70s BCE) and by Demetrius Lacon, Zeno's younger contemporary. In the 80s or 70s he moved to Italy and earned the patronage of Lucius Calpurnius Piso Caesoninus, father-in-law of Julius Caesar. He seems to have spent part of his life at Herculaneum in Campania, probably in Piso's villa, and to have formed around him an Epicurean community of pupils and friends. His writings constitute the largest surviving portion of the library of the villa, which was buried beneath the mud and ashes when Vesuvius erupted in 79 CE and was partly excavated in the mid-eighteenth century. Thirty-seven distinct works are known or conjectured to be his and are contained in carbonized papyrus rolls in various states of fragmentation and corruption. However, it has been possible to gain considerable knowledge of Philodemus's methods and views. He emerges as a prolific writer with a wide range of interests who advances a conception of Epicurean orthodoxy first

defined by Zeno and exhibits the intellectualism characteristic of the school of Athens. He was respected in educated Roman circles: Cicero speaks well of him, and he seems acquainted with both Vergil and Horace.

About thirty of his poems are preserved in the *Palatine Anthology*, and additional evidence suggests that he may have written hundreds. It is controversial whether there are relations between Philodemus's poetic output, his poetic theory, and his philosophical commitments. Except for a poetic invitation to Piso to participate in a festival in Epicurus's honor, his elegant epigrams make no mention of Epicureanism. Most of them concern love, and several contain autobiographical elements. They can be read as illustrating Philodemus's thesis that poetry as such does not benefit but only entertains.

In *On Poems*, he develops and defends his views, arguing both against literary theorists who held that a good poem be morally useful (Heraclides of Pontus, Neoptolemus of Parium, and an unnamed Stoic philosopher) and against formalists (notably, Crates of Mallos) who judged a poem only by reference to its form and aesthetic quality. He considers poetry an imitative art appreciated by reason, which requires careful composition in order to present clearly certain thoughts and move the listener. What makes a poem good is appropriate thoughts expressed in appropriate diction; changing the arrangement of words can destroy the poetic goodness of a verse. However, *On the Good King According to Homer* shows how to derive benefit from the poetry of Homer, especially how to extract both warning and advice from Homer's portrayal of different rulers. *On Music*, too, dissociates moral profit from artistic form. Music as such has no mimetic character. It is sound, an irrational element that causes pleasure to the ear. It affects the soul only via poetry, texts, or thought, which, however, are external to the musical art. *On Rhetoric* suggests a comparable approach to sophistic or epideictic rhetoric. Refuting Epicurean rivals who deny that rhetoric is an art, Philodemus holds that while forensic and political rhetoric are not arts, epideictic or sophistic rhetoric is. It consists mainly in the transmissible method of using the one naturally correct language to write clear and persuasive compositions, and the criteria pertaining to it are independent of its utility.

Philodemus gained credit for his historical work as well. The *Arrangement of the Philosophers*, especially the two books on the Academics and the Stoics, contains biographical and doxographical material and, occasionally, summaries of philosophical doctrines. The *Works on the Records of Epicurus and Some Others* relates the early

history of the Epicurean school whereas the treatise *On Epicurus* eulogizes the founder and alludes to rituals of the Epicurean communities. The polemical treatises *On the Stoics* and *Against the ...* should also be mentioned. Historical information about the theological doctrines of philosophers from the Presocratics to the Stoic Diogenes of Babylon is found in Philodemus's theological work *On Piety*, which offers a powerful defense of Epicurus's piety and reflects Zeno of Sidon's interpretation of Epicurus's views about the nature of the gods and our concepts and knowledge of them. *On the Gods* discusses our fear of the gods whereas *On the Way of Life of the Gods* treats aspects and attributes of divine existence. Both in theology and in other areas, Philodemus endorses the epistemological positions of his school, some of which may have been mentioned in a work on perception. *On Signs* confirms that he is also committed to the Epicurean methodology developed and defended against Stoic criticisms by Philodemus's teachers in Athens—in particular, the similarity method (a method of sign-inference based on analogy and induction) and the related procedure of comparative assessment (*epilogismos*). Two other works, one of which is subtitled *From the Lectures of Zeno*, make remarks about scientific methodology.

Philodemus engages in both theoretical and practical ethics, often in connection with moral psychology. *On Choices and Avoidances* rehearses canonical theses such as the cardinal principles of Epicurus's doctrine, the criteria of moral choice, the so-called fourfold medicine (*tetrapharmakos*), and the relation between the virtues and pleasure. *On Frank Speech* is the central piece of the ensemble *On Characters and Ways of Life*, to which *On Gratitude* and *On Conversation* also belong. It discusses frank speech (*parrhesia*), the principal educational method of late Epicurean schools and a major tool of moral and psychological therapy, and it reflects the views of Zeno on whose lectures the treatise is based.

Another major work is *On Vices and the Opposite Virtues and the People in whom they occur and the Situations in which they are found*. There survive the extant remains of three books that analyze and treat, respectively, the vices of flattery, arrogance, and greed, as well as other vices of professional administrators and money makers. The fragmentary contents of *On Wealth* are thematically related to this last topic.

The books *On Folly*, *On Lack of Proper Measure*, *On Erotic Love*, and, possibly, *On Envy* belong to the multi-volume project *On the Passions*. We know very little about them whereas a good deal survives of *On Anger*, which describes the nature and consequences of anger and

draws a distinction between violent rage and natural anger. Philodemus condemns the former but allows room for the latter, steering what might seem a middle course between the Peripatetic approval of rightful anger and the Stoic aim of eradicating the emotion altogether. *On Death* is conceptually related to the group *On the Passions* and may have belonged there. The surviving text addresses the question of whether the moment of death is always *physically* painful, and also examines cases in which death may cause great *emotional* pain, such as dying prematurely, ingloriously, or unjustly and leaving behind grieving friends. Philodemus's analyses and arguments, and his concession that it is sometimes natural to feel *bites* of sorrow, constitute significant contributions to moral psychology. Moreover, his methods of treating the emotions occupy an important place in the therapeutics of the Hellenistic era.

## PHILO JUDAEUS

(fl. 20 BCE–40 CE)

Philo Judaeus, the Jewish Hellenistic philosopher, was the son of a wealthy and prominent Alexandrian family. Philo was well educated in both Judaism and Greek philosophy. Little is known about the actual events of his life except that in 40 CE the Jewish community of Alexandria sent him as the head of a delegation to Emperor Caligula to seek redress from the wrongs which the Gentile population inflicted upon the Jews. His *Legacy to Gaius* tells the story of this mission. Although he also wrote moral and philosophic treatises on problems then current, the main bulk of his writings are philosophic discourses on certain topics of the Hebrew Scripture. In content they are, on the one hand, an attempt to interpret the scriptural teachings in terms of Greek philosophy and, on the other, an attempt to revise Greek philosophy in the light of those scriptural traditions.

The scriptural teachings with which Philo set out to revise Greek philosophy contained certain definite conceptions of the nature of God and his relation to the world but only vague allusions to the structure and composition of the world. In dealing with the latter, therefore, he felt free to select from the various views of Greek philosophers whichever seemed to him the most reasonable, although occasionally he supported the selection by a scriptural citation. In dealing with the conception of God, however, he approached Greek philosophic views critically, rejecting those that were diametrically opposed to his scriptural traditions and interpreting or modifying those which were plastic enough to lend themselves to remodeling.

### GOD, PLATONIC IDEAS, CREATION

Of the various conceptions of God in Greek philosophy, Philo found that the most compatible with scriptural teaching was Plato's conception, in the *Timaeus*, of a God who had existed from eternity without a world and then, after he had brought the world into existence, continued to exist as an incorporeal being over and above the corporeal world. But to Plato, in the *Timaeus*, besides the eternal God, there were also eternal ideas. Philo had no

objection to the existence of ideas as such, for he held that there was a scriptural tradition for the existence of ideas. But he could not accept the eternity of the ideas, for, according to his scriptural belief, God alone is eternal. By a method of harmonization that had been used in Judaism in reconciling inconsistencies in Scripture, Philo reconciled the *Timaeus* with the scriptural tradition by endowing the ideas with a twofold stage of existence: First, from eternity they existed as thoughts of God; then, prior to the creation of the world they were created by God as real beings. He may have found support for the need of such a harmonization in the many conflicting statements about the ideas in Plato's dialogues.

The ideas, which in Plato are always spoken of as a mere aggregation, are integrated by Philo into what he terms "an intelligible world," an expression that does not occur in extant Greek philosophic writings before him. Then, following a statement by Aristotle that the "thinking soul" (that is, nous), "is the place of forms" (that is, ideas), Philo places the intelligible world of ideas in a nous, which, under the influence of scriptural vocabulary, he surnamed Logos. Accordingly, he speaks also of the Logos as having the aforementioned two stages of existence.

For the same reason that he could not accept the view that the ideas are eternal, Philo also could not accept the view commonly held by contemporary students of Plato that the preexistent matter out of which, in the *Timaeus*, the world was created was eternal. But as a philosopher he did not like to reject altogether the reputable Platonic conception of a preexistent matter. And so here, too, he solved the difficulty by the method of harmonization. There was indeed a preexistent matter, but that preexistent matter was created. There were thus to him two creations, the creation of the preexistent matter out of nothing and the creation of the world out of that preexistent matter. For this too, it can be shown, he may have found support in certain texts of Plato.

In the *Timaeus*, Plato describes the creation of the world as an act that God "willed" (*ἐβουλήθη*), and similarly the indestructibility of the world is described by him as being due to the "will" (*βούλις*) of God. Presumably, by will in its application to God, Plato here means the necessary expression of God's nature, so that the creation of the world, and of this particular world of ours, was an act that could not be otherwise; and similarly the indestructibility of the world is something that cannot be otherwise. Philo, however, following the scriptural conception of God as an all-powerful free agent, takes the will by which God created the world to mean that had God

willed, he could have either not created the world or created another kind of world. And similarly, if it be his will, he can destroy the world, although, on the basis of a scriptural verse, Philo believed that God would not destroy it.

#### LAWS OF NATURE, MIRACLES, PROVIDENCE

The scriptural conception of God as an all-powerful free agent is extended by Philo to the governance of the world. Finding scriptural support for the belief in causality and in the existence of certain laws of nature current among Greek philosophers, except the Epicureans, Philo conceived of God's governance of the world as being effected by intermediary causes and by laws of nature which God had implanted in the world at the time of its creation. He even tried his hand at classifying the laws of nature that happen to be mentioned by various Greek philosophers. But in opposition to the Greek philosophers, to whom these laws of nature were inexorable, he maintained that God has the power to infringe upon the laws of his own making and create what are known as miracles. These miracles, however, are not created arbitrarily. They are always created with design and wisdom for the good of deserving individuals or deserving groups of individuals or humankind as a whole, for, to Philo, God governs by direct supervision not only the world as a whole but also the individual human beings within the world.

To express this particular departure of his from the generality of Greek philosophers, Philo gave a new meaning to the Greek term *πρόνοια*, "providence." To those Greek philosophers who made use of this term it meant universal providence, that is, the unalterable operation of the inexorable laws of nature whereby the continuity and uniformity of the various natural processes in the world are preserved. To Philo it means individual providence, that is, the suspension of the laws of nature by the will and wisdom and goodness of God for the sake of human beings whose life or welfare is threatened by the ordinary operation of those laws of nature. With this conception of individual providence, Philo takes up the discussion of the human soul.

#### SOUL AND WILL

On the whole, Philo's conception of the soul is made up of statements derived from various dialogues of Plato. He distinguishes between irrational souls, which are created together with the bodies of both men and animals, and rational souls, which were created at the creation of the world, prior to the creation of bodies. Of these preexis-

tent rational souls, some remain bodiless but others become invested with bodies. The former are identified by Philo with the angels of Scripture. Having in mind certain passages in Plato where such unbodied souls are identified with the popular Greek religious notions of demons and heroes, but knowing that Plato himself and also Aristotle and the Stoics dismissed these popular notions as mere myths, Philo says that the angels of Moses are what philosophers call demons and heroes, but he warns the reader not to take the existence of angels as mere myths. With regard to the preexistent rational souls that become embodied, he says, following Plato, that they are equal in number to the stars and are to be placed in newly born human beings whose bodies are already endowed with irrational souls. Again following Plato, Philo says that the irrational souls die with the bodies, whereas the rational souls are immortal. But he differs from Plato in his conception of the immortality of the soul. To Plato, the soul is immortal by nature and is also indestructible by nature. To Philo, immortality is a grace with which the soul was endowed by the will and power of God, and consequently it can be destroyed by the will and power of God if it has proved itself unworthy of the grace bestowed upon it.

A similar revision was also introduced by Philo into the Greek philosophic conception of the human will. In Greek philosophy, a distinction is made between voluntary and involuntary acts. But since all the Greek philosophers, except the Epicureans, believed in causality and in the inexorability of the laws of nature, for them the human will, to which they ascribed the so-called voluntary acts, is itself determined by causes and is subject to those inexorable laws of nature which govern the universe, including man, who is part of it. To all of them, except the Epicureans, no human act was free in the sense that it could be otherwise. The term *voluntary* was used by them only as a description of an act which is performed with knowledge and without external compulsion. To all of them, therefore, there was no free will except in the sense of what may be called relative free will. To Philo, however, just as God in his exercise of individual providence may see fit to infringe upon the laws of nature and create miracles, so has he also seen fit to endow man with the miraculous power to infringe upon the laws of his own nature, so that by the mere exercise of his will man may choose to act contrary to all the forces in his nature. This conception of free will is what may be called absolute free will.

## KNOWLEDGE

Philo also revised the philosophic conception of human knowledge, including the philosophic conceptions of man's knowledge of God. Human knowledge, like all other events in the world, including human actions, is, according to Philo, under the direct supervision of God. Like all other events in the world, which are to Philo either natural, in the sense that they are operated by God through the laws of nature which he has implanted in the world, or supernatural, in the sense that they are miraculously created by God in infringement upon those laws of nature, so also human knowledge is either natural or supernatural, called by Philo "prophetic," that is, divinely revealed.

Under natural knowledge, Philo deals with all those various types of knowledge from sensation to ratiocination that are dealt with by Greek philosophers, especially Plato and the Stoics. He presents prophetic knowledge as a substitute for that type of knowledge that in Greek philosophy is placed above the various senso-ratiocinative types of knowledge and is described as recollection by Plato, as the primary immediate principles by Aristotle, and as the primary conceptions by the Stoics. Like all miracles, prophetic knowledge is part of God's exercise of his providence over individuals, groups of individuals, or humankind in general. An example of prophetic knowledge due to God's exercise of his providence over individuals is Philo's account of his own experience: Often, in the course of his investigation of certain philosophic problems, after all the ordinary processes of reasoning had failed him, he attained the desired knowledge miraculously by divine inspiration. An example of prophetic knowledge due to God's exercise of his providence over a group of individuals, as well as over humankind in general, is Philo's recounting of the revelation of the law of Moses.

## HUMAN KNOWLEDGE OF GOD

Corresponding to the two kinds of human knowledge are two ways by which, according to Philo, man may arrive at a knowledge of God—an indirect ratiocinative way and a direct divinely revealed way. Philo describes the indirect way as the knowledge of the existence of God which the "world teaches" us, and he deals with the various proofs for the existence of God advanced by Greek philosophers. Most acceptable to him is the Platonic form of the cosmological proof in the *Timaeus*, inasmuch as it is based on the premise of a created world. He modifies the Aristotelian form of the cosmological proof so as to establish the existence of a prime mover, not of the motion of the

world but of its existence. He similarly modifies the Stoic proof from the human mind to establish the existence not of a corporeal God immanent in the world but of an incorporeal God above the world.

In his discussion of the direct way of knowing God, however, Philo makes no mention of the Stoic proof of the innateness of the idea of God. His own direct way of knowing God he describes as a “clear vision of the Uncreated One.” But as he goes on to explain it, this direct way of knowing God is only another version of the various indirect ways of knowing him and is similarly based upon the contemplation of the world. The difference between the indirect and direct ways is this: In the case of the various indirect ways, both the knowledge of the world and of the existence of God derived therefrom are attained laboriously by the slow process of observation and logical reasoning; in the case of the direct way, both the knowledge of the world and of the existence of God derived therefrom are flashed upon the mind suddenly and simultaneously by divine inspiration.

But the knowledge of God that may be gained by either of these two ways is, according to Philo, only a knowledge of his existence, not a knowledge of his essence; for as Philo maintains, “it is wholly impossible that God according to his essence should be known to any creature.” God is thus said by him to be “unnamable” *ἀκατόνομαστος*), “ineffable” *ἄρρητος*), and “incomprehensible” *ἀκατάληπτος*). This distinction between the knowability of God’s existence and the unknowability of his essence does not occur in Greek philosophy prior to Philo. In fact, in none of the extant Greek philosophic literature prior to Philo do the terms *unnamable*, *ineffable*, and *incomprehensible*, in the sense of incomprehensible by the mind, occur as predications of God. Moreover, it can be shown that both Plato and Aristotle held that God was knowable and describable according to his essence. Philo was thus the first to introduce this view into the history of philosophy, and he had arrived at it neither by Scripture alone nor by philosophy alone. He had arrived at it by a combination of the scriptural teaching of the unlikeness of God to anything else and the philosophic teaching that the essence of a thing is known through the definition of the thing in terms of genus and specific difference, which means that the essence of a thing is known only through its likeness to other things in genus and species. Since God is unlike anything else, he is, as Philo says, “the most generic being” (*τὸ γενικώτατον*), that is, the *summum genus*, and hence he cannot be defined and cannot be known.

As a corollary of this conception of the unknowability and ineffability of God, it would have to follow that one could not properly speak of God except in negative terms, that is, in terms which describe his unlikeness to other things. But still Scripture repeatedly uses positive terms as descriptions of God. All such terms, explains Philo, whatever their external grammatical form, whether adjectives or verbs, are to be taken as having the meaning of what Aristotle calls property, and the various terms by which God is described are to be taken as mere verbal variations of the property of God to act, in which he is unlike all other beings. For to act is the unique property of God; the property of all created beings is to suffer action.

### THEOCRATIC GOVERNMENT

Philo widened the meaning of the conception of natural law in its application to laws governing human society. To Greek philosophers, with the exception of the Sophists, this application of the conception of natural law (or, as they would say, law in accordance with nature) meant that certain laws enacted by philosophers in accordance with what they described as reason or virtue were also in a limited sense in accordance with nature, that is to say, in the mere sense that they were in accordance with certain impulses, capacities, rational desires which exist in people by nature. The Greek philosophers assumed, however, that no law enacted for the government of humans, even when enacted by philosophers in accordance with reason and virtue, can be regarded as natural law in the sense of its being fully in harmony with the eternal and all-embracing laws of nature by which the world is governed. Philo agrees with the philosophers as to the limited sense in which enacted human law may be regarded as natural law but argues that a law revealed by God, who is the creator of the world (as, to Philo, the law of Moses was), is fully in harmony with the laws of nature, which God himself has implanted in the world for its governance. To Philo, therefore, natural law came to mean a divinely revealed law.

This widened conception of natural law led Philo to answer the question raised by Greek philosophers as to what was the best form of government. To both Plato and Aristotle no form of government based upon fixed law can be the best form of government, and Plato explicitly maintains that the best form of government is that of wise rulers who are truly possessed of science, whether they rule according to law or without law and whether they rule with or without the consent of the governed.

Against this, Philo argues that the best form of government is that based upon fixed law, not indeed upon manmade fixed law, but upon a divinely revealed fixed law. In a state governed by such a divinely revealed law, every individual has his primary allegiance to God and to the law revealed by God. Whatever human authority exists, whether secular, governing the relation of person to person, or religious, governing the relation of humanity to God, that authority is derived from the law and functions only as an instrument of the application of the law and its interpretation. Such a state, whatever its external form of government, is really ruled by God, and Philo came near coining the term *theocracy* as a description of it; the term was actually so coined and used later, by Flavius Josephus. But Philo preferred to describe it by the term *democracy*, which he uses not in its ordinary sense, as a description of a special form of government in contradistinction to that of monarchy and aristocracy, but rather as a description of a special principle of government, namely, the principle of equality before the law, which to him may be adopted and practiced by any form of government.

## VIRTUE

In the course of his attempt to analyze the laws of Moses in terms of Greek philosophy, Philo injects himself into the controversy between the Peripatetics and the Stoics over the definition of virtue. Guided by scriptural tradition, he sides with Aristotle in defining virtue as a mean between two vices; hence, in opposition to the Stoics, he maintains that virtue is not the extirpation of all the emotions, that some emotions are good, that there is a difference of degree of importance between various virtues and various vices, and that the generality of human beings are neither completely virtuous nor completely wicked but are in a state which is intermediate between these two extremes and are always subject to improvement. He maintains, however, that by the grace of God some exceptional persons may be born with a thoroughly sinless nature.

Following Plato and Aristotle, both of whom include under the virtue of justice certain other virtues which they consider akin to justice, but guided also by scriptural tradition, Philo includes under justice two virtues that are entirely new and are never mentioned in any of the lists of virtues recorded under the names of Greek philosophers. Thus, on the basis of the scriptural verse (Genesis 15:6) that "Abraham had faith (*ἐπίστευσεν*) in God and it was counted to him for justice (*δικαιοσύνην*)," Philo includes "faith" (*πίστις*), which he takes to mean faith in

the revealed teachings of Scripture, as a virtue under what the philosophers call the virtue of justice. Similarly, because the Hebrew term *zedakah* in Scripture is translated in the Septuagint both by *δικαιοσύνη*, "justice" (Genesis 18:19) and by *ἐλέημοσύνη*, "mercy," "alms" (Deuteronomy 6:25, 24:13), Philo includes "humanity" (*φιλανθρωπία*), in the sense of giving help to those who are in need of it, as a virtue under the philosophic virtue of justice. But on the basis of Scripture only, without any support from philosophy, he describes also "repentance" (*μετάνοια*) as a virtue. In Greek philosophy, repentance is regarded as a weakness rather than as a virtue.

His scripturally based conception of free will as absolute led Philo to give a new meaning to the voluntariness of virtue and the voluntariness of the emotion of desire as used in Greek philosophy. Both Aristotle and the Stoics, using the term *voluntary* in the relative sense of free will, agree that virtue is voluntary, but they disagree as to the voluntariness of the emotions. To Aristotle, all emotions are involuntary, except the emotions of desire and anger, the latter of which by the time of Philo was subsumed under desire; to the Stoics, all emotions are voluntary. Philo, however, using the term *voluntary* in its revised sense of absolute free will, maintains that in this revised sense the term *voluntary* is to be applied, as in Aristotle, to virtue and to the emotion of desire.

Philo similarly gave a new meaning to the philosophic advice that virtue is to be practiced for its own sake. To Plato, Aristotle, and the Stoics, this advice was meant to serve as a principle of guidance to those who, like themselves, did not believe in individual providence and were not impressed by the explanations offered in the popular Greek religious theodicies as to why virtue is not always rewarded and vice not always punished. The reason underlying this advice was that since there is no certainty as to what external goods or evils would follow the practice of either virtue or vice, it is preferable for man to take his chance on the practice of virtue. This reasoning was presumably based on the common human experience that it is easier for one to induce in himself a feeling of happiness in the misery that may follow a life of virtue than it is to induce in himself a feeling of happiness in the misery, and sometimes even in the joy, that may follow a life of vice.

To Philo, however, the advice to practice virtue for its own sake is based upon his belief that providence is individual; that, despite common observation to the contrary, no virtue goes unrewarded; that acts of virtue are of graded merits; and that the reward is always in accordance with the merit of the act. With all this in the back

of his mind, Philo's advice to practice virtue for its own sake (which he expresses in a different context by the statement that man is to serve God out of love and not out of expectation of a reward) means that such a practice of virtue is of the highest degree of merit, and the reward for it, which ultimately is of a spiritual nature in the hereafter, will be in accordance with its merit.

## PHILOSOPHY OF HISTORY

Finally, Philo's belief in God as a free agent who acts by will and design in the world as a whole, as well as in the life of individual human beings, has led him to a theoteological philosophy of history. Alluding to passages in Polybius's *Histories*, in which the rise and fall of cities, nations, and countries are explained by analogy to the Stoic conception of cosmic history as a cyclical process which goes on infinitely, by necessity and for no purpose, Philo describes the cyclical changes in human history as being guided by "the divine Logos" according to a preconceived plan and toward a goal which is to be reached in the course of time. The preconceived plan and goal is that ultimately "the whole world may become, as it were, one city and enjoy the best of politics, a democracy." His description of the ultimate best of politics is an elaboration of the Messianic prophecies of Isaiah and Micah as to what will come to pass in the end of days.

This is a brief synopsis of Philo's revision of Greek philosophic conceptions of the nature of God and his relation to the world and man. The historical significance of Philo is that his revision became the foundation of the common philosophy of the three religions with cognate Scriptures—Judaism, Christianity, and Islam. This triple religious philosophy, which originated with Philo, reigned supreme as a homogeneous, if not a completely unified, system of thought until the seventeenth century, when it was overthrown by Benedict de Spinoza, for the philosophy of Spinoza, properly understood, is primarily a criticism of the common elements in this triple religious philosophy.

Harry A. Wolfson (1967)

## PHILO JUDAEUS [ADDENDUM]

The original entry on Philo Judaeus was written by Harry Wolfson, one of the preeminent scholars of medieval religious philosophy. A major premise of his general work is that Philo's philosophical project stands as the foundation for the religious philosophizing common to the three monotheistic cultures: Judaism, Christianity, and Islam. Though Philo, a Hellenized Alexandrian Jew of the first century CE, had little impact upon his own people, he had a manifest impact upon the church fathers, and according to Wolfson his "attempt to interpret the scriptural teachings in terms of Greek philosophy" was common philosophical coin until Spinoza, another Jew, in the seventeenth century tore down Philo's harmonizing project.

Philo scholarship was abundant throughout the last few decades of the twentieth century. There originated an annual conference, *The Studia Philonica Annual*. Much recent work has emphasized the Greek (Alexandrian) milieu that incubated Philo and his philosophy. Philo almost certainly knew no Hebrew and was familiar (only)

with the Septuagint version of scripture. Further, his project of teasing out the inherent philosophicality of scripture took the form of allegory—a method adopted from the Stoic method of allegorical exegesis of Homer—that reached final form in the work of Crates of Mallos in the second century BCE. “Armed with Greek allegorical exegesis,” writes David Winston, “which seeks out the hidden meanings that lie beneath the surface of any particular text, and given the Middle Platonist and Neo-Pythagorean penchant to read back new doctrines into the works of a venerable figure of the past, Philo was fully prepared to do battle for his ancestral tradition” (1981, p. 6). This passage by Winston describes the tool, and the philosophical prejudices, that motivated Philo to reveal the deepest truths of Scripture. As Maimonides adapted Aristotelian categories for purposes all his own, so Philo is to be understood “as essentially adapting contemporary Alexandrian Platonism, which was itself heavily influenced by Stoicism and Pythagoreanism, to his own exegetical purposes” (Dillon 1977, p. 182). Caught between two cultures, Philo stands as the first monotheistic thinker to find a manifest use for Greek philosophy for explicating his own religious tradition.

## PHILOLAUS OF CROTON

(c. 470–385 BCE)

Philolaus of Croton (a Greek city in southern Italy) was a philosopher/scientist in the Pythagorean tradition. He was a contemporary of Socrates, being born c. 470 BCE, twenty years after Pythagoras died, and living until c. 385. On his first trip to Italy, Plato may have met an aged Philolaus; he mentions him as a teacher of the Thebans Simmias and Cebes in the *Phaedo*. A large body of pseudo-Pythagorean writings appeared in the first century BCE, and a number of these were forged in Philolaus's name, because he was one of the three most famous early Pythagoreans (along with Pythagoras himself and Archytas). Some fifteen fragments and a number of testimonia survive from these forged works. Philolaus, in fact, wrote one book, *On Nature*, which was probably the first book in the Pythagorean tradition (Pythagoras wrote nothing). Approximately eleven genuine fragments of that book have survived along with a number of testimonia. Aristotle discusses Pythagorean philosophy extensively but does not assign this philosophy to Pythagoras himself but rather to the "people called Pythagoreans," whom he treats as slightly older contemporaries of the atomists. This dating fits Philolaus exactly, and the agreement between the philosophy described by Aristotle and the fragments of Philolaus's book shows that Philolaus was the primary source for Aristotle's account.

Philolaus argued that the nature of the cosmos as a whole and of all things in it was to be explained in terms of two types of elements, unlimiteds and limiters. The unlimiteds include the material elements favored by his predecessors in the pre-Socratic tradition, such as earth, air, fire, and water but also continua such as space and time. Philolaus is emphatic, however, that such principles are not adequate to explain the cosmos because (1) limits, such as shapes, are also part of the cosmos humans can observe, and (2) such limiting features cannot have arisen from what is unlimited. Philolaus's cosmogony illustrates the role of these principles; the first thing to emerge was the central fire, which is a combination of the unlimited, fire, and the limiter, center. This central fire then draws in other unlimiteds such as time, void, and breath, which will be combined with limits to produce the cosmos known to humans.

Philolaus introduces harmony as an essential third principle, which specifies the way in which limiters and unlimiteds are combined. The central example is the musical scale in which the unlimited continuum of sound is limited by specific notes; harmony insures that these

notes do not have a haphazard order, however, but are "fitted together" in accordance with whole number ratios. This idea depends on the earlier Greek discovery that, if a person plucks two strings, one of which is twice the length of the other, we will hear the interval of the octave between the two sounds, so that the octave corresponds to the ratio 2: 1. Similarly, the fifth will correspond to the ratio 3: 2 and the fourth to the ratio 4: 3. Philolaus appears to regard the cosmos as a whole as structured according to the ratios that determine diatonic scale. Plato may be influenced by Philolaus in using this same scale to construct the world soul in the *Timaeus*.

By specifying the "formula" according to which limiters and unlimiteds combine, numbers also define the essence of a given thing and thus play an important epistemological role for Philolaus: "And indeed all things that are known have number. For it is not possible that anything whatsoever be understood or known without this" (Fr. 4). On the one hand, Aristotle is clearly right that numbers are not separate from things in this system, as they were later in Plato; Philolaus and his successor Archytas were interested in the numbers of things, not in numbers separated from things. On the other hand, Aristotle's suggestion that the Pythagoreans thought that things just were numbers or that they were made of numbers is not supported by the fragments of Philolaus, where it is clear that things are made of limiters and unlimiteds. According to Philolaus, our senses reveal a world composed of unlimiteds and limiters (e.g., stuffs and shapes), but on further examination the phenomena point to the numerical ratios that govern them. It is doubtful that Philolaus had explicitly addressed the metaphysical status of these ratios. Aristotle may have thought that if numbers reveal the essence of things, then things are, in an important sense, numbers; but this is Aristotelian interpretation. Philolaus prefers to say that things are composed of limiters and unlimiteds and known through the numerical ratios in accordance with which the limiters and unlimiteds are combined.

Philolaus is the first person to move the earth from the center of the universe and make it a planet, and Copernicus saw Philolaus as an important predecessor. The earth does not orbit around the sun in Philolaus's system, however; the fixed stars, five planets, sun, moon, earth, and an enigmatic counter-earth all orbit around the central fire. The system may have some origins in a religious cosmology in which the central fire is identified with Tartarus, a region under the earth where the guilty are punished in Greek mythology. Aristotle suggests that the counter-earth was introduced to satisfy the *a priori*

requirement that there be ten heavenly bodies around the central fire, because the Pythagoreans regarded ten as the perfect number. On the other hand, there is clear evidence that Philolaus intended the system to explain astronomical phenomena as well as satisfying *a priori* or religious requirements. The system can explain basic phenomena and is the first to include the five known planets in correct order, although it cannot account for such things as the apparent retrograde motion of planets. Philolaus clearly responded to objections to his system, which were based on the phenomena, arguing that the motion of the earth around the central fire did not produce a parallax effect, because the distance from the earth to the central fire was small in comparison to the distance between the earth and the planets. Similarly human beings never see the central fire or counter-earth, because the side of the earth on which they live is always turned away from the center, the earth rotating once on its axis during each orbit of the central-fire.

Philolaus argued that in each area of inquiry it was necessary to begin by identifying the minimum number of principles required to explain the phenomena. Limiters, unlimiteds, and harmony are the basic metaphysical principles; bile, blood, and phlegm explain disease; intellect, sensation, nutrition/growth, and generation are the basic psychic faculties. Philolaus drew an analogy between the birth of the cosmos and the birth of a human being, arguing that the embryo is initially hot and draws in cooling breath immediately upon birth, just as the cosmos begins with the central fire drawing in breath from the unlimited. It may be that he regarded the soul as a harmony of physical opposites, a view that Plato, perhaps in criticism of Philolaus, shows in the *Phaedo* to be inconsistent with a belief in an immortal soul.

In the *Philebus*, “the method of the men before our time,” which Plato adapts to address problems in his own metaphysics, is clearly the metaphysical system of Philolaus, which thus had a significant impact on Plato’s later metaphysics. Some have argued that Philolaus’s metaphysics must go back to Pythagoras, but Aristotle clearly dates it to the time of Philolaus, and the system itself—with its emphasis on the necessity of limiters in addition to unlimiteds makes most sense, if it arose after Pythagoras—at a time when Parmenides had championed the role of limit in explaining reality.

## PHILO OF LARISSA

(159/8–84/3 BCE)

Philo of Larissa was a student of Clitomachus (187/6–110/9 BCE), whom he succeeded as head of the Academy in 110/09 BCE. In 88 BCE Philo transferred his activities from Athens to Rome, where Marcus Tullius Cicero, among others, studied under him. Present-day evidence does not allow one to say for certain whether Philo was the last head of the Academy or was succeeded by his student, Antiochus of Ascalon.

Philo taught rhetoric as well as philosophy, and an extended analogy of his between the way in which philosophy cares for the soul and the way in which medicine cares for the body has been preserved. But he seems to have been chiefly interested in epistemology, then the dominant concern of the Academy, and scholars are best informed about his views in this area.

It is likely that Philo first upheld Clitomachus’s version of Academic skepticism, which endorsed the two theses for which Academics had argued in their controversy with the Stoa since the time of Arcesilaus, who was head of the Academy in the mid-third century BCE. These are that nothing can be known—or a conclusion that amounts to this in the context of the debate with the Stoa—and that, in consequence, one should suspend judgment about all matters. As head of the school, how-

ever, he defended a mitigated form of skepticism that continued to embrace the thesis that nothing can be known, but now permitted assent to probable impressions, among them the impression that nothing can be known. The account of probability on which this view depends (*probabile* is Cicero's Latin for the Greek *pithanon*, meaning "persuasive") had been developed by Carneades (214/3–129/8 B.C.E.), Clitomachus's teacher, as an alternative to cognitive impressions that the Stoics had made the foundation of their epistemology and that supposedly afforded an absolutely secure guarantee of truth. This position had been anticipated by Metrodorus of Stratonicea, another pupil of Carneades, and seems to have been the position to which Aenesidemus, the one-time Academic who revived the Pyrrhonian school of skepticism in the first century BCE, objected.

In Rome, however, Philo came to hold that knowledge is possible. He did this not by renouncing the Academy's arguments against the Stoa, but by reinterpreting them. He now took them to show, not that knowledge is impossible, but that knowledge is impossible on the Stoic conception of knowledge, which is therefore mistaken. The fault lay with their insistence on a foundation of impressions that could not be false, a condition that the Academy had long argued could not be met and that Philo now held need not be met. And he maintained that his Academic predecessors had never intended to show anything else by their arguments. These new views were opposed by Academics who remained attached to skepticism and Antiochus, who had become convinced that knowledge is possible precisely because the Stoic conditions could be satisfied.

None of Philo's writings have survived. Though he probably wrote other works on epistemology and ethics, the only books we know of are the so-called "Roman Books," in which Philo set out his late views on knowledge and the history of the Academy.

## PHILO OF MEGARA

(c. 400s BCE)

Very little is known about the life of Philo of Megara, or Philo Dialecticus. Since he was a pupil of Diodorus Cronus at the same time as Zeno of Citium, the founder of the Stoa (cf. Diogenes Laertius, DL 7.16), he was very probably active in Athens in the last decade of the 4th century BCE. He was not, as is assumed in the older literature, a member of the Megarian school of philosophy, but belonged to a separate sect, the Dialecticians. Hence there is no reason to make Megara his birthplace. From the titles of two lost treatises by the Stoic Chrysippus that were directed against Philo, we learn that Philo wrote *On Signs* (DL 7.191) and *On Moods (of Argument)* (DL 7.194). He also wrote a dialogue called the *Menexenus*, in which the five daughters of the Dialectician Diodorus Cronus, all of them also Dialecticians, were made to appear. It is possible that the theory of signs referred to in Pseudo-Galen's *Historia philosopha* c. 9 as belonging to the "dialecticians" goes back to Philo's treatise. The logical terminology in this report is in accordance with that used by the Dialecticians, and the epistemological terminology does not yet show Stoic influence. Signs are here defined as a special class of conditionals, namely sound conditionals with a true antecedent revealing the consequent. We are on safer ground with two other claims attributed to Philo, one concerning implication, the other the definition of modal concepts.

Philo argued that a conditional is true if and only if it is not the case that its antecedent is true and its consequent false (cf. Sextus Empiricus, *SE Adv. Math.* 8.113–114). Hence Philo seems to have given for the first time a truth-functional definition of the conditional. Against this claim, Diodorus Cronus held that a conditional is true if and only if it was not possible and is not possible that its antecedent is true and its consequent false (cf. *SE, Adv. Math.* 8.115–117). Thus the conditional "If it is day, I am talking," which proves to be true, according to Philo, provided that I am talking while it is day, will be false according to Diodorus. Although Sextus Empiricus in his report on this dispute has the consequent "follow" from the antecedent, it is not clear whether Philo and/or Diodorus want to make their criteria for the truth of the conditional a sufficient condition for the validity of an argument. It would have rather bizarre consequences in both cases: For Philo, any true propositions would entail each other, and for Diodorus, any true propositions about the past would entail each other.

Philo defines the possible as that “which, by the intrinsic nature of the proposition, is receptive of truth”; he defines the necessary as that “which, since it is true, by its own nature, is never receptive of falsehood”. Similarly, the non-necessary is defined as that “which by its own nature is receptive of falsehood” and the impossible as that “which according to its own nature could never receive truth” (cf. Boethius, *De interpretatione* ii, 234). Here again he disagrees with Diodorus, who defines the possible as that “which either is or will be (true).” For Diodorus there can thus be no unrealized possibilities, whereas this is possible with Philo. Philo’s modal logic, like that of Aristotle, seems to be based on an essentialist epistemology.

## PHILOPONUS, JOHN

(490–570)

John Philoponus of Alexandria, a sixth-century philosopher and theologian, is best known for his radical attempts to refute fundamental tenets of contemporary Aristotelian–Neoplatonic school philosophy. His main historical significance lies in the fact that he anticipated by centuries the early modern emancipation of natural philosophy from Aristotelian dogmatism. Philoponus (literally *Lover of Work*), or John the Grammarian, as he called himself, is commonly labeled a Christian Neoplatonist, but this epithet is misleading. Philoponus was a Christian, most likely by birth, and he received the standard philosophical training available at Alexandria in his day. Thus, his philosophical orientation was not a matter of choice, and his fierce rationalism, which he employed

also as a tool to resolve controversial questions that divided Christianity, bears no resemblance to the genuine Christian Neoplatonism of Pseudo-Dionysius, the Areopagite (c. 500). Roughly 100 years after his death, the Third Council of Constantinople (680–681) condemned his theological doctrines as heresy and thereby curtailed the overall philosophical influence he could have had in later centuries.

Almost everything about Philoponus’s life remains a matter of hypothesis. He was born presumably around 490 CE, but it is not known where (Kaster 1988); in the early sixth century, he studied in Alexandria, reading philosophy under Ammonius, Son of Hermias (c. 440–520), who had been a pupil of Proclus at Athens. In the early 520s, Philoponus taught both grammar and philosophy at Alexandria; some of his early commentaries on Aristotle are based on Ammonius’s lectures, but in the process of multiple revisions, Philoponus added explanations, observations, and criticisms of his own. In the late 520s, early 530s, around the time of Justinian’s eviction of the pagan philosophers in Athens (c. 529), Philoponus turns to writing polemical commentaries (on Proclus and Aristotle), which no longer aim at elucidation but at refutation, especially of the pagan doctrine of eternalism. These works provoked immediate condemnation of by Simplicius of Cilicia, a contemporary member of the Athenian School, the last great pagan mind of antiquity and expert commentator on Aristotle.

Although Philoponus was one of the most powerful and independent thinkers of his time, he never succeeded Ammonius as professor of philosophy. The reasons for this are unclear; although unknown external, personal or political circumstances may have played a role, a likely explanation is that Philoponus had reached a point where his fundamental disagreement with the philosophical establishment compromised his ability to continue the pedagogical tradition of the school. Leadership of the philosophical school remained in pagan hands well into the second half of the sixth century. Philoponus’s later writings, from the 540s onward, deal with contemporary issues of theological controversy. He expounded his theological views with philosophical rigor, whether rejecting the orthodox belief in the divine–human duality of the nature of Christ (miaphysitism) or defending the substantial distinctness of the hypostases of the Trinity (tritheism). Philoponus must have died around 570.

Philoponus’ *œuvre*, which bears witness to his interests in grammar, philosophy, psychology, medicine, mathematics, astronomy, and theology, may be divided into three related yet distinct parts (Scholten 1996): (1)

The commentaries on Aristotle (*Categories*, *Prior and Posterior Analytics*, *Physics*, *On Generation and Corruption*, *Meteorology*, and *On the Soul*); (2) the treatises of the critical period, notably, the two monumental polemical treatises *On the Eternity of World against Proclus* (shortly after 529) and the influential *On the Eternity of World Against Aristotle* (early 530s, extant only in fragments); and (3) a number of works on theological doctrine, some of which are only extant in Syriac translation; most important of the last group is a still-extant commentary on the biblical creation myth (*On the Making of the World*, written between 546 and 560) which also targets the naïve Christian cosmography of Cosmas Indicopleustes.

In his philosophical works, one can roughly distinguish between two kinds of criticism: on the one hand, the grappling with implausible Aristotelian theories, mostly physical, and on the other hand, outright repudiation of fundamental cosmological doctrines. Aristotle's definition of light as an incorporeal and instantaneous transition from the potentiality (*dunamis*) of a medium to be transparent to the actuality (*energeia*) of transparency fails to account for the laws of optics and for the calefactory property of the sun. Philoponus proposes to interpret light as an *incorporeal activity* rather than a state, capable of warming bodies and comparable to the soul in animals. Later, in the *Meteorology* commentary, which may be the transcript of his last lecture series on Aristotle, he argues materialistically that light and heat are consequences of the fiery nature of the sun, and that heat is generated when the rays emanating from the sun are refracted and warm the air through friction.

The *Physics* commentary contains one of his most celebrated achievements, the theory of the impetus, which is commonly regarded as a decisive step from an Aristotelian dynamics toward a modern theory based on the notion of inertia. To what extent Philoponus was influenced by previous philosophical or theological authors is a matter of controversy (Fladerer 2003). His own discussion, at any rate, commences with the expression of dissatisfaction with Aristotle's explanation that a projectile continues to move on account of the air's turbulence generated by the projectile itself. Philoponus proposes instead that a projectile moves on account of a kinetic force that is impressed on it by the mover and that exhausts itself in the course of the movement. In short, the medium contributes nothing to a projectile's motion; rather, it impedes it. Moreover, Philoponus holds that there is nothing to prevent motion from taking place in the void.

Occasionally, Philoponus resorts not only to thought experiments but also to pertinent observations that resemble physical experimentation. Aristotle's verdict that the speed of a falling body is proportional to its weight and indirectly proportional to the density of the medium is challenged by the same kind of empirical evidence that Galileo mustered centuries later.

Philoponus is critical of Aristotle's conception of space. He substitutes Aristotle's definition of the *place* of a body (the inner surface of that which contains it) with a conception of three-dimensional extension, its volume. Likewise, the most fundamental level of physical reality is not some mysterious *prime matter* but three-dimensional, indeterminate, and unqualified *corporeal extension*, a concept reminiscent of Descartes's *res extensa*.

The issue at stake in the two polemics against Proclus and Aristotle is the question of the contingency of the world. The earlier work obliterates a pamphlet of eighteen arguments for the eternity of the world written in the previous century by the powerful Neoplatonist Proclus. The lost *Against Aristotle* tackled influential arguments for eternity in *On the Heavens I* and *Physics VIII*. In both cases, Philoponus succeeds in pointing out numerous contradictions, inconsistencies, fallacies, and improbable assumptions. One clear casualty is Aristotle's peculiar postulate of an incorruptible celestial element (ether). The observable irregularities in the heavens, their complexity and changes in color, undermine the thesis of the radical ontological difference between the celestial and sublunary regions. Dissecting the text in unprecedented ways, Philoponus even paves the way for influential demonstrative arguments for noneternity. Although Philoponus concedes that in nature nothing comes to be from nothing, he offers the first *philosophical* defense of the Christian belief that God created the world *ex nihilo*. In the late theological treatise *On the Making of the World*, Philoponus suggests in passing that the celestial bodies were set to spin by a powerful impetus at the time of their creation and that they now continue to move not on account of their own nature but by the will of God.

It is impossible to gauge how Philoponus's ideas resonated with Christians during his lifetime. He was read and admired by Syrian and, to some extent, Islamic philosophers, but the anathema of 681 severely hampered the further propagation of his theological and philosophical work. As Simplicius before them, later thinkers like Thomas Aquinas (1224–1274) and Zabarella (1533–1589) roundly rejected Philoponus. Eventually, the arguments against eternity persuaded Bonaventure

(1217–1274) and Gersonides (1288–1344), and the theory of the impetus was reaffirmed by Buridan (1295–1356) and Oresme (1325–1382). In the sixteenth century, the first editions as well as numerous translations (into Latin) of the commentaries and the treatise against Proclus began to appear in print. In particular, Philoponus's criticism of Aristotle in the *Physics* commentary was widely discussed and persuaded such diverse thinkers as Gianfrancesco Pico della Mirandola (1469–1533) and Galileo Galilei (1564–1642).

## Bibliography

### MAJOR WORKS

- On the Use and Construction of the Astrolabe*, edited by H. Hase. Bonn: Weber, 1839 (ibid., Rheinisches Museum für Philologie 6, 1839, 127–171). Reprinted and translated into French by Alain P. Segonds, *Jean Philopon, traité de l'astrolabe*. Paris: Librairie Alain Brieux, 1981. Translated into English by H. W. Green in *The Astrolabes of the World*. Vols. 1 & 2. Robert T. Gunther. Oxford: University Press, 1932; Reprinted, London: Holland Press, 1976, pp. 61–81.
- Commentary on Aristotle's Physics*. In *Commentaria in Aristotelem Graeca*, XVI–XVII, edited by H. Vitelli. Berlin: Reimer, 1887–1888. Philoponus's most important commentary in which he challenges Aristotle's tenets on time, space, void, matter, and dynamics; there are signs of revision. Partial translations: *Philoponus, On Aristotle's Physics 2*, by A. R. Lacey. London: Duckworth, 1993; *Philoponus, On Aristotle's Physics 3*, by M. Edwards. London: Duckworth, 1994; *Philoponus, On Aristotle's Physics 5–8*, by Paul Lettinck. London: Duckworth 1993–1994; *Philoponus, Corollaries on Place and Void*, by David Furley. London: Duckworth, 1991.
- On the Making of the World (De opificio mundi)*, edited by Wilhelm Reichardt. Leipzig: Teubner, 1897. Greek text and German translation by Clemens Scholten. *De opificio mundi = Über die Erschaffung der Welt*. Freiburg, New York: Herder, 1997. A theological–philosophical commentary on the Creation story in the book of Genesis, written probably 557–560.
- On the Eternity of the World against Proclus (De aeternitate mundi contra Proclum)*, edited by Hugo Rabe. Leipzig: Teubner, 1899. Reprinted, Hildesheim: Olms, 1984. Translated by Helen S. Lang and Anthony D. Macro. *De aeternitate mundi. English and Greek*. Berkeley: University of California Press, 2001. A detailed criticism of Proclus's eighteen arguments in favor of the eternity of the world.
- On the Eternity of the World against Aristotle (De aeternitate mundi contra Aristotelem)*. Not extant; fragments reconstructed and translated by Christian Wildberg. *Philoponus, Against Aristotle on the Eternity of the World*.

London: Duckworth, 1987. A refutation of Aristotle's doctrines of the fifth element and the eternity of motion and time consisting of at least eight books.

## PHILOSOPHICAL ANTHROPOLOGY

Modern philosophical anthropology originated in the 1920s. During the 1940s it became the representative branch of German philosophy. It arose with, and has absorbed, *Lebensphilosophie*, existentialism, and phenomenology, although it is not identical with them. It has affinities with pragmatism and the sociology of knowledge. Although it is historically based on certain German traditions, it is also indebted to, and largely anticipated by, the eighteenth-century "science of human nature." It combines the critical traditions of the Enlightenment with an emphasis on dogmatic certitude.

## HISTORICAL BACKGROUND

Following Bernhard Groethuysen, philosophical anthropology is often conceived as embracing all previous philosophy, insofar as previous philosophy dealt with man's place in the world. But this wide conception blurs the distinctive features of philosophical anthropology. Its history is best restricted to those authors and ideas whose impact is either admitted or can be traced in the literature of modern philosophical anthropology.

The impact of Søren Kierkegaard, Karl Marx, and Friedrich Nietzsche is pervasive. Other generally acknowledged forerunners are Blaise Pascal, Johann Gottfried Herder, Johann Wolfgang von Goethe, Immanuel Kant, G. W. F. Hegel, and Ludwig Feuerbach. Pascal's influence is discernible in philosophical anthropology's conception of man as self-contradictory and mysterious, capable of surpassing his natural limits in quest of authenticity. Pascal's distinction between the organic *esprit de finesse* and the abstract and lifeless *esprit géométrique* was accentuated by Kant's distinction between the phenomenal world of the senses, with its quest for happiness (in the sense of egotistic pleasure), and the noumenal world of the thing-in-itself, between a world of determinate law and a world of transcendental choice. These concepts reveal themselves in the philosophical anthropologists' assumption of an unbridgeable gap between value and reason, between the ideal and the practical. Kant's basic questions—"What can I know? What ought I to do? What may I hope?"—are universally accepted in philosophical anthropology.

Herder was the first German author to correlate biology and the philosophy of man. From him stems the conception of man as a deficient being who must compensate for his lack of natural tools and weapons by the creative use of weapons and technology. Hegel's theory of alienation and its Marxist version have become a vital element in philosophical anthropology's comprehension and critique of society. Feuerbach formulated the claim that man can be used as the common denominator of philosophy, the true *ens realissimum*, embracing reason, will, and emotion. He held that philosophical anthropology was to take the place of theology; and indeed, contemporary philosophical anthropology may be regarded as secularized theology. Feuerbach conceived of God as a projection and objectification of the human spirit, reflecting the categorial structure of the human mind and its conceptual tools. This, as well as the corresponding Hegelian view of the divine spirit as being reflected in human history, is one of the recurring themes of cultural philosophical anthropology.

In a specifically German version and modified by the methodology of the practitioners of the *Geisteswissenschaften*, the "science of human nature," which stemmed from Thomas Hobbes, John Locke, and the Earl of Shaftesbury and reached its culmination in the eighteenth century, is the principal root of philosophical anthropology. David Hume's *Treatise of Human Nature* provided a program for philosophical anthropology. "There is no question of importance whose decision is not comprised in the science of man.... In pretending to explain the principles of human nature we in effect propose a complete system of the sciences" (Everyman ed., Vol. I, p. 5). Philosophical anthropology took up Hume's empiricism with regard to the moral sciences, as well as his conception of religion.

Adam Smith's spectator theory of the moral sentiments was an early statement of the excentric position of man. The "Newtonian-Baconian" school of Scottish and French social thought of the eighteenth century (Francis Hutcheson, Adam Ferguson, John Millar, Dugald Stewart, Pierre-Louis Moreau de Maupertuis, Denis Diderot, and Jean Le Rond d'Alembert), which culminated in John Stuart Mill's sociology, was a direct precursor of philosophical anthropology in its aim of putting the study of man on an empirical biological basis. This school sought to elucidate and bridge the gap between man's distinctive nature and the sociocultural order in "the belief that it was natural for man to make an order of life different from that in which the race was nurtured earlier, that it was in the nature of his equipment that he should react intelligently and creatively to the situations in which he found himself" (G. Bryson, *Man and Society*, Princeton, NJ, 1945, p. 173).

The more widely recognized forerunners of philosophical anthropology—Herder, Christian Garve, and Wilhelm von Humboldt—were directly influenced by the Scottish and French anthropologists and Encyclopedists, who had undermined Cartesian dualism. Thus, at the end of the eighteenth century, there was a wide acceptance of certain propositions concerning man's creative powers, his individuality, and his sociability. The Scottish and French precursors, however, had intended to develop more rigorous methods of investigation than those used by contemporary philosophical anthropologists.

## SUBJECT MATTER, ATTITUDE, AND GOAL

Like existentialism and *Lebensphilosophie*, philosophical anthropology studies man's existence, his experiences, and his anxieties, combining the subjectivism of existen-

tialism with the cultural objectivism of *Lebensphilosophie*. It uses the phenomenological methods of *Verstehen* and reduction. Philosophical anthropology shares with existentialism, phenomenology, and *Lebensphilosophie* a critique of society. Yet these currents are not identical; Heidegger and Karl Jaspers, for example, refuse to be identified with philosophical anthropology, despite their great impact on it.

Philosophical anthropology seeks to interpret philosophically the facts that the sciences have discovered concerning the nature of man and of the human condition. It presupposes a developed body of scientific thought, and accordingly, in its program it aspires to a new, scientifically grounded metaphysics. It seeks to elucidate the basic qualities that make man what he is and distinguish him from other beings. It combines, and mediates between, what Kant designated as physiological and pragmatic anthropology.

Physiological anthropology studies man's natural limitations; pragmatic anthropology deals with man's potentialities, with what he, as a free agent, makes of himself, or is able and ought to make of himself. Thus, philosophical anthropology studies both man as a creature and man as the creator of cultural values—man as seen by a scientific observer and man as interpreted by himself (*Aussen-* and *Innenansicht*). Accordingly, most philosophical anthropologists wish to combine scientific methods with an imaginative philosophical approach.

Philosophical anthropology seeks to correlate the various anthropologies that have developed with the specialization of the sciences. Max Scheler distinguished between scientific, philosophical, and theological anthropologies, or interpretations of the fundamental structure of human activities, which know nothing of one another. In order to stem what its followers describe as anarchy of thought and the "loss of the center," philosophical anthropology offers itself as a coordinating discipline. With the dissolution of traditional beliefs in guidance by gods, by kings and feudal leaders, by God, or by nature, there is today a general lack of direction. Man is now, as he was for Protagoras, the only possible measure. By coordinating and interpreting fragmented knowledge, philosophical anthropology aims at a new understanding of man's essential qualities and potentialities. It aims to accomplish this by the development of suitable methods, by a factual elucidation of the perplexities inherent in human institutions, and by borderline research (coordinating different branches of the sciences) used as a basis for a new "map of knowledge."

Since philosophical anthropology arose as an interpretation of various scientific disciplines, it has practitioners in many fields. Although there are only a few academic chairs of philosophical anthropology (Göttingen, Nijmegen), the number of professed philosophical anthropologists is large, chiefly in the German-speaking countries, but also in the Netherlands, Spanish-speaking countries, the United States, and France. Modern French humanism, whether existentialist, religious, or Marxist, is both historically and analytically allied with philosophical anthropology. Many philosophical anthropologists stress that they are theological, historical, political, juristic, biological, phenomenological, or cultural philosophical anthropologists. Much so-called philosophical anthropology is best treated under metaphysics, ontology, theory of value, epistemology, theology, philosophy of science or of history, or under the related contemporary philosophies. This entry will discuss only the distinctive features.

Philosophical anthropology embraces most of the social sciences. Some leading practitioners, such as Arnold Gehlen, emphasize the concept of action, rather than man, as the distinguishing feature of philosophical anthropology, and define it as a new empirical discipline, *Handlungswissenschaft* (similar to "behavioral science" and the "theory of action"), as distinct from the natural sciences and the *Geisteswissenschaften*.

Philosophical anthropology is an attempt to construct a scientific discipline out of man's traditional effort to understand and liberate himself. At the same time, however, it is pervaded by the same antiscientific currents that mark existentialism, *Lebensphilosophie*, and phenomenology. But it is its dialogue with science that gives philosophical anthropology its peculiar character.

## THE CRISIS OF SCIENCE

Philosophical anthropologists see a "crisis of science," a crisis first brought into view by three "humiliations of man." First, the humiliation of Copernican astronomy removed man's habitat, the earth, from the center of the universe; second, Charles Darwin's biological evolutionism "shamed and degraded" man; and third, the historical schools revealed the relativity of religious and national cultural values. The crisis in science has been brought to a head by modern developments in depth psychology, post-Euclidean mathematics, and the indeterminacy principle in nuclear physics. From the scientific point of view, these developments represent advances rather than a crisis. However, German philosophers since Kant have conceived of science as being fixed in a rigid mathemati-

comechanical determinism. According to philosophical anthropologists, this basic concept has broken down. There is a wide consensus among Continental thinkers that nineteenth-century materialism has been overcome and that the methods of the *Geisteswissenschaften* and phenomenology have been vindicated.

These methods seek the meaning immanent in events and in the works of man rather than the causal nexus between events. They aim to interpret other minds (both individual and collective), their peculiar intentions and tendencies, and the institutions through which their ideas have found expression. They investigate the conscious and unconscious actions of human beings and the structure of interpersonal (social and cultural) relationships. These methods are descriptive, interpretative, organic, and concrete, rather than explanatory, mechanical, and abstract, as in the natural sciences. This distinction of two methodologies—causal explanation on the one hand and *Verstehen* and phenomenological reduction on the other—takes up the emphasis of what is known in English as the Germano-Coleridgean school on, in the words of J. S. Mill, a philosophy of society in the form of a philosophy of history seeking a philosophy of human culture.

### THEORY OF KNOWLEDGE

The crisis of science, according to philosophical anthropologists, evinces a deep crisis in the theory of knowledge—a crisis that makes imperative the adoption of pragmatic theories of truth. Traditional epistemology, they claim, was occupied with only one of the functions of consciousness. It failed to take into account what Pascal called the *logique du coeur* or *esprit de finesse*, which was akin to Samuel Taylor Coleridge's "imagination" and John Henry Newman's "illative reason." And consciousness itself is only a part of the forces that shape human reasons. For philosophical anthropologists, as for sociologists of knowledge, knowledge is determined by dispositions and by outside factors. Erich Rothacker claims that all knowledge is based on the particular ways of thought (*dogmatische Denkformen*) of national and sectional cultures, which determine both the questions asked and the answers given. Questions and answers have no validity apart from their appropriateness to the cultural environment (*Umwelt*). On the other hand, Scheler sought to establish an objective scale of values that would take into account nonrational elements. He distinguished in an ascending order the strata of vitality, intellectuality, and holiness (*Herrschaftswissen*, *Leistungswissen*, and *Heilswissen*). Despite his epistemological relativism,

Rothacker has applied a similar scheme of "lower" and "higher" values in his psychological theory. Although most philosophical anthropologists profess value relativism, implicit value scales may be discerned underlying their methodological views and cultural criticism.

### METHODOLOGY

Philosophical anthropology rejects the Cartesian dualism of body and soul: Man is not part animal and part spirit but a being *sui generis*, distinct from animals in physical condition and in aspirations. This attitude, together with philosophical anthropology's theological roots, may account for a nearly universal (although currently weakening) rejection of Charles Darwin and Sigmund Freud for allegedly appealing to the forces of primitivism and animality in man. At the same time, many philosophical anthropologists reject modern intellectualism; their rejection of rationality, like that of many existentialists and *Lebensphilosophs*, has its roots in the romantic reaction to the Enlightenment and the French Revolution. In its suspicion of *Verwissenschaftlichung* ("scientism"), philosophical anthropology perpetuates the traditional German attacks on *Reflexionsphilosophie*, in which the nonrational aspects of reality are alleged to be ignored.

Philosophical anthropology's conception of method was formulated by Wilhelm Dilthey and Edmund Husserl. Husserl's nonempirical phenomenological approach to philosophical questions was claimed to be presuppositionless, wholly scientific, and logically prior to the natural sciences. It is concerned with meanings, an intuitive comprehension of directly experienced essences, and it involves a distinct method for "analyzing" (or rather, interpreting) facts, qualities, relationships, and the basic categories of human nature and culture—a method of analysis different from that which results in an explanatory theory. However, such thinkers as the biologist Adolf Portmann and the psychologist Karl Jaspers attempt to combine the scientific and interpretative approaches.

Ludwig Binswanger, for example, does not exclude the methods of natural science, but raises two objections to reveal their inherent limitations. One is that all abstractions are transpositions and simplifications of reality. The other is that the registration of stimuli in experimental psychology restricts the field of investigation so as to make the perception of meaningful wholes impossible; it precludes the essential selective and synthesizing activities.

Helmuth Plessner sees philosophical anthropology as the paradigm of borderline research. Although there is

still a methodological gap between the physical and the social sciences, there has been spectacular progress toward methodological and substantive unification of physics, chemistry, and mineralogy, and of physiology and biochemistry. This progress supplies a model for philosophical anthropology. In its physical concerns, philosophical anthropology should correlate the work of medicine, zoology, chemistry, and physics, and in its non-physical concerns, it should correlate the work of psychology, psychoanalysis, psychiatry, and the cultural sciences.

The physical and nonphysical concerns correspond to the traditional divisions of body and soul and of empiricism and subjective idealism. The division between body and soul emphasizes the ineluctable natural limitations of man and the determined aspects of his nature, and thus ignores his freedom and historicity, while the division between empiricism and subjective idealism has traditionally lost itself in metaphysical speculation. Philosophical anthropology tries to avoid both extremes; it sees man as essentially *homo absconditus*, inscrutable, an open question. Man must formulate his destiny so that he is not held rigidly in one role but safeguards his creative freedom. The direction in which this freedom permits man to fulfill himself is not amenable to scientific discovery, and thus science is devalued. Man's choices depend on his philosophical understanding of his own position in the world.

An infinite variety of choices is open to man. What distinguishes man's nature is not how he chooses, but that he does choose—that he is not determined by his biological and physiological constitution but is formed in the light of cultural values he himself has created and internalized. Philosophical anthropology's contribution to the study of cultures is its emphasis on the creative element in the unfolding of the various conceptions of man's position in the world. Therefore, man's self-understanding, or self-image, is a central theme of philosophical anthropology.

### THE SELF-IMAGE OF MAN

Formerly, man was threatened not primarily by man, but by nature. Through science, nearly all natural phenomena have been or can be brought under man's control. Man is threatened neither by nature nor by the God who made nature, but by his own use of nature. Man's enemy is man, manmade structures, or the God who made man.

Again, even in coming to know nature, man (or his scientific representatives) meets himself rather than nature. Man no longer seeks nature as such, but nature as

we question it for specific scientific purposes and in the specific contexts of axiomatic frameworks that we ourselves have determined.

Thus, man is inescapably confronted by man. We have reason to ask, What is this man? But what causes us to ask questions about the form in which man's subjective image of himself appears in his consciousness?

Man's subjective image determines what he makes of himself. Animals are as nature has created them, but man must complete his character; nature has supplied only the rudiments of it. Man must form his own personality, and he does so according to his image of what he can and should be. Scheler has delineated a historical typology of Western man's self-images, or "reality-worlds."

Man first saw himself as *homo religiosus*, a view based on the Judeo-Christian legacy of supernaturalism and its ensuing feelings of awe and of inherited guilt. The next stage was *homo sapiens*, rational man in harmony with the divine plan. Since the Enlightenment, this image has been largely superseded by the naturalistic, pragmatic image of *homo faber*—man as the most highly developed animal, the maker of tools (including language), who uses a particularly high proportion of his animal energy in cerebral activities. Body and soul are regarded as a functional unity. Human being and development are explained by the primary urges of animal nature—the desire for progeny and the desire for food, possessions, and wealth. Machiavellianism, Marxism, racism, Darwinism, and Freudianism, it is claimed, are based on this interpretation of man.

These three self-images of man have in common a belief in the unity of human history and in a meaningful evolution toward higher organization. The images of *homo dionysiacus* and *homo creator* break with this tradition and herald a new orientation of anthropological thought. In the image of man as *homo dionysiacus*, man sees decadence as immanent in human nature and history. Typical exponents of this view are Arthur Schopenhauer, Nietzsche, and neoromantics like Ludwig Klages, Oswald Spengler, and Leo Frobenius. Man is seen as the "deserter" or the faux pas of life; as a megalomaniac species of rapacious ape; as an infantile ape with a disorganized system of inner secretions; or as essentially deficient in vital powers and dependent for survival on technical means. Man's power of thought is an artificial surrogate for missing or weak instincts, and his "freedom to choose" is a euphemism for his lack of direction. Human social institutions are pitiful crutches for assuring the survival of a biologically doomed race. Reason is regarded as separate from the soul, which belongs to the

vital sphere of the body. Reason is the destructive, “demoniac” struggle with, and submergence of, the healthy activity of the soul.

The image of man as *homo creator* is likewise derived from Nietzsche, and also from Feuerbach. But the Nietzschean superman has been transformed into a stricter philosophical conception by Nicolai Hartmann, Max Scheler, and the Sartrean existentialists. Scheler called this view a “postulatory atheism of high responsibility.” Man has no ontological knowledge of an ultimate being. Contrary to Kant’s postulate of the ethical need for a God, in the new view there must be no God—for the sake of human responsibility and liberty. Only in a mechanical, nonteleological world is there the possibility of a free moral being. Where there is a planning, all-powerful God, there is no freedom for man responsibly to work out his destiny. Nietzsche’s phrase “God is dead” expresses the ultimate moral responsibility of man; the predicates of God (predestination and Providence) are to be related to individual man.

Man’s awareness of his own self-images illuminates the whole range of his genuine potentialities so that his choice of an authentic form of life is not restricted by narrowness of view.

## THE MAJOR BRANCHES

Philosophical anthropology shares with French humanism a particular critical analysis of society, but before this analysis can be presented, it is necessary to make a survey of the important branches of philosophical anthropology and of their results.

**BIOLOGICAL PHILOSOPHICAL ANTHROPOLOGY.** The reaction to determinism in the physical sciences has given rise to biological philosophical anthropology, or bioanthropology. Bioanthropology scrutinizes biological theories philosophically, primarily to correlate man’s creative achievements and attitudes with his physiological organization. Man’s cultural role—his character as a symbol-making being capable of abstraction, forethought, language, and intersubjective communication—is depicted as an irreducible function of his physiological constitution.

Among many important practitioners of bioanthropology are the biologists F. J. J. Buytendijk and Adolf Portmann and the philosopher Arnold Gehlen. Important starting points of bioanthropological thought have been Walter Garstang’s concept of paidomorphosis and Jakob von Uexküll’s concept of milieu (*Umwelt*), which was developed earlier, in philosophical terms, by Edmund

Husserl. Paidomorphosis emphasizes the embryonic qualities that are preserved in man but lost in adult animals, as well as man’s retarded extrauterine development. Gehlen has used the concept of man as a fetal ape to account for man’s cultural achievements which, he claims, are conditioned by man’s helpless status in the world. Devoid of instincts and of natural weapons and tools, man has been compelled to compensate for his shortcomings by active responses to the challenges of his environment and of his physiological urges. Man defends himself by his actions, whose scope, direction, and intensity, in contrast to instinctive reactions, are within his discretion. He transforms the natural environment into a system of action (*Handlungskreis*), the responses to which are perpetuated in institutions and language. Man’s cultural environment is thus both a physiological condition of his survival and a distinctive criterion of his nature.

**Uexküll.** From his investigations into animal physiology, Uexküll derived a theory of the specific environmental determination of human life. Each species of animal lives in its own *Umwelt*; its consciousness of sense data is strictly limited by its innate capacities of perception. The range of these capacities corresponds to the teleology immanent in the “life plan” of different animals and is strictly limited to the life plan’s specific tasks. Uexküll started from Kant’s theory that the categories of the understanding determine the perception and conception of the data of the senses. It was Uexküll’s teleological interpretation that distinguished his work from that of Western contemporaries who independently developed the sociology of animals. In the German romantic tradition, Uexküll was concerned with fighting the “mechanistic,” positivistic conception of science that he saw represented in biochemistry and behaviorism.

**Buytendijk.** Buytendijk’s physiological and psychological investigations have been undertaken in close contact with such phenomenologically oriented thinkers as Scheler, Plessner, Viktor von Weizsäcker, and V. E. von Gebattel. Like Uexküll, Buytendijk rejects Cartesian dualism and its mechanical interpretation of bodily processes; unlike Uexküll, he rejects the hypothesis that man is determined by his *Umwelt*. Through his detailed comparisons of animal and human physiology and psychology, Buytendijk has sought to work out man’s unique condition as expressed in his capacity for abstraction and symbolization (the ability to create signs representing what is bodily absent), and in his capacity for the logical correlation of signs. For Buytendijk, biology is a historical science that must be understood in motivational, teleological terms. He conceives of motives and processes as

value-related and spontaneous, derived from the built-in planning capacity of a self-structuring organism. Parallels with *verstehende* sociology are obvious, but Buytendijk's impressive ability to rest his philosophical views on a biological basis cannot conceal the fact that he held his views prior to his scientific illustration and testing of them.

*Portmann.* Adolf Portmann's work represents the culmination of bioanthropology. It aims at an integration of biological with psychological, sociological, and anthropological thought. According to Portmann, human biology has turned into anthropology, because the life of man, despite superficial similarities to animal life, is something *sui generis*. Portmann emphasizes the uniqueness of human action, language, foresight, and upright carriage, and of the human growth rhythm—duration of pregnancy, bodily proportions, extrauterine babyhood, and late formation of the female pelvis. These qualities, he claims, arise from a characteristic interpenetration of the hereditary process and teleological, sociocultural processes. Man's individuality (which continues to grow while the body decays) and man's sociability combine to establish his undetermined "openness," in contrast to determination of the animal by his *Umwelt*.

Portmann's central concept is "internality," the fact that individuals are centers of purposeful activity who use the external shell of the body as a means of self-expression and of communication with other individuals. Portmann does not claim that the affirmation of man's individuality and sociability provides the "meaning of life." Although specific mysteries of man's biological structure have been solved, he claims, the "basic fact" for philosophical anthropology continues to be man's "mysteriousness." Man has no built-in evolutionary mechanism leading to an equilibrium; there is only a creative variability (*Disponibilität*) of the human situation. Man's spontaneous individuality creates new self-images; his sociability spreads and maintains them.

Portmann has sought, however, to advance beyond the limits of functional morphology to a vantage point that will illuminate the hierarchy of values—a vantage point whose need has increased in view of the tremendous potential power of biotechnical advances to influence and change the human condition, and perhaps human nature. However, as in the biophilosophies of Henri Bergson, Pierre Teilhard de Chardin, and Julian Huxley, it is easier to discern the philosophical basis of Portmann's biological hypotheses than it is to discover any positive contribution that biology has made to his philosophical thought. He first developed his conception of man as functional unit as a philosophical hypothesis.

"Openness" has been a theme of philosophical anthropology since the time of Herder and Kant.

In general, it must be said that no substantive lesson is to be drawn from either functional or analytical biology, except that it is of man's essence to create structured and meaningful systems of action. The biological foundation of man's creativity entails no concrete guide to what man ought to do. Nothing would appear to follow from the fact that creativity has biological roots except that man cannot permit himself to be altogether determined by any given environment. He must transcend it creatively, and he must be guided by ideas and leitmotifs rather than by instincts, by decisions rather than by reactions to stimuli. But the questions of what decisions man will take and what ideas he will adopt are not answered by bioanthropology, which emphasizes the malleability of human nature as a basic fact. Any insight into the potential content of human achievement must therefore be based on the plurality of the cultures that have unfolded in history. Bioanthropology thus leads into cultural philosophical anthropology.

**CULTURAL PHILOSOPHICAL ANTHROPOLOGY.** Like American cultural anthropology, cultural philosophical anthropology is concerned with man and his works, with culture history and culture sociology, and with historical morphology and the philosophy of history. It is interested primarily in developed societies—"high cultures" that have created a style of their own beyond the biological and trivial uniformities of the tribal state. Like German sociology, it emphasizes the multiformity rather than the uniformity of human nature, and the history rather than the theory of cultures. Like Portmann's bioanthropology, it finds an ultimate mystery in man—the mystery of archetypes and racial dispositions.

Cultural anthropology combines Dilthey's historicism with the phenomenological method. Man comes to know and liberate himself through history. A comparative study of societies elucidates the human situation and the human predicament. But this study results in the same merely formal characteristics elaborated by bioanthropology—the adaptability of the human mind, the need for a "sane" worldview, sociability with its ensuing problems, a common growth rhythm, and common basic physiological urges.

Arnold Gehlen and Erich Rothacker are the most representative cultural philosophical anthropologists, while Werner Sombart is the most opinionated. Gehlen and Rothacker present integrated theoretical systems that have an ultimately psychological basis. Their psycholo-

gies, like that of Dilthey, are essentially descriptive and interpretative, and their psychological interpretations mirror their cultural philosophies.

Rothacker has classified cultural factors in a scale by “laws of polarity.” He seeks to understand individual cultures by a process of “reduction” to “national souls” (attitudes and dispositions that generate *Weltanschauungen*) and to myths. These ur-experiences are not further reducible; they are embodied in the racial inheritance. Therefore, although people do create and develop the *Umwelt* of their national cultures, the possibilities that are thereby realized are ultimately determined. Rothacker’s historicist relativism is less free from ethnocentrism than one might be led to expect by the emphasis of philosophical anthropology on the openness of man.

Gehlen’s psychology is rooted in the archaic stage of cultural development. The values of this stage serve as criteria for the evaluation of late cultures, which accordingly appear as falls from grace.

In Sombart’s anthropology ethnocentric traits are also emphasized. Thus, man’s irreconcilable diversity rather than his potential openness is seen as distinguishing the human situation.

Ernst Cassirer, on the other hand, sought to discover the basic function of human cultural achievements (language, myth, religion, art, science, history) behind their innumerable forms and to trace them to a common origin in man’s symbol-making power—the power to build up an “ideal world” of his own.

**PSYCHOLOGICAL PHILOSOPHICAL ANTHROPOLOGY.** Bioanthropology and cultural philosophical anthropology are the most important branches of philosophical anthropology. Among other branches, only psychological philosophical anthropology and theological philosophical anthropology require separate mention.

Psychological philosophical anthropology is the most successful post-Freudian development in psychiatry on the Continent and, through existential psychoanalysis, is exerting considerable influence in the English-speaking world. The outstanding figures in this movement are Ludwig Binswanger, Erwin Straus, and Medard Boss. Erich Fromm seeks to incorporate his psychology within philosophical anthropology, and Rollo May in the United States and R. D. Laing in Britain follow similar lines. Their common belief is that traditional experimental psychology requires the assistance of philosophical thought to arrive at satisfactory results. Some psychological philosophical anthropologists oppose the empirical hypotheses and inductive statistical methods of experimental

psychology; most of them combine experimental methods with a specific philosophical or phenomenological approach.

Since psychological philosophical anthropology deals with individual cases, it lends itself to concrete and descriptive investigations. Analyses have been made of laughter and weeping, fantasy, shame, resentment, pleasure, love, and fear. These analyses do not consist in mere registration of stimuli but in selective and synthesizing acts of interpretation by phenomenological “reduction” to an intuition of essential qualities. Plessner has traced the capacity for laughter and weeping to man’s “excentricity,” his ability to transcend his innate nature and to observe, judge, and respond to situations. Human moods (*Stimmungen*) are typically described as obstacles to the achievement of authenticity. The irrational elements in moods undermine the continuity of character, which is man’s potential ability to give meaning and direction to his life. Accidental attitudes that arise from the challenge of situations thus deprive man of his right to make responsible choices; they tie him to an impoverished, one-sided anthropology.

Binswanger developed existential analysis from Freud’s psychoanalysis. He describes Freud’s positivist, “utilitarian” anthropology as one-sided and negative. Its culture concept, he claims, concentrates negatively on the taming of natural urges rather than positively on a teleological image of man’s potentiality. Freud’s “somatographic” or “somatomorphic” conception of existence stresses the scientific analysis of sleep, dream, passion, and sensuality while, according to Binswanger, it neglects the historical and cultural aspects of existence, such as religion, art, ethics, and myth, all of which are as important as science. In Binswanger’s view psychological investigation should be directed toward the self-transcending, exercise of man’s liberty to make authentic choices. The psychologist’s task is to illuminate the “inner life history” of the patient, his self-structuring in the light of his inner motivation. Self-structuring is equivalent to character or to the response that the individual makes to the challenge of the world around him. St. Augustine, to whom we owe the beginnings of autobiography, is a case in point. Illness prevented him from carrying out his ambition to become an orator. He transcended his natural disability by turning toward the spiritual world and thus arrived at his essential “real being.” He could have reacted otherwise—by resentment or frustration, by neurosis or suicide. These and other potentialities held out to Augustine the temptation to restrict his character by the impoverishment inherent in giving in to an irresponsible choice—a

choice suggested by the logic of the situation. Augustine chose an autonomous life that preserved his access to a full range of human values. Psychosis is explained as an “abortive encounter” with existence, or a form of existential misdirection. Diagnosis of a psychosis therefore depends on a valid interpretation of what constitutes an authentic existence. An authentic existence, according to Binswanger, consists in a life in keeping with a legitimate cultural (religious or national) tradition; in a dialogue with other beings (the “Thou”); or in the ability to act in character in the face of situational challenges.

However, the first of these criteria depends on values that are subject to unresolved doubt; the other two are so devoid of specific content that they hardly invite contradiction. Existential analysis, even more than psychoanalysis, obliterates the line between the normal and the abnormal and reduces psychological problems to questions of *Weltanschauung*.

Viktor von Weizsäcker, V. E. von Gebattel, Erwin Straus, and Harald Schultz-Hencke have carried out structural analyses of inhibited character types and, in particular, of sexual perversions. Health is defined as openness to all potentialities of life, and obsessional urges are therefore interpreted as disturbed worldviews that enslave the individual in rigid, one-sided, compulsive attitudes and interfere with his social “I-Thou” relationships. Sexual perversions, in particular, have been construed by Gebattel as obsessional urges that preclude a lasting I-Thou relationship based on mutual freedom, and as thus being incapable of providing ultimate satisfaction. Medard Boss, however, arguing from an equally existential basis, stoutly rejects this view. Gebattel’s apotheosis of the procreative element in love, however, points to the close affinity of philosophical anthropology with “secularized theology.”

**THEOLOGICAL PHILOSOPHICAL ANTHROPOLOGY.** Theological anthropology emphasizes the Biblical conception of man in a dialogue with God. Martin Buber, Emil Brunner, and Dietrich Bonhoeffer are remarkable representatives of this movement, although their work is best studied in its theological context. However, the openness of man and his individuality and sociability are dominant themes of their work. The human difficulty of making the right choices is paralleled by the theological conception of man as simultaneously just and sinning.

A merely intellectual and logical exposition of God’s message, in their view, is not enough for an understanding of God’s revelation. An emphatic existential I-Thou relationship between man and God, based on the *logique*

*du coeur*, is required. What matters is not that something is true, but how it can be made to come true. Belief in God has been explained by theological philosophical anthropologists, following Feuerbach, in terms of the self-understanding and the creative self-image of man.

The need for a postscientific interpretation of the Creed that is appropriate to a “mature” humanity and avoids theological sophistry has become a leading motif of theological anthropology, and this makes it difficult to distinguish between its tenets and those of secular philosophical anthropologies.

## CRITIQUE OF SOCIETY

Philosophical anthropology shares with contemporary French humanism the conception that there is a crisis of the sciences that reflects a radical crisis of European society. It rejects contemporary bourgeois society, from either a romantic or a Marxist viewpoint, for the alleged dehumanizing tendencies it has developed in the process of rationalization following the breakup of feudal and religious institutions.

The rise of scientific rationalism is not regarded as a process of liberation from the shackles of superstition, conventions, and fallacies, but as a process that has deprived Western man of his “center of gravity” and has alienated him from his authentic nature through the replacement of value by “means-end” relationships, by neutral experiment, and by mechanico-mathematical abstraction. In the view of philosophical anthropologists, the “age of transition,” or “age of crisis,” which heralded the acceptance of utilitarianism in the English-speaking world, is still unresolved. Man’s salvation from alienation is not seen as a continuous process of improvement or of piecemeal social engineering but as a radical challenge that is less concerned with practical reform than with a utopian rejection of the modern world.

The central theoretical insights of philosophical anthropology consist in an affirmation of the individuality and sociability of man as ultimate values. This theory would seem to suggest a social organization that combines an optimum of free choice with the minimum encroachment on individual liberty that is compatible with a viable social coexistence. This is in fact the utilitarian image of man that has prevailed since the early nineteenth century in the English-speaking world, where this image of man has been internalized to such an extent that the discussion of ultimate metaphysical questions has predominantly given way to the discussion of means to assure the accepted end of mutual accommodation and individual discretion. By contrast, on the Continent, and

especially in Germany, the romantic reaction to the French Revolution precluded the acceptance of the philosophy of the Enlightenment. No commonly accepted concept of society was developed to counterbalance an unbridled individualism except the radical panaceas of nationalism and totalitarianism. By emphasizing the importance of both individuality and sociability, philosophical anthropology is returning to the type of position that gave birth to utilitarianism, and it may therefore be a step toward a utilitarian view of the world. Although most of its representatives present ethnocentric or nihilistic conclusions, these are not inevitable consequences of philosophical anthropology's affirmation of the creativity and sociability of man.

(See "Philosophical Anthropology" in the index for articles on philosophers who have especially concerned themselves with the topic.)

## PHILOSOPHY

Defining *philosophy* is itself a philosophical problem. Perhaps a great many philosophers would agree that whatever else philosophy is, it is the critical, normally systematic study of an unlimited range of ideas and issues. But this characterization says nothing about what sorts of ideas or issues are important in philosophy or about its distinctive methods of studying them. Doing this will require some account of the special fields of the subject, its methods, its connections with other disciplines, its place in the academy, and its role in human culture. The task is large. Philosophy pursues questions in every dimension of human life, and its techniques apply to problems in any field of study or endeavor. It may be described in many ways. It is a reasoned pursuit of fundamental truths, a quest for understanding, a study of principles of conduct. It seeks to establish standards of evidence, to provide rational methods of resolving conflicts, and to create techniques for evaluating ideas and arguments. Philosophy may examine concepts and views drawn from science, art, religion, politics, or any other realm.

The best way to clarify these broad characterizations of philosophy is to describe its principal subfields (all of which are addressed in more detail in entries in this Encyclopedia devoted to them alone). It is appropriate to start with what might be called *traditional* subfields of philosophy, most commonly taken to be epistemology, ethics, logic, metaphysics, and the history of philosophy. These remain central in philosophical research; and although they are by no means its exclusive focus, they are intimately connected with virtually every other field of philosophical research and are widely treated as core areas in the teaching of the subject.

### FIVE TRADITIONALLY CENTRAL SUBFIELDS OF PHILOSOPHY

**EPISTEMOLOGY.** Epistemology concerns the nature and scope of knowledge and justification. What does it mean to know (the truth), and what is the nature of truth? What sorts of things can be known, and can we be justified in our beliefs about what goes beyond the evidence of our senses, such as the inner lives of others or events of the distant past? Is there knowledge beyond the reach of science? What are the limits of self-knowledge? Can there be genuine moral knowledge? Quite apart from the depth, modality, or subject matter of knowledge, we may also ask: What are its basic sources? They have been widely thought to be perception, memory, introspection,

and reason (understood as a kind of reflection). But what of testimony? And can any substantive knowledge, say in mathematics, be utterly independent of experience in the way a priori (reason-based) knowledge is sometimes held to be?

A major epistemological problem connected with all of these sources is the status of skepticism. Skepticism has many forms, depending on the kind of knowledge or justification it represents as unattainable. What is commonly called Humean skepticism (deriving from David Hume's writings on causation and inductive inference) challenges the belief that any inductive arguments (*probable arguments*, in Hume's terminology) can ground knowledge. Cartesian skepticism, powerfully stated in Descartes's *Meditations*, challenges the belief that we have knowledge at all. Quite apart from whether there can be knowledge or justified belief, there is the question of the structure that a body of knowledge or of justified beliefs must have. Must it, for instance, contain beliefs possessing a kind of axiomatic status, or can it consist of elements that all lack that status or, indeed, are in no way privileged relative to other elements? Traditional *foundationalists*, such as Descartes, have held a view of the first kind; moderate foundationalists (represented by a large proportion of epistemologists since the middle of the twentieth century) hold that foundational cognitions are necessary in a body of knowledge or justified belief but need only be in a certain way noninferentially justified as opposed to indefeasibly justified; and coherentists and other non-foundationalists have posited various ways aimed at accounting for knowledge and justification without appeal to foundational elements.

**ETHICS.** Ethics is the philosophical study of morality, particularly conceived as a set of standards of right and wrong conduct. Its most theoretical branch (commonly called *metaethics*) concerns the meanings or, more broadly, the logic, of our moral concepts—such as right action, obligation, and justice—the kinds of evidence we have for propositions about the corresponding subject matter, and the sorts of properties that apparently underlie the application of the concepts. On some major ethical views, such as J. S. Mill's utilitarianism, our obligations derive from our potential contributions to enhancing what is good. For this reason, among others, the concept of the good and the distinction between intrinsic and instrumental goodness are also major concerns of ethical inquiry. On other major ethical views, such as Immanuel Kant's, moral obligatoriness is a property possessed by acts themselves by virtue of their falling under nonconsequentialist principles, for instance, a

principle that, quite apart from the consequences of lying, prohibits it.

*Normative ethics* is commonly contrasted with metaethics and is concerned to formulate and assess principles meant to guide moral decisions, whether in private or public life. A major question it raises is what moral specific obligations we have. Another is what moral rights persons as such have and, related to this, what legal rights a just society must accord its citizens. Still another is what constitutes a valid excuse for wrongdoing. Any moral philosopher may be concerned with the broad question of how moral disagreements may be rationally settled, and here we have a question that has both metaethical and normative aspects.

**LOGIC.** Logic is concerned to provide sound methods for distinguishing valid from invalid arguments or, on a wider conception, good from bad arguments in terms of criteria for determining how much support the conclusion receives from the premise(s). Arguments may be considered ordered sequences of propositions in which some—the premise(s)—are conceived as supporting another—the conclusion. A standard example is the following syllogism, which has a very common form: its premises are that *all human beings are mortal* and that *Socrates is mortal*; its conclusion is that *Socrates is a human being*. Deductive logic is concerned with appraising arguments in relation to the question whether the premises *entail* (or logically imply) the conclusion, as with the syllogism just presented. Inductive logic is concerned with appraising arguments in relation to probabilistic support. From premises about the factors that cause influenza, medical experts may conclude that millions of people will be infected during the next flu season. Inductive logic addresses the problem of how we may tell what probability this conclusion has given those premises. More generally, logic helps us to assess how well our premises support our conclusions, to see what we are committed to accepting when we hold a view, and to avoid adopting positions for which we lack supporting reasons. As applied to everyday thinking, the use of logic also helps us to find arguments where we might otherwise simply see a set of loosely related statements, to discover assumptions we did not know we were making, and to formulate the minimum claims we must establish if we are to prove (or inductively support) our point.

**METAPHYSICS.** Metaphysics seeks basic criteria for determining what sorts of things are real. Criteria of this kind are the special concern of ontology, which is central in metaphysics. Among major ontological questions are

these: Are there mental, physical, and abstract things (such as numbers)? Or is there just the physical and the spiritual? Might there be merely matter and energy? Are persons highly complex physical systems, or do they have properties not reducible to anything physical? How much can a person—or other kind of thing—change and remain the very person or thing it is? In the case of persons, this question is central for the problem of personal identity, which, in turn, is crucial for understanding the possibility of nonembodied life. Another question about persons is whether they can be free in a sense not possible for lower animals and whether their freedom is possible if the world should be a deterministic system, that is, one in which every event is entailed by a universal law of nature and some simultaneous or antecedent event. What constitutes a law of nature, and, in particular, what constitutes a causal law, are themselves major questions in metaphysics. Metaphysics has also been traditionally taken to include cosmology, which is concerned with the nature of the universe as a whole and pursues such questions as whether it must have a beginning in time, whether it can be infinite, and whether it must have been created and, if so, by what kind of being or in what way. The nature of time is itself an important metaphysical question.

**HISTORY OF PHILOSOPHY.** The history of philosophy might be thought to be a branch of the discipline of history rather than of philosophy, much in the way the history of science is a branch of history and not itself a branch of science. This conception would be quite inadequate to the standard conception of the history of philosophy in the field of philosophy. On that conception the history of philosophy is a genuine subfield of philosophy: It is the historical and *philosophical* study of the history of the subject. It commonly includes more in the way of philosophical interpretation and—sometimes—philosophical appraisal of major texts than historiographic studies of either a single philosopher or whole periods in the history of the subject. This is in part because the interpretation—and certainly the proper appraisal—of a philosopher is itself a philosophical problem, often involving epistemological or metaphysical theorizing. A study of a single philosophical work important in the history of philosophy may thus count as a contribution to the history of philosophy and not just to the study of its author.

The history of philosophy, then, examines major philosophers, the influence of one philosopher on another (say, Aristotle on Aquinas, Husserl on Heidegger, or Frege on Russell) or entire periods in the development

of philosophy, such as the Ancient, Medieval, Modern, Nineteenth Century, and Twentieth Century periods. It seeks to understand great figures, their influence on others, and their importance for perennial and contemporary issues. The history of philosophy in a single nation is often separately studied, as in the case of American Philosophy. So are major movements within a nation, such as German Idealism, as well as international movements with a substantial history, such as Existentialism, Logical Positivism, and Phenomenology.

From the wide scope of many of the questions pursued in these philosophical fields, it should be clear that philosophy has a kind of generality possessed by no other field. Metaphysics, for instance, concerns the basic categories encompassing *everything* that exists, and epistemology concerns standards of evidence that apply in *any* kind of thinking. It will also be evident that every other discipline presupposes answers to certain philosophical questions. All of the sciences, for example, presuppose that facts about the past can yield knowledge or justified beliefs about the future. Finally, it should be apparent that, although there are distinctively philosophical questions, no subject matter is (in all its aspects) beyond the reach of philosophical inquiry. Any subject matter can raise philosophical questions: about (for instance) the kinds of entities it concerns, its epistemological presuppositions, and its connection with other subjects.

## OTHER MAJOR SUBFIELDS OF PHILOSOPHY

Many branches of philosophy have grown from the traditional core areas just described. What follows is a sketch of a number of the major ones. Comprehensiveness is not possible here, but a wider conception can be formed by reading the entries devoted to the subfields that will be described.

**PHILOSOPHY OF MIND.** This subfield has emerged largely from metaphysical concerns with mental phenomena. The philosophy of mind addresses not only the possible relations of the mental to the physical (for instance, to brain processes) but to the many concepts having an essential mental element: belief, desire, intention, emotion, feeling, sensation, passion, will, personality, and others. To what extent are any of these concepts explicable in terms of behavioral tendencies? Quite apart from that, what is the relation between mental properties and physical ones? Are the former dependent on the latter, and if so, what kind of dependence is in question? Could two biological beings, for instance, be alike in all

their physical properties and still differ in their mental ones? A number of major questions in the philosophy of mind cluster in the area of *action theory*: What differentiates actions, such as raising an arm, from mere body movements, such as the rising of an arm? A common answer has been that actions but not bodily movements must be caused by such mental events as volitions. But must mental elements, such as intentions, beliefs, and emotions enter into adequate explanations of our actions, or can actions be explained by appeal to ordinary physical events? And is a kind of mental causation, or at least the absence of a certain kind of deterministic causation, required for our actions to be *free*?

**PHILOSOPHY OF RELIGION.** Another traditional concern of metaphysics is to understand the concept of God, including special attributes such as being all-knowing (omniscient), all-powerful (omnipotent), and wholly good (omnibenevolent). Does omnipotence, for instance, entail the ability to alter the laws of logic? Both metaphysics and epistemology have been concerned to assess the various grounds offered to justify one or another form of theism (these include the famous cosmological and ontological arguments, among others treated in this encyclopedia). The philosophy of religion—also called *philosophical theology*—systematically examines these topics and many related subjects, such as the relation between faith and reason, the nature of religious language, the relation of religion and morality, and the question of how a God who is wholly good could allow the kind and amount of evil the world apparently contains. Here the philosophy of religion overlaps the theory of value, a branch of ethics. It is common for a major question to cross philosophical fields in this way, and the same holds for the relation between theology and ethics, for instance in relation to the question whether the rightness of actions could be equivalent to divine commandedness.

**PHILOSOPHY OF SCIENCE.** This is probably the largest subfield, generated in substantial part by epistemology and in part by metaphysics. Philosophy of science has been commonly divided into philosophy of the natural sciences and philosophy of the social sciences. It has recently been divided further, into philosophy of physics, of biology, of psychology, of economics, and of other sciences. Philosophy of science clarifies both the quest for scientific knowledge and the results yielded by that quest. It does this by exploring the logic of scientific evidence; the nature of scientific laws, explanations, and theories; the nature of the theoretical entities posited in explaining observable phenomena; and the possible connections

among the various branches of science. How, for instance, is psychology related to brain biology, and biology to chemistry? And how are the social sciences related to the natural sciences? Are they methodologically like the latter but incapable of discovering universal as opposed to statistical laws? Must they work with mentalistic concepts such as belief and desire? Does explanation have the same form across the several sciences?

**SUBFIELDS OF ETHICS.** From ethics, too, have come major subfields. *Political philosophy* concerns the justification—and limits—of governmental control of individuals; the meaning of equality before the law; the basis of economic freedom; and many other problems concerning government. It also examines the nature and possible arguments for various competing forms of political organization, such as laissez-faire capitalism, welfare democracy (capitalistic and socialistic), anarchism, communism, and fascism. *Social philosophy*, often taught in combination with political philosophy (which it overlaps), treats moral problems with large-scale social dimensions. Among these are the ethics of journalism and the media, the basis of compulsory education, the possible grounds for preferential treatment of minorities, the justice of taxation, and the appropriate limits, if any, on free expression in the arts. The *philosophy of law* explores such topics as what law is, what kinds of laws there are—for instance, only positive (enacted) law or also, as Thomas Aquinas held, natural law—and how law is or should be related to morality. It also examines the sorts of principles that should govern punishment and criminal justice in general (ethical questions about law do not exhaust the philosophical questions about it but have been among those central in the philosophy of law). *Medical ethics* addresses many problems arising in medical practice and medical science. Among these are standards applying to physician–patient relationships; moral questions raised by special procedures, such as abortion and ceasing of life-support for terminal patients; and ethical standards for medical research, for instance, genetic engineering and experimentation using human subjects. *Business ethics* addresses such questions as the place of business in society, how moral obligations may conflict with the profit motive, and how these conflicts may be resolved. Other topics often pursued are the nature and scope of the social responsibilities of corporations, their rights in a free society, and their relations to other kinds of organizations.

**PHILOSOPHY OF ART (AESTHETICS).** This is one of the oldest subfields. It concerns the nature of art, including

both the performing arts and literature, painting, and sculpture. Major questions in aesthetics include how artistic creations are to be interpreted and evaluated and how the arts are related to one another, to natural beauty, and to morality, religion, science, and other important elements of human life. Aesthetics also deals with epistemological questions concerning the kinds of evidence we can have about an artwork and—sometimes—the kinds it can give us about the world, particularly about human beings. There is also a metaphysics of the aesthetic: What kind of property is beauty in a painting, power in a symphony, or unity in a poem, and is a poem a physical entity existing where it is written or remembered, or is it something more abstract of which these mental and physical entities are in some sense vehicles?

**PHILOSOPHY OF LANGUAGE.** This field has close ties to both epistemology and metaphysics and, in the latter connection, to the philosophy of mind. It treats a broad spectrum of questions about language: the nature of meaning, the relations between words and things, the various theories of language learning, and the distinction between literal and figurative uses of language. A major concern in the field is the theory of reference: What, for instance, is required for us to succeed in referring to Socrates by using that name when we have never met him nor even read anything written by him? And if our thoughts are mental and *in* the mind, how can their content be about external objects? A question connected with all of these problems is the relation between the linguistic and the conceptual. To what extent, for instance, is it possible to have concepts at all without linguistic terms to express them, and is thought itself possible apart from language? Since language is crucial in nearly all human activity, the philosophy of language bears on our understanding both of other academic fields and of much of what we ordinarily do.

**OTHER IMPORTANT SUBFIELDS.** There are many other subfields of philosophy, and it is in the nature of philosophy as critical inquiry to develop new subfields when new directions in the quest for knowledge, or in any other area of human activity, raises new intellectual problems. There is no limit to the number of variety of possible subfields of philosophy. Among the subfields not yet mentioned, but often a focus or research or teaching (at least as a part of other courses), are Philosophy of Logic, Philosophy of History, Philosophy of Mathematics, Philosophy of Medicine, Philosophy of Education, Philosophy of Feminism, Philosophy of Linguistics, Philosophy

of Criticism, Philosophy of Culture, Philosophy of Film, and Philosophy of Sport.

### PHILOSOPHICAL METHODS

The *Dialogues of Plato* made famous what might be called the *Socratic method* in philosophy. It is the dialectical method, pursued by Socrates as represented by Plato in the *Dialogues*, in which ideas are set out, explored in relation to their meaning and implications, and assessed by such criteria as consistency and plausibility in relation to various standards, sometimes including common sense. In both Plato and Aristotle, we find early examples of what may plausibly be called *conceptual analysis*. Aristotle provides a particularly good example of how this may be conceived. In his *Nicomachean Ethics*, for instance, he seeks to give an account of the concept (or anyway of a concept) of virtue. He saw himself as clarifying the essence of the phenomenon of virtue; but if this essentialist view is understood in terms of his philosophical practice, it seems consistent with construing some of what he did as a kind of conceptual analysis. He is guided by the use of the relevant Greek terms in what we may suppose was educated parlance; yet he is not talking merely about linguistic usage. This is not to assimilate his kind of conceptual analysis to a Platonic kind on which concepts are to be understood by intellectual apprehension of them as abstract entities accessible to reflection. Indeed, if there are times when his analytic technique recalls Plato, there are others when his attention to usage and to what is said brings to mind some moments in the later work of Ludwig Wittgenstein.

A major question here, on which there is persisting difference of judgment among philosophers, is the extent to which these intellectual procedures (whether Aristotelian or Platonic) are genuinely different from *linguistic analysis*. A related question is the degree of the authority of linguistic usage in determining the content of a concept. As important as dialectical method and conceptual analysis are in philosophy, however, neither can be described as *the* method of philosophy. It may be that every major philosopher has used at least one of them at some point; but even supposing (what is certainly controversial) that philosophy cannot be competently pursued on a large scale without some measure of at least the latter, there are other methods of inquiry that should be considered philosophical.

An important route to understanding philosophy and, especially, philosophical method, is a comparison of philosophical method with scientific method. From at least the middle of the twentieth century, and in at least

much of the Western philosophical tradition, there has been a (sometimes tacit) belief in scientific method as the paradigm of an objective, rational method of seeking truth. There has been an associated belief, or presupposition, that philosophy must, in methodology as well as doctrine, take account of the progress of science. This is not to say that the (or a) method of science, or some interpretation of scientific method, has become the dominant *philosophical* method. But there is a widely held assumption—which we might call the *assumption of the philosophical primacy of scientific method*—that scientific method is the primary model of the rational pursuit of truth, in a sense implying both that our philosophical method, if not itself scientific, should bear an appropriate resemblance to scientific method and that our philosophical results are probably mistaken if they are at odds with, or even unable to account for the possibility of, well-established scientific findings. It will help to describe this primacy assumption in the three major areas of concern in this entry: epistemology, metaphysics, and methodology.

**EPISTEMOLOGY.** Where scientific method currently has the primacy that has been mentioned, then, first of all, we might expect the assumption of its primacy to have an antirationalist thrust. For despite the rationalist point that a priori truths do not compete with scientific statements in explanation or theorizing, such truths are also traditionally conceived as beyond refutation by scientific procedures and as knowable by a nonscientific method (a kind of reflection). The second point is positive: The influence of scientific method as a model of rational belief formation has given impetus to the view that much of what we know is discovered by inference to the best explanation (a kind of inductive inference), and much of what we understand is understood in terms of underlying theoretical states or entities. Thus, even self-knowledge can be taken to be not only constituted by corrigible belief (roughly, belief whose justification can be defeated) but, often at least, to comprise beliefs arrived at by unconscious (or at least unnoticed) inference from appropriate data. The fallibilism that comes with a deep appreciation of scientific method has similar implications in other areas of apparent human knowledge.

**METAPHYSICS.** In metaphysics, the assumption of the philosophical primacy of scientific method implies a tendency to take science as the arbiter of the real. The obvious point here is that we should tend to countenance as real whatever our best confirmed scientific theories posit as such, or at least posit as explanatorily basic. (Granted,

it is not always clear what this is even if we can decide what our best-confirmed theories are). But there is a further implication. We must also countenance as real whatever must be posited to understand science itself, for instance properties, numbers, or sets. And, in part on the basis of assuming Occam's Razor (roughly, the principle that in providing explanations we should not posit more entities or types of entities than necessary), many philosophers think we need countenance nothing else.

One good illustration of the point here is the effort to support realism in ethics by arguing (against both noncognitivist and epiphenomenalist views in metaethics) that moral properties have causal and explanatory power and hence can play an explanatory role substantially similar to the role of theoretical entities in the sciences. Moral realists need not be causalists, however; they all agree in holding the cognitivist metaethical view that moral claims have truth value (hence are true or false), but rationalists among them may deny that moral properties—even if in some way grounded in nonmoral properties, such as lying, beating, and killing, that have causal power—are themselves causal properties. Most philosophers would grant, however, that whether or not genuine properties *must* have causal power, whatever does have that power is real.

**METHODOLOGY.** If what has been said about the metaphysical implications of the assumption of the primacy of scientific method is correct, it should be easy to understand some of the methodological implications for philosophy. For in a way, the second metaphysical implication is methodological: Its basis is largely a commitment to scientific method as so well established, and so near to being self-evidently essential in the search for truth, that we should countenance whatever realities must be posited to account for its success and need *not* countenance any others. A further methodological implication is a tendency to solve philosophical problems, so far as possible, by construing them in a way that lends itself to scientific treatment. The mind–body problem is a good case in point, and eliminative materialism (which claims that explanations of behavior do not ultimately depend on appeals to the mental) illustrates how what seems unnecessary for scientific treatment of a problem may be ontologically discountenanced. Where the assumption of the philosophical primacy of scientific method is at its most influential, philosophical method is conceived as only locally autonomous: Scientific method and the results of its application are the basic determinants of both our standards of rationality and our inventory of reality.

Quite apart from the role in their thinking of scientific method as a model for philosophical inquiry, it may be that philosophers naturally tend to take one or the other of two central philosophical domains, epistemology or metaphysics, or some account developed therein, as primary, as *first philosophy*, in a suggestive but now uncommon terminology. If we give priority to epistemology, we tend to produce an ontology that posits the sorts of objects about which our epistemology says we can have knowledge or justified belief. If we give metaphysics priority, we tend to produce an account of justified belief which allows knowledge or justified belief about the sorts of things our ontology countenances as real. One's philosophical method affects both one's epistemology and metaphysics and one's sense of the relation between them. If our method is dominated by a priori reflection, we are likely to be rationalists in epistemology and realists in metaphysics, at least to the extent of countenancing whatever abstract objects must be posited to ground a priori knowledge. If our method is dominated by observation and experiment, or even by the idea that philosophical claims are ultimately responsible to observation and experiment, we are likely to tend toward empiricism in epistemology and, in metaphysics, to seek an ontology that countenances as real only what is either experienceable or necessary to account for our knowledge of what we experience.

Like epistemology or metaphysics, philosophical method can be primary in shaping a philosophical outlook. It is doubtful that it can wholly determine such an outlook; for apart from certain epistemological and metaphysical commitments, one cannot develop or even use a method. Similarly, one cannot develop an epistemology without making at least tentative metaphysical commitments or construct a metaphysics without making at least tentative epistemological commitments. Philosophers seem to accept as apparently axiomatic that what is knowable is in some sense real; and though, as many philosophers would regard as a lesson of skepticism, it is not self-evident that what is real is knowable, many philosophers cannot easily give up the conviction, or the quest to establish, that this is so. If this apparent asymmetry concerning the knowable and the real is genuine, then taken together with the primacy of our experience in our relations to others and the world, it may explain why epistemology tends, in at least many philosophers, to contribute even more than metaphysics to determining their overall views.

If philosophical method is to be clarified by the comparison with scientific method and not obscured by

assimilation to the latter, it is essential that we distinguish scientific method from something of which it is an immensely impressive special case: *theoretical method*. The former is empirical and, broadly speaking, experimental. The latter is the more general method of building and rebuilding theories in relation to data: raising questions, hypothesizing, comparing and evaluating hypotheses in relation to data, revising theories in the light of the comparisons and evaluations, and adopting theories through assessing competing accounts of the same or similar problems. This distinction has not always been recognized or fully appreciated. For one thing, given the influence of empiricism (an influence to which few in modern philosophy are entirely immune), some thinkers tend to see scientific method as the only kind of theoretical method, at least outside logic and mathematics. But theoretical method is not the property of empiricism; rationalists can also use it, and so can both nonphilosophers and philosophers who are uncommitted with respect to, say, empiricism, rationalism, and pragmatism.

What is here called the theoretical method is very old—as ancient as systematic philosophy itself. It is illustrated in the Socratic attempt to refine definitions by revising them in response to examples and counterexamples; and it, or some major element in it, figures in all of the general philosophical methods considered here. However, the assumption of the primacy of scientific method and with it the often tacit view that scientific method is the only rational theoretical method outside logic and mathematics, is far from obvious.

Consider metaphysics: Properties and propositions, for example, far from being banished, are indispensable for many philosophers, including many who are scientifically oriented. Quite properly, this is in part because of what is required to understand science. But it may be in metaphysics, philosophy of language, and philosophy of mind that we find the greatest impetus toward preserving these common targets of Occam's Razor. Consider epistemology: There is to date no consensus that the traditional domain of the a priori has been accounted for on scientific or, especially, empiricist lines. If only a limited number of philosophers are willing to defend the view that there are synthetic a priori propositions (roughly, substantive propositions, such as basic moral principles, knowable on the basis of reflection on their content), increasingly, many philosophers are alive to the possibility that there may be. This is not to say that the analytic–synthetic distinction has been adequately clarified or is even important in many of the ways it has been thought to be. The suggestion is only that the categories

of the analytic and the a priori are less and less widely thought to have been shown unintelligible or empty or even equivalent.

## THE AUTONOMY OF PHILOSOPHY

Given what has been said in this entry, it should be plain that philosophy is a distinctive area of inquiry. Even if its concerns overlap those of various other disciplines, it has its own problems and at least some of its own methods. But distinctiveness is not the same as autonomy, which, as applied to a field of inquiry, implies a kind of independence of other such fields. Is philosophy autonomous in this sense? Positively, a rationalistic perspective can provide a stronger basis for the autonomy of philosophy than can an account of philosophy based on assuming the philosophical primacy of scientific method. The reference here is to *hard autonomy*—the kind grounded in a distinctive conceptual and methodological status. This is quite different from *soft autonomy*—the sociological and institutional independence of the discipline manifest chiefly in its generally having its own academic departments.

Soft autonomy is sustainable even if one's philosophical perspective is that of *naturalism*, which, in a strong form, might be described in rough terms as the view that nature is the whole of reality, and the only basic truths are truths of nature. On a form of this view associated with W. V. Quine, philosophy is continuous with natural science. This implies that there is no radical difference in the kinds of claims they can justify or in their standards of evidence: Indeed, epistemology itself is taken to be a kind of psychological inquiry into our cognitive standards and practices. The recently developed field of cognitive science, moreover, may from this perspective be viewed as a kind of naturalized philosophy of mind though its range may include more than problems addressed in that subfield of philosophy. This naturalistic approach to philosophy does not imply that there are no philosophical questions appropriately answered by reflection rather than through scientific inquiry, but the status of the answers is empirical rather than a priori; they are ultimately responsible to observation, as are scientific hypotheses, if in a less direct way. By contrast, on the traditional view that at least some major philosophical theses are a priori, it is clear why they are accountable to distinctively philosophical standards and need not be judged by the evidence drawn from sensory observation or scientific experiments.

To be sure, on the view that philosophy is simply more general than science or asks questions different in

subject matter from those of the special sciences, a de facto autonomy may be sustained, an autonomy that is more than sociological and less than conceptual. But on that view, philosophy does not stand apart from science in the same way nor does it possess autonomous standards of assessment, particularly in normative matters. If, as has been common in the history of philosophy, it is seen as an autonomous cultural resource, as a normative critical enterprise responsible to its own standards, it would seem desirable that philosophy stand apart from science in the suggested way. But distinctness is not opposition nor does distinctness entail competition. Moreover, supposing the hard autonomy thesis is mistaken, soft autonomy may be retained with renewed emphasis. If (in ways to be sketched below) philosophy is, or at least should be, a cultural resource, then whatever philosophers think about hard autonomy, they have reasons to preserve the soft, sociological autonomy of the discipline.

#### PHILOSOPHY IN RELATION TO OTHER DISCIPLINES

There are many other disciplines, and here it is possible only to indicate how philosophy is related to some of the major ones. The place to begin is with the idea that philosophy is in a sense the *metadiscipline*, the one whose proper business includes accounting for the structure, methodology, and, indeed, the implicit metaphysics and epistemology, of the other disciplines.

For understanding other disciplines, philosophy is indispensable. Many important questions about a field, such as the nature of its concepts and its relation to other disciplines, do not belong to that discipline, are not usually pursued in it, and are philosophical in nature. Philosophy of science, for instance, is needed to supplement the understanding of the natural and social sciences, which may be derived from scientific work itself. Philosophy of literature and philosophy of history are of similar value in understanding the humanities, and philosophy of art is important in understanding the arts. Philosophy is, moreover, essential in assessing the various standards of evidence used by other disciplines. Since all fields of knowledge employ reasoning and must set standards of evidence, logic and epistemology have a general bearing on all of these fields.

Normative disciplines and their subfields—those subfields that overlap normative ethics or properly propose broadly ethical standards—deserve special comment. These include (among others) law, theology, and aesthetics.

**LAW.** The field of law generates many philosophical questions. One concerns the very nature of law, which some have held to imply a connection with morality and others have taken to be entirely a matter of institutional realities, such as a structure of promulgations and enforcements. On either view, philosophy bears directly on important questions of what relation the law *should* have to morality. It also bears on the relevant standards of evidence. What, for instance, constitutes proof of guilt, and what should determine who counts as a reasonable person in relation to standards of negligence and due care? The topics of moral and legal responsibility, including the problem of diminished capacity and partial blameworthiness, are also areas in which philosophical and legal concerns overlap.

**THEOLOGY.** Theology is another field that overlaps philosophy. Philosophy of religion concerns not only the problem of adequately characterizing the divine nature but the related question of the rationality conditions for religious faith. Another major question pursued in both philosophy and theology is the relation between ethics and religion. Both areas of inquiry are connected with understanding the nature of evil—whether moral, as with wrongdoing, or natural, as in the case of death from floods—and how evil is possible (in various kinds and degrees) in a world under a god who is all-knowing, all-powerful, and wholly good. Historically, philosophy has influenced theology, just as theology has influenced philosophy. Although it is widely thought that either can be pursued in abstraction from the other, philosophical assumptions are both inevitably presupposed and commonly discussed in the field of religion.

**AESTHETICS.** Philosophy of art has been mentioned; aesthetics also includes the theory of natural beauty and related questions concerning aesthetics value. Although it should be granted that practitioners of the arts need not know even the rudiments of the philosophy of their art, this is rarely, if ever, so for professional critics and interpreters of the arts. Even if it is possible for critics, philosophy provides a way of conceiving the work and products of the artist that helps critics to appreciate it and to see its place in the culture to which it belongs. Literature in particular may either raise philosophical questions in its own creative works or invite their philosophical interpretation. Philosophy itself constructs mininarratives as central examples, uses dialogue—implicitly or explicitly—and not infrequently relies on metaphors and other literary devices. It is a literary medium from the vantage point of which other kinds of literature can be viewed in

relation to kindred standards of coherence, plausibility, clarity, and profundity.

The relation of philosophy to the professions should also be considered here. Its bearing on law has been noted. Not all of the professions can be mentioned, but it is appropriate to say something briefly about medicine, journalism and communication, and the broad field of business and economics.

**MEDICINE AND OTHER HEALTH PROFESSIONS.** The very notion of health is normative, particularly in the case of mental health. In this connection, ethics is clearly pertinent; so is philosophy of mind, with its emphasis on understanding the human person. Philosophy of science may yield a better understanding of—and even a greater capacity for—the integration of medical research with medical practice. Philosophy of religion can lead to a better understanding of many patients and of various other people with whom physicians work closely. Aesthetics and the history of philosophy may enhance the common ground practitioners can find with patients or colleagues who are from other cultures or have unusual orientations or views. Philosophy of medicine and medical ethics are obviously of direct relevance.

**JOURNALISM AND COMMUNICATION.** Journalists face a number of challenges on which philosophy bears. One is determining what is important enough to need coverage. Another is what constitutes objectivity in reporting on events and balance in editorializing. A third is ascertaining the quality of evidence on a given issue; this may be crucial in deciding whether to trust a source or to rely on an anonymous one. A comparative and, in some cases, a historical perspective is highly desirable (and arguably obligatory) in journalism; in achieving perspectives of these kinds, philosophical reflection is useful and sometimes indispensable. There are also more specific ways in which philosophy bears on journalism and communication: Philosophy of language, for example, should enhance understanding of communication, and philosophy of science should cast light on some of the technical subjects with which many people in journalism and communication must deal. Beyond this, political and social philosophy can deepen understanding of society and social institutions. For journalists with special interests, aesthetics, philosophy of law, and philosophy of religion are highly pertinent to the questions they face.

**BUSINESS.** For many people in business and (applied) economics, the bearing of philosophy on the world of commerce seems at best tenuous. But what we have seen

about business ethics alone should belie that impression. A sound ethical perspective is essential for producing a sound code of ethics; philosophical training is valuable in providing a clear, adequately comprehensive, and defensible code. Economic justice, as with employment policy and fair competition, is a major concern that is clarified by work in ethics. So are the nature and responsibilities of corporations, unions, and political parties. Moreover, if cost-benefit analysis is to be mastered, the understanding and assessment of probabilities is essential. These topics are treated by inductive logic and epistemology.

### THE PLACE OF PHILOSOPHY IN THE ACADEMY

Some of what should be brought out here is implicit in what has been said: That philosophy is a basic and comprehensive field of knowledge and, as such, has a place in higher education should now be evident. Philosophy also contributes to the capacity for problem solving in any field. In this respect its value is interdisciplinary and subject matter neutral.

**CRITICAL THINKING.** The first thing to note in this connection is that the study of philosophy helps to develop both the capacity and the inclination to do critical thinking. Logic is the most general philosophical field that develops this ability. Ethics alone is quite general. Studies in the subject should show how philosophical reflection is applicable to moral problems of many kinds. Courses in ethics commonly aim both at giving students a better understanding of moral problems and at helping them develop a reasonable moral outlook from which to approach the moral problems that confront them in their own lives. No other discipline treats these problems in the same comprehensive and systematic ways. Indeed, scientists and others often explicitly hold that such problems are outside their professional domain. Epistemology may be cited as the only discipline that examines standards of evidence and criteria of rational belief systematically and in ways applicable to any subject matter whatsoever. A similar point holds for many other topics that are treated in depth by philosophy and are important for critical thinking; they include definition, knowledge, explanation, causation, justification, communication, meaning, and truth.

**NORMATIVE ISSUES.** Philosophy provides a unique and systematic approach to normative issues—those concerning what ought or ought not to be, what is right or wrong, what is intrinsically desirable or undesirable, and so on—as opposed to what is as a matter of fact simply the case.

What are the basic moral rights of persons? What moral obligations do people in a society have to one another? What constitutes justice in the distribution of goods and in the determination of punishment? Inquiries in such areas as ethics, political philosophy, philosophy of law, and aesthetics treat normative questions in depth. Courses in these fields usually examine several theories proposed by philosophers in answering these questions, and typically, students in them are encouraged to formulate and defend their own answers to the questions using the methods and concepts introduced in the courses. Given the importance that moral, social, aesthetic, and other value questions have in human life, the contribution philosophy can make in a balanced curriculum is incalculable. It might be thought that these questions do or can receive adequate treatment in the social sciences or perhaps in literature and history. These other disciplines, however, do not, and do not claim to, deal with normative questions in the way philosophy does; and many of the important normative problems philosophers study are not raised in other fields.

**INTERDISCIPLINARY PERSPECTIVE.** An important function of philosophy is to foster interdisciplinary perspective. For instance, although scientific explanation is, in one form or another, common to all the sciences, conceptual questions about its nature and comparative questions about its logic in the different sciences belong to the philosophy of science. Some of these questions have been treated by scientists but rarely with the comprehensiveness and generality required for a synoptic understanding of the topic. Every discipline generates some essentially philosophical questions about itself, and many questions about relations among different disciplines are also philosophical. Both kinds of questions are examined in such areas as philosophy of science, philosophy of art, philosophy of law, philosophy of history, and philosophy of language. Philosophy also critically examines methods of inquiry, both in science and in everyday life. Its approach in this is usually conceptual, evaluative, and comparative; and typically the philosophical study of these topics differs from other approaches in the techniques used, in the questions pursued, and in the scope of the theories produced in answering these questions. Both in exploring the interrelations among other disciplines and in examining their methods of inquiry, philosophy fulfills a unique and important role as a metadiscipline. It provides a kind of understanding of the other disciplines—particularly of their presuppositions, standards of evidence, and modes of explanation—which other fields of study neither attempt nor are able to provide.

**WRITING AND EFFECTIVE COMMUNICATION.** A major aim of higher education is to contribute to the quality of discourse in and beyond its institutions of learning. The study of philosophy generally requires analytical writing, critical reading, and formulating intellectual problems and proposed solutions to them. For these reasons, work in philosophy can greatly improve writing and communication skills. Even if writing is taught virtually throughout the curriculum, philosophy can play a major and distinctive part in the task. No other discipline emphasizes, in the same ways, either verbal argumentation or conceptual analysis. Few other disciplines emphasize, to the same degree, students' producing their own theories or critical assessments as opposed to exposition of existing material. In addition, clarity, accurate interpretation, due consideration for others' positions, and the importance of using concrete examples are also stressed in competent teaching of the writing that philosophy requires. These qualities of philosophical training in writing and speaking make the study of philosophy especially valuable in preprofessional pursuits as well as for those seeking a more general education.

## THE CULTURAL SIGNIFICANCE OF PHILOSOPHY

**INTELLECTUAL HISTORY AND CROSS-CULTURAL VISION.** In its historical and cross-cultural investigations, philosophy provides a sense of intellectual history and contributes to one's understanding of one's own culture in relation to other cultures. Most philosophy departments and institutes have programs of research and teaching that address at least ancient, modern, and contemporary philosophy. Many departments offer courses in philosophies produced by cultures other than their own. Studies in these areas help people to locate themselves historically and culturally, to work out a reasonable system of values, and to achieve an understanding of alternatives among values, cultural patterns, and intellectual traditions.

**EXAMINATION OF WORLD VIEWS.** A presupposition of higher education is that most reflective people seek a coherent view of the world that makes sense of their experience, guides them in certain major decisions, and gives them at least tentative answers to some of the perennial problems concerning human life and its place in the universe. The study of philosophy helps one to formulate and assess such views, whether they are drawn from the history of thought in a particular part of the world from comparative cross-cultural studies, from popular inter-

pretations of current science, or from the one's own—perhaps quite unarticulated—reactions to one's experience. Among the (partial) world views commonly examined in philosophy are materialism, which construes everything there is, including persons, as essentially physical; dualism, which takes minds and hence persons to be radically different from purely physical entities; and, of course, theism in many of its forms. Often, sociopolitical orientations, such as liberal democracy and Marxian socialism, are associated with world views. In examining these positions and world views, the approach of philosophy is holistic, conceptual, and evaluative. Moreover, whatever world view philosophers may hold, in teaching philosophy, they normally make it their business to present forcefully arguments for *and* against their own positions. Their most characteristic concern in this kind of endeavor is to develop a framework for making rational decisions on world views and sociopolitical orientations, not to inculcate any particular one.

#### ARTICULATION AND CRITIQUE OF PUBLIC POLICY.

A huge number of public policy issues are *mainly* moral, and most of them have significant parts that are moral. Normative ethics thus has special bearing on their proper resolution. Abortion and prostitution are mainly moral issues; this is because the chief disagreements are generally over moral rights and principles rather than over nonmoral facts. Distribution of wealth and the structure of the health care system are largely moral issues; but nonmoral factual questions, such as what effects one or another system has, are relatively more important for these issues than for the former two. Moral philosophy speaks directly to problems of public policy. For one thing, they involve questions of justice and of human rights. It is a major task of moral philosophy to develop an adequate theory of justice and a related theory of moral rights. These theories attempt to answer such questions as whether justice requires an equal distribution of wealth; whether everyone has a right to material well-being; whether punishment, as distinct from rehabilitation, is morally justified; and what moral obligations rich nations have to help poor nations. The abortion issue is of particular concern here. This is because a major aspect of it concerns the metaphysical question (also debated in theological contexts) of what constitutes a human person. The issue cannot be adequately understood, then, without a degree of both ethical and metaphysical sophistication.

Philosophers, like others, are divided on these questions, but on one important point they are largely agreed: that there *are* ways of distinguishing good from bad rea-

soning on moral questions and that some answers to these questions are better than others. In any case, it should be clear that philosophical reflection may help in clarifying issues, evaluating or constructing arguments on each side, determining the full range of policy options, framing definitions (particularly in drafting legislation), deducing consequences from a position so that we can see what it commits us to, eliciting and criticizing basic assumptions, and evaluating a moral issue in the light of the best theories and principles available in moral philosophy.

**THE PHILOSOPHER.** Philosophy is so broad and complex that no one is an expert in all of its fields. This does not entail that there is nothing of a general kind that can be said about what constitutes a philosopher. The simplest thing to say is that any philosopher will have a high level of competence in at least one of the subfields described here. That will imply using at least one method sketched above or a substantially similar method; it will also imply having a sense of some of the other subfields of philosophy. It does not imply taking any particular view or reflecting on any particular problem. Philosophical training and dialectic are, however, sources of intellectual versatility. In this and other ways, philosophy can add to the depth, scope, and acuity of the wise, much as wisdom can add to the powers of discernment and judgment of the philosopher.

It is widely known that, etymologically, philosophy is the love of wisdom. There is also a strong association—perhaps partly derived from the emphasis on practical wisdom in both Plato and Aristotle—of philosophical reflection with wisdom. In part for these reasons, some people have assumed that a philosopher must be wise, particularly in practical matters. If wisdom in a domain (such as human relations) is taken to be knowledge and soundness of judgment in that domain, it is true that philosophical reflection has high potential for leading to a degree of wisdom, at least in some important domains. It is certainly true that wisdom is a characteristic of many philosophers and inclines many who have it to appreciate one or another philosophical problem. But philosophical competence is no guarantee of wisdom, and wisdom of many kinds is possible for nonphilosophers.

Perhaps the most positive point to be made here is that philosophical competence in a subject-matter area will reveal at least a substantial proportion of the truths and some of the conceptual resources that are needed by a person who has wisdom in that domain. Much depends on the area in question: The more *conceptual* or norma-

tive it is, the greater the bearing of philosophy. Philosophical competence brought to the field of law, for example, can go a long way: Major questions in the law concern evidence, conceptual distinctions, and such normative notions as justice and blameworthiness. These are areas in which epistemology and ethics have much to contribute. The connection of philosophy to computer science may be less close; but even apart from the importance of logic in this field, there are ethical questions of, for instance, privacy and intellectual property rights, for which competence in ethics is of great value.

Quite apart from whether philosophers are characteristically wise, their cultural role includes criticism of major elements in their culture, particularly those that are intellectual, ethical, aesthetic, religious, or political. Certain important kinds of philosophical criticism are in a certain way neutral: The charge of inconsistency or incoherence is morally neutral; the point that an argument is invalid is logical and leaves open whether the argument's constituent propositions are true. A not uncommon view among philosophers has been that, *qua* philosophers, they should remain neutral in this way, abstaining from moral and political positions. On this view, taking these positions is appropriate for philosophers in their role as citizens but not in their role as professional philosophers.

A less restrictive view is that philosophers as a group, as represented by, for instance, the American Philosophical Association, should not take moral or political positions in official resolutions; and a still less restrictive position would apply this restriction to political but not moral issues. Nonetheless, just as there are philosophical works that systematically defend normative ethical views, there are some defending normative political positions. Why, it may be asked, should philosophers who have well-developed normative political positions not put them forward for the general public as philosophically well grounded? Publication itself may be regarded as a step in this direction, particularly if the style of the work and the medium of publication lend themselves to wide reading by the general public. Moreover, as electronic publication becomes more widespread and more readily accessible to the general public, the distinction between what is published for a professional audience and what is addressed to a wide public audience may become harder to draw.

Disagreement among philosophers about the proper cultural role of philosophy is likely to continue, and they can quite reasonably hold different views on the kinds of public moral or political positions appropriate for wide dissemination by philosophers as individuals as opposed

to philosophers acting institutionally or as a corporate body. But we may safely say that, particularly with the declining influence of positivism from the middle of the twentieth century to the present time, few philosophers now believe that taking normative positions in ethics, politics, and elsewhere is not properly philosophical. One way to put a major part of this point is to say that philosophers as such may be prescriptive as well as descriptive. Indeed, even counseling people to avoid slipshod reasoning is prescriptive. Moreover, quite apart from any explicit prescriptions, criticisms of reasoning or counterexamples to proposed ideas are implicitly prescriptive: Plainly, one should not rely on bad reasoning or maintain an idea to which there are clear counterexamples. As a critical enterprise, philosophy is implicitly normative. As appraising major guiding ideas in human life, it is implicitly prescriptive.

## CONCLUSION

Philosophy is the systematic and critical study of ideas and issues, a reasoned pursuit of fundamental truths, a quest for a comprehensive understanding of the world, a study of principles of conduct, and much more. Every domain of human existence raises questions to which its techniques and theories apply, and its methods are applicable in the study of any subject or the pursuit of any vocation. Its inquiries encompass the critical study of knowledge and reality, of value and obligation, of religion and science, of language and literature, of art and the professions. In the academy, philosophical studies enhance the capacity for problem solving, the ability to understand and express ideas, and the power to frame cogent arguments. In the culture in which it is practiced, philosophy can be a critical voice, a defender of ideals, a creator of visions.

Philosophy also develops understanding and enjoyment of things whose absence impoverishes many lives: aesthetic experience, communication with many different kinds of people, discussion of current issues, the discerning observation of human behavior, and intellectual zest in the pursuit of knowledge. For individuals in or outside the academy, the study of philosophy provides a major route to developing a well-reasoned vision of the good life and an ability to communicate this vision, defend it, and where necessary modify it. A well-reasoned vision of what human life ought to be yields an ordered set of long-term goals and a sense of the significance of life; it provides, often, the steady intellectual stimulation of comparing a theory of human experience with the constantly changing, ever-surprising panorama that our

experience is; and it anchors our relations with others in a framework that enables us to conceive human conduct with some measure of clarity and understanding.

### ***Bibliography***

This entry contains many proper names, as well as many terms common in philosophy, that have entries devoted to them in this encyclopedia. Readers seeking an overall perspective on the nature of philosophy are urged to consider entries on these philosophers or philosophically important terms. One may also find much of relevance to understanding what philosophy is by consulting the entries on special fields, say epistemology, ethics, metaphysics, and the philosophy of subfields, such as philosophy of mind, of religion, or of science. Also recommended are the philosophy entries in the first edition of this work (1967) and its supplement (1996). Some of the material in this entry is drawn (with permission) from parts of two documents (of which the author was principal writer) published by the American Philosophical Association with the idea of clarifying the nature of the field and its academic study: “The Role of Philosophy Programs in Higher Education.” *Proceedings and Addresses of the American Philosophical Association* 53 (3) (1980): 363–370; and “Philosophy: A Brief Guide for Undergraduates.” *Proceedings and Addresses of the American Philosophical Association* 56 (2) (1982): i–xviii. Some material is also based on the author’s “Realism, Rationality, and Philosophical Method,” written with a similar purpose and appearing in *Proceedings and Addresses of the American Philosophical Association* 61 (1987): 65–74.

## PHILOSOPHY OF BIOLOGY

Biology refers both to the systematic investigation of living things, and to the body of knowledge that is the product of that investigation. Throughout biology’s history, however, some important questions debated by biologists have not been so much about the organisms being studied, but about the nature of life, the proper way to investigate it and the form biological knowledge should take. When inquiry shifts from questions about living things to questions about proper and improper ways of asking, or answering, or adjudicating, such questions, it shifts to a philosophical level. One need not, of course, be trained in a department of philosophy to contribute to such an inquiry. Indeed many of the most significant contributions to the subject have been made by people trained in the sciences. Nevertheless such contributions are to the subject designated as philosophy of biology.

One assumption implicit in the very name is that the biological sciences are distinctive enough from other sciences that a general inquiry into the nature of science will not suffice. It was common among logical empiricists to suppose it would—in texts written in that tradition one often finds the biological and social sciences dealt with in chapters late in general books in philosophy of science (Braithwaite 1953, Hempel 1966, Nagel 1961). Two early challenges to this assumption were *The Ascent of Life* by Thomas Goudge (1961) and *The Biological Way of Thought* by Morton Beckner (1959).

These two early contributors were followed by a number of introductions to philosophy of biology written in the 1970s and 1980s, most of which were focused narrowly on evolution and genetics, and a standard set of associated philosophical questions (Hull 1974, Ruse 1973, Rosenberg 1985, Sober 2000). But in 1982 an NEH Summer Institute in Philosophy of Biology organized by Richard Burian and Marjorie Grene attracted a group of philosophers ready to focus more or less exclusively on the biological sciences. In 1984 *Philosophy of Science* devoted a “special issue” to the philosophy of biology; shortly thereafter Michael Ruse played a pivotal role in organizing both a journal (*Biology and Philosophy*) and a society (International Society for History, Philosophy, and Social Studies of Biology) devoted exclusively to the biological sciences. Since that time, the scope of research has broadened dramatically, with important contribu-

tions focusing on the biomedical sciences, physiology, cell biology, neurobiology, and developmental biology (Amundson 2005; Bechtel and Richardson 1993; Fox Keller 2000; Oyama, Griffiths, and Gray 2001; Robert 2004; Schaffner 1993; Sterelny and Griffiths 1999). And it is now common in general introductions to philosophy of science to have two chapters on philosophy of biology (for example, Salmon et al. 1992; Machamer and Silberstein 2002). In addition, there has been a tendency to integrate advances in the history of biology into these philosophical discussions.

This entry focuses on issues associated with three related biological domains: genetics, evolution, and development. Some of the most interesting recent philosophical work is focused on developmental biology and its relationship to the other two domains just mentioned. But important work is also being done on areas such as ecology, ethology, and neurobiology: each raises its own special philosophical questions.

#### DARWIN, MENDEL AND A PARTIAL SYNTHESIS

Two publications in the mid-nineteenth century—Charles Darwin's *On the Origin of Species* and Gregor Mendel's "Experiments in Plant Hybridization"—were to have a lasting impact on the structure of the scientific study of life, an impact still evident in the way philosophers think about biology as a science. Darwin self-consciously characterized the theory of evolution by natural selection presented in his book as one that would provide a theoretical unity to the study of life. As he put it in a letter to the philosopher Sir John Herschel:

... I find so many young and middle-aged truly good workers in different branches, either partially or wholly accepting my views, *because they find that they can thus group and understand many scattered facts*. This has occurred with those who have chiefly or almost exclusively studied morphology, geographical Distribution, systematic Botany, simple geology & palaeontology.

(BURKHARDT 1994, PP. 135–136)

Darwin argued that central to explanations in all these domains were a set of "laws," which modern scholars identify as the principles at the core of the theory of evolution by natural selection:

*Variation*. The characteristics of the individual members of a species vary to a greater or lesser degree.

*Inheritance*. Some of that variation is heritable, transmitted from parents to off-spring.

*Geometric increase*. Populations tend to increase at a geometric rate.

*Struggle for existence*. Given limited resources, predation, disease, and so on, the tendency to geometric increase is checked, leading to a struggle for survival.

*Differential survival*. Individuals with advantageous variations tend on average to survive longer and leave more off-spring.

*Differential reproduction*. The offspring of parents with advantageous variations tend to have the same advantageous variations.

Darwin used the term "Natural Selection" to refer to the last two principles: "I have called this principle, by which each slight variation, if useful, is preserved, by the term Natural Selection..." (Darwin 1859/1964, pp. 117, 127) And, since the above theory neither provides for the introduction of new variation nor for the divergence within species that actually leads to speciation, he followed the presentation of his theory with lengthy discussions of divergence of character and laws of variation. Crucially, he saw divergence leading to new species and higher taxa as simply long run extrapolations of the same processes that lead to the production of varieties within a species; and he decoupled the causes of new variation from the adaptive needs of the organism.

Modern presentations of the theory often reduce it to a combination of the production of heritable variation and the differential perpetuation of variation. Many philosophical problems emerge from this reduction, and a number of philosophers have been urging a formulation of the theory more in tune with Darwin's.

In 1866, just seven years after Darwin's *Origin*, a scientifically trained monk published the results of nine years of careful experimentation. Mendel's work was revolutionary both in its methods and its conclusions. Trained at the University of Vienna in experimental physics and statistics as well as botany (where he learned about recent developments in agricultural plant hybridization), Mendel realized that the combination of experimental controls and statistical analysis could be used to solve the puzzles of plant hybridization. In the varieties of pea plants with which he experimented, he established that a number of factors were inherited independently, that if one crossed plants with alternate forms of a factor (for example, green and yellow peas) all their offspring would appear like one or the other (the dominant form), and that the next generation of plants would

reveal a ratio of the forms of approximately three dominant to one recessive. Further experimental analysis would reveal that the “dominant” plants were a predictable mixture of pure dominants and plants with a dominant and a recessive factor.

But he went beyond just outlining his experiments and providing plausible inductive inferences from them. In the last section of his paper he suggested an underlying causal mechanism that could account for the observed regularities that he had reduced to a mathematical law of the development of hybrids.

Largely ignored for the remainder of the nineteenth century, the basic idea was developed in quite different ways by many researchers from different disciplinary backgrounds in the first decade of the twentieth century. Scholars have from then until now referred to this theory of inheritance as Mendelian genetics, and the regularities he uncovered experimentally as “Mendel’s laws.” And because this theory had essentially two distinct components—one related to inheritance, and one related to development—it in theory provided a way of unifying branches of the study of life that Darwin admitted he had not. A number of key steps taken between 1905 and 1920 isolated Mendel’s “factors” (genes) to chromosomes and paved the way for generalizing Mendel’s principles of inheritance in a mathematical form that would allow their investigation in large populations that do not breed under strictly controlled experimental conditions. This permitted the integration of Mendelian genetics with Darwinism, and it is no surprise that the leading figures in creating this synthesis—J. B. S. Haldane, Ronald Fisher, and Sewall Wright—all had a passion for both mathematics and natural history (Provine 1971, Plutynski 2004, Sarkar 1992). And all had, by quite different routes, fallen under the spell of Darwin’s theory of evolutionary descent driven primarily by natural selection.

The basic idea behind their synthesis was remarkably simple: think of populations of organisms in terms of the frequencies of the genes associated with the various traits found in those populations, and think of evolution in terms of gradual changes in those frequencies, under such influences as the migration of organisms in and out of the population, randomly occurring genetic mutations, genetic recombinations of various kinds and, above all, natural selection. Mathematical models were developed which permitted one to predict changes in the genetic make up of future populations given information (or, more often, assumptions) about these variables, the number of alleles of genes for given traits and assumptions about the relative fitnesses of different combinations of

these alleles, known as “genotypes.” The crucial step in developing these models was, of course, that each of these potential influences on gene frequencies was treated as a quantitative variable—including fitness.

It should be noted that all of these people—and the founder of experimental population genetics, Thomas Hunt Morgan, should be added—treat “genetics” as the study of the transmission of genes in reproduction. Indeed, even in the twenty-first century a synonym for Mendelian genetics is transmission genetics. The Evolutionary Synthesis did not include the study of development or developmental genetics, except for the use of embryological evidence in constructing evolutionary phylogenies. We will come back to this omission later.

Concluding the preface of *Evolution: The Modern Synthesis*, Julian Huxley declared: “The need today is for concerted attack and synthesis” (Huxley 1942, p. 8). That Synthesis was in the making when he wrote (the key publications by Theodosius Dobzhansky, Ernst Mayr, and George Simpson were published between 1937 and 1944), and by the 1959 centenary of the publication of Darwin’s *Origin* it was declaring itself triumphant. Most of the philosophical issues related to evolutionary biology under discussion in the 2000s are a direct consequence of the form that the “Synthetic” theory takes. This entry mentions five that are critical and discusses four of them in detail.

- 1) The concept of chance in evolutionary theory and the theory’s probabilistic nature.
- 2) Fitness and selection.
- 3) Units and levels of selection.
- 4) The nature selection/adaptation explanations.
- 5) The ontological status of species and the epistemological status of species concepts.

**THE ROLE OF CHANCE.** Chance is a contrastive concept; to say that some outcome is chance is typically to deny that it resulted from some cause or other. In evolutionary theory “chance” plays a key role both in discussing the generation of variation and the perpetuation of variation (a distinction owed to John Beatty; see also Sober 1984, ch. 4). Consider the following variation grid, created by considering whether the contribution to fitness of a variation does or does not play a role in either the generation or the perpetuation of that variation:

	Variations	
	Generation	Perpetuation
Fitness Biased	Lamarck	Darwin
Not Fitness Biased	Darwin	Lamarck
	Neutralism	Neutralism

The uniquely Darwinian position is that the generation of variation is chance in that it is not biased by fitness differences (as it is for Lamarckian theories), but the perpetuation of variation typically is biased by fitness differences. Neutralism, to be discussed shortly, will claim that a significant amount of evolutionary change is due to randomly generated variation that is perpetuated by chance as well.

But now consider the following discussion of chance and selection:

In Darwin's scheme of things, recall, chance events and natural selection were consecutive rather than alternative stages of the evolutionary process. There was no question as to which was more important at a particular stage. But now that we have the concept of random drift taking over where random variation leaves off, we are faced with just such a question. That is, given chance variations, are further changes in the frequencies of those variations more a matter of chance or more a matter of natural selection?

(BEATTY 1984, p. 196)

In the first two sentences, as often, the generation of variation is characterized as a "chance" process because selection plays no role at that stage—the generation of variations is not biased by the adaptive requirements of the organism. The concept of "random variation" is often used by neo-Darwinians as a synonym for "chance variation" in precisely this sense, as in the following from a product of Morgan's "fruit fly lab" and one of the architects of the evolutionary synthesis:

... mutation is a random process with respect to the adaptive needs of the species. Therefore, mutation alone, uncontrolled by natural selection, would result in the breakdown and eventual extinction of life, not in the adaptive or progressive evolution.

(DOBZHANSKY 1970, p. 65)

The generation of variations is a "chance" process in the sense that the probability assignments are not biased by "adaptive needs" or "fitness."

The remainder of the quotation from Beatty concerns the perpetuation of variations, and in particular

how to distinguish variations perpetuated by selection from those perpetuated by another process known as "random drift," in which traits that are selectively neutral may become fixed in a population simply as a result of what statisticians call "errors of sampling." Suppose, for example, that a pair of bats get blown to an island far away from their colony. They mate, and their offspring mate, and a number of genes become fixed in the growing populations simply because they were present in the founding pair, not because they are favored by selection. In the above quoted paper Beatty argues that "it is conceptually difficult to distinguish natural selection from random drift" (Beatty 1984, p. 196). As the entry discusses, this problem arises from a standard way of characterizing "fitness."

Genetic drift plays a critical role in one primary challenge to the neo-Darwinian synthesis, "neutralism," and the concept of chance is often used to draw the contrast. In the following quote, one prominent champion of the neutral theory of molecular evolution characterizes his position:

... the great majority of evolutionary changes at the molecular (DNA) level do not result from Darwinian natural selection acting on advantageous mutants but, rather, from random fixation of selectively neutral or very nearly neutral mutants through random genetic drift, which is caused by random sampling of gametes in finite populations.

(KIMURA 1992, p. 225)

Here genetic drift refers to a process whereby a selectively neutral allele becomes fixed in a population as a result of a "random (chance) sampling of gametes." This is a rival to neo-Darwinism only because of Kimura's claim that this produces a majority of the evolutionary changes at the molecular level. The contrast between "chance" and "fitness biased" processes is used by Kimura to distinguish means of perpetuating certain variations. We are contrasting two sampling processes.

There is currently a lively debate about whether to characterize this contrast by reference to differences in the sampling processes (Millstein 2002, 2005) or by reference to the expected outcomes of sampling (Brandon and Carson 1996, Brandon 2005). On Millstein's view it is realistically possible for the outcomes to be identical, and thus she seeks to defend a view according to which selection is defined as discriminate sampling (based on selectively relevant differences) and drift as indiscriminate sampling. Both samplings are "probabilistic," of course, but that in no way obviates the above contrast.

**FITNESS AND SELECTION.** All parties to this dispute are now realizing that wider issues about the nature of probability, explanation, mathematical abstraction, and causation are likely at stake in such disagreements. As one case in point, at least part of the dispute over differentiating drift from selection derives from the tendency to characterize natural selection so that it is indistinguishable from random drift (Brandon 1990, Lennox 1992, Lennox and Wilson 1994).

If we think of selection as a discriminative or biased sampling process, that natural raises the question of the basis of the biasing. Typically, the answer is that it is differences in fitness, the values assigned to different genotypes in the models of population genetics, which some readers will think of as different degrees of adaptation to the relevantly characterized environment.

But as noted above, it is not uncommon to find characterizations of the fitness of a genotype in terms of its relative contribution to the gene pool of future generations—the genotype contributing the larger percentage being the fitter. The expression “survival of the fittest” has essentially been eliminated from any serious presentation of Darwinian selection theory but the concept of “fitness” plays a prominent, and problematic, role. In the mathematical models used in population genetics “fitness” is represented by the variable  $W$ . Here is a rather standard textbook presentation of the relevant concepts:

In the neo-Darwinian approach to natural selection that incorporates consideration of genetics, fitness is attributed to particular genotypes. The genotype that leaves the most descendants is ascribed the fitness value  $W = 1$ , and all other genotypes have fitnesses, relative to this, that are less than 1. . . . Fitness measures the relative evolutionary advantage of one genotype over another, but it is often important also to measure the relative penalties incurred by different genotypes subject to natural selection. This relative penalty is the corollary of fitness and is referred to by the term selection coefficient. It is given the symbol  $s$  and is simply calculated by subtracting the fitness from 1, so that:  $s = 1 - W$ .

(SKELTON 1993, p. 164)

In this passage evolutionary advantage is equated with reproductive success and fitness is treated indifferently as a quantitative measure of both. But since, as we have seen, natural populations can evolve (via drift) in the absence of natural selection, and since balancing selection may prevent a population from evolving, it is clear that establishing, by measuring different reproduc-

tive rates among its members, that the genetic makeup of a population has changed does not establish that natural selection was the source of that change; nor does the fact that no change has been measured establish that natural selection is not operative.

The most widely accepted solution to this problem is to argue that fitness measures a reproductive propensity of organisms (Brandon 1978, Mills and Beatty 1979, Richardson and Burian 1992). Brandon tends to equate fitness in this sense with “adaptedness,” and to contrast it with “realized fitness”—differences in realized fitness are explained by differential adaptation to a common selective environment. This suggests that fitness is in some sense relational, enhancing chances of reproducing relative to an environment (Lennox 1992, Lennox and Wilson 1994). In any case, as Millstein has insisted, characterizing fitness as a reproductive propensity raises the question of how to understand this propensity and its organic basis (Millstein 2003).

**UNITS AND LEVELS OF SELECTION.** A number of challenges to Darwinian selection theory have emerged since the mid-twentieth century. Those challenges can be placed into two broad categories: (1) proposed limitations on natural selection as the primary cause of evolutionary change; and (2) expansions of the scope of natural selection to include new “targets” and “levels.” It will be noted that in neither case is it obvious that the theory itself requires modification in the face of such challenges—in principle these might be nothing more than challenges to the theory’s range of application. However, if it turned out that most evolutionary change could be explained without recourse to natural selection, this would be grounds for arguing that evolutionary biology was no longer Darwinian (see Godfrey-Smith in Orzack and Sober 2001.)

Darwin conceived of natural selection as almost exclusively an interaction between individual organisms and their organic and inorganic environments. Taking that as our starting point, we can see two challenges to Darwinism today with respect to the units of selection. One comes from those defending a strong form of genic selectionism, such as G. C. Williams (1966, 1992) and Richard Dawkins (1976, 1982), who argue that selection is always and only targeting genes. Here is a clear statement:

These complications [those introduced by organism/environment interactions] are best handled by regarding individual [organismic] selection, not as a level of selection in addition

to that of the gene, but as the primary mechanism of selection at the genic level.

(WILLIAMS 1992, p. 16)

Dawkins' preferred mode for making the same point is to refer to organisms—or interactors, to use language introduced by David Hull—as the vehicles of their genes (the replicators), in fact vehicles constructed by the genome for its own perpetuation. Neither Williams nor Dawkins deny that there is interaction between phenotype and environment that plays a role in the differential perpetuation of genes. Their argument is that those interactors are part of the “genic selection mechanism,” as Williams worded it above.

This view has been extensively challenged by philosophers of biology on both methodological and conceptual grounds (Brandon 1996, ch. 8; Mitchell 2003, ch. 4; Moss 2003, ch. 1; Sober 1984, chs. 3, 7; Sterelny and Griffiths 1999, chs. 4–5), though there are, among philosophers, also enthusiastic supporters (Dennett 1995). In all the give and take, it is seldom noticed how odd it is that defenders of this view claim to be carrying the Darwinian flag (Gayon 1998 and Gould 2003 are exceptions). Yet it is certainly not a position that Darwin would recognize—and not merely because he lacked a coherent theory of the units of inheritance. It is not a Darwinian view because for Darwin it was differences in the abilities of organisms at various stages of development to respond to the challenges of life that had causal primacy in the explanation of evolutionary change. Gene selectionism was explicitly challenged on these grounds by key figures in the Synthesis (for example, Ernst Mayr).

The Darwinian view of the units of selection also has challenges from the opposite direction. In the 1970s a number of biologists working in the fields of paleontology and systematics challenged the Neo-Darwinian dogma that you could account for “macro-evolution” by simple, long-term extrapolation from the processes modeled by population genetics. (The case was enhanced by parallel and contemporaneous developments in embryology and functional morphology that are discussed in the last section of this entry.) Stephen Jay Gould (2003), in a chapter titled “Species as Individuals in the Hierarchical Theory of Selection” combines two conceptually distinct theses: first, the thesis defended by Michael Ghiselin (1997) and championed and refined by David Hull (2001), that species are in a robust sense of the term “individuals”; and second, that there may well be selection among groups of organisms, *qua* groups. This approach brings us to the brink of problem (5) on the list,

how to understand the species category and species as taxa, questions discussed only briefly.

Gould exemplifies one approach to group selection—the unit of selection is always the individual, but there are individuals other than individual organisms that are subject to selection. A very different result emerges if one assumes that groups of organisms such as demes, kin-groups, or species, though not individuals, are nevertheless possible units of selection. Adding to the conceptual complexity, some researchers propose that “group selection” be restricted to the process whereby group-level traits provide advantages to one group over another, in which case there are strict conditions delimiting cases of group selection, while others focus solely on group level effects. Thus a debate analogous to that earlier discussed regarding the definitions of “fitness” emerges here—by group selection do we mean a distinct level of causal interaction, or merely a tendency within certain populations for some well defined groups to displace others over time? (For further discussion, see Sterelny and Griffiths 1999, 151–179; Hull 2001, 49–90.) It is now common to characterize “selection,” “interactor,” and “replicator” abstractly and to specify the conditions under which an entity is properly identified as a unit of selection. This allows one to leave it an open and essentially empirical question whether, under the right conditions a particular “unit” could be subject to selection. With the modular picture of development that is emerging, the “developmental module” will likely be added to the list.

**SELECTION, ADAPTATION, AND TELEOLOGY.** Perhaps the central promise of Darwinism, and the reason it was rightly seen as a challenge to the Argument from Design for a benevolent creator, was that it provides a scientific explanation for both phylogenetic continuity and adaptive differentiation by means of the same principles. The nature of “selection explanations” is a topic to which much philosophical attention has been devoted in recent years (Allen, Bekoff, and Lauder 1998; Sober 1984). How does one account for the apparently teleological character of explanation by natural selection?

The appearance of teleology is certainly present in Darwinian explanations, and has been since Darwin spoke of natural selection working solely for the good of each being. The appearance of teleology stems from the ease with which both evolutionary biology and common sense take it for granted that animals and plants have the adaptations they do because of some benefit or advantage to the organism provided by those adaptations. But in

what sense can the adaptive advantage be the cause of the presence of the adaptation?

Some insist it cannot (Ghiselin 1997). Others argue that such explanations are actually masked appeals to the past effects of selection (see the papers in Allen, Bekoff, and Lauder, section 3). This entry sketches a case that shows selective explanations of adaptations are robustly teleological (see Lennox 1992, 1993; and the papers in Allen, Bekoff, and Lauder 1998, section 1).

Are the functions performed by confirmed adaptations a central and irreducible feature of explanations of the presence of those adaptations? If the answer is yes, the explanations are teleological. Take the following example. In research combining painstaking field work and laboratory experimentation, John Endler demonstrated that the color patterns of males in certain Caribbean guppy populations resulted from a balance of mate selection and predator selection. For example, he demonstrated that a group of males with a color pattern that matched that of the bottoms of the streams and ponds they populated except for bright red spots have that pattern because a common predator in those populations, a prawn, is color blind for red. Thus red spots did not put their possessors at a selective disadvantage, and were attractors for mates (Endler 1983).

Their pattern of coloration was a complex adaptation serving the functions of predator avoidance and mate attraction—and it is an adaptation, as that term is used in Darwinism, only if it is a product of natural selection (Williams 1966, Brandon 1985, Burian 1983). In order for it to be a product of natural selection, there must be an array of color variation available in the genetic/developmental resources of the species wider than this particular pattern but including this pattern. Which factors are critical, then, in producing differential survival and reproduction of guppies with this particular pattern in a shared homogeneous environment? The answer would seem to be the *value*-consequences this pattern has compared to others available in promoting viability and reproduction. In popular parlance (and the parlance favored by Darwin), this color pattern is good for the male guppies that have it, and for their male offspring (Binswanger 1990, Brandon 1985, Lennox 1992). This is a robust version of “consequence etiology” accounts of selection explanations (Bekoff, Allen, and Lauder 1998, section 1), which stresses that selection ranges over value differences which are causally relevant to one among a number of color patterns having a higher fitness value. Selection explanations are, then, a particular kind of teleological explanation, an explanation in which that for the

sake of which a trait is possessed, its valuable consequences (avoiding predation, attracting mates), account for the trait’s differential perpetuation and maintenance in the population.

**SPECIES AND TAXONOMY.** Darwin at one point in the *Origin* says that he considers the term “species” one that is given arbitrarily, for convenience. He based that comment on a review of the taxonomic work of his day, and a similar review today would have the same result. Equally competent taxonomists will disagree about whether to rank a group of similar organisms as members of the same species or as members of two distinct species. This issue takes on philosophical import because speciation—the “origin of species,” to use Darwin’s language—is taken to be the key step in the evolution of life. One would hope to have a clear way of deciding, at least in principle, when that step has been completed! But every attempt to give a clear account of what makes a taxonomic unit a member of the species category runs up against rather compelling problems. Surrounding this topic, which has generated an enormous literature, are both epistemological issues regarding the basis for our species concepts and ontological issues about the nature of species. Interested readers should consult the work of Marc Ereshefsky (1992, a collection of essays defending various views of the species category) or Kim Sterelny and Paul Griffiths (1999, chapter 9; a readable and current overview of the issues).

## GENES

In standard texts in the philosophy of biology in the 1970s and 1980s (as well as in most of the more technical journal articles) genetics played a key role in the discussion of two philosophical topics: reductionism, and the structure of evolutionary theory (Hull 1974, ch. 1; Schaffner 1969; Ruse (1973), ch. 10; Rosenberg 1985, ch. 4). The discussion began by importing a theory of reduction that had been developed with physical theories in mind, and asking whether, on such models, there had been a reduction of Mendelian or transmission genetics to the molecular level. This model, developed most clearly by Ernst Nagel (1961), imagined two theories formalized with axioms and laws. Reduction would require that the laws of one theory be, in some clear sense, deducible from the fundamental laws of the other, as, with appropriate corrections, Kepler’s planetary laws could be from those of Newtonian celestial mechanics. Typically, this would also require that the key concepts in the two theories be interdefinable. This model was developed into a “general reduction/replacement model” by Kenneth Schaffner (1969) in a paper in which he argued

for the potentially application of such a model to the case of genetics.

David Hull (1974) pointed out that a critical problem in the way of achieving this goal was that the two theories had essentially different goals and domains—hereditary transmission of differences versus genetic input into the biochemistry of development. This suggested to him not only the impossibility of a reduction, but its irrelevance to biology. All parties to this discussion concluded that one needed a much more elaborate account of both biological theory structure and explanation to even try to answer the question.

A number of recent discussions have stressed that understanding both biological investigation and explanation in terms of mechanisms and their operations provides a more realistic picture of fields such as neurobiology and molecular biology (see Machamer, Darden, and Craver 2000; Waters 1994, 2000). It may also provide a more tractable notion of “reduction” in terms of “underlying mechanisms.” Detailed histories of the development of genetics played a very important role in this discussion, and thus it was one important area driving the integration of history and philosophy of biology. A fine review of that topic, as well as a carefully hedged defense of genic reductionism which takes into account the complex, interlevel nature of typical biological theories, can be found in Schaffner 1993, chapter 9 (and see Waters 1994 for a somewhat different defense).

One of the puzzles that emerges from reviewing the literature on genetics and reduction is that Hull’s point, mentioned above, about the fundamentally different aims of molecular genetics and transmission genetics only really gets serious consideration once developmental biology comes to the fore in the 1990s (see Waters 1994 and the papers in Beurton, Falk, and Rheinberger 2000). This is still very much a discussion in process, so the entry touches on some of the philosophical and historical questions being raised about different uses of the gene concept (or, alternatively, different gene concepts) in evolutionary and developmental contexts.

The traditional gene concept associated with Mendelian genetics that formed the basis of evolutionary biology was important because it was the basis of heritable differences in populations. Genes, or more precisely alleles, were the sources of heritable variation in populations, and thus provide “the material basis for evolution.” In the context of developmental biology, however, the focus of research has always been on the genes as sources of deep relationships among species within and even

across phyla. Here is a succinct expression of the difference:

In the Modern Synthesis of population genetics and evolution, genes become manifest by differences in alleles that are active in conferring differential reproductive success in adult individuals. The gene is thought to act as a particulate, atomic unit. In current syntheses of evolution and developmental genetics, important genes are manifest by their similarities across distantly related phyla, and they are active in the construction of embryos. These developmental genes are thought to act in a context-dependent network.

(SCOTT GILBERT, IN BEURTON, FALK, AND RHEINBERGER 2000, P. 178)

In a defense of genic selectionism George Williams argues that genes should be understood as units of information.

Only DNA provides the durable archive for most of the earth’s organisms. This constraint should not blind us to the fact that it is information we are concerned with, and that DNA is the medium, not the message. A gene is not a DNA molecule; it is the transcribable information coded by the molecule.

(WILLIAMS 1992, P. 11)

Williams praises philosophers for adopting the distinction between replicators and interactors discussed earlier, but he is critical of them for regarding “replicators as material objects and miss[ing] the codex concept” (Williams 1992, p. 12). Notice that what this approach does is allow nominal acceptance of advances in our understanding of cellular mechanisms at the molecular level while continuing to treat the gene as an “atomic” unit differentiated by reference to phenotypic differences. That is, development can continue to be “black boxed” by taking the gene to be any selectively relevant bit of the “codex” for the organism. In principle it should allow Williams to take on board a suggestion made by Sterelny and Griffiths; on grounds that lots of things get replicated in reproductive cycles “gene selectionism should be generalized to ‘replicator selectionism’” (Sterelny and Griffiths 1999, p. 69).

However, taking this approach also raises a new set of concerns, namely those involved with the application of concepts from information theory in the characterization of genes and gene action. This way of talking became extremely popular after the “breaking of the genetic code” in the 1960s. Complementary strands of this “double

helix” consist of only four bases, two purines (Adenine [A] and Thymine [T]) and two pyrimidines (Guanine [G] and Cytosine [C]); and since proteins consist of polypeptide chains made from only twenty different amino acids, if DNA is to contain the “instructions” for synthesizing all the possible proteins, the simplest possible “code” would be one in which three bases combined to specify each amino acid. The bases came to be represented as the “letters” of the genetic “alphabet”; they combine into syllables, words and “reading frames”—the book of life! The coded script is “transcribed” and “translated”; there is an “encoding” and “decoding” process; and with the discovery of the complexities of DNA transcription, it is not surprising that terms like “editing” and “proofreading” got added. It is not inevitable that these metaphors should lead researchers to present the genome as both the architect and the blueprint for building an organism—but it was natural. (For a compelling story of the history, see Keller 2000.)

Are there problems with it? A number of philosophers of biology think so, and they are discussed in this entry in two parts. The entry first discusses those problems that are not specific to developmental biology, and then discusses the philosophical debates around Developmental Systems Theory and “evo-devo.”

The aforementioned quotation from George Williams (1992) establishes that some evolutionary biologists want to take the information metaphor one step further, and allow it to float free from its source in the discovery of the relationship between DNA sequence and amino acid differences. Genes are units of information, pure and simple. The value of doing this is that it allows one to avoid the troubling fact that the causal complexity of the processes involved in biological development make it quite meaningless to talk about some relatively short and self-contained DNA sequence as a gene for anything other than an amino acid, perhaps.

What could “information” be, in this case? It seems not to be information in the sense of mathematical information theory. One suggestion is to see it from a “teleosemantic” point of view; that is, genes are something akin to units of “meaning,” their meaning being what they are present for, the phenotypic trait whose selection insures the replication of that gene (Sterelny and Griffiths 1999, pp. 82–92). Critics have argued that this simply severs completely the causal connection between DNA sequences and phenotypic traits. And it looks as if the original impulse for gene selectionism gets lost. It looks like the interactor—whether it is a colony, an animal, or a gamete—is the only serious causal determinant of differ-

ential reproduction. “A purely functional notion of a gene, untied to anything constant at the molecular level, is not a definition suitable for gene selection theory, whatever its other uses might be” (Sterelny and Griffiths 1999, p. 90).

A very different defense of the language of information in biology would in fact tie it very tightly to the detailed machinery of molecular biology, and therefore takes seriously the role of the analogies based on this language in the development of molecular genetics, such as treating DNA as a “reading frame” made up of triplet units, which then allows one to see certain mutations as analogous to “frame shifts” that create nonsense (Maynard Smith 2000, p. 184). But even here, the sense of “information” that seems relevant to the analogy is again a semantic notion tied to meaning and intentionality, not that of the ‘signals’, ‘channels’, and ‘sources’ of “information theory.” And thus all the problems associated with that notion are still present. (See the replies to Maynard Smith in Godfrey-Smith 2000; Sarkar 2000.) There is consensus here, however, that the language associated with codes and information storage and retrieval was extremely important in the development of molecular biology. Insofar as there is disagreement, it is over whether these metaphors have outlived their usefulness and are now in fact the source of significant misunderstanding.

## THE CHALLENGE OF DEVELOPMENT

Much recent philosophy of biology has focused on the process of development. There are at least two reasons for this. First, the model of the gene described in the previous section is deeply problematic, and one response was the philosophical defense of a developmentalist alternative based on the work of Susan Oyama, known as Developmental Systems Theory or DST. In an important and productive exchange on “the developmentalist challenge” to this sort of “genetic primacy,” Ken Schaffner (1998) identified eleven theses of DST, and focused on four with which he thinks serious researchers in biomedical molecular genetics would, in one form or another, agree. The basic idea is that development is a product of a complex time series of interactions among many cellular and extra-cellular factors, among which “genes” (and the quotation marks are important) are just one. As a consequence, DST denies what I have called “information theoretic determinism.” In so far as the information metaphor has value (this is currently much disputed), it is applicable only to the developing system—genes carry

information, if at all, only as aspects of developmental systems.

Another obvious consequence of DST is the rejection of various common themes of behavioral genetics (Lewontin 1995). Schaffner's approach to these DST theses is to compare them with work done on a "simple model system," one of the organisms at the center of human genome research, the nematode worm *C. elegans*. This worm became a model organism due to Sidney Brenner adopting it to investigate the development, from zygote to mature adult, of an entire nervous system (and behavior). It was ideal for many reasons, not the least of which was its simplicity—a nervous system containing only 302 neurons forming roughly 5,000 synapses. Schaffner compares the DST theses about genes, development and behavior with the results of the massive, worldwide research assault on *C. elegans* to see how they hold up. This entry cannot follow the details, but one can see from his eloquent conclusion that at least some of the DST argument is acceptable to him:

Characterizing simple "genes for" behaviors is, accordingly, a drastic oversimplification of the connection between genes and behavior, *even when we have the (virtually) complete molecular story*. The melody of behavior represents no solo performance—it is the outcome of an extraordinarily complex orchestra—and one with no conductor.

(SCHAFFNER 1998, p. 247)

This paper was the target for responses from philosophers of biology and biologists more or less sympathetic to DST (Gilbert and Jorgensen 1998, Wimsatt 1998) and Schaffner was given the last word in reply. This selection of papers constitutes the best introduction to the DST reply to gene-centered research (see Waters 2005).

Independently of philosophical discussion of DST, there are compelling reasons for philosophers to be interested in evolutionary developmental biology, or "Evo-devo." Given the long history of both developmental biology and evolutionary biology, and the long history of their interactions, one might wonder why the goal of integration has appeared on the horizon only in the twenty-first century. The answer is a complex of historical, philosophical, and biological components.

According to one historical narrative (Beurton, Falk, and Rheinberger 2000; Burian 2005), the rapid development of new investigative techniques in molecular biology, driven in part by the medical and agricultural potential of the methods of genetic modification, and the field of "genomics" that evolved along with the Human

Genome Project, provided the means for investigating development at the molecular level. This gave rise to a number of quite revolutionary discoveries; this entry notes only two: (1) The "Hox" regulatory genes encode a special sort of protein with a stretch of amino acids known as a "homeodomain." These proteins attach to quite specific segments of DNA, regulating the expression of a series of genes. These proteins act in concert and have "modular" effects on such things as organ formation, body segmentation and bilateral duplication of body parts (a clear introduction can be found in Burian 2005, chs. 11 and 12). (2) Molecular genetics is providing a highly complex, "interactive" picture of gene regulation. It will be noted that in the description of the Hox genes it became clear that certain proteins were responsible for their regulation. In fact all sorts of signals, some coming from within the cell and some from the extracellular environment, play a role in gene expression. This is now so widely accepted that philosophers and historians refer to it as "the interactionist consensus." According to this picture, genes are one of many interacting factors all of which must play their roles in order to give rise to an organism—the study of this interactive process is termed "epigenetics," though it is unclear to what extent its practitioners understand development as a truly epigenetic process (Robert 2004, ch. 1).

On this view, the integration of evolutionary and developmental biology will be—is being—effected by the long overdue integration of molecular genetics, and the molecular understanding of development, into evolutionary studies. At least one advocate of this view (Burian 2005) has stressed the modularity of this view of development, and the implication of the semi-autonomy of these developmental modules (body segmentation and bilateralism, organ systems, limb structure, and so on) for the way evolution can possibly work.

There is another way of viewing the history, being developed in different ways by Alan Love and Jason Robert (Love 2003, Robert 2004). Love focuses on what the proponents of Evo-devo claim their investigations can do that the current evolutionary "synthesis" cannot. Many proponents of this field put the explanation of evolutionary novelties such as feathers, tetrapod limbs, or jaws as the central contribution of development to evolution. While they are happy to concede to population genetics and ecological genetics the explanation of gradual evolutionary changes in traits associated with one or a few Mendelian genes, they argue that the explanation of the appearance of novelties at particular phylogenetic junctures requires an understanding of the network of

changes in the organization of developmental resources needed to produce the novel structure, and an understanding of its functional morphology. The history of work on evolutionary novelties focuses attention on a number of research programs in developmental biology, functional morphology and paleontology, all focused on understanding the first appearance of novel structures and behaviors—and all more or less ignored by the evolutionary synthesis.

Jason Robert argues for the primacy of the organism as it develops from zygote to maturity, and thus for a seriously “top down” or “whole to part” view of developmental causation. This allows us to see the analytic tools that allow us to understand the details of the developmental mechanisms as a first step, with true understanding of development coming when we have an integrated understanding of how those mechanisms interact. Pretty much everyone looking at this rapidly developing area of biology agrees with the following sentiment from Burian:

During the next few decades, I believe, biologists will highlight the roles played in constructing organisms by dynamic regulatory systems above the level of the genome. The result will be a non-vitalist but much more holistic, vision of the organism, one that places the integration of the organism at the focus of attention. In short, our new understanding of the apparatus regulating gene expression has undermined classical genetic determinism.

(BURIAN 2005, p. 243)

As Robert as pointed out, this prediction for the future sounds remarkably like a return to the “organismic” biologists, such as E. S. Russell, writing in the 1920s and 1930s, against the then rising tide of a population genetic centered evolutionary synthesis (Robert 2004). There are, of course, critics of this viewpoint. While the aforementioned text indicated that Schaffner’s review of *C. elegans* research encouraged him to accept, at least in a modified form, some of the theses of “the developmentalist challenge” to genetic determinism, the modifications were significant. And some would likely say he has gone too far, arguing that what we have in this new molecular understanding of development is a vindication of reductionism (Waters 1994, 2004, 2005; Rosenberg 1985, discussed in Robert 2004, pp. 12–15).

Evo-devo once again brings into focus the question of the unity of biology as a science. As stressed earlier, one thing that the evolutionary synthesis provided for philosophers of biology was an image of how the biological sciences could be unified that was decidedly unlike

the standard models based on the physical sciences. The attempt to unify evolutionary biology and developmental biology may complicate that image considerably. The fields omitted from the synthesis share key concepts (for example, gene, homology) with evolutionary biology, but appear to deploy them in very different ways. Moreover, the methods of investigation in functional morphology, developmental biology and population genetics or ecology are extremely different. The central problems and questions to be answered are very different, because the basic research agendas of the fields are very different. A field that focuses on “the production of the tetrapod limb” and a field that thinks of populations as gene pools of heritable variation being sampled by selection do not appear to look at organisms in the same way (Amundson, in Orzack and Sober 2001; Love 2003). As this proposed “synthesis” or “integration” takes place, philosophers of biology can both test their models of theoretical unification against the accomplishment of evo-devo, and can provide its advocates with ideas about adequacy conditions for a successful integration. One thing appears certain at this point: evo-devo specialists who have explicitly written on this topic see a special set of problems that will require an integration of concepts and techniques from evolutionary biology and developmental biology; they do not imagine one field being gradually “reduced” to another.

What, then, are the logical and conceptual prerequisites for such an integrated investigation? If we look back to where we started in this entry, it will be recalled that the “integration” of Darwinism with the Mendelian genetics of populations, required the concepts of “fitness” and “selection” to be reshaped into a mathematical form; and what began as a cytologically and developmentally based genetics eventually “black-boxed” development in the interests of focusing on the transmission of genetic “information” from one generation to the next. These changes, in the interests of integration or synthesis, gave rise to a host of philosophical problems. Perhaps, with philosophers and historians inextricably involved with this new synthesis, at least some problems can be avoided.

James Lennox (2005)

## PHILOSOPHY OF ECONOMICS

Why would philosophers be interested in economics? There are at least two answers. First, lessons from eco-

nomics bear directly on moral and political philosophy, as well as on theorizing about rationality. Second, economics provides a case study of some of the most challenging problems in the philosophy of science.

### ECONOMICS AS MORAL PHILOSOPHY

What is the ethical basis of economics? If economics is grounded in a theory of the right, what kind of theory is it? Is it a theory of the right grounded in a utilitarian conception of the greatest good for the greatest number, or a Kantian conception of the sovereignty of individual economic agents? Or, if economics is grounded in a theory of value, is the value to be understood in utilitarian or contractarian terms (as an aggregate, or as a matter of mutual advantage)?

PLATO. Alfred North Whitehead described philosophy as a series of footnotes to Plato. What about economics? Plato's *Republic* describes the emergence of a society not by social contract or by conquest but spontaneously, through the workings of the market. "The barest notion of a state must include four or five men" (Book II, 369D). People need food, shelter, and clothing, but "all things are produced more plentifully and easily and of a better quality when one man does one thing" (Book II, 370B). People thus start to specialize in farming, carpentry, and weaving. It quickly becomes obvious, though, that "more than four citizens will be required, for the husbandman will not make his own plough ... Neither will the builder make his tools—and he too needs many; and in like manner the weaver and shoemaker" (Book II, 370C). Commercial society thus emerges as an unplanned consequence of the transparent advantages of the division of labor.

ADAM SMITH. In more substantial ways, economics is a footnote to yet another philosopher, born some twenty centuries later. It was Adam Smith, professor of logic and of moral sciences at the University of Glasgow, whose work led more or less directly to the rise of economics as a separate academic discipline. The first three chapters of Smith's *Wealth of Nations* (1776 [1776]) explain the role that division of labor plays in a prosperous society, culminating in a brilliant critique of protectionist trade policy. Using the manufacture of pins as an example, Smith notes that a solitary worker could scarcely make one pin per day, but in a pin-making factory employing ten workers, "one man draws out the wire, another straightens it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head ... ; and the important business of making a pin is, in this manner, divided into about eight-

een distinct operations ... Those ten persons, therefore, could make among them upwards of forty-eight thousand pins a day" (p. 15).

Smith then explains how the division of labor is facilitated by the propensity to truck and barter. We do not build factories for our own personal consumption. We specialize to that degree only when we have opportunities to serve large communities. Smith's next insight is that the extent of specialization is limited by the size of the market. A rural carpenter specializes in anything made of wood; a carpenter in a large city specializes in residential house construction; a carpenter serving national and international markets can specialize in making childproof doorknobs. The wealth of nations depends on economic agents being able to reach far beyond their small circle of friends. The farther they can reach, the larger the markets they can reach both as producers and as consumers, the greater will be the division of labor, and the richer they and everyone with whom they trade will be. Because economic agents work with suppliers, distributors, and customers on a global scale, they can produce thousands of pins a day, rather than a small handful at best.

The homage Smith pays, then, is not so much to the self-interest of butchers and bakers as to the division of labor that enables artisans to continuously be renewing, reinventing, and extending the limits of their craft. These opening chapters of *Wealth of Nations* are perhaps the most insightful part of the most insightful work of economics ever written.

Smith's most pointed argument on behalf of a lightly regulated economy, though, is probably to be found in his less famous work, *The Theory of Moral Sentiments* (1759 [1759]). There, Smith argues that a "man of public spirit" will not be a fanatical reformer but instead "will respect the established powers and privileges even of individuals, and still more those of the great orders and societies ... When he cannot conquer the rooted prejudices of the people by reason and persuasion, he will not attempt to subdue them by force" (p. 223). By contrast, a "man of system," "is apt to be very wise in his own conceit, and is often so enamored with the supposed beauty of his own ideal plan of government that he cannot suffer the smallest deviation from any part of it. He goes on to establish it completely and in all its parts, without any regard either to the great interests, or to the strong prejudices which may oppose it. He seems to imagine that he can arrange the different members of a great society with as much ease as the hand arranges the different pieces upon a chess board. He does not consider that the pieces upon the chessboard have no other principle of motion besides

that which the hand impresses upon them; but that in the great “chess board” of human society, every single piece has a principle of motion of its own, altogether different from that which the legislature might choose to impress upon it” (1976 [1759], p. 234).

**SMITH’S LEGACY.** Smith anticipates Marx in expressing reservations about the alienating aspects of repetitive labor in a factory setting. Smith also comes close to anticipating James Buchanan and Gordon Tullock’s insight (1962) that legislators respond to incentives as much as anyone else does—that legislators are not philosopher-kings, above the fray, but instead make their moves on a chess board of society, like everyone else. None of the pieces gets to decide where all the other pieces will be at a given moment. Political order, like economic order, biological order, or any other complex order, will take its shape not because any particular designer intended it to take that shape, but simply because that is what happened when the pieces came together, all with plans of their own. The insight of Smith, Buchanan and Tullock, and others, is that our world is strategic—all the way up. Even a country’s most powerful politicians can do no more than hope to exert some influence. It is hard to incorporate this insight into moral and political philosophizing. What would it be like to develop a theory of how to live, and how to pursue social change, in a world where no one is in charge?

Alexander Rosenberg (1988) observes that the products of natural selection are exquisitely functional and almost unimaginably complex, despite no one being in charge. Unplanned economies likewise are functional, indeed typically more functional than centrally planned ones. How is this possible? Friedrich Hayek (1994) argues that a free economy economizes on rationality, morality, and knowledge in a way that a central plan cannot. Central planning models assume central planners will know what they need to know, and will use such knowledge wisely, and for purposes other than their own. Starting with such assumptions, advocates of central planning aim to invest planners with enough power (to implement the “right” decisions) that other agents with less benign plans will be unable to interfere. Unfortunately, giving central planners that much power to do the right thing also gives them that much power to do the wrong thing: to repay debts to their most powerful supporters, to cover up mistakes, to eliminate enemies (anyone who criticizes them), and so on. According to Hayek, there is a fatal conceit involved in thinking that economies would work better if, per impossible, central planners were in charge.

To Ludwig von Mises (the other main protagonist in the “Socialist Calculation Debate,” along with Hayek), economics is a value-free, a priori science, more or less like mathematics. But Daniel Hausman and Michael McPherson (1996) plausibly conclude that, “economics remains partly a moral science. It can’t be done without moral presuppositions, and it’s hard to do it well without addressing moral issues intelligently. Similarly, moral philosophy can’t be done without beliefs about human interactions, and it’s hard to do it well without knowledge of the kind that economists seek” (p. 8). For example, Hausman and McPherson ask whether market competition results in firms with moral scruples being driven into bankruptcy. They give several reasons to think the answer is no, but their main point is simply that the question matters, and matters in economics, not only in moral philosophy. It bears whether there is any point in being in favor of the market competition that economists study.

Extending Hausman and McPherson’s point, and relating it back to Adam Smith, if a firm would need to dominate a small town market in order to do a profitable volume of business, it may find itself needing to cater to the interests of a “lowest common denominator.” Or at least, the firm that survives to serve that small market in the long run will be the one that best serves the majority of clients in that small market. By contrast, if a firm can operate on a global scale (advertising on the Internet, perhaps), then capturing even 1 percent of the market can be hugely profitable. In this way, globalization makes possible a proliferation of specialized firms catering to especially discerning clientele, raising free-range poultry, growing organic broccoli, auctioning nineteenth-century German marbles, manufacturing parachutes out of recycled newspaper, or whatever entrepreneurs think of next. (Israel Kirzner, a student of Mises, criticizes how standard equilibrium models treat entrepreneurial innovation. As Kirzner sees it, standard models treat innovations as exogenous shocks, when in fact entrepreneurial innovation is a central driving force in all but the most repressive states, which is why real economies are *always* in disequilibrium.)

## ECONOMICS AS SCIENCE

Lionel Robbins (1935) defined economics as “the science which studies human behavior as a relationship between ends and scarce means which have alternative uses” (p. 16). It is amazing how much can be derived from a premise that economic agents put scarce resources to their most efficient use. But is the premise true? Milton Friedman (1984) seems to say it makes little difference; the

unrealism of a theory's assumptions are unimportant, so long as the theory's predictions are correct. Hausman describes Friedman's essay as the most influential work on economic methodology of the twentieth century. Analogously, Hausman says, Ptolemy's astronomy is still used for navigational purposes. Is Hausman right? The idea is theory-laden, and more technical than it appears. It is true that the Copernican revolution did not require us to make any radical changes in our ways of navigating, but is that like saying our navigational methods are premised on the earth being at the center of the universe? Probably not, but Hausman's main point still stands: We do not need to know the rock-bottom truths of astronomy, astrophysics, or anything else in order to have theories that track relevant facts well enough to enable us to navigate. Likewise, in economics, the statement that economic agents are pursuing their own self-interest is close enough to the mark for many purposes, and accordingly has, for many purposes, a lot of explanatory and predictive power. We better understand much of what we see around us when we grasp that self-interest is a more or less ubiquitous motive. Yet, we also see every day that people are motivated by things other than self-interest: by benevolence, vengefulness, and also (as Hobbes observed) by pigheaded, self-destructive vainglory.

**THE SCIENTIFIC ATTITUDE.** One of the biggest methodological blunders we could make would be to retreat from this messy empirical reality to the empty platitude that people do whatever they do, and this is all we really mean when we say all action is self-interested. When we give up the willingness to let our generalization be tested (and sometimes disconfirmed) by reality, we also give up the generalization's relevance as a tool for understanding reality. As a sometimes disconfirmed generalization, the postulate of self-interest lets us know when to regard a behavior as surprising, worthy of scientific curiosity, and so on. We may find that seemingly altruistic behavior turns out to be, in some previously unnoticed way, self-interested after all. But so long as we avoid the trap of assuming this *must* be the case, no matter what, we leave ourselves open to learning something new. (The new direction of progress may not be economics per se. New directions tend to evolve into new sciences. Just as moral philosophy helped spawn economics, economics can help spawn new disciplines or subdisciplines.) Meanwhile, so long as we understand the postulate of self-interest as a simplification of reality, one that abstracts from messy empirical details, the postulate will be useful.

Karl Popper sought to distinguish between science and nonscience. The real issue is about scientific attitude—whether a theory's proponents treat the theory as something to scrutinize rather than to zealously defend. In any case, it is hard to confirm an economic theory, or any other kind of theory. We give theory a chance to fail, and are impressed by and more confident in it as it survives repeated testing. But as scientists we acknowledge that surviving a test does not put us in a position to be supremely confident. Real science does not work that way; its fruits are not indubitable certainties.

What are the limits of a general theory's ability to help us understand? Daniel Little suggests, "The abstract analysis of the firm based on rational agents arriving at efficient outcomes must be supplemented with more detailed analysis of the specific circumstances and arrangements within which the firm took shape" (1995, p. 6). This is not a throwaway line but is in fact rather disturbing. It suggests there are severe albeit vague limits on the prospects for general explanation.

In the same way, one might see the history of philosophy as pointing to a similar conclusion. Namely, the search for general explanations, general theories, even general definitions, has a history of butting up against recalcitrant limits. There is a point to analyzing knowledge as justified true belief; yet, we now know of cases where this analysis is not good enough. It seems that no matter how much we tweak a theory or a definition, perfection is not an option. When cartographers try to map a three-dimensional terrain by projecting it onto two dimensions, there is no such thing as a representation of the terrain without distortion. A Mercator projection makes Greenland look as large as Africa, and anything we do to correct this distortion of relative size will distort something else in the process. This is an example of a problem for which a perfect solution simply does not exist, and theorists in all sorts of philosophical disciplines, confident though they may be that there is an objective truth about the three dimensional terrain out there, and that their job as theorists is to provide an accurate map of that objective reality, are finding themselves facing the reality that, as a rule rather than as an exception, there are no perfectly accurate theories. Our theorizing needs to be supplemented by knowledge of the local terrain. There is no denying our need for practical wisdom, or as Little puts it, for "detailed analysis of specific circumstances and arrangements" (1995, p. 6).

**ECONOMICS AS AN EXPERIMENTAL SCIENCE.** Experimental economics starts with the idea that economic

hypotheses are testable in replicable ways in laboratory settings. What is an experiment? What is a theory? What would count as testing a theory? When we test a theory, are we trying to prove it, or disprove it? Are the meanings of economic concepts exhausted by their verification conditions, or are economic theories important and meaningful apart from any efforts we make or could make empirically to test them?

For example, Hausman says, “one might argue that preferences and beliefs are in some sense unobservable” (1984, p. 15). But inferential bases for the ascription of preferences can rather unambiguously be observed in laboratory settings. Experimental subjects can be given opportunities to buy and sell “widgets” that are stripped of all properties other than resale value—the widgets are nothing more than entries on a computer-kept ledger. Experimenters specify those resale values (that is, how much money subjects will be paid for any widgets they possess at the end of the experiment). Thus, much information that is hidden outside the laboratory can be known and controlled in a laboratory setting, enabling researchers to draw reasonably well-grounded inferences about subjects’ motives and strategies.

For example, if we interpret subjects as being in a prisoner’s dilemma situation, such that declining to cooperate is a dominant strategy, and then we see subjects cooperating instead, we are free to hypothesize that the situation is not really a prisoner’s dilemma, retreating to a view that by definition subjects will act to maximize their payoff, and therefore by definition subjects will decline to cooperate in a genuine prisoner’s dilemma. In a laboratory setting, we can do better than that. We can specify all the payoffs and communicate them unambiguously to experimental subjects. We can train them over a sequence of trial runs to make sure they understand their situation. Then we can observe and learn. If subjects do not behave as our theories predict, or if 60 percent behave as predicted and 40 percent do not, then so be it. There is no such thing as being in a situation where there is exactly one theory that fits the observed facts. It is a truism in philosophy of science that any given set of observations will be compatible with an infinite number of theoretical explanations.

Nevertheless, what we learn to accept in the laboratory is that subjects do not consistently act to maximize their monetary payoff. They show inclinations to cooperate, to trust, to be “fair,” and so on, that go beyond anything it is reasonable for us to try to explain in terms of the hypothesis that subjects are acting to maximize their monetary payoff. We can even design the experiment so

as to yield fine-grained information about why subjects decline to cooperate, when they do. For example, we can suppose that the two main reasons not to cooperate in a prisoner’s dilemma are greed (the preference to get the good for free when one expects others to cooperate in producing the good) and fear (the preference not to cooperate when one expects others not to). In the field, it may be impossible to tell the difference between greed and fear, since all we observe is whether subjects are cooperating. Laboratory experiments, though, can be designed to tell the difference. That is, we can go beyond the hypothesis that everyone will defect when defection is a dominant strategy to test the hypothesis that when people defect, it is because they are afraid their partners will defect, not because they hope to exploit partners who cooperate. In the laboratory there is much defection, but also much cooperation, and much more cooperation when fear is eliminated as a motive for defection, even when the motive to free ride is left untouched, indeed, even when defecting remains a dominant strategy (see Mark, Schmitz, and Walker 1989). Perhaps this takes us from economics proper into fields such as psychology, sociology, and so on. But economists probably should find move encouraging, inasmuch as it indicates that their simplest behavioral postulates, in virtue of being disconfirmable (and sometimes disconfirmed), are at the same time fruitful and interesting.

**ENVIRONMENTAL ECONOMICS AND ENVIRONMENTAL PHILOSOPHY.** Environmental economists are presumed to be advocates of conservationist “wise use” policies, where environmental philosophers are presumed to be advocates of preservationist “no use at all” policies regarding scarce environmental assets. Perhaps the picture never was this simple, but in any case it is changing. Philosophers like Bryan Norton (1991) and Mark Sagoff (2004) are, in various ways, going beyond simple dichotomies in search of new policy paradigms that make sense from both long-term environmental and medium-term economic perspectives.

**THE PSYCHOLOGICAL AND INSTITUTIONAL PREREQUISITES OF MARKET ECONOMIES.** Since the fall of the Soviet Union, and the subsequently mixed results of formerly communist countries in establishing market economies, wiser and humbler economists have been exploring the idea that market economies cannot be invented, manufactured, or decreed but must instead be treated as organically evolving systems that grow over time. Citizens of the former Soviet Union, it seems, do not understand instinctively how to behave as market

agents. If they grow up in a world where the only examples of entrepreneurship involve bribery and theft, then they will think of entrepreneurs as a species of predator and will not grasp the concept of mutual advantage in the way that owners of small businesses in free countries do.

**ECONOMICS OF CULTURE.** Economists likewise have begun to turn their attention to the intertwined evolution of economy and culture. Explosions of cultural innovation seem to occur in cities that are at the same time undergoing explosive growth as worldwide commercial centers.

**BEYOND HOMO ECONOMICUS.** As noted earlier, the postulate of self-interest is most illuminating when treated as a testable empirical hypothesis, so that when behavior fails to conform, it will not simply be ignored but will instead be seen as of scientific interest. One of many cases in point is the “ultimatum” game. Two subjects are assigned the task of dividing a fixed amount of money. The first subject, Proposer, makes a proposal about how to divide the money. The second subject, Responder, has two options: reject the proposal, in which case neither subject gets anything; or accept the proposal, in which case the subjects split the money as proposed. The game is not repeated, so a Responder who is rational as per the Homo economicus model ought to accept any proposal that offers Responder a positive payoff. A bit more tenuously, Proposer, expecting Responder to be rational as per the Homo economicus model, ought to offer responder the smallest possible positive payoff. In fact, neither of these predictions is born out in the laboratory. Proposers most commonly offer to split the money fifty-fifty. Cristina Bicchieri (2005) reports that in a variety of trials and conditions, including in different cultures, responders tend to reject offers below 20 percent of the total, even when the stakes are substantial relative to prevailing wage rates in the subjects’ community.

**NEUROECONOMICS.** Kevin McCabe tested a variation of the ultimatum game while recording subjects’ brain activity with functional MRI (Kevin McCabe, et al, 2001). In some trials, subjects were informed that their partner was a computer program playing a fixed probabilistic strategy; these were paired with trials where subjects were informed that their partner was another human subject. Roughly half the subjects chose not to cooperate with human partners. Their brain activity was similar in the computer partner and human partner trials. Subjects who did cooperate, roughly half the total, showed markedly greater brain activity in the prefrontal cortex.

The implication: subjects who cooperate are not treating trials with human partners as situations calling simply for payoff calculation. The prefrontal cortex is thought to be the part of the brain dealing with social situations, not with arithmetic calculation. Cooperators evidently are treating the transaction not only as an economic exchange but also as a social exchange, calling for empathetic understanding of the motivations of another agent. It is too early to say where this line of research is leading, but it suggests we may hope some day for a unified explanation of departures from the postulate of self-interest, including the above-reported departures from dominant strategy in the prisoner’s dilemma. That is, subjects who do not conform to the predictions of Homo economicus models may be departing from the models in virtue of perceiving the situation as calling not for calculation of their possible payoffs, but instead for something else, such as an exchange of tokens of mutual respect. In any case, our sensitivity to economic motives is a variable. What gets us to focus on the economic bottom line—the numbers—rather than on friendships, grudges, self-esteem, status, and so on, is interestingly complex.

## PHILOSOPHY OF EDUCATION, EPISTEMOLOGICAL ISSUES IN

Epistemological issues have always enjoyed a central place (along with metaphysical, moral, and social/political issues) in philosophical thinking about education. In the entry "Philosophy of Education, History of" in this encyclopedia, Kingsley Price skillfully treats the entire history of the subject, from the Presocratics to John Dewey. This entry covers the intervening decades, focusing on epistemological issues.

By the time of Dewey's death in 1952, philosophy in the English-speaking world was becoming increasingly dominated by the analytic movement, which emphasized as methodological matters the importance of clarity, careful analysis, rigorous argumentation, and detailed attention to language, and philosophy of education was no exception to this general trend. The key figures in the development of analytic philosophy of education were Israel Scheffler in the United States, and Richard Peters and Paul Hirst in the United Kingdom. While their work exemplified two different strands of analytic philosophy—Peters and Hirst worked in the 'ordinary language' tradition of analytic philosophy, which emphasized the explication of meanings as manifested in ordinary language, while Scheffler's brand of analysis took more seri-

ous account of logic and its associated formal techniques, and was more inclined to overrule ordinary language when theoretical improvement could be so gained—both sought to bring a level of clarity and sophistication to an area of philosophy that did not always enjoy these, and to integrate philosophy of education with general philosophy. The following discusses some central epistemological issues in philosophy of education.

### EPISTEMIC AIMS OF EDUCATION

What is the fundamental epistemic aim of education? For educators, is the highest aim that of *truth* and the bringing about of true belief in students? Or is it, rather, *rationality* and the fostering of rational (or perhaps *justified*) belief? Perhaps that aim is the more encompassing one of *knowledge*, which includes and integrates both of the previous possibilities? Or could the aim be that of enhancing student *understanding*? Each of these has its advocates and deserves brief explication.

**TRUTH.** The most important contemporary advocate of truth as the fundamental epistemic aim of education is Alvin Goldman (1999). On his '*veritistic*' view, the fundamental epistemic aim of education is the production of true belief in students, along with the development of student ability to discover new (to them) truths by way of inquiry.

Goldman's view has much to recommend it, although it faces some difficulties as well. First, not all modes of transmitting truths to students—brainwashing, indoctrination, deception, and the like—are educationally acceptable, despite their efficacy in producing true belief. Second, from the educational point of view it matters not only *that* students believe truths, but also *on what basis* they believe them: Mindless or otherwise unjustified true belief is not typically the intended aim of educational activities, despite the truth of the relevant student belief. Third, the general failure to enjoy 'direct access' to truth suggests that the relevant educational aim is not true belief, but rather student ability to estimate or judge the truth competently (Scheffler 1965, p. 54). These difficulties suggest that the fundamental epistemic aim of education is not true belief but rather *rational* belief.

**RATIONALITY/CRITICAL THINKING.** The great majority of historically significant philosophers of education have endorsed the fostering of student rationality, or its educational cognate *critical thinking*, as the (or at least a) basic epistemic aim of education. On this view, educational efforts ought to strive to foster the abilities and dis-

positions conducive to rational student belief, the latter conceived as belief properly based on *good reasons*. Accordingly, educational activities are epistemically successful just to the extent that they result in enhanced student ability to evaluate candidate reasons for belief fairly and competently, and strengthened student disposition both to so evaluate and to believe accordingly. The dispositional or 'critical spirit' element of the view connects epistemic matters with matters of *character*, and the view as a whole is justified in terms of an appeal to the moral duty to treat students with *respect as persons*: Treating students with respect requires educating them in ways intended to foster critical thinking and thereby their autonomy, independence of judgment, and ability to shape—as far as possible—their own minds and lives (Siegel 1988, 1997; Bailin and Siegel 2003).

Although versions of this view enjoy considerable support from both philosophers (historical and contemporary) and educators, it faces the important objection that rationality and critical thinking are arguably best thought of not as ends in themselves, but rather instrumentally, as *means* to the end of true belief: Why think that the former are epistemically valuable, other than as an effective route to truth (Goldman 1999)? This raises two questions: Can rationality/critical thinking be thought to be valuable other than instrumentally, as a means to truth? Can the virtues of both these putative epistemic ends of education be suitably combined (Siegel 2005b)?

**KNOWLEDGE.** Taking the fundamental epistemic aim of education to be knowledge has the advantage that, suitably understood in its 'strong' sense, that aim includes both truth and rationality/justification. This better captures the sense in which educators are concerned with the fundamental epistemic aim of *education*, since, from the educational point of view, mere true student belief is less adequate than true belief that is justified, rational, or otherwise based on good reasons; and justified or rational but nevertheless false belief is less adequate than such belief that is also true. This view, that knowledge (in the 'strong' sense that includes both truth and rational justification as conditions of knowledge) is the fundamental epistemic aim of education, is defended by several contemporary authors (Scheffler 1960, 1965, 1989; Adler 2003; Siegel 2005b). It appears to capture the strengths of both the previous views and to meet the objections to them outlined above.

**UNDERSTANDING.** The way in which all these putative epistemological aims of education involve student *under-*

*standing* is less than crystal clear, and a plausible case has been made by Catherine Z. Elgin, furthering a philosophical approach pioneered by Nelson Goodman, that it is the latter—rather than truth, rationality or knowledge—that deserves to be regarded as the fundamental epistemic aim of education (Elgin 1999a, 1999b). Whether or not understanding can be integrated successfully with the other main proposed epistemic aims of education, can be shown to be less fundamental than those others, or deserves pride of place as the fundamental such aim, remains the subject of ongoing debate.

### TESTIMONY, TRUST, AND TEACHING

Should students believe what their teachers tell them? Arguably, they should, and recent work on the epistemology of testimony suggests as much (Goldman 1999). But student belief in the otherwise unsupported testimonial pronouncements of their teachers conflicts with the view that critical thinking is an important aim of education, since such belief seems clearly enough not to be belief based on reasons subjected to critical scrutiny by the believer/student. Live issues concerning the epistemology of testimony are helpfully illuminated by the educational case. This is obviously not the place to tackle the broad question of the epistemology of testimony. But the educational case concerning testimony in the classroom setting deserves brief comment.

First, it is important to be clear about the sort of student under consideration. Very young children/students cannot evaluate the testimonial pronouncements of their teachers; they lack the cognitive capacity to do so. Such capacity develops gradually; before it is substantially achieved, trust in their teachers' pronouncements seems unproblematic. But how long is the period during which students enjoy such a holiday from the ordinary demands of responsible oversight of their cognitive lives? This is, at least in part, an empirical matter concerning the facts of psychological/cognitive development. Once such development has taken place and students are able to monitor and evaluate the epistemic standing of their beliefs, do those testimony-based beliefs enjoy positive justificatory status if the only thing the student can say in their defense is "my teacher said so"? Here the *reductionist* (who, like David Hume, holds that testimony-based beliefs are justified only if that justification can be reduced to testimony-independent good reasons to trust the speaker's testimony on a given occasion) and the *antireductionist* (who, like Thomas Reid, holds that testimony is itself a basic source of justification) will divide in the predictable way. But the latter will have to explain why the aim of fos-

tering critical thinking (discussed above) can or should be abandoned in the case of teacher testimonial pronouncements, and how so abandoning it can be reconciled with the duty to treat students with respect as persons. It is not meant here to suggest that the antireductionist is doomed to failure. But the educational case does provide a sharp test case of epistemological views concerning testimony.

It should also be noted that the case in which students have nothing to justify their belief in the testimonial pronouncements of their teachers other than the pronouncements themselves is arguably relatively rare and certainly not typical. Just as believers typically have considerable evidence for the general reliability of testimony, so that their trust in testimonial pronouncements is accompanied by testimony-independent evidence that sanctions such trust (Adler 2002), so, too, do students typically have such evidence concerning their teachers' pronouncements. For even when students begin a class with no testimony-independent reason for believing what their teacher tells them, as the class proceeds and students observe their teacher lecture, explain, answer questions, and extemporize, such observation itself provides testimony-independent reason for trusting the teacher's testimonial pronouncements concerning the subject matter at hand (Siegel 2005b).

### INDOCTRINATION, TEACHING, AND BELIEF

Questions concerning the places of testimony and trust in the classroom lead naturally to questions concerning teaching and indoctrination. During the decades in which the analytic approach dominated the field, philosophers of education devoted considerable effort to the analysis of the concept of indoctrination (Snook 1972, Spiecker and Straughan 1991, Siegel 1988). The theories of indoctrination developed then divided into three broad types, which located indoctrination in either the *aim* or *intention* of the teacher/indoctrinator (namely, to get students to believe matters independently of the evidence for them), the *method* employed in transmitting the relevant beliefs (that is, in a way that precludes student questioning or demand for reasons), or the character or *content* of the doctrines transmitted (that is, content that does not admit of rational support or that is believed independently of such support). These three ways of understanding indoctrination have in common that (successful) indoctrination results in beliefs that students do not, will not, and/or cannot subject to critical scrutiny. That is, indoctrination, when successful, results

in student acquisition of both specific beliefs and of habits or dispositions to believe independently of the evidential status of the indoctrinated beliefs. In this way indoctrination appears to be incompatible with most of the epistemic aims of education canvassed above, most obviously that concerning the fostering of rationality/critical thinking.

However, the seemingly obvious view that educators should eschew indoctrination in favor of more respectable epistemic educational practices is not so quickly established. First, can education be nonindoctrinating, either in principle or in practice, or is indoctrination inevitable? One might think it unavoidable since, as was suggested above, at least at early stages of development, students do not in fact have the cognitive capacity to challenge, evaluate, or critically consider that which they are taught. If it is for this reason unavoidable, is indoctrination as a consequence not necessarily or always a bad thing, something to be avoided by responsible educators? After all, if students are incapable of subjecting teacher testimonial pronouncements to critical scrutiny until after a certain cognitive-developmental stage is reached, language and concepts acquired, and an appropriate level of reasoning ability attained, it is hard to see how teachers can help bring students to the point at which they can exercise their critical abilities except by indoctrinating them. The alternative view, namely, that indoctrination is avoidable, requires a distinction between indoctrination and nonindoctrinating belief inculcation, but such a distinction is often thought to be controversial (Siegel 1988, 2005b).

Second, (why) should we value educational processes that result in student ability to subject candidate beliefs to critical scrutiny? Philosophers of education who differ in their answers to the question of the fundamental epistemic aim of education will differ in their answers to this one. Veritists will answer that we should value such processes because that ability will increase student acquisition of true belief. Advocates of critical thinking will answer, rather, that we should value them because student acquisition of rational/justified belief will be enhanced, and, moreover, that desirable dispositions will be fostered. Advocates of knowledge (in the strong sense) will embrace both these answers. Those who think indoctrination inevitable may well deny that we should value such processes at all (and may deny that there are, in fact, any such processes).

## OPEN-MINDEDNESS, BELIEF, AND COMMITMENT

A further epistemic good related to critical thinking, often regarded as a basic educational aim, is that of *open-mindedness*: Roughly, the ability to regard one's beliefs as fallible and subject to rational rejection or revision in light of evidence and critical reflection (Hare 1979, 1985). But how can open-mindedness be reconciled with the aim of fostering student knowledge or rationality, given that the latter involve student *belief*? That is, how can students be expected both to believe those belief-candidates that reasons and evidence indicate are worthy of belief, and at the same time to remain open-minded about those very beliefs? This tension is insightfully addressed by Jonathan Adler (2004), who urges that open-mindedness be conceived as a meta-attitude toward one's beliefs rather than as a weakening of one's degree of belief or a weakened commitment toward the beliefs themselves, and that it be understood in terms of our general interest in attaining knowledge; he relates these matters to other fundamental issues concerning tolerance, autonomy, and authority that have long animated philosophers of education.

## FURTHER TOPICS

There is a range of further issues concerning epistemological dimensions of education that should be mentioned, even though they cannot be addressed in detail here. They include the following issues.

**FURTHER ISSUES CONCERNING CRITICAL THINKING.** Partly because of its enduring status as a favored educational ideal, considerable philosophical energy has been expended on issues concerning critical thinking other than those already addressed. A particularly animated discussion involves the question of its *generalizability*: Is critical thinking generalizable—that is, applicable to a broad range of topics, domains, and issues—or is it rather *subject-specific*, such that critical thinking in one domain or discipline is importantly different from critical thinking in other areas? A range of views on the question can be found in *The Generalizability of Critical Thinking* (Norris 1992). A further issue is the place of *domain-specific knowledge* in critical thinking; here William Hare (1995) is particularly helpful. The relation between critical and creative thinking has also attracted considerable attention, with some arguing that these are fundamentally distinct and others arguing against such a sharp distinction. The topic has been insightfully treated in a series of works by Sharon Bailin,

who challenges the distinction; see Bailin and Siegel 2003 and references therein.

**CURRICULUM.** It seems obvious enough that the curriculum should contain that knowledge/information thought to be most important for students to have, but the value and epistemological status of particular sorts of curricular content is controversial. Should a given subject, say mathematics, enjoy pride of place in the curriculum because it is in some sense intellectually central, or is its place secured by virtue of its practical importance or in some other way? More broadly, do particular content areas—science, language and literature, history, and the like—deserve their place in the curriculum because they constitute distinct “forms of knowledge” that are in some sense epistemologically fundamental, intrinsically important, and therefore the stuff of which all “liberally educated” students should be familiar (Hirst 1974)? Can this “forms of knowledge” view of traditional school subjects be sustained (Phillips 1987, pp. 120–136)? Moreover, does this idea of “liberal education” overemphasize the traditional and theoretical to the detriment of the practical, and/or does it reflect a culturally biased “Eurocentric” view of reason, knowledge, and education’s character and priorities (Siegel 1997, Bailin and Siegel 2003)?

**TEACHING AND LEARNING.** How should teaching and learning be conceived and the former conducted? The issues here are many and complex and depend for their resolution on psychological matters as well as on philosophy of mind and other areas of philosophy, yet they are rightly thought to be epistemological (in part) in so far as teaching is thought to involve knowledge transmission and the development of the ability to acquire knowledge, and learning is thought to involve such acquisition. (Passmore 1980, Pearson 1989, Hare 1993).

**“GROUP EPISTEMOLOGIES” AND FEMINIST, MULTICULTURALIST, AND POSTMODERNIST CHALLENGES TO IDEALS OF REASON IN EDUCATION.** By the 1970s analytic philosophy began to lose its dominant position in the field and, again, philosophy of education followed the trend established in the parent discipline. The rise of Feminism, Multiculturalism, and Postmodernism brought with them important challenges to traditional views concerning the universality and neutrality of ‘reason’ and rationality and, indeed, to the nature of knowledge itself. While space precludes serious attention to these challenges here, or even a clear articulation of the issues, they are an important part of the contemporary scene in the philosophy of education. (For further discus-

sion and references, see Bailin and Siegel 2003; Siegel 1997, 2004, 2005).

## PHILOSOPHY OF EDUCATION, ETHICAL AND POLITICAL ISSUES IN

*Education* is the promotion of learning and development. Educational activities include attending to explanations, lectures, or demonstrations, but it does not follow that teaching or direct instruction is the whole or the essence of education. Education also involves the communication of care and the transmission of elements of at least one culture, but these, too, are only part of what constitutes education. Additionally, education is a form of governance; *to educate* has always meant "to rear, bring up, instruct, train, discipline, develop," but its Latin root, *ēducāre*, is related to *ēducere* (from *ē*, "out," and *dūcere*, "to lead"), a term of governance. The terms *pedagogy* and *pedagogue* (schoolteacher) derive similarly from the Greek *paidagōgos*, a term of governance (from *paidion*, "child," and *agō*, "to lead") referring to the household slave who supervised the children and led them out into the city from one teacher and place of learning to another. The modern term *governess*, signifying a woman employed to educate the children of a household, is similarly and conspicuously a term of governance.

As a form of governance, education requires justification, and it entails responsibilities, aims, a manner of going about its business, and substance or a communi-

cated content. These are the fundamental aspects of governance, and the philosophy of education can be organized by categories corresponding to them: the authority to educate (justification), the adequate and equitable provision of education (responsibilities), the aims of education (aims), pedagogy and educational ethics (manner), and curriculum (substance or content).

On this account of the divisions of philosophy of education, it becomes evident that an ethic of governance would provide a unifying normative structure. The most obvious and durable illustration of this is an ethic of respect for persons as self-determining agents. Ethics of this kind have dominated philosophy from the time of Socrates, and they have implications for each of the five named aspects of governance and for each of the five corresponding divisions of philosophy of education. The primary aim and responsibility of educators is to promote autonomy or effective self-determination, and to do so equitably, displaying equal respect within their sphere of educational authority. The scope of the educational authority they possess, the manner in which they exercise that authority, and the content of the education they provide will in turn be limited and shaped by the character of this responsibility. They endeavor to cultivate the intellectual and moral virtues essential to good judgment, to nurture capabilities that will provide the basis of lives worth living, and to enable each student to understand the circumstances of his or her own life and the possibilities that lie before him or her. While promoting autonomy or effective self-determination in such ways, educators teach in a manner respectful of their students and the values inherent in the subjects they teach.

An influential alternative to such an ethic of respect is the ethic of care championed by Nel Noddings (1992) and others. Considered as an ethic of education, it assigns great importance to caring for students. It proposes the development of caring in students as the central purpose or aim of education and sets forth a conception of curriculum based not on the diverse forms of disciplinary knowledge but on the diverse forms of human developmental potentials and diverse "centers of care" or objects of potential interest and devoted attachment. Advocates of this view are less clear about its implications for matters of educational justice and authority, but in addressing the latter, they begin from the presumption that care and control are incompatible. They concede that an ethic of care does not constitute a comprehensive moral point of view, but the debate, which originated not in moral theory but in the psychology of moral development, has

been framed as an opposition and subsequent reconciliation between justice and care.

An alternative would be to hold that the literature of care offers not a competing ethic or ethical theory, but a cluster of important empirical observations about the fundamental place in human development and well-being of being cared for, coming to care about and for oneself, and forming attachments. These tenets have been acknowledged by liberal theorists who regard a deontological ethic of respect as morally fundamental. Examples include the attention to continuity and quality of relationships in schools in the work of Randall Curren (2000, 2003) and conceptions of teaching and the curriculum as providing potential objects of attachment and fulfillment, as discussed in the work of Kenneth Strike (2003) and Harry Brighouse (2005).

Within the educational framework established by an ethical-political orientation, there are roles to be played by guiding norms of other sorts, such as epistemic rationality, craftsmanship, and artistry. If self-determination is enhanced by knowledge and understanding, then curricula must communicate, and teachers display respect for, the epistemic norms pertaining to knowledge and understanding. If the promotion of autonomy or meaningful choice among satisfying lives requires that students have opportunities to experience and develop competence in pursuits that are fulfilling and allow them to make their way in the world, then curricula must communicate, and teachers display respect for, the norms of craft and artistry proper to such pursuits.

Attempts have been made to undermine the distinction between epistemic and moral-political norms that is assumed here. Postmodernists and some varieties of feminists and neo-Marxists hold that the norms of epistemic rationality, at least in their familiar forms, are aspects of systems of oppression and have no objective standing. Such views have had many defenders within the philosophy of education in recent years, but the moral principles they appear to rely on are no more radical than those of the dominant liberal-democratic tradition, which has itself always been at least latently egalitarian. What distinguishes these contemporary critical stances is the assumptions of fact they employ, their salutary attention to previously neglected forms of inequality and disrespect, and—more problematically—their epistemic and metaphysical doctrines.

Although many of the ethical and political issues in philosophy of education were addressed by R. S. Peters and others in, and opposed to, the analytical philosophy of education movement of the 1960s and 1970s, philo-

sophical exploration of them has become more common since the 1980s. This growth of interest in such issues includes debates about parental choice in schooling, public support for religious schools, moral education, inclusion of students with disabilities in regular classrooms, accountability and high-stakes testing, affirmative action in university admissions, and the limits of academic freedom.

## EDUCATIONAL AUTHORITY

The question of how to apportion authority over education between parents and public authorities has become important since the early 1980s, as parents in the United States have challenged public school curricula and have increasingly chosen home schooling, usually on religious grounds. What role should parental wishes and rights play in determining the content of public education? When it comes to regulating private, religious, and home schooling, how are parents' interests in the faith and character of their children to be balanced against the protection of children's interests and the need to prepare them for citizenship in a multicultural society? Is it acceptable to exempt religious schools from laws that protect girls and women from discrimination on the basis of sex?

William Galston and other defenders of wide parental discretion argue that parents can be trusted more than government authorities to know and protect their children's interests, that parents have a strong and legitimate interest in transmitting their values to their children, and that it is in the interest of children to be educated in the "thick" cultural traditions that faith communities can provide but that public institutions constrained by requirements of neutrality cannot. James Dwyer (1998) and others have argued in response that it is incoherent to attribute to parents an individual liberty that entails a right to control or predetermine the life course of another person, even a child. Amy Gutmann (1987), Eamonn Callan (1997), Stephen Macedo (2000, 2002), and others have argued that respect for reasonable pluralism cannot be secured by unlimited accommodation of the wishes of parents whose own cultural communities are intolerant. Civic virtues of respectful and reasoned engagement with the views and values of others must be educationally nurtured if a political culture of tolerance and mutual respect is to survive, and it follows from this that educational policy must favor, if not absolutely insist upon, universal standards of civic education. Dwyer, Brighouse, Meira Levinson (1999) and others argue that liberal respect for children as persons in their own right requires policies that ensure that all chil-

dren enjoy an education that introduces them to a variety of cultural and ethical traditions and enables them to think critically about the circumstances and conduct of their own lives.

A related debate over school choice and privatization has taken on significance as schemes to promote parental choice among schools (for example, providing government vouchers redeemable for all or part of tuition) have spread to many parts of the world. Defenders of such schemes have argued that they are necessary to eliminate the differential impact of ability to pay on the freedom of parents to practice their religions, but also that a free market in educational services would promote efficiency and superior educational results. The debate is fraught with empirical speculation on all sides, but Colin Crouch (2003) has made a strong case for the view that privatization would abandon the idea that education is a right of citizenship, and others have addressed the ethical and political principles involved in ways that set the empirical issues aside. Curren has examined the grounds on which a public system of schools might be considered necessary, and he and Brighouse have arrived at similar requirements of justice for any system of education to be deemed acceptable (Curren 2000, Brighouse 2000). Both argue that some choice schemes might satisfy those requirements, that responsibility lies with the state to ensure that those requirements are met, and that public authority over education must be retained at least to the extent necessary to fulfill that responsibility.

A third debate concerns the professional authority of educators themselves. The authority to teach is typically granted through processes of certification and selective employment. But once teachers are employed, by what means are they, schools, and those who supervise them to be held accountable for their performance? Debate has focused on the promise and perils of high-stakes testing as a mechanism of accountability, and there is clearly much of ethical significance at stake. To what extent do extensive testing regimes undermine student motivation to learn? To what extent do they limit the exercise of sound professional judgment and thereby undermine good teaching?

### EDUCATIONAL RESPONSIBILITIES

How are educational adequacy and equity to be understood? One debate concerns the kind of educational equality to be achieved and the degree to which equality is a requirement of justice. The major divide has been between those who argue that schooling is to be distributed so as to promote equality of opportunity to live well

and those who defend one or another threshold of educational adequacy. Best known among the latter views is Gutmann's argument that in order for the rights of citizenship to be meaningful, every citizen must be provided an education sufficient to make possible *effective* participation in democratic processes (Gutmann 1987).

Another area of lively debate concerns the diversity of students served by schools. The main topics have been religious diversity and the free exercise of religion, gender equity, racial justice and antiracist education, the rights of linguistic minorities, and justice for students with disabilities.

As regards higher education, the focus has been on access or who gains admission. The issue of whether the use of standardized admissions tests such as the SAT (Scholastic Assessment Test) is racially discriminatory has been examined in detail by Robert Fullinwider and Judith Lichtenberg (2004), and countless philosophers have contributed to the debate over the merits of affirmative action in admissions as a way to promote racial and gender equity.

All such views are dismissed as insufficiently transformative, socially and politically, by Paulo Freire and other advocates of revolutionary pedagogies. Because they view the content of conventional schooling as inherently exclusionary and oppressive in ways that sustain unjust regimes, they hold that justice demands forms of teaching that liberate oppressed populations by promoting critical consciousness and action.

### EDUCATIONAL AIMS

Does the aim of educating children for their own good conflict with the aim of educating them for the common good? Is the point of transmitting culture to sustain the culture, to benefit the child, or both? Is the point of civic education to stabilize governments that may be corrupt, to prepare citizens to be vigilant in discouraging government corruption, or both? Is the point of education to promote a thriving economy, to enable the child to earn a living, or both? For example, if the economy needs more engineers, how far can schools go in developing the required science curriculum in a preprofessional direction without violating the spirit of a "general" education? What makes the potential for conflict more than conjectural is the existence of other models of the science curriculum. Instruction in science might aim for a broad humanistic and historical understanding of science or an appreciation of the relationships between science, technology, and society; and such aims would not require the

emphasis on mastery of equations and their application that is characteristic of preprofessional instruction.

The hope of reconciling education's worthy aims has rested largely with the enterprise of identifying a highest aim. The dominant choice through much of the Western tradition has been fostering good judgment in matters both public and private; but the dominant choice in recent decades has been autonomy. Although its meaning is often not well defined, *autonomy* seems to signify much the same thing as practically applied good judgment. The coherence and adequacy of the concept of autonomy have been questioned, usually on the grounds that it ignores the social context of personal identity, choice, and efficacy. Defenders of autonomy argue that the metaphysical assumptions of autonomy are not what critics suppose.

### PEDAGOGY, DISCIPLINE, AND THE ETHICS OF TEACHING

The landscape of pedagogy has been dominated by different versions of the contrast between pedagogies of content delivery and pedagogies of critical thinking, some more politically charged than others. Friere frames this as a contrast between the "banking" and "problem solving" models, others as a contrast between transmission and construction(ism), and still others as a contrast between teaching that does or does not promote active learning and critical thinking. Defenders of problem solving, constructionist, and critical-thinking pedagogies all offer ethical and emancipatory rationales.

The matter of how coercive classroom management should be has been discussed in connection with pedagogy, classroom dialogue, and theories of motivation and basic psychological needs. A key issue is whether the organization of work and social life in the classroom creates the opportunities for all students to satisfy their basic psychological needs in acceptable ways. If it does, then problems of classroom management will be small, and if it does not, then it will be both more necessary and less just to penalize unwanted conduct.

While most work on the ethics of teaching addresses specific issues, Strike (2003) offers a general account that incorporates ideals of promoting growth, exemplifying civic virtues, and teaching one's subject with integrity or in a way that is true to its inherent virtues. Work on the ethics of higher education has addressed issues of academic freedom, tenure, institutional neutrality, university-business partnerships, sexual harassment, diversity, research ethics, ethical issues in student-life policies, athletics, and the professional responsibilities of faculty and administrators.

### THE SUBSTANCE OF SCHOOLING

Discussion of the content of education has often taken the idea of an education in the liberal arts as its point of departure, and multicultural calls to broaden the "canon" or textual basis of liberal education have proliferated. The purpose of a multicultural curriculum is variously described as providing a more accurate view of the world, promoting the self-esteem of those not born into the culturally dominant class or race, correcting the self-perceptions of those who do belong to the dominant class or race, or promoting intercultural or interracial understanding, harmony, mutual respect, or global citizenship. A more radical strand of critique, advanced by Walter Feinberg (1983) and others, holds that the function of schooling is to reproduce social and economic inequality and that school curricula are systems of exclusionary knowledge codes, which mediate that function.

In recent years the major debates about moral education have revolved around three kinds of models and how to move beyond them. Cultural-transmission models call for initiating children into the prevailing moral order by immersing them in a school culture that replicates and teaches it through rituals, moralistic literature, and the like. These models are faulted primarily for their lack of progressivism. Romantic or child liberationist models trust children to spontaneously develop moral sensibilities and commitments but are faulted for their empirical shortcomings. Intellectualist or neo-Kantian models have attempted to sidestep debates over the content of morality and moral education by focusing on the form of morality and moral reasoning. Lawrence Kohlberg's cognitive-developmental variant of this model has been widely influential and widely criticized for ignoring the motivational aspect of moral development and for promoting an ethic of justice that is at odds with the patterns of female moral development, which are said to pertain more to care and inclusion. Alternative models include an ethics of care that emphasizes the nurturing of natural sympathy, neo-Aristotelian approaches that defend roles for both habituation and critical reason, and mixed developmental approaches that consider the moral sentiments, social and community factors, and identity formation together with the cognitive aspects of moral development.

## PHILOSOPHY OF EDUCATION, HISTORY OF

There was probably a time when human culture was transmitted spontaneously from one generation to another. The young of the species cannot survive to maturity unless they assimilate some beliefs about the world, some attitudes toward it, and some skill in solving the practical problems it presents; and the only source from which they can derive this minimal wisdom is the culture of their elders. The tendency to imitate offers a ready-made mechanism for inheritance, and in primitive communities, where benign surroundings allowed a leisurely and spontaneous association with children or where a harsh environment spared no time from the effort to keep soul and body together, the education of the young must have proceeded without much thought or care. In societies that were a little more advanced, the need for instruction in tribal ceremonies and the apprenticeship of sons to fathers and of daughters to mothers may have covered spontaneous education with a thin veil of deliberateness. Still, in uncivilized communities generally, culture must have been passed on without the agency of persons especially devoted to that purpose.

Through time, beliefs accumulate, attitudes grow more diversified, skills become more numerous and more complex. This increase in the volume of culture must have rendered obsolete the deliberate spontaneity of its transmission. Mastering what there was to know required special and enduring effort; teaching others to master it demanded more than a casual supervision of their lives. A culture thus enhanced could find lodgment only in a special class of persons—those who were able to encompass it. And this class—seers, priests, and scholars—must have become its chief dispenser to succeeding generations.

### BEGINNINGS IN GREECE

There are two important consequences of the concentration of culture in the hands of a specialized class. Conscious of their possession, scholars naturally came to ask

how it might be improved and purified; and this question led to the beginning of research. Second, because they were held responsible for instruction, both scholars and laymen came to expect that some good purpose should be served by their teaching—that it not only should preserve and extend culture but that teaching should serve some other purpose as well.

The earliest records show that the first of these effects, the beginning of research, began to appear in Europe near the beginning of the sixth century BCE. For a long time, no doubt, the learned had looked upon the things of sensory experience as irreducible constituents of the world and, relying upon ancient religious belief, had explained the origin and changes of those things by reference to the gods who presided over them. Now, however, a torrent of speculation deprived sensory things of their irreducible reality and the gods of their explanatory force. Water, pure matter, air, fire—each was advanced as the ultimate stuff of things by some. Other thinkers preferred a substance which possessed all the qualities of sensory things and that was broken into many small bits. Some regarded sensory things as nothing but atoms moving in the void; others resolved their hitherto independent reality into numbers or mathematical structures. And others, still, saw their independence disappear into the absolute unity that was the only reality. Almost all saw the things of ordinary sensory experience as resulting from natural forces working upon the elements or somehow breaking up the unity. The more ancient wisdom was improved by pointing out that the world was really something different from what it seemed to the senses and by disallowing any explanatory value to myth.

**SOPHISTS.** The second effect of the concentration of culture, the desire to serve a higher purpose, began to appear about the middle of the fifth century BCE. The diversity of opinions concerning the nature of things, their origin and change, and related topics, led in some minds to a profound skepticism. Gorgias (c. 480–380 BCE) argued that nothing exists; that if something did, no one could know it; and that if one could know it, he could communicate his knowledge to no one else. Protagoras (c. 490–c. 421 BCE) held that man is the measure of all things. Each concluded that belief is properly an individual concern and that what is good and right is similarly dependent upon individual interests. They did not draw the conclusion that one might do as he pleased, however; they urged, rather, that conformity to custom and convention furthers the interest of the individual person more than flouting does. They and their fellow Sophists moved through the cities of Hellas, giving instruction in the

practical arts, in the humane and literary subjects, in rhetoric, in law and politics, and in the more theoretical considerations out of which their natural and egoistic principles grew. They asked a fee for their instruction, and that procedure was an innovation. But an even greater novelty was their view of their own function as teachers—a view of the transmission of culture not for its own sake merely, or for *ad hoc* purposes, but in order to help their pupils achieve the comprehensive goal of a practically successful life at home, in the court, or in the legislative assembly.

**SOCRATES.** Socrates (c. 470–399 BCE), to judge from Plato's presentation of him, was even more conscious of his mission as a teacher than were the Sophists. He shared their skepticism toward physical and cosmological theories, but unlike them he refused to leave unchallenged any dogmatic trust in conventional morality. In his hands rhetoric became dialectic; and in his teaching the purpose to which the pupils of the Sophists put the former—the persuasion of others to whatever view the speaker finds most useful—became the discovery of truth, in the dialectical search for which all barriers of personal prejudice and social dogma must give way. He was convinced that the human mind could discover the truth about the physical world and about the life of man in it, although he was equally certain that no one had yet achieved this knowledge. His mission as a teacher, he thought, was to free his pupil's mind from confusion and dogma in order that it should be able to find and recognize the truth—especially the truth about the good or virtue. Confusion and dogma would disappear upon examination of the unclear and unfounded ideas that constituted them. Thus, although Socrates' purpose was positive, his teaching often shows a primarily negative aspect. The skepticism and conventionality of the Sophists brought an objective of prudence to their education; but the skepticism and rationality of Socrates gave to his instruction the purpose of a life of virtue whose discovery required a clarification of the ideas involved in ordinary discourse.

**PLATO.** Plato (427–347 BCE), influenced by the Sophists as well as by the speculative scientists and metaphysicians and inspired by the instruction of Socrates, gave us the first fully developed philosophy of education—that is, the first explicit, philosophical justification of a theory of education. In his *Republic*, on the basis of observation, he ascribed to all human beings, but in varying degrees, three distinct abilities: the ability to reason, which seeks the good life, the ability for appetite, which is connected with the body and is somewhat wayward, and the

ability to enforce the decisions of reason about what is good against the inclination of appetites. He ascribed to all states, on a similar basis, three functions: that of legislation, that of economic production and distribution, and that of armed enforcement of law and foreign policy.

Plato recommended that education be employed as the chief method of reforming both the individual's character and the state. In a just character each of the three abilities is exercised to the height of its power: Reason recognizes what is good, the appetites freely conform, and the ability to enforce the decisions of reason assures that conformity. In a just state each adult citizen performs that function for which he is best fitted: The highly rational engage in legislation, the predominantly spirited (Plato's name for the ability to enforce reason's decisions about the good) enforce it, and the chiefly appetitive operate the economy. Justice consists in a harmony that results when each part of a thing performs the function proper to it and refrains from interfering with the function of any other part. Reform in individual character and in the state is movement toward personal and social justice.

A system of universal, compulsory, public education from birth to maturity ought to be instituted to bring about this individual and social improvement. All should be taught to read, to write, to count, to appreciate the traditional poetry and drama (highly censored for the young), and to engage in gymnastic exercise. Some should learn the military art, and others should study the sciences and dialectic—the search for the fundamental principle that explains all reality and value. Each student should be tested to discover which ability dominates his soul and should be sent into the state to perform the function appropriate to it when he reaches the limit of his development, which the testing reveals. Thus, each class in the state would be recruited from those best fitted to perform its function. Such a system of education would produce individuals whose souls are as just as their abilities allow and a state whose parts or classes are similarly harmonious.

Plato's philosophical justification of his theory of education consists of three parts. First, he shows that the just state or republic and the just individual are good. For every class of things, there is a Form, or Idea, existing in a supernatural realm, resemblance to which determines the class. The resemblance between a member of the class and its Form is its goodness. The Form for the class of states is that pattern into which the three constituent classes fall when each performs its proper function. The Form for the class of human beings is that pattern into which the parts of the soul fall when each is properly

developed. Thus, insofar as a person is just, he is also good, for he resembles the Form of humanity. And insofar as the state is just, it is also good, for it resembles the Form of states. The goodness of a just character and of a just state warrants Plato's recommending them to our efforts.

Besides this ethical support for his recommendations Plato provides a metaphysical explanation for the facts upon which he rests them—the facts of human nature and of society. Every particular falls into some class, and the class is made what it is by virtue of the Form copied by all the members of that class. If we ask, then, why every human being should possess the three abilities (reason, appetite, and spirit) and why every state should perform the three functions (legislation, economic production and distribution, and law enforcement), the answer is that they cannot fail to possess and perform them since exactly that is required by their Forms.

Plato's epistemology gives a third support to his theory of education. First, his contention that we can know only the Forms in their logical connections, coupled with the view that the entire realm of becoming is a copy of that of the Forms, leads to the conclusion that even though knowledge is not an infallible guide to the course of nature it is more useful than mere opinion. In this way he argues that knowledge is useful in the pursuit of justice. He holds, second, that the only method appropriate to acquiring knowledge is that of purely rational inference. Assuming that the method of learning is identical with that of discovering truth, he argues that instruction should follow the path of deduction wherever that is possible.

Plato's philosophy of education resembles in some respects the thought of the metaphysicians and physicists of the fifth and sixth centuries; with them it shares the faith that the human mind can achieve knowledge of what exists. It resembles the thought of the Sophists in its insistence that the world of ordinary sensory experience cannot be known. But of their reliance on conventional morality, it shows no trace at all. Rather, Plato shares with Socrates the conviction that virtue can be known and that it is the business of education to reform conventional morality in its direction.

**DEFINITION OF "PHILOSOPHY OF EDUCATION."** Plato's work, especially in the *Republic*, serves as a paradigm of a definition of the phrase "philosophy of education." He sets forth an educational theory—that is, a view about the facts of human nature and society on which are based recommendations about the curriculum, the meth-

ods, and the administration of education, regarded as means to the ultimate goal of just and good citizens living in a just and good society. His ethical theory justifies this goal; his metaphysical theory supports the recommendations ancillary to the goal; and his epistemology explains the effectiveness of some of the teaching methods he advocates as well as our capacity to perceive truth generally. “Philosophy of education” means any body of thought like this one—any body of thought that includes a theory of education, an ethics that justifies the goal that the theory adopts, a metaphysics that explains the psychological and sociological parts of the theory of education, and an epistemology that explains why certain methods of teaching and learning are effective and demonstrates our ability to know the truth of any thought whatsoever.

Many philosophies of education do not contain reference to all the subjects with which Plato was concerned. Nonetheless, his reflections on education fix the meaning of the phrase by constituting a model, resemblance to which (at least to some degree and in some respect) allows any body of thought to be called philosophy of education.

**HELLENISTIC THOUGHT.** After Plato’s work, nothing very novel was added to philosophy of education for some seven centuries. There is extant some work of Aristotle’s (384–322 BCE), but it is fragmentary and a part of a theory of education rather than a philosophical treatment of such a theory. Epicurus (341–270 BCE) and his followers Zeno of Citium (336?–265? BCE) and the Stoics advocated a tranquility in life—the Epicureans through cultivation of quiet pleasures easily obtained, the Stoics through willing acceptance of the lot for which one is necessarily determined and (among the later members of the school) through a love for all humankind viewed as a brotherhood. But Epicureans and Stoics, as far as we know, themselves developed neither a theory nor a philosophy of education. In the first century CE, Quintilian (c. 35–c. 95) published his *Institutio Oratoria* (*The Training of an Orator*). Quintilian recommends that in his training an orator be given appropriate objectives toward which he can direct his native but unformed impulses. The life of the orator, he dimly suggests, is good because it meets the Stoic requirements of indifference to external circumstance and utility to fellow citizens. His book harks back to the humanistic curriculum of the educator and orator Isocrates (436–338 BCE) and to the Sophists. It was of much influence in later antiquity and again, after its rediscovery, on humanistic education in the Renaissance, but it embodies a theory of education rather than

philosophical reflection upon education. Other authors, for example, Plutarch (c. 46–120 CE) and Quintus Septimius Florens Tertullian (c. 160–c. 220), comment on education, but not in a philosophical way.

Although the literature of the Hellenistic age shows little that is new in philosophy of education, two ideas of great importance for change in that philosophy were, nonetheless, gradually coming to dominate men’s minds. One is the idea that a chief factor in the good life is obedience to law; the other, that a necessary ingredient in that same life is the happiness of a love that unites all those who obey the law as well as each of them to the law-giver himself. The Christian ideal of the brotherhood of men under God, their creator, is the expression these ideas assumed, and the movement of Christianity, although influenced by Plato, not to mention Plotinus (205–270), produced a new philosophy of education.

## MIDDLE AGES

**AUGUSTINE.** The new philosophy is the work of St. Augustine (354–430). Human nature, according to his view, must be described in terms of substance and faculties influenced by historical forces. Every human being is a combination of body and soul; the soul possesses the faculties of knowing, feeling, and willing. The first enables us to know whatever we sense and remember to have sensed, certain abstract principles which the mind carries within itself, and the world of sensible things as they are ordered by those principles. The faculty of feeling enables us to desire and to feel emotions which center on desires. The faculty of willing enables us to choose from among differing desires those we want to realize—an ability which exercises itself freely and which, when exercised correctly, employs rules of choice that flow from divine commands.

Human nature cannot be accounted for in terms of substance and faculties alone, however. A historical force always determines how these faculties operate. Before the Fall, Adam and Eve used their faculties in the right way—especially their faculty of desire, directing its operation upon what they ought to desire, centering their love on God and on one another in communion with him, and choosing freely to obey his commands whenever the clamor of bodily appetite opposed itself to the right. But from their original sin, of which the Fall was a natural consequence, flows the force which determines their descendants to act as sinfully as they—to choose freely to disobey God’s command by selecting egoistic and carnal desires for realization. Human nature must be painted in terms of substance and faculties corrupted by early events in human history.

Human society is constituted by the direction of the activities of its members toward a single goal, but, like the human soul, it cannot be understood merely in terms of this abstract function. The unity of purpose that in principle constitutes the family, the city, the empire, and the community of humans and angels is disrupted by inherited self-seeking. Another historical force determines two other communities—the city of earth and the city of God—each of which is reflected in the four just mentioned. The advent of Christ signifies God's wish to enable men, despite their sinfulness, to merit salvation. The city of earth is made up of those who refuse to believe in Christ's mission and to repent; its members will not be saved. The city of God is composed of those who believe in that mission and feel genuine repentance; its members will enter upon eternal communion with God after the day of judgment.

The ultimate objective of education grows out of the corruption of human nature and God's concern over it. Like the ultimate objective of the church, that of education is conversion and repentance. On the elementary level the curriculum should be the seven liberal arts—a program of studies prefigured by Plato's curriculum; on the advanced level it should consist in philosophy and theology. The method appropriate to the lower level involves censorship and the prevention of idleness in order to stifle sinful desires. The liberal arts should be taught in an authoritative manner because not all who seek elementary instruction are sufficiently rational to know the truth and since no more than belief is required for salvation. On the higher level, authority gives way to proof since those who advance thus far are able to achieve knowledge. The liberal arts, coupled with religious worship and instruction, ensure correct belief about the nature and order of the universe and about God's relation to man; philosophy and theology show the more able—those destined for the hierarchy of the church—why those beliefs are true.

Augustine's philosophical reflections upon his theory of education stem from his conception of God. He advances, first, a theory of language according to which every word means what it names, and every sentence, the combination of things named by its component words. He concludes that since on this theory no one can tell someone else what he does not already know, each man must learn for himself by consulting things as they are illuminated in a light of divine origin. Teaching is not informing; it is reminding others or ourselves of the knowledge supplied by God.

Second, from the concept of God flows the justification of the objective of education. The goodness of each created thing consists in its resemblance to the idea held before God's mind as the pattern for its creation; this idea is its exemplar. The exemplar for men is the obedience to God's commands and love for him and for one another in him that gave perfection to life before the Fall. To be happy is to possess what one wants at the time of wanting it; since God is the only eternal thing, he is the only dependable object of desire. To be happy is to illustrate the exemplar for man, and conversion, the objective for education, consists in achieving that condition.

Augustine finds in God, also, a metaphysical explanation of human nature and society. In the first moment God created everything either in actuality or in potentiality. All history—each person's repentance or failure to repent, each society's deeds, both good and bad—is the unfolding of what was first merely potential; what happens is what must happen because of the initial creation and God's all-comprehending providence. Human nature and society must be corrupt; hence, conversion must be the ultimate purpose of education.

*Later medieval thought.* During the centuries that followed the death of Augustine the interest in another world became so dominant that education diminished in importance, and reflection upon it very nearly ceased. Attention was centered on the otherworldly results of repentance or its failure at the expense of training for terrestrial existence; and so dogmatic was the assurance of the need for conversion that any effort to justify this objective appeared useless if not impious. The clergy, then Europe's teacher, offered a meager training to those working toward holy orders and some understanding of religious ritual to the laity. But the transmission of culture diminished greatly. The widespread acceptance of the otherworldly objective of education stifled philosophical reflection upon it. Comment on education is found in the writings of the Venerable Bede (673?–735), of Alcuin (735–804), and of Hrabanus Maurus in the early ninth century; but they are at most casual and at least unphilosophical. Thomas Aquinas (1224?–1274) devoted some systematic attention to the philosophy of education, but his chief contribution to it concerns not the objective of training but the nature of teaching—a discussion which continues the thought of Augustine on that subject.

RENAISSANCE. With the Renaissance came a revival of interest in ancient learning and a recognition of value in terrestrial life. In accord with this change of outlook some

writers assigned to education an egoistic and prudential purpose like that of the Sophists. Reformationist thought—at least in Martin Luther’s case—demanded universal, compulsory, state-controlled education in order that religion should be national and God’s word available directly to all. Ignatius Loyola (1491–1556), through the Society of Jesus, established a widespread system of schools and universities; and in 1599 the society established a plan of education for them (*ratio studiorum*) that exercised much influence on Catholic education. But Reformationist and Counter-Reformationist literature reveals much more polemic and dogma than philosophical reflection upon education.

## MODERN PERIOD

**COMENIUS.** In the seventeenth century, philosophical reflection upon education began anew, and its history from that time to the present is that of the gradual secularization and naturalization of the Christian objective assigned to education by Augustine. The work of John Amos Comenius (1592–1670) begins this process. (In particular, see his *The Great Didactic* and *The Way of Light*.)

Like Augustine, Comenius holds that human nature is corrupted by inherited sin, but he also asserts that it is capable of absolute perfection. The soul contains the possibilities of erudition (perfect knowledge), of virtue (adherence to the rules of right conduct), and of piety (love of God, the author of humankind). Like Augustine, Comenius viewed history as a decline from innocence, but he held, nonetheless, that there is a zigzag pattern in history, leading to an age of perfect terrestrial existence before the last judgment devoid of international strife and ruled over by Christ. In this last age the possibilities in the human soul realize themselves in perfect knowledge, virtue, and piety, and all societies unite in a single international brotherhood. The reward for striving after this perfection is immortal blessedness. Comenius held that a system of public, universal, state-supported schools, from childhood to maturity, should further the full actualization of the soul’s possibilities and assist history toward its goal. The curriculum should constitute a cyclical development from the simple and abstract elements of science, art, language, literature, and religion to their complex and concrete forms. The methods of instruction should consist in the uniform application to the young of the human species of principles observed in the development of the young of other species, both plant and animal.

Comenius’s philosophical reflection on his theory of education centers, like Augustine’s, around the notion of God. God made humankind in his own image, and, because God is perfect, humans may become so as well. To achieve perfect knowledge is to make perfectly clear to ourselves the things our sensations reveal and to order them according to innate principles which reason brings to light. To perfect conduct is to identify the rule of one’s will with a command of God, and to perfect piety is to love God in one’s obedience to him. Human nature and human history find a metaphysical explanation in divine providence, which manifests itself through the opposed forces of light and darkness. The business of education is to perfect individuals in the three ways mentioned. It also makes the personal life of each human being perfectly Christian and aids history in its progress toward final social perfection.

**LOCKE.** Late in the seventeenth century, not long after Comenius, John Locke (1632–1704) published *Some Thoughts concerning Education*. In this book, in *An Essay concerning Human Understanding*, and in *Second Treatise of Civil Government*, he carried further the secularization of the objective of education started by Comenius. With Augustine and Comenius, Locke held that man is free, but in opposition to them he denied that man is inherently sinful by virtue of his racial history. Each person is a mental substance joined to a bodily substance, as Augustine asserted; mental activity, however, can be described wholly without reference to substance, in terms of two faculties, understanding and will. The faculty of understanding enables man both to know and to desire, but what man knows is determined by the ideas his environment allows to enter his mind, and what he desires is determined by the objectives his environment supplies to a few native instincts. The second faculty is the will, and its exercise consists in choosing desires for realization where they conflict.

Society in the state of nature is based on a natural division of labor and on the need to care for offspring. In that state the original “common” of the world was largely transformed into private property, and the function of primitive society was to enforce natural law, or the law of God according to which private property ought to be respected. Disputes inevitably arose, and, since everyone possessed the power to enforce the law of nature, they often could not be settled amicably. Political society came into existence as a guarantee against such disputes. It is based upon a contract or agreement between the community and others according to which each member of the community agrees not to exercise his power to

enforce natural law provided that the others who constitute the government will exercise it for him. It follows that the exercise of governmental power is legitimate only where it protects private-property rights. A government of the kind instituted after the Glorious Revolution, having popular representation, Parliamentary determination of the sovereign, majority rule, and separation of legislative from executive power, Locke held, is best suited for achieving this objective because it can most efficiently check unnecessary governmental activity.

The purpose of education is to produce people who will advance the happiness of the community. They must be of good character and properly disposed toward learning. Good character consists in the habits of acting virtuously, prudently, and with good breeding. The proper disposition toward learning is not possession of it but an esteem for it and the habit of acquiring it when the need arises. These habits and dispositions can best be acquired by a tutorial education at home, by a method of pitting one instinctual desire against another in order to establish them, and by presentation of clear and distinct ideas to the pupil in the order and connection possessed by their objects. In both moral and intellectual training one should appeal to the interests of the child, bring him to learn for himself, and give public approbation to his success. The child who will benefit from such instruction and who will contribute to the happiness of the community is the son of landed gentry, who can look forward to a place in government. The poor should be given sufficient education to make them religious and self-supporting.

The production and maintenance of a good society is the chief objective of Locke's theory of education. Such a society is one in which men find pleasure or happiness in the performance of duty, and Locke's ethical reflection endeavors to justify this conception of the good life. Duty is obedience to natural law as embodied in civil law concerning the protection of private property. Like all moral principles, it can be known with certainty to be valid; it can be demonstrated from the ideas of God, of his creature man, and of the relation between them. The moral and intellectual training of the gentleman will cause him to find his pleasure in doing his duty; the exercise of this duty through government as well as through more informal social controls will spread a similar happiness throughout all levels of society.

Locke's theory of knowledge led him to conclude that we can be perfectly certain of any proposition whose truth we can intuit, demonstrate, or perceive through our senses or through our memory of such perception. Since

the validity of duty can be demonstrated, we can know that it is right to perform it; and in this way, his emphasis on moral education is justified. Since the theory holds that we can know very little of the sensible world—only what we remember having perceived through our senses or are now perceiving through them—the de-emphasis of intellectual pursuits is also justified. We must accept many propositions about nature on faith or as merely probable; hence, we do not need to busy the heads of the young with any detailed consideration of them.

ROUSSEAU. Jean-Jacques Rousseau (1712–1778) advanced three distinct philosophies of education; in the most influential of the three he varied the social theme found in Locke's thought. In his discussion of a new constitution for Poland he advocated a highly nationalistic program on the ground that where a nation's institutions are in good health, education should support and renew them. In *Émile*, he set forth a program appropriate to women, holding that their education should give them charm, ability for household management, and thorough-going dependence on their husbands in matters not pertaining to the home. But the major part of *Émile* deals with the education of gentlemen, embodies a theory of education that has exerted much influence upon educational practice, and assigns to education a social ideal quite as secular and political as Locke's but applied in an altogether different way.

Rousseau described human nature, as did Locke, as independent of historical influences and as initially perfectly innocent. A human being is a substance with faculties—those of pleasure and pain, of sense, of reason, of desire and emotion, and of will. These faculties emerge clearly at different stages in the life of the individual according to a general pattern, and the personality is more or less stable according as the newly emerged faculty is made to harmonize with the exercise of others already established. Despite the general pattern, each individual differs from others and must achieve stability through a procedure adapted to his own case.

In the early history of humankind there was no society. Men were independent and therefore equal. With improvement in techniques of hunting, fishing, and farming, they acquired property; with property, they acquired families, differentiation of economic function, interdependence, and inequality. As society became more complex, greed, ambition, and deliberate selfishness entered the soul; in time, men developed government and law in order to protect the property of the wealthy against one another's greed and against the greed of the poor.

Inequality is fixed in the structure of eighteenth-century society and is due for removal by revolutionary action.

Rousseau presented detailed recommendations for educating gentlemen to live happily in these circumstances. They differ for each stage of development, but he urged that in all the child must learn for himself through personal observation of and active participation in the world of nature and society. A tutor who devotes his entire career to one pupil should attend to the pupil's individual interests and instruct him by rousing those interests into activity. The young man who completed this education would have enjoyed to the full each of the stages in his development and would be possessed of a strong body and stable mind. This stability would consist in his possessing no desire for whose realization he did not also possess the requisite power. It would make him neither learned nor urbane, but it would lead him to adopt a rural life in which he could survive the social storm Rousseau anticipated.

Rousseau advanced three criteria for knowledge: sensory experience of the consequences of action, the dictates of the heart, and practical utility. The first he transformed into a method of instruction—the method of letting the child experience for himself the consequences of acting upon his ideas in order to learn what is true about nature and society. The second he employed to warrant his inclusion in education of a considerable amount of simple religious doctrine. The third he relied upon to exclude from education a great deal of philosophy and other literature that he found devoid of practical consequence.

Rousseau's metaphysical reflection led him to hold that all of nature, including men's bodies and their actions, is governed by law but that since duty often requires one to act in ways other than those determined by this law, there is a supernatural realm in which duty presides. To act according to duty is to use the right rule for selecting one desire from among many as a basis for action, and since this selection and realization runs counter to nature, we must be exercising free will when we act rightly.

Rousseau's thought about morality concluded with the view that the good life is one in which there is neither the shallowness of desires that have been multiplied to match excess in power nor the discontent of an excess of power over desires but the happiness which occurs when power to fulfill desires equals the desires one harbors and is exercised to realize only those which are in accord with duty—a view not unlike Locke's. Duty Rousseau understood in terms of the general will. This is the welfare of

the nation as opposed to the corporate will, or the welfare of a smaller group, and to the particular will, or the welfare of the individual.

It is our duty to act for the general will where that is possible. But in the major nations of Europe all institutions have been subverted to the service of corporate and particular wills. The social contract (which is, whatever the historical account of it may be, the agreement to act in accord with duty rather than for some lesser goal) has been betrayed by those in authority. Consequently, the ideal of duty cannot serve as the purpose of education generally. The realization or preservation of one's own will must be put in its place. In this way Rousseau justified the individualistic effort at internal peace that informs the theory of education with which he was most concerned.

**PESTALOZZI.** The educational proposals of Johann Heinrich Pestalozzi (1746–1827), unlike those of Rousseau, whom he greatly admired, bear no trace of direct revolutionary inclinations. But he had a warm sympathy for the downtrodden, and he advocated education for all as a condition of social reform. By his example and his books he contributed greatly to the common-school movement in Europe and America. The influence of Rousseau on his thought is evident chiefly in Pestalozzi's insistence on treating children in ways appropriate to the process of development through which they all must pass.

This process exhibits three stages. The contents of the child's mind are at first blurred and indistinct. Next, objects stand out in consciousness characterized by explicit forms and qualities. Last, these objects are understood as examples of general concepts; they are, to use Pestalozzi's word, defined. Throughout the process the person is himself active in securing and clarifying images and in transforming them into ideas that contain knowledge. Each child should be dealt with in accord with the place he occupies in this threefold process, and a major part of teaching consists in enabling him to work out for himself his own knowledge or definition of things.

Knowledge always contains three elements: the number of things known, the form they exhibit, and the language that embodies them. Pestalozzi concluded that learning must start with the elements into which each of these may be analyzed. The elements of number are units, and arithmetic (operations with units) must be mastered in order to understand number. Form Pestalozzi seems to have thought of as visual and tactual; its elements, consequently, are lines, angles, curves, etc. The student must understand these elements before he can understand

form. The elements of language are ultimately letters, and the mastery of language depends on mastering their spoken and written forms.

Pestalozzi set forth detailed methods for teaching the elements of number, form, and language. They grew out of those he thought natural to a mother's dealings with her children. In the family situation a mother can know in what stage of development each of her children finds himself; she can teach him to count, to draw, and so on, through use and observation of ordinary materials in the context of the economic employment, such as spinning and weaving, in which the family engages; and she can assure herself that he comes to perceive objects clearly and to define them for himself according as his stage of growth permits. These methods, directed toward enabling each child to acquire knowledge based on his own perception (*Anschauung*) of things, Pestalozzi thought could be employed in a school situation. The schools he operated in Switzerland, taking the Swiss village family as their model, attracted imitators from many parts of Europe and America.

Besides knowledge of things, teaching should bring children to a knowledge of skills which exhibit their physical or motor capacities as knowing does their intellectual abilities; and Pestalozzi thought that the performance of deeds could be analyzed into elements just as knowledge could. He was convinced that learning how to do things required the mastery of elementary motions, just as coming to know required the mastery of the elements of number, form, and language. The teaching of morality and religion—more important than that of knowledge and skill—involved transferring the child's feelings of dependence on the mother to other persons in society and to God. But Pestalozzi's treatment of the development of the motor and moral capacities is not so detailed and clear as his discussion of the education of the intellect although he insisted upon the inseparable unity of the three capacities.

The direct influence of Pestalozzi on philosophy of education is negligible. He was not interested in it. Still, his schools and his writings on the theory of education strongly influenced some who were.

**FROEBEL.** Pestalozzi's younger contemporary Friedrich Froebel (1782–1852) spent several years working in one of Pestalozzi's schools. Froebel was also much given to philosophical reflection, upon which, he thought, the theory and practice of schools depended—especially that of the kindergarten, which he invented almost single-handed.

Froebel's speculations found the goal of education in the full and integrated development of all the powers of the individual and in the internal harmony, as well as the harmonious relations with society, nature, and God, that this development assures. This goal cannot be imposed upon the student; he must achieve it for himself through activities expressive of the powers he harbors. One who has accomplished the goal exhibits a steadiness and solidity of character that gives him integrity in all situations and the intellectual habits (not a store of remembered facts) that enable him to acquire knowledge when necessary.

The process by which this goal may be reached, the process of education, consists in the unfolding of what is present in infancy. Each person is like a plant, and as a plant develops toward a given stage of maturity, so the life of each human being consists in the filling out, through increase of varied detail, of a pattern present from the start. This process is also one of increasing clarity of self-expression and culminates in a clear consciousness of the self. The development of the individual is altogether continuous, and the stages of infancy, childhood, boyhood, youth, and maturity into which it is divided are characterized not by the emergence of novelties, as Rousseau had suggested, but by an increase of clarity in consciousness of the tendencies present in all.

Froebel worked out methods of education in accord with this view of individual development. The methods applicable in the earlier stages should merely enable spontaneous expression of the pupil's self; methods applicable to the later stages should supervise and direct that development. His treatment of the stage of childhood amounts to the nearly single-handed invention of the kindergarten—an institution that spread quickly, especially throughout the United States. His treatment of boyhood involved considerable innovation in the methods, materials, and curriculum of elementary schools.

In the first stage, the infant should be nurtured and cared for. In the second, the senses and language develop, and the child's tendencies toward this development should be permitted free expression. Play is the most important method for this expression. Froebel invented various apparatus (called "gifts") to serve as educative toys; introduced activities (called "occupations"), such as drawing and clay modeling, which, along with the gifts, develop sense perception; emphasized song and spontaneous conversation to develop language and prescribed games, often played in a circle (to which figure he attached cosmic if obscure significance), to develop the sociality inherent in the child.

The stage of boyhood should be developed by instruction. The boy is becoming self-conscious; in order to develop steadiness of character, he should participate in the administration of the school through school government. The study of nature, stories, learning in groups, family work, making things—all these further steadiness of character and habits of intellectual readiness. Froebel insisted that instruction, the direction of development, should not aim at the practically useful but at that self-consciousness of integrated and developed powers which is the proper objective of individual and social evolution. About the stages of youth and maturity Froebel had little comment.

Froebel saw education—the early, spontaneous, and the later, but directed, unfolding of the essential powers of each individual—in a metaphysical setting, tinged with mysticism, obscurantism, and incoherence and indebted heavily to the absolute idealism of his day. The Absolute embraces everything and is continually evolving as force in nature and as mind in man. This cosmic evolution proceeds from action to reaction to equilibrium, from simple to complex, from unconsciousness to self-consciousness. Froebel identifies the Absolute with God and its evolution with his creation. Everything has a purpose that unifies it and that binds it into larger organic wholes, by virtue of evolution or creation. The evolution of the Absolute is reflected in miniature in that of humanity. The human race has developed through five stages, and the life of each individual reflects this racial and cosmic evolution. Education, Froebel thought, ought to enable this process to fulfill itself in each person without hindrance. It ought to be the minister to individuals of a cosmic and racial evolution.

The best life for man is the fullest realization of a consistent will—the consciousness of the best self that he can develop. This self-consciousness is awareness of purposes inherent in him; in becoming aware of them, man becomes free. Evil is the distortion by some external factor of a tendency native to the self; all tendencies are naturally good if allowed to develop into self-conscious, harmonious freedom. Although some education should direct, the fundamental early education is chiefly negative; that is, preventive of external obstruction to the development of natural tendencies.

Froebel's metaphysical and ethical doctrines inspired him to activity that had enormous practical effect upon the schools directly, and while the chief influence on his thought lies in the practical work of Pestalozzi, Immanuel Kant (1724–1804) influenced it indirectly, at least

through the pervasive effect of his theories on German thought in general.

KANT. The impact on educational theory of the work of Pestalozzi and Froebel was an emphasis on developing individuality in the student, and this impact may be traced to the thought of Rousseau. In the work of Kant a greater optimism than Rousseau's gave a less individualistic objective to education.

Kant conceived of human nature in terms of three faculties: cognition, which organizes sensory elements into the orderly world of experience; desire, which exercises itself in an instinctive effort at lawless, egoistic domination over others; and will, which selects desires for realization according to a rule. Human society grows out of the exercise of these faculties. The instinctual desire for domination leads to conflict between individuals; the faculty of cognition yields knowledge about how this conflict can be avoided—by association in republics; and the will leads to actual societies of this kind for mutual protection. But between republics conflict breaks out anew; and in order to avoid it, these states tend to unite in a peaceful international community. This community is the natural result of the unimpeded development of human faculties; and since we must believe that all things develop their capacities fully, we must believe that it stands at the end of historical progress.

It is the ultimate objective of education not to advance the welfare of individual students, but to promote the realization of the peaceful international state as the embodiment of human perfection. Accordingly, teachers should not regard the economic or other success of their charges but should center attention upon the fullest possible development of their faculties. This development can be assured by supplying to the cognitive faculty the general truths it should use to organize sensory elements into nature as we experience it, by rigorously disciplining the faculty of desire in order to eliminate the instinct for lawless behavior, and by enabling the will freely to use the right rules in organizing the remaining desires. The result of such instruction will be a perfected character and intellect, which, through the progress of generations, will assist history to realize the educational ideal.

Kant's ethical theory supplies a criterion for the kind of conduct which makes the international state possible. It is conduct which embodies rules that can be generalized without absurdity—rules which fit into the famous "categorical imperative." "Break your promise when you wish to" is not such a rule; for if instead of applying it to

your own desires alone, you try to imagine all persons using it in selecting some for realization, the notion of a promise completely disappears. The rule degenerates into the nonsensical “Break a promise which no one ever takes to be a promise when you wish to.” “Always keep your promise” is a necessary moral rule, and like all rules which fit the categorical imperative it is so because we cannot imagine the generalization of its opposite without imagining something rationally absurd. In the international state the character of each person will be so perfected that each will act upon such a rule when it is necessary to make a moral choice. Thus, the state will be both realized and preserved. Kant’s philosophy of morals, in this way, clarifies part of the notion of an ideal social order which education should subserve.

Kant’s metaphysics makes a great deal of the distinction between two realms—the realm of things we can experience, or phenomena, and the realm of things which transcend experience, or noumena. Following Rousseau, Kant held that human beings dwell in both realms and that in the former their desires and actions are determined by natural laws, whereas in the latter they are governed by right rules or duties. To act rightly requires that a person freely employ a right rule and that he not act in a way determined by a law of nature. Hence, whenever one acts rightly he acts as a free citizen of the noumenal world—he freely applies a rule to his desires to decide which one to act upon. This proposition of Kant’s ethical theory illumines his method of training the will; that is, his method of preventing the growth of habit and of requiring that children freely adopt a rule in some hypothetical situation of choice.

Kant’s views about history provide a goal for his theory of education, and his ethical and metaphysical theories explain part of that ideal and the method proposed for arriving at it.

**FICHTE.** Rousseau’s despair of achieving the national welfare led him to advocate the cultivation of individual self-sufficiency; and while it was no part of their theories, the effect of the work of Pestalozzi and of Froebel was to further attention to the individual student in the practice of education. Kant’s enthusiasm for international well-being led him to advocate a future achievement for the entire race through the fostering of universal faculties rather than through the development of individuality. Enthusiasm for national existence as opposed both to individuality and to internationalism brought Johann Gottlieb Fichte (1762–1814) to advocate an objective more like the one Rousseau would have recommended if

he had been more hopeful about the national institutions of his day.

Addressing the German people during the subjection of Prussia to Napoleon Bonaparte, Fichte urged that education be used to unite all Germans in a state that, through purity of race and character, would lead the world. Education was the only independent action allowed by the French; if all German children were separated from their parents, reared in a partially self-governing community in which each individual might learn directly the responsibilities of citizenship, taught through the energizing force of interest rather than by reward and punishment, and thus prepared for an adult life of wholehearted and unswerving duty, this possibility of independent action could be turned to the advantage of all Germany. It would lead to the creation of a reformed and unified German state, devoted to the right, and worthy (unlike others) of world dominance. This nationalistic objective of his somewhat fanciful proposals Fichte might have supported by his view that the best state is highly authoritarian—one in which the fulfillment of each man’s duty to work is made possible by the state’s provision of the opportunity and compensation for work and the complete control of the economy required by that guarantee. This socialistic ideal, in turn, he might have supported by his view that the physical world must be understood as the means and medium by use of which and in which duty becomes embodied in fact. This view is consonant with his metaphysical idealism, according to which the ego posits itself and its objects for the purpose of doing what it ought—a position Fichte developed out of his criticism of Kant’s doctrine concerning noumena.

**HERBART.** Like Fichte, Johann Friedrich Herbart (1776–1841) gave much thought to the doctrine of noumena; but unlike him, he arrived at a kind of realism, to be described later, opposed to the metaphysical idealism Fichte, G. W. F. Hegel, and others made current in the Germany of his day. He relied upon it to advance an objective of education which assigns importance both to individuality and to sociality—both to being a person of the best possible sort and to being a citizen of the best possible society.

There are five criteria, the “moral ideas,” all of which must be exhibited by a person with the best possible character and a society of the best possible sort. Applied to a person, the first two of these ideas are relations between his will and other aspects of his character, while the last three are relations between his will and other persons.

When one knows what he wills and approves of it, he is “inwardly free,” and inward freedom is the only freedom men enjoy. When one’s will is strong, directed toward many things, or “many-sided,” and constituted by inclinations toward objectives systematically ordered by the teleological relations they bear to one another, he possesses “perfection.” When one directs his will toward enabling the wills of others to be realized, for the sake of that realization rather than for his own benefit, he is “benevolent.” The remaining two ideas apply not to wills alone but to the embodiment in action of one person’s will with respect to others. When several persons deliberately live according to a principle or law, thus preventing conflict, each individual acts “rightly”; and when a person willfully benefits or harms another, the idea of “equity” or “requital” requires that a corresponding benefit or injury be visited upon the doer of the deed.

A society—a political state or group of any kind—to which the five moral ideas apply is one in which law prevails because of the general relinquishment of rights whose exercise leads to conflict; one in which there is a system of rewards which makes requital to each citizen for that relinquishment; one in which an administrative system exhibits benevolence by assuring to all the greatest satisfaction of will; one in which many interests or wills, both individual and collective, find coherent realization or perfection in a cultural system; and one in which the society, being “inwardly free,” knows its own will and approves of it—a trait that requires a soul for society not unlike that of the individual person.

Assuming that if the individuals in a group acquire the moral ideas the group will also, Herbart holds that the immediate objective of education is to produce individuals who exhibit them; and the production of such persons consists in the appropriate use of truths of psychology. These truths describe the relations of ideas or representations, and Herbart is distinguished in the history of psychology as having been among the first to have endeavored to state those relations in a rigorous, mathematical way. He regarded the propositions of his psychology as based on introspection and as justified by metaphysical reflection. Released from its technical form, his psychology may be stated, in part, as follows.

Each idea, Herbart held, endeavors to preserve itself and succeeds in that endeavor to some degree, that is, *is* itself, more or less. The degree of its success depends upon its relations to other ideas, and these are of three kinds: of opposition, of mere dissimilarity, and of similarity. Red and blue (not-red) are opposed to each other, and short of some third idea that combines them, such as

the idea of a substance red on one surface and blue on another, they cannot both be present in the same consciousness. Red and circular are merely dissimilar; consequently, they may both present themselves either in combination in a red circle or in simple juxtaposition or may be present separately. A red rose and a red apple are similar ideas; consequently, one may come to be attached to the other. The effort of each idea to preserve itself—an effort which cannot be completely canceled—succeeds insofar as we are conscious of the idea. The greater the success, the greater is the clarity of our awareness of it; the less the success, the dimmer our consciousness of it. But the degree of the success of any idea depends upon the aid and attack it sustains from others; so that the clarity or obscurity of any idea—its place with respect to the threshold that separates conscious from unconscious ideas (a piece of psychological apparatus made current by Herbart)—depends upon the context of other ideas in which it occurs. Where they oppose it and are stronger than it is, it disappears into unconsciousness and becomes an unconscious impulse, striving to emerge into consciousness the moment it is not prevented by the occurrence there of its stronger opposites. Where the context includes merely dissimilar ideas, it may remain in consciousness, but not for long. The flux of experience will soon bring ideas into consciousness that will drive it down into the dark through opposition or keep it in the light by uniting with it through similarity. Where other ideas are similar, they come to its aid, forming a strong union that, so long as it remains, draws to itself its similars, inward from new sensory perceptions and upward from the storehouse of unconscious old sensations. Such a union of ideas is an “apperceptive mass” or “circle of thought”—another piece of psychological apparatus Herbart helped to make current. The psychology upon which Herbart based his educational procedures informs us that new pieces of information can be mastered only insofar as they become united with some apperceptive mass of ideas and that insofar as they are not so united, they are transformed into unconscious strivings, able to present themselves to consciousness only when a lack of their opposites there allows it or the presence of their similars there draws them up into it.

A person consists of ideas that dwell on two levels. On the level of consciousness he is a succession of ideas, each of which originates either in physiological activity or in sensation and quickly unites with some apperceptive mass or is pressed down into unconsciousness by the success of others striving to occupy consciousness. On the level of unconsciousness are all the ideas whose weakness or whose lack of similarity to those in consciousness

chains them in that dark domain. On the level of consciousness the succession of ideas is punctuated by acts of attention. These are simply ideas in which we are, more or less, completely “absorbed.” Some, like loud sounds, are involuntary; others, like highly discriminated shades of color or purposefully held thoughts, are voluntary. As objects of attention these ideas are isolated, but they either quickly become unconscious or acquire “meaning” and connection by drawing up into consciousness those “circles of thought,” or apperceptive masses of similar ideas, in whose context they acquire significance. An idea attended to much or clearly, together with its circle of thought, is an interest—a desire to bring into existence that which it represents in some future time. The apperceptive mass to which the idea belongs, together with the relations of that mass to others, presents a framework for its suppression, its mere entertainment, or its realization and makes it a desire rather than a free-floating fancy—a part of the person rather than a casual caprice. An act of will is a desire together with the intention that what it refers to should occur. The ego is the central point of the person—the present idea from which memories radiate into the past, interests (desires, acts of will, etc.) into the future, and to which entire apperceptive masses are drawn from the domain of the unconscious or forced down into it.

Ideas, thus arranged and centered, exhaust the person as an introspectible entity. They result from the exercise of no faculties (Herbart seems both to have used this concept and to have declared it nonsignificant), for the soul possesses none. To think of something, to desire it, to will it, to have a feeling toward it—all this is nothing but, in different ways, to be conscious of an idea as connected with others.

Herbart’s view of the nature of a person provided him with a method of education which became widespread both in theory and in practice. Education, he held, is instruction, and instruction should consist in four steps. (His followers made them five, prefixing “preparation” for it to “presentation” of an idea.) First, the idea or information to be learned must be “presented” to the student’s clear attention; second, the idea thus presented must be allowed to draw up from the student’s unconsciousness all ideas whatsoever whose similarity attracts them to it; third, through comparison most of these associations should be eliminated in favor of those which give the idea its proper meaningfulness in a circle of thought; last, to strengthen the idea’s bonds in that circle, the student should be brought to “apply” the idea to new situations. This procedure, based upon the flux of ideas from

the center of attention into the apperceptive mass to which they belong, gives the student mastery over new information; and mastery, or the ability to reproduce ideas, is the purpose of instruction.

To instruct a person is to construct him; since feelings, desires, etc., are all ideas, providing the student with ideas is providing him with all the materials of personality. But the instructor, by arranging the conditions in which the student acquires new ideas, determines not merely the materials out of which he is formed but also the organization or form those materials assume. And a person, as we have seen, is simply ideas organized in a certain way.

But education is not merely the construction of a person; it is also the effort to construct one who exhibits the five moral ideas. Herbart refers to this aim as the production of “character,” and he deals chiefly with the production of “perfection,” or “many-sidedness.” If the child’s attention is called to many things in his own experience, and if the store of this experience is supplemented vicariously through communication with other persons—a communication based on sympathy with them—his interests will naturally become numerous, and by control of the natural mechanism of apperception, well organized and strong. Perfection of will or character, tinged with an inevitable individuality, is a necessary ingredient in the objective of education, but it is also essential to sensible choices in adult life.

Herbart advanced a metaphysical view as a ground for his psychology. Reality is neither mental, as the prevalent idealism held, nor physical in the sense of being extended in space and time. Its characteristics are quite unknowable except for those of being independent of our minds and composed of perfectly simple entities (*Realen*), not unlike the monads of Gottfried Wilhelm Leibniz. These simple reals conflict with one another from time to time, and on such occasions, there occurs an effort on the part of each to preserve itself from destruction. In a body, this act of self-preservation is its state; in a soul, such an act of self-preservation is an idea that represents, so far as that is possible, the attacking entity. Being simple, the soul cannot engage in more than one act at once; hence the struggle of ideas against one another and the inevitable fall into unconsciousness or into the unity of some apperceptive mass.

The ethical theory by which Herbart justified the five moral ideas as the standard for personal and social existence is one which holds that moral judgments are a species of aesthetic judgments. As such, they neither need nor can be given justification. The human taste prefers

persons and societies that live up well to the five ideas, but the validity of the standard by which they are measured is still nothing different in kind from the taste we enjoy for music, painting, and the natural landscape.

J. S. MILL. In determining the objective for education, John Stuart Mill (1806–1873) disregarded several distinctions emphasized by his predecessors. He ignored the distinction between national and international well-being, speaking of society without qualification, and he argued that individual and social interests might be identified. But his work resembles that of Herbart in some ways: He endeavored to make use of psychology to achieve his educational objective, and the psychology he employed, although it regarded the elements of the mind in a different way, attributed relations to them—those of association—not altogether unlike those Herbart thought he had found.

Mill conceived of a human being in terms of a body and mind, but although they occur in his thought he scarcely makes use of the ideas of substance and of faculty in understanding human nature. The body, with the help of external things, determines what our sensations are like, and it harbors physiological structures which cause us to find activities and things of certain kinds instinctually pleasant or painful. The mind is a series of sensations and ideas with attendant feelings and emotions, held together by connections of an associative kind. Conscious elements are connected in these ways when they have been associated in past experience in certain circumstances. Under these conditions, when one element recurs in consciousness it brings its associates with it. The conditions of association are never repeated from one person to another; hence, every human being is unique.

In his *Utilitarianism* Mill holds that the best society is one in which there is the greatest amount of happiness for the greatest number of people. He understands happiness as constituted by pleasure properly proportioned between higher and lower activities, individual self-realization, and fulfillment of duty.

The chief purpose of education is to bring individuals closer to this social ideal. Careful attention to the content of the curriculum can develop the proper proportion between higher and lower desires and consequently between higher and lower pleasures. The method of instruction can ensure individual self-realization by making room for free discussion and personal discovery of truth. The most difficult task is so to associate egoistic pleasures with fulfillment of duties as to connect them in all subsequent experience. The success of this effort will

be a person who finds pleasure in doing what he ought even though doing so involves personal sacrifice. Compulsory elementary education for all and higher education for those who can benefit from it will go a long way toward a society in which happiness is at its maximum.

Mill supported his theory of education by providing a justification of the utilitarian ideal by a theory of meaning according to which free discussion of the consequences of our ideas is the best way to make their meaning clear and by a theory of knowledge according to which we can, by using his famous canons of empirical inquiry, come to be perfectly certain about the sequences of things in nature whose use enables the development of that type of character which will advance the good society.

SPENCER. Herbert Spencer (1820–1903) advanced as the objective for education a life for the individual suffused with pleasure and as full as possible. Its fullness consists in the satisfaction of five kinds of interests, listed here in order of decreasing importance: those pertaining to one's own preservation directly, to it indirectly as does making one's living to begetting and rearing a family, to political and social affairs, and to aesthetic enjoyments. The only knowledge that enables the adequate satisfaction of these interests is scientific, and education of the intellect should be concerned to propagate it rather than knowledge of the classics. Moral education should consist in allowing the natural consequences of mistakes to strengthen knowledge of how to satisfy these interests, and physical education should provide a body that would further their satisfaction. Each individual is charged with finding his own happiness, and the function of government should be merely that of preventing others from infringing upon his pursuit of it. Consequently, education itself should be privately sought and conducted rather than socially compelled and supported.

Spencer held the metaphysical view that reality is unknowable, that it manifests itself in the individual life as phenomena—some vivid and some faint—and that it is expressed in the cosmic dimension as evolution—as change from homogeneous to heterogeneous conditions through differentiation and integration. In evolution survival goes to the fittest; and the fittest are those who find the phenomenon of vivid pleasure associated with the useful and utility in those actions that bring about or constitute “complete living.” Education should assist in realizing this end that, in any case, evolution marks out for man.

DEWEY. In the work of John Dewey (1859–1952), the most influential of the twentieth-century philosophers of education, Mill's ideal for education is somewhat simplified and his doctrine of the meaning of ideas, together with Spencer's emphasis on the utility of knowledge, transformed into a criterion for distinguishing knowledge from belief. As we have seen, Mill thought that happiness consists of three distinct factors—pleasure, duty, and self-realization—and he held that education should promote the greatest amount of happiness for the largest number of people. In the place of pleasure Dewey put activity that is satisfactory to the person acting; in the place of duty, the most satisfactory activity; and in the place of self-realization, the fact that the most satisfactory activity is that which the individual most genuinely prefers. The best life, Dewey held, is one in which the most genuinely satisfactory activity is most widespread throughout society. This view depends on his view of human nature.

Human nature cannot be understood in terms of substance and faculty, for there are no such things. Consequently, there can be no single set of activities that characterize all human life, as traditional philosophers and psychologists have supposed. All human beings begin life as biological organisms, filled with unformed energy or impulse, ready to assume whatever direction experience assigns; and since each environment generates a different experience of the world—a different set of patterns of response to it—human beings vary as much as do their environments. The habits that impulse takes on sometimes cease to provide a satisfactory release for it, and in these situations intelligence enters into life to solve the problems thus created. We form hypotheses as to how impulses can be reorganized, look forward to the consequences in action, select those whose anticipation makes us prefer them, act to secure them, and thus test the hypothesis from which they were inferred. Intelligence is the master habit of readjusting others when they break down, and while it characterizes human beings, it does so in no specific way since its possession brings with it no special knowledge but only the ability to acquire any knowledge whatever by finding it in the consequences of action.

Dewey thought of society in terms of group habits. A nation is composed of political parties, religious institutions, courts, etc., and each of these is a complex habit of acting in which many people take part. A society is a set of group habits or institutions that fit together. A good society is one which, by virtue of the ways in which its

subordinate institutions fit together, enables growth in satisfaction for its citizens.

Education, according to Dewey, is the process of imposing on the impulse of infants the society or the set of group habits into which the infants are born; it is the perpetuation of society. But it is also a good deal more. For since one of the habits to be imposed upon impulse is that of acting intelligently, education must also foster the reform of society toward an ever better condition. To perpetuate intelligence is to begin its use, and the schools are thus the basis for social progress.

Since there is no single set of abilities running throughout human nature, there is no single curriculum which all should undergo. Rather, the schools should teach everything that anyone is interested in learning. Since a child can learn nothing without using his intelligence, and since this comes into play only when some habit breaks down, he should be inspired with interest in the subject matter he should learn and then made to feel some problem in not actuating that interest or habit. This method requires individual attention to discover particular interests and capabilities. Since the child learns best when he is working with others, he should be given a certain measure of participation in school affairs. In the light of these strictures on curriculum, method, and administration Dewey hoped to produce a child highly endowed with intelligence and disposed to reform society in the direction of the ideal of continually growing satisfactions.

Dewey's ethical ideal was advanced as a justification for this pedagogical objective. To be morally good is to be a set of consequences, deliberately intended and capable of satisfying impulse better than would any other set to which it is preferred; it is a preferred activity. To say that such activity satisfies impulse better than does some other which is rejected is to say that it makes possible more satisfactions in oneself and others than does the other—that it contains the possibility of greater growth. Democracy is a better society than any other because it permits more satisfaction of impulse on the part of more people than does any other. And the intelligent person leads a better individual life than does one who acts from some other habit, such as superstition, because his life contains the opportunity for more satisfactions than does that of one who is hemmed in by dogma. The criterion of growth shows that the objective of education ought to be the democratic society and the intelligent man.

Dewey's theory of knowledge lends support to the reformist tendency in education. The truth of a proposition is its utility, and to know something is to be aware of how to use the known proposition to secure some desir-

able consequence. Consequently, any genuine teaching will result, if successful, in someone's knowing how to bring about a better condition of things than existed earlier. Knowledge is knowing how to do what is useful—a view that may have resulted from Dewey's consideration of Spencer and Mill. This theory of knowledge helps to give the pragmatic flavor to Dewey's philosophy of education.

Dewey's metaphysical reflection helps in the same direction. Traditional metaphysics, such as Plato's, has erred in supposing that truth is a passive apprehension of the real and that its object is eternally separated from the vicissitudes of experience. Traditional metaphysical reflection has forgotten that to mean something is to act to secure certain consequences, and it has therefore overlooked the truth that knowing what is real consists in meaning it or in acting in a certain way to bring about certain consequences. What is real is a set of experiences, each of which is meant by some agent and all of which are connected together in one thing or event by his activity. Dewey used this notion of what is real to justify his method of learning by doing, his view of the curriculum as whatever interests of each student enable him to organize into a unity on his own, and of method as the procedure for arousing interest in organizing or reorganizing the elements of a subject matter.

In Plato's philosophy of education the supernatural realm of the Forms, by lending validity to the just person and the just state, supported the program of education. In St. Augustine's work the educational ideal was organized wholly around God and the theological view of his relation to things; a similar description applies to Thomas Aquinas's thought about education. Comenius also centered his philosophy of education around religious and theological doctrines, but his insistence on the future perfection of human life on earth and on the observation of nature in the search for effective teaching methods marks a beginning in the process of naturalizing the wholehearted supernatural Christian ideal of his predecessors.

Locke found a basis for the goal of education in God's will, but the national welfare, which God's law or the law of nature promotes, and the analysis of it partly in terms of pleasure are additional worldly conditions whose emphasis constitutes a different facet of the disintegration of the supernatural ideal. Rousseau held that God exists, but the chief justification of his objective for education—an internally peaceful life apart from society—lies not in God's having ordained it but in the notion of the general will and its absence from national institutions. Froebel, a follower of Pestalozzi and of

Rousseau, made much use of religious language, but by identifying God and the Absolute he removed philosophy of education still further than did Rousseau from a religious center.

Kant held that we cannot avoid belief in God, although he also held that the belief can have no experiential content; but this position effects his educational goal in no way. The chief moral component of that goal is the categorical imperative—a notion Kant wished to conceive wholly in logical terms. The peaceful international state is not justified by being God's will but by being the result of a social life which embodies duty and which constitutes the perfect realization of our intellectual and moral powers. Fichte found the ideal for education in a national existence that would assure Germany of a position of world importance, and Herbart held that individuals and societies that are morally worthwhile are those that satisfy the aesthetic demands of human beings. Spencer made no use of religious propositions in his philosophy of education; nor did Mill, although he regarded great religions as great works of the imagination. Dewey's ideal of a society, containing the possibility of most growth in satisfaction, is completely devoid of religious affiliation. He would probably have said that interest in achieving it can become religious—that, indeed, it should—but by "religious" he would have meant little more than enthusiastic.

The history of philosophy of education reflects a movement evident in other phases of thought—a successive contribution on the part of antiquity to the Christian ideal for transmitting culture from one generation to another and then a gradual elimination from that ideal of supernatural and Christian elements. Of course, at no time has there been a wholehearted and single-minded devotion to any ideal, and there are many who do not accept naturalism today. Nonetheless, one way of understanding the history of philosophy of education is to regard the attitude of philosophers toward the justification and explanation of educational theory as having been expressed first in Plato's classic supernaturalism, next in Augustine's Christian supernaturalism, and then as undergoing a gradual alteration into the wholly non-Christian and naturalistic view represented by John Dewey.

## PHILOSOPHY OF FILM

In one way, the philosophy of film is almost as old as the technology of film; in another way, it is a phenomenon that only emerges fully a century after the earliest screenings of films in 1895. Philosophizing about film has been with us for around a century in the form of the lively debates about the nature of the new medium that sprang up in the wake of its invention. As early as 1907 Henri Bergson had adopted the *cinematographic illusion* as a key metaphor of the scientific, and classical philosophical, conception of time and movement. And in 1916 we see the publication of the first extended philosophical treatise on film, as medium and art form, with the publication of Hugo Münsterberg's (1863–1916) *The Photoplay: A Psychological Study* (2002). So the two-way traffic between film and philosophy—the new medium as a source of philosophical insight and the application of philosophy to the problems thrown up by it—begins.

The publication of Münsterberg's study inaugurated the tradition of *film theory*—reflection on the nature of the medium of film, philosophical in all but name, but typically written by filmmakers, writers, art historians, and cultural critics rather than philosophers per se. Film theorists were preoccupied with the ontology of cinema and with the nature of representation and expression in film, and discussion of these matters typically revolved around the concept of *medium specificity*—the notion, in Münsterberg's words, that the new technology constituted a “specific form of artistic endeavor” (Münsterberg 2002, p. 65) with specific properties and potentials, which demarcated it from the established arts. Münsterberg contrasted film—the *photoplay*—with the stage play, and argued that the key to the power of film was its ability to express human intentional states, such as attention, memory, imagination, and emotions. “The close-up,” wrote Münsterberg of one of the key techniques of film, “has objectified in our world of perception our mental act of attention and by it has furnished art with a means which far transcends the power of any theater stage” (Münsterberg 2002, p. 87). This principle of contrast with established art forms, which was ubiquitous in discussions of film through at least its first half century, arose from the desire to demonstrate that film was not merely a technological curiosity, a fairground novelty, or a means of recording and reproduction that might serve to disseminate paintings or plays, but, precisely, a legitimate art form on a par with any of the established arts.

This emphasis on the specificity of film was a legacy of philosophical aesthetics and especially the attempts

from the eighteenth century onward to establish a *system of the arts*. Two of the most significant theorists, for example, filmmaker Sergei Eisenstein (1898–1948); and Rudolf Arnheim (1904–, who would become best known as a psychologist of art, made significant allusions to G. E. Lessing's (1729–1781) *Laocoön: An Essay on the Limits of Painting and Poetry* (1766). Lessing had argued that poetry and painting each have their characteristic domains of representation—the temporal and the spatial—and corresponding limits to what they can effectively represent. In his 1938 essay “A New *Laocoön*,” Arnheim follows Lessing's example by arguing that theater and cinema, similarly, need to be understood as distinct media with distinct essential features and thus different aesthetic advantages and deficits. Without denying the existence of ‘composite’ artistic forms—such as opera, in which drama and music are combined—Arnheim argues that, ultimately, theatre is the art of dialogue, while cinema is the art of the moving visual image. Formulating his ideas in the wake of the introduction of the *talkie* in the late 1920s, Arnheim argued that the addition of speech to the movies was a kind of contamination or corruption of the medium proper.

Eisenstein developed the notion of *montage*, which he regarded as the definitive feature of the art of film, through both his filmmaking practice and his theoretical writings, as well as in dialogue with other major filmmakers and theorists of the period—including Lev Kuleshov (1899–1970), V. I. Pudovkin (1893–1953), Dziga Vertov (1896–1954), and Béla Balázs (1884–1949). Initially referring narrowly to the editing of shots, Eisenstein widened the reference of montage to include any technique that involved the interaction of more basic elements: In this sense, one can speak of montage within a shot or between whole sections of a film as much as the montage between two shots literally cut together.

Eisenstein's essay on the *Laocoön* makes reference to Lessing's work in a manner quite different from Arnheim. Where Arnheim draws an analogy between painting and poetry, on the one hand, and cinema and theater, on the other, for Eisenstein, it is the substance of Lessing's claims about painting and poetry and the relationship of cinema to these two forms that is at stake. Cinema—or more particularly, montage—synthesizes the temporality of poetry with the spatiality of painting. Eisenstein ranges widely and generously across literature, painting, theater, and music, and where Arnheim and Münsterberg are concerned to distinguish the characteristics of theater and cinema, Eisenstein more often than not discerns protocinematic techniques in these other art forms. The

specificity of cinema thus emerges for Eisenstein more in terms of the realization and culmination of techniques evident in older media and art forms rather than in the addition of a new medium of art, which stands alongside the traditional forms.

Münsterberg, Eisenstein, and Arnheim were all rooted in the era of *silent* cinema. André Bazin (1918–1958) is widely regarded as the first major theorist of the sound era, and while he, like his precursors, was concerned with the specificity of cinema and often explored the nature of cinema by comparative examination of other media, his perspective on film marks a departure from those theories emerging from the silent era. In “The Ontology of the Photographic Image” (1945), Bazin argues that what is distinctive of and crucial to film is its ability to *capture* the phenomenal world, in the most literal sense; a film is like a fingerprint of reality. Bazin does not wish to deny that films are, like all works of art, the products of those who design them. Greta Garbo (1905–1990) may have been carefully groomed and lit for the camera, but it is still, in a strong sense, the real Garbo that we see in the film. Thus, in contrast to Münsterberg’s focus on the rendering of intentional states in films, the distinctive capacity of film as an art for Bazin lies in the way in which human intentionality is bypassed at a certain vital moment in the production of a film, allowing reality to impress itself upon the film unmediated by human intentions or interests.

In *Image and Mind*, Gregory Currie terms this dimension of film and photography “natural counterfactual dependence,” which contrasts with the “intentional counterfactual dependence” of painting (Currie 1995, p. 55): The properties of a photograph or a film depend directly on visible properties of the scene before the camera whereas the properties of a painting of the same scene are “mediated by the beliefs of the artist” (Currie 1995, p. 54). And this facet of film is something that filmmakers can facilitate, as in the practice of location shooting where the artifice of studio set construction and the control that such artifice brings with it is foregone in favor of the relative unruliness of real spaces. Such techniques bring out the special kind of realism that (on this account) is inherent in the medium as such.

### CONTEMPORARY PHILOSOPHY OF FILM AND THE PROBLEM OF SPECIFICITY

Given the existence of a rich tradition of film theory—the surface of which is only scratched here—in what sense is it true to say, that the philosophy of film only coalesced as

a field of debate a century after the invention of the medium? Following Bergson, there have been other important contributions by professional philosophers, including Maurice Merleau-Ponty (1908–1961), Bazin’s contemporary and an influence upon him. The American philosopher Stanley Cavell has made a distinctive contribution (to which we will return) by developing and elaborating an ontology of cinema incorporating Bazin’s key insights. And there have been other isolated philosophical essays on film. But it is not until the 1990s that a continuous debate about film emerges among professional philosophers, eventually establishing itself as a subdomain within aesthetics and the philosophy of art—a field of debate sufficiently developed to warrant a separate entry in this encyclopedia. Two rather divergent areas of debate have emerged that, for good or ill, generally fall in line with the division between modern analytic and Continental philosophy. In relation to the latter, there is a substantial literature around the work of Gilles Deleuze. Alongside the literature on and by Deleuze stands work by other contemporary Continental philosophers, such as Jean-François Lyotard, Paul Virilio (1932–) and Slavoj Žižek (1949–). Through much of this work, the influence of psychoanalysis is evident.

Deleuze’s approach to cinema, as advanced in his two-volume *Cinema* (1992), is based on a fundamental reevaluation of Bergson’s remarks on the relationship between cinema, movement, and time. In *Creative Evolution* (1907), Bergson argued that both classical philosophical and modern scientific conceptions of movement in fact eliminated movement as an authentic phenomenon by representing motion as a series of immobile instants strung together. The mechanism of cinema realized this conception in literal terms: a succession of still frames which, when projected in sufficiently quick succession, generate an impression or illusion of movement. Deleuze argues, however, that the cinema also enables, and is a part of, the recognition of movement as an irreducible phenomenon. And as cinema evolves over the course of the twentieth century, it provides us not only with an image of movement but one of time—in the Bergsonian sense of *duration* of time as a continuous, experiential whole.

The conception of the *philosophy of film*, and of philosophy more broadly embodied by Deleuze’s approach to cinema, is—at least on its own understanding—in marked contrast to more widely accepted notions of philosophy. Rejecting the idea that the philosophy of film *reflects on* the phenomenon of film, Deleuze argues instead that the philosophy of film—like philosophy

more generally—is a creative activity and in this sense is parallel to the activity of filmmaking rather than standing above or outside it. Where filmmakers create through the medium of cinema, in the form of sequences of movement and duration, philosophers create concepts. Deleuze is thus eager not only to play up the creative character of philosophy as he understands it but to emphasize the conceptual value of filmmaking.

The growing literature on cinema within Anglo-American aesthetics comprises the second major branch of contemporary philosophy of film. The main intellectual reference points here are analytic philosophy of mind and language, cognitive psychology, and Wittgenstein. The two contemporary conversations on the philosophy of film are largely separate even if the participants in each can hear the other conversation and occasionally might even talk to each other. There are certainly points of connection: Deleuze's claim that the cinema provides us with an image of movement resonates with the debate in analytic philosophy of film concerning the sense in which the motion we see in a film is real (rather than merely illusory) while his claim that the postwar era witnesses the flourishing of a cinema that privileges time rather than movement echoes the claim within Anglo-American film theory that much art cinema liberates time and space from their traditional subordination to the demands of narrative.

Among the philosophers who have helped to establish the analytic strand of the philosophy of film, none have contributed more than Noël Carroll (1947–); and among the many orthodoxies that Carroll has challenged is the very idea of medium specificity.

In “Forget the Medium!” (2003), Carroll questions both the coherence of the concept *the* medium of film as well as the prescriptivism that typically follows on from the positing of specific qualities that are thought to be distinctive of the medium. He points out that if we think of the medium in terms of the tools and materials of an artistic practice, few, if any, art forms will be defined by a single, fixed medium of expression (and, more radically, he suggests that some art forms may not have *a medium* at all). *Painting* really encompasses a whole range of possible means of marking a surface in order to create a visual design, just as the creation of music encompasses a vast array of instruments for shaping sound. We can, however, understand why earlier film theorists may have focused on the idea of a new medium since the technology of film ushered in a type of depiction that was different in kind, and not merely in degree, from anything that preceded it: moving, photographic depiction. The devel-

opments in the basic technology of film were, for the first thirty years of cinema, all refinements of this technology, and so it could appear to have an underlying stability and unity that made it apt to think of in terms of a single medium.

Later technological developments, however, begin to strain the concept of a single and stable medium—Arnheim's alarm at the coming of synchronous sound was shared by many filmmakers and theorists of the time. The advent of television and video raises equally difficult questions—if film is a unique and distinctive medium, should we posit still another new medium of the electronic moving image? And still another one for the digital moving image? Many have answered these questions in the affirmative, erecting boundaries between the various types of moving image. The emergence of new moving image technologies has often led to attempts at distinguishing the specificity of each of these media—such specificity usually taking account not only of the material nature of the technology but of its institutional and social deployment: Thus, television is said to have its own specificity, distinct from that of film, not only because of the electronic basis of broadcasting but the corporate nature of most television output; its continuous *flow*; and the small-screen, domestic context of television viewing. Video, in turn, has been defined dialectically against television, focussing on the portability, immediacy, capacity for instant replay and live feedback, and nonnarrative experimentation characterizing video art and activist video.

Carroll, however, contends that the positing of a succession of media *specificities* only compounds the error of thinking of film as a medium and proposes, instead, that we engage in some conceptual pruning and relandscape-ing. In place of the medium of film, we should think in terms of the *art form of the moving image*. This superordinate category captures what was new when cinema first emerged and what continues to mark works of this type off from paintings, photographs, operas, novels, and so forth, but it does so without tying it to any particular technology.

From another angle, the emergence of computer-generated imagery as a pervasive feature of mainstream narrative filmmaking has led some theorists to argue that there really was something importantly distinctive about the prototypical live action, photographic film characteristic of the first century of cinema but that that distinctiveness is now disappearing. As the computerized rendering of moving picture settings and characters becomes commonplace—whether through the modifica-

tion of a live action source or through digital creation from the ground up—the Bazinian idea of film as an imprint of reality is weakened. As we watch *The Lord of the Rings*, we really cannot be sure which parts of the image were created through the act of photographic recording (of a set, a real location, a performer) and which were generated digitally; all we can be confident of is that the film as a whole represents a blending of these methods. As a consequence, according to Lev Manovich (1960–) in *The Language of New Media*: “cinema can no longer be clearly distinguished from animation.” Far from being distinct from painting, by virtue of the direct causal relationship between image and referent, cinema in the digital age has become, instead, “a subgenre of painting” (Manovich, p. 295). Manovich’s view of digital media forms the mirror image of and complement to the realist ontology of film favored by Currie, for whom both animation and abstract film are, at best, marginal instances of film.

## OTHER DEBATES

So we find in contemporary philosophy of film a continued debate about the very idea of *film*, as a unified phenomenon and coherent field of study. However, there are a multitude of other debates underway, intersecting at various angles with arguments about the ontology of the medium. The themes and questions being addressed include the following:

(1) *The perception of moving images*. What do we see when we look at a moving photographic image? Do we see a representation? Or is such a moving image *transparent*, in the sense that we see the objects depicted through the moving image, as Kendall Walton (1939–) has argued? Do we *imagine seeing* that which is depicted, or do we engage in *perceptual imagining*, as Currie contends, in which we imagine that certain things are true, based on the moving images we see, but we do not imagine seeing those things? To what extent is our ability to comprehend moving pictures dependent on certain natural perceptual capacities and to what extent on learned conventions?

(2) *Identification, emotional response and ethics*. In what sense and to what extent might we be said to *identify* with the characters, or the camera, when we watch a film? Do we typically empathize or sympathize with characters? Are we subject, in any sense, to an *illusion*? Are our emotional responses to film largely irrational and paradoxical, or is there a kind of rationality to them? Do these emotions have a sig-

nificant relationship to the ethical value of cinema—its ability, in small or large ways, either to corrupt or to educate? Does the medium of film, or particular forms of filmmaking, embody ideological values and beliefs, such as those bearing on gender or ethnic identity?

(3) *Authorship, intention, and expression*. Given the collective basis of almost all film production, can a film be *authored* in just the same way as a poem or a painting? Does the fact of multiple authorship affect the expressive capacities of film, relative to other art forms, or the way in which we interpret and appreciate films?.

(4) *Fiction and nonfiction*. How does the psychology of watching fiction differ from the psychology of watching documentaries? Does a filmic fiction share more with a novel than a documentary film; does a documentary share more with written history or reportage than it does with a fiction film? Is there a sense in which all films have a documentary dimension?.

## FILM AS PHILOSOPHY

One important question that has become a focus of debate asks: To what extent might film be a vehicle of philosophy as opposed to its subject? Can film serve as a distinct medium through which the act of philosophy might be undertaken as opposed to a phenomenon to which philosophy is applied? Can film philosophize? Eisenstein was one of the most forthright and ambitious defenders of the idea that film might act *as* philosophy, with plans for a film version of Karl Marx’s *Das Kapital* and a host of arguments in support of *intellectual cinema*. But Eisenstein was not alone. According to Deleuze, the cinema creates new concepts by its own distinctive means. And Cavell has argued that certain key cinematic genres, such as the “Comedy of Remarriage” discussed in *Pursuits of Happiness* (1981), give expression to the philosophical problem of skepticism, insofar as they dramatize, within the intimate arena of romance, the difficulty of knowing the thoughts and feelings of others. Moreover, in the hands of some writers, the *film as philosophy* thesis is very much akin to the treatment of literature as a kind of philosophy, a proposal advanced most explicitly by Martha Nussbaum.

To a considerable degree, the plausibility of the proposal depends on the conception of philosophy that is assumed within it; so the debate is ultimately driven onto the terrain of metaphilosophy. On the one hand, to the

extent that one conceives of philosophy as a professional discipline whose central goals are the posing of questions and the making of arguments in a reasonably robust and formalized sense, then the idea that film might act as an effective medium for such goals looks strained. On the other hand, to the extent that one thinks of philosophy more broadly as a form of self-conscious reflection on any aspect of life that we usually accept unthinkingly, then film—along with art in general—looks much more promising as a means of engaging in such reflection and thus as a form that philosophy might take.

Among the proponents of the film as philosophy thesis are Stephen Mulhall (1962–) and Thomas Wartenberg. Where Cavell focusses on *classical Hollywood* films (especially screwball comedies and melodramas), Mulhall has developed and extended Cavell's approach to encompass contemporary Hollywood filmmaking through studies of the *Alien* tetralogy and the *Mission: Impossible* films. For Mulhall the series of *Alien* films embody philosophical reflection not only on the overt themes of the films, such as human embodiment and the process of reproduction, but on various aspects of the nature of commercial filmmaking itself, including stardom, authorship, and sequelism. Mulhall is emphatic about the strength of his claims, stating that certain films should be seen “as thinking seriously and systematically about [philosophical views and arguments] in just the ways that philosophers do” (Mulhall 2002, p. 2).

Wartenberg has emphasized the various ways in which films might make genuine contributions to philosophy even if they cannot be construed as making arguments in any conventional sense, including the creation of thought experiments that challenge habitual assumptions and the provision of illustrations that are integral to a philosophical claim, and thus cannot be discarded without damage to the claim in question. Wartenberg has argued that the first *Matrix* film engages us philosophically by creating a thought experiment resembling René Descartes's image of the evil demon, challenging our confidence in the knowledge we gain from sense experience. In other work Wartenberg has emphasized the insights that films may proffer on the terrain of social, political, and moral philosophy. Other authors have made parallel claims about the philosophical significance of various art and avant-garde films, but what unites Cavell, Mulhall, and Wartenberg and makes them distinctive is their emphasis on popular filmmaking, the type of filmmaking that might seem the least congenial—and thus offering the greatest challenge—to the film as philosophy hypothesis.

Counterarguments to these proposals stress the special nature of philosophical knowledge (in normative, if not descriptive terms); the central role of explicit reasoning and argument within it; and the distinctness of philosophy from cognition, self-reflection, and knowledge considered more generally. Paisley Livingston (1951–) has argued that proponents of the *bold* version of the thesis, for whom films can make original philosophical contributions exploiting the specific properties of the medium, are faced with a disabling dilemma: If the contribution can be paraphrased, then any uniqueness premised on medium specificity disappears; if it cannot be paraphrased, then it is difficult to see how a contribution is being made to philosophy proper, when conceived as a discursive discipline. Murray Smith (1962–) has made the complementary point that the *nonparaphrasability* of art is one of its most significant values, and one that brings it into tension with the widely accepted philosophical goals of clarity and explicitness.

Wherever one stands on this issue, and on the question of specificity, the emergence of a debate on the idea of film as philosophy, alongside the diversity of other questions and debates described here, testifies to the seriousness with which the moving image is now taken by philosophers and the consolidation of the philosophy of film at the outset of cinema's second century.

## PHILOSOPHY OF HISTORY

The term “philosophy of history” probably covers a larger variety of endeavors than similar terms such as “philosophy of law” or “philosophy of science.” It is hard to bring under one definition the many philosophical questions and responses that are concerned with history. One reason for this, which has long been acknowledged, is that the English term “history,” like its cognates in many Western languages (*histoire, Geschichte*), is normally used to refer to two distinct, though related, things. On the one hand it refers to the temporal progression of large-scale human events, primarily but not exclusively in the past; on the other hand, “history” refers to the discipline or inquiry in which knowledge of the human past is acquired or sought. Thus “philosophy of history” can mean philosophical reflection on the historical process itself, or it can mean philosophical reflection on the knowledge we have of the historical process. Philosophers have done both sorts of things, and this has led to a distinction between “substantive” (or sometimes “speculative”) and “critical” (or “analytical”) philosophy of history. The first is usually considered part of metaphysics, perhaps analogous to the “philosophy of nature,” whereas the second is seen as epistemology, as in the “philosophy of science.” While this distinction has been useful, it becomes blurred when we find some philosophers doing a mixture of both, and others, while certainly reflecting philosophically on history, doing neither. This entry begins with the standard distinction, only to see it lose some of its usefulness in the course of the exposition.

### 1. “SUBSTANTIVE” PHILOSOPHY OF HISTORY: PHILOSOPHICAL REFLECTION ON THE HISTORICAL PROCESS

The term “philosophy of history” originates with Voltaire in the 1760s, but it is most closely associated with German philosophers of the Enlightenment and post-Enlightenment periods: Kant, Herder, Hegel, and Marx. Hegel’s “Lectures on the Philosophy of History,” delivered in the 1820s and published shortly after his death, have dominated the discussion. The lectures represent Hegel at the height of his influence, and their relatively brief (less than a hundred pages) introduction is as clear and straightforward as it is comprehensive. Soon translated into other languages (e.g., English in 1857), it is probably the most widely read of Hegel’s works. So great was Hegel’s impact that his approach to history became paradigmatic not only for many who followed his lead, but

also for those who later attacked the very project of the philosophy of history. What is more, philosophers who reflected on history before Hegel are often thought to have been engaged in the same kind of inquiry he was. But this is anachronistic, and misleading. The substantive philosophy of history is often described, in keeping with Hegel, as the search for the meaning and purpose of world history, and for the force that drives history toward its goal. While this describes many instances of reflection on the historical process, it is a simplification and is not necessarily an apt description of philosophical thought about history prior to Hegel. The most general description of the substantive philosophy of history is that the philosopher tries to “make sense” of the historical process, usually in the face of evidence to the contrary. But the “sense” that the philosopher seeks varies considerably: sometimes it is rational sense, sometimes moral sense, sometimes religious sense.

Philosophical reflection on the historical process seems to originate in early Christian philosophy, which is in turn indebted to the Jewish conception of time. The Hebrew scriptures introduce historical time into a world dominated by cyclical and ahistorical conceptions of time. Indian, Persian, and Greek thought are based on unchanging patterns and eternal recurrence, in which individual events, both natural and human, get whatever significance they have from reflecting, imitating, or instantiating these timeless forms. The sequence of individual events is not “going anywhere.” Their essence, what gives them their being, lies outside of time altogether. In spite of the compelling historical accounts left by Herodotus and Thucydides, for Greek philosophers even political arrangements—constitutions such as aristocracy, monarchy, democracy—are portrayed, in the classical texts of Plato and Aristotle, for example, as following cyclical patterns of rise, fall and repetition.

By contrast, for the ancient Jews, human events—both political and religious—get their significance not from a “vertical” and imitative relation to eternal patterns, but from a “horizontal” relation backward and forward to other events in real time: backwards to creation, Adam’s fall, God’s covenant with his people, its captivity, exile, rulers, and heroes, and so on; forward to the redemption of God’s people with the coming of the Messiah. Time is the story of a people’s progress from creation through perils, dangers, and risks to final salvation. Christianity takes up this historical conception of time and intensifies it, first by affirming the coming of the Messiah as a central, real historical event, in the *middle* of history, as it were, pointing ahead to a final salvation in

the second coming; and second, by extending the promise of salvation to all mankind through a progressive spread and universal triumph of Christianity. Creation, the fall, incarnation, and last judgment are unique, unrepeatable occurrences, and individual events and deeds, both human and divine, are arrayed along a line of time that extends from beginning to end. Given this conception, events are coming from somewhere and are going somewhere in time. Origin and destiny give meaning to human events and actions.

This conception of historical time is not itself a philosophy of history but a cultural and religious worldview. Philosophical reflection begins when this conception generates problems, as it did in the age of Augustine. This philosopher struggled with problems of good and evil, freedom and divine justice, responsibility and punishment. History entered the picture when these concepts were projected onto the stage of the large-scale social events of his own time. The conversion of the Roman Empire under Constantine (323 CE) was seen by early Christian theologians as the vindication of their religion and the harbinger of its eventual triumph throughout the world. During Augustine’s time (354–430) the empire was under attack by barbarians, Rome itself had been invaded, and the empire seemed in danger of destruction. Pagans took this as a sign that Christianity was responsible for the demise of the empire, and Christians wondered why God seemed to be punishing Rome rather than rewarding it for its conversion and crowning it with glory. Here it was historical developments, rather than just evil deeds and events, that seemed at odds with religious doctrine, and this constituted the problem Augustine felt the need to solve, addressing both pagan and Christian audiences.

In response, Augustine denied that salvation and divine justice were to be sought in human secular history or its political or even religious institutions. Instead, they were to be found in the City of God, whose citizens have their real life outside secular time. Augustine had already considered the notion of time as limited by eternity in trying to reconcile free will and God’s foreknowledge. Augustine’s response to the problem of history was to seek the meaning and purpose of history not in history itself, but rather outside of time altogether. In Augustine’s thought, the Platonic conception of the timeless realm triumphs over the religious view of history handed down from Judaism and Christianity. As often occurs in the history of Christian thought, Greek philosophy comes to the rescue of the religious worldview. At the same time Augustine inaugurates the tradition of Christian apolo-

getics, later called theodicy: justifying God's ways to humans. Because of the presuppositions that frame Augustine's whole discussion, his project might best be called a theology of history.

Two things should be noted about history as Augustine conceives it: First, as we have noted, its purpose and goal lie not in historical time but outside and beyond it; second, in spite of Augustine's emphasis on human freedom, the driving force behind historical change, what links human events to their ultimate purpose, is the divine will. These two features of history remained more or less constant in the Christian tradition until the time of the enlightenment. Jacques Bénigne Bossuet's *Discourse on Universal History* (1681) still shares in this conception. He sees the world in apparent moral disorder, with the authority of the church being challenged, but assures his readers of the guidance of divine providence and the ultimate salvation of the faithful.

Giambattista Vico, in the *New Science* (1725–1730), also appeals to the idea of providence, but his approach to history is more novel and more modern, because he thinks of providence as embodied in rational, developmental laws rather than acts of divine intervention. He also believes that providence uses narrow human self-interest and self-love to further its own higher ends, a concept usually seen as foreshadowing Hegel's idea of the cunning of reason. Vico is also known for dignifying historical knowledge, in the face of both ancient and modern disdain for it when compared to our knowledge of nature. Because human beings make history through their own acts, Vico believes, they are capable of knowing it. Because God creates nature, only he can truly know it. In this Vico challenges his contemporaries, the Cartesian defenders of the new mathematical science of nature as the paradigm for all knowledge.

In the French Enlightenment, humans take center stage and their reason makes them capable of shaping their own destinies. Human events come under calculation and control. The future is no longer something to be prophesied or predicted, but something to be produced. The legitimacy of rulers can be questioned, and the people can overthrow them. History begins to look like a progress from a past of darkness and superstition into the light of reason and human self-determination. The purpose and goal of history now lies not outside and beyond it, but within it at some attainable point in the future. It is the result of human rather than divine agency, and it is now conceived not as salvation but as emancipation.

Even though Voltaire introduces the term "philosophy of history" it is possible to argue that his view of his-

tory, shared by the enlightenment *philosophes* and the revolutionaries of the eighteenth century, was not so much a philosophical reflection on history but again, like the religion of the Jews and early Christians, an emerging political and cultural worldview. The philosophy of history begins, as before, when this worldview generates problems. The late enlightenment period produced a vast new literature of discovery and travel, which led among other things to the beginnings of history as something like an academic discipline with critical methods and justifiable assertions. While this trend was not completed until the nineteenth century, even its beginnings allowed for a new distinction between our warranted knowledge of the past and our beliefs about history's overall direction and goal.

Thus Kant's forays into the philosophy of history tend to raise critical questions about what the enlightenment philosophers never doubted. A late text (1798) bears the title "An old question raised again: is the human race constantly progressing?" But even his earlier essay, "Idea for a Universal History from a Cosmopolitan Point of View" (1784), his major contribution to the philosophy of history, argues only for the limited thesis that the course of past history "permits us to hope" for "a steady and progressive though slow evolution" toward a better state for mankind (1963, p. 11). Kant wants to share the enlightenment point of view, just as he wants to endorse the claims of natural theology, but his critical reason forces him to limit its pretensions. As should be expected when reading Kant, of course, in no way is the idea of divine providence taken for granted. Progress in history, should it be found, would be toward "the achievement of a universal civic society which administers laws among men" (p. 16), which is "the most difficult and the last [problem] to be solved by mankind" (p. 17). He discusses at some lengths the difficulties of such an achievement, asserting as he does elsewhere that it would require solving "the problem of a lawful external relation among states" (p. 18). This is the greatest difficulty of all, because we can see the same antagonism among states as among individuals, which has led again and again to war. But after "devastations, revolutions, and even complete exhaustion," nature brings states to the realization that they must move "from the lawless condition of savages into a league of nations" (p. 19).

By the time he reaches this point the status of Kant's discourse on history should be clear to the reader. He is not making claims about the actual course of history; rather, he is outlining the ideal conditions under which alone, he thinks, history could exhibit any progress.

Because these conditions are in his day far from having been realized, Kant's claims are clearly prescriptive and moral in character. Thus he can assure practicing historians that he is making no attempt to displace their work, because he is propounding an Idea of world history based upon an *a priori* principle (p. 25), an "[I]dea of how the course of the world must be if it is to lead to certain rational ends" (p. 24).

By using the term "Idea," a *terminus technicus* from the *Critique of Pure Reason*, which the translators signal by means of capitalization, Kant indicates a rational concept whose empirical reality not only is not, but, according to the *Critique*, cannot be exhibited in experience. But, like human freedom itself, neither can its possibility be empirically denied. Thus the course of history does not provide evidence that the "civic union of the human race" will ever be achieved, but neither does it prove that it never will be. Its realization must at least be regarded as possible, and the Idea that we have of it may help bring it to pass (p. 24). Kant is telling us not where history is going but where it *ought* to be going. Only in this minimal sense can philosophy help "make sense" of history, namely by articulating the "cosmopolitan standpoint" from which alone it can be freed from its apparent moral chaos. And by showing that its moral realization is at least possible, it "permits us to hope" for a better future. Kant's concept of hope is usually associated with his philosophy of religion and refers to the individual's hope for salvation in the world to come. But here he rationally justifies hope for a better future for mankind on earth.

In *Idea for a Universal History*, the concepts of a universal civic society, or league of nations, and of history as progressing toward it, legitimize certain political choices. They are Ideas capable of guiding our action in the social sphere. Kant is anticipating the project of expanding his ethical principles, with such notions as a kingdom of ends, into a political theory. Ethics and politics alike belong to Kant's practical philosophy, not his theoretical philosophy. Their central concern is not with what is the case but with what we ought to do. And the same is true of his philosophy of history.

Johann Gottfried von Herder, a younger contemporary of Kant's, is another German philosopher who reacts critically to the enlightenment's views of history. In his *Ideen zur Philosophie der Geschichte der Menschheit* (1784–1791), he undertakes a universal history, and for him, as for Voltaire, this means expanding the traditional scope of history to include non-European peoples. But Herder takes this insight in a different direction. While the thinkers of the French Enlightenment sought proof of

the universality of human reason, Herder by contrast is struck by the diversity and particularity of human nature, embodied in distinct peoples and cultures. Rejecting the Enlightenment's emphasis on reason, legislation and science, Herder sees human nature in the expressions of feeling, such as art, music, poetry, and custom.

The Enlightenment philosophers saw the growth of scientific rationality expanding to the political realm and imagined a future in which reason triumphed over the dark forces of superstition and emotion. Herder, with his emphasis on diversity and culture, was less convinced that history was moving in any unified direction, much less a progressive one. True, his devout Protestantism kept him from embracing the complete cultural relativism that many would later draw from his work. But in contrast to Kant, whose sympathies still lie with the Enlightenment, Herder becomes one of the first great figures of the Romantic movement that grew up in opposition to it.

It is against this background of the Enlightenment and its German critics that Hegel's classic text must be understood. He begins by distinguishing a "philosophische Weltgeschichte" from history proper; philosophy, he says, has "thoughts of its own," *a priori* thoughts, to bring to the study of history (1988, p. 10). But the "only" thought that philosophy brings to the study of history is that of reason—"that reason rules the world," and thus that world history like everything else can be seen as a rational or reasonable (*vernünftig*) affair (p. 12). Reason not only sets the goal for history but also governs the realization of that goal. Hegel did not invent this idea, he reminds us; the idea that reason rules the world is that of Anaxagoras, and it has also been expressed in the idea of divine providence. This too suggests a rational plan, God's plan, but providence is usually portrayed as being hidden from us. Unwilling to settle for pious ignorance, Hegel believes that the rationality of providence can be known and explained. If we take seriously the idea of providence, the demonstration of its rationality would amount to a theodicy or "justification of God" (p. 18).

The embodiment of reason is spirit (*Geist*), both in individuals and in peoples, whose nature is to be conscious and self-conscious, and whose actualization is to be autonomous and self-sufficient, that is, to be free. But this actualization is a temporal process, and that process is history. Spirit actualizes itself and achieves freedom through history, drawing its energy from human passions and intentions; but the result of this process is often at odds with the actual intentions of the individuals and peoples involved. It is here that Hegel's speaks of the "cunning of reason" (p. 35), because reason achieves ends

of its own by using the ends of others. In history, it is only when individuals and peoples organize themselves into states that freedom can finally be truly actualized. It is here, in law, the ethical life of the community and political order, not in the mere absence of constraint, that the “positive reality and satisfaction of freedom” are to be found (p. 41).

The actual course of history can be seen as the display of human perfectibility leading toward the realization of freedom. This pathway is not a smooth one, however, but consists in the spirit’s “hard and endless struggle against itself.” Spirit hides its own nature from itself, and is even “proud and full of enjoyment in this self-estrangement” (p. 59). Individuals and peoples struggle against each other, and many morally good and virtuous people suffer unjustly. But history moves on a different plane, and here the acts of individuals, especially those of the great figures of history, are not to be judged by moral standards. It is the spirit of peoples, not individuals, that are the agents of history, but these, “progressing in a necessary series of stages, are themselves only phases of the one universal Spirit: through them, that World Spirit elevates and completes itself in history, into a self-comprehending *totality*” (p. 82). The self-comprehension of world spirit is philosophy itself.

In several places Hegel presents in the broadest outlines the necessary stages through which the world spirit has passed on its path toward the realization of freedom. In the ancient “oriental” world only one—the emperor or tyrant—is free. In the Greek and Roman worlds only *some* persons are free. It was first the “Germanic peoples, through Christianity, who came to the awareness that every human is free by virtue of being human” (p. 21). The realization of freedom is the goal that gives meaning to what happens in history, and this realization takes place within history itself, not beyond it. Moreover, it has occurred or is occurring in “our world,” “our time” (Hegel 1956, p.524).

Karl Marx is usually seen as a continuation of the classical period of the philosophy of history. Marx admitted some indebtedness to Hegel, but thought of himself as the anti-Hegel, whose idealism “stands on its head” and “must be turned right side up again.” More important, Marx rejected not only Hegel, and Hegel’s philosophy of history, but academic philosophy as a whole, wanting to be read and understood strictly as a social theorist and reformer. Yet it seems beyond doubt that Marx expounds a philosophy of history in the “classical” sense. Even understood as a blueprint for reform or revolution, his work is founded on and cannot be understood apart from

an account of history. This account is summarized neatly by his collaborator, Friedrich Engels, in his preface to the 1888 English edition of the *Communist Manifesto*, in which he states what he calls the “fundamental proposition of Marxism.” “In every historical epoch,” Engels writes, “the prevailing mode of economic production and exchange and the social organization necessarily following from it” form the basis of that epoch. “Consequently the whole history of mankind ... has been a history of class struggles, contests between exploiting and exploited, ruling and oppressed classes.” The outcome of this history is that “nowadays, a stage has been reached” where the emancipation of the exploited and oppressed class—the proletariat—from the exploiting and ruling class—the bourgeoisie—would entail “at the same time, and once and for all, emancipating society at large from all exploitation, oppression, class distinctions, and class struggles” (Marx and Engels 1998, p. 48). The notion of history as class struggle recalls Hegel’s description of the spirit’s “hard and endless struggle against itself,” its “self-estrangement” in which it “must overcome itself as its own truly hostile hindrance” (Hegel 1988, p. 59). In the background of these descriptions is Hegel’s famous account in his *Phenomenology of Spirit* of the struggle between master and servant, an account that can be interpreted in economic and material terms, and which is certainly an account of exploitation and oppression. As Marx admits, this is the origin of a “dialectic” account of the movement of history, which Marx appropriates for his own purposes.

Different as they are from each other to their adherents, Hegel and Marx both reveal their indebtedness to the Enlightenment. For both, it is human affairs and strivings, not divine actions, that drive history, and its purpose or culmination, conceived not as salvation but emancipation, lies within history, not outside or beyond it. Yet unlike the Enlightenment idea of progress, their conception seems to require an end of history. Hegel often speaks as if it has already arrived, and Marx projects it into the near future. Both are unclear what happens after that.

This was but one of many conceptual problems that led to widespread criticism of Hegel’s and Marx’s philosophies of history and to a general mistrust of the whole project. The idea of attributing a purpose or goal to history as a whole became suspect. Hegel’s speculative idealism fell on hard times, and his philosophy of history was seen as the worst manifestation of its extravagant pretensions. It was also read by many, rightly or wrongly, as a glorification of the Prussian monarchy as the culmi-

nation of history. Marx's apparent belief in an inevitable outcome of history was not widely accepted by philosophers, even those sympathetic to his proposed political and social reforms; only the official orthodoxy of the Soviet Union and other communist states took it seriously. Sweeping treatments of history as a whole and the rise and fall of civilizations, such as Oswald Spengler's *Decline of the West* (1918–1922) and Arnold Toynbee's *A Study of History* (1934–1954), were reviewed in the popular press, but not taken seriously by academic philosophers.

The criticism of the philosophy of history reached a high point in the years following World War II and came from different directions. Karl Loewith (*Meaning in History*, 1949) argued that the classical philosophy of history was a secularized version of the Christian story of salvation, that is, religion in disguise. Karl Popper (*The Poverty of Historicism*, 1957) denounced it as pseudoscience. Both studies linked it to the development of twentieth-century totalitarianism. Positivists and analytic philosophers rejected it as an incoherent and unrealizable philosophical project.

Something resembling the classical philosophy of history stayed alive, in milder form, in European and North American Marxism. With the discovery and publication of Marx's early writings in the early 1930s and after, a fuller picture emerged of Marx the thinker, different from the Marx of Soviet propaganda. In particular, the full sense of Marx's indebtedness to Hegel, and his connection to the young, "left" Hegelians became clearer, something that had already been argued by Georg Lukacs in his *History and Class Consciousness* (1923). Marx also influenced the work of many historians, especially in Britain and France. Thus in Western eyes Marx took his place belatedly as a "respectable" philosopher in the Hegelian and post-Hegelian tradition, a development Marx himself would probably not have welcomed. This in turn led to a new assessment of Hegel himself in light of his influence on Marx.

Thus a tendency developed in the 1930s and after to read Hegel through the eyes of Marx and vice versa. This happened in France under the influence of Alexandre Kojève and Jean Hyppolite, and in Germany through the "Frankfurt School" of Herbert Marcuse, Max Horkheimer, and Theodore Adorno. In this tradition Hegel and Marx were read not so much as making metaphysical or quasi-scientific claims about the direction or outcome of history as offering blueprints for political action and social analysis. Like Kant, they were outlining

the conditions under which history *could* make sense, rather than asserting that it does.

Western Marxism remained strong in Europe and later in America through the Cold War period, but by the 1980s French philosophers began to turn away. The "grand narratives" of both Marxism and the capitalist idea of progress were seen by such thinkers as Jean-Francois Lyotard and Michel Foucault as belonging to a period of "modernity" that was coming to an end and giving way to a "postmodern" age. These and other philosophers, who came to be identified with the "post-moderns" label, thought of themselves as continuing the attack on the substantive philosophy of history that had begun a century before, but broadening it to include the Enlightenment idea of human progress, linked to science and technology, still held by many in the West. Defenders of the Enlightenment project, such as Jürgen Habermas, feared that this wholesale rejection of the Enlightenment was a new kind of antirationalism and a rejection of important human values. The postmoderns tend to see in any overarching or "totalizing" set of values the specter of oppression.

These debates have generally not been interpreted as continuations of the classical philosophy of history, but both sides can be seen as thinking about history and its direction in broad terms. And both sides share the ultimate value of emancipation as the key to progress in history. Though the explicit pursuit of questions in the style of the classical philosophy of history is rare, there have been recent examples. The collapse of the Soviet Union, and the trend away from dictatorships and toward democracies in Latin America and elsewhere in the 1990s, inspired Francis Fukuyama (*The End of History and the Last Man*, 1992), to revive Hegel's idea of the End of History. The march toward freedom announced by Hegel, he argued, long discredited by the atrocities of the twentieth century, could now be seen to be back on track. Fukuyama's thesis did not attract many adherents; was soon thought, like Hegel's, to be refuted by events; and was treated by many as an artifact of its time. The same, of course, could be said of the grandiose claims of Hegel and Marx—or indeed of any other philosopher.

The persistence and recurrence of philosophical reflections on the course of history as a whole, as in the case of the debates about modernity and of Fukuyama's book, indicate that the substantive philosophy of history may not have completely disappeared. Perhaps the need to make sense of history, and the continued existence of cultural worldviews about history, such as the idea of progress, will always push philosophers to look at history

as a whole in search of its meaning and purpose—or to deny that it has any.

## 2. “CRITICAL” PHILOSOPHY OF HISTORY: PHILOSOPHICAL REFLECTION ON HISTORICAL KNOWLEDGE

Serious discussion of questions about historical knowledge began in the nineteenth century, when the substantive philosophy of history had passed its peak in Hegel and history had established itself as a serious discipline in the academy. Prior to the late Enlightenment period, history was generally conceived as a literary genre more valued for the moral and practical lessons it could derive from past events than for its accuracy in portraying them. In some ways the substantive philosophy of history, looking for purpose and meaning in the whole of history, was simply a more sweeping and more pretentious version of ordinary historical discourse. By the middle of the nineteenth century, important new historical studies of antiquity and the middle ages had appeared. Beginning in Germany, history had acquired the dignity and trappings of a *Wissenschaft*, complete with critical methods for evaluating sources and justifying its assertions. The great historian Leopold von Ranke, one of the leading figures of the “historical school” in Germany, was explicitly repudiating the idea of history as edifying moral discourse when he famously claimed that the purpose of his historical work was simply to show the past “as it really was” (*zeigen, wie es eigentlich gewesen*).

For philosophers from Descartes through Kant, mathematics and mathematical natural science had served as the paradigm case of knowledge of the real world. How did the newly flourishing knowledge of the historical past fit in? Some philosophers, such as John Stuart Mill and those in the “positivist” tradition inaugurated by Auguste Comte, argued for the unity of all knowledge and tried to assimilate history to science. Just as physics formulated the laws of nature, and explained events by their means, the science of society would seek out social laws; history was just a case of applying these laws to the past.

Led by the neo-Kantians (e.g., Wilhelm Windelband, Heinrich Rickert,) and by Wilhelm Dilthey, German philosophers questioned this understanding of historical knowledge, focusing on the fact that its object is not natural occurrences but human actions. With history in mind, they began to work out the idea of *Geisteswissenschaften* or sciences of the human spirit, in contrast to the sciences of nature. Not only is the object of history

different from that of the natural sciences, they maintained, its aim is also different: it is concerned with individual events and courses of events for their own sake, not in order to derive general laws from them (it is “idiographic” rather than “nomothetic”). Moreover, because human actions are at the center of historical concern, to give an account is often to understand the subjective thoughts, feelings, and intentions of the persons involved rather than to relate external events to their external causes (“understanding” rather than “explanation”). For some philosophers, this made it inevitable that the historian’s value judgments would enter into the account of events and actions, and that the “objectivity” so prized in natural science was neither attainable nor desirable.

This opposition between “positivists” and what we might call the “humanists” on the status of historical knowledge, begun in the nineteenth century, continued to shape the epistemology of history well into the twentieth century. Those positivists who accepted the humanists’ description of historical knowledge could not consider history to be a genuine science. Those humanists who wanted to defend history as offering genuine knowledge of the past had to contend that the natural sciences did not offer the only model for what qualifies as knowledge. Among the latter, two notable attempts to characterize historical knowledge are those of Benedetto Croce and R. G. Collingwood (1999). Both argued that historical understanding of the past requires moving from action as an external event (e.g., Caesar leading his army across the Rubicon) to the reconstruction of the “inside” of the event: the experience or thought of the agent that motivated it.

Some of the issues that concerned philosophers of history were reflected in the work of historians as well. With the rise of the social sciences in the twentieth century (sociology, anthropology, political science), many historians coveted a place among them, arguing that history had to be “objective” and “value-free.” If that meant ignoring the subjective motivations of historical agents, so be it. They borrowed quantitative methods from the social sciences and applied them to the study of the past. Leading the way were the historians of the *Annales* school in France, beginning in the 1930s. Its best-known theoretician, Fernand Braudel, argued that history should shift its focus from the “surface” ripples of political history to the deeper-lying and slower-moving currents of social, economic, and geographical change. The move toward social history had a large impact on the discipline, and it was partly motivated by the desire to make history more “objective”—but only partly. Braudel’s view

reflected something closer to the substantive than to the critical philosophy of history, namely a belief about what the historical process really is.

Among philosophers, the positivist conception of historical knowledge was revived in the 1940s, under the aegis of the unity-of-science movement in analytical philosophy, by Carl G. Hempel. The focus was on the idea of *historical explanation*: Does history merely describe events, or does it try to explain them? And if it explains them, how does its mode of explanation compare with explanation in natural science?

Hempel argued that history does attempt to explain events, not merely describe them, and it does so according to a pattern no different from that found in the natural sciences: it brings events under general laws that allow us to show how they follow from their antecedents. Given such a law, the event to be explained should be logically deducible from its antecedents. Critics such as William Dray (1989) objected to Hempel's "covering law theory" (as Dray called it) on several grounds. Dray did not dispute the claim that history often tries to explain events, but, following Collingwood, he argued that a satisfying historical explanation often consists of reconstructing the reasons behind an action rather than finding its external causes. Further, it is hard to find general laws, of the kind that would be comparable to physical laws, being articulated in historical work.

Hempel conceded that historical accounts bear little surface resemblance to scientific explanations, that they seem to offer merely probabilistic rather than deductive explanations, and that their accounts are often just "sketches" of more complete explanations. But in doing so, he revealed the strongly prescriptive character of his account—a character it shared with much of the epistemology of his day. The implication was that if history could not live up to the standard of natural science, it could not qualify as genuine knowledge. Dray's larger objection to Hempel's approach was that philosophers should pay attention to what historians actually do, and to the wide variety of conceptual strategies in their work, rather than prescribing standards derived from abstract logical analysis or reducing their work to an imitation of a different, and equally idealized, endeavor. In this he was a harbinger of a trend in analytic epistemology that eventually extended even to the philosophy of natural science itself.

Nevertheless, the discussion of history among analytic philosophers in the 1950s was dominated by the theme of causal explanation, and above all by the contrast with the natural sciences. Hempel's proposal set the tone.

Even those such as Dray, who argued for the autonomy of historical knowledge, shared this preoccupation. Thus the confrontation of "positivists" with "humanists" continued. At the same time, the discussion extended to other, related topics.

One distinction that was much discussed in this literature was that between history and chronicle. It was agreed that history had to do more than just list facts. As Morton White put it schematically in his *Foundations of Historical Knowledge* (1965):

The chronicler is likely to tell us: "The king of England died, and then the queen of England died, and then the prince of England died, and then the princess of England died"... But a corresponding history may read: "The king of England died, so the queen of England grieved. Her grief led to her death. Her death led the prince to worry, and he worried to the point of suicide. His death made the princess lonely, and she died of that loneliness..." (1965, p. 223)

A chronicle simply lists a series of events in the order in which they happened, but according to White, "a history contains causal statements" (p. 223). But what kind of causation do emotions have? Even they seem to have the teleological character of reasons. The distinction between chronicle and history raises further problems. The chronicle involves more than a simple statement of facts. The historian has *selected*, from all the possible facts there are, some that are relevant to the story that is to be told. The problem of selection relates to the problem of historical objectivity, because even if facts are established by careful critical methods, the decision of which ones to look for, and which to include in a historical account, may derive from the interests and values of the historian.

Another problem, related to explanation, had to do with the nature of the *explanandum* in historical accounts. What do historians explain? The distinction between explanation and understanding, or between explanation by causes vs. explanation by reasons, may be relevant to the discussion of individual persons and their actions. But in history the focus is more often on large-scale entities such as nations, peoples, and classes, and on events such as wars, revolutions, and economic crises. We often impute actions or mental states to states or groups, as when we say that "Congress decided," "Japan was offended," "organized labor was fed up," and the like. To what extent are these expressions just shorthand for references to the actions or feelings of individuals? If these large-scale entities do not themselves act and feel, are they subject to causal explanation, and if so what kind? Are

there social laws governing the behavior of such entities and the occurrence of such events, which can be discovered independently of reference to the individuals that make them up, as methodological holists believe? Or must everything be traced, at least implicitly, to individuals? These are questions, of course, that arise in the social sciences generally and are not peculiar to history.

Positivism, reductionism, and the unity-of-science movement gradually lost their hold on analytic philosophy, largely under the influence of the later Wittgenstein, and philosophy of science was itself transformed. Arthur Danto, whose *Analytical Philosophy of History* appeared in 1965, later wrote an essay called “The Decline and Fall of the Analytical Philosophy of History” (1995). Danto claimed that Hempel’s project was one of the many casualties of Thomas Kuhn’s *The Structure of Scientific Revolutions* (1962). In an ironic reversal of fortune, worthy of a good novel, the attempt to absorb the philosophy of history into the philosophy of science was upended when science was reconceived as an essentially historical phenomenon and the philosophy of science became a branch of the philosophy of history—or at least of history proper. Epistemology was now devoted to describing what scientists actually did, rather than producing idealized and prescriptive accounts, and this meant following their work historically.

Danto was too hard on himself, however, when he described himself retrospectively as pursuing a Hempelian program. His *Analytical Philosophy of History* was actually itself part of a revolution going on the philosophy of history in the 1960s. The model for the philosophical understanding of history was shifting from *science* to *literature*. The old idea of history as a literary genre was revived. While Danto continued to think of history as explaining events causally, his account of how it does this drew heavily on the concept of *storytelling* or *narrative*. The concept of narrative had been used before in analytic philosophy, to distinguish between chronicle and history, but Danto’s sophisticated treatment of it was explicitly modeled on literary narratives such as novels. At the heart of Danto’s account is the idea that in a historical narrative, as in a good story, events are selected and described retrospectively with reference to later events. Thus the temporal character of events, and the temporal position of the narrator in relation to them, determines the structure of a historical account.

But Danto was not alone in looking to the literary model. W. B. Gallie had published a book called *Philosophy and Historical Understanding* (1964) whose premise was that “history belongs to the genus ‘story.’” With the

work of Louis Mink in the early 1970s (later collected in *Historical Understanding*, 1987), the trend was well under way to look at narrative as a “cognitive instrument” and history as “mode of comprehension” (these are Mink’s terms) based on narrative. Some analytic philosophers (e.g., Maurice Mandelbaum and Leon Goldstein) objected to the emphasis on narrative for favoring the literary presentation of history over the hard work of discovery, evaluation of sources and critical hypothesis that lies behind it. History, they said, is a disciplined inquiry whose goal is knowledge. Narrative is merely the way—indeed only one way—its results are “written up” for public consumption. But Mink’s idea is that narrative is more than just literary presentation. It constitutes a conceptual framework for dealing with human events, utterly distinct from scientific explanation, which is entirely appropriate to history. Danto later calls narrative the “metaphysics of everyday life” (Danto 1985, p. xiv).

In literary theory, of course, the study of narrative had a long tradition and had produced a number of classic studies in the English-speaking world. The rise of French structuralist literary theory in the 1960s had also involved considerable focus on narrative, drawing on the earlier work of theorists from Eastern Europe such as Roman Jakobson and Vladimir Propp. But literary theory and the philosophy of history had little contact until the appearance of Hayden White’s *Metahistory* in 1973. Drawing on the literary theories of Northrup Frye, Roland Barthes, and others, White produced a theory of narrative in general that he then applied to history by examining the work of both classical historians (Ranke, Michelet) and philosophers of history (Hegel, Marx). White (1973) argues that their work is guided by the same plot structures—romance, comedy, tragedy, and satire—that govern the production of literary texts. White’s book was widely influential but also highly controversial, especially among historians, because White seemed to be portraying their work as guided by literary motives, or motifs, rather than by the project of telling the truth about the past.

By this time the study of narrative was burgeoning on all sides, with a lot of emphasis on the fact that narrative or storytelling is a cross-cultural and cross-disciplinary phenomenon *sui generis*, turning up not only in history and fiction, but also in films, folktales, medical case histories, psychotherapy, medieval altar paintings and tapestries, comic strips, court testimony, and so on. Some theorists proposed a new discipline, to be called “narratology,” which would seek out the common features of narrative in all its manifestations. Under the broadening

influence of both Hayden White (1973) and structuralist and poststructuralist theories of literature, the works of historians were studied as examples of narrative form.

At a time when many historians, as noted earlier, were trying to escape traditional approaches by shifting the focus of history away from human actions, there was much difference of opinion on whether narrative was essential to history at all. *Annales* historians in France, and quantitative historians (“cliometricians”) elsewhere, disdained traditional historical language and thought narrative dispensable. Those who followed the trend toward the history of “*mentalites*,” or social attitudes and thought patterns, implicitly agreed. The point was made that histories have not always told stories. White, by contrast, argued that even such standard examples of non-narrative history as Burkhard’s *Civilization of the Renaissance in Italy* and Huizinga’s *Waning of the Middle Ages*, were implicit or truncated literary narratives. Paul Ricoeur in *Time and Narrative* (1983) made a similar claim about Braudel’s *The Mediterranean and the Mediterranean World*, the example *par excellence* of the *Annales* school’s nonnarrative approach, arguing that large-scale “quasi-persons” turned up in “quasi-plots” in Braudel’s work, a kind of narrative in disguise.

### 3. POSTMODERN SKEPTICISM AND ITS CRITICS

To the outside observer it might seem that with this shift to the discussion of narrative, the epistemological questions that originally motivated the “critical” philosophy of history were gradually fading from view. In the work of Danto, Mink, and Gallie, the concept of narrative had evolved, partly in reaction to the positivist program of Hempel, within the world of analytical philosophy, and it was undoubtedly part of the critical or epistemological reflection on historical knowledge. Even though these thinkers increasingly took literature as their model for understanding history, they were still interested in history’s cognitive role. But when this tradition collided with structuralism in Hayden White’s work, and with the larger, more literary world of narratology, the problem of knowledge seemed to lose its interest. The focus had shifted from history as knowledge to the historical text as literary artifact (as White called it). While this development is sometimes called the “linguistic turn” in the philosophy of history, it is more properly called the turn to the text. Literary analysis had apparently replaced epistemology.

This is only partly true, however, as there was more to the structuralist and poststructuralist treatment of history than just literary interest. Their analysis contained a

profoundly skeptical view of history as a claim to knowledge. They were inclined to see narrative structure as an *a priori* cultural form imposed on the real world, an alien structure that by its very nature distorted or misrepresented the messy and chaotic character of human life and action. Their model was fiction, and they saw narrative originating in the literary imagination or the archetypal plot structures embedded in culture. As for history, which pretends to represent the past as it really was, here narrative inevitably achieves the opposite effect, according to them. At best it dresses up reality, reflecting our need for satisfying coherence, and, if we really believe it, derives from wishful thinking. Far from reflecting reality, it escapes from it. At worst, narrative in its role as the “voice of authority” seeks to put across a moral view of the world in the interests of power and manipulation. This skeptical view was increasingly expressed in the writings of Hayden White, after *Metahistory*, and to some extent in those of Mink as well.

There is some irony in this development. The turn to narrative had begun as an attempt to defend the autonomy of history against the claim that it had to be transformed into science in order to be genuine knowledge. It was another chapter in the ongoing battle of the humanists against the positivists. For the humanists, narrative, like “understanding,” as opposed to “explanation,” was supposed to be capable of telling us about the past as it really was—human actions and intentions—whereas scientific reduction was the alien framework imposed from outside. Now the narrativists seemed to join the positivists in believing that the literary form of traditional history stands in the way of its epistemic pretensions. As we have seen, the antinarrative historians of the *Annales* school, and many other social and economic historians, agreed with them. The only difference was that the poststructuralists, unlike the positivists and the working historians, held no brief for the epistemic pretensions of the sciences and social sciences either. All was linguistic construction, all was imposed on reality—if indeed it makes any sense to speak of a “reality” outside our constructions.

Thus epistemology had not completely disappeared from the narrative treatment of history; there was still a concern for its epistemic status. But the consensus among the most influential poststructuralist or postmodern theorists (the latter term came to prevail) was that it had none. Many of the issues associated with the critical philosophy of history—objectivity, the role of evidence, the nature of explanation—were simply not treated at all. To that extent the project of the critical philosophy of history had been transformed, if not eclipsed.

One theorist who had a lot to say about historical knowledge was Michel Foucault, whose work gradually took on enormous importance from the late 1960s on, first in France and then elsewhere. Foucault's early work was in the history of medicine and psychiatry, but it engaged fundamental social and philosophical issues such as the normal vs. the abnormal and reason vs. insanity. His middle works (*The Order of Things* [1970], *The Archaeology of Knowledge* [1972]) dealt more broadly with knowledge in the human sciences. In keeping with the "linguistic turn," his focus was on forms of discourse, and his treatment took the form of contrasting widely divergent historical examples of scientific theory. His thoughts on history came through primarily in his defense of his own approach against more traditional treatments. He contrasted his own method, which he called "archaeological," with what he called the "history of ideas." He opposed the latter not only because he wanted to look beyond the surface level of ideas to the "discursive practices" that lay behind them; but also because the traditional historical approach tended to view the science of the past as a deficient form of knowledge striving toward the present. Rather than being a teleological continuum, according to Foucault, history manifests discrete breaks between radically different periods, which cannot properly be compared at all as if their sciences were all trying to do the same thing. Foucault was clearly criticizing traditional historians for imposing a teleological structure on the past; but he was doing so by arguing for an alternative conception of historical reality. Thus his work perhaps belongs as much to the substantive as to the critical philosophy of history. And while it differs in some ways from the more literary approach to history of other contemporary trends, it is like them in treating historical knowledge as conceptual construction. The question of its truth does not arise.

This did not sit well with many historians, who were still toiling away, reading documents, sifting and evaluating evidence, attempting to tell the truth, and to distinguish it from falsity, about the past. Historians on the whole had never had a great deal of patience with the philosophy of history; now many were further alienated, if not openly hostile. It is true that White, Barthes, and others had opened the hostilities by portraying professional history, in effect, as a powerful establishment managing the past for political purposes. Now many historians argued that, on the contrary, by questioning the idea of historical truth, the postmoderns were fostering an "anything goes" attitude that opened the doors to Stalinist-style rewriting of history, Holocaust denial, and other falsifications. Postmodern theory provided no way of dis-

tinguishing between history and fiction, in the view of its critics. Some historians, it is true, were intrigued by skeptical doubts about history's capacity to know the past. Robert Novick noted (*That Noble Dream*, 1988) that even the respected American historian Charles Beard, in the 1930s, had called historical objectivity a "noble dream" that could never be fulfilled; and Novick went on to argue, with the help of postmodern theories, for an even stronger skepticism about the past. As could be expected, his 1988 book stirred much controversy among professional historians.

But historians were not the only ones who were unhappy with the postmodern turn. Philosophers in the analytic tradition (McCullagh, Bunzl) were prompted by the controversy over Novick's book to mount arguments against the skeptical relativism it represented. While generally admitting the role of culture and language in shaping our approach to the past, these authors adduce some of the standard arguments about the self-refuting character of skepticism and defend the place of evidence and critical judgment in distinguishing better from worse historical accounts. Paul Ricoeur (1984–1988), a continental philosopher who also drew heavily on the analytical philosophy of history, attempted to soften the excesses of postmodernism by reconnecting narrative texts with their roots in human experience. Ricoeur believed that narrative, in both fictional and historical form, "humanizes" the experience of time, bringing order and measure to human existence. He argued that history and fiction draw on each other and often intersect in important ways. But he did not agree with the tendency of his French contemporaries to reduce history to fiction, or to blur the distinction between them. In writing about history, he devoted careful attention to the restraining and guiding role of document and evidence in historical discourse. He also believed that narrative texts build on structures that are already present in ordinary experience, transforming them, and then affecting and enriching ordinary experience in their turn.

Other philosophers of history countered the views of White and the postmoderns by arguing against the idea that narrative is an alien framework imposed on a non-narrative reality. What reality is meant? Human reality, which history is about, is the temporal flow of experiences and actions that engage persons in their social context. While it may not always have the crafted contours of a novel's plot, neither is it a chaotic absence of order or a meaningless one thing after another. According to this argument, human experience, and especially human action, are ordered in a manner that foreshadows the

structures of narrative itself. Events are experienced as temporal configurations with beginnings, middles, and ends; actions project an end and organize the means for achieving it. The agent grasps a sequence of events together in a temporal order much as a narrator organizes the events of a story; it is as if the agent is constructing and telling himself a story and then acting it out. On this view the narrative we find in historical writings—and in fictional writings too—is not a merely literary device at odds with the human world, it is something more like an extension of human existence by other means.

According to this “continuity theory” (as some have called it), narrative structures constitute “the metaphysics of everyday life,” as Danto called it, and offer the key to understanding not only experience and action, but also the self who acts (1985, p. xiv). The self can be seen as constructing itself by implicitly or explicitly telling, and of course also revising, its life story. This theory can be extended from individual to social life, where it becomes relevant to history. Communities, large and small, may be said to constitute themselves in the stories they tell themselves about themselves. Here historical consciousness and historical writing have their place. Written history can be seen as the collective memory that permits a society to hold itself together and plan its future.

Critics of the continuity theory have argued that it does not succeed in answering the skepticism of the post-moderns, which was seemingly its intention. It counters the theory that historical narrative is in principle incapable of portraying the past by arguing against the radical discontinuity between narrative and the real world. But even if it succeeds in demonstrating the protonarrative character of everyday action and experience, and in extending this to the social level, it does not account for the differences between these protonarrative structures and fully formed narratives we find in novels and histories. As regards historical knowledge, this theory, according to its critics, fails to provide a positive account of how narrative can succeed in arriving at historical truth and distinguishing it from falsehood.

#### 4. HISTORICITY, HISTORICISM AND THE HISTORICIZATION OF PHILOSOPHY

These criticisms inadvertently reveal something about the discussion of narrative and history, especially when it draws on continental philosophy for its inspiration, that once again raises questions about how to classify it as philosophy of history. We already found that the focus on historical narratives as literary texts, under the influence

of White and the structuralists, moved away from traditional epistemological questions without completely abandoning them. Historical knowledge took a back seat to the literary properties of historical writing. Some of the attempts we have been discussing, designed to counter the influence of poststructuralism on the philosophy of history, similarly defy the standard classification. This is because they draw heavily on the phenomenological and hermeneutical tradition going back to Husserl and Heidegger. These philosophers reflect on history in a way that is indeed related to traditional epistemological and even metaphysical concerns, but not in the way associated with the standard distinction between the substantive and the critical. In this tradition, the key concept is “historicity.”

“*Geschichtlichkeit*,” sometimes translated as “historicity,” is a term used by Husserl and Heidegger in the 1920s and 1930s in their phenomenological descriptions of consciousness and human existence. The importance of this notion attests to the influence on both philosophers of Dilthey, who had died in 1911 but whose posthumously published work was still studied intensely. We have encountered Dilthey as the philosopher of the *Geisteswissenschaften*, whose project of working out a “critique of historical reason” made him an important contributor to the epistemological debates about history. But he also believed that historical knowledge is rooted in certain features of human existence. “We are historical beings before we become observers of history,” he wrote, “and only because we are the former do we become the latter.” (Dilthey 2002, p. 297)

Husserl and Heidegger, following Dilthey’s lead, expand in slightly different ways on what it means to be a “historical being.” The phenomenological concept of “world” is central for both: The human world is not merely a container for human beings but a complex of meanings. Past and future are part of that world, and both philosophers devote extensive analysis to temporality. Human experience is not confined to the present but consists of a temporal grasp, holding on to the past and anticipating or projecting its future. The self is not simply a substance that persists through time, but a self-constituting unity of temporal interrelations. These are all essential, ontological features of human existence: it is not as if the human being existed first and then just happened to come up against the world, the past, the future. An existence without these would not be a human existence at all.

The same can be said of the social dimension of existence—Husserl speaks of intersubjectivity and Heidegger

of being-with-others. Taking this dimension into account, we can see that past and future take on broader meanings. The social past—history—has meaning for us and figures in our lives prior to and independently of explicit historical representation and disciplined inquiry. Husserl asserts in his late works that all human activity, even that of a science such as mathematics, has to be understood historically. According to Heidegger, we appropriate our history in an act of self-interpretation, and it becomes part of the future we project for ourselves. Our history is part of our self-understanding and in that sense part of our being. Like the world and others, history is an essential feature of our existence, not something added on or something we could be without.

Though the term “narrative” is not used in these early treatments of the concept of historicity, the idea is implicit in it. Dilthey did compare self-understanding to the composition of an implicit autobiography. The German term *Geschichte*, like the French *histoire*, can mean both “history” and “story,” and both senses of the term are often implied.” Husserl writes that “the ego constitutes itself for itself, so to speak, in the unity of a *Geschichte*,” suggesting that the temporal synthesis of past, present and future, in which the self takes shape, is like telling the story of one’s life (Husserl 1999, p. 75). It is easy to see in these concepts the prefiguration of the narrative conception of human time that later theorists apply to history in the larger, social sense.

How does the discussion of historicity fit into the philosophy of history? Clearly it qualifies as philosophical reflection on history, but it does not correspond to the standard categories with which we began. It does have some bearing on the understanding of history as a discipline, in the sense that it seeks the roots of historical knowledge in human existence. It addresses the question of why we seek to know about the past at all. It suggests that the past is more than just an object of curiosity for us, because it corresponds to a dimension of our being. Knowing about the past is knowing where we have come from and thus who we are. History as a disciplined, critical inquiry, as it has developed in the academy, is thus just an extension and intensification of the project of self-knowledge. But while this addresses the nature of historical inquiry, it is not raising the traditional epistemological questions about whether genuine knowledge of the past is possible, how or whether objectivity can be achieved, etc. It is interested in historical inquiry as a human activity, and seeks to understand its significance within human existence as a whole.

If these questions are not epistemological, it may be argued that they are metaphysical. Understanding human nature, after all, has always been a central metaphysical endeavor. This does not mean, however, that these questions are part of the substantive philosophy of history. The latter has traditionally set out to understand the whole process of human history, and this is different from the focus on what is essential to individual human existence. We find few pronouncements in the phenomenological, hermeneutical or narrativist literature about the meaning and purpose of history as a whole.

The concept of historicity became an issue in the French structuralist attack on the phenomenological tradition in the 1960s. The anthropologist Claude Lévi-Strauss argued that many of the non-Western societies he studied were “peoples without history” in the sense that they devalue temporal change. The primary purpose of social organization in these societies is to prevent change or contain it as much as possible within an interpretive framework in which its significance can be denied. Their sense of themselves as individuals and as societies is not derived from a consciousness of the difference between past, present and future. Unlike Western societies, they have no interest in their past origins, nor do they ponder their future destiny; in this sense they are not characterized by historicity at all. Lévi-Strauss famously attacked Jean-Paul Sartre for making historicity essential to humanity and by implication excluding “peoples without history” from the human race. Either they are somehow less than human, or they are relegated as “primitive peoples” to some remote prehistory, even though they still exist in the present. Lévi-Strauss’s attack foreshadows the postmodern view that the emphasis on history is a “Eurocentric,” and thus provincial and limited, conception.

A related trend in twentieth-century philosophy might be seen as an extension of the notion of historicity, though it does not necessarily follow from it. If human existence is through-and-through historical, then all human endeavor is dependent on and limited to its historical position, including the search for truth. Truths thought to be timeless turn out to be nothing more than reflections of their historical age. Historical relativism of this sort is sometimes called “historicism” (though that term has also been used in a different sense—notably by Karl Popper, who used it to mean “historical determinism”). We have already encountered skeptical relativism about historical knowledge itself, and we have noted that some philosophers are skeptics about scientific knowledge as well. But to attribute the relativity of all knowledge to history in particular is a special form

of skepticism. Like all skepticism, this form has self-referential problems, because the alleged relativity would extend to the relativist thesis itself.

But some philosophers have not flinched at this prospect, propounding the radical historicization even of philosophy. Thus the later Heidegger, and more recently Richard Rorty, view philosophy itself as a large-scale episode in Western history that is nearing or has reached its end. Perhaps this is the ultimate inversion of Hegel's grand design for the philosophy of history: He thought history had come to an end by being fully comprehended in thought. Philosophy ultimately triumphs over history. For Heidegger and Rorty, it is philosophy that has come to an end, and the triumph belongs to history.

## PHILOSOPHY OF LANGUAGE

What, if anything, can philosophy teach us about language? It is a feature of English that its adjectives come before its nouns, as in *green table*. This syntactic fact distinguishes English from French. In English there is a difference in sound between words that begin with a b and ones that begin with a p. This phonological fact distinguishes English from other languages. Some Arabic languages, for example, have trill sounds. This phonetic feature distinguishes these Arabic languages from English. Are any of these linguistic features philosophically interesting?

It is doubtful whether any philosopher seriously believes that, qua philosopher, they have anything interesting to say about the syntactic, phonetic, and phonological features of languages in general or of English in particular. Why, then, should it be any different for all of the other features of language? For example, that in English a relative pronoun precedes the noun phrase it modifies or that English declarative sentences are of the subject-verb-object variety, are interesting facts about English syntax, but why should any of this be of philosophical interest?

Many theorists claim that philosophers of language are interested in answering questions of the sort: What need someone know in order to understand his or her language? Do they need to know the sorts of facts just mentioned? In some sense of *know*, they must. Someone who speaks English, normally, can recognize another as a non-English speaker, as a nonnative English speaker, or not a perfectly fluent English speaker simply by virtue of the fact that this speaker employs syntactic structures or phonemes that are not a part of English, or fails to recognize differences between distinct phonemes of English. For example, if someone failed to recognize a difference between an articulation of the words *bit* and *bet*, this would constitute partial evidence that the individual in question does not (fully) grasp English. But why is this philosophical? It is not! Still, philosophy does matter to language. Why anyone should think so is a complicated matter; one that an answer to will be sketched in the sections that follow.

### COMMUNICATIVE ABILITIES

It is uncontroversial that linguistic expressions carry meaning. Right now, you are looking at ink marks on a piece of paper. These marks are in English, they have meaning, and should you know these meanings, you can

figure out what they say. We spend a lot of our lives exercising our communicative abilities; abilities to produce utterances (spoken, written, felt, etc.) that others can interpret; and, abilities to interpret utterances that others have produced. These abilities in assigning meanings to expressions—simple and complex—are required in order to ask for help, read traffic signs, interest others, surf the net, read newspapers, write e-mails, watch movies, comfort others, listen to lectures, order food, read a bus schedule, buy wine, quarrel, and make jokes.

One of the central topics in philosophy of language today is to provide an explicit and systematic account of whatever knowledge we have of the meanings of the expressions of our language that enables us to communicate with it. Surrounding these projects are a number of subtle philosophical issues.

### WHAT IS MEANING?

What is the meaning of an expression? Traditional scholarly books and articles all weigh in with one analysis or another about the nature of meaning. Some posit that the meaning of an expression is what it applies to (*apple* means the set of apples), the idea that we associate with it (*God* means, say, the idea of a benevolent omnipotent omniscient being), or the characteristic behavior that it uses evince (*Fire!* means run for safety), and so on.

Criticisms run that this or that analysis cannot be right, because if meaning were this, then two expressions that differ in meaning would turn out to be synonymous, or that a meaningful expression would turn out to be, on the proposed analyses, meaningless. For example, a critic of the view that the meaning of an expression is what it applies to might argue that even though the two sentences “Cicero was Roman” and “Tully was Roman” are not synonymous as the referents of *Cicero* and *Tully* are the same. A critic of the view that the meaning of an expression is the idea(s) we associated with it might argue that even though someone can associate the idea of warm weather with the word *grass*, the idea of warm weather is still not part of its meaning. Anyone who denies this should visit Ireland in January.

Though neither argument is definitive (after all, paraphrasing Ludwig Wittgenstein, theories do not get refuted; they just become no longer interesting to defend), they still illustrate how theories of meaning can be, and often are, evaluated. In traditional criticisms, intuitions about what we believe expressions to mean are dominate. The question of what the relationship is between theories (the sole aim of which is to provide an analysis of an important concept) and theories (the aim

of which is to explain various phenomena) is left open by this to and fro (for more on the analysis of the concept of meaning, see William P. Alston's *Philosophy of Language*).

A major shift in the philosophical study of meaning took place about fifty years ago with the abandonment of efforts to analyze the concept of meaning (Quine 1953). But, if it is not an analysis of the concept of meaning that philosophers are after, what, then, warrants evaluations of various claims about what meaning is?

Whatever meaning is, it is relatively uncontroversial what knowledge of it enables us to do: It enables us to understand language. Because we know what the expressions of our language mean, we understand English. In rejecting an account we are saying in effect that this cannot be what we know that enables to understand English, because if it were we need not understand English. Thus, if you were taught the referent of every English word, you would not understand an English interlocutor. On this account, being asked, "Was Cicero the same man as Tully?," should produce bewilderment. On the referential theory, it is analogous to being asked whether bachelors are unmarried men. But if it is not knowledge of the referent of an expression that enables one to understand it, what does enable one to understand it?

The picture that understanding a word is learning to associate an idea with it goes back at least to the early empiricist Thomas Hobbes. It is a bad theory, for suppose you were told, "Though grass covers Ireland in January, it is not warm there then." Were your understanding of the word *grass* to include the idea of warmth, you should find this comment linguistically confused, much like being told "Though John is a bachelor, he has a wife!" But if understanding consists neither in knowing the referents of your words, nor the ideas you associate with them, what then might you know that would enable you to understand English?

The picture that dominated theories of meaning throughout most of the last century is (various versions of) linguistic behaviorism (Skinner 1957). Linguistic competence with an expression is knowing how to behave appropriately when confronted with its uses. For example, suppose you are told "Go get a coke!" In virtue of understanding English, what should you do? Should you automatically get a coke? Presumably not, for that would render linguistically competent English speakers all very active. Perhaps you need only know what you are supposed to do. But what are you supposed to do when someone asks you for a coke? Good manners might require that you should do something when asked, but understanding English requires nothing of you. These

various critical points are intended to establish that no particular behavior is associated with language understanding, and so they scream out for clarification from anyone who wants to be a behaviorist about linguistic competence, clarification that was never forthcoming (Chomsky 1959).

### MEANING IS RELATIONAL, EXTRINSIC, VAGUE, AND CONVENTIONAL

Beginning with a banality such as understanding a language requires knowing the meanings of its expressions, as philosophers well know, is a necessary precaution against a rampant background of skepticism in some philosophical quarters about the notion of meaning. Some of this skepticism generates from the consideration that whatever is alleged to carry meaning does not do so inherently. For instance, there is nothing about English words that requires "Snow is white" to mean that snow is white. In another language, they might mean grass is green, and so it follows that whatever words mean depends partly on the language from which these words originate. But this sort of relativity should not compromise the reality of what words mean. After all, no one is inherently a father. The relational property of fatherhood depends on a relationship to someone else—a child. Likewise, whether or not a string of words means that snow is white depends on this string's relationship to a specific language.

This issue concerning the meaning of words should not be confused with reservations about the reality or truth of conventions. Being married, like fatherhood, is a relational property. But unlike fatherhood, marriage is not grounded in biology. It is, so to speak, a matter of convention or social arrangement who is married to whom. But, extant conventions might easily have been different. Everyone who is currently married might just as easily not have been without suffering any substantial change to their being—rather, only a change in convention. It is a mistake, however, to infer from this possibility that there really is no such thing as marriage. Likewise, if it is a matter of convention that *dog* means dog and not cat, then it does not follow that there should be a dispute over what *dog* means.

The reality of meaning is equally left uncompromised by considerations about vagueness or borderline cases. Two words translate or paraphrase each other just in case they share the same meaning. In many instances, we are simply unsure whether two words translate or paraphrase each other; and there is no higher source to which we can appeal to settle our doubts. In short, that

meaning is relational, extrinsic, vague, or conventional does not compromise its reality.

#### LANGUAGE AND USE OF LANGUAGE: SEMANTICS AND PRAGMATICS

Of course, linguistic meaning is not our only employment of the concept of meaning. We sometimes speak of another's action as meaningful, as when identifying purpose as our aim. In seeking the meaning for which Bill burned down his house, however, it need not be assumed that Bill's act of burning down his house is meaningful in the same way as the English sentence "Bill burned down his house" is. For one, it is not conventional meaning we seek in another's act, but rather the underlying intentions. For what reason did Bill carry out his sorry deed?

Similarly, people use words with intent. John might assert "Snow is white" because he wants to alert his listeners to the fact that English is his native tongue. No one would conclude on this basis that the words "Snow is white" mean that English is John's language. We can see clearly that with these speech acts, the notion of meaning enters twice. First, in choosing a vehicle to express our message, words whose conventional meaning best conveys that message are employed. And, secondly, in interpreting a linguistic act, an attributed meaning can and often does exceed this conventional meaning.

An audience can exploit context and individual histories in order to discern an agent's purpose or message. Why did he tell me, "I love you," when he knows that I am fully aware of it? Does he mean to reassure me? Or, does he dread losing me, and so, means by his words for me to feel guilt about our imminent separation? Such exegetical issues concern us all whenever we try to size up what others mean by their particular use of words. With conventional linguistic meaning, speakers rely on a prior comprehension in order to convey successfully a message; with these other sorts of meaning, speakers hope—wittingly or not—to exploit presumed shared beliefs and expectations in discerning nonconventional meaningful aspects of linguistic acts.

In summary: When theorizing about meaning, it is crucial to distinguish between language and the use of language. Languages, such as English, exist independently (in a sense that requires clarification) of what anyone happens to do with them. If these sentences together in this order had never been assembled, it would have made no difference to the existence of English. English words and sentences would have meant whatever they do. Speakers simply exploit the meanings of these words in their writings, and a reader exploits those same meanings

in order to understand what is written. For an example, consider sentence (1): Some American musicians are scared of a small Norwegian troll.

Most likely, (1) has never before been written. That, of course, does not prevent it from meaning whatever it does in English. It has its meaning independently of ever having been uttered or thought about. So far our discussion has been primarily concerned with the meaning that sentences have in English (by virtue of being English sentences)—that is, their conventional or literal meaning. The study of the literal meaning of words and sentences is often called semantics.

Conventional meaning, however, is as we have seen not the be all and end all of communication. We often (maybe always) use sentences to communicate contents quite different from their conventional meaning, as observed in the following conversation. Sam asks Chris in sentence (2): Can you help Alex with his paper tonight? Chris in sentence (3) responds: I'm driving into New York to see Jill. By uttering (3), Chris can succeed in telling Sam that she cannot help Alex with her paper that night. Of course, that's not the literal meaning of sentence (3). The literal meaning of that sentence is that Chris is driving into New York to see Jill. But by uttering (3), Chris can succeed in communicating to Sam more than the literal meaning of the sentence she uttered. The study of how words and sentences can be used to communicate contents that go beyond their literal meaning is often called pragmatics. The goal of pragmatics is to study the various mechanisms that speakers exploit to communicate content that goes beyond literal meaning (for more on the distinction between pragmatics and semantics, see H.P. Grice's *Studies in the Ways of Words*). But in ascribing conventional meaning, one can incur theoretical costs.

#### REPRESENTATIONAL AND COMPOSITIONAL MEANING (SEMANTIC) THEORIES

Philosophers of language and linguists talk about the vehicles that carry meaning as both representational and compositional. Representations represent—so the sentence "Bill Clinton is tall" represents Bill Clinton as tall; however, the sentence "The president of the United States in 1999 is tall" also is true of Bill Clinton, and also represents him as tall, but it does so in a different manner. But it differs not only inasmuch as it uses a different vehicle. The Italian sentence "*Il presidente degli Stati Uniti in 1999 e' alto*" represents Bill Clinton as tall in exactly the same way that "The president of the United States in 1999 is tall" does, even though these two vehicles of representa-

tion are distinct. With these two sentences, however, the vehicles are synonymous—they carry the same meaning, whereas the first two are not synonymous, though both vehicles happen to be true in the same circumstances.

Suppose, for instance, that someone else had been president in 1999; then, the latter two sentences with definite descriptions might be false, but the first sentence with a proper name would still be true. So, whatever meaning is, it would appear to be more fine-grained than a mere symbol-object relationship. If words were merely tags for objects, no two co-tags would differ in meaning. It would seem that vehicles denote objects under representational guises, and these guises are part of what that expression means.

There has been much written about the nature of this guise, yet little of it has been clear. Whatever guises are, we have seen that they must be more fine-grained than the objects to which expressions apply because expressions with the same referent can differ in meaning, but guises must also be more coarsely-grained than the ideas speakers associate with expressions. Two people might use the same expression but associate different ideas with it; for you, *snow* might connote misery but for a skier it might connote joy.

Synonymous sentences in the same or distinct languages are supposed to share guises; those that are non-synonymous do not, even if the sentences happen to be about the same objects, events, or state of affairs. Like the shadows in Plato's cave allegory, guises suggest existing somewhere in between linguistic items and idiosyncratic ideas associated with expressions by individual speakers, on the one hand, and the objects to which they are conventionally attached, on the other.

Guises are what determine whether a linguistic item is about one thing and not another; they are the concepts that enable us to understand the linguistic items we use. The definite descriptions *the forty-second president of the United States* and *the husband of Hilary Clinton* pick out the same person, Bill Clinton, but they do so in different ways. The ways in which they pick him out are another way to think about the guises associated with expressions. The former expression picks out Bill Clinton partly by virtue of his having the property of being the forty-second president of the United States; and the latter expression picks him out partly by virtue of his being Hilary Clinton's husband. Thus, these two expressions each represent the same individual, but they do in different ways—under different guises.

But there is more to the concept of a guise than is evidenced by representational powers. Natural languages are essentially productive and systematic. They exhibit productivity in that there are no obvious upper bounds on the number of creative linguistic acts that can be performed through speech. Novel sentences can be formed by conjoining any two meaningful indicative sentences—as in, “John left, but Mary stayed”—or by prefacing any meaningful indicative sentence with a psychological verb—as in, “Carl believes that Martha is ill” or “Carl fears that Martha is ill.”

Because humans lack magical abilities, this capacity to produce and comprehend novel linguistic acts requires explanation. The standard explanation is that speakers of a natural language must have learned rules that enable them to determine the meaning of a complex expression strictly on the basis of its significant parts. The existence of such compositional rules explains our capacity with productive representational systems—by assuming that any unbounded representational system is compositional, we have an explanation for mastery over productive representational systems (for further discussion of compositionality, see Jerry Fodor's and Ernie Lepore's *Compositionality Papers*).

The property of compositionality can also be invoked in order to explain the following feature: It is a distinctive feature of English that when a grammatical sentence of the form “A R's B” is meaningful, then if “B R's A” is grammatical, not only is it also meaningful, but its parts are presumed to make the exact same meaningful contribution that they do in the original configuration. This aspect of a representational system is referred to as its systematicity.

The existence of a set of compositional rules accounts for systematicity as well as productivity. Compositionality requires that meaningful expressions compose in systematic ways to produce meaningful complexes. The expressions *the red shoe*, *the table*, and *fell on* mean what they mean regardless of whether they are configured to read “The red shoe fell on the table,” or “The table fell on the red shoe.” To be more specific: reconsider (1). Its literal meaning and, indeed, the literal meaning of any English sentence, depends on two factors: A) the meaning of the words (i.e., *some, American, musicians, are* and *troll*); and B) the way in which these words are assembled. Put together as in (4), what results is a sentence entirely different in meaning from (1): (4) Some Norwegian musicians are scared of a small American troll.

From these apparently obvious facts we can derive the idea that languages have compositional meaning theories. The idea is that the literal meaning of a sentence (its literal or conventional content) is the result of the (literal/conventional) meaning of its parts (the words in it) and the manner in which these parts are put together (their mode of composition).

Furthermore, as we have already noted, in addition to the systematicity of our sentences, speakers are also able to understand and produce indefinitely many sentences—sentences neither they nor anyone else in their community has ever uttered before. This shows that their knowledge of language must be productive; it must extend beyond a fixed lexicon of predefined static elements, and must include a generative system that actively composes linguistic knowledge so as to describe arbitrarily complex structures. The hallmark of productivity in language is recursion. Recursive patterns of complementation, as in (5), and recursive patterns of modification, as in (6) and (7), allow phrases to be nested indefinitely many times within a single sentence: (5) Chris thinks that Kim thought that Robin wanted Sandy to leave; (6) Chris bought a gorgeous new French three-quart covered copper saucepan; (7) Chris is writing a book that describes inventors that have built machines that changed the world that we live in.

Speakers' capacity to formulate and recognize an open-ended array of possible sentences shows how acute a problem it is to coordinate meaning across speakers. When we learn the meanings of expressions of our native language, we must generalize from the finite record of our previous experience to an infinity of other expressions and situations. If we thereby arrive at a common understanding of the meanings of these expressions, it must be because language is structured by substantive and inherent constraints that we are able to exploit. More generally, if our discoveries in the theory of meaning are to help explain how speakers can use language meaningfully, we should expect that the generative mechanisms we postulate as theorists will be compatible with the psychological mechanisms that underlie speakers' abilities.

There are many ways to implement this idea of a compositional meaning theory. One that has been prominent in the philosophical literature is that a theory of meaning for a natural language, *L*, should consist of a finite set of axioms specifying the meaning of the words and the rules for how they can be composed. These axioms would then permit the derivation of theorems that specify the meaning of complex expressions (such as *some American musicians*) and sentences, such as (1)–(7).

So understood, a semantic theory is a formal theory from which we can derive the meaning of an infinity of English sentences. The reason why (1)–(7) mean what they mean in English is that their meanings are encoded, so to speak, in the basic axioms of a correct meaning theory for English.

A straightforward way, then, for a philosopher of language to explain productivity and systematicity is to assume that the meanings of particular sentences can be calculated by inference from general facts about meaning in the language. For example, consider the compositional meaning theory presented in (8)–(10): (8) *Snow* is a noun phrase and refers to the stuff *snow*; (9) *White* is an adjective phrase and refers to the property *whiteness*; and (10) If *N* is a noun phrase and refers to the stuff *S* and *A* is an adjective phrase and refers to the property *P*, then *N is A* is a sentence and is true if, and only if, *S is P*.

From this theory, we can derive (11) as a logical consequence: “*Snow is white*” is true if, and only if, *snow is white*. Why should we think of (11) as a characterization of the meaning of the English sentence “*Snow is white?*” We can because it links up this sentence with a condition in the world stated in objective terms—in this case, the condition that *snow is white*. As theorists of meaning, we can utilize this kind of theory, which Donald Davidson calls an interpretive truth-theory, to provide a general account of how sentences link up with conditions in the world (Davidson 1967, 2001; Lepore and Ludwig 2005).

We use atomic formulas to axiomatize the meanings for elementary structures in the language and use conditional formulas to describe the meaning of complex structures in the language as a function of the semantics of their constituents. We then reason logically from the axioms to associate particular sentences with particular conditions in the world. As in (8)–(10), this inference will be compositional, in that the conclusions we derive will be inferred through a logical derivation that mirrors the syntactic/grammatical derivation of the sentence.

There are two ways to view interpretive truth-theories such as (8)–(10). We can exploit an interpretive truth-theory to formulate a theory of meaning for a new language. For example, we could be pursuing translation. In this case, we are interested in systematically articulating translations of sentences in the object language in terms of sentences in our own; we understand these translations to be derived by inference from the axioms of the theory. Another way to view interpretive truth-theories (and other sorts of compositional theories of meaning), such as (8)–(10), is as ingredients of the speakers' psychology. On this view, we regard the axioms of a

theory of meaning as generalizations that native speakers know tacitly about their own language. When speakers formulate or recognize particular utterances, they reason tacitly from this implicit theory to derive conclusions about specific new sentences. On this understanding, interpretive truth-theories offer an explanation of how speaker knowledge of meaning and inference underlie linguistic competence.

## FORMALISM IN PHILOSOPHY OF LANGUAGE

The view we just described invites an analogy between the semantics of natural languages and the semantics of the artificial languages of formal logic. The analogy goes back to Gottlob Frege (1879), who took logic to clarify the features of natural language essential for correct mathematical thought and communication. The work of Richard Montague (1974) took the analogy further. Montague explicitly advocated an exact parallel between the semantic analysis of English—what ordinary speakers actually know about their language—and the semantics of intentional higher-order logic. In fact, many techniques originally developed for giving semantics to logical languages turn out to be extremely useful in carrying out semantic analysis.

## INDIRECT SPEECH ACTS

Interpreting a dream partly involves assigning it meaning, but does this imply that dreams are representational in the way that language is? In one sense, they are obviously so. This is the sense in which we might say of any image that it is representational. An image of a horse is of a horse, and not of sheep. But this is a notion of representation irrelevant to our current concerns in the philosophy of language, because it appeals to a natural (and not a conventional) relation between an image and its corresponding object. If dreams are supposed to be representational in the same sense in which photographs or other sorts of images are, then talk of a compositional theory of interpretation or meaning of dreams is not anything like the sort of theory that one invokes for systems of representations such as natural language. For one, photographic images are neither productive nor systematic, nor are they even fine-grained in the way in which linguistic representational systems are. An image of Bill Clinton is an image of the president of the United States, and nothing short of an election can pull them apart. More famously, an image of John giving Bill a toy is indistinguishable from an image of Bill receiving a toy from John, though these inseparable acts are distinct. It is clear that

the sort of systematicity that occurs so naturally within bona fide linguistic representational systems cannot be applied to images with the same ease.

We return now to our earlier contrast between literal/conventional meaning and meaning in purpose or what we might call agent meaning. When the subject is employing so-called indirect speech acts, then what one means by one's words must take into consideration background factors. So, for example, suppose Janet says, "It's raining outside." Her words mean that it is raining outside, but she herself might mean for her audience to bring their umbrellas. When Janet spoke she intended her audience to come to believe what she was trying to get across. In order for her words to have meant that her audience is to take their umbrellas, she must have intended her audience to recognize her ulterior motive.

Speaker meaning in contrast to literal/conventional meaning, then, requires (at least) two sorts of intentions, one about what a speaker is trying to get their audience to believe by their utterance and another about getting them to recognize what he or she is trying to do. More specifically, what a speaker means by their words depends on what they intend their audience to come to believe, and what he or she intends them to recognize him or her as intending them to come to believe. Both component intentions, tacitly or not, must accompany an utterance in order for the speaker to mean something by what they say. By Janet's utterance of "It's raining," she means for her listener to bring their umbrella just in case she intends them to come to believe this and she intends them to recognize that she intends them to come to believe this. She intends for them to come to believe they are to bring their umbrella, and she intends them to recognize that she intends them to come to believe they are to bring their umbrella.

Implicit in our discussion is, of course, the assumption that speaker meaning can exceed word meaning. For you to bring your umbrella is not what Janet's words "It's raining" literally/conventionally mean, nor is it implied by anything that these words literally/conventionally mean. Speaker meaning is determined by word meaning alone just in case it is either expressed or implied by what the words used mean; conversely, it is not determined by literal meaning alone if it is neither expressed nor implied by what the speaker's words literally mean. A simple test separates the former distinction from the latter. If we try to deny speaker meaning determined by word meaning, then we end up making inconsistent claims. Because Janet can consistently assert that it is raining outside without intending for you to bring any umbrella, what

she means is neither expressed nor implied by what her words mean (Grice 1989).

Inquiries about speaker meaning not determined by word meaning are about nonlinguistic motives, beliefs, desires, wishes, fears, hopes, and other psychological states that provoke verbal expression. Speaking is an action; it is what we do with meaningful words. This requires reasons, and reasons not entirely about what our words mean. Linguistic and nonlinguistic psychological states both come into play.

## SENTENCES MEANING AND UNDERSTANDING

To sum up: One chief goal of philosophy of language is to show how speaker knowledge of a natural language allows speakers to use utterances of sentences from their language meaningfully. As we have seen, one rough and tentative answer has been: If speakers know a recursive compositional meaning theory for their language, then they can use its rules and axioms to calculate interpretive truth conditions for arbitrarily complex novel sentences. But we have also seen that even if speakers can infer the truth conditions of sentences from their language on the basis of (tacitly) employing a compositional meaning theory for their language, such knowledge alone cannot account for all of what goes on in communication. Communication invariably takes us further than the literal/conventional meaning of our words. How do we go further in a communicative exchange than what our words literally mean?

A preliminary, approximate answer is this: We begin by idealizing the information mutually available to us in a conversation as our common ground (Stalnaker 1973). The common ground settles questions about whose answers are uncontroversial, in that interlocutors know the answers, know that they know the answers, and so forth. Meanwhile, the common ground leaves open a set of possibilities about which there is not yet agreement: Maybe there is a matter of fact that could turn out (for all that the interlocutors know) to be one of various ways, or maybe the interlocutors actually do know how it turns out but do not realize that the knowledge is shared—so it could be that the others know, and it could be that they do not—and so forth. We might represent these possibilities in the common ground as a set of possible worlds (situations).

Let the set of possible worlds in which a given sentence is true represent the proposition associated with the sentence. If we adopt this picture, then we can formalize the effect that asserting a formula has on the common

ground. When interlocutor A asserts a formula *f*, he or she introduces into the conversation the information that *f* is true. Suppose that *f* expresses the proposition that *p*. Before A asserts *f*, the common ground is some set of worlds *C*. After, the common ground must also take into account *f*. This formula *f* restricts the live possibilities by requiring the worlds that are in the common ground to make true the further proposition that *p*. So, the change that occurs when A asserts *f* is that the common ground goes from *C* to *C* together with the proposition that *p*. This concise model forms the basis of a range of research characterizing the relationship between truth-conditional semantics (literal/conventional meaning) and conversational pragmatics in formal terms (van Benthem and ter Meulen 1997).

This idealization obviously has its limits. And it is easy to come up with strange puzzles when one moves (perhaps inadvertently) beyond the limits of these idealizations. Before considering one such puzzle, we digress to discuss perhaps one of the most important results from one of the most important research programs in the philosophy of language in the last half-century.

## SAUL KRIPKE AND HILARY PUTNAM ON TWIN EARTH

Imagine a planet exactly like Earth, except that where Earth has water, this other planet, Twin Earth, has another mysterious substance, say, XYZ. To human senses, this substance seems exactly the same as water; nevertheless, it has a fundamentally different chemical structure. Imagine further that it is still the year 1700, and chemical structure has yet to be discovered. Still, we judge that the English word *water*, on Earth, means water, whereas the Twin English word *water*, on Twin Earth, means XYZ. Moreover, if an earthling were suddenly teleported to Twin Earth, they would still speak English, and their word *water* would still mean water—this despite the fact that they might have exactly the same dispositions as Twin Earthers have to accept or reject statements about their new surroundings. In short, the unfortunate earthling would think they were surrounded by lots of water, and would be completely wrong.

What moral should we draw from Putnam's (1975) Twin Earth thought experiments? Should we conclude that when you look at how a speaker is disposed to respond to English sentences, *water* can be interpreted equally well as water, XYZ, or even the disjunction of the two? These interpretations are different, and they assign distinct truth values to English sentences in meaningful (but ultimately inaccessible) situations. In fact, though,

when we say *water* in English means water, according to Kripke, we are applying a standard based on our recognition that English speakers intend to pick out a particular kind of stuff in their own environment.

As a community, English speakers have encountered this stuff and named it *water*. And as a community, English speakers work together to ensure first that the community maintains the referential connection between the word *water* and that stuff, and only secondarily, that the individuals in the community can themselves identify examples of the stuff in particular situations. When as observers we recognize that *water* means water, we are not summarizing the epistemic abilities of particular speakers. Rather, we are summarizing social commitments and causal connections in the community that have worked across speakers to hook the word *water* up with the stuff, and keep it that way. What philosophers of language do, ultimately, is to explain how speakers can use language to refer in shared ways to shared aspects of the world.

Kripke (1972) motivates his account with an analogy between words for kinds, such as *water*, and proper names, such as *Richard Feynman*. In the case of proper names, we can point to the social practices that initially fix the reference of a name and transmit that reference within the community. A baby boy is born. His parents call him by a certain name. They talk about him to their friends. Others meet him. The name spreads from link to link much like a chain. To use another example: Let us say that a speaker on the far end of a similar type of chain, who hears about Richard Feynman, may be referring to him even though they cannot remember from whom they first heard his name. They know Feynman is a famous physicist. A certain passage of communication reaching ultimately to the man himself does reach the speaker. The speaker is then referring to Feynman even though he or she cannot identify him uniquely. He or she does not know what a Feynman diagram is and does not know what the Feynman theory of pair production and annihilation is. Not only that, the speaker would have trouble distinguishing between Gell-Mann and Feynman (Kripke 1980).

The result is that we can judge a speaker's reference with a proper name independently of sentences that the speaker would accept or reject. In the case of common nouns such as *water*, the word has had its reference since time immemorial. Nevertheless, new speakers still link themselves into chains of reference that participate in and preserve the connection between *water* and water. So analogously, we take an English speaker's word *water* to

refer to water, independently of sentences the speaker would accept or reject.

Most philosophers of language find the Kripke/Putnam views about the meanings of names and so-called natural kind terms satisfying; it offers a close fit to an intuitive understanding of ourselves. It seems that we really do commit to use our words with the same reference as our community. And when others make claims about the world, it seems that we really do assess and dispute those claims with respect to the common standard in the community.

For example, on the Kripke/Putnam view, we inevitably focus on certain aspects of an agent's verbal behavior and not others when we assign meanings to their utterances. We do so because we locate the theory of meaning as part of a broader science of the mind, which combines a theory of language with a theory of action (including an account of our intentions and social relationships) and a theory of perception (including an account of the limits and failings of our observation). The theory of meaning in itself explains only so much—and, not surprisingly, just because we understand the meaning of someone's sentences, we do not ipso facto understand them.

Crucially, this new view predicts that some statements are necessarily true solely in virtue of the meanings of the words involved. We have already seen that it is a fact about meaning that *Richard Feynman* names Richard Feynman, or that *water* names water. We can go further. *Hesperus* names the planet Venus, *Phosphorus* names the planet Venus, *is* names the identity relation. So sentence (12) follows, just as a matter of meaning alone: (12) Phosphorus is identical to Hesperus. Given that *Hesperus* and *Phosphorus* are both names for the planet Venus, (12) must be true. There is no way that that planet could have failed to be that planet. Like sentence (12), the other facts that follow from the meanings of our language are necessarily true.

However, on the Kripke/Putnam account, facts about meaning turn out not to be knowable a priori. We discover them. To illustrate, imagine that, early on, the ancient Greeks were in an epistemic situation that left it open whether the bright object that sometimes appeared in the morning sky was the same as the bright object that sometimes appeared in the evening sky. They could not distinguish themselves from their doubles on a Twin Earth where the morning star and the evening star actually were distinct objects (alien satellites, we might suppose). These Twin Earthers would speak a language in which (12) translates into a false sentence—indeed, a

necessarily false sentence. For the ancient Greeks, however, the translation of (12) was necessarily true. Eventually, the ancient Greeks advanced their science, and improved their epistemic situation. They realized that, in our case, there is only one celestial object. At the same time, then, they discovered that (12) is necessarily true.

When we reflect on the generality of Twin Earth thought experiments, it is clear that facts about meaning are knowable a posteriori. We can imagine being quite wrong about what our world is like. In these imaginary situations, our empirical errors extend to errors we make about what our words mean. And, of course, we can also imagine disagreeing with others about what the world is like. Though we are committed to use our words with the shared reference of our community, we must be prepared to resolve our dispute by giving up facts that we think are necessarily true—facts that we think characterize the meanings of our words and the contents of our thoughts. With this model of how proper names and common nouns attach to the world before us, we are now ready to return to the puzzles alluded to above in connection with assertion.

## ASSERTION

Why would a speaker ever assert an identity statement like (12)? The trigger for a puzzle comes from arguments that sentence (12) must be true. If this is so, then consider what happens when A asserts C. We update the common ground C by intersecting it with the set of all possible worlds (situations)—the proposition expressed by Hesperus is Phosphorus—leaving exactly the same set C. A, therefore, on this model, has done nothing; the interlocutors' information has not changed at all! But obviously this result is absurd. What has gone wrong?

In fact, in assuming that assertions update the context with the proposition they express, we have implicitly assumed that the participants in the conversation have certain and complete knowledge of their language. For example, interlocutors can calculate that Hesperus is Phosphorus expresses a necessarily true proposition only if they can calculate that Hesperus names Venus and Phosphorus names Venus. Of course, under such circumstances, they do not learn anything from the sentence. It is easy to see how this assumption could go unnoticed.

In discussion, we typically assume the reference of our terms—precisely what matters in the “Hesperus is Phosphorus” case—is not at issue. However, consider how to formalize uses of sentences in more realistic situations (as we do so, we must be careful to respect the intuitions of Kripke's and Putnam's thought experiments

[Stalnaker 1978]). Suppose an interlocutor B does not know that Hesperus is Phosphorus. What that really means is that B cannot distinguish between two possible situations. In the first, there is only one heavenly body out there, and B's community speaks a language English<sub>1</sub> where both Hesperus and Phosphorus are names for that body. In the second, there are two distinct heavenly bodies, and B speaks a language English<sub>2</sub> where Hesperus is a name for one of them and Phosphorus is a name for the other. Because these possibilities are open for B, they must both also be represented in the common ground.

Now, we need a correspondingly expressive notion of assertion. When interlocutor A says something, A is committed that it is true according to the standards for reference that prevail in the community. Any assertion that A makes should turn out to be true in the language A speaks. What we have just seen is that any point of evaluation *w* in the common ground could potentially have its own language English<sub>*w*</sub> with relevant differences from English as spoken in the real world. Adapting Stalnaker's (1978) terminology, we can associate any utterance *u* with a diagonal proposition; this proposition is true at a point *w* if the proposition that *u* expresses in English<sub>*w*</sub> is true in *w*.

In the case of Hesperus being Phosphorus, the effect of A's assertion is to intersect the common ground with this diagonal proposition. Concretely, we retain in the common ground worlds of the first kind, where English<sub>1</sub> is spoken, Hesperus and Phosphorus are necessarily the same and A's assertion is necessarily true. However, we discard from the common ground worlds of the second kind, where English<sub>2</sub> is spoken, Hesperus and Phosphorus are necessarily different and A's assertion is necessarily false (there is substantially more to be said about the relationship between utterance meaning and the information that interlocutors convey).

## METHODOLOGICAL ISSUES

We have seen that many important philosophical issues have to be settled in advance before a theorist can construct a compositional meaning theory for, say, English in order to account for linguistic competence with English. For example, the theorist is required to be guided by some idea of what counts as getting it right. If the goal is to get a set of axioms from which the theorist can infer the literal meaning of all possible English sentences, he or she needs to have some idea of how to determine that a particular theory implies the correct literal meanings. Here are four interrelated philosophical topics devoted to such methodological issues:

- **Semantics-Pragmatics Distinction:** Within the totality of communicated content (all the information communicated by an utterance) it is difficult to distinguish between the literal content and that which is generated through various pragmatic mechanisms (it has proved exceedingly difficult to distinguish between semantic content and pragmatic content). Any theory of meaning must incorporate criteria that distinguish different kinds of content and tells us how to classify content. Many debates in philosophy of language are based, in part, on different ways of drawing the semantics—pragmatics distinction.
- **Role of Appeals to Intuitions:** Most arguments in philosophy of language appeal to intuitions. We appeal to intuitions about what was said about grammaticality, about inferential connections, and sometimes about what would be true in other possible worlds. No position in the philosophy of language can be defended without various appeals to intuitions. That raises two questions: Why should we think intuitions provide us with reliable evidence? What kinds of intuitions should we rely on?
- **The Nature of Meaning:** How a philosopher of language goes about constructing a theory of meaning will depend on what he thinks meaning is. Are meanings entities? Is meaning reducible to something else? Do we even need to appeal to meaning or can we leave it out of theory of communication? The meanings of sentences are often referred to as propositions. What are propositions? These foundational issues have dominated discussion in philosophy of language for centuries.
- **The Nature of Languages:** There is an ongoing philosophical debate about what languages are, what kind of objects they are. Some think they are abstract objects, some think they are social/public objects, some think they are psychological structures, some think natural languages such as English should play an important theoretical role, some think they are superfluous in a serious meaning theory.

## WIDER PHILOSOPHICAL IMPLICATIONS

To the noninitiated, research in the philosophy of language can seem technical and without deep philosophical implications. However, any such perception is simply the result of ignorance. Debates in the philosophy of language have wide-reaching implications for all branches of

philosophy and research in those other branches inevitably make assumptions about issues that belong under the rubric *philosophy of language*. Indeed, it is not possible to do serious work in any branch of philosophy today without a solid training in the philosophy of language.

The list of such important connections between the philosophy of language and the rest of philosophy could be made very, very long indeed. Limitations of space require we restrict attention to a few topics—epistemology will be one of them. Some of the most discussed contemporary positions in contemporary epistemology draw in a very direct way on views from the philosophy of language.

David Lewis (1996) claims that the epistemological skeptic (i.e., someone who argues that knowledge is impossible) can be refuted once the correct theory of meaning for *know* is adopted. According to Lewis, the correct theory for *know* is one that assigns it a context sensitive meaning, much as with the expressions *I*, *you*, and *here*. Obviously, once someone claims that the meaning of an expression is context sensitive, they become accountable to the philosophy of language. The theory of meaning for context sensitive expressions such as *I* is well-evidenced, and so, if *know* is like them it will have to stand up to certain qualifying tests all such expressions satisfy.

Putnam (1982) argues that his theory of meaning and reference implies that the skeptic's central argument is incoherent. His argument is based on a philosophical position on the nature of meaning. To the extent that his theory of meaning stands up to the scrutiny of the philosopher of language, skepticism may be refuted.

Kripke (1972) argues, as we saw above, that his theory of proper names refutes the traditional view (going back at least to Immanuel Kant) that necessary truths can only be knowable a priori and contingent truths only a posteriori. According to Kripke, it follows from the theories of meaning for proper names and natural kind terms such as *gold* and *tiger* that we can discover necessary truths empirically (many scientific discoveries turn out to be discoveries of necessary truths), and it turns out that we can gain knowledge of contingent facts a priori.

Some of the most discussed contemporary positions in contemporary metaphysics also draw in a very direct way on views from the philosophy of language. Kripke (1972) argues that his theory of reference implies that mental states cannot be physical states (i.e., that materialism is false).

Some of the most discussed contemporary positions in contemporary value theory draw in a very direct way on views from the philosophy of language also. One of the central strands in contemporary ethics is called expressivism. This is the view that sentences containing moral terms (e.g., *good*, *bad*, *should* and so on) cannot be true or false. They serve simply to express attitudes. Expressivism is a view about the meaning of words (Ayer 1946).

Ernest Lepore (2005)

## PHILOSOPHY OF LANGUAGE IN CONTINENTAL PHILOSOPHY

The task of the philosophy of language within the tradition of continental European philosophy has been to overcome the idea of language as an instrument or as a means at the disposal of human beings. Although it has proved possible retrospectively to see Georg Wilhelm Friedrich Hegel (1770–1831) as a resource for this task, Johann Georg Hamann (1730–1788) and Wilhelm von Humboldt (1767–1835) both contributed more. Hamann was the first to give centrality to language and Humboldt, with his formulation that language is an *energeia* not an *ergon*, an activity not a work, opened the door to a more dynamic approach to it. However, it was not until the second half of the twentieth century that these insights were fully explored and decisively surpassed.

### MARTIN HEIDEGGER

Martin Heidegger's attempt to go beyond the instrumental and expression theories of language is most pronounced in his later thought, especially in *On the Way to Language*. His formulation, *Die Sprache spricht* (language

speaks) is an effort to displace the centrality of the human subject in accounts of language: It is not primarily the human being, but language, that speaks. The human being speaks only in response to language. This insight arose when he shifted his focus from everyday speech, which is explored at length in *Being and Time* as part of his account of everyday existence, to the poetic word. Already in 1936, in “The Origin of the Work of Art” (2002 [1950]), Heidegger claimed that it was not the human being, as in *Being and Time*, but art and most specifically poetry, that brings beings into the open and gives to human beings their outlook on themselves. This led directly, some ten years later, to the famous formulation of his *Letter on “Humanism”* (1998 [1947]) that “language is the house of Being” (p. 239). It announces not only the sense in which humans inhabit language, but also the sense in which the human being belongs to the historical destiny of Being and is called to respond to it. The implications of this account emerge not only in his readings of the poetry of, for example, Friedrich Hölderlin, Stefan George, Rainer Maria Rilke, and Georg Trakl—readings that are directed to undergoing an experience with language such that language transforms people—but also in his reading of the history of philosophy, where thinkers are understood to be saying the word of Being for their time. The words of Being function, somewhat like the work of art, to found a world.

Heidegger’s approach to language is directed against the tendency to understand language in terms of something else, such as activity, spirit, or world view. That is why the focus falls on experiencing language. It is Heidegger’s view that language shows itself as language only when language comes to be infused with silence. Language comes to be infused with silence mundanely when language fails people so that they are lost for words. For Heidegger, the thinker experiences something similar at a more profound level at the end of European and North American metaphysics. At that time the thinker lacks a word for Being and so can no longer accomplish the philosophical task of naming Being, for example, as *idea*, *energeia*, *subjectum*, or will. Indeed, for Heidegger it is only the lack of a word for Being in our epoch that gives rise to the insight that naming Being was the philosopher’s task. However, this is not a negative experience. It is in the experience of language that Heidegger positions his thought as no longer metaphysical, albeit it is not yet beyond European and North American metaphysics. That Heidegger’s clearest accounts of this experience arise in the course of his readings of Hölderlin and George show the extent to which his own self-understanding was moulded by the dialogue between poetry and thinking.

## MAURICE MERLEAU-PONTY

Like Heidegger, Maurice Merleau-Ponty in *Phenomenology of Perception* (1962 [1945]) distinguished a creative or speaking speech that formulates for the first time, which he called *parole parlante*, from ordinary or spoken speech, *parole parlée*. What unites all of Merleau-Ponty’s texts on language is a concern for the creative aspect of language, its capacity to say what has never been said, which he explored as an antidote to the dream of some philosophers to develop a transparent, algorithmic, language. However, unlike Heidegger, Merleau-Ponty’s approach to language was from the outset already informed by psychology, and by the late 1940s he had begun to incorporate developments in linguistics. This tendency culminates in “Indirect Language and the Voices of Silence,” which begins with Ferdinand de Saussure’s insight that meaning is a function of the differences between words, their divergence from each other. Words do not directly signify anything; they are not tied to a preestablished signification. There is thus an “instructive spontaneity” of speech that leads Merleau-Ponty to the insight that people do not speak of Being so much as Being speaks in them, a formulation with clear Heideggerian echoes. The vitality of speech is also apparent when in a conversation one can no longer tell, as Merleau-Ponty famously puts it, what comes from one’s dialogue partner and what is one’s own contribution.

## HANS-GEORG GADAMER

Dialogue is also at the core of Hans-Georg Gadamer’s account of language. In his philosophical hermeneutics, which he developed in most detail in *Truth and Method* (1989 [1960]), he highlighted how in dialogue one seeks to reach an understanding with a living person or a text about some topic. However, underlying the effort to reach agreement was an already existing agreement because every dialogue presupposes a community of language as the element in which the dialogue takes place. Hence he conceived the task of a hermeneutical reflection on language not as that of investigating how each language in spite of its differences from other languages could say everything it wants to say, which he characterized as a concern of the philosophy of language and linguistics. His question was rather how to make sense of the intimacy of thought and language because language is not a prison, which is evident because one can readily come to understand a foreign language. Gadamer’s answer was to reject accounts of language that relied on conventionalism and preschematization in favor of an account that emphasized its generative and creative power. This led

Gadamer to formulate the idea of the virtuality of language, by which he meant its inexhaustibility, its capacity to exceed what has already been said. Gadamer's account of the infinite resources of language can be seen as an attempt to resist Heidegger's account of the breakdown of the function of language within European and North American metaphysics, but he shared with Heidegger the conviction that language has people in its grip, that it speaks people more than people speak it. As evidence for this view he cited that the time when a text was written can be more precisely determined by its linguistic usage than from its author.

### JACQUES DERRIDA

At the heart of Jacques Derrida's understanding of language is his identification of European and North American metaphysics with logocentrism, such that the alleged primacy of presence within European and North American metaphysics is reflected in the alleged transparency of speech and the speaker's mastery over it. By contrast, writing, even before it reaches its destination, is organized around the absence, and possible death of the sender or the addressee, or both. Derrida's deconstruction of logocentrism is sometimes mistakenly understood as a championing of writing to compensate for its previous reduction to the status of a mere supplement to speech, for example, as when Plato presented it as an aid to memory. Nevertheless, Derrida's interest is not so much in what is normally understood by writing as in what he calls arche-writing or protowriting, which is the condition of all forms of language, indeed of all organized systems. Derrida's use of the word "writing" in this contest is strategic: It is intended to reverse the priority of speech over writing, but only as a prelude to passing beyond the opposition between them both.

As Derrida explained in *Of Grammatology* (1976), the inflation of the sign *language* is the inflation of the sign itself. He presented this as a symptom of the historical epoch in which what had finally been gathered under the name *language* came to be summarized as *writing*. Derrida thus does not advocate grammatology in the sense of a science of writing, but, engaging in his own form of grammatology in the sense of a provisional science of textuality, he finds that both linguistics and psychoanalysis fail to recognize the resistance of language to pure ideality, and thus fail to escape logocentrism. However, once made thematic, this tension need not be regarded negatively. By shifting the focus to textuality Derrida draws attention to the way that one can find, for example within the language of Saussure and Sigmund

Freud, both the symptoms of the logocentrism of European and North American metaphysics and the trace of what it represses. Derrida performs a similar operation on Heidegger, from whom he had initially drawn the basic outline of his account of European and North American metaphysics. In this way, Derrida continued Heidegger's project of overcoming the conception of language as instrument or medium, but without relying on poetic language to accomplish the task, as had been the case with Heidegger, Merleau-Ponty, and Gadamer.

## PHILOSOPHY OF LANGUAGE IN INDIA

The earliest Indian thinking about language, found in Vedas (Arapura and Raja 1990), is speculative, but later

discussions involve sophisticated arguments among various schools of thought. These discussions, which concern speech units (Sanskrit *śabda*, “sound, speech element, word”) and associated meanings (*artha*), share certain themes. One is epistemological. Sounds are evanescent; an instant after they are pronounced they disappear. Consequently, the question arises: How can one rightly speak of complex units like words (*pada*) and sentences (*vākya*) as perceptible entities? Similarly, though one speaks of actions and things involved in them, it is also arguable that acts and things which are thought to be perceived as wholes actually are not so; there is a stream of instants, none of which lasts long enough to enable a qualified cognition of complex external entities. How, then, can one maintain that speech units signify actual actions and things? The second point concerns theory and procedure. Indian scholars operate with constructs in order to account for facts and behavior. This approach was evident already at an early period (ca. 7th c. BCE), when Vedic scholars posited constructed analyzed texts (*pada-pāṭha*) from which the Vedic texts as continuously recited (*samhitāṭha*) were derived by rules.

Indian thinkers accept certain means of acquiring knowledge, referred to as *pramāṇa* (a derivative of *pra-mā* [3rd sg. pres. *pramimīte*], apprehend”). At least two *pramāṇas* are generally accepted: direct perception (*pratyakṣ*) and inference (*anumāna*). A third, verbal transmission (*śabda āgama*), is accepted by others, including Patañjali’s yoga system. A means of knowing through similarity of one thing to another (*upamāna*) makes up a set of four *pramāṇas* adopted by a major school of logicians, Nyāya. Not all thinkers, however, accept *śabda āgama* as a separate *pramāṇa*; some account for knowledge acquired verbally through inference.

## MEANINGFUL UNITS AND SYMBOLS

Systematic speech sounds—vowels (*a, ā, i, ī*, etc.) and consonants (*k, kh, g, gh, ṅ*, etc.) are distinguished from mere sounds (*dhvani*) such as the noise made by a drum. Classes of larger units are also recognized, the major ones being nominal forms (*nāman*), verbs (*ākhyāta*), preverbs (*upasarga*), and particles (*nipāta*); for example, *gauḥ* (nom. sg.), “cow, ox,” *gacchati* (3rd sing. pres.), “goes, is going,” *upa* in *upa gacchati*, “approaches,” and *vā*, “or,” respectively.

At an early stage, represented in pre-Pāṇinian texts and alluded to in later works like Patañjali’s great mid-second-century BCE commentary (*Mahābhāṣya*) on Pāṇini’s c. fifth-century BCE grammar, verbs and nouns were defined semantically. In one view, verbs signify vari-

eties of being (*bhāva*): something comes into being (*jāyate*, “is born”), continues to be (*asti*, “is”), undergoes change while remaining the same entity (*viparaṇamate*, “changes”), increases (*vardhate*, “grows”), decreases (*apakṣiyate*, “diminishes”), and ceases to be (*vinaśyati*, “perishes”). Some scholars reduce these to three stages, with the second encompassing the third, fourth, and fifth. Alternatively, verbs are considered to signify particular actions (*kriyā, karman*), the most general action being signified by *kr*, “do.” This definition is supported by usage: (1) *devadattaḥ pacati*, “Devadatta is cooking,” is an appropriate answer to (2) *kim karoti devadattaḥ*, “What is Devadatta doing?” These two views are superseded by considering that whatever a verbal base (*dhātu*) signifies—now spoken of as *kriyā* or *bhāva*—is conceived of as involving continuity in time, always associated with some time. As a consequence, not only terms such as *kr* (*karoti*), “do,” *pac* (*pacati*), “cook,” and *vraj* (*vrajati*), “go,” but also ones like *as* (*asti*), “be,” *ās* (*āste*), “be seated,” and *sthā* (*tiṣṭhati*), “come to a stand, be in place,” are now part of a single class of units signifying *kriyā/bhāva*. The canonical statement of this position, which can be seen already in the *Mahābhāṣya*, appears in Bharṭṛhari’s mid-fifth-century *Vākyapadīya* (3.8.1): whatever is always spoken of as something to be brought to accomplishment, whether it is already accomplished or not, is referred to as *kriyā* (“action”) by virtue of its taking on a sequential status.

Contrasting with such semantic definitions, there is a formal approach, epitomized by the grammarian Pāṇini, who assigns to his class of units called *dhātu* verb bases listed in an appendix to the main corpus of rules and to items derived from both verbs and nominal forms (Cardona 1997).

There is a conception of units under which words are groups of sounds and larger units are groups of words. This view is represented in the section of Kauṭilya’s *Arthaśāstra* (disputed date but not later than the third century CE) that deals with writing edicts (2.1.13–14) and in other works. It is already reflected in an argument Kātyāyana (third century BCE) mentions when he speaks of a group of sounds (*varṇasaṅghāta*) as being meaningful (*arthavat*). The same view is presupposed in the *Ṛgvedaprātiśākhya* (2.2), which describes the continuous recitation of a text (*samhitā*) as consisting in one’s continuously putting together the last sounds of words (*padāntān*) with the initial sounds (*padādibhiḥ*) of following words, without any temporal separation (*kālavyavahānena*). Pāṇini himself (1.4.109: *paraḥ sannikarśaḥ samhitā*) states that the maximum drawing together (*paraḥ sannikarśaḥ*) of sounds is called *samhitā*. One may

consider that such a procedure accepts that sounds do actually come together to form larger units, but it is also possible that this is an artifact necessary for the proper description by rules of what is found in a language.

From an argument presented by Kātyāyana and Patañjali, it is clear they were aware that one cannot speak of physical sounds truly co-occurring in immediate succession, for example, *gauḥ*, “cow” = *g-au-ḥ*. For speech does not produce two sounds simultaneously, since sounds (*varṇānām* [gen. pl.]) have the property of disappearing immediately upon being pronounced (*uccarita-pradhvaṁsivāt* [abl. sg.], Kātyāyana’s *vārttika* 10 on 1.4.109: ... *uccarita-pradhvaṁsivāca varṇānām*). As Patañjali explains: when *g* is pronounced, there is no *au* or *ḥ*; when *au* is pronounced, there is no *g* or *ḥ*; and when *ḥ* is pronounced, there is *g* or *au*.

If there is no physical composite unit such as *gauḥ*, the question arises: What is it that it is understood to signify? Two approaches were taken on this issue. One involves memory. It is assumed that when a sound is perceived, this experience leaves in one a lasting trace (*saṁskāra*, *vāsanā*); the last sound uttered in a given stretch produces a cognition accompanied by the traces left from preceding cognitions of sounds, and this final cognition is what produces an understanding of meanings of words and the sentences they make up. Alternatively, sounds are considered merely to manifest (*vyāñj*) actual meaning bearers. These signifiers are posited elements called *sphoṭa*, distinct from physical sounds but manifested (*vyāñgya*, “to be manifested”) by them. Three major *sphoṭa* types are assumed: sentence (*vākyasphoṭa*), word (*padasphoṭa*), and subword meaningful elements (*varṇasphoṭa*) such as bases and affixes.

The first of these views was proposed at least by the time of the Mīmāṃsaka commentator Śabara (second century) and was accepted by adherents of different schools. The *sphoṭa* theory was first expounded fully by the grammarian-philosopher Bhartṛhari and remained basically the position of grammarians. Each of these positions was subjected to criticisms. Arguments against the first revolve about the nature of memory, what is recalled, and in what manner; the main argument against the *sphoṭa* position is that it requires positing units which one can do without.

## WORD-MEANING RELATIONS

Speakers and hearers communicate and understand messages by means of words and sentences of a language they share. It is therefore universally accepted that a relation (*sambandha*) holds between words (*śabda*, *pada*) and

meanings (*artha*) and that this relation can be a direct or indirect one, respectively called *śakti* (“capacity”) or *abhidhā* (“signifying”) and *lakṣaṇā* (“secondary meaning relation, metaphor”). A term that directly signifies (*vācaka*) a meaning is qualified as *śakta* (“capable”) and its meaning as *śakya*, the object of this capacity. For example, *gaṅgā* directly refers to a flow of water, the river Gaṅgā. By *lakṣaṇā*, the same term can refer to the banks of the river. Thinkers of different schools engaged in arguments concerning both the nature of what is signified and the relations that link words and their meanings.

Concerning what words signify, at one extreme there is the view that terms like *ghaṭa*, “clay pot,” *aśva*, “horse,” *pac*, “cook, bake,” refer to actual external entities, including actions one can witness. Other positions start from the observation that what one can actually perceive is not such an external thing (*vastu*) or action (*kriyā*): The latter is a stream of moments (*kṣaṇa*) that are beyond direct perception, and the former also can be broken down into such moments. The putative wholes treated as having identity are mental constructs (*vikalpa*).

One view consequent on this observation, adopted by certain Buddhist thinkers, is that signification applies negatively, being a removal or differentiation (*apoha*) of all that is not the momentary entity in question, which is thus differentiated (*apodha*, “removed”) from all others. The relation between a word—itsself a construct—and its significand is then one of cause (*kāraṇa*) and effect (*kārya*): Words have mental constructs as their sources and bring about a comprehension of mental constructs. Although they accept that words and their meanings are related as signifier and significand (*vācyavācakabhāvasambandha*), Pāṇinian grammarians such as Bhartṛhari—with earlier precedents—also consider the cause and effect relation acceptable and conceive of the significands as word-meanings (*śabdārtha*) that are mental (*bauddha*) and not necessarily external objects (*vastu*).

In this connection, grammarians speak of a *vivakṣā*, a desire to speak about things in a particular manner. For example, it is in the nature of things that a sword (*asi*) serves as a means of cutting; one says, for example, (3) *devadattḥ asinā chinatti*, “Devadatta is cutting with a sword,” using the instrumental *asinā* to refer to a sword as a means. If a sword is quite sharp, one may also appropriately say (4) *asiḥ sādhu chinatti*, “the sword (*asiḥ*, nom. sg.) cuts well (*sādhu*),” speaking of a sword as an agent of cutting in the same way that (3) refers to Devadatta as an agent. In order to account for such usages, Pāṇini orders a group of rules that assign direct participants in the

accomplishment of actions (*kāraka*) to particular categories in such a manner that the participant in question is eligible to be assigned both to the category of participants called *karāṇa*, “instrument,” by virtue of being the means (*sādhakatama*, “which is means more than any other”) of accomplishing an act and, by a later rule, to the category of agents (*kartr*) by virtue of being an independent (*svatantra*) participant. Since a sword cannot be spoken of as an independent participant in the act of cutting without one’s simultaneously considering it a means used by someone, this involves a conflict (*vipratishedha*), and Pāṇini provides explicitly that in case of such conflicts, what is provided for by a subsequently stated rule takes precedence over the provision of a preceding rule (see Cardona 1974). In connection with such situations, Patañjali notes that this involves what he calls *laukikī vivakṣā*, “communal desire to speak”; that is, it is not a matter of individual preference but of the way a community of speakers (*loka*, “world”) expresses itself.

There is also the point of view that words have a natural relation of fitness (*yogyatā*) with their meanings, comparable to the fitness of different sense faculties with respect to what is perceived. Moreover, words and their meanings are commonly identified with each other.

However one conceives of the relation, each generation acquires a knowledge of words related to their meanings by observing how people interact. For example, a child witnesses an interaction between his father (F) and his grandfather (G): G says (5) *gām ānaya*, “bring the cow,” to F, who then brings a cow, but F brings a horse when G says to him (6) *aśvam ānaya*. The child learns therefrom that *gām* and *aśvam* respectively designate a cow and a horse. This is an instance of reasoning from concurrent presence (*anvaya*) and absence (*vyatireka*): (a)  $x \rightarrow y$ , (b)  $\bar{x} \rightarrow \bar{y}$ . If both hold, then  $x$  which precedes  $y$  is its cause. Thus, if a given meaning is understood when a given term or member of a set of terms is used and not understood when this is not used, then the comprehension of the meaning in question is said to be caused by the term, to which this meaning is attributed.

Assuming that words designate positive significands, in ordinary usage one thinks of the term *go*, “cow,” as referring to something that one can see and speak of repeatedly, using the same term. Moreover, in order to account for the repeated cognition of a cow each time one is seen, which can be verbalized saying (7) *iyam gauḥ*, “this is a cow,” it is assumed that each cow belongs to a class characterized by a class property (*jāti*), “generic prop-

erty”) that inheres in every member: *gotva* (“the property of being a cow”).

If one assumes that a word-meaning relation is learned between an instance of the term *go* and a particular cow and also assumes that when another instance of *go* is used it too can refer to this particular cow, then the reasoning procedure shown above is violated, since one now has  $y$  in the absence of  $x$ . To assume that a separate relation is grasped between each instance of *go* and each individual (*vyakti*) cow has the consequence that no speaker can acquire the knowledge of such an infinite number of relations. Various solutions are proposed to remedy the situation (see Deshpande 1992 and Scharf 1996). One view, espoused by Mīmāṃsakas, is that the primary word-meaning relation is between a term and the class property (*jāti*). A sentence such as (5) is used, however, with the intention (*tātparya*) that someone bring a cow, not a class property. This is accounted for by assuming that in such an utterance *gām* signifies not only a class property, through a primary relation (*śakti*), but also a particular cow, through the secondary relation called *lakṣaṇā*. An alternative to this position is adopted by grammarians and logicians of the Nyāya school: A term like *go* signifies an individual (*vyakti*) qualified (*viśiṣṭa*) by its class property.

There are other instances where *lakṣaṇā* is said to operate. Consider (8) *kuntān praveśaya*, “have the javelins (*kuntān* [acc. pl.]) come in (*praveśaya*).” *Praveśaya* is a form (2nd sg. imper.) of a causative verb whose non-causal is *praviś* (3rd sg. pres. *praviśati*) “enter.” Javelins cannot enter a room of themselves, so they cannot be caused to perform this act in the same way that one can cause people to enter a room. In order to make sense of the intent (*tātparya*) of a speaker who uses (8), it is accepted that *kunta* here bears a secondary relation with the men who bear javelins. In the same vein, consider (9) *gaṅgāyām matsyāḥ*, “there are fish in the Gaṅga,” and (10) *gaṅgāyām ghoṣaḥ*, “there is a dairy colony on the Gaṅga.” Assuming that *gaṅgāyām* (loc. sg. fem.) is used to refer to a locus in or on which something is located, (9) makes immediate sense, but (10) is hard to understand: fish can live in a river but a village of dairymen cannot be located physically in or on a body of flowing water. It is assumed, then, that in (10) *gaṅgā*, which bears a primary word-meaning relation with a river, now bears a secondary relation with its bank (*tīra*).

(10) involves an assumed semantic incompatibility such that it is not possible for the primary meanings of *gaṅgāyām* and *ghoṣaḥ* to be related. However, it is not sufficient to say that what prompts one to understand a sec-

ondary meaning here is solely the impossibility of the referents being connected (*anvayānupapatti*). For this could be resolved also under the assumption that *ghoṣa* has a secondary relation with fish, so that (10) is understood to say what (9) says. Yet this is not the case: A person who hears (10) understands it to say that a dairy colony is located on the edge of the Gaṅga. Accordingly, the major reason prompting a secondary word-meaning relation is considered to be the impossibility of reconciling the primary meaning of a term with the intention (*tātparyā*) of a speaker.

Understanding (8) and (10) in the way shown involves setting aside the primary meanings of *kunta* and *gaṅgā*. Consider now (11) *arko' starī gataḥ*, “the sun (*arkaḥ*) has set (*gataḥ*, “gone,” *astam*, “home”).” This can have its literal meaning. Without rejecting this meaning, moreover, there are several possible meanings that can be suggested (*vyaṅgya*, “to be made manifest”), depending on contexts and the persons uttering (11). For example, a go-between saying this to a woman who is to meet a lover suggests it is time to set out, but a servant saying this to a Brahmin means to imply that it is time for his master to perform the evening prayer. Another function of words is therefore considered, called *vyañjanā* (usually translated “suggestion”). This is principally accepted by theoreticians of poetics, though later Pāṇinian grammarians accept it, mainly because under the theory that a meaning bearer is a *spṛṣṭa*, which is manifested (*vyaṅgya*) by physical sounds.

## SENTENCE AND SENTENCE MEANING

Adherents of various schools of thought in ancient and medieval India adopted different views concerning sentences and their meanings. One position—most systematically elaborated and defended first by Bhartṛhari—is that the true unit of communication is an atomic (*akhaṇḍa*) sentence (*vākya*), associated with an equally atomic sentential meaning, considered to be the object of a single flash of knowledge, hence referred to as *pratibhā* (“flash”). This thesis can be justified in so far as actual communication involves whole utterances, but it encounters the problems mentioned earlier in connection with words and their meanings: it is not possible for one to acquire a knowledge of all relations between all possible atomic sentences and their meanings. Moreover, a grammarian’s aim is to give a generalized description of all possible sentences in terms of their structures, both formal and semantic, which is impossible if this thesis is taken strictly. Hence, Pāṇinians agree that at least one lower level—of words—must be accepted in terms of

both language learning and description. They maintain, however, that words and their constituent bases, affixes, and so forth are constructs posited in order to account for whole utterances.

Under another view, held by some Mīmāṃsakas, there are no sentences qua distinct meaningful units. The sentential meaning of any stretch one calls a sentence is now accounted for indirectly, through the meanings of individual words. A parallel is drawn with the effect produced by utterances such as (12) *putras te jātaḥ*, “You’ve had a son” (*putraḥ* [nom. sg.], “son,” *jātaḥ* [pptcple. nom. sg. m.], “born,” *te* [dat. sg.], “to you”) or (13) *garbhiṇī te duhitā*, “Your (*te* [gen. sg.]) daughter (*duhitā*) is pregnant (*garbhiṇī*).” Each of the words of these sentences signifies its particular meaning. These word meanings are then related to each other in accordance with the speaker’s intention (*tātparyā*) to convey a message and the hearer’s semantic expectation (*ākāṅkṣā*) that each meaning has to be linked to other meanings of words in the utterances. The effects are happiness on the part of a man who learns he has had a son and sadness on the part of a man who learns his unmarried daughter is pregnant. Similarly, the words of all utterances denote only their individual meanings, which are then related to each other. An intermediate position is taken by logicians of the Nyāya system, who consider that the meaning of an utterance is apprehended through the intermediary of related words: The first word is first cognized as shown earlier, with the consequent memory of the word-meaning relation and a memory trace of the word and its meaning, then this process is repeated until, with the perception of the last word, a cumulative memory trace results of all the words and their meanings related to each other.

Whatever position one takes, two requirements apply to sentences. First, constituents must be in proximity (*āsatti*): each word following the first word of a sentence is uttered immediately after the preceding word, without the intervention of any term that is not syntactically related to the others. Secondly, there must be semantic expectancy (*ākāṅkṣā*), so that a hearer expects that the meaning signified by a word such as *gām* in (5) is connected with an action, since it contains an object-signifying suffix, and *ānaya* requires an object. As shown, the intention of a speaker (*tātparyā*) also comes into play. Another requirement must be met if one is mainly interested in an utterance’s serving as a means of conveying true knowledge: semantic compatibility (*yogyatā*, “the property of being connectible”). For example, each word of (14) *agninā puṣpāṇi siñcati*, “... is irrigating (*siñcati*) flowers (*puṣpāṇi* [acc. pl.]) with fire (*agninā* [instr. sg.],”

conveys a meaning that is immediately understood. (14) cannot, however, convey a meaning acceptable in our world, where the act of irrigating requires a liquid (*dravadravyya*) as a means. Accordingly, Naiyāyikas would deny that (14) has the status of *pramāṇa*. One might go so far as to deny that (14) produces a verbal cognition (*śābdabodha*). Against this, the following is pointed out. Upon hearing (14), a person would respond by asking how one can speak of irrigating with something that is not a liquid? The hearer has indeed related the meanings of the words in the well-formed utterance (14) according to their syntax, but the resulting sentence meaning is not acceptable in the world as we experience it.

Adherents of different schools differ also concerning the ways in which verbal cognitions (*śābdabodha*) are portrayed. Pāṇinian grammarians, logicians of the Nyāya school, and Mīmāṃsakas of the Bhāṭṭa school can agree that (15) *devadattaḥ kaṭam karoti*, “Devadatta is making (*karoti* [3rd sg. pres.]), a mat (*kaṭam* [acc. sg.]),” speaks of a given man making a mat. On the other hand, they give different paraphrases reflecting what they consider to be the *śābdabodha* prompted by this sentence, reflecting the preoccupations and theoretical premises of different schools of thought (see Cardona 1975 and Matilal 1985). Pāṇini accounts for the structure of Sanskrit through a set of derivational rules starting from semantics, and this is most efficiently done under the assumption that the principal meaning of (15) is the action. Naiyāyikas are principally interested in the values of utterances as conveyors of valid knowledge, and within this system they operate with subjects and predications, so that the main qualificand in (15) is the person referred to by *devadattaḥ*. Mīmāṃsakas deal chiefly with the exegesis of Vedic utterances related to ritual performance, and in this context the principal meaning of an utterance is the act of bringing about a result.

## CONCLUSION

These different interests and the fact that adherents of these systems and others either accepted the authority of Pāṇinian grammar or reacted to it led to ongoing arguments and counterarguments, with successive refinements over millennia, making India a center for the intense study of language and the philosophy of language.

## PHILOSOPHY OF LAW, HISTORY OF

The problems of authority, law and order, obligation, and self-interest first became central topics of speculation in the thought of the Sophists (late fifth and early fourth centuries BCE). The most famous Sophists all stressed the distinction between nature (*physis*) and convention (*nomos*), and they put laws in the latter category. They generally attributed law to human invention and justified obedience to law only to the extent that it promoted one's own advantage. Laws were artificial, arrived at by consent; the majority of acts that were just according to the law were contrary to nature; the advantages laid down by the law were chains upon nature, but those laid down by nature were free. In the time of the Sophists notions of law, justice, religion, custom, and morality were largely undifferentiated; yet in this same period some of the crucial problems of legal philosophy were first formulated, and attempts were made at a formal definition of law. Thus, Xenophon (*Memorabilia* I, 2) reported that Alcibiades, who associated with both Critias and Socrates, remarked to Pericles that no one can really deserve praise unless he knows what a law is. Pericles replied that laws are what is approved and enacted by the majority in assembly, whereby they declare what ought and what ought not to be done. He admitted that if obedience is obtained by mere compulsion, it is force and not law, even though the law was enacted by the sovereign power in the state. Xenophon also reported an alleged conversation between Socrates and the Sophist Hippias in which both maintained an identity between law, or what is lawful, and justice, or what is right, while admitting that laws may be changed or annulled (*ibid.* IV, 4). Socrates claimed that there are "unwritten laws," uniformly observed in every country, which cannot conceivably be products of human invention. They are made by the gods for all men, and when men transgress them, nature penalizes the breach.

Socrates and the Sophists, as presented in Plato's dialogues, disagreed concerning human nature. The Sophists conceived of man as egoistically motivated and antisocial, whereas for Socrates, as for Plato and Aristotle, man was a social being with other-regarding as well as self-regarding motives, who finds fulfillment in social life. By contrast, the Sophist Calicles, in Plato's *Gorgias*, holds that man is no exception to the law of nature, according to which the stronger rules; manmade laws and social institutions violate human nature. The less radical Sophists,

although they could not identify law with some feature of reality, still accepted its practical usefulness.

### PLATO AND ARISTOTLE

PLATO. There is hardly any problem of legal philosophy not touched upon by Plato. He wrote during the decline of the Greek polis, when law and morality could appear as mere conventions imposed by shifting majorities in their own interest and the harmony between the legal order and the order of the universe could not easily be maintained. Plato sought to restore, as far as possible, the traditional analogy between justice and the ordered cosmos. Justice, or right action, cannot be identified with mere obedience to laws, nor can a truly moral life be reduced to conformity with a conventional catalog of duties. Duties involve a knowledge of what is good for man, and this bears an intimate relation to human nature. The question "What is justice?" dominates Plato's *Republic*. Plato conceived of justice as that trait of human character which coordinates and limits to their proper spheres the various elements of the human psyche, in order to permit the whole man to function well. In order to understand the operation of justice in the human soul, Plato examined human nature writ large, the city-state. The state functions well when it is governed by those who know the art of government, and the practice of this art requires a positive insight into the Good. In a just society every citizen performs the role of which he is best capable for the good of the whole. Similarly, in the moral economy of the individual's life, justice prevails when reason rules and the appetites and lower passions are relegated to their proper spheres. A just social order is achieved to the extent to which reason and rational principles govern the lives of its members.

Plato's emphasis on reason found its way into his definition of law. Law is reasoned thought (*logismos*) embodied in the decrees of the state (*Laws* 644D). Plato rejected the view that the authority of law rests on the mere will of the governing power. The *Laws* contains a detailed discussion of many branches of law and is an attempt at a formulation of a systematic code to govern the whole of social life. In contrast with the ideal polis of the *Republic*, in which there would be little need for legislation, in the *Laws* Plato accepted "law and order, which are second best" (*Laws* 875D).

ARISTOTLE. Aristotle, who discussed law in numerous contexts, nowhere gave a formal definition of it. He wrote variously that law is "a sort of order, and good law is good order" (*Politics* 1326a), "reason unaffected by desire"

(*ibid.* 1287a), and “the mean” (*ibid.* 1287b). However, these must be taken not as definitions but as characterizations of law motivated by the point Aristotle was making in the given context.

Following Plato, Aristotle rejected the Sophistic view that law is mere convention. In a genuine community—as distinguished from an alliance, in which law is only a covenant—the law concerns itself with the moral virtue of the citizenry (*Politics* 1280b). Aristotle sharply distinguished between the constitution (*politeia*) and laws (*nomoi*); the constitution concerns the organization of offices within the state, whereas the laws are “those according to which the officers should administer the state, and proceed against offenders” (*ibid.* 1289a). The constitution of a state may tend to democracy, although the laws are administered in an oligarchical spirit and vice versa (*ibid.* 1292b). Legislation should aim at the common good of the citizens, and justice—what is equal—should be determined by the standard of the common good (*ibid.* 1283a). Yet Aristotle recognized that the law is often the expression of the will of a particular class, and he stressed the role of the middle class as a stabilizing factor.

In his discussion of the forms of government in Book III of the *Politics*, Aristotle took up the Platonic problem of rule by the best man versus rule according to laws. A society of equals by its very nature excludes the arbitrary rule of one man. In any case, even the best man cannot dispense with the general principles contained in laws; and legal training helps to make better officers of government. Furthermore, administrators, like all men, are subject to passion, and it is thus preferable to be judged by the impersonal yardstick of the laws. This in no way conflicts with the need to change the law through legislation when it has been found by experience to be socially inadequate. But not all law is the product of legislation; customary law is in fact more important than the written law.

Aristotle’s discussion of the judicial process foreshadows many modern notions. Although it is better to have written laws than to rely completely on discretion, “some matters can be covered by the laws and others cannot” (*ibid.* 1287b20). General rules are insufficient to decide particular cases (*ibid.* 1286a26), although “well-drawn laws should themselves define all the points they possibly can and leave as few as may be to the decision of the judges” (*Rhetoric* 1354a32). Aristotle seems to have had two considerations in mind. First, judicial decision making is practical—it involves deliberation—and as such cannot be completely determined in advance. Second, the resolution of disputed issues of fact in a particular case, on which the decision depends, cannot be settled

in advance by legislation. This stress on the insufficiency of general rules connects with Aristotle’s influential discussion of equity (*epieikeia*). Equity is just, “but not legally just but a correction of legal justice” (*Nicomachean Ethics* 1137b10). Aristotle sometimes seems to suggest that equity comes into play when there are gaps in the law, so that it consists in the judge’s acting as the lawgiver would act if he were present. Yet he also seems to suggest that equity corrects the harshness of the law when adherence to the written law would work an injustice. Principles of equity are thus closely related to the unwritten universal laws “based on nature,” a “natural justice” binding on all men, even those who have no association or covenant with each other. Nevertheless, what is naturally just may vary from society to society.

The locus classicus of Aristotle’s discussion of justice is Book V of the *Nicomachean Ethics*. Generically, justice has to do with one’s relations to others, and there is a sense of “justice” that refers to the complete moral virtue of the member of the community in such dealings. There is also a sense in which “justice” refers to a particular virtue involving the fair dealings of individuals in matters handled by private law. Two kinds of rights fall under this special virtue: rights in division (where each individual claims his fair share of goods, honors, and so on) and rights in redress (for wrongs done by one individual to another, such as failure to fulfill a contract).

## ROME

**STOICS.** The Stoics, who conceived of the universe as a single, organic substance, exercised a lasting influence on legal thought. Nature, which exhibits structure and order, and man both partake of intelligence, or reason (*logos*). An animal is directed by a primary impulse toward self-preservation that adapts it to its environment. In man, reason is the “engineer of impulse,” and man’s actions may be evaluated only within the framework of the whole of nature. The criterion of moral action is consistency with the all-determining law of nature (*koinos logos*). This conception of a law of nature that is the ultimate standard of human laws and institutions was combined with Aristotelian and Christian notions to form the long-standing natural-law tradition of medieval legal philosophy. Another important Stoic contribution was the belief in the equality of all men in a universal commonwealth and a rejection of Aristotle’s doctrine of slavery.

**CICERO AND SENECA.** The writings of Marcus Tullius Cicero (106–43 BCE) were important in transmitting classical legal thought to the medieval world. Although he

was a professional arguer of legal cases, Cicero's philosophical treatment of law in his *De Legibus* disclaims any interest in "clients' questions" or the "law of eaves and house-walls." His legal philosophy was essentially Stoic; he denied that the positive law of a community (written or customary), even when universally accepted, is the standard of what is just. Nor is mere utility the standard: "Justice is one; it binds all human society, and is based on one law, which is right reason applied to command and prohibition" (*De Legibus* I, 15). An unjust statute is not a true law. Law and morality are logically connected, and only that which conforms to the law of nature is genuine law. This view exercised a lasting influence on natural-law thinking and reappeared in the thought of Thomas Aquinas.

Like Cicero, Lucius Annaeus Seneca (c. 4 BCE–65 CE) aided in transmitting Stoic notions to later thinkers. He reiterated the conception of the equality of all men under natural law, but perhaps more important was his conception of a golden age of human innocence, a pre-political state of nature. Legal institutions became necessary as human nature became corrupted.

**ROMAN LAW.** The influence of Stoicism may be traced in pronouncements of the Roman jurists. It is disputed whether these were any more than remarks designed to ornament legal texts, but they nevertheless influenced the thought of later ages. The jurists distinguished three kinds of law: *jus naturale*, *jus gentium*, and *jus civile*. In practice, the last originally referred to the law of the city of Rome, but ultimately it was applied to any body of laws of a given community. The *jus gentium* first meant the law applied to strangers, to whom the *jus civile* was not applicable, and was later extended to those legal practices common to all societies. Gaius (mid-second century), who systematized the Roman law in his *Institutes*, identified the *jus naturale* and *jus gentium* as universal principles of law agreeable to natural reason and equity. Thus, law was not a mere expression of human will or institution but that which is rationally apprehended and obeyed. The *jus gentium* was not an ideal law by which the positive law was judged but the rational core of existing legal institutions.

Ulpian (c. 170–228) distinguished *jus naturale* from *jus gentium* by stating that *jus naturale* is not peculiar to human beings but is taught by nature to all animals. Thus, among animals there is an institution similar to human marriage. Slavery and its attendant rules are products of the *jus gentium*, for by the *jus naturale* all men were born free. It is not clear, however, that Ulpian

regarded slavery as bad. To him we owe the oft-repeated definition of justice: "the constant wish to give each his due" (*Digest* I, 1, 10). Following Celsus (c. 67–c. 130), he defined law (*jus*) as "the art of the good and the equitable" (*ibid.* I, 1, 1). Again, it does not seem that Ulpian thought of the *jus naturale* as an ideal law opposed to the *jus civile* or to the *jus gentium*. It has been suggested that behind Ulpian's thought was a conception of a natural state antecedent to the conditions of organized society.

The doctrines of the Roman jurists owe their lasting influence to their incorporation into the *Corpus Juris Civilis* of Justinian (sixth century), principally in the section called the *Digest*. The compilers of Justinian's *Institutes* (a section of the *Corpus Juris*) seem to have distinguished the *jus naturale* from the *jus gentium* and seem to have regarded the former as a set of immutable divine laws by which the positive law may be morally evaluated (*Institutes* I, 2, 11; III, 1, 11). The *Corpus Juris* also preserved statements of the Roman jurists concerning the source of the authority to make and unmake the laws constituting the civil law. According to a number of these statements, this authority resides in the consent of the people; however, the statement that "what pleases the prince has the force of law" (*Digest* I, 4, 1) was probably a more accurate view of the facts. Justinian seems to have combined these views theoretically in his reference to a (nonexistent) "ancient law" by which the Roman people transferred all their powers to the emperor (*Codex* I, 17, 1, 7).

## EARLY MIDDLE AGES

To the legal thought of the Stoics and the Roman philosophers and jurists the Church Fathers added a distinctively Christian element. The law of nature was no longer the impersonal rationality of the universe but was integrated into a theology of a personal, creative deity. The relationship among the Mosaic law, the Gospels, and natural law emerged as a specific problem; the notion of *jus divinum* (divine law) as a distinct type of law, along with the three recognized by the jurists, was crystallized. The notion of the fall of man from a state of perfection (which may be compared with the view of Seneca) played an important role. Thus, according to St. Ambrose (340–397) the Mosaic law—a law of sin and death (see Romans 8:2)—was given because man failed to obey the law of nature. The fact that many legal institutions, such as slavery and private property, deviate from this ideal law does not necessarily imply that they are unjust or illegitimate; for the natural law is adapted to man only in a condition of innocence.

Of the Church Fathers, St. Augustine (354–430) was perhaps the most original and complex: Only one point

in his thought will be noted here. Cicero maintained that nothing can be nobler than the law of a state (*De Legibus* I, 14) and that if a state has no law, it cannot truly be considered a state (ibid. II, 12). The law of the state must therefore embody justice, for without *justitia* there is no *jus*. Augustine considered this position in *The City of God*, Book XIX. According to Augustine, since Rome had no justice, Cicero's position has the inconvenient consequence that Rome was no state at all. We must therefore seek another definition of "state" (*populus*) in which justice is not an essential element. Augustine stressed the notion of order—"a harmonious multitude"—with the suggestion that legal order need not be moral or just. There are passages in Augustine, however, which seem to uphold a more orthodox natural-law position. In any event the terms of his discussions are somewhat different; his main points of contrast are divine and human law, rather than *jus naturale* and *jus civile*.

The sources of the natural-law theories that were to dominate Western legal philosophy for many centuries were the writings of the Greek and Roman philosophers and poets, Justinian's *Corpus Juris Civilis*, and the Church Fathers. Isidore of Seville (c. 560–636), an encyclopedist and an important transmitter of Roman thought to later writers, concisely expressed the natural-lawyer's ideal regarding positive law: "Law shall be virtuous, just, possible to nature, according to the custom of the country, suitable to place and time, necessary, useful; clearly expressed, lest by its obscurity it lead to misunderstanding; framed for no private benefit, but for the common good" (*Etymologies* V, 21).

## MIDDLE AGES AND RENAISSANCE

**CIVILIANS AND CANONISTS.** In the revived study of Roman law in the twelfth century, associated with the glossators, legal philosophy received a fresh stimulus. Of special interest are the attempts at reconciling differences among the Roman jurists on the definition of law and the classification of its branches. In the main, the civilians were in the broad tradition of natural-law thinking; *jus* flows from *justitia*, although it must always fall short of perfect justice, which is God's alone. Irnerius (c. 1050–c. 1130) thus claimed that statutes ought to be interpreted in the light of equity. Strict law requires that all agreements be kept, but equity allows exceptions to the rule. This equity, according to Azo (c. 1150–c. 1230), must be written, rather than a principle found in the judge's heart.

The middle of the twelfth century also saw the systematization of the canon law. In the *Decretum* of Gratian a high degree of jurisprudential competence was brought

to this task. The tripartite division of law of the Roman lawyers was verbally accepted, but the leading conceptions were Augustine's *jus divinum* and *jus humana*. Natural law was identified with the former, while the distinctive feature of the latter (covering both *jus gentium* and *jus civile*) was custom. Natural law is contained in the Mosaic law and the Gospels; the command to do unto others what we would have them do unto us is its fundamental principle. Natural law relates to man's rational nature and is immutable; the *mistica*, the cultic regulations found in Scripture, are part of the natural law only in their moral aspect. The commentators on Gratian further divided natural law so as to include not only commands and prohibitions but also *demonstrationes*, which point to what is good for humankind, such as possession of all things in common. In man's fallen condition custom has legitimately modified the *demonstrationes* in permitting private property and slavery. The other branches of natural law may not be abrogated and are the standards by which even the ecclesiastical law must be judged. Gratian (if not all his commentators) seems to have generally maintained a clear distinction between natural (divine) law and canon law.

**AQUINAS.** The rediscovery of Aristotle in the thirteenth century greatly influenced the further development of legal philosophy. The culmination of the natural-law tradition is the theory of Thomas Aquinas (c. 1224–1274), who integrated Stoic, Christian, and Aristotelian elements within a comprehensive philosophic system. Laws are standards of conduct that have a binding, or obligatory, character. This can be understood only if laws have some kind of rational origin. Combining this view with a teleological conception of nature and social order, Aquinas regarded legal control as purposive. Laws, he concluded, are ordinances of reason promulgated for the common good by the legitimate sovereign. Four types of law may be distinguished: eternal law, an expression of God's rational ordering of the universe; divine law, which guides man toward his supernatural end; natural law, which guides man toward his natural end; and human law, which regulates through the prospect of punishment the affairs of men in a given community in the light of that community's special requirements. Crucial to the concept of natural law are the notions of natural inclinations and right reason. "All those things to which man has a natural inclination are naturally apprehended by reason as being good and consequently as objects of pursuit, and their contraries as evil, and objects of avoidance" (*Summa Theologiae* I–II, 94). The relationship between inclination and reason, accounting for the apprehension of the natu-

ral law, has been variously interpreted. The precepts of natural law have as their common foundation the principle “Do good and avoid evil.” Natural law is a standard to which human law must conform, and Aquinas employed Aristotle’s conception of practical reasoning in explaining the derivation of human law from natural law by the legislator, thus accounting for differences between legal systems and for the possibility that rational men should disagree as to what human laws ought to be. He affirmed the long-standing view that an unjust law is no law; but although an unjust law is not binding in conscience, considerations of utility may require one to obey it. Aquinas allowed that such “laws” may be said to possess a “legal” character insofar as they are promulgated under the color of law by the legitimate prince.

Aquinas discussed in detail and with great acuity all of the problems treated by his predecessors. His influence may be traced in the English writers John Fortescue (c. 1394–c. 1476), Thomas Hooker (c. 1586–1647), and Christopher St. Germain (1460–1540). According to St. Germain, natural law is nothing other than the common-lawyer’s notion of “reasonableness.” More recent Thomistic thinkers, such as François Gény (1861–1959) and Jean Dabin, have advanced novel ideals within the Thomistic tradition.

**OCKHAM.** Some medieval writers seem to have espoused a protopositivism in their emphasis on the primacy of the will; this is characteristic of the Augustinian-Franciscan tradition. Thus, William of Ockham (c. 1285–1349) regarded the divine will as the norm of morality. “By the very fact that God wills something it is right for it to be done.” Nevertheless, it is doubtful that Ockham would have affirmed that what the sovereign commands is just. His position is somewhat unclear, however, for he—like all medieval writers—continued to use the rhetoric of natural law in his *Dialogus*: In one of its senses *jus naturale* is composed of universal rules of conduct dictated by natural reason. A right, such as the immutable right of private property, is a dictate of right reason.

**RISE OF ABSOLUTISM.** A tendency to combine natural-law doctrines with a theory of royal absolutism began in the fourteenth century. A group of civilians, known as the postglossators, undertook to forge a workable system of law out of the older Roman law, which they regarded as the *jus commune* of Europe. The technically trained administrators in the rising nation-states, they were naturally concerned with fundamental problems of legal theory. Bartolus of Sassoferrato (1314–1357) maintained that the ruler is not bound by the laws, although it is

“equitable” that he should voluntarily submit to them. The *jus gentium*, however, is immutable. Lucas de Penna (1320–1390) discussed jurisprudential questions in detail. Law is the articulation of the ethical virtue of justice, and reason is the foundation of law. At the same time he maintained, as did many civilians, that the prince’s lordship rests on divine authority. The ruler is responsible to God alone and not to the people; law is not the expression of the will of the community. Nonetheless, although the prince is unfettered by the laws, bad laws (those that contradict divine law) have no binding force. It is not clear, in Lucas’s view, whether the obligation to obey law derives primarily from the rationality of law or from the divine grant of authority to the ruler.

## LATER RENAISSANCE

**BODIN.** Jean Bodin (1530–1596), the great exponent of unlimited sovereignty under natural law whose views were apparently influenced by the fourteenth-century civilians, like them appears to have had difficulty in adapting Christian legal thought to the conditions of the secular nation-state. In his *Six Books of the Commonwealth* Bodin was emphatic that “law is nothing else than the command of the sovereign in his exercise of sovereign power.” But although the prince “has no power to exceed the law of nature,” which is decreed by God, it seems plain that Bodin no longer thought of right reason as linking natural and positive law. Bodin’s endorsement of the command theory also appears in his treatment of custom. The relative weights of positive law and custom had long been debated by the medieval lawyers, but Bodin was one of the first to hold that custom owes its legal authority to the sufferance of the ruler. In this he anticipated the idea of tacit command expressed by Thomas Hobbes and John Austin.

**INTERNATIONAL LAW.** The emergence of nation-states also brought the problem of the rational foundation of international law to the forefront of legal thinking. This development may be seen in the writings of the Spanish Thomists Francisco de Vitoria (1492/1493–1546) and Francisco Suárez (1548–1617) and of Hugo Grotius (1583–1645), a Dutch Protestant jurist with broad humanistic leanings. According to Vitoria, the *jus gentium* either belongs to or is derivable from the natural law and consists in prescriptions for the common good in the widest sense, namely, for the international community. Rights and obligations are thus conferred upon nations acting through their rulers.

The conception of a law of nations was developed in great detail by Suárez. Although his *De Legibus* is Thomistic in many respects, Suárez explicitly stated that Aquinas's account of law is inadequate. Suárez began by distinguishing laws in the prescriptive sense from laws of nature in the descriptive sense, which are laws only metaphorically. (Many positivists trace the origin of natural-law thinking to the tendency to confuse these two types of law.) With regard to prescriptive laws, Suárez defined a law (*lex*) as "the act of a just and right will by which the superior wills to oblige the inferior to this or that" or as "a common, just and stable precept, which has been sufficiently promulgated" (*De Legibus* I, 12). The reference to stability is notable: Laws generally survive both the lawgiver and the populace living when they are enacted, and they are valid until abrogated. Such considerations have led recent writers to reject the identification of laws with mere acts of will; but although Suárez rejected the voluntaristic notion of natural law associated with the Ockhamists, he held that the civil law is enacted "more by the will than by reason." It is not derived from natural law by logical inference but by "determination," and hence is, in a sense, arbitrary (*ibid.* II, 20). Most medieval writers tended to use *lex* and *jus* interchangeably; Suárez, however, defined the latter as "a certain moral power which every man has, either over his own property or with respect to what is due to him" (*ibid.* I, 2). Although Aquinas briefly discussed *jus naturale* as contrasted with *jus positivum* (*Summa Theologiae* II–II, 57), the concept of a "natural right" was almost entirely absent from his thought. It is clearly present in Suárez, who, in the style of John Locke (1632–1704) and the Enlightenment philosophers, formulated a list of natural rights. Nevertheless, the individualism of these writers is not present in Suárez. His attitude was quite remote from eighteenth-century natural-law and natural-right theorists, who thought that a perfect system of law could be deduced from the natural law.

Despite Grotius's tendency to underestimate his predecessors, his *De Jure Belli ac Pacis* (1625) clearly showed the influence of such writers as Vitoria and Suárez. He developed their notion of a "just war," a topic that was still discussed by Hans Kelsen (1881–1973) and other twentieth-century theorists concerned with the problem of sanctions in international law. Just wars presuppose the existence of laws governing relations between sovereign states; such laws have their origin in natural law and in treaties, which in turn presuppose precepts of the law of nature. The denial of the existence of natural law supposes that men are egoistically motivated, accepting law as a "second best." However, following Aristotle and

the Scholastics, Grotius held that man is social, altruistic, and rational. Therein lies the origin of law, which would be binding whether or not God exists. This statement has been regarded by historians as epoch making; they claim that Grotius separated jurisprudence from theology. More important, perhaps, is the tendency in Grotius and others who followed him to identify natural law with certain rational principles of social organization, and thus to loosen its tie with the Stoic metaphysical conception of the law of nature.

## SEVENTEENTH TO LATE NINETEENTH CENTURIES

**HOBBS AND MONTESQUIEU.** Thomas Hobbes (1588–1679) was perhaps the most important of the seventeenth-century legal philosophers. His break with the tradition of natural law provoked much controversy. Hobbes employed the terminology of "natural right," "laws of nature," and "right reason." But the first was for him simply "the liberty each man hath to use his own power as he will himself, for the preservation of his own nature; that is to say, of his own life" (*Leviathan* 14); the second are principles of self-interest, which are often identified with the third. There is no right reason in nature (*Elements of Law* II, 10, 8). The natural condition of humankind is one of perpetual war, in which common standards of conduct are absent. There is no right or wrong, justice or injustice, mine or thine in this situation. The crucial steps in Hobbes's theory are the identifications of society with politically organized society and of justice with positive law. Laws are the commands of the sovereign; it is in reference to such commands that the members of a society evaluate the rightness or justness of their behavior. An "unjust law" is an absurdity; nor can there be legal limitations on the exercise of sovereign power. No writer has put forward a positivistic conception of law with greater style and forcefulness than Hobbes. Difficulties in his position emerge from his concession that although the sovereign cannot commit an injustice, he may commit iniquity; the idea of injury to God in the state of nature; and the treatment of conscience in *De Cive*. Hobbes solved the problem of the source of the obligation to obey the sovereign's command by his "social contract" doctrine, the interpretation of which is still discussed by scholars. His unfinished *Dialogue between a Philosopher and a Student of the Common Laws of England* examines various doctrines of the English law as put forward by Sir Edward Coke, and it is notable for its critical examination of Coke's statement that reason is the life of the law.

The *Second Treatise of Civil Government* by Locke, primarily an attack on Robert Filmer's "divine right" theory, contains certain implied criticisms of Hobbes. Its interest for legal philosophy lies in its use of a version of the social contract to treat the question of the obligation to obey the law, its conception of limitations on sovereign power, and its individualistic view of natural inalienable rights, particularly rights in property. Locke's influence was enormous, and his view of natural rights had a profound effect on the development of law in the United States.

A new approach to the understanding of law and its institutions was put forward by Baron de Montesquieu (1689–1755). He, too, spoke the language of natural law and defined laws as "necessary relations arising from the nature of things" (*The Spirit of the Laws* I, 1). But his special importance lies in his attempt to study legal institutions by a comparative historical method, stressing the environmental factors that affect the development of law. This suggestion had been anticipated by Bodin, and Giambattista Vico (1668–1744) had also applied a historical method to the study of Roman law, but Vico's work had little immediate influence. Montesquieu's doctrine of the separation of powers had an extraordinary influence. His sharp separation of judicial from legislative and executive power reinforced the conception that the judge is a mere mouthpiece of the law and that judges merely declare the existing law but never make it. In 1790, in his *Reflections on the Revolution in France*, Edmund Burke turned the historical approach to a practical political use when he protested against proceeding a priori in the "science of constructing a commonwealth."

**KANTIANISM.** Immanuel Kant (1724–1804) contributed to legal philosophy as he did to other branches of philosophy. The keynote of his legal philosophy was inspired by Jean-Jacques Rousseau (1712–1778), who set as the problem of his *Social Contract* the reconciliation of social coercion and individual freedom. Kant's legal philosophy may be called a philosophy of justice in which the concept of freedom plays a central role. Kant sought a systematic understanding of the principles underlying all positive laws that would enable us to decide whether these laws are in accordance with moral principles. Positive law "proceeds from the will of a legislator," and any viable legal system will take into account the particular conditions of the given society. With these conditions the theory of law has no concern. The theory is an application of the results of moral philosophy to the conditions of "men considered merely as men." This endeavor covers both the domain of law (*Recht*) and the domain of ethics; the prin-

ciple that right action is action in conformity with universalizable maxims holds for both juridical and moral laws. A law (*Gesetz*) is a formula expressing "the necessity" of an action. Juridical and moral laws are distinguished in that the former regulate external conduct irrespective of its motives. (But this does not mean that a judge should necessarily ignore the lawbreaker's motives when passing sentence upon him.) Any man, as a morally free agent, is entitled to express his freedom in activity so long as it does not interfere with the similar freedom that others possess. This is the principle underlying all legislation and "right." Juridical law also involves the authority to compel conformity and to punish violations. The necessary and sufficient condition for legal punishment is that the juridical law has been broken. It must be recognized, however, that the domain of such law is restricted by the limits of compulsion. While it is morally wrong to save one's own life by killing another, even where this is the only expedient, it can never be made legally wrong to kill in such a case. The principle of law receives content in Kant's application of it to particular private rights in external things and in his analysis of the methods for acquiring such rights.

Kant's influence on jurisprudence, after being somewhat eclipsed by Hegelianism, reemerged at the end of the nineteenth century. One of the most important neo-Kantians was Rudolf Stammler (1856–1938), who invented, but eventually discarded, the phrase "natural law with variable content." Accepting the Kantian distinction between "form" and "matter," he attempted to discern the form of all laws. He defined law as "exceptionless binding volition." Just law is an ideal involving principles of respect and cooperation.

**UTILITARIANISM AND POSITIVISM.** While Kant and his followers may be said to have fostered a variety of natural-law thinking (although different from the Stoic and Thomistic types), Jeremy Bentham (1748–1832) and his followers (notably John Stuart Mill) claim to have rejected such thinking entirely. Of the influences on Bentham, two may be briefly noted. David Hume (1711–1776) argued that moral distinctions are not derived from reason; passion, or sentiment, is the ultimate foundation of moral judgment. Justice is grounded in utility. Second, the Italian criminologist Cesare Beccaria (1738–1794), in his *Of Crimes and Punishments* (1764), subjected the existing institutions of criminal law and methods of punishment to relentless criticism. His standard of judgment was whether "the greatest happiness of the greatest number" was maximized. Bentham acknowledged his debt to Beccaria, and this "principle of

utility” was the base of Bentham’s voluminous projected “codes.” He did not, however, define the nature of law by reference to utility. In his *The Limits of Jurisprudence Defined* (published in 1945) he defined a law as the expression of “the will of a sovereign in a state.” Bentham’s views, which were well suited to deal with the problems engendered by the industrial revolution in England, were of immense importance in effecting legal reform. In 1832, the year of his death, the Reform Act was passed, largely as a result of the work of his followers. Mill’s *On Liberty* (1859) is an attempt to treat the limits of legal coercion by the state along modified utilitarian lines.

In legal philosophy Bentham’s influence affected the English-speaking world especially through the thought of John Austin (1790–1859), the seminal figure in English and American legal positivism and analytic jurisprudence. Austin tried to find a clear demarcation of the boundaries of positive law, which would be antecedent to a “general jurisprudence” comprising the analyses of such “principles, notions, and distinctions” as duty, right, and punishment, which are found in every legal system; these analyses in turn were to be employed in “particular jurisprudence,” the systematic exposition of some given body of law. Austin began by distinguishing “law properly so called” and “law improperly so called.” The former is always “a species of command,” an expression of a wish or desire, analytically connected with the ideas of duty, liability to punishment (or sanction), and superiority. The last notion led Austin to his famous and influential analysis of “sovereignty”; “laws strictly so called” (positive laws) are the commands of political superiors to political inferiors. From this it follows that international law is merely “positive international morality” rather than law in a strict sense. (Some writers, viewing this as an unfortunate and perhaps dangerous consequence, were led to various revisions of Austinianism.) Austin’s “separation” of law and morality is often taken as the hallmark of legal positivism. “The existence of law is one thing; its merit or demerit is another,” he wrote in *The Province of Jurisprudence Determined* (V, note). Yet Austin was a utilitarian; in distinguishing between the law that is and the law that ought to be, he did not mean that law is not subject to rational moral criticism grounded in utility, which he took to be the index to the law of God. At this point Austin was influenced by such “theological utilitarians” as William Paley.

Austin’s views were subjected to vigorous discussion both without and within the traditions of positivism and analytical jurisprudence. And as the disciplines of history,

anthropology, and ethnology assumed an increasing importance during the nineteenth century, rival approaches to the understanding of law developed. Thus, Sir Henry Maine (1822–1888), who formulated the historical law that legal development is a movement from status to contract, argued in his *Early History of Institutions* (London, 1875) that the command-sovereignty theory of law has no application in a primitive community, where law is largely customary and the political “sovereign,” who has the power of life or death over his subjects, never makes law. The Austinian view can be saved only by maintaining the fiction that what the “sovereign” permits, he commands. Nonetheless, Austin had many followers at the turn of the twentieth century, such as T. E. Holland (1835–1926) and J. W. Salmond (1862–1924), who attempted to preserve the imperative and coercion aspects of his theory while introducing revisions.

The role of the courts was increasingly emphasized. In the United States, John Chipman Gray (1839–1915) wrote *The Nature and Sources of the Law* (New York, 1909; 2nd ed., New York, 1921), one of the most important American contributions to the subject. Acknowledging his debt to Austin, Gray defined law as “the rules which the courts [of the State] lay down for the determination of legal rights and duties.” This required him to construe statutes, judicial precedents, custom, expert opinion, and morality as sources of law rather than as law. All law is judge-made. The machinery of the state stands in the background and provides the coercive element, which does not enter into the definition of “law.” Gray’s influence may be traced in the realist movement in the United States.

#### HEGELIANISM AND THE HISTORICAL SCHOOL.

While England was largely under the sway of the utilitarians, Kantianism, Hegelianism, the historical school, and legal positivism flourished in Germany, both singly and in various combinations. In his *Philosophy of Right*, G. W. F. Hegel (1770–1831) developed some Kantian themes in his own characteristic way. Law and social-political institutions belong to the realm of “objective spirit,” in which interpersonal relationships, reflecting an underlying freedom, receive their concrete manifestations. In attempting to show the rightness and the rationality of various legal relationships and institutions in given moments of the development of “spirit,” and in seeing them as natural growths, Hegel formulated a theory of law and the state that was easily combined with various historical, functional, and institutional approaches to legal phenomena.

Friedrich Karl von Savigny (1779–1861) is often regarded as the founder of the historical school. His *Of the Vocation of Our Age for Legislation and Jurisprudence* (1814) was published before Hegel's work and was probably influenced by Johann Gottlieb Fichte (but not by Fichte's *Grundlage des Naturrechts*, 1796), whose notion of the "folk-spirit" was widely known. Law, like language, originates spontaneously in the common consciousness of a people, who constitute an organic being. Both the legislator and the jurist may articulate this law, but they no more invent or make it than does the grammarian who codifies a natural language. Savigny believed that to accept his conception of law was to reject the older notions of natural law; nevertheless, it is often claimed that Savigny's conception was merely a new kind of natural law standing above, and judging, the positive law.

Otto von Gierke (1844–1921), the author of *Das deutsche Genossenschaftsrecht*, clearly fits into the tradition of the historical school. Gray, in *The Nature and Sources of the Law*, subjected the theories of Savigny and his American follower, James C. Carter (1827–1905), to severe criticism. It should be noted that Maine's views have nothing in common with those of Savigny; in Maine's work the metaphysics of the *Volksgeist* is entirely absent.

#### LATE NINETEENTH CENTURY TO MID-TWENTIETH CENTURY

**JHERING AND GERMAN POSITIVISM.** Rudolf von Jhering (1818–1892), eminent both as a historian of law and as a legal theorist, rejected both Hegel and Savigny: Hegel, for holding the law to be an expression of the general will and for failing to see how utilitarian factors and interests determine the existence of law; Savigny, for regarding law as a spontaneous expression of subconscious forces and for failing to see the role of the conscious struggle for protection of interests. However, Jhering shared the broad cultural orientation of many of the Hegelians, and he was grateful to Savigny for having overthrown the doctrine of "immutable" natural law. Jhering's contribution was to insist that legal phenomena cannot be comprehended without a systematic understanding of the purposes that give rise to them, the study of the ends grounded in social life without which there would be no legal rules. Without purpose there is no will.

At the same time there are strong strains of positivism in Jhering: Law is defined as "the sum of the rules of constraint which obtain in a state" (*Der Zweck im Recht*, p. 320). In this respect he was close to the German positivists, who emphasized the imperative character of

law. Karl Binding (1841–1920), an influential positivist, defined law as "only the clarified legal volition [*Rechtswille*] of a source of law [*Rechtsquelle*]" (*Die Normen und ihre Uebertretung*, p. 68). In this period the slogan of German positivism, "All law is positive law," emerged. Yet Jhering opposed many of the claims of the analytical positivists; his essay "Scherz und Ernst in der Jurisprudenz" (Leipzig, 1885) ridiculed their "heaven of jurisprudential concepts."

**SOCIOLOGICAL AND ALLIED THEORIES.** Jhering's work foreshadowed many of the dominant tendencies of twentieth-century legal philosophy. Hermann Kantorowicz regarded Jhering as the fountainhead of both the "sociological" and "free-law" schools. The former term covers too wide a group of writers to be surveyed here, some of whom were concerned solely with empirical work, while others combined empirical work with a philosophical outlook. Proponents of the jurisprudence of interests (*Interessenjurisprudenz*) eschewed Jhering's inquiries into the metaphysical and moral bases of purposes, claiming that he did not sufficiently attend to the conflict of interest behind laws; law reflects dominant interest. (Similar analyses were made in the United States; for example, the "pressure-group" theory of politics advanced by A. F. Bentley [1870–1957] in *The Process of Government*, Chicago, 1908.) Much attention was devoted to the analysis of the judicial process and the role that the "balancing" of interests plays in it. As Philipp Heck, one of its leading exponents, remarked: "The new movement of 'Interessenjurisprudenz' is based on the realization that the judge cannot satisfactorily deal with the needs of life by mere logical construction" (*Begriffsbildung und Interessenjurisprudenz*, p. 4).

This sentiment was endorsed by the closely allied "free-law" movement. According to this group, "legal logic" and the "jurisprudence of conceptions" are inadequate for achieving practicable and just decisions. The judge not only perforce frequently goes beyond the statute law, but he also often ought to go beyond it. The "free-law" writers undertook the normative task of supplying guidelines for the exercise of judicial discretion, and the judicial function was assimilated to the legislative function. The focus on such problems reflected the enormous change, occasioned by the industrialization of Western society, in the functions of the state. No longer did the nation-state exist merely to keep the peace or protect preexisting rights; rather, it played a positive role in promoting social and individual welfare. The philosophy of law thus became increasingly concerned with the detailed working out of the foundations of legal policy.

The “free-law” theorist Eugen Ehrlich (1862–1922), who influenced such American theorists as Karl N. Llewellyn (1893–1962) and other representatives of legal realist tendencies, summarized his *Grundlegung der Soziologie des Rechts* as follows: “At the present as well as at any other time, the center of gravity of legal development lies not in legislation, not in juristic science, nor in judicial decision, but in society itself.” He rejected the positivistic tenet that only norms posited by the state are legal norms, for in any society there is always more law than is expressed in legal propositions. The “inner order” of an association is the basic form of law. Ehrlich also engaged in empirical study of the “legal facts” (*Rechtstatsachen*) and “living law” of various communities in the Austro-Hungarian Empire. Ehrlich may thus be said to have considered custom as law in its own right. However, many positivists would argue that he was not able to account for the normative character of custom.

**MARXISM.** The Marxist stress on economic interests was often combined with the sociological and free-law views. Central to the Marxist position are the notions of “class” (usually defined in terms of legal relationship to property and the means of production) and “class interest,” which leads to the analysis of the role of law in different societies with differing class structures. Addressing their critics, Karl Marx and Friedrich Engels wrote: “Your law [*Recht*] is but the will of your class exalted into statutes [*Gesetz*], a will which acquires its content from the material conditions of existence of your class” (*Communist Manifesto*, 1848). This suggests that law is merely part of the ideological superstructure and has no effect on the material organization of society. It raises the question of whether law exists in all societies—for instance, in primitive society or in the “classless” society arising after the triumph of socialism—and the further question of the nature and function of law in the transitional period from capitalism to socialism. The issue of “revolutionary legality” or “socialist legality” was treated by V. I. Lenin, E. Pashukanis, and Andrei Vishinsky. An important Marxist study of the relationship between law and the economy is that of the Austrian socialist Karl Renner (*Die Rechtsinstitute des Privatrechts und ihre soziale Funktion*, 1929).

**PURE THEORY AND RELATIVISM.** Although the sociological approaches to law have many practitioners, the most controversial and perhaps the most influential twentieth-century view was that of Hans Kelsen, a leading exponent of legal positivism. Influenced by the epistemology of the neo-Kantians, Kelsen distinguished sharply between the “is” and the “ought,” and consequently

between the natural sciences and disciplines, such as legal science, which study “normative” phenomena. Legal science is a descriptive science—prescriptive and valuational questions cannot be scientific—and Kelsen’s “pure theory” aimed at providing the conceptual tools for studying any given legal system irrespective of its content. The theory is “pure” in that it is divorced from any ideological or sociological elements; it attempts to treat a legal system simply as a system of norms. Kelsen’s view was thus similar to the analytical jurisprudence of Austin, but Kelsen regarded legal norms as “de-psychologized commands.” In order to understand an act of will as a norm-creating act, we must already employ a norm that serves as a “schema of interpretation.” The jurist who seeks to understand legal phenomena must ultimately presuppose a basic norm (*Grundnorm*), which is not itself a positive legal norm. Legal systems are sets of coercive norms arranged in hierarchical fashion; lower norms are the “concretizations” of higher norms. In Kelsen’s analysis the “dualisms” of state and law and public and private law disappear, and the relationship between international law and national legal systems is seen in a fresh light.

Unlike Kelsen, Gustav Radbruch (1878–1949) did not found a school. His position, which he called relativism, has many affinities with that of Kelsen; but Radbruch maintained that law, which is a cultural phenomenon, can be understood only in relation to the values that men strive to realize through it. He attempted to analyze these values in relation to legal institutions, showing the “antinomies” among these values that led to his relativism. World War II raised the question in the minds of many legal philosophers whether the separation of law and morals of legal positivism, which was popular in Germany, contributed to the rise of Nazism. Concern over this problem seems to have caused Radbruch to move away from his earlier relativism toward a kind of natural-law position.

**REALISM AND OTHER RECENT TRENDS.** In the United States, until the mid-twentieth century, legal philosophy had largely been the province of lawyers rather than of professional philosophers. This may account for its sociological and realistic tone. The erudite Roscoe Pound (1870–1964) was its most prolific writer. Pound recognized the influence of Josef Kohler (1849–1919) and his notion of jural postulates and, especially, of Jhering. The pragmatism of William James also contributed to the development of his views. In an early article, “Mechanical Jurisprudence” (*Columbia Law Review* 8 [1908]: 605–610), Pound argued for an understanding of the interests that the law seeks to protect. Introducing a dis-

inction between “law in books” and “law in action,” he maintained the need for a close study of the actual operation of legal institutions. On both scores his influence in the United States has been momentous, but it is difficult to summarize his position; he is often associated with a “social engineering” approach to law. Law contains both precepts and ideal elements. Among precepts Pound distinguished rules, principles, conceptions, doctrines, and standards. It is pointless to isolate some canonical form to which all laws are reducible. The ideal element consists of received ideals “of the end of law, and hence of what legal precepts should be and how they should be applied.” Pound offered an elaborate, although tentative, survey of the individual, public, and social interests secured by law. This list was criticized and amended by Pound’s Australian disciple Julius Stone (*The Province and Function of Law*, 1946). In his later years Pound moved toward a kind of natural-law thinking, arguing for a more intimate connection between law and morality; he abjured the realist tendencies, which had been influenced by his earlier thought, as “give it up” philosophies.

It is exceedingly difficult to characterize the legal realists; they disclaim a common doctrine but recognize an interest in a common set of problems. With J. C. Gray, the spiritual godfather of American legal realism was Justice Oliver Wendell Holmes Jr. (1841–1935). In his seminal essay “The Path of the Law” (*Harvard Law Review* 10 [1896]: 457–478), he advocated viewing law as the “bad man” would, in terms of the practicable remedies afforded individuals through the medium of the courts. Holmes presented in that article his famous definition of law as “the prophecies of what the courts will do in fact.” It may be argued, however, that this definition, while perhaps adequate from the advocate’s viewpoint, can hardly apply to the judge. When the judge asks what the law is on some matter, he is not trying to predict what he will decide.

Joseph W. Bingham was one of the first realists. In “What Is the Law?” (*Michigan Law Review* 11 [1912]: 1–25 and 109–121), Bingham argued that legal rules, like scientific laws, have no independent existence, being simply mental constructs that conveniently summarize particular facts. Laws are really judicial decisions, and the so-called rules or principles are among the (mentally) causative factors behind the decision. This nominalism and behaviorism, which characterized much of early realist writing, was criticized by Morris R. Cohen (1880–1947), until recently one of the few academic philosophers in the United States concerned with legal philosophy. “Behavior analysis” was advocated by Karl N.

Llewellyn, who extended it beyond judicial behavior to “official” behavior (*Jurisprudence*, Chicago, 1962; collected papers).

The so-called myth of legal certainty was attacked by Jerome Frank (1889–1957) in his *Law and the Modern Mind* (New York, 1930), which explained the genesis of the myth in Freudian terms. In the sixth edition (New York, 1949) Frank was somewhat friendlier toward natural-law thinking, characterizing his change of attitude as going from an earlier “rule-skepticism” to “fact-skepticism” (*Courts on Trial*, Princeton, NJ, 1949). Other important realists include Thurman Arnold, Leon Green, Felix Cohen, Walter Nelles, Herman Oliphant, and Fred Rodell. Both positivism and realism were attacked by Lon L. Fuller (*Law in Quest of Itself*, Chicago, 1940), a leading American exponent of non-Thomistic natural-law thinking (*The Morality of Law*, New Haven, CT, 1964). The revival of natural-law doctrines is one of the most interesting features of current legal thought. Recent contributions and criticisms may be found in the journal *Natural Law Forum*.

The Scandinavian countries are a center of legal philosophy, and many of their leading writers are realists. They are more consciously philosophical than their American counterparts. The leading spirit was Axel Hägerström (1868–1939), who rejected metaphysical presuppositions in legal philosophy and insisted on an understanding of legal phenomena in empirical terms. Many legal concepts can be understood only as survivals of “mythical” or “magical” thought patterns, which should ideally be eliminated. Vilhelm Lunstedt (*Legal Thinking Revised*, Stockholm, 1956) was most radical in his rejection of metaphysics. Values are expressions of emotion and should be excluded from legal science. The “method of social welfare” should be substituted for the “method of justice.” Alf Ross (*On Law and Justice*, London, 1958) argued that the first method is as “chimerical” as the second and presents an analysis of legal policy-making as a kind of rational technology. Laws, Ross argued, are directives to courts. The concept “valid law” as used by jurists and legal philosophers cannot be explicated in purely behavioristic terms; inner psychological attitudes must also be included. A similar view is presented by Karl Olivecrona (*Law as Fact*, London, 1939), who wrote important realist analyses of legal language and severely criticized command theories of law, such as Austin’s. In *Inquiries into the Nature of Law and Morals* (translated by C. D. Broad, Cambridge, U.K., 1953), Hägerström argued that Kelsen’s “pure theory” never escapes the “will” element either, and hence falls subject

to all the criticisms that may be leveled against the command theories.

In the mid-twentieth century, the most influential legal philosopher in the English-speaking world was H. L. A. Hart. In his *Concept of Law* (Oxford, 1961) he developed a view of law as consisting of a “union of primary and secondary rules.” The former are rules imposing duties; the latter are rules of recognition, change, and adjudication. The first of the secondary rules (those for recognizing the rules of a system) seems to be crucial to his account of all three. His position was in many respects similar to that of Kelsen. He gave an interesting analysis, allied to Ross’s account, of what it means to say that a rule exists. Hart saw the relationship between law and morals as contingent, in contrast with the Thomistic view of a logical connection between the two; this led him to an interpretation of natural law not unlike that presented by some Renaissance writers. In a number of important articles Hart focused on the nature of definition in jurisprudence, the analysis of psychological concepts in the law, legal responsibility, and the principles of punishment.

## PHILOSOPHY OF LAW, HISTORY OF [ADDENDUM]

The problems of authority, law and order, obligation, and self-interest first became central topics of speculation in the thought of the Sophists, in the late fifth and early fourth centuries BCE. The most famous Sophists stressed the distinction between nature (*physis*) and convention (*nomos*), and they put laws in the latter category. They generally attributed law to human invention and justified

obedience to law only to the extent that it promoted one's own advantage. Laws were artificial, arrived at by consent; most acts that were just according to the law were contrary to nature; the advantages laid down by the law were chains upon nature, but those laid down by nature were free.

In the time of the Sophists notions of law, justice, religion, custom, and morality were largely undifferentiated; yet in this same period some of the crucial problems of legal philosophy were first formulated, and attempts were made at a formal definition of law. Thus, Xenophon (*Memorabilia* I, 2) reported that Alcibiades, who associated with both Critias and Socrates, remarked to Pericles that no one can really deserve praise unless he knows what a law is. Pericles replied that laws are what is approved and enacted by the majority in an assembly, whereby they declare what ought and what ought not to be done. He admitted that if obedience is obtained by mere compulsion, it is force and not law, even though the law be enacted by the sovereign power in the state. Xenophon also recounted an purported conversation between Socrates and the Sophist Hippias in which both maintained an identity between law—or what is lawful—and justice—or what is right—while admitting that laws may be changed or annulled (*Memorabilia* IV, 4).

Socrates claimed that there are "unwritten laws," uniformly observed in every country, that cannot conceivably be products of human invention. They are made by the gods for all men, and when men transgress them, nature penalizes the breach.

Socrates and the Sophists, as presented in Plato's dialogues, disagreed concerning human nature. The Sophists conceived of humans as egoistically motivated and anti-social, whereas for Socrates, as for Plato and Aristotle, people are a social beings, other-regarding as well as self-regarding, who find fulfillment in social life. By contrast, the Sophist Callicles, in Plato's *Gorgias*, holds that we are no exception to the law of nature, according to which the stronger rules; man-made laws and social institutions violate human nature. The less radical Sophists, although they could not identify law with some feature of reality, still accepted its practical usefulness.

### PLATO AND ARISTOTLE

PLATO. There is hardly any problem of legal philosophy not touched upon by Plato. He wrote during the decline of the Greek polis, when law and morality could appear as mere conventions imposed by shifting majorities in their own interest and the harmony between the legal

order and the order of the universe could not easily be maintained. Plato sought to restore, as far as possible, the traditional analogy between justice and the ordered cosmos. Justice, or right action, cannot be identified with mere obedience to laws, nor can a truly moral life be reduced to conformity with a conventional catalogue of duties. Duties involve a knowledge of what is good for human beings, and such knowledge bears an intimate relation to human nature.

The question “What is justice?” dominates Plato’s *Republic*. Plato conceived of justice as that trait of human character that coordinates and limits to their proper spheres the various elements of the human psyche. In order to understand the operation of justice in the human soul, Plato examined human nature writ large: the city-state. The state functions well when it is governed by those who know the art of government, and the practice of this art requires a positive insight into the Good. In a just society every citizen performs the role to which he or she is best suited for the good of the whole. Similarly, in the moral economy of the individual’s life, justice prevails when reason rules and the appetites and lower passions are relegated to their proper spheres. A just social order is achieved to the extent to which reason and rational principles govern the lives of its members.

Plato’s emphasis on reason found its way into his definition of law. Law is reasoned thought (*logismos*) embodied in the decrees of the state (*Laws* 644D). Plato rejected the view that the authority of law rests on the mere will of the governing power. The *Laws* contains a detailed discussion of many branches of law and is an attempt at a formulation of a systematic code to govern the whole of social life. In contrast with the ideal polis of the *Republic*, in which there would be little need for legislation, in the *Laws* Plato accepted “law and order, which are second best” (*Laws* 875D).

ARISTOTLE. Aristotle, who discussed law in numerous contexts, nowhere gave a formal definition of it. He wrote variously that law is “a sort of order, and good law is good order” (*Politics* 1326a), “reason unaffected by desire” (*Politics* 1287a), and “the mean” (*Politics* 1287b). However, these must be taken not as definitions but as characterizations of law motivated by the point Aristotle was making in the given context.

Following Plato, Aristotle rejected the Sophistic view that law is mere convention. In a genuine community—as distinguished from an alliance, in which law is only a covenant—the law concerns itself with the moral virtue of the citizenry (*Politics* 1280b). Aristotle sharply distin-

guished between the constitution (*politeia*) and laws (*nomoi*); the constitution concerns the organization of offices within the state, whereas the laws are “those according to which the officers should administer the state, and proceed against offenders” (*Politics* 1289a). The constitution of a state may tend to democracy, although the laws are administered in an oligarchical spirit and vice versa (*Politics* 1292b). Legislation should aim at the common good of the citizens, and justice—what is equal—should be determined by the standard of the common good (*Politics* 1283a). Yet Aristotle recognized that the law is often the expression of the will of a particular class, and he stressed the role of the middle class as a stabilizing factor.

In his discussion of the forms of government in Book III of the *Politics*, Aristotle took up the Platonic problem of rule by the best man versus rule according to laws. A society of equals by its very nature excludes the arbitrary rule of one individual. In any case, even the best person cannot dispense with the general principles contained in laws; and legal training helps to make better government officials. Furthermore, administrators, like all people, are subject to passion, and it is thus preferable to be judged by the impersonal yardstick of the laws. The importance of the rule of law in no way conflicts with the need to change the law through legislation when it has been found by experience to be socially inadequate. But not all law is the product of legislation; customary law is in fact more important than the written law.

Aristotle’s discussion of the judicial process foreshadows many modern notions. Although it is better to have written laws than to rely completely on discretion, “some matters can be covered by the laws and others cannot” (*Politics* 1287b20). General rules are insufficient to decide particular cases (*Politics* 1286a26), although “well-drawn laws should themselves define all the points they possibly can and leave as few as may be to the decision of the judges” (*Rhetoric* 1354a32). Aristotle seems to have had two considerations in mind. First, judicial decision-making is practical—it involves deliberation—and as such cannot be completely determined in advance. Second, the resolution of disputed issues of fact that determine the outcome of a particular case cannot be settled in advance by legislation. This stress on the insufficiency of general rules connects with Aristotle’s influential discussion of equity (*epieikeia*). Equity is just, “but not legally just but a correction of legal justice” (*Nicomachean Ethics* 1137b10).

Aristotle sometimes seems to suggest that equity comes into play when there are gaps in the law, so that it

consists in the judge's acting as the lawgiver would act if he were present. Yet he also seems to suggest that equity corrects the harshness of the law when adherence to the written law would work an injustice. Principles of equity are thus closely related to the unwritten universal laws "based on nature," a "natural justice" binding on all persons, even those who have no association or covenant with one another. Nevertheless, what is naturally just may vary from society to society.

The *locus classicus* of Aristotle's discussion of justice is Book V of the *Nicomachean Ethics*. Generically, justice has to do with one's relations to others, and there is a sense of justice that refers to the complete moral virtue of the member of the community in such dealings. There is also a sense in which "justice" refers to a particular virtue involving the fair dealings of individuals in matters handled by private law. Two kinds of rights fall under this special virtue: rights in division (where each individual claims his fair share of goods, honors, and so on) and rights in redress (for wrongs done by one individual to another, such as failure to fulfill a contract).

## ROME

**STOICS.** The Stoics, who conceived of the universe as a single, organic substance, exercised a lasting influence on legal thought. In their view, nature, which exhibits structure and order, and man both partake of intelligence, or reason (*logos*). An animal is directed by a primary impulse toward self-preservation, which adapts it to its environment. In humans, reason is the "engineer of impulse," and our actions may be evaluated only within the framework of the whole of nature. The criterion of moral action is consistency with the all-determining law of nature (*koinos logos*). This conception of a law of nature that is the ultimate standard of human laws and institutions was combined with Aristotelian and Christian notions to form the long-standing natural-law tradition of medieval legal philosophy. Another important Stoic contribution was the belief in the equality of all people in a universal commonwealth and a rejection of Aristotle's doctrine of slavery.

**CICERO AND SENECA.** The writings of Cicero (106–43 BCE) were important in transmitting classical legal thought to the medieval world. Although Cicero was a professional arguer of legal cases, his philosophical treatment of law in his *De Legibus* disclaims any interest in "clients' questions" or the "law of eaves and house-walls." His legal philosophy was essentially Stoic; he denied that the positive law of a community (written or customary),

even when universally accepted, is the standard of what is just. Nor is mere utility the standard: "Justice is one; it binds all human society, and is based on one law, which is right reason applied to command and prohibition" (*De Legibus* I, 15). An unjust statute is not a true law. Law and morality are logically connected, and only that which conforms to the law of nature is genuine law. This view exercised a lasting influence on natural-law thinking and reappeared in the thought of Thomas Aquinas.

Like Cicero, Seneca (c. 4 BCE–65 CE) aided in transmitting Stoic notions to later thinkers. He reiterated the conception of the equality of all persons under natural law, but perhaps more important was his conception of a golden age of human innocence, a prepolitical state of nature. Legal institutions became necessary as human nature became corrupted.

**ROMAN LAW.** The influence of Stoicism may be traced in pronouncements of the Roman jurists. It is disputed whether these were any more than remarks designed to ornament legal texts, but they nevertheless influenced the thought of later ages. The jurists distinguished three kinds of law: *jus naturale*, *jus gentium*, and *jus civile*. In practice, the last originally referred to the law of the city of Rome, but ultimately it was applied to any body of laws of a given community. The *jus gentium* first meant the law applied to strangers, to whom the *jus civile* was not applicable, and was later extended to those legal practices common to all societies. Gaius (mid-second century), who systematized the Roman law in his *Institutes*, identified the *jus naturale* and *jus gentium* as universal principles of law agreeable to natural reason and equity. Thus, law was not a mere expression of human will or institution but that which is rationally apprehended and obeyed. The *jus gentium* was not an ideal law by which the positive law was judged but the rational core of existing legal institutions.

Ulpian (c. 170–228) distinguished *jus naturale* from *jus gentium* by stating that *jus naturale* is not peculiar to human beings but is taught by nature to all animals. Thus, among animals there is an institution similar to human marriage. Slavery and its attendant rules are products of the *jus gentium*, for by the *jus naturale* all people were born free. It is not clear, however, that Ulpian regarded slavery as bad. To him we owe the oft-repeated definition of justice: "the constant wish to give each his due" (*Digest* I, 1, 10). Following Celsus (c. 67–c. 130), he defined law (*jus*) as "the art of the good and the equitable" (*ibid.* I, 1, 1). Again, it does not seem that Ulpian thought of the *jus naturale* as an ideal law opposed to the

*jus civile* or to the *jus gentium*. It has been suggested that behind Ulpian's thought was a conception of a natural state antecedent to the conditions of organized society.

The doctrines of the Roman jurists owe their lasting influence to their incorporation into the *Corpus Juris Civilis* of Justinian (sixth century), principally in the section called the *Digest*. The compilers of Justinian's *Institutes* (a section of the *Corpus Juris*) seem to have distinguished the *jus naturale* from the *jus gentium* and seem to have regarded the former as a set of immutable divine laws by which the positive law may be morally evaluated (*Institutes* I, 2, 11; III, 1, 11). The *Corpus Juris* also preserved statements of the Roman jurists concerning the source of the authority to make and unmake the laws constituting the civil law. According to a number of these statements, this authority resides in the consent of the people; however, the statement that "what pleases the prince has the force of law" (*Digest* I, 4, 1) was probably a more accurate view of the facts. Justinian seems to have combined these views theoretically in his reference to a (nonexistent) "ancient law" by which the Roman people transferred all their powers to the emperor (*Codex* I, 17, 1, 7).

## EARLY MIDDLE AGES

To the legal thought of the Stoics and the Roman philosophers and jurists the Church Fathers added a distinctively Christian element. The law of nature was no longer the impersonal rationality of the universe but was integrated into a theology of a personal, creative deity. The relationship among the Mosaic law, the Gospels, and natural law emerged as a specific problem; the notion of *jus divinum* (divine law) as a distinct type of law, along with the three recognized by the jurists, was crystallized. The notion of the fall of man from a state of perfection (which may be compared with the view of Seneca) played an important role. Thus, according to St. Ambrose (340–397) the Mosaic law—a law of sin and death (see Romans 8.2)—was given because humans failed to obey the law of nature. The fact that many legal institutions, such as slavery and private property, deviate from this ideal law does not necessarily imply that they are unjust or illegitimate; for the natural law is adapted to us only in a condition of innocence.

Of the Church Fathers, St. Augustine (354–430) was perhaps the most original and complex: Only one point in his thought will be noted here. Cicero maintained that nothing can be nobler than the law of a state (*De Legibus* I, 14) and that if a state has no law, it cannot truly be considered a state (*ibid.* II, 12). The law of the state must therefore embody justice, for without *justitia* there is no

*jus*. Augustine considered this position in *The City of God*, Book XIX. According to Augustine, since Rome had no justice, Cicero's position has the inconvenient consequence that Rome was no state at all. We must therefore seek another definition of "state" (*populus*) in which justice is not an essential element. Augustine stressed the notion of order—"a harmonious multitude"—with the suggestion that legal order need not be moral or just. There are passages in Augustine, however, which seem to uphold a more orthodox natural-law position. In any event, the terms of his discussions are somewhat different; his main points of contrast are divine and human law rather than *jus naturale* and *jus civile*.

The sources of the natural-law theories which were to dominate Western legal philosophy for many centuries were the writings of the Greek and Roman philosophers and poets, Justinian's *Corpus Juris Civilis*, and the Church Fathers. Isidore of Seville (c. 560–636), an encyclopedist and an important transmitter of Roman thought to later writers, concisely expressed the natural-lawyer's ideal regarding positive law: "Law shall be virtuous, just, possible to nature, according to the custom of the country, suitable to place and time, necessary, useful; clearly expressed, lest by its obscurity it lead to misunderstanding; framed for no private benefit, but for the common good" (*Etymologies* V, 21).

## MIDDLE AGES AND RENAISSANCE

**CIVILIANS AND CANONISTS.** The revived study of Roman law in the twelfth century, associated with the glossators, gave a fresh stimulus to legal philosophy. Of special interest are the attempts at reconciling differences among the Roman jurists on the definition of law and the classification of its branches. In the main, the civilians were in the broad tradition of natural-law thinking; *jus* flows from *justitia*, although it must always fall short of perfect justice, which is God's alone. Irnerius (c. 1050–c. 1130) thus claimed that statutes ought to be interpreted in the light of equity. Strict law requires that all agreements be kept, but equity allows exceptions to the rule. This equity, according to Azo (c. 1150–c. 1230), is a principle that must be written, not merely lodged in the judge's heart.

The middle of the twelfth century also saw the systematization of the canon law. In the *Decretum* of Gratian a high degree of jurisprudential competence was brought to this task. The tripartite division of law of the Roman lawyers was accepted, but the leading conceptions were Augustine's *jus divinum* and *jus humana*. Natural law was identified with the former, whereas the distinctive feature

of the latter (covering both *jus gentium* and *jus civile*) was custom. Natural law is contained in the Mosaic law and the Gospels; the command to do unto others what we would have them do unto us is its fundamental principle. Natural law relates to our rational nature and is immutable; the *mistica*, the cultic regulations found in scripture, are part of the natural law only in their moral aspect.

The commentators on Gratian further divided natural law so as to include not only commands and prohibitions but also *demonstrationes*, which point to what is good for all humans, such as possession of all things in common. In our fallen condition custom has legitimately modified the *demonstrationes* in permitting private property and slavery. The other branches of natural law may not be abrogated and are the standards by which even the ecclesiastical law must be judged. Gratian (if not all his commentators) seems to have generally maintained a clear distinction between natural (divine) law and canon law.

**AQUINAS.** The rediscovery of Aristotle in the thirteenth century greatly influenced the further development of legal philosophy. The culmination of the natural-law tradition is the theory of Thomas Aquinas (1224–1274), who integrated Stoic, Christian, and Aristotelian elements within a comprehensive philosophic system. Laws are standards of conduct that have a binding, or obligatory, character. This idea can be understood only if laws have some kind of rational origin. Combining this view with a teleological conception of nature and social order, Aquinas regarded legal control as purposive. Laws, he concluded, are ordinances of reason promulgated for the common good by the legitimate sovereign.

According to Aquinas, four types of law may be distinguished: eternal law, an expression of God's rational ordering of the universe; divine law, which guides us toward our supernatural end; natural law, which guides us toward our natural end; and human law, which regulates through the prospect of punishment the affairs of people in a given community in the light of that community's special requirements. Crucial to the concept of natural law are the notions of natural inclinations and right reason. "All those things to which man has a natural inclination are naturally apprehended by reason as being good and consequently as objects of pursuit, and their contraries as evil, and objects of avoidance" (*Summa Theologiae* I-II, 94). The relationship between inclination and reason, accounting for the apprehension of the natural law, has been variously interpreted. The precepts of natural law have as their common foundation the princi-

ple "Do good and avoid evil." Natural law is a standard to which human law must conform, and Aquinas employed Aristotle's conception of practical reasoning in explaining the derivation of human law from natural law by the legislator, thus accounting for differences between legal systems and for the possibility that rational men should disagree as to what human laws ought to be. He affirmed the long-standing view that an unjust law is no law; but although an unjust law is not binding in conscience, considerations of utility may require one to obey it. Aquinas allowed that such "laws" may be said to possess a "legal" character insofar as they are promulgated under the color of law by the legitimate prince.

Aquinas discussed in detail and with great acuity all of the problems treated by his predecessors. His influence may be traced in the English writers John Fortescue (c. 1394–1476), Thomas Hooker (c. 1586–1647), and Christopher St. Germain (1460–1540). According to St. Germain, natural law is nothing other than the common-lawyer's notion of "reasonableness." Among late-twentieth century Thomist scholars, the works of John Finnis have been especially influential.

**OCKHAM.** Some medieval writers seem to have espoused a protopositivism in their emphasis on the primacy of the will; this is characteristic of the Augustinian-Franciscan tradition. Thus, William of Ockham (c. 1285–1349) regarded the divine will as the norm of morality. "By the very fact that God wills something it is right for it to be done." Nevertheless, it is doubtful that Ockham would have affirmed that what the sovereign commands is just. His position is somewhat unclear, however, for he—like all medieval writers—continued to use the rhetoric of natural law in his *Dialogus*: in one of its senses, *jus naturale* is composed of universal rules of conduct dictated by natural reason. A right, such as the immutable right of private property, is a dictate of right reason.

**THE RISE OF ABSOLUTISM.** A tendency to combine natural-law doctrines with a theory of royal absolutism began in the fourteenth century. A group of civilians known as the postglossators undertook to forge a workable system of law out of the older Roman law, which they regarded as the *jus commune* of Europe. The technically trained administrators in the rising nation-states, they were naturally concerned with fundamental problems of legal theory. Bartolus of Sassoferrato (1314–1357) maintained that the ruler is not bound by the laws, although it is "equitable" that he should voluntarily submit to them. The *jus gentium*, however, is immutable. Lucas de Penna (1320–1390) discussed jurisprudential questions in

detail. Law is the articulation of the ethical virtue of justice, and reason is the foundation of law. At the same time, he maintained, as did many civilians, that the prince's lordship rests on divine authority. The ruler is responsible to God alone and not to the people; law is not the expression of the will of the community. Nonetheless, although the prince is unfettered by the laws, bad laws (those that contradict divine law) have no binding force. It is not clear, in Lucas's view, whether the obligation to obey law derives primarily from the rationality of law or from the divine grant of authority to the ruler.

## LATER RENAISSANCE

**BODIN.** Jean Bodin (1530–1596) was a great exponent of unlimited sovereignty under natural law whose views were apparently influenced by the fourteenth-century civilians. Like them, he appears to have had difficulty in adapting Christian legal thought to the conditions of the secular nation-state. In his *Six Books of the Commonwealth*, Bodin was emphatic that “law is nothing else than the command of the sovereign in his exercise of sovereign power.” But although the prince “has no power to exceed the law of nature,” which is decreed by God, it seems plain that Bodin no longer thought of right reason as linking natural and positive law. Bodin's endorsement of the command theory also appears in his treatment of custom. The relative weights of positive law and custom had long been debated by the medieval lawyers, but Bodin was one of the first to hold that custom owes its legal authority to the sufferance of the ruler. In this he anticipated the idea of tacit command expressed by Thomas Hobbes and John Austin.

**INTERNATIONAL LAW.** The emergence of nation-states also brought the problem of the rational foundation of international law to the forefront of legal thinking. This development may be seen in the writings of the Spanish Thomists Francisco de Vitoria (c. 1492–1546) and Francisco Suárez (1548–1617) and of Hugo Grotius (1583–1645), a Dutch Protestant jurist with broad humanistic leanings. According to Vitoria, the *jus gentium* either belongs to or is derivable from the natural law and consists in prescriptions for the common good in the widest sense—namely, for the international community. Rights and obligations are thus conferred upon nations acting through their rulers.

The conception of a law of nations was developed in great detail by Suárez. Although his *De Legibus* is Thomistic in many respects, Suárez explicitly stated that Aquinas's account of law is inadequate. Suárez began by

distinguishing laws in the prescriptive sense from laws of nature in the descriptive sense, which are laws only metaphorically. (Many positivists trace the origin of natural-law thinking to the tendency to confuse these two types of law.) With regard to prescriptive laws, Suárez defined a law (*lex*) as “the act of a just and right will by which the superior wills to oblige the inferior to this or that” or as “a common, just and stable precept, which has been sufficiently promulgated” (*De Legibus* I, 12). The reference to stability is notable: Laws generally survive both the lawgiver and the populace living when they are enacted, and they are valid until abrogated. Such considerations have led recent writers to reject the identification of laws with mere acts of will; but although Suárez rejected the voluntaristic notion of natural law associated with the Ockhamists, he held that the civil law is enacted “more by the will than by reason.” It is not derived from natural law by logical inference but by “determination,” and hence is, in a sense, arbitrary (*De Legibus* II, 20).

Most medieval writers tended to use *lex* and *jus* interchangeably; Suárez, however, defined the latter as “a certain moral power which every man has, either over his own property or with respect to what is due to him” (*De Legibus* I, 2). Although Aquinas briefly discussed *jus naturale* as contrasted with *jus positivum* (*Summa Theologiae* II–II, 57), the concept of a “natural right” was almost entirely absent from his thought. It is clearly present in Suárez, who, in the style of Locke and the Enlightenment philosophers, formulated a list of natural rights. Nevertheless, the individualism of these writers is not present in Suárez. His attitude was quite remote from eighteenth-century natural-law and natural-right theorists, who thought that a perfect system of law could be deduced from the natural law.

Despite Grotius's tendency to underestimate his predecessors, his *De Jure Belli ac Pacis* (1625) clearly showed the influence of such writers as Vitoria and Suárez. He developed their notion of a “just war,” a topic still discussed by theorists concerned with the problem of sanctions in international law. Just wars presuppose the existence of laws governing relations between sovereign states; such laws have their origin in natural law and in treaties, which in turn presuppose precepts of the law of nature. The denial of the existence of natural law supposes that people are egoistically motivated, accepting law as a “second best.” However, following Aristotle and the Scholastics, Grotius held that humans are social, altruistic, and rational. Therein lies the origin of law, which would be binding whether or not God exists. This statement has been regarded by historians as epoch-making;

they claim that Grotius separated jurisprudence from theology. More important, perhaps, is the tendency in Grotius and others who followed him to identify natural law with certain rational principles of social organization and thus to loosen its tie with the Stoic metaphysical conception of the law of nature.

## THE SEVENTEENTH TO LATE-NINETEENTH CENTURIES

**HOBBS AND MONTESQUIEU.** Thomas Hobbes (1588–1679) was perhaps the most important of the seventeenth-century legal philosophers. His break with the tradition of natural law provoked much controversy. Hobbes employed the terminology of “natural right,” “laws of nature,” and “right reason.” But the first was for him simply “the liberty each man hath to use his own power as he will himself, for the preservation of his own nature; that is to say, of his own life” (*Leviathan* 14); the second are principles of self-interest, which are often identified with the third. There is no right reason in nature (*Elements of Law* II, 10, 8). The natural condition of mankind is one of perpetual war, in which common standards of conduct are absent. There is no right or wrong, justice or injustice, mine or thine in this situation. The crucial steps in Hobbes’s theory are the identifications of society with politically organized society and of justice with positive law. Laws are the commands of the sovereign; it is in reference to such commands that the members of a society evaluate the rightness or justness of their behavior. An “unjust law” is an absurdity; nor can there be legal limitations on the exercise of sovereign power.

No writer has put forward a positivistic conception of law with greater style and forcefulness than Hobbes. Difficulties in his position emerge from three areas: his concession that, although the sovereign cannot commit an injustice, he may commit iniquity; the idea of injury to God in the state of nature; and the treatment of conscience in *De Cive*. Hobbes solved the problem of the source of the obligation to obey the sovereign’s command by his “social contract” doctrine, the interpretation of which is still discussed by scholars. His unfinished *Dialogue Between a Philosopher and a Student of the Common Laws of England* examines various doctrines of the English law as put forward by Sir Edward Coke, and it is notable for its critical examination of Coke’s statement that reason is the life of the law.

The *Second Treatise of Civil Government* by John Locke (1632–1704), primarily an attack on Robert Filmer’s “divine right” theory, contains certain implied

criticisms of Hobbes. Its interest for legal philosophy lies in its use of a version of the social contract to treat the question of the obligation to obey the law, its conception of limitations on sovereign power, and its individualistic view of natural inalienable rights, particularly rights in property. Locke’s influence was enormous, and his view of natural rights had a profound effect on the development of law in the United States.

A new approach to the understanding of law and its institutions was put forward by Montesquieu (1689–1755). He, too, spoke the language of natural law and defined laws as “necessary relations arising from the nature of things” (*The Spirit of the Laws* I, 1). But his special importance lies in his attempt to study legal institutions by a comparative historical method, stressing the environmental factors that affect the development of law. This suggestion had been anticipated by Bodin, and Giambattista Vico (1668–1744) had also applied a historical method to the study of Roman law, but Vico’s work had little immediate influence. Montesquieu’s doctrine of the separation of powers had an extraordinary influence. His sharp separation of judicial from legislative and executive power reinforced the conception that the judge is a mere mouthpiece of the law and that judges merely declare the existing law but never make it. In 1790, in his *Reflections on the Revolution in France*, Edmund Burke turned the historical approach to a practical political use when he protested against proceeding a priori in the “science of constructing a commonwealth.”

**KANTIANISM.** Immanuel Kant (1724–1804) contributed to legal philosophy and other branches of philosophy. The keynote of his legal philosophy was inspired by Jean-Jacques Rousseau (1712–1778), who set as the problem of his *Social Contract* the reconciliation of social coercion and individual freedom. Kant’s legal philosophy was a philosophy of justice in which the concept of freedom plays a central role. Kant sought a systematic understanding of the principles underlying all positive laws, one that would enable us to decide whether these laws are in accordance with moral principles. Kant held that positive law “proceeds from the will of a legislator,” and any viable legal system will take into account the particular conditions of the given society: With these conditions the theory of law has no concern. The theory is an application of the results of moral philosophy to the conditions of “men considered merely as men.” This endeavor covers both the domain of law (*Recht*) and the domain of ethics; the principle that right action is action in conformity with universalizable maxims holds for both juridical and moral laws.

A law (*Gesetz*) is a formula expressing “the necessity” of an action. Juridical and moral laws are distinguished in that the former regulate external conduct irrespective of its motives. (But this does not mean that a judge should necessarily ignore the lawbreaker’s motives when passing sentence upon him.) Any person, as a morally free agent, is entitled to express his freedom in activity so long as it does not interfere with the similar freedom that others possess. This is the principle underlying all legislation and “right.” Juridical law also involves the authority to compel conformity and to punish violations. The necessary and sufficient condition for legal punishment is that the juridical law has been broken. It must be recognized, however, that the domain of such law is restricted by the limits of compulsion. While it is morally wrong to save one’s own life by killing another, even where this is the only expedient, it can never be made legally wrong to kill in such a case. The principle of law receives content in Kant’s application of it to particular private rights in external things and in his analysis of the methods for acquiring such rights.

Kant’s influence on jurisprudence, after being somewhat eclipsed by Hegelianism, reemerged at the end of the nineteenth century. One of the most important Neo-Kantians was Rudolf Stammler (1856–1938), who invented but eventually discarded the phrase “natural law with variable content.” Accepting the Kantian distinction between “form” and “matter,” he attempted to discern the form of all laws. He defined law as “exceptionless binding volition.” Just law is an ideal involving principles of respect and cooperation.

**UTILITARIANISM AND POSITIVISM.** Although Kant and his followers may be said to have inspired a variety of natural-law philosophies (although different from the Stoic and Thomistic types), Jeremy Bentham (1748–1832) and his followers (notably John Stuart Mill) claim to have rejected such thinking entirely. Of the influences on Bentham, two may be briefly noted. David Hume (1711–1776) argued that moral distinctions are not derived from reason; passion, or sentiment, is the ultimate foundation of moral judgment, and justice is grounded in utility. Second, the Italian criminologist Cesare Beccaria (1738–1794), in his *Of Crimes and Punishments* (1764), subjected the existing institutions of criminal law and methods of punishment to relentless criticism. His standard of judgment was whether “the greatest happiness of the greatest number” was maximized. Bentham acknowledged his debt to Beccaria, and this “principle of utility” was the base of Bentham’s voluminous projected “codes.” He did not, however, define the

nature of law by reference to utility. In his *The Limits of Jurisprudence Defined* (published in 1945) he defined a law as the expression of “the will of a sovereign in a state.” Bentham’s views, which were well suited to deal with the problems engendered by the Industrial Revolution in England, were of immense importance in effecting legal reform. In 1832, the year of his death, the Reform Act was passed, largely as a result of the work of his followers. Mill’s *On Liberty* (1859) is an attempt to treat the limits of legal coercion by the state along modified utilitarian lines.

In legal philosophy Bentham’s influence affected the English-speaking world especially through the thought of John Austin (1790–1859), a seminal figure in English and American legal positivism and analytic jurisprudence. Austin tried to find a clear demarcation of the boundaries of positive law, which would be antecedent to a “general jurisprudence” comprising the analyses of such “principles, notions, and distinctions” as duty, right, and punishment, which are found in every legal system; these analyses in turn were to be employed in “particular jurisprudence,” the systematic exposition of some given body of law.

Austin began by distinguishing “law properly so called” and “law improperly so called.” The former is always “a species of command,” an expression of a wish or desire, analytically connected with the ideas of duty, liability to punishment (or sanction), and superiority. The last notion led Austin to his famous and influential analysis of “sovereignty”: “laws strictly so called” (positive laws) are the commands of political superiors to political inferiors. From this it follows that international law is merely “positive international morality” rather than law in a strict sense. (Some writers, viewing this as an unfortunate and perhaps dangerous consequence, were led to various revisions of Austinianism.) Austin’s “separation” of law and morality is often taken as the hallmark of legal positivism. “The existence of law is one thing; its merit or demerit is another,” he wrote in *The Province of Jurisprudence Determined* (V, note). Yet Austin was a utilitarian; in distinguishing between the law that is and the law that ought to be, he did not mean that law is not subject to rational moral criticism grounded in utility, which he took to be the index to the law of God. At this point Austin was influenced by such “theological utilitarians” as William Paley.

Austin’s views were subjected to vigorous discussion both without and within the traditions of positivism and analytical jurisprudence. And as the disciplines of history, anthropology, and ethnology assumed an increasing

importance during the nineteenth century, rival approaches to the understanding of law developed. Thus, Sir Henry Maine (1822–1888), who formulated the historical law that legal development is a movement from status to contract, argued in his *Early History of Institutions* that the command-sovereignty theory of law has no application in a primitive community, where law is largely customary and the political “sovereign,” who has the power of life or death over his subjects, never makes law. The Austinian view can be saved only by maintaining the fiction that what the “sovereign” permits, he commands. Nonetheless, Austin had many followers at the turn of the twentieth century, such as T. E. Holland (1835–1926) and J. W. Salmond (1862–1924), who attempted to preserve the imperative and coercion aspects of his theory while introducing revisions.

The role of the courts was increasingly emphasized. In the United States, John Chipman Gray (1839–1915) wrote *The Nature and Sources of the Law*, one of the most important American contributions to the subject. Acknowledging his debt to Austin, Gray defined law as “the rules which the courts [of the State] lay down for the determination of legal rights and duties.” This required him to construe statutes, judicial precedents, custom, expert opinion, and morality as sources of law rather than as law itself. All law, on this view, is judge-made. The machinery of the state stands in the background and provides the coercive element, which does not enter into the definition of “law.” Gray influenced the realist movement in the United States.

**HEGELIANISM AND THE HISTORICAL SCHOOL.** While England was largely under the sway of the utilitarians, other trends flourished in Germany: Kantianism, Hegelianism, the historical school, and legal positivism. In his *Philosophy of Right*, G. W. F. Hegel (1770–1831) developed some Kantian themes in his own characteristic way. In his view, law and social-political institutions belong to the realm of “objective spirit,” in which interpersonal relationships, reflecting an underlying freedom, receive their concrete manifestations. In attempting to show the rightness and the rationality of various legal relationships and institutions in given moments of the development of “spirit,” and in seeing them as natural growths, Hegel formulated a theory of law and the state that was easily combined with various historical, functional, and institutional approaches to legal phenomena.

Friedrich Karl von Savigny (1779–1861) is often regarded as the founder of the historical school. His *Of the Vocation of Our Age for Legislation and Jurisprudence*

(1814) was published before Hegel’s work and was probably influenced by Fichte (but not by Fichte’s *Grundlage des Naturrechts*, 1796), whose notion of the “folk-spirit” was widely known. Law, like language, originates spontaneously in the common consciousness of a people, who constitute an organic being. Both the legislator and the jurist may articulate this law, but they no more invent or make it than does the grammarian who codifies a natural language. Savigny believed that to accept his conception of law was to reject the older notions of natural law; nevertheless, it is often claimed that Savigny’s conception was merely a new kind of natural law standing above, and judging, the positive law.

## THE LATE-NINETEENTH AND TWENTIETH CENTURIES

**JHERING AND GERMAN POSITIVISM.** Rudolf von Jhering (1818–1892), eminent both as a historian of law and as a legal theorist, rejected both Hegel and Savigny: Hegel, for holding the law to be an expression of the general will and for failing to see how utilitarian factors and interests determine the existence of law; Savigny, for regarding law as a spontaneous expression of subconscious forces and for failing to see the role of the conscious struggle for protection of interests. However, Jhering shared the broad cultural orientation of many of the Hegelians, and he was grateful to Savigny for having overthrown the doctrine of “immutable” natural law. Jhering’s contribution was to insist that legal phenomena cannot be comprehended without a systematic understanding of the purposes that give rise to them, the ends grounded in social life without which there would be no legal rules. Without purpose there is no will.

At the same time there are strong strains of positivism in Jhering: Law is defined as “the sum of the rules of constraint which obtain in a state” (*Der Zweck im Recht*, p. 320). In this respect he was close to the German positivists, who emphasized the imperative character of law. Karl Binding (1841–1920), an influential positivist, defined law as “only the clarified legal volition [*Rechtswille*] of a source of law [*Rechtsquelle*]” (*Die Normen und ihre Ueber-tretung*, p. 68). This period saw the emergence of the slogan of German positivism: “All law is positive law.” Yet Jhering opposed many of the claims of the analytical positivists; his essay “Scherz und Ernst in der Jurisprudenz” ridiculed their “heaven of jurisprudential concepts.”

**SOCIOLOGICAL AND ALLIED THEORIES.** Jhering’s work foreshadowed many of the dominant tendencies of

twentieth-century legal philosophy. Hermann Kantorowicz regarded Jhering as the fountainhead of both the “sociological” and “free-law” schools. The former term covers too wide a group of writers to be surveyed here, some of whom were concerned solely with empirical work, whereas others combined empirical work with a philosophical outlook. Proponents of the jurisprudence of interests (*Interessenjurisprudenz*) eschewed Jhering’s inquiries into the metaphysical and moral bases of purposes, claiming that he did not sufficiently attend to the conflict of interest behind laws; law reflects dominant interest. (Similar analyses were made in the United States; for example, the “pressure-group” theory of politics advanced by A. F. Bentley [1870–1957] in *The Process of Government*). Much attention was devoted to the analysis of the judicial process and the role that the “balancing” of interests plays in it. As Philipp Heck, one of its leading exponents, remarked: “The new movement of ‘Interessenjurisprudenz’ is based on the realization that the judge cannot satisfactorily deal with the needs of life by mere logical construction” (*Begriffsbildung und Interessenjurisprudenz*, p. 4).

This sentiment was endorsed by the closely allied “free-law” movement. According to this group, “legal logic” and the “jurisprudence of conceptions” are inadequate for achieving practicable and just decisions. The judge not only perforce frequently goes beyond the statute law, but he also often ought to go beyond it. The “free-law” writers undertook the normative task of supplying guidelines for the exercise of judicial discretion, and the judicial function was assimilated to the legislative function. The focus on such problems reflected the enormous change, occasioned by the industrialization of Western society, in the functions of the state. No longer did the nation-state exist merely to keep the peace or protect preexisting rights; rather, it played a positive role in promoting social and individual welfare.

The philosophy of law thus became increasingly concerned with the detailed working out of the foundations of legal policy. The “free-law” theorist Eugen Ehrlich (1862–1922), who influenced such American theorists as Karl N. Llewellyn (1893–1962) and other representatives of legal realist tendencies, rejected the positivistic tenet that only norms posited by the state are legal norms, for in any society there is always more law than is expressed in legal propositions. The “inner order” of an association is the basic form of law. Ehrlich also engaged in empirical study of the “legal facts” (*Rechtstatsachen*) and “living law” of various communities in the Austro-Hungarian empire. Ehrlich may thus be said to have considered cus-

tom as law in its own right. However, many positivists would argue that he was not able to account for the normative character of custom.

**MARXISM.** The Marxist stress on economic interests was often combined with the sociological and free-law views. Central to the Marxist position are the notions of “class” (usually defined in terms of legal relationship to property and the means of production) and “class interest,” which lead to the analysis of the role of law in different societies with differing class structures. Addressing their critics in *The Communist Manifesto* (1848), Marx and Engels wrote: “Your law is but the will of your class exalted into statutes, a will which acquires its content from the material conditions of existence of your class” (p. 24). This suggests that law is merely part of the ideological superstructure and has no effect on the material organization of society. It raises the question of whether law exists in all societies—for instance, in primitive society or in the “classless” society arising after the triumph of socialism—and the further question of the nature and function of law in the transitional period from capitalism to socialism. The issue of “revolutionary legality” or “socialist legality” was treated by Lenin, E. Pashukanis, and Andrei Vishinsky. An important Marxist study of the relationship between law and the economy is that of the Austrian socialist Karl Renner (*Die Rechtsinstitute des Privatrechts und ihre soziale Funktion*, 1929).

**PURE THEORY AND RELATIVISM.** Although the sociological approaches to law had many practitioners, a more controversial and perhaps more influential twentieth-century view was that of Hans Kelsen, a leading exponent of legal positivism. Influenced by the epistemology of the Neo-Kantians, Kelsen distinguished sharply between the “is” and the “ought,” and consequently between the natural sciences and disciplines, such as legal science, which study “normative” phenomena. Legal science is a descriptive science—prescriptive and valuational questions cannot be scientific—and Kelsen’s “pure theory” aimed at providing the conceptual tools for studying any given legal system irrespective of its content. The theory is “pure” because it is divorced from any ideological or sociological elements; it attempts to treat a legal system simply as a system of norms. Kelsen’s view was thus similar to the analytical jurisprudence of Austin, but Kelsen regarded legal norms as “de-psychologized commands.” In order to understand an act of will as a norm-creating act, we must already employ a norm which serves as a “schema of interpretation.” The jurist who seeks to understand legal phenomena must ultimately presuppose

a basic norm (*Grundnorm*), which is not itself a positive legal norm. Legal systems are sets of coercive norms arranged in hierarchical fashion; lower norms are the “concretizations” of higher norms. In Kelsen’s analysis the “dualisms” of state and law and public and private law disappear, and the relationship between international law and national legal systems is seen in a fresh light.

Unlike Kelsen, Gustav Radbruch (1878–1949) did not found a school. His position, which he called relativism, has many affinities with that of Kelsen; but Radbruch maintained that law, which is a cultural phenomenon, can be understood only in relation to the values that men strive to realize through it. He attempted to analyze these values in relation to legal institutions, showing the “antinomies” among these values that led to his relativism. World War II raised the question in the minds of many legal philosophers whether the legal positivism that was popular in Germany, with its separation of law and morals, contributed to the rise of Nazism. Concern over this problem seems to have caused Radbruch to move away from his earlier relativism toward a kind of natural-law position.

REALISM. In the United States, legal philosophy had largely been the province of lawyers rather than of professional philosophers. This may account for its sociological and realistic tone. The erudite Roscoe Pound (1870–1964) was the most prolific writer on this subject. Pound recognized the influence of Josef Kohler (1849–1919) and his notion of jural postulates and, especially, of Jhering. The pragmatism of William James also contributed to the development of his views. In an early article, “Mechanical Jurisprudence,” Pound argued for an understanding of the interests that the law seeks to protect. Introducing a distinction between “law in books” and “law in action,” he maintained the need for a close study of the actual operation of legal institutions.

On both scores his influence in the United States has been momentous, but it is difficult to summarize his position; he is often associated with a “social engineering” approach to law. Law contains both precepts and ideal elements. Among precepts Pound distinguished rules, principles, conceptions, doctrines, and standards. It is pointless to isolate some canonical form to which all laws are reducible. The ideal element consists of received ideals “of the end of law, and hence of what legal precepts should be and how they should be applied.” Pound offered an elaborate, although tentative, survey of the individual, public, and social interests secured by law. This list was criticized and amended by Pound’s Aus-

tralian disciple Julius Stone (*The Province and Function of Law*, 1946). In his later years Pound moved toward a kind of natural-law thinking, arguing for a more intimate connection between law and morality; he abjured the realist tendencies, which had been influenced by his earlier thought, as “give it up” philosophies.

It is difficult to characterize the legal realists; they disclaimed a common doctrine but recognized an interest in a common set of problems. Along with J. C. Gray, the spiritual godfather of American legal realism was Justice Oliver Wendell Holmes, Jr. (1841–1935). In his seminal essay “The Path of the Law,” he advocated viewing law as the “bad man” would, in terms of the practicable remedies afforded individuals through the medium of the courts. Holmes presented in that article his famous definition of law as “the prophecies of what the courts will do in fact.” It may be argued, however, that this definition, while perhaps adequate from the advocate’s viewpoint, can hardly apply to the judge. When the judge asks what the law is on some matter, he is not trying to predict what he will decide.

Joseph W. Bingham was one of the first realists. In “What Is the Law?” Bingham argued that legal rules, like scientific laws, have no independent existence, being simply mental constructs that conveniently summarize particular facts. Laws are really judicial decisions, and the so-called rules or principles are among the (mentally) causative factors behind the decision. This nominalism and behaviorism, which characterized much of early realist writing, was criticized by Morris R. Cohen (1880–1947). “Behavior analysis” was advocated by Karl N. Llewellyn, who extended it beyond judicial behavior to “official” behavior (*Jurisprudence*, Chicago, 1962; collected papers).

The so-called myth of legal certainty was attacked by Jerome Frank (1889–1957) in his *Law and the Modern Mind*, which explained the genesis of the myth in Freudian terms. In the sixth edition Frank was somewhat friendlier toward natural-law thinking, characterizing his change of attitude as going from an earlier “rule-skepticism” to “fact-skepticism.” Other important realists are Thurman Arnold, Leon Green, Felix Cohen, Walter Nelles, Herman Oliphant, and Fred Rodell. Both positivism and realism were attacked by the Harvard legal philosopher Lon L. Fuller (1902–1978), a leading American exponent of non-Thomistic natural-law thinking.

The Scandinavian countries were a center of legal philosophy, and many of their leading writers have been realists. They have been more consciously philosophical than their American counterparts. The leading spirit was

Axel Hägerström (1868–1939), who rejected metaphysical presuppositions in legal philosophy and insisted on an understanding of legal phenomena in empirical terms. Many legal concepts can be understood only as survivals of “mythical” or “magical” thought patterns, which should ideally be eliminated. Vilhelm Ljunstedt (*Legal Thinking Revised*, Stockholm, 1956) was most radical in his rejection of metaphysics. Values are expressions of emotion and should be excluded from legal science. The “method of social welfare” should be substituted for the “method of justice.” Alf Ross (*On Law and Justice*, London, 1958) argued that the first method is as “chimerical” as the second and presents an analysis of legal policy-making as a kind of rational technology. Laws, Ross argued, are directives to courts. The concept “valid law” as used by jurists and legal philosophers cannot be explicated in purely behavioristic terms; inner psychological attitudes must also be included. A similar view was presented by Karl Olivecrona (*Law as Fact*, London, 1939), who wrote important realist analyses of legal language and severely criticized command theories of law, such as Austin’s. In *Inquiries Into the Nature of Law and Morals* (translated by C. D. Broad, Cambridge, 1953), Hägerström argued that Kelsen’s “pure theory” never escapes the “will” element either, and hence it falls subject to all the criticisms that may be leveled against the command theories.

**CRITICAL LEGAL STUDIES.** The critical legal studies (CLS) movement, associated with the work of Duncan Kennedy, among many others, borrowed much from legal realism. CLS scholars shared the rule-skepticism of the realists and their rejection of legal formalism. Both groups emphasized the role played by extra-legal factors in shaping the law. For CLS scholars, however, the realists did not go far enough in developing a “critique” of the ideological bias concealed within legal doctrines. A central preoccupation of the critical scholars was the indeterminacy and vagueness of the law. CLS writers attempted to “deconstruct” the law by exposing its inconsistencies and tracing them to the conflicting social and economic forces responsible for shaping it.

**H. L. A. HART AND POSITIVISM.** One of the most influential legal theorists of the last half of the twentieth century, H. L. A. Hart (1907–1992), in his *Concept of Law*, developed the view that the law is a union of “primary” and “secondary” rules. Primary rules impose duties; secondary rules specify how primary rules may be changed, interpreted, and recognized as valid. A rule of recognition specifies what is to count as law in a given system. In a

series of works beginning with *Taking Rights Seriously*, Ronald Dworkin attacked Hart’s theory, maintaining that when courts reason about “hard” cases, they invoke standards or principles that cannot be captured by a Hartian rule of recognition. Principles (such as “no man should profit from his own wrongdoing”) are part of the law, Dworkin argued, and so Hart’s positivism is descriptively inaccurate. In *Law’s Empire*, Dworkin argued that law is an “interpretive” concept, so that a judge facing a difficult case must seek to identify the best “constructive interpretation” of the legal doctrine of his community, viewing the legal materials normatively, in their “best light.” Law is the product of an interpretation that best sums up the legal texts and principles of a given community into a coherent and attractive whole.

Hart’s work spurred debate among legal positivists regarding the proper understanding of Hart’s rule of recognition. Hart maintained that moral norms are not necessarily a part of the criteria for the validity of law. But could there be legal systems that *do* incorporate moral criteria of legal validity? “Exclusive” legal positivists, such as Joseph Raz, responded in the negative; “inclusive” positivists, such as Jules Coleman, answered affirmatively.

**LATE-TWENTIETH-CENTURY DEVELOPMENTS.** A resurgence of interest in natural law characterized the end of the twentieth century, with works by Robert George (*In Defense of Natural Law*) and especially John Finnis, beginning with his *Natural Law and Natural Rights*. Several other prominent jurisprudential “schools” also emerged in the last decades of the twentieth century. Among these were feminist jurisprudence and the law and economics movement. Work by Catherine MacKinnon and other feminist lawyers sought to expose the patriarchal assumptions underlying purportedly neutral legal doctrine; and scholars led by scholar and judge Richard Posner argued that an economic analysis of the formation and function of legal rules and doctrines provides the best explanation for existing law.

## PHILOSOPHY OF LAW, PROBLEMS OF

The existence of legal systems, even the most rudimentary, has afforded the opportunity for a variety of academic disciplines. Of these some are, or purport to be, empirical: They include the historical study of particular legal systems or specific legal doctrines and rules, and sociological studies of the ways in which the content and the efficacy of law and the forms and procedures of law-making and law-applying both influence and are influenced by their economic and social setting, and serve social needs or specific social functions. But since law in most societies soon reaches a very high degree of complexity, its administration requires the special training of judges and professional lawyers. This in turn has created the need for a specific form of legal science concerned with the systematic or dogmatic exposition of the law and its specific methods and procedures. For this purpose the law is divided into distinct branches (such as crime, tort, and contract), and general classifications and organizing concepts are introduced to collect common elements in the situations and relationships created by the law (such as rights, duties, obligations, legal personality, ownership, and possession) or elements common to many separate legal rules (such as act and intention).

No very firm boundaries divide the problems confronting these various disciplines from the problems of the philosophy of law. This is especially true of the conceptual schemes of classification, definition, and division introduced by the academic study of the law for the purpose of exposition and teaching; but even some historical and sociological statements about law are sufficiently general and abstract to need the attention of the philosophical critic. Little, however, is to be gained from elab-

orating the traditional distinctions between the philosophy of law, jurisprudence (general and particular), and legal theory, although importance has often been attributed to them. Instead, as with other branches of philosophy, it is more important to distinguish as belonging to the philosophy of law certain groups of questions which remain to be answered even when a high degree of competence or mastery of particular legal systems and of the empirical and dogmatic studies mentioned above has been gained. Three such groups may be distinguished: problems of definition and analysis, problems of legal reasoning, and problems of the criticism of law. This division is, however, not uncontroversial; and objections to it are considered in the last section of the article.

### PROBLEMS OF DEFINITION AND ANALYSIS

**THE DEFINITION OF LAW.** All the obscurities and prejudices that in other areas of philosophy surround the notions of definition and of meaning have contributed to the endlessly debated problems of the definition of law. In early arguments the search for the definition of law was assumed to be the task of identifying and describing the "essence" or "nature" of law, and thus the uniquely correct definition of law by reference to which the propriety of the use, however well established, of the expressions "law" and "legal system" could be tested. It is frequently difficult to distinguish from this search for the essence of law a more modest conception of definition that, while treating the task as one of identifying and describing the standards actually accepted for the use of these expressions, assumes that there is only one "true," "strict," or "proper" use of them and that this use can be described in terms of a single set of necessary and sufficient conditions. A wide range of different considerations has shown how unrealistic or how sterile this assumption is in the case of law and has compelled its surrender. Among these considerations is the realization that although there are central clear instances to which the expressions "law" and "legal system" have undisputed application, there are also cases, such as international law and primitive law, which have certain features of the central case but lack others. Also, there is the realization that the justification for applying general expressions to a range of different cases often lies not in their conformity to a set of necessary and sufficient conditions but in the analogies that link them or their varying relationships to some single element.

*Lexical definitions and deviant cases.* The foregoing are difficulties of definition commonly met in many areas of philosophy, but the definition of law has peculiar diffi-

culties of its own. Thus, the assumption that the definition of law either has been or should be lexical, that is, concerned with the characterization or elucidation of *any* actual usage, has been challenged on several grounds. Thus it is often asserted that in the case of law, the area of indeterminacy of actual usage is too great and relates to too many important and disputed issues, and that what is needed is not a characterization or elucidation of usage but a reasoned case for the inclusion in or exclusion from the scope of the expressions “law” and “legal system” of various deviations from routine and undisputed examples. These deviant cases include not only international law and primitive law but also certain elements found in developed municipal legal systems, such as rules to which the usual sanctions are not attached and rules that run counter to fundamental principles of morality and justice.

*Pragmatic definitions.* In the above circumstances some theorists disclaim as necessarily deceptive any aim to provide an analysis or definition of law which is a neutral description or elucidation of usage; instead, they speak of the task of definition as “stipulative,” “pragmatic,” or “constructive,” that is, as designed to provide a scheme or model for the demarcation and classification of an area of study. The criterion of adequacy of such pragmatic definitions is not conformity to or the capacity to explain any actual usage but the capacity to advance the theorists’ specific aims, which may differ widely. Thus, a definition of law to be used for the instruction or assistance of lawyers concerned primarily with the outcome of litigation or court proceedings will differ from the definition used to demarcate and unify the fruitful area of historical study and will also differ from the definition to be used by the social critic concerned with identifying the extent to which human interests are advanced or frustrated by modes of social organization and control.

*Structural problems.* Neither the legitimacy of pragmatic definitions nor their utility for deliberately chosen objectives need be disputed. But it is clear that they avoid rather than resolve many of the long-standing perplexities that have motivated requests for the definition of law and have made it a philosophical problem. The factors that have generated these perplexities may be summarized as follows: Notwithstanding the considerable area of indeterminacy in their use, the expressions “law,” “a law,” “legal system,” and a wide range of derivative and interrelated expressions (“legislation,” “courts of law,” “the application of law,” “legal adjudication”) are sufficiently determinate to make possible general agreement in judgments about their application to particular instances. But

reflection on what is thus identified by the common usage of such terms shows that the area they cover is one of great internal complexity; laws differ radically both in content and in the ways in which they are created, yet despite this heterogeneity they are interrelated in various complex ways so as to constitute a characteristic structure or system. Many requests for the definition of law have been stimulated by the desire to obtain a coherent view of this structure and an understanding of the ways in which elements apparently so diverse and unified. These are problems, therefore, of the structure of law.

*Coercion and morality.* Reflection on the operations of a legal system discloses problems of another sort, for it is clear that law as a mode of influence on human behavior is intimately related to and in many ways dependent upon the use or threat of force on the one hand and on morality and justice on the other. Yet law is also, at points, distinct from both, so no obvious account of these connections appears acceptable: They appear to be not merely contingent, and since they sometimes fail, the statement of these connections does not appear to be any easily comprehensible species of necessary truth. Such tensions create demands for some stable and coherent definition of the relationships between law, coercion, and morality; but definitions of law have only in part been designed to make these important areas of human experience more intelligible. Practical and indeed political issues have long been intertwined with theoretical ones; and as is evident from the long history of the doctrines of natural law and legal positivism, the advocacy of a submissive or a critical attitude to law, or even of obedience or disobedience, has often been presented in the form of a persuasive definition of the relationship between law and morality on the one hand and between law and mere force on the other.

THE ANALYSIS OF LEGAL CONCEPTS. Although legal rules are of many different types and may be classified from many different points of view, they have many common constituents; and although the law creates for both individuals and groups a great variety of different situations and relationships, some of these are constantly recurrent and of obvious importance for the conduct of social life. Both lawyers and laypeople have frequent occasion to refer to these common elements and situations, and for this purpose they use classifications and organizing concepts expressed in a vocabulary which has bred many problems of analysis. These problems arise in part because this vocabulary has a more or less established use apart from law, and the points of convergence and divergence between legal and nonlegal usage is not always

immediately obvious or easily explicable. It is also the case that the ways in which common elements in law or legal situations are classified by different theorists in part reflect and derive from divergent conceptions of law in general. Therefore, although different writers use such expressions as “rights” and “duty” in referring to the same legal situations, they select different elements or aspects from these situations. A third factor calling for clarification is the fact that many of the commonest notions used in referring to legal phenomena can be explicated only when certain distinctive ways in which language functions in conjunction with practical rules have been understood. These problems of analysis are illustrated in the case of the concepts of (1) legal obligation or duty, (2) a legal transaction, and (3) intention. (Certain distinctions once made between the notions of a legal obligation and a legal duty are no longer of importance and will be disregarded.)

*Legal obligations or duties.* The situation in which an individual has a legal duty to do or to abstain from some action is the commonest and most fundamental of all legal phenomena; the reference to duty or its absence is involved in the definition of such other legal concepts as those of a right, a power, a legal transaction, or a legal personality. Whenever the law of an effective legal system provides for the punishment of those who act or fail to act in certain ways, the word *duty* applies. Thus, to take a simple example, if the law requires under penalty that persons of a certain age shall report for military service, then such persons have, or are “under,” a legal duty to do so. This much is undisputed, however much theorists may dispute over the analysis of “duty” or its application to situations created not by the criminal law but by the law relating to torts or to contract.

However, even the above simple situation can be viewed from two very different standpoints that give rise to apparently conflicting analyses of duty. From one of these (the predictive standpoint), reporting for military service is classified as a duty simply because failure to report renders likely certain forms of suffering at the hands of officials. From the other standpoint (the normative standpoint), reporting for military service is classified as a duty because, owing to the existence of the law, it is an action that may be rightly or justifiably demanded of those concerned; and failure to report is significant not merely because it renders future suffering likely but also because punishment is legally justified even if it does not always follow disobedience.

From Jeremy Bentham onward the predictive analysis of duty as a chance or likelihood of suffering in the event

of disobedience to the law has been advocated by important writers for a variety of theoretical and practical reasons. On the one hand it has seemed to free the idea of legal duty from metaphysical obscurities and irrelevant associations with morals, and on the other to provide a realistic guide to life under law. It isolates what for some people is the only important fact about the operation of a legal system and what for all people is at least one important fact: the occasions and ways in which the law works adversely to their interests. This is of paramount importance not only to the malefactor but also to the critic and reformer of the law concerned to balance against the benefits which law brings its costs in terms of human suffering.

By contrast, the normative point of view, without identifying moral and legal duty or insisting on any common content, stresses certain common formal features that both moral and legal duty possess in virtue of their both being aspects of rule-guided conduct. This is the point of view of those who, although they may not regard the law as the final arbiter of conduct, nevertheless generally accept the existence of legal rule as a guide to conduct and as legally justifying demands for conformity, punishment, enforced compensation, or other forms of coercion. Attention to these features of the idea of duty is essential for understanding the ways in which law is conceived of and operative in social life.

Although theorists have often attributed exclusive correctness to these different standpoints, there are various ways in which they may be illuminatingly combined. Thus, the normative account might be said to give correctly the meaning of such statements as that a person has a legal duty to do a certain action, while the predictive account emphasizes that very frequently the point or purpose of making such statements is to warn that suffering is likely to follow disobedience. Such a distinction between the meaning of a statement and what is implied or intended by its assertion in different contexts is of considerable importance in many areas of legal philosophy.

*Legal transactions.* The enactment of a law, the making of a contract, and the transfer by words, written or spoken, of ownership or other rights are examples of legal transactions which are made possible by the existence of certain types of legal rules and are definable in terms of such rules. To some thinkers, such transactions (acts in the law, or juristic acts) have appeared mysterious—some have even called them magical—because their effect is to change the legal position of individuals or to make or eliminate laws. Since, in most modern systems of law, such changes are usually effected by the use of words, written or spoken, there seems to be a species of legal

alchemy. It is not obvious how the mere use of expressions like “it is hereby enacted ...,” “I hereby bequeath ...,” or “the parties hereby agree ...” can produce changes. In fact, the general form of this phenomenon is not exclusively legal, although it has only comparatively recently been clearly isolated and analyzed. The words of an ordinary promise or those used in a christening ceremony in giving a name to a child are obvious analogues to the legal cases. Lawyers have sometimes marked off this distinctive function of language as the use of “operative words,” and under this category have distinguished, for example, the words used in a lease to create a tenancy from the merely descriptive language of the preliminary recital of the facts concerning the parties and their agreement.

For words (or in certain cases gestures, as in voting or other forms of behavior) to have such operative effect, there must exist legal rules providing that if the words (or gestures) are used in appropriate circumstances by appropriately qualified persons, the general law or the legal position of individuals is to be taken as changed. Such rules may be conceived from one point of view as giving to the language used a certain kind of force or effect which is in a broad sense their meaning; from another point of view they may be conceived as conferring on individuals the legal power to make such legal changes. In Continental jurisprudence such rules are usually referred to as “norms of competence” to distinguish them from simpler legal rules that merely impose duties with or without correlative rights.

As the expressions “acts-in-the-law” and “operative words” suggest, there are important resemblances between the execution of legal transactions and more obvious cases of human actions. These points of resemblance are of especial importance in understanding what has often seemed problematic—the relevance of the mental or psychological states of the parties concerned to the constitution or validity of such transactions. In many cases the relevant rules provide that a transaction shall be invalid or at least liable to be set aside at the option of various persons if the person purporting to effect it was insane, mistaken in regard to certain matters, or subjected to duress or undue influence. There is here an important analogy with the ways in which similar psychological facts (*mens rea*) may, in accordance with the principles of the criminal law, excuse a person from criminal responsibility for his action. In both spheres there are exceptions: In the criminal law there are certain cases of “strict” liability where no element of knowledge or intention need be proved; and in certain types of legal transaction, proof that a person attached a special meaning to the words he

used or was mistaken in some respect in using them would not invalidate the transaction, at least as against those who have relied upon it in good faith.

Attention to these analogies between valid legal transactions and responsible action and the mental conditions that in the one case invalidate and in the other excuse from responsibility illuminates many obscure theoretical disputes concerning the nature of legal transactions such as contract. Thus, according to one principal theory (the “will” theory) a contract is essentially a complex psychological fact—something that comes into being when there is a meeting of minds (*consensus ad idem*) that jointly “will” or “intend” a certain set of mutual rights and duties to come into existence. The words used are, according to this theory, merely evidence of this consensus. The rival theory (the “objective” theory) insists that what makes a contract is not a psychological phenomenon but the actual use of words of offer and acceptance, and that except in special cases the law simply gives effect to the ordinary meaning of the language used by the parties and is not concerned with their actual states of mind. Plainly, each side to this dispute fastens on something important but exaggerates it. It is indeed true that, like an ordinary promise, a legal contract is not made by psychological facts. A contract, like a promise, is “made” not by the existence of mental states but by words (or in some cases deeds). If it is verbally made, it is made by the operative use of language, and there are many legal rules inconsistent with the idea that a *consensus ad idem* is required. On the other hand, just because the operative use of language is a kind of action, the law may—and in most civilized legal systems does—extend to it a doctrine of responsibility or validity under which certain mental elements are made relevant. Thus a contract, although made by words, may be vitiated or made void or “voidable” if a party is insane, mistaken in certain ways, or under duress. The truths latent among the errors of the “will” theory and the “objective” theory can therefore be brought together in an analysis that makes explicit the analogy between valid transactions made by the operative use of language and responsible actions.

**Intention.** The fact that the law often treats certain mental states or psychological conditions as essential elements both in the validity of legal transactions and in criminal responsibility has thrust upon lawyers the task of distinguishing between and analyzing such notions as “will,” “intention,” and “motive.” These are concepts that have long puzzled philosophers not primarily concerned with the law, and their application in the law creates fur-

ther specific problems. These arise in various ways: There are divergencies between the legal and nonlegal use of these notions which are not always obvious or easily understood; the law, because of difficulties of proof or as a matter of social policy, may often adopt what are called external or objective standards, which treat certain forms of outward behavior as conclusive evidence of the existence of mental states or impute to an individual the mental state that the average man behaving in a given way would have had. Although statutes occasionally use such expressions as “maliciously,” “knowingly,” or “with intent,” for the most part the expressions “intentionally” and “voluntarily” are not the language of legal rules but are used in the exposition of such rules in summarizing the various ways in which either criminal charges or civil claims may fail if something is done—for instance, accidentally, by mistake, or under duress.

The problems that arise in these ways may be illustrated in the case of intention. Legal theorists have recognized intention as the mental element of central importance to the law. Thus, an intention to do the act forbidden by law is in Anglo American law normally the sufficient mental element for criminal responsibility and also is normally, although not always, necessary for responsibility. So if a man intends to do the act forbidden by law, other factors having to do with his powers of self-control are usually irrelevant, although sometimes duress and sometimes provocation or deficient ability to control conduct, caused by mental disorder, may become relevant. In fact, three distinct applications of the notion of intention are important in the law, and it is necessary to distinguish in any analysis of this concept (1) the idea of intentionally doing something forbidden by law; (2) doing something with a further intention; and (3) the intention to do a future act. The first of these is in issue when, if a man is found to have wounded or killed another, the question is asked whether he did it intentionally or unintentionally. The second is raised when the law, as in the case of burglary defined as “breaking into premises at night with the intention of committing a felony,” attaches special importance or more severe penalties to an action if it is done for some further purpose, even though the latter is not executed. The third application of intention can be seen in those cases where an act is criminal if it is accompanied by a certain intention—for instance, incurring a debt with the intention never to pay.

Of these three applications the first is of chief importance in the law, but even here the law only approximates to the nonlegal concept and disregards certain elements in its ordinary usage. For in the law the question whether

a man did something intentionally or not is almost wholly a question concerning his knowledge or belief at the time of his action. Hence, in most cases when an action falling under a certain description (such as wounding a police officer) is made a crime, the law is satisfied, insofar as any matter of intention is concerned, if the accused knew or believed that his action would cause injury to his victim and that his victim was in fact a police officer. This almost exclusively cognitive approach is one distinctive way in which the law diverges from the ordinary idea of intentionally doing something, for in ordinary thought not all the foreseen consequences of conduct are regarded as intended.

A rationale of this divergence can be provided, however. Although apart from the law a man will be held to have done something intentionally only if the outcome is something aimed at or for the sake of which he acted, this element which the law generally disregards is not relevant to the main question with which the law is concerned in determining a man’s legal responsibility for bringing about a certain state of affairs. The crucial question at this stage in a criminal proceeding is whether a man whose outward conduct and its consequences fall within the definition of a crime had at the time he acted a choice whether these consequences were or were not to occur. If he did, and if he chose that insofar as he had influence over events they would occur, then for the law it is irrelevant that he merely foresaw that they would occur and that it was not his purpose to bring them about. The law at the stage of assessing a man’s responsibility is interested only in his conscious control over the outcome, and discards those elements in the ordinary concept of intention which are irrelevant to the conception of control. But when the stage of conviction in a criminal proceeding is past, and the question becomes how severely the criminal is to be punished, the matter previously neglected often becomes relevant. Distinctions may be drawn at this stage between the individual who acted for a certain purpose and one who acted merely foreseeing that certain consequences would come about.

The second and third applications of the notion of intention (doing something with a further intent and the intention to do a future action) are closer to nonlegal usage, and in the law, as elsewhere, certain problems of distinguishing motive and intention arise in such cases.

## PROBLEMS OF LEGAL REASONING

Since the early twentieth century, the critical study of the forms of reasoning by which courts decide cases has been a principal concern of writers on jurisprudence, espe-

cially in America. From this study there has emerged a great variety of theories regarding the actual or proper place in the process of adjudication of what has been termed, often ambiguously, "logic." Most of these theories are skeptical and are designed to show that despite appearances, deductive and inductive reasoning play only a subordinate role. Contrasts are drawn between "logic" and "experience" (as in O. W. Holmes Jr.'s famous dictum that "the life of the law has not been logic; it has been experience") or between "deductivism" or "formalism" on the one hand and "creative choice" or "intuitions of fitness" on the other. In general, such theories tend to insist that the latter members of these contrasted sets of expressions more adequately characterize the process of legal adjudication, despite its appearance of logical method and form. According to some variants of these theories, although logic in the sense of deductive and inductive reasoning plays little part, there are other processes of legal reasoning or rational criteria which courts do and should follow in deciding cases. According to more extreme variants, the decisions of courts are essentially arbitrary.

**LEGISLATION AND PRECEDENT.** In Anglo American jurisprudence the character of legal reasoning has been discussed chiefly with reference to the use by the courts of two "sources" of law: (1) the general rules made by legislative bodies (or by other rule-making agencies to which legislative powers have been delegated) and (2) particular precedents or past decisions of courts which are treated as material from which legal rules may be extracted although, unlike legislative rules, there is no authoritative or uniquely correct formulation of the rules so extracted. Conventional accounts of the reasoning involved in the application of legislative rules to particular cases have often pictured it as exclusively a matter of deductive inference. The court's decision is represented as the conclusion of a syllogism in which the major premise consists of the rule and the minor premise consists of the statement of the facts which are agreed or established in the case. Similarly, conventional accounts of the use of precedents by courts speak of the courts' extraction of a rule from past cases as inductive reasoning and the application of that rule to the case in hand as deductive reasoning.

In their attack on these conventional accounts of judicial reasoning, skeptical writers have revealed much that is of great importance both to the understanding and to the criticism of methods of legal adjudication. There are undoubtedly crucially important phases in the use of legal rules and precedents to decide cases which do not

consist merely of logical operations and which have long been obscured by the traditional terminology adopted both by the courts themselves in deciding cases and by jurists in describing the activities of courts. Unfortunately, the general claim that logic has little or no part to play in the judicial process is, in spite of its simple and monolithic appearance, both obscure and ambiguous; it embraces a number of different and sometimes conflicting contentions that must be separately investigated. The most important of these issues are identified and discussed below. There are, however, two preliminary issues of peculiar concern to philosophers and logicians which demand attention in any serious attempt to characterize the forms of legal reasonings.

*Deductive reasoning.* It has been contended that the application of legal rules to particular cases cannot be regarded as a syllogism or any other kind of deductive inference, on the grounds that neither general legal rules nor particular statements of law (such as those ascribing rights or duties to individuals) can be characterized as either true or false and thus cannot be logically related either among themselves or to statements of fact; hence, they cannot figure as premises or conclusions of a deductive argument. This view depends on a restrictive definition, in terms of truth and falsehood, of the notion of a valid deductive inference and of logical relations such as consistency and contradiction. This would exclude from the scope of deductive inference not only legal rules or statements of law but also commands and many other sentential forms which are commonly regarded as susceptible of logical relations and as constituents of valid deductive arguments. Although considerable technical complexities are involved, several more general definitions of the idea of valid deductive inference that render the notion applicable to inferences the constituents of which are not characterized as either true or false have now been worked out by logicians. In what follows, as in most of contemporary jurisprudential literature, the general acceptability of this more generalized definition of valid inference is assumed.

*Inductive reasoning.* Considerable obscurity surrounds the claim made by more conventional jurisprudential writers that inductive reasoning is involved in the judicial use of precedents. Reference to induction is usually made in this connection to point a contrast with the allegedly deductive reasoning involved in the application of legislative rules to particular cases. "Instead of starting with a general rule the judge must turn to the relevant cases, discover the general rule implicit in them .... The outstanding difference between the two methods is the

source of the major premise—the deductive method assumes it whereas the inductive sets out to discover it from particular instances” (G. W. Paton, *A Textbook of Jurisprudence*, 2nd ed., Oxford, 1951, pp. 171–172).

It is of course true that courts constantly refer to past cases both to discover rules and to justify their acceptance of them as valid. The past cases are said to be “authority” for the rules “extracted” from them. Plainly, one necessary condition must be satisfied if past cases are in this way to justify logically the acceptance of a rule: The past case must be an instance of the rule in the sense that the decision in the case could be deduced from a statement of the rule together with a statement of the facts of the case. The reasoning insofar as the satisfaction of this necessary condition is concerned is in fact an inverse application of deductive reasoning. But this condition is, of course, only one necessary condition and not a sufficient condition of the court’s acceptance of a rule on the basis of past cases, since for any given precedent there are logically an indefinite number of alternative general rules which can satisfy the condition. The selection, therefore, of one rule from among these alternatives as the rule for which the precedent is taken to be authority must depend on the use of other criteria limiting the choice, and these other criteria are not matters of logic but substantive matters which may vary from system to system or from time to time in the same system. Thus, some theories of the judicial use of precedent insist that the rule for which a precedent is authority must be indicated either explicitly or implicitly by the court through its choice of facts to be treated as “material” to a case. Other theories insist that the rule for which a precedent is authority is the rule which a later court considering the precedent would select from the logically possible alternatives after weighing the usual moral and social factors.

Although many legal writers still speak of the extraction of general rules from precedents, some would claim that the reasoning involved in their use of precedents is essentially reasoning from case to case “by example”: A court decides the present case in the same way as a past case if the latter “sufficiently” resembles the former in “relevant” respects, and thus makes use of the past case as a precedent without first extracting from it and formulating any general rule. Nevertheless, the more conventional accounts, according to which courts use past cases to discover and justify their acceptance of general rules, are sufficiently widespread and plausible to make the use of the term *induction* in this connection worth discussing.

The use of *induction* to refer to the inverse application of deduction involved in finding that a past case is

the instance of a general rule may be misleading: It suggests stronger analogies than exist with the modes of probabilistic inference used in the sciences when general propositions of fact or statements about unobserved particulars are inferred from or regarded as confirmed by observed particulars. *Induction* may also invite confusion with the form of deductive inference known as perfect induction, or with real or alleged methods of discovering generalizations sometimes referred to as intuitive induction.

It is, however, true that the inverse application of deduction involved in the use of precedents is also an important part of scientific procedure, where it is known as hypothetic inference or hypotheticoductive reasoning. Hence, there are certain interesting analogies between the interplay of observation and theory involved in the progressive refining of a scientific hypothesis to avoid its falsification by contrary instances and the way in which a court may refine a general rule both to make it consistent with a wide range of different cases and to avoid a formulation which would have unjust or undesirable consequences.

Notwithstanding these analogies, the crucial difference remains between the search for general propositions of fact rendered probable by confirming instances but still falsifiable by future experience, and rules to be used in the decision of cases. An empirical science of the judicial process is of course possible: It would consist of factual generalization about the decisions of courts and might be an important predictive tool. However, it is important to distinguish the general propositions of such an empirical science from the rules formulated and used by courts.

**DESCRIPTIVE AND PRESCRIPTIVE THEORIES.** The claim that logic plays only a subordinate part in the decision of cases is sometimes intended as a corrective to misleading descriptions of the judicial process, but sometimes it is intended as a criticism of the methods used by courts, which are stigmatized as “excessively logical,” “formal,” “mechanical,” or “automatic.” Descriptions of the methods actually used by courts must be distinguished from prescriptions of alternative methods and must be separately assessed. It is, however, notable that in many discussions of legal reasoning these two are often confused, perhaps because the effort to correct conventional misdescriptions of the judicial process and the effort to correct the process itself have been inspired by the realization of the same important but often neglected

fact: the relative indeterminacy of legal rules and precedents.

This indeterminacy springs from the fact that it is impossible in framing general rules to anticipate and provide for every possible combination of circumstances which the future may bring. For any rule, however precisely formulated, there will always be some factual situations in which the question whether the situations fall within the scope of the general classificatory terms of the rule cannot be settled by appeal to linguistic rules or conventions or to canons of statutory interpretation, or even by reference to the manifest or assumed purposes of the legislature. In such cases the rules may be found either vague or ambiguous. A similar indeterminacy may arise when two rules apply to a given factual situation and also where rules are expressly framed in such unspecific terms as “reasonable” or “material.” Such cases can be resolved only by methods whose rationality cannot lie in the logical relations of conclusions to premises. Similarly, because precedents can logically be subsumed under an indefinite number of general rules, the identification of *the* rule for which a precedent is an authority cannot be settled by an appeal to logic.

These criticisms of traditional descriptions of the judicial process are in general well taken. It is true that both jurists and judges, particularly in jurisdictions in which the separation of powers is respected, have frequently suppressed or minimized the indeterminacy of legal rules or precedents when giving an account of the use of them in the process of decision. On the other hand, another complaint often made by the same writers, that there is an excess of logic or formalism in the judicial process, is less easy to understand and to substantiate. What the critics intend to stigmatize by these terms is the failure of courts, when applying legal rules or precedents, to take advantage of the relative indeterminacy of the rules or precedents to give effect to social aims, policies, and values. Courts, according to these critics, instead of exploiting the fact that the meaning of a statutory rule is indeterminate at certain points, have taken the meaning to be determinate simply because in some different legal context similar wording has been interpreted in a certain way or because a given interpretation is the “ordinary” meaning of the words used.

This failure to recognize the indeterminacy of legal rule (often wrongly ascribed to analytical jurisprudence and stigmatized as conceptualism) has sometimes been defended on the ground that it maximizes certainty and the predictability of decisions. It has also sometimes been welcomed as furthering an ideal of a legal system in

which there are a minimum number of independent rules and categories of classification.

The vice of such methods of applying rules is that their adoption prejudices what is to be done in ranges of different cases whose composition cannot be exhaustively known beforehand: Rigid classification and divisions are set up which ignore differences and similarities of social and moral importance. This is the burden of the complaint that there is an excessive use of logic in the judicial process. But the expression “an excessive use of logic” is unhappy, for when social values and distinctions of importance are ignored in the interpretation of legal rules and the classification of particulars, the decision reached is not more logical than decisions which give due recognition to these factors: Logic does not determine the interpretation of words or the scope of classifications. What is true is that in a system in which such rigid modes of interpretation are common, there will be more occasions when a judge can treat himself as confronted with a rule whose meaning has been predetermined.

**METHODS OF DISCOVERY AND STANDARDS OF APPRAISAL.** In considering both descriptive and prescriptive theories of judicial reasoning, it is important to distinguish (1) assertions made concerning the usual processes or habits of thought by which judges actually reach their decisions, (2) recommendations concerning the processes to be followed, and (3) the standards by which judicial decisions are to be appraised. The first of these concerns matters of descriptive psychology, and to the extent that assertions in this field go beyond the descriptions of examined instances, they are empirical generalizations or laws of psychology; the second concerns the art or craft of legal judgment, and generalizations in this field are principles of judicial technology; the third relates to the assessment or justification of decisions.

These distinctions are important because it has sometimes been argued that since judges frequently arrive at decisions without going through any process of calculation or inference in which legal rules or precedents figure, the claim that deduction from legal rules plays any part in decision is mistaken. This argument is confused, for in general the issue is not one regarding the manner in which judges do, or should, come to their decisions; rather, it concerns the standards they respect in justifying decisions, however reached. The presence or absence of logic in the appraisal of decisions may be a reality whether the decisions are reached by calculation or by an intuitive leap.

**CLEAR CASES AND INDETERMINATE RULES.** When the various issues identified above are distinguished, two sets of questions emerge. The first of these concerns the decisions of courts in “clear” cases where no doubts are felt about the meaning and applicability of a single legal rule, and the second concerns decisions where the indeterminacy of the relevant legal rules and precedents is acknowledged.

*Clear cases.* Even where courts acknowledge that an antecedent legal rule uniquely determines a particular result, some theorists have claimed that this cannot be the case, that courts always “have a choice,” and that assertions to the contrary can only be *ex post facto* rationalizations. Often this skepticism springs from the confusion of the questions of methods of discovery with standards of appraisal noted above. Sometimes, however, it is supported by references to the facts that even if courts fail to apply a clearly applicable rule using a determinate result, this is not a punishable offense, and that the decision given is still authoritative and, if made by a supreme tribunal, final. Hence, it is argued that although courts may show a certain degree of regularity in decision, they are never bound to do so: They always are free to decide otherwise than they do. These last arguments rest on a confusion of finality with infallibility in decisions and on a disputable interpretation of the notion of “being bound” to respect legal rules.

Yet skepticism of this character, however unacceptable, does serve to emphasize that it is a matter of some difficulty to give any exhaustive account of what makes a “clear case” clear or makes a general rule obviously and uniquely applicable to a particular case. Rules cannot claim their own instances, and fact situations do not await the judge neatly labeled with the rule applicable to them. Rules cannot provide for their own application, and even in the clearest case a human being must apply them. The clear cases are those in which there is general agreement that they fall within the scope of a rule, and it is tempting to ascribe such agreements simply to the fact that there are necessarily such agreements in the use of the shared conventions of language. But this would be an oversimplification because it does not allow for the special conventions of the legal use of words, which may diverge from their common use, or for the way in which the meanings of words may be clearly controlled by reference to the purpose of a statutory enactment which itself may be either explicitly stated or generally agreed. A full exploration of these questions is the subject matter of the study of the interpretation of statute.

*Indeterminate rules.* The decisions of cases that cannot be exhibited as deductions from determinate legal rules have often been described as arbitrary. Although much empirical study of the judicial process remains to be done, it is obvious that this description and the dichotomy of logical deduction and arbitrary decision, if taken as exhaustive, is misleading. Judges do not generally, when legal rules fail to determine a unique result, intrude their personal preferences or blindly choose among alternatives; and when words such as *choice* and *discretion*, or phrases such as “creative activity” and “interstitial legislation” are used to describe decisions, these do not mean that courts do decide arbitrarily without elaborating reasons for their decisions—and still less that any legal system authorizes decisions of this kind.

It is of crucial importance that cases for decision do not arise in a vacuum but in the course of the operation of a working body of rules, an operation in which a multiplicity of diverse considerations are continuously recognized as good reasons for a decision. These include a wide variety of individual and social interests, social and political aims, and standards of morality and justice; and they may be formulated in general terms as principles, policies, and standards. In some cases only one such consideration may be relevant, and it may determine decision as unambiguously as a determinate legal rule. But in many cases this is not so, and judges marshal in support of their decisions a plurality of such considerations which they regard as jointly sufficient to support their decision, although each separately would not be. Frequently these considerations conflict, and courts are forced to balance or weigh them and to determine priorities among them. The same considerations (and the same need for weighing them when they conflict) enter into the use of precedents when courts must choose between alternative rules which can be extracted from them, or when courts consider whether a present case sufficiently resembles a past case in relevant respects.

Perhaps most modern writers would agree up to this point with this account of judicial decision where legal rules are indeterminate, but beyond this point there is a divergence. Some theorists claim that notwithstanding the heterogeneous and often conflicting character of the factors which are relevant to decision, it is still meaningful to speak of a decision as *the* uniquely correct decision in any case and of the duty of the judge to discover it. They would claim that a judicial choice or preference does not become rational because it is deferred until after the judge has considered the factors that weigh for and against it.

Other theorists would repudiate the idea that in such cases there is always a decision that is uniquely correct, although they of course agree that many decisions can be clearly ruled out as incorrect. They would claim that all that courts do and can do at the end of the process of coolly and impartially considering the relevant considerations is to choose one alternative that they find the most strongly supported, and that it is perfectly proper for them to concede that another equally skilled and impartial judge might choose the other alternative. The theoretical issues are not different from those that arise at many points in the philosophical discussions of moral argument. It may well be that such terms as *choice*, *discretion*, and *judicial legislation* fail to do justice to the phenomenology of considered decision: It is the law felt involuntary or even inevitable character that often marks the termination of deliberation on conflicting considerations. Very often the decision to include a new case in the scope of a rule or to exclude it is guided by the sense that this is the “natural” continuation of a line of decisions or carries out the “spirit” of a rule. It is also true that if there were not also considerable agreement in judgment among lawyers who approach decisions in these ways, we should not attach significance and value to them or think of such decisions as reached through a rational process. Yet however it may be in moral argument, in the law it seems difficult to substantiate the claim that a judge confronted with a set of conflicting considerations must always assume that there is a single uniquely correct resolution of the conflict and attempt to demonstrate that he has discovered it.

**RULES OF EVIDENCE.** Courts receive and evaluate testimony of witnesses, infer statements of fact from other statements, and accept some statements as probable or more probable than others or as “beyond reasonable doubt.” When it is said that in these activities special modes of legal reasoning are exhibited and that legal proof is different from ordinary proof, reference is usually intended to the exclusionary rules of the law of evidence (which frequently require courts, in determining questions of fact, to disregard matters which are logically relevant), or to various presumptions that assign greater or lesser weight to logically relevant considerations than ordinary standards of reasoning do.

The most famous examples of exclusionary rules are those against “hearsay,” which (subject to certain exceptions) make inadmissible, as evidence of the facts stated, reports tendered by a witness, however credible, of statements made by another person. Another example is the rule that when a person is charged with a crime, evidence

of his past convictions and disposition to commit similar crimes is not admissible as evidence to show that he committed the crime charged. An example of a rule that may give certain facts greater or less probative weight than ordinary standards do is the presumption that unless the contrary is proved beyond reasonable doubt, a child born to a woman during wedlock is the child of both parties to the marriage.

The application of such rules and their exceptions gives rise to results which may seem paradoxical, even though they are justifiable in terms of the many different social needs which the courts must satisfy in adjudicating cases. Thus, one consequence of the well-known exception to the hearsay rule that a report of a statement is admissible as evidence of a fact stated if it is made against the interest of the person who stated it, is that a court may find that a man committed adultery with a particular woman but be unable to draw the conclusion that she committed adultery with him. A logician might express the resolution of the paradox by saying that from the fact that *p* entails *q* it does not follow that “it is legally proved that *p*” entails “it is legally proved that *q*.”

Apart from such paradoxes, the application of the rules of evidence involves the drawing of distinctions of considerable philosophical importance. Thus, although in general the law excludes reports of statements as evidence of the facts stated, it may admit such reports for other purposes, and in fact draws a distinction between statements of fact and what J. L. Austin called performative utterances. Hence, if the issue is whether a given person made a promise or placed a bet, reports that he uttered words which in the context amounted to a promise or a bet are admissible. So, too, reports of a person’s statement of his contemporary mental states or sensations are admissible, and some theorists justify this on the ground that such first-person statements are to be assimilated to behavior manifesting the mental state or sensation in question.

## PROBLEMS OF THE CRITICISM OF LAW

**ANALYSIS AND EVALUATION.** A division between inquiries concerned with the analysis of law and legal concepts and those concerned with the criticism or evaluation of law *prima facie* seems not only possible but necessary, yet the conception of an evaluatively neutral or autonomous analytical study of the law has not only been contested but also has been taken by some modern critics to be the hallmark of a shallow and useless legal posi-

tivism allegedly unconcerned with the values or ends which men pursue through law.

*Objections to pure analysis.* Many different objections to a purely analytical jurisprudence have been made. By some it has been identified with, or thought to entail commitment to, the view that a legal system is a closed logical structure in which decisions in particular cases are “mechanically” deduced from clear antecedent rules whose identification or interpretation presents no problem of choice and involves no judgment of value. Other critics have contended that any serious demand for the definition of a legal concept must at least include a request for guidance as to the manner in which, when the relevant legal rules are unclear or indeterminate, particular cases involving the concept in question should best be determined. It is assumed by these critics that any question concerning the meaning of expressions such as “a right” or “a duty,” as distinct from the question of what rights or duties should be legally recognized, are trivial questions to be settled by reference to a dictionary. Still others have urged that since the maintenance of a legal system and the typical operations of the law (legislation, adjudication, and the making of legal transactions) are purposive activities, any study that isolates law or legal phenomena for study without considering their adequacy or inadequacy for human purposes makes a vicious abstraction that is bound to lead to misunderstanding.

*Replies to objections.* None of the above seem to constitute serious objections. The difficulties of decision in particular cases arising from the relative indeterminacy of legal rules are of great importance, but they are distinct from analytical questions such as those illustrated earlier, which remain to be answered even when legal rules are clear. Thus the isolation and characterization of the normative and predictive standpoints from which law may be viewed and the precise manner of interplay between subjective and objective factors in legal transactions are not things that can be discovered from dictionaries. But attention to them is indispensable in the analysis of the notion of a legal obligation, a legal right, or a contract. There is of course much justice in the claim that in order to understand certain features of legal institutions or legal rules, the aims and purposes they are designed to fulfill must be understood. Thus, a tax cannot be distinguished from a fine except by reference to the purpose for which it is imposed; but to recognize this is not to abandon an analytical study of the law for an evaluative one. The identification of something as an instrument for certain purposes leaves open the question whether it is good or bad, although such identification may indicate the stan-

dards by reference to which this question is to be answered. In any case, there are many features of legal rules that may profitably be studied in abstraction from the purposes which such rules may be designed to achieve.

**CRITERIA OF EVALUATION.** Nonetheless, protests against the severance of analytical from critical or evaluative inquiries, even if misdirected in their ostensible aim, often serve to emphasize something important. These protests are usually accompanied by and sometimes confused with a general thesis concerning the standards and principles of criticism specifically appropriate to law. This is the thesis (which has appeared in many different forms in the history of the philosophy of law) that, whatever may be the case with value judgments in other fields or with moral judgments concerning the activities of individuals, the criteria which distinguish good law from bad do not merely reflect human preferences, tastes, or conventions, which may vary from society to society or from time to time; rather, they are determined by certain constant features of human nature and the natural environment with which men must contend.

The doctrine of natural law in its various traditional forms embodies this thesis. There are, however, obscurities and metaphysical assumptions involved in the use by natural-law theorists of the notions of nature and reason that make their formulations unacceptable to most modern secular thought; and they often confuse their important arguments concerning the principles by which law and social institutions should be judged with arguments designed to show that a reference to morality or justice must be introduced into the definition of law or legal validity. Nonetheless, it is possible to segregate these tangled issues, and some important modern philosophical arguments concern the possibility of restating in an acceptable form the claim that there are certain objective and rationally determined criteria for the evaluation and criticism of law. These arguments will be sketched here in relation to substantive law, procedural law, and the ideas of justice and utility.

**SUBSTANTIVE LAW.** The purposes that human beings pursue in society and for the realization of which they employ law as an instrument are infinitely various, and individuals may differ in the importance they attach to them and in their moral judgments about them. But the simplest form of the argument that there are certain constant criteria for the evaluation of a legal system consists in the elaboration of the truth that if law is to be of any value as an instrument for the realization of human pur-

poses, it must contain certain rules concerning the basic conditions of social life. Thus it is not only true that the legal system of any modern state and any legal system which has succeeded in enduring have contained rules restricting the use of violence, protecting certain forms of property, and enforcing certain forms of contract; it is also clear that without the protections and advantages that such rules supply, people would be grossly hampered in the pursuit of any aims. Legal rules providing for these things are therefore basic in the sense that without them other legal rules would be pointless or at least would operate only fitfully or inefficiently. Criticism of a legal system on the grounds that it omitted such rules could be rebutted only by the demonstration that in the particular case they were unnecessary because the human beings to which the system applied or their natural surroundings were in some way quite extraordinary, that is, that they lacked certain of the salient characteristics that persons and things normally have. This is so because the need for such rules derives from such familiar natural facts as that people are both vulnerable to violence and tempted to use it against each other; that the food, clothes, and shelter necessary to existence do not exist naturally in limitless abundance but must be grown or manufactured by human effort and need legal protection from interference during growth and manufacture and safe custody pending consumption; and that to secure the mutual cooperation required for the profitable development of natural resources, people need legal rules enabling them to bind themselves to future courses of conduct.

Argument along these lines may be viewed as a modest empirical counterpart to the more ambitious teleological doctrine of natural law, according to which there are certain rules for the government of human conduct that can be seen by men endowed with reason as necessary to enable people to attain the specifically human optimum state or end (*finis, telos*) appointed for human beings by Nature or (in Christian doctrine) by God. The empirical version of this theory assumes only that, whatever other purposes laws may serve, they must, to be acceptable to any rational person, enable men to live and organize their lives for the more efficient pursuit of their aims. It is, of course, possible to challenge this assumption and to deny that the fact that there are certain rules necessary if fundamental human needs are to be satisfied has any relevance to the criticism of law. But this denial seems intelligible only as a specifically religious doctrine that regards law as the expression of a divine will. It may then be argued that people's lives should be regulated by the law not in order to further any secular human purposes

but because conformity to God's will is in itself meritorious or obligatory.

A more serious objection to the empirical argument conducted in terms of human needs for protection from violence to the person and property and for cooperation is the contention that although these are fundamental human needs, the coercive rules of a legal system need not provide for them. It may be said that the accepted morality of all societies provides a system of restraint which provides adequately for these needs, and that the vast majority of people abstain from murder, theft, and dishonesty not from fear of legal sanctions but for other, usually moral, reasons. In these circumstances it may be no defect in a legal system that it confines itself to other matters in relation to which the accepted morality is silent.

It seems clear, however, that social morality left to itself could not provide adequately for the fundamental needs of social life, save in the simplest forms of society. It may well be that most individuals, when they believe themselves to be protected from malefactors by the punishments, threats of punishment, and physical restraints of the law, will themselves voluntarily submit to the restraints necessary for peaceful and profitable coexistence. But it does not follow that without the law's protections, voluntary submission to these restraints would be either reasonable or likely. In any case, the rules and principles of social morality leave open to dispute too many questions concerning the precise scope and form of its restraints. Legal rules are needed to supply the detail required to distinguish murder and assault from excusable homicide and injury, to define the forms of property to be protected, and to specify the forms of contract to be enforced. Hence, the omission of such things from the legal system could not be excused on the ground that the existence of a social morality made them unnecessary.

**PROCEDURAL LAW.** Laws, however impeccable their content, may be of little service to human beings and may cause both injustice and misery unless they generally conform to certain requirements which may be broadly termed procedural (in contrast with the substantive requirements discussed above). These procedural requirements relate to such matters as the generality of rules of law, the clarity with which they are phrased, the publicity given to them, the time of their enactment, and the manner in which they are judicially applied to particular cases. The requirements that the law, except in special circumstances, should be general (should refer to classes of persons, things, and circumstances, not to indi-

viduals or to particular actions); should be free from contradictions, ambiguities, and obscurities; should be publicly promulgated and easily accessible; and should not be retrospective in operation are usually referred to as the principles of legality. The principles that require courts, in applying general rules to particular cases, to be without personal interest in the outcome or other bias and to hear arguments on matters of law and proofs of matters of fact from both sides of a dispute are often referred to as rules of natural justice. These two sets of principles together define the concept of the rule of law to which most modern states pay at least lip service.

These requirements and the specific value that conformity with them imparts to laws may be regarded from two different points of view. On the one hand, they maximize the probability that the conduct required by the law will be forthcoming, and on the other hand, they provide individuals whose freedom is limited by the law with certain information and assurances that assist them in planning their lives within the coercive framework of the law. This combination of values may be easily seen in the case of the requirements of generality, clarity, publicity, and prospective operation. For the alternative to control by general rules of law is orders addressed by officials to particular individuals to do or to abstain from particular actions; and although in all legal systems there are occasions for such particular official orders, no society could efficiently provide the number of officials required to make them a main form of social control.

Thus, general rules clearly framed and publicly promulgated are the most efficient form of social control. But from the point of view of the individual citizen, they are more than that: They are required if he is to have the advantage of knowing in advance the ways in which his liberty will be restricted in the various situations in which he may find himself, and he needs this knowledge if he is to plan his life. This is an argument for laws that are general in the sense of requiring courses of action and not particular actions. The argument for generality in the sense of applicability to classes of persons is different: It is that such rule confer upon the individual the advantage of knowing the restrictions to which the conduct of others besides himself will be subject. Such knowledge in the case of legal restrictions that protect or benefit the individual increases the confidence with which he can predict and plan his future.

The value of the principles of natural justice which concern the process of adjudication are closely linked to the principles of legality. The requirement that a court should be impartial and hear arguments and proofs from

both sides of a dispute are guarantees of objectivity which increase the probability that the enacted law will be applied according to its tenor. It is necessary to ensure by such means that there will be this congruence between judicial decisions and the enacted law if the commitment to general rules as a method of government is taken seriously.

Care must be taken not to ascribe to these arguments more than they actually prove. Together they amount to the demonstration that all who have aims to pursue need the various protections and benefits which only laws conforming to the above requirements of substance and procedure can effectively confer. For any rational person, laws conferring these protections and benefits must be valuable, and the price to be paid for them in the form of limitations imposed by the law on one's own freedom will usually be worth paying. But these arguments do not show, and are not intended to show, that it will always be reasonable or morally obligatory for people to obey the law when the legal system provides them with these benefits, for in other ways the system may be iniquitous: It may deny even the essential protections of the law to a minority or slave class or in other ways cause misery or injustice.

**JUSTICE AND UTILITY.** The equal extension to all of the fundamental legal protections of person and property is now generally regarded as an elementary requirement of the morality of political institutions, and the denial of these protections to innocent persons, as a flagrant injustice. Even when these protections are denied, lip service is often paid to the principle of equal distribution by the pretense that the persons discriminated against are either criminal in intention, if not in deed, or are like children who are incapable of benefiting from the freedom which laws confer and are in need of some more paternalistic regime.

*Inadequacy of utilitarianism.* Different moral philosophies offer different vindications of the principle of equality. The matter is considered here in order to illustrate the philosophical problems that arose in the criticism of law concerning the relative place of the notions of utility and justice. The central principle of utilitarianism, insofar as it supplies a moral critique of law, may be stated as the doctrine that there is only one vice in legal arrangements, namely, that they fail to produce the greatest possible total of happiness in the population within their scope. The concept of a total of happiness or pleasure or satisfaction is of course open to well-known objections. But on any interpretation, utilitarian princi-

ples, if unrestricted, must endorse legal or social arrangements if the advantages they give to some persons outweigh the disadvantages imposed on others. For a consistent utilitarian there can be no necessary commitment to any principles requiring an equal distribution.

However, in some cases, if allowance is made for principles of diminishing marginal utility, it may be shown that an equal distribution is the most efficient, in the sense of producing the greatest total of happiness. But for the utilitarian this is a contingent matter to be established in each case, not a matter of moral principle or justice; and where the question concerns the distribution of the fundamental legal protections of person and property, there seems no compelling utilitarian argument in favor of an equal distribution. Thus, a slave-owning class might derive from the system of slavery benefits outweighing the misery of the slaves. Bentham urged that this was not the case, owing to the inefficiency of slave labor, and therefore he rejected slavery; but he rejected it as inefficient rather than as unjust. Plainly, this form of argument is a very insecure foundation for the principle that all people are morally entitled to the equal protection of the laws, and it seems clear that utilitarian principles alone cannot give any account of the moral importance attached to equality and in general to the notion of the just, as distinguished from an efficient, distribution as a means of happiness.

*Moral argument for equality.* The simplest moral argument in support of the equal distribution of the law's fundamental protections is one that combines the idea that no rational person could wish himself to be denied these fundamental legal protections with the principle of the universalizability of moral judgment: Moral judgments concerning social and legal arrangements must conform to the requirement that no man could regard as morally acceptable the withholding from others with needs and in circumstances similar to his own of those benefits which he would not wish to be withheld from himself. If this principle is admitted, it follows that it cannot be a sufficient moral ground for accepting legal arrangements that the advantages they give to some outweigh the disadvantages for others. The equal extension to all of the law's protections satisfies both the principle of utility, which requires that the law should advance human happiness, and the independent principle of justice, that the gain in happiness should be distributed fairly. According to this qualified form of utilitarianism, the best legal and social arrangements realize the most efficient of just distributions.

More ambitious arguments have been advanced to show that in spheres other than the distribution of the fundamental protections of the law, utilitarianism is acceptable only if qualified by independent principles of just distribution, and also to demonstrate that the distribution required by justice is in all spheres *prima facie* that of equality, unless inequalities can be shown to work ultimately for the equal benefit of all. Whatever the strength of these more general arguments may be, it is true that in relation to many legal institutions, utilitarianism unrestricted by other principles of justice yields results which would not be regarded as morally tolerable. This is particularly true of punishment. In all civilized legal systems it is recognized that no man should be punished except for his own conduct, and (with certain exceptions in the case of minor offenses) only then for such of his actions as were voluntary or within his power to control. Such limitations on the scope of punishment seem obvious requirements of justice to the individuals punished, but it is at least doubtful whether they can be adequately supported on purely utilitarian grounds.

**THE OBLIGATION TO OBEY THE LAW.** The philosophical investigation of the obligation to obey the law requires a distinction between the utilitarian and other moral aspects of this subject similar to that outlined in the case of justice. It seems clear that the mere existence of a legal system, irrespective of the character of its laws, is not sufficient in any intelligible theory of morality to establish that a person ought morally to do what its laws require him to do. Yet there are also powerful arguments against a purely utilitarian theory of the obligation to obey law which would regard this obligation as simply a special case of the obligation to promote happiness, with the corollary that disobedience to bad laws is justified if the consequences of disobedience (including any harm done to others through the weakening of the authority of the legal system) are better in utilitarian terms than the consequences of obedience. Among features of the moral situation for which this utilitarian theory fails to account there are two of peculiar importance. The first is that the obligation to obey law is one which is considered as owed by the citizen specifically to the members of his own society in virtue of their relationship as fellow members, and is not conceived merely as an instance of an obligation to men in general not to cause harm, injury, or suffering. Second, men are often held to be subject to an obligation to obey the law even though it is clear that little or no harm will be done to the authority of the legal system by their disobedience, as in cases (like that of the conscien-

tious objector) where those who disobey the law willingly submit to punishment.

The theory of a social contract focused on these two aspects of the obligation of obedience to law, and it is possible to detach from what is mythical or otherwise objectionable in contract theory certain considerations which show that the obligation to obey the law may be regarded as the obligation of fairness to others, which is independent of and may conflict with utility. The principle involved, stated in its simplest form, is that when a number of persons restrict their liberty by certain rules in order to obtain benefits that could not otherwise be obtained, those who have gained by the submission of others to the rules are under an obligation to submit in their turn. Conflicts between this principle and the principle of utility are possible because often the benefits secured by such restrictions would arise even if considerable numbers failed to cooperate and submit to the rules in their turn. For the utilitarian, there could be no reason for anyone to submit to rules if his cooperation was not necessary to secure the benefits of the system. Indeed, if a person did cooperate, he would be guilty of failing to maximize the total happiness, for this would be greatest if he took the benefits of the system without submitting to its restraints. The consideration that the system would fail to produce the desired benefits or would collapse if all were to refuse their cooperation is irrelevant in a utilitarian calculation if, as is often the case, it is known that there will be no such general refusal.

## Bibliography

### DEFINITION OF LAW

The major classics of jurisprudence in which definitions of law are elaborated include Thomas Aquinas, *Summa Theologiae* I, 2, 90–97; Jeremy Bentham, *The Limits of Jurisprudence Defined* (New York, 1945) and *The Comment on the Commentaries* (Oxford: Clarendon Press, 1928); John Austin, *The Province of Jurisprudence Determined* (London: J. Murray, 1832); J. C. Gray, *The Nature and Sources of the Law* (New York, 1909); and Hans Kelsen, *General Theory of Law and State*, translated by Anders Wedberg (Cambridge, MA: Harvard University Press, 1945).

More recent contributions include Hermann Kantorowicz, *The Definition of Law* (Cambridge, U.K.: Cambridge University

Press, 1958); H. L. A. Hart, *The Concept of Law* (Oxford: Clarendon Press, 1961); and Richard Wollheim, "The Nature of Law," in *Political Studies* 2 (1954): 128–142.

### ANALYSIS OF LEGAL CONCEPTS

On legal obligations and duties, see Jeremy Bentham, "Essay on Logic," in *The Works of Jeremy Bentham*, edited by J. Bowring, 11 vols. (Edinburgh, 1838–1843), Vol. VIII, pp. 213–293 and *Fragment on Government* (London, 1776), Ch. 6; and O. W. Holmes Jr., "The Path of the Law," in *Collected Legal Papers* (New York: Harcourt Brace, 1920), pp. 167–202.

On legal transactions, see Axel Hägerström, *Inquiries into Law and Morals*, translated by C. D. Broad (Uppsala, 1953), Ch. 5; Morris R. Cohen, *Law and the Social Order* (New York, 1933), Ch. 2; John L. Austin, *How to Do Things with Words* (Oxford, 1962); and Wesley N. Hohfeld, *Fundamental Legal Concepts* (New Haven, CT: Yale University Press, 1964).

On intention, see Jeremy Bentham, *An Introduction to the Principles of Morals and Legislation* (London, 1789), Ch. 8; John Austin, *Lectures on Jurisprudence* (London, 1869), Chs. 18–19; G. L. Williams, *The Criminal Law: The General Part*, 2nd ed. (London: Stevens, 1961), Ch. 2; and G. E. M. Anscombe, *Intention* (Oxford, 1957).

### PROBLEMS OF LEGAL REASONING

On logic and law, see Julius Stone, *The Province and Function of Law* (London: Stevens, 1947), Chs. 6–7; J. C. Jensen, *The Nature of Legal Argument* (Oxford: Blackwell, 1957); Norberto Bobbio, "Diritto e logica," in *Il problema della giustizia* (Milan, 1962), pp. 11–44; and Lars Bergstrom, "Imperatives and Ethics," in *Filosofiska Studier* 7 (1962): 94ff.

On rule and discretion in judicial decision, see John Dickinson, "Legal Rules: Their Function in the Process of Decision," in *University of Pennsylvania Law Review* 79 (1931): 833ff., and "The Problem of the Unprovided Case," in *Recueil d'études sur les sources de droit en honneur de F. Gény* (Paris, 1934), Vol. 11; Jerome Frank, *Law and the Modern Mind*, 6th printing (New York, 1949); Edward Levi, *Introduction to Legal Reasoning* (Chicago, 1949); John Wisdom, "Philosophy, Metaphysics, and Psycho-analysis," in his *Philosophy and Psycho-analysis* (Oxford, 1952); and Richard Wasserstrom, *The Judicial Decision* (Stanford, CA: Stanford University Press, 1961) and "The Obligation to Obey the Law," in *University of California Law Review* 10 (1963): 780–807. Also see *Jurimetrics: Law and Contemporary Problems* 28 (1963).

### PROBLEMS OF THE CRITICISM OF LAW

On problems of the criticism of law, see Alf Ross, *On Law and Justice*, translated by Margaret Dutton (London: Stevens, 1958); John Rawls, "Justice as Fairness," in *Philosophical Review* 67 (1958): 164–194; H. L. A. Hart, *The Concept of Law* (Oxford: Clarendon Press, 1961), Chs. 8–9; Torstein Eckhoff, "Justice and Social Utility," in *Legal Essays: A Tribute to Frede Castberg* (Oslo, 1963), pp. 74–93; and Lon Fuller, *The Morality of Law* (New Haven, CT: Yale University Press, 1964).

H. L. A. Hart (1967)

## PHILOSOPHY OF LAW, PROBLEMS OF [ADDENDUM]

One of the dominant issues in philosophy of law since Hart's main entry was published has been the dispute between Hart and Ronald Dworkin about the best way to characterize a legal system and the modes of legal reasoning (especially by judges) most appropriate to it.

### RULES AND SOCIAL PRACTICES

**THE RULE OF RECOGNITION.** Hart identified two main kinds of rules in a complex and mature legal system. There are rules that tell people what to do or not do (tax laws, criminal laws, traffic laws), and there are rules that tell people how to do certain kinds of things (in order to accomplish such legal transactions as making valid wills or binding contracts and conveying property). Among the latter kind of rules he identified a small set that he regarded as fundamental to all but the most primitive legal systems: These rules tell how to identify a particular legal system and, within it, how to make laws and adjudicate claims arising under law. Hart's main entry does not address these fundamental rules.

The first kind of fundamental rule Hart famously styled the "rule of recognition." It identifies the primary sources of law (e.g., the Queen-in-Parliament) and it prioritizes these sources (e.g., statute law > common law > "customary law"). Because this and the other fundamental rules determine what is to count as valid law within that system, they have normative legal force there but are not themselves properly called *valid* laws.

**SOCIAL PRACTICES AND LEGAL SYSTEMS.** Hart's rule of recognition is more like a social practice (or, better, the presuppositions of such a practice) than it is like a black-letter rule of any sort. To follow or engage in a social practice is to conform reflectively to an existing, ongoing pattern or template as a matter of appropriate conduct. The practice functions as a standard and serves as a basis for criticizing deviations. Officials (almost all of them most of the time, in the standard case) simply follow the social practice: They presuppose it internally in what they actually do when they make and enforce given laws. They do so not out of fear of sanctions, but rather because so acting is the regular and expected thing to do. Ordinary citizens need not be aware of the authoritative sources of law (or the other fundamental rules) in their country; but they do need to know what the laws are, for it is these they

follow or conform to. In the standard case, a substantial number of them do so in the same way as the officials do—by taking an internal point of view. This concordance between officials and ordinary citizens constitutes law as a social practice. One of Hart's main objects in invoking the idea of a social practice (or rule) is to say that a system of laws, as an exemplar of such a practice, is distinguishable from a large-scale scheme of coercion.

**VALID LAWS AND JUDICIAL DISCRETION.** Any legal system, insofar as it is a social practice, is an effective legal system, one where laws are conformed to most of the time by most of the people. When laws and court decisions in an effective system are made (or almost always made) in strict conformity to the fundamental rules, such a system would be a full and proper legal system. Here all the laws and court decisions that are made in accordance with the fundamental rules would be valid ones.

Hart does not think that a given law or decision (simply as valid) can cover and determine the correct outcome for all the instances that come within its proper range. For reasons that he spells out in the main entry, there will always be some such cases where the "law runs out." In those cases judges and executive officials will have to use "discretion"; they will have to supplement the law with what he calls (in the main entry) "interstitial legislation."

### PRINCIPLES AND INTEGRITY

**ONE RIGHT ANSWER: HERCULEAN JURISPRUDENCE.** Ronald Dworkin was Hart's main critic in the last three decades of the twentieth century. One of his main criticisms is that legal systems have inbuilt features such that judges, taking the law as it is, can be said to have a duty to make the best decision. In simplest terms, then, Dworkin closes Hart's alleged gaps in law (which allow for judicial discretion) by turning to the character of legal reasoning itself, within a determinate legal system.

Dworkin's theory, using a model judge (named Hercules) for purposes of illustration, is called "law as integrity." Dworkin's main argument may be put this way: If two different judges, both committed to law as integrity agreed literally on everything—agreed "preinterpretedly" on what counts as law in a given system (an agreement one can expect from all lawyers, judges, and jurists in the determinate legal system within which they work, say, the United States or the United Kingdom); agreed on the relevant facts of the case; agreed on the law (the relevant propositions of law) and on the history of politics/law and on an interpretation of the political insti-

tutions in their country; agreed about the relevance of the same governing principles in the case at hand; and agreed about the main substantive principles embedded in their own legal system (especially justice [e.g., rights] and fairness [e.g., democratic decision making]) and about the interpretation and the preferred ordering of each of these—they'd reach the same decision. Thus, there is one (and only one) determinate decision a given Herculean judge would reach in a given case within the existing resources of the law, in a determinate legal system.

The theory that there is always one and only one right answer (though it may not always be reached) runs into real problems, however, when one considers a panel of such judges who must reach a single decision through discussion and voting. Here different judges, deploying somewhat different interpretive choices than Judge Hercules, may come up with answers that are significantly different from Hercules's own answers. Such judges would reach their decisions in the right way, in accordance with the ideals and procedures of law as integrity; and each judge's decision, based on convictions grounded in the law's resources, would be a wholly sound one. There could in principle, then, be more than one right answer. Given the way the world is and given Dworkin's own statement in the matter at the end of *Law's Empire* (1986, pp. 412–413), there probably would in fact be more than one right answer.

This reading does not supplant the orthodox reading for a single judge; it continues to be the case here that there is, for that judge, one and only one determinate best answer in a given case. But it does force an amendment on the “one and only one right answer” thesis for a panel of judges, or for a whole judicial system. Here, though there continues to be no need for Herculean judges ever to go outside the law's resources to reach a judicial decision, and no need for them to use discretion (or “interstitial legislation”) to fill in gaps in the law, more than one right answer is possible—indeed, is to be expected.

**CONVERGENCES.** Hart conceded, in the “Postscript” to his *Concept of Law* (1994), that he had not given sufficient attention to principles in the law or found an appropriate role for them in his theory. He also allowed that given legal systems could have a set of embedded substantive principles (a public morality, as Dworkin called it); such principles are, for Hart, typically enshrined in a written constitution and in judicial reasoning about that constitution.

On the other hand, Dworkin's acknowledgment of the important place of near unanimous “preinterpretive”

agreement on what counts as law in a given system marks an almost wholesale acceptance of Hart's idea of the nature and importance of a rule (or norm) of recognition in a mature and complex legal system. And there's much merit to Hart's observation that “Dworkin's later introduction of interpretive ideas into his legal theory [in *Law's Empire*] ... brought the substance of [h]is position very close to my own” in recognizing that the courts have to deal interpretively with underdetermination in the written law. Hart continues, “Arguably [though] before the introduction of interpretive ideas into his theory there seemed to be a great difference between our respective accounts of adjudication....” (Hart, “Postscript” to *Concept of Law* [1994], note to p. 272 on p. 307.)

### UTILITARIANISM AND BASIC RIGHTS

Hart alluded in his main entry to difficulties utilitarianism had in accommodating within its normative frame the central issues of justice (that is, distribution of basic benefits and protections equally to all). But since the time at which Hart's main entry was written, significant attempts have been made within utilitarianism (under the name “indirect” utilitarianism) to address and perhaps resolve this problem.

Many people in the 1970s and 1980s—including John Rawls, Ronald Dworkin, and even thinkers broadly sympathetic to utilitarianism, such as David Lyons—concluded that utilitarianism was somehow incompatible in particular with basic rights (human or constitutional), or at least with the priority habitually given to such rights.

The problem they see is that no one can think that acting in accordance with any given right (especially if the social rules that formulate such things are kept fairly simple and easy to follow) will on every occasion yield up a result that is compatible with the general happiness principle. Sometimes deviating from that policy will have the greater welfare value. And, given the general happiness principle itself, the principle that the greater benefit should be preferred to the lesser and that normative requirements on action can always be set to achieve the greater benefit, that deviation should be taken. Sometimes a right ought to yield to these considerations: It should do so when so doing holds the prospect of greater well-being.

**INDIRECT UTILITARIANISM.** In an effort to deal with the problem the critics had identified, this new version of utilitarianism shifts the focus of attention from Jeremy Bentham, who did not countenance the idea of basic moral rights, to J. S. Mill, who did. Roughly, the theorists

of indirect utilitarianism assert that direct appeals to general welfare are self-defeating, all things considered, and that putting standing constraints on the principle—such as a system of moral rules (typically relatively simple and easily followable rules) or a coherent set of civil or constitutional rights justifiable by the standard of general happiness—in fact produces the greater well-being.

Indirect utilitarians do not, however, assert that moral rules should never be overridden nor individual rights ever broached. Rather, on their view, where rules or rights conflict (as they inevitably will, many have argued), some sort of appeal to the general happiness is in order.

Here is where the notion of an indirect utilitarianism comes crucially into play. Its advocates argue that the principle of general happiness should not directly determine what is to be done even here. Rather, the principle operates only indirectly in all such cases. It bears down, not on individual actions per se but on the rules themselves. Here the general welfare principle is used merely to help determine which rule is weightier, a determination that occurs gradually (over time and with experience) and cumulatively, or used to help determine a policy (a second-order rule of conduct), all things considered, for conduct when these particular moral rules (or these particular rights) conflict.

Thus, on their account it is possible to have policies for action (to have both moral rules and rights) that are justifiable by the standard of general happiness and at the same time to shield these policies from direct confrontation with (and possible overthrow by) the happiness principle on individual occasions. Thus, indirect utilitarianism (if all its arguments and presumptions are allowed) seemingly establishes that utilitarianism is compatible with basic constitutional rights and their priority—at least in the case of those rights that are themselves justifiable in accordance with the general happiness principle.

**CRITICISM.** But considerations of corporate good and of aggregate welfare (including those that amount to nothing more than the increased well-being of some individuals at the expense of others) can and do in fact override constitutional rights on given occasions. Indirect utilitarians cannot really deny this. If they do, then the jumping-off point of indirect utilitarianism would disappear along with the problem it was designed to solve. There would simply be no point to a strategy of shielding moral rules and constitutional rights from being overridden by corporate or aggregate political policies on those occasions

when such policies were arguably supported as preferable by direct reference to the standard of general happiness.

Thus, indirect utilitarians are in effect forced to admit that social policies could override constitutional rights, within the utilitarian frame they have devised. After all, social policies in their view merely reflect, cumulatively, the results of applying general welfare considerations to occasions of acting in accordance with those policies. And they have admitted, necessarily, that sometimes corporate or aggregate political policies would in fact be supported as preferable over moral rules and constitutional rights by direct reference to the standard of general happiness.

If this is so, the general happiness principle could not support the assignment of constitutionally guaranteed benefits and protections to each and every individual person in advance, so to speak, and across the board. It could not do so if, in effect, such rights tied the utilitarian politician's hands against allowing corporate or aggregate interests to override or supersede constitutional rights when, cumulatively and all things considered, those aggregate interests could be seen to conduce to greater benefit. Indirect utilitarians cannot allow for politically fundamental constitutional rights that have a built-in, standing, and overriding priority over corporate or aggregate considerations. To this degree, then, philosophical utilitarianism is incompatible with the notion of basic rights (human or constitutional rights) as that idea is commonly understood.

## RECENT CRITICAL PHILOSOPHY OF LAW: MODERN AND POSTMODERN

Recent decades have witnessed the birth of several noteworthy developments or movements within the philosophy of law. Broadly these divide into two camps. Those belonging to the first remain more or less faithful to a generally modernist and liberal orientation to legal philosophy. They include law and economics and the liberal humanist strand of feminist jurisprudence. Those belonging to the second camp take up a generally post-modernist and postliberal orientation to legal philosophy. They include critical legal studies in its various manifestations along with the more radical strands of feminist jurisprudence and critical race theory.

Characteristic of modernist liberal legal philosophy are the following assumptions:

- (i) human reason is univocal and universal;
- (ii) language represents reality and truth is correspondence to reality;

- (iii) knowledge requires justification from foundations;
- (iv) the methodological path to foundations is analysis (often drawing on methodological individualism or social atomism in the social sciences);
- (v) all persons share some morally significant basic freedom and equality;
- (vi) to be legitimate government must be constitutional and limited;
- (vii) law serves legitimate government through its institutional subordination of power to reason; and
- (viii) the true path to historical and moral progress is that marked by the rule of law.

Characteristic of postmodern and postliberal legal philosophy is the rejection of several if not all of these assumptions. Thus: human reason is multivocal and relativistic; language shapes or determines reality; truth is largely coherence; knowledge does not require justification from foundations; and so on. The most significant and general feature of postmodernist and postliberal legal philosophy, however, is its unwillingness to affirm the rule of law as either an empirical possibility or normative goal. On the postmodernist and postliberal view, it is not reason, but power, will, desire, the subconscious, the chance of history, or the forces of nature to which law is always in the end subordinate and through which any historical or moral progress must ultimately be won.

## LAW AND ECONOMICS

As a development or movement within legal philosophy, law and economics took flight in the 1970s with Richard Posner's *The Economic Analysis of Law* (published originally in 1973). But its roots reach back to work in the early 1960s by Guido Calabresi, Ronald Coase, and others, as well as to legal realism's instrumentalist stance toward law and associated efforts to bring economic analysis to bear on legal issues in the early twentieth century. What unifies the law and economics movement is a commitment to putting the concepts, methods, and principles of microeconomics to work center stage in the study of law. Several law and economics theses have been advanced.

One thesis was straightforwardly descriptive. Some or all of the law was said to be best described exclusively or primarily in terms of economic efficiency. The law of tort, for example, was best understood as an institutional attempt to minimize the costs of accidents overall for society, including the cost of preventing accidents. A sec-

ond thesis was straightforwardly normative. Some or all of the law was said to be properly criticized or evaluated exclusively or primarily in terms of economic efficiency. Wherever the law failed to promote or realize economic efficiency, it was to be criticized and reformed. Subsequent theses claimed that considerations of economic efficiency were the key to making accurate predictions of future legal developments, or to explaining legal history, or to giving the best interpretation of various legal systems (e.g., the United States or the United Kingdom). The normative thesis remains today the most widely affirmed and discussed. But taken as a thesis about the primary or overriding aim of law it is not compelling.

**ECONOMIC EFFICIENCY.** Economic efficiency is a property of transactions or relations between persons and was developed as a proxy for aggregate utility, which was thought unmeasurable given the impossibility of interpersonal utility comparisons. If a transaction or relation makes all those it affects better off or at least no worse off by their own lights, then there is good reason to believe that it increases aggregate utility (though it is not possible to know by how much). Such a transaction or relation is Pareto superior to its status quo ante. Any state of affairs from which no Pareto superior transactions or relations is possible is Pareto optimal. The set of Pareto optimal states of affairs marks the limit of our ability rationally to act so as to improve aggregate utility.

Of course, some non-Pareto optimal states of affairs may actually represent gains in aggregate utility over any or all Pareto optimal states of affairs. But without being able to do interpersonal utility comparisons, there is no way of reliably picking them out. From a utilitarian perspective, then, using the law to facilitate or produce Pareto superior transactions and relations up to but not beyond a point of Pareto optimality is a normatively sound ambition. The law may do this in at least three ways: (i) distributing legal rights and entitlements to those who value them most; (ii) redistributing the costs and benefits of some transaction or relation so as to render it efficient on the Pareto criteria; or (iii) sustaining an open and transparent market with low transaction costs and few incentives for strategic holdout behavior so that persons can voluntarily exchange until they arrive at a Pareto optimal state of affairs (which, according to the Coase theorem, they will do).

The Pareto criteria of economic efficiency have limited application because most transactions or relations between persons generate transaction costs or adverse third-party effects. The Kaldor-Hicks criterion of effi-

ciency accounts for this by picking out as efficient any transaction or relation in which those who gain enough that they could in principle (but need not actually) compensate from their gain those who lose, such that no person impacted by the transaction or relation would be made worse off by it relative to its status quo ante. The Kaldor-Hicks criterion, however, is problematic at the level of application because two different states of affairs may be reciprocally Kaldor-Hicks efficient (the Scitovsky paradox). As more refined criteria of efficiency continue to be introduced, the underlying idea remains the same: Economic efficiency is a proxy for aggregate utility.

**DESCRIPTIVE THESIS.** Whereas it is possible superficially to describe many areas of the law in terms of economic efficiency, the extent to which the law is well described in such terms is difficult to determine. It may be more efficient (reduce costs overall) for the law to deal with accidental harms through liability rather than property rules because the latter would require those who cause accidents to undertake the costly project of reaching agreements with their victims *ex ante*. But, because of the complexity and general unavailability of the information required, it is nearly impossible to defend any particular liability rule as privileged from the point of view of economic efficiency. The expected costs associated with any particular rule will be a function not just of the degrees and probabilities of harm from accidents covered by the rule, but also of such things as the costs of the care required to avoid liability and of administering and enforcing the rule. The descriptive thesis advanced by law and economics becomes less compelling as the picture of law to which it is applied is made more realistic and fine-grained.

**NORMATIVE THESIS.** Attention has shifted over recent years to the normative claim that regardless of how the law as it stands is best described, surely it ought primarily to aim at economic efficiency. This claim is problematic. First, prescriptions that make use of highly simplified economic models inattentive to the kinds of information alluded to above are of marginal use. But the costs (e.g., of information gathering) of building more useful models are likely prohibitive. Second, it is not clear why efficiency should be taken as normatively primary for the law. Whereas there may be good utilitarian reasons to insist that legal reforms always be efficient relative to their status quo ante, there are no good utilitarian reasons to insist that legal reforms either be Pareto optimal regardless of the path to them or be Kaldor-Hicks efficient, because neither guarantees a gain in aggregate utility over

the status quo ante. It is unlikely that there are any other good moral reasons (of fairness, or consent, or respect for autonomy) to privilege Pareto optimality or Kaldor-Hicks efficiency as the overriding aim of the law. Thus, the case for grounding legal criticism and reform exclusively in considerations of economic efficiency is weak. Still, economic efficiency may (and probably should) play a subordinate role in legal criticism and reform.

## FEMINIST JURISPRUDENCE

Characteristic of feminist jurisprudence are two claims, one descriptive and explanatory, the other normative. The former is that the patriarchal oppression of women is fundamentally realized through law. The latter is that the ending of patriarchal oppression must rank at or near the top of the list of aims in terms of which the law is properly criticized and reformed. Apart from these claims, however, there is little general consensus within feminist jurisprudence. Positions vary with respect to whether women and men share the same fundamental interests, whether those interests are rooted in a biologically or psychologically given human nature, the extent to which those interests are malleable regardless of their genesis, and the proper relationship of the law to those interests.

Liberal humanist feminists generally regard the abolition of patriarchy as a substantially completed task, the completion of which is possible without radical change to the basic structure of modern liberal legal institutions and theory. They aspire to an egalitarian humanism realized under the rule of law. They endeavor to reveal and reform those remaining areas of the law—for example, rape law, employment law, and marriage law—through which patriarchal oppression continues to operate. Progressive feminists also generally regard the abolition of patriarchy as a substantially completed project, the completion of which is possible under the rule of law. But they argue for more radical substantive changes to modern liberal legal theory—for example, the recognition of special rights for women as distinct from men, or the redrawing of the lines marking a private domain presumptively immune to state intervention. These more radical changes to substantive law may be argued for on the grounds that women possess at least some fundamental interests distinct from men, or that under current conditions privacy merely secures a social space for the unchecked reproduction of patriarchal self-understandings.

So, for example, whereas liberal humanist feminists insist that the free speech and privacy rights common to

men and women properly protect the private consumption of pornography, progressive feminists typically endorse legal restrictions on the private consumption of pornography, or at least that pornography that depicts women as mere sexual objects or as subordinate to men. The call for a “battered woman’s syndrome” defense to homicide is also a progressive feminist initiative; it is a carefully limited but substantively radical revision to a particular legal doctrine (concerning intent) necessary if the fundamental interests of women are to be secured under the rule of law.

Whereas liberal humanists and progressive feminists divide over the means necessary and appropriate to a final victory over patriarchy, they both seek that victory within and through the rule of law and thus share a modernist orientation toward the law. Radical feminists are different. They argue that patriarchy depends on and is at least partially constituted through the rule of law. They reject the modernist aspiration to historical and moral progress through law and seek a more radical revision to the legal status quo ante. Radical feminists argue that the categories most basic to modern liberal legal theory and practice—such as due process, equal rights, fairness, state neutrality, consent, individual responsibility, privacy, justice, objectivity, impartiality, and rules—underwrite and obscure patriarchal oppression. They seek both to illuminate this fact and to suggest alternative, typically non-legal or extralegal, frameworks for thinking about and realizing social order.

Feminist jurisprudence has been and remains theoretically diverse and rich. This is in part because it remains politically and methodologically open. Feminist legal theorists have often allied themselves with and drawn on the work of those pursuing other emancipatory political agendas. In its various strands, feminist jurisprudence draws on neo-Marxist and poststructuralist critical theory, queer theory, race theory, neopragmatism, Lacanian psychoanalytic theory, and rational choice theory.

## CRITICAL LEGAL STUDIES

Critical Legal Studies (CLS) grew out of a conference in the 1970s that sought to bring together the New Left politics of the 1960s, American Legal Realism’s instrumentalist stance toward law, and European social theory (structuralism and poststructuralism). At its inception, then, CLS was divided between modernist and postmodernist orientations toward the law, drawing from Nietzsche, Marx, Weber, Habermas, Foucault, and Derrida. In time, this division was settled in favor of a postmodernist orientation. What began as a radical critique of law under

conditions of modern capitalism became a more radical critique of the idea of law itself. At its most provocative, at least in the United States, CLS called into question the possibility of realizing justice under or through law.

Though CLS had some presence in England and Germany, it was and remains (to the extent that it remains at all) primarily an American development. Throughout its history, CLS organized itself generally around two theses. The first was that legal systems, both in their content and operations, were best understood as ideological systems of legitimation. The second was that legal systems were indeterminate and thus incapable of subordinating the exercise of coercive political power to reason. Together these theses underwrite the proposition that law is always and everywhere only the politics of power by another name.

CLS, like American Legal Realism, understood the content and structure of the law to derive in the end from nonlegal normative commitments. And, again like Legal Realism, it sought honesty about that fact. Just as legal realists had undertaken to show that much of American law was determined by a *laissez-faire* political ideology rather than any science of legal reasoning, so too did CLS scholars. What was not so determined was determined, on the CLS view, by patriarchal or racist or other morally suspect political commitments. Of course, legal realists sought to expose the ideological bases of law so as to place law in the service of morally more reputable non-legal or extralegal political commitments (generally utilitarian and progressive). CLS scholars generally rejected this instrumentalist approach to law. They tended to argue that the law was always an effect, and could never be the genuine cause, of underlying political, social, and economic change. The point of demystifying the law and exposing it as ideological in nature was not to put it in the service of a more noble cause, but rather to encourage non- or extralegal means to social reform.

That the content and methods of mature legal systems almost always underdetermine the answer to at least some legal questions is neither a radical nor particularly controversial claim. By the 1960s, few legal philosophers thought mature legal systems were or could be fully autonomous and possessed of sufficient internal resources to generate, mechanically as it were, a single determinate answer to every legal question. The existence of so-called hard cases was taken for granted. That all cases were hard cases, however, was not. It is this thesis that CLS, in its most ambitious moments, advanced: that mature legal systems (or at least particular legal systems, e.g., the United States and the United Kingdom) are rad-

ically indeterminate and, accordingly, that the rule of law is impossible.

Three lines of argument were advanced for this thesis. The first and least ambitious rooted the indeterminacy of the law in the formal structures of law. Legal rules competed not only with one another, but with more flexible standards and principles. Precedents, often diverse themselves, could always be read narrowly or broadly. Principles of statutory construction pointed in multiple directions. And so on. While sufficient to debunk any vision of legal reasoning as scientific or mechanical, this argument is not sufficient to establish the radical indeterminacy of law. The sheer number of easy cases never litigated suggests that legal reasoning is not inherently radically indeterminate.

A second and more ambitious argument rooted the indeterminacy of the law in the inconsistency or incoherence of liberal political morality (presumably foundational at least in the United States and the United Kingdom and other contemporary liberal democracies). Liberal political morality valued both individual self-interest and the collective or common good, saw the individual as ultimately free and responsible and socially constituted, and committed itself to state neutrality while privileging secular modernist humanistic conceptions of the good. It was, in short, inconsistent and incoherent. But competing principles and commitments are not necessarily inconsistent or contradictory. Liberal political morality may indeed express and undertake to mediate rationally and reasonably the tension between several competing principles and commitments. It need not, for all that, be reducible to an irrational self-contradiction or to incoherence.

The third and most ambitious argument for the indeterminacy of the law appealed to the structure of language and thought itself. The argument here, drawn from poststructuralist linguistic and social theory, was that the possibility of language and thought, the possibility of meaning itself, presupposed for any particular utterance or expression the existence of a multiplicity of meanings. If legal language could mean even one thing, then, it must necessarily mean or potentially mean many things. For several years many CLS scholars made the case for this proposition by using “deconstructive” strategies of critical reading to “trash” legal propositions privileged within the conventional order of legal reasoning. But this argument ultimately proved to be its own undoing. It dissolved the purposeful human subject in an endless proliferation of meanings and reduced progressive poli-

tics to the obscure mysticism of such slogans as “deconstruction is justice.”

The future of CLS as a movement in legal philosophy remains unclear. Its most provocative claims have been largely abandoned, whereas its more modest but also more plausible claims (about the relationship of law to politics and underdetermination within the law) have been largely assimilated into more mainstream jurisprudential thinking.

## PHILOSOPHY OF MEDICINE

The subject matter unique to philosophy of medicine—as opposed to those issues that are best seen under the heading of philosophy of biology—is clinical medicine and its underlying methodology and assumptions. Crucial to philosophy of medicine is the family of terms *disease*,

*malady*, *health*, *normal*, *abnormal*, *condition*, and *syndrome*, all of which have evaluative aspects to their definitions. For all its scientific base, medicine must be a value-laden practice guided by the values of its practitioners and its public. It is in this regard—but not only in this regard—that the claim “Medicine is an art and a science” should be understood.

### DISEASE, HEALTH, AND NORMALITY

A stable departure from physiological normality that causes death, disability, pain, loss of pleasure, or inability to achieve pleasure is the sort of entity that is called disease (Clouser, Culver, and Gert 1981). The departure has to be stable enough so that it causes similar problems in similar people and so that it is recognizable by different medical practitioners as the same disease entity. When the departure is less clearly individuable than a disease, the entity is referred to as a syndrome.

Normality and health are relative terms. They are relative to species, age, gender, (perhaps) social status, race, and ultimately to one's own physiology. A healthy (normal) eighty-five-year-old is different from a healthy (normal) twenty-year-old; and a healthy (normal) professional athlete is different from a healthy (normal) philosophy professor. Normal health is also relative to one's values. Unless a person feels comfortable doing what she wants to do, she can claim to be unhealthy by saying things like: “I just don't feel up to par.” In this sense health is a theoretical state of a person.

The concept of biological variability derives its useful sense from the relativity of *normal*. Biological variability makes generalization problematic in a way that generalizing from one billiard ball to any such object is not. Biological variability—meaning that no two organisms are exactly alike—is trivially true. It is unhelpful, except as a reminder that generalization is problematic.

Diseases are real to the extent that they are stable departures from normality (sometimes called “baseline”) as defined above. Obviously, diseases are not like traditional physical objects. They can overlap and be in two places at the same time. (Mental diseases present their sorts of problems, which parallel issues in philosophy of mind and philosophy of psychology.) Diseases are real in that they cause real pain, disability, or both; they are real in the sense that they can be reduced to physiological occurrences. Diseases are theoretical in the sense that they are not traditional physical objects, and they are identified only relative to a value structure that then becomes part of the medical theory. For example, given the current medical theory of European and North American scien-

tific medicine, chronic fatigue syndrome is a disease. But against the backdrop of eighteenth-century medicine, it would have been seen primarily as a characteristic of some women and lazy men. Chiropractic medicine sees disease only in terms of misalignment of vertebrae. The reality of disease, a sense for reduction, and the theory-ladenness of disease exemplify traditional questions in philosophy of science.

What is classifiable as a disease is also a function of what physicians are willing to do, what they are interested in, and what will be reimbursed. Thus, infertility is treated as a disease in large part because it is a terrible burden to some, it is interesting to deal with medically, and people are willing to pay for treatment. Being short is also treated as a condition worth reversing (in children) for the same sorts of reasons. This makes disease relative to culture and economic conditions.

Treating a condition as if it were a disease makes it a disease in a stipulative sense but not in the physiological sense. Baldness and bad breath would be conditions that might be troublesome, most effectively treated medically, and yet still not classified as diseases. However, if they are caused by a disease, they may be considered signs of an underlying medical condition. Psychiatry periodically re-decides whether certain psychological conditions should be considered diseases.

Genetics adds an interesting twist to defining disease and thinking about health. Consider a disease such as sickle-cell anemia, where homozygous recessive is a serious disease but the heterozygous condition can be beneficial in malarial areas (heterozygotes have a better survival rate from malaria than do either homozygotic forms) but still can, in rare instances, cause serious medical problems. Thus, in a nonmalaria infested area, the heterozygous condition might be called a disease. Huntington's disease is caused by a dominant gene whose effects do not manifest themselves until (usually) middle age. Should one consider a teenager with the dominant gene diseased? One could say that the person is healthy now even though the gene is one that will cause a disease later in life. But this is not really correct, because there are subtle changes in body chemistry caused by the dominant gene even when there are no Huntington's symptoms. One normally would say something such as, "a mutation in the normal gene is what causes Huntington's disease." This locution is odd for two reasons: (1) the person (almost assuredly) never had a normal gene to mutate; and (2) using "normal" when speaking of the gene would seem to imply that "abnormal" and "diseased" might be

usable for genes as well. But, of course, the gene for Huntington's disease is not a normal gene with a disease.

## THE LOGIC OF DIAGNOSIS

Diagnosis and scientific explanation present similar philosophical problems, especially with respect to explanation, causality, and laws. Diagnosis begins with history taking and moves on to the physical examination. The standard history questions assume that disease entities have a typical natural history to them.

Signs are objective characteristics, such as blood pressure and broken bones. Symptoms are the subjective characteristics reported by the patient—for example, pain and lightheadedness. The signs and symptoms of disease vary with the stage of the disease. Thus, an early stage of any disease may be confused for the later stage of another. Physicians look for the best overall explanation for the condition, given the patient's individuating factors such as age, gender, occupation, stress factors, and so forth. The best explanation is assumed to be the most probable explanation, where the disease is considered to be the cause of the condition being investigated.

A standard procedure in diagnosis is the rule-out test. A physician limits the diagnosis to a few conditions and then does a test, which, if negative, will rule out one of the possible causes. This procedure is repeated until only one likely answer is left. This is in keeping with a simplistic version of falsification.

Doctors also use a simple confirmation strategy in diagnosis. Usually, more than one confirmatory test result is required before the diagnosis is accepted. Other predictions will have to be borne out by test results as well as physical findings and consistent history. Laboratory tests are crucial to modern-day diagnoses, although they present problems. Results are subject to false positives (disease reported when absent) and false negatives (disease not reported when present). The best test has a high true positive ratio and a low false positive ratio. Bayes's theorem can be used to calculate the probability that a person with a positive test actually does have the disease in question.

Because test results are continuous, cutoff points must be chosen. The cutoff points are chosen based on how serious an error would be. If a disease is fatal and can be treated safely, then a high false positive rate would be acceptable. For less worrisome conditions, compromise between the two figures is possible. Again, values are part of what looks like an objective aspect of medicine. In this sense, medical diagnosis may be different from the usual

picture of the scientific method. There are other differences as well.

Some of the crucial aspects of physical diagnosis—for example, interpreting heart sounds and kinds of rashes—are subjective and cannot be taught so much as they must be learned by practice. The apprenticeship of medical students and physicians (residents) is, in this sense, different from the time graduate students in science spend learning bench laboratory skills. Also, anecdotes play a role in diagnosis in a way that they would not in physics or most other sciences. Related to the reliance on anecdotes is that the best physicians just seem to sense that, no matter where the facts are pointing, something else is going on. Subjectivity, anecdotes, and intuition seem not, in general, to be good scientific methodology, and yet it seems to be precisely what separates the great clinicians from the ordinary ones. The key to understanding these great diagnosticians is probably pattern recognition.

Physicians often wait in order to let a disease show itself more clearly, sometimes confirming their diagnoses by follow-up: Did the condition follow its predicted course? Did the treatment have the expected effect and in the expected manner? If not, the diagnosis may well have been incorrect. Even if the follow-up is consistent with the diagnosis, the actual condition may have been different and may have remitted on its own or have been similar enough to the disease suspected so that it responded to the treatment. In these sorts of cases, physicians do not know that they were wrong; they will count these cases as successes and so use them to support a similar diagnosis the next time. There is no practical defense against this failing.

## HOLISM AND REDUCTIONISM

Holistic medicine assumes that diseases are primarily a function of lifestyle and life events of the patient. A holistic approach to diagnosis will focus as much on psychosocial history as it will on traditional signs and symptoms. Stress as a factor in disease is important in holistic accounts. Reductionistic medicine focuses more on physiology as the key to diagnosis, treatment, and taxonomy of disease. The reductionistic approach is the legacy of scientific medicine begun in the mid-nineteenth century.

## PHILOSOPHY OF MIND

The mind seems to occupy a special place in the world. It is the seat of thought and feeling, of rationality and moral concern. Is it fundamentally different from the other things we find in the natural world? Is it possible for the mind to be investigated scientifically? Can one ever really know what is going on in the mind of someone else?

Such questions delineate the subject matter of the philosophy of mind. The central problem in this area is the *mind-body problem*: the project of finding an account of the mind that locates it in the broader physical world. While this problem does not exhaust the philosophy of mind, one's response to it imposes substantial constraints on what one may say about other questions in this area.

One of these questions concerns mental causation. It seems obvious that what happens in the mind can bring about physical events in one's body and vice versa. If, however, the mental is radically different from the physical, such causal commerce may seem problematic. A related question concerns the prospects for psychology. If there is difficulty in supposing that causal laws govern the mental, what sorts of results can we expect from the scientific investigation of the mind?

Another question concerns epistemology. The *problem of other minds* is the project of explaining how one can know about the minds of others. The problem arises as a result of an asymmetry between how one knows about one's own mental states and how one knows about others' mental states. I know what I am thinking or feeling by a peculiar means devoid of inference from more basic bits of knowledge. I do not have to make observations on the basis of which I find out what is going on in my mind. Indeed, I may be unable to err about my own mental states. By contrast, I cannot know what someone else is thinking or feeling without observing their behavior, and the inferences I make are plainly subject to error. One may wonder if such inferences are ever justified. Even if they are justified, one may wonder how it is possible that the very same kind of phenomena may be known in such radically different ways.

These questions presume, of course, that we know how to sort the mental from the nonmental in the first place. Two features seem especially characteristic of the mental. First, many mental states exhibit what is known as *intentionality*. They have content directed at the world; they are about things. The belief that the earth is flat, for example, has as its content the proposition that the earth is flat; the fear of flying, for another example, is about flying. Second, any mental state involving an experience displays the striking feature that it makes sense to speak of *what it is like* to be a particular kind of creature having that kind of experience. Mental states having this what-it-is-like character may be called *phenomenal* states, and if someone is in such a state, we may say that that person is *phenomenally conscious*.

Some remaining questions in the philosophy of mind aim at more specific kinds of mental phenomena. What is the difference between an emotion and a mood? How is an intention to act related to a desire to act? Such questions often branch into other areas of philosophy: the philosophy of action, of responsibility, and so on.

## THE MIND-BODY PROBLEM

Leaving the notion of reduction at an intuitive level, we may distinguish the two dominant positions on the mind-body problem as follows. Materialism (or physicalism) is the thesis that the mental reduces to the physical. More cautiously, every mental entity is ultimately nothing above and beyond the physical entities that exist. Once certain physical entities are in place, nothing extra is needed for the mental entities to exist as well. By contrast, dualism is the thesis that the mental and physical are ultimately distinct, so that neither reduces to the other. What makes the mind-body problem a problem is that we seem to have powerful evidence for both of these incompatible positions.

On the one hand, the physical workings of the brain apparently suffice to account for our behavior. If the mind is not in some way reducible to the brain, it is hard to see what room there could be for the mind to play any role in our behavior. Yet it surely does play such a role. Further, it is plain that events affecting the brain have systematic effects on the mind as well. So simplicity favors eliminating the mind as an extra entity.

On the other hand, the mind resists such a reduction. It is hard to see how the physical aspects of anything could add up to its having thoughts or feelings. Any putative creature with a mind may well be a mindless automaton. The point is made most vivid if we consider a physical organism built out of the very same physical ingredients as you, the reader. It seems possible that such an organism may yet be mindless, despite its physical and behavioral similarity to a creature that has a mind. If this is right, then clearly what makes you a creature with a mind does not automatically accompany your physical characteristics; it is something over and above the physical. Hence, materialism is false.

Materialism and dualism are not the only options. One other option is idealism (or phenomenalism), according to which it is the physical that ultimately reduces to the mental. Further, there is the view that neither the mental nor the physical reduces to the other. Rather, both reduce to some third, neutral entity. This position is sometimes known as neutral monism. Neither alternative has been widely endorsed. Idealism is apt to seem simply incredible, and neutral monism may seem frustratingly mysterious.

## DUALISM

René Descartes developed the most famous form of dualism, a form known as Cartesian substance dualism. On

this view, the mind is a substance (and hence capable of existing on its own without any distinct supporting entities, such as a body). It is distinct from any physical object in that it is essentially without spatial extension. A dualist need not adopt all of these tenets, however. A dualist need hold only that mental properties—such as being in pain or intending to leave the room—are in principle independent of any combination of physical properties.

As noted above, there is considerable pressure to opt for materialism in order to make sense of the causal role that the mental has in affecting our behavior. One route that the dualist might take in the face of this pressure is to endorse epiphenomenalism—the view that, contrary to appearances, mental events never cause physical events. There would then be no need to accommodate the causal role of the mind. This advantage is offset, however, by a grave difficulty in accounting for one’s knowledge of other minds. When I know what someone else is thinking, my primary evidence is that person’s behavior. In treating this as evidence, I presume that part of what brings about such behavior is the person’s mental states. Epiphenomenalism undercuts this presumption and throws into doubt the value of such evidence.

There is no requirement that a dualist be an epiphenomenalist. Perhaps the most attractive form of dualism is one that maintains causal interaction between mind and body while rejecting the supposition that the mind is a substance. The view known as *emergentism* does exactly this. (For a classic defense of the view, see C. D. Broad’s *The Mind and Its Place in Nature*.) Emergentism may be characterized by three theses. First, it rejects the view that the mind is a substance, maintaining only that there are two types of properties, mental properties and physical properties (property dualism). Second, it claims that once an organism reaches a certain level of complexity, the laws of nature dictate that it will then have various irreducible mental properties. Third, it holds that these mental properties subsequently make a difference to the organism’s behavior. More precisely, in the presence of mental properties, the physical elements of the organism behave differently from what one would expect on the basis of just the general laws governing those physical elements when not assembled in this special fashion. The emergentist thus makes the bold empirical claim that we have in effect only an incomplete view of the laws of physics, that if one were to examine the physical events occurring in creatures with minds, one would find that the usual laws do not apply.

## LOGICAL BEHAVIORISM

In the first half of the twentieth century, logical behaviorism held sway as the main alternative to dualism. On this view, any statement about the mental can be translated into a statement about behavioral dispositions. A statement such as “Amy is in pain” is synonymous with some such statement as “Amy is disposed to wince, cry out, etc.” Since wincing and crying out are themselves physical events, it seems that something purely physical can be disposed to undergo such events. If being in pain is merely being thus disposed, then a purely physical thing can be in pain. (A seminal statement of this view may be found in Gilbert Ryle’s *The Concept of Mind*.)

Logical behaviorism has several attractive aspects. First, it makes good sense of our knowledge of other minds. If pain is simply the disposition to wince, cry out, or the like, then I can know that someone is in pain simply by observing those behaviors. Second, it fits happily with the familiar picture of how we come to learn psychological terms, specifically, that one learns what others mean by the word “pain” by observing that pain is attributed to people on the basis of their overt behavior. Third, the view explains why we have apparent a priori knowledge of the links between certain mental states and certain behaviors. We do not have to gather empirical evidence to support the claim that wincing is typically a sign of pain.

Logical behaviorism nonetheless faces a very basic problem, namely, that no proposed translation is in fact plausible unless it makes use of further mental terms. Consider again the statement “Amy is in pain.” It seems possible for this to be true even when she is not disposed to wince, cry out, or the like. Suppose, for instance, that she wishes not to let anyone discover her pain and is thus determined to suppress any overt indications of it. She will then not be inclined to behave in those ways.

Of course, we could try to understand the behavioral disposition in a more complex fashion. We might unpack the disposition claim as follows: “Amy is in such a state that *if she were to feel uninhibited*, she would wince, cry out, etc.” The situation in which she never displays such behaviors because she is determined to suppress such signs is no counterexample to this translation. But if this is the translation on offer, then we have not succeeded in showing how a purely physical entity could be in pain, since the complex characteristic assigned to Amy is already mental in part in that it refers to feeling uninhibited—a mental characteristic in its own right. In general, any attempt to characterize a behavioral disposition seems bound to include such a reference.

## THE IDENTITY THEORY

The identity theory rose to prominence in the middle of the twentieth century, succeeding logical behaviorism as the leading materialist theory. The view is simple: Every type of mental state is identical with some type of physical state, probably a neurophysiological state. (An extensive overview of the sorts of considerations that helped lead many philosophers to the identity theory can be found in Herbert Feigl's extensive essay "The 'Mental' and the 'Physical'.")

What is novel in the identity theory is not so much its simple positive claim as its disavowals: The identity claim is not accompanied by any claim about translation. This feature of the identity theory enables it to avoid many of the usual objections to materialism. This virtue can be illustrated by working with a well-known example. Consider the claim that being in pain is identical with some type of brain process, say, having one's C-fibers firing. Identity theorists suppose that the relation between "being in pain" and "having one's C-fibers firing" is analogous to the relation between "the morning star" and "the evening star": the terms have different senses, but the same referent. Other favored examples include the identity of lightning with a kind of electrical discharge, or the identity of heat with molecular motion. In each case, the identity can only be discovered empirically; it cannot be discovered by a priori analysis of the meanings of the terms.

While the a posteriori character of these identity claims is a key appeal of the identity theory, it is also the source of important objections. One such objection was made famous as "objection 3" in J. J. C. Smart's classic paper "Sensations and Brain Processes" (1959). If an identity statement of the form " $M = P$ " is a posteriori, different concepts must be associated with " $M$ " and " $P$ ." Those different concepts involve different properties that pin down the referent of " $M$ " and " $P$ ." For example, with the identity "the morning star = the evening star," the first name is associated with certain properties, such as being visible in the morning, that are not associated with the second name. Now turn to the alleged identity of pain with C-fiber firing. By analogy, we should conclude that despite the truth of this identity, there are nonetheless two distinct sets of properties, those associated with "pain" and those associated with "C-fiber firing." The objection, finally, is that the property associated with "pain" is a mental property that has yet to be identified with anything physical. Any a posteriori identity between the mental and physical will leave an unreduced residue

of mental properties, and these mental properties undermine materialism.

Smart's response to this objection was to acknowledge that there must be different senses associated with the mental and physical terms of the identity while insisting that the sense of the mental term can be explained without appeal to any further mental properties. For instance, he claims that the sentence "I see a yellowish-orange afterimage" is equivalent in meaning to "There is something going on in me which is like what goes on in me when I see an actual orange in good light." The vocabulary in this second statement is topic-neutral in the sense that it is silent on the nature of what is going on; it may or may not be a physical process. When we identify the experience of a yellowish-orange afterimage with a type of brain process, that identity is justified by the empirical evidence that shows that the named type of brain process is in fact what is going on when one sees an actual orange in good light.

It is worth stressing here that, while the identity theorists advertised a lack of commitment to translations of psychological sentences, this sort of objection seems to force them to providing translations nonetheless. Their translations might prove to be just as dubious as the behaviorist's translations.

## ANOMALOUS MONISM

One important challenge to the identity theory is posed by anomalous monism, the view championed by Donald Davidson and made famous in his essay "Mental Events." The view may be defined as a combination of one positive thesis and one negative thesis. Positively, it holds that each particular mental event is also a particular physical event, though categories of mental events cannot be equated with categories of physical events. Anomalous monism thus endorses a thesis of token identity, but not type identity. The negative thesis is that the mental is anomalous: there are no strict laws involving mental events as such. This anomalism allegedly blocks the discovery of laws relating the mental and the physical, laws apparently needed to justify a claim of identity between mental and physical properties.

The negative claim is aimed directly at the identity theory; it seeks to undercut potential sources of empirical support for that view. It is worth noting that even if anomalism is consistent with the identity theory, it is certainly significant for psychology, since it rules out the ambition of psychology to uncover strict laws governing the mental.

The positive thesis also challenges the identity theory, albeit indirectly, in that it suggests that one can be a materialist without being an identity theorist. If it suffices for materialism to say that each particular mental event is identical with some physical event, then a materialist may rest content with such instead of holding out for the more ambitious theory of type identity. Yet few philosophers are convinced that a thesis of token identity is sufficient for materialism. Intuitively, a materialist must hold, at a minimum, that how someone is mentally depends on how that person is physically. The thesis of token-event identity does not secure this result.

### SUPERVENIENCE

The idea that how things are physically must determine how things are mentally may be captured by the notion of *supervenience*, also introduced into the philosophy of mind by Davidson. To say that mental properties supervene on physical properties is (roughly) to say that any two creatures that are exactly alike physically must also be exactly alike psychologically. There may be no neat match-up of mental and physical properties, but supervenience implies that how things are mentally is fixed by how things are physically.

The notion of supervenience is in this way useful for formalizing a kind of dependence of the mental on the physical, although there have been many subtly different ways of making the notion precise. There is an important limitation to any supervenience thesis, however, in that the thesis itself leaves unanswered questions as to why and how the mental is determined in this fashion. To answer these questions, it seems that a more committed theory of the nature of the mental is needed.

### FUNCTIONALISM

A distinct challenge to the identity theory came in the form of functionalism. This is the view that mental properties are functional properties, that is, properties defined by the causal or functional roles they play. Consider the property of being a laundry detergent. Something is a laundry detergent if and only if it can combine with water in a washing machine to clean clothes. Various different chemicals can play this role equally well. When a particular chemical plays this role, it is said to *realize* the property of being a detergent. Since many different chemicals can play this role, the property of being a detergent is multiply realized and cannot be identified with any one of its realizers. (A seminal paper advocating functionalism is Hilary Putnam's "The Nature of Mental States.")

One motivation for functionalism is the conviction that it is in fact very unlikely that there is a single physical property to be found in all creatures sharing a given mental state. Functionalism accommodates this conviction by allowing mental properties to be multiply realized, and it does so without giving up on materialism, as an individual can have a functional property solely in virtue of his physical characteristics.

Functionalism has also been found attractive because of the apparent similarity between minds and computers. Consider what it is for a computer to run a program. The same program can be run by many different sorts of machines, so long as they have distinguishable states that play the right roles relating inputs, outputs, and each other. If the mind is akin to a computer, mental states may plausibly be classified as functional, relating sensory inputs, behavioral outputs, and different internal states. (For an important challenge to this analogy, see John Searle's "Minds, Brains, and Programs.")

A further appeal of functionalism is that it promises a degree of autonomy for psychology. If mental properties are multiply realized, then one can investigate what mental properties do without worrying about the specific physical characteristics of the underlying realizers. It is, of course, controversial how much autonomy this provides.

Even if we opt for functionalism, there remains much work to be done by way of locating the right sorts of functional properties to identify with various mental properties. The two distinctive features of the mind mentioned earlier—intentionality and phenomenal consciousness—provide targets for such work.

### INTENTIONALITY

Theories of intentionality have generally taken either of two forms. They differ primarily in whether they determine the content of a mental state by appeal to the overall functioning of the mind in question or by appeal to individual mental states in isolation. On the former (interpretational) approach, a subject *S* has the belief that *P* just in case the belief that *P* appears in the overall assignment of intentional states providing the best interpretation of *S*. The details of the theory depend on what it takes to amount to a good interpretation. Typically, the idea is that the theory must predict the behavior of *S* and make *S*'s thoughts and actions by and large *rational* for someone in that environment.

The other (causal/informational) approach, which focuses on specific connections between particular brain states and states in the world, is encouraged by the idea

that we may be able to distinguish within states such as believing that *P* and hoping that *P* a common element—a *representation* that *P*—for which an independent physicalist theory can be given. The physical state *N* may represent that *P* by virtue of a causal link, in that someone in state *N* has the information that *P*. On a very simple version of this view, *N* represents that *P* if and only if the only thing that can cause someone to be in *N* is the fact that *P*. This simple version fails to make room for false representations, however; some way is needed to distinguish those causes of the representing state that fix its content and those that do not. (Seminal works in this area include Fred Dretske's *Knowledge and the Flow of Information* and Jerry Fodor's *Psychosemantics*. A useful survey may be found in the anthology *Mental Representation: A Reader*, edited by Stich and Warfield.)

### CONTENT EXTERNALISM

Whatever theory of content one develops, an important constraint is imposed by content externalism. This is the view that the content of someone's mental states is determined not solely by that person's intrinsic features; the larger social and historical environment in which that person is embedded makes a difference. An easy route to seeing the point is to consider beliefs about particular individuals. Suppose that Amy and Basil are friends, that Amy believes that Basil is intelligent, and further, that Basil has a twin about whom Amy knows nothing. Amy's belief is plainly about Basil, not his twin. Yet if the situation were reversed, so that Amy was acquainted with Basil's twin instead of Basil, her belief would have had a different content, even though she would have been intrinsically the same in both cases. Hence, the contents of one's mental states may vary while one's intrinsic features remain unchanged. (Two fundamental papers about content externalism are Hilary Putnam's "The Meaning of 'Meaning'" and Tyler Burge's "Individualism and the Mental.")

This observation has raised two concerns. First, some worry that externalism is problematic for the view that intentional mental states can play a causal role in determining behavior. The worry, crudely put, is that since content is determined by wider environmental factors, content can play a causal role in behavior only if those wider environmental factors themselves play a causal role, which seems mysterious. A second concern is that externalism may be incompatible with the privileged access to our own minds that we seem to have. We need not investigate our environment to know what we think; yet if the contents of our thoughts depend on that envi-

ronment, it may seem mysterious how we manage such a feat. These two problems have motivated some philosophers to introduce a notion of narrow content—mental content determined solely by the intrinsic features of the agent. If there is such a thing as narrow content, any theory of intentionality needs to accommodate it as well as content individuated in a more ordinary fashion.

### PHENOMENAL CONSCIOUSNESS

The second distinctive aspect of the mind with which materialists must contend is phenomenal consciousness. What sort of physical and/or functional property can ensure that its bearer is undergoing an experience?

Many positive approaches to phenomenal consciousness take their cue from the fact that phenomenal states seem bound up with intentionality. Consider, for instance, what it is like to look at a bright red tomato. That experience plausibly represents the world as being a certain way: as containing a bright red tomato. One may even argue that all phenomenal states include such content. The state of pain, for instance, may represent one's body as being damaged.

What makes a state phenomenal, however, is not simply its having a certain content. Something else must be added to distinguish the mere belief that there is a bright red tomato in front of one from the visual experience of a bright red tomato in front of one. A variety of proposals have been offered as to what might make the difference. On one option, the content of a phenomenal state plays a rather different functional role in the overall system than the content that attaches to a mere belief. On another, a phenomenal state is a representational state that itself is represented by some other, higher-order representational state.

Whatever the merits of these theories, few would hold that they can be seen to be true simply as a matter of conceptual analysis. It is simply too easy to imagine situations in which the proposed physical and functional conditions are met even while nothing is experienced at all. Indeed, it seems quite conceivable that a being could have all the various physical and functional properties that we ourselves have and yet be devoid of phenomenal consciousness. Such creatures are known as philosophical zombies—physical duplicates of ourselves for whom all is "dark inside." (For influential discussions, see David Chalmers, *The Conscious Mind*; Peter Ludlow et al., eds., *There's Something about Mary*; and Ned Block et al., eds., *The Nature of Consciousness*.)

The fact that we can easily conceive of such zombies does not, of course, settle the issue in favor of dualism. As is familiar from the work of the identity theorists, the identity in question may be a posteriori. Consider the case of heat and molecular motion again. There is, in fact, no possible situation in which heat is present without molecular motion; nonetheless, we can apparently conceive of such a situation. We may explain away that apparent conceivability, however, by pointing out that we could then be imagining a world in which something other than heat *appears* to be heat, because, we imagine, this other thing produces heat sensations. We have misdescribed the genuine possibility we imagined.

The materialist appears to be obligated to offer a similar sort of story explaining away our apparent ability to conceive of zombies. There is, however, an important difference between the psychophysical case and the case of phenomenal states. In the heat example, we could distinguish between the appearance of heat and the heat itself, but in the case of phenomenal states, it is unclear that a comparable distinction can be drawn. (This well-known argument is found in Saul Kripke's *Naming and Necessity*.)

The difficulty here is related to one discussed earlier—namely, that made famous as "objection 3" in Smart's classic defense of the identity theory. There the worry turned on the implications of saying that mental and physical terms are associated with quite distinct concepts. The materialist needs to offer some story about those concepts that allows us to explain the a posteriori character of the identity claim, and the apparent possibility of zombies, in a way consistent with the claim that *all* properties are ultimately nothing over and above physical properties. Whether any such story is available remains an extremely controversial question.

## PHILOSOPHY OF PHYSICS

The philosophy of physics investigates the logical, conceptual, metaphysical, and epistemological foundations of the physical sciences, especially fundamental physics. It is concerned with general issues such as the subject matters and aims of physics, the nature of physical laws, the

direction of time, and issues specific to particular theories such as the measurement problem in quantum mechanics and the status of the second law in thermodynamics. The philosophy of physics is enormously relevant to traditional metaphysics because it addresses the implications of physical theories for fundamental ontology, the natures of time and space, laws, causal relations, counterfactuals, and natural kinds. This encyclopedia includes entries on general, specific, and metaphysical issues in the philosophy of physics, so this entry will serve mainly as a guide to the main problems in philosophy of physics and to direct the reader to more specific articles.

The best short characterization of physics derives from Aristotle's view that physics is the science of motion and the causes of motion of material bodies; paradigmatically the motions of planets, projectiles, and pointers. The primary aim of fundamental physics has been to find a true theory (or theories) that specifies a fundamental ontology, spatiotemporal structure and laws, and that provides a complete (or as complete as possible) account of the motions of such material bodies. Many natural phenomena (e.g., the tides, the weather, rainbows, the growth of plants, the movements of animals, light, and even mental phenomena) either involve the motions of material bodies or are the causes of motions of material bodies. It follows that the scope of physics includes most everything. A true theory that accounted for the motions of all material bodies would be a theory of everything or at least of everything capable of making a difference to the positions and motions of material bodies.

The possibility of their being a complete physical theory was given a tremendous boost by the development of Newtonian or classical mechanics (see the "Classical Mechanics, Philosophy of" entry). The ontology of classical mechanics consists of dimensionless particles that possess inertial mass and certain other intrinsic properties and that move in a three-dimensional space in accordance with certain laws. Macroscopic material bodies are identified with more or less stable configurations of dimensionless particles and the motions of a particle are described in terms of the change of spatial position (or relative spatial position) over time.

The motion of a particle (and so the motions of the material bodies) is determined by the forces acting on it via the single dynamical law  $F=m(p)a$  where  $F$  is the total force (the vector sum of all forces acting on particle  $p$ ) on  $p$ ,  $m(p)$  is the inertial mass of  $p$  and  $a$  is  $p$ 's acceleration. A free particle (one on which the total force is 0) moves at a constant velocity. Newtonian forces are determined by the intrinsic natures of particles (their masses, charges,

and so on) and their relative positions. For example, the attractive gravitational force particles exert on one another is given by  $F = Gm_1m_2/r^2$ ; where  $m_1, m_2$  are the gravitational masses of the two particles and  $r$  is the distance between the two particles. Classical mechanics was enormously successful in accounting for the motions of material bodies in circumstances where the total force on a body could be (approximately) determined as in the motions of the planets, comets, projectiles, and so on.

Classical mechanics is usually understood as supporting determinism. This means, roughly, that the state of the universe at time  $t$  together with the dynamical laws determines the state of the universe at any other time. Pierre Simon de Laplace made this vivid by imagining a supreme intelligence that ascertains the state of the universe at one time and then, knowing the laws of mechanics, is able to predict the state of the universe at any other time. There are subtle issues concerning the relations between determinism and prediction and also issues concerning whether classical mechanics is genuinely deterministic. It is only given certain qualifications concerning the nature of the force laws and the assumption that the system is isolated (see the "Determinism and Indeterminism" entry). Many philosophers think that the issue of the truth of determinism has significant implications for issues concerning free will (see the "Determinism and Freedom" entry) and more generally the place of mind in nature.

During the latter half of the nineteenth century classical mechanics was extended to include light and other electromagnetic phenomena. This involved introducing electromagnetic fields and dynamical equations (Maxwell's equations) that described the dynamics of electromagnetic fields and interactions between the motions of charged particles and fields. Light was understood as a kind of wave disturbance in the aether—a posited substance that was supposed to fill all space and provide the ground for electromagnetic fields. Also, toward the end of the nineteenth century it became increasingly plausible that matter is composed of atoms of various kinds and that these can be identified with Newtonian particles. By the last decade of the nineteenth century the package of Newtonian mechanics, Maxwellian electromagnetic theory, and the atomic theory of matter looked like good candidates for the sought after complete theory of the motions of material bodies. Of course this turned out not to be so.

One of the main philosophical discussions inspired by classical mechanics concern the natures of space and time. Isaac Newton thought of space as a kind of arena in

which particles move. Newtonian space is absolute in that its existence and nature is independent of the particles it contains. It is three-dimensional, infinite in each dimension, homogeneous, and Euclidian. The positions of and so distances between particles are defined in terms of their locations in space. It follows that for Newton there are distinct possible universes in which all the distances among particles are identical but the positions are translated. Famously, G.W. Leibniz argued that it is difficult to make sense of absolute space. He observed that God would have no reason to place the material contents of space in one region of absolute space rather than another and concluded that absolute space offends the principle of sufficient reason.

The dispute between Newton and Leibniz blossomed into a debate between those (absolutists) who think of space as an independent entity that provides spatial structure and those (relationists) who think of spatial relations between particles as primary. There are famous arguments on both sides. Relationists observe that by the lights of Newtonian physics, absolute position and motion are empirically inaccessible. Empiricist considerations suggest to them that we should not believe that absolute space exists. Absolutists respond that although we cannot determine absolute motion, absolute space is required to provide an adequate explanatory theory including the explanation of possible distance relations and of rotations. Relationists reply by arguing that the empirical content of Newtonian theory is that trajectories are physically possible only if they can be embedded into absolute space and satisfy the Newtonian laws, but that reference to absolute space is merely a convenient fiction. Only spatial relations are real. This debate has survived the demise of Newtonian mechanics and continues in discussions of the interpretations of relativity theories (see the entries “Space in Physical Theories” and “Relativity Theory”).

Newton also thought of time as absolute. He suggests that time flows throughout the universe at a constant rate. It is assumed that a free particle traverses equal absolute distances in equal intervals of absolute time and so free motion measures absolute time. There is also an absolutist/relativist issue concerning the nature of time. Relativists observe that Newtonian theory provides no empirical access to absolute temporal locations. Again empiricist considerations suggest that physics can do without Newtonian time.

Some relativists claim that the empirical content of classical mechanics involve only facts about temporal sequences of interparticle distances. On a sophisticated

relativist account, the laws of classical mechanics specify which sequences of interparticle distances are physically possible (see Julian Barbour’s *The End of Time* and the “Time in Physics” entry for further detail). Exactly how far one can go in dispensing with apparent spatial and temporal structure in favor of spatial and temporal relations while maintaining the empirical core of classical mechanics—or relativity and quantum mechanics—remains a lively topic of discussion.

Another issue concerning time in classical mechanics involves the apparent direction or arrows of time. Many apparently lawful processes, in particular those associated with thermodynamics, are temporally directed. For examples, gasses diffuse, ice in warm water melts, and electromagnetic waves emanate from moving charged particles and the entropy of isolated systems never decreases. In addition, causation, counterfactuals, memory, decision, and so forth are temporally directed. However, the dynamical laws of classical mechanics are temporally symmetric in that for any sequence of particle positions that are in accord with those laws (i.e., is physically possible), the reversed sequence of positions is also physically possible. Where then does the arrow of time come from? Newton seems to have thought of time as possessing an intrinsic direction of flow. But it is hard to see how this flow—whatever “flow” amounts to—can account for the temporal asymmetries. It seems that the solution must lie in physical laws or conditions rather than the metaphysical nature of time.

There has been much work within physics on the problem of reconciling temporally asymmetric processes, in particular those of thermodynamics, with temporally symmetric fundamental laws. (see the “Philosophy of Statistical Mechanics” entry). Ludwig Boltzmann observed that most of the micro states compatible with, say, a block of ice floating in warm water are ones that evolve toward the future in accordance with their dynamical laws to ones in which the ice block melts. *Most* is determined relative to a natural measure on the set of micro states and Boltzmann understood this to mean that it is very likely that the ice block will melt. However, it turns out that, relative to the same probability measure, it is very likely that the ice cube evolved from one that was more melted in the past! This follows from the temporal symmetry of the laws. One response to this problem is that the explanation of temporal asymmetries lies in the macro state of the very early universe. It is posited that this state was one of enormously low entropy (and satisfies certain further conditions) and it is also posited that there is a probabil-

ity distribution over micro states that realize this state. This is called “the past hypothesis” (Albert 2000).

It has been argued that it follows from the past hypothesis and the dynamical laws that macroscopic systems that become approximately energetically isolated (e.g., an ice cube in warm water) will satisfy (the appropriate statistical versions of) the laws of thermodynamics. Some philosophers have pursued his idea further and claimed that all of the temporal arrows are ultimately derivable from the past hypothesis and the dynamics. The foundations of statistical mechanics and the relations between fundamental laws of physics and special science laws (see the “Special Sciences” entry) remain controversial philosophical issues.

The idea that the package of classical mechanics, electromagnetic theory, the atomic theory of matter, and statistical mechanics constitute the complete theory of motion was undermined during the first decades of the twentieth century as it became clear that these theories are incompatible with one another and inadequate as a theory of the very small—atomic structure—and the very big—cosmology. One big problem is that in Maxwell’s equations the speed of light appears as a constant of nature. It was thought that this speed is relative to the aether. This suggests that it ought to be possible to measure the absolute velocity of the Earth relative to the aether by sending light rays in various directions. However, experiments designed to measure the velocity of the Earth relative to the aether yielded null results. It appeared that measurements of the speed of light yield the same result no matter the velocity of the source or receiver. Obviously, some modification of classical mechanics/electromagnetic theory was required.

H. A. Lorentz proposed modification of the Newtonian laws so that clocks and measuring rods, which are in motion with respect to absolute space, systematically slow down and shorten. As a consequence, although there are facts about the velocities of bodies with respect to absolute space, it also turns out that those velocities cannot be detected. Albert Einstein’s special theory of relativity (STR) makes a quite different and revolutionary proposal. It rejects absolute Newtonian space-time as the framework for the motions of matter in favor of Minkowski space-time.

In Minkowski space-time the fundamental notion is that of the space-time interval between events. Einstein posited that the interval between any two events connected by a light ray is 0. This has the consequence that there are no absolute (frame independent) facts about the elapsed time or spatial distance between two events. It

also follows that there are pairs of events (events that cannot be connected by a light ray) for which there are no absolute facts about their temporal order. Einstein’s proposal entails the same phenomena as Lorentz’s as a result of changing the underlying spatiotemporal structure.

The change from Newtonian space and time to Minkowski space-time suggested to Einstein the possibility of accounting for gravitation not as a force between bodies, but rather as a feature of space-time itself. He succeeded in doing this in the general theory of relativity (GTR). The main idea of the general theory is that the geometry of space-time itself has a geometrical structure that is not Euclidian (i.e., flat) but, rather, depends locally on the distribution of matter and energy. According to GTR, bodies freely move on geodesics (the shortest paths between points in space-time) and what counts as a geodesic is given by the geometry. Because gravitation is an effect of space-time in the GTR, not a force as in classical mechanics, it follows that it acts on all bodies in the same way. This is quite different from Newtonian mechanics in which gravitation is a force that acts the same on all bodies only because inertial mass and gravitational mass are equal. Where in Newtonian mechanics space is an inert arena, in the GTR space-time is a dynamical entity that changes over time through interactions with matter. Both the STR and the GTR are spectacularly successful in their empirical predictions (see “Relativity Theory” entry).

The STR and the GTR have been the objects of much discussion in the philosophy of physics. Among the main issue are: paradoxical scenarios; for example, the twin paradox and the possibility of closed causal loops and apparent time travel, the extent to which the metric of space-time is a real fact or is, to some extent, conventional (see the entry on “Conventionalism”), descendents of the absolutist/relationist dispute within relativistic frameworks, the formulation and viability of determinism within relativity theory (see the “Hole Argument” entry), the compatibility relativity, and quantum mechanics.

The other major failure of classical mechanics/electromagnetic theory concerned its inadequacy as accounts of atomic structure and interaction between atoms and light. According to these theories, atoms should be unstable. Further, it was found, contrary to these theories, that matter emits radiation only with certain specific frequencies, that light behaves in particle-like as well as wave-like ways, and that electrons behave in wave-like as well as particle-like ways. Over the first third of the twentieth century a novel theory—quantum mechanics—developed to account for these and many other phenomena. In

quantum mechanics the state of a system at  $t$  is characterized by a wave function  $\Psi(t)$ .

$\Psi(t)$  specifies the values of certain “observables” (position, momentum, spin, and so on) and the probabilities of obtaining various measurement results. A novel feature of quantum mechanics is that  $\Psi(t)$  specifies the values of only some observables; for example, if it specifies the value of  $x$ -spin, say spin up (in which case it is said to be an eigenstate of  $x$ -spin with value spin up), it specifies no value for other spin observables (e.g.,  $y$ -spin). This is an instance of Werner Heisenberg’s uncertainty principle.  $\Psi$  also specifies the probabilities of the results of measurements of other spin observables. If  $\Psi_1$  is an eigenstate of observable  $O$  with value  $v_1$  and  $\Psi_2$  is an eigenstate of  $O$  with value  $v_2$ , then the superposition  $c_1\Psi_1 + c_2\Psi_2$  is a well-defined state that specifies no value for  $O$  but says that the probability of a measurement of  $O$  yielding value  $v$  is  $c^2$ .  $\Psi(t)$  evolves deterministically by Schrödinger’s law except when measured. When measured,  $\Psi$  collapses probabilistically to an eigenstate of the measured observable.

Quantum mechanics is beset with puzzles. The dominant way of thinking about quantum mechanics—the Copenhagen interpretation—holds that an observable possesses a determinate value only when the state is an eigenstate of that observable. What does it mean for an electron to possess a position but no determinate momentum (or the other way round) and yet for there to be a probability of a measurement yielding a particular value? It turns out that, in typical (nonmeasurement) interactions, the macroscopic system will evolve into a state that is not an eigenstate of ordinary properties. This is the situation of Erwin Schrödinger’s cat that ends up in a state that is not an eigenstate specifying whether it is alive or dead (see “Quantum Mechanics” entry). What can that mean?

Further, that measurement appears in the fundamental laws is immensely implausible and completely unsatisfactory without a precise characterization of measurement. There is also the novel feature that typical quantum states are nonlocal. As Einstein observed and John Bell demonstrated (see entries on “Einstein, Albert” “Bell, John, and Bell’s Theorem,” and “Non-locality”), there are quantum states involving pairs of particles for which a measurement on one of the pair instantaneously changes the probabilities of certain measurement results for the other particle. This appears to be a kind of influence at a distance that seems incompatible with special relativities apparent prohibition on superluminal causal

influences. Whether or not the conflict is genuine is a subtle issue

For most of its history and up until the present, these problems encouraged an instrumentalistic construal of quantum mechanics (see entries on “Scientific Realism” and “Copenhagen Interpretation”). Instrumentalism amounts to giving up the ambition of a complete true theory of motion. However, in the last few decades a number of realist interpretations of quantum mechanics have been proposed. These include Bohmian mechanics, many world/minds theories, and spontaneous collapse theories. Each of these interpretations specify an explicit ontology (that interprets the wave function realistically and may include other items) and laws governing that ontology that yield results matching (or approximately matching) the predictions of orthodox quantum theory. In some, such as Bohmian mechanics, the dynamical laws are completely deterministic, whereas in others, such as the GRW collapse theory, are probabilistic. Because these interpretations are empirically equivalent (or approximately empirically equivalent), they provide an interesting real example of theory underdetermination (see the entry on “Underdetermination Thesis, Duhem-Quine thesis”).

Among the notable features of realist interpretations of quantum mechanics are the difficulty squaring it with relativity theories. Currently, there is no satisfactory quantum version (realist or not) of general relativity. Producing such an account is one of the urgent problems of contemporary physics. Less often appreciated is the difficulty in reconciling quantum mechanics and Einstein’s Minkowski formulation of special relativity. A realist understanding of the wave function seems to require (because of nonlocal states) more space-time structure than Minkowski space-time provides. Interpretations of quantum theory and connections with relativity will be of central concern in the philosophy of physics in the twenty-first century.

## PHILOSOPHY OF RELIGION

Analytical “philosophy of religion,” still in its infancy in the 1960s, has developed markedly since then. Other approaches have certainly continued to play a part in philosophy of religion written in English, even more so in other languages. Process philosophy, for example, inspired by the thought of Alfred North Whitehead and exemplified in the ongoing work of Charles Hartshorne and others, has retained influence in philosophy of religion and in theology, probably more than in other areas of philosophy. Phenomenology, postmodernism, and other approaches characteristic of the European continent inspire important contributions to the subject. Indeed, there is often not a sharp line between different approaches. Continental writers such as Søren Kierkegaard figure extensively in undoubtedly analytical writing about religion, and analytical philosophy of religion makes such extensive use of medieval material as to be more or less continuous with neoscholastic treatments of the subject.

Although there had been a few earlier analytical essays about various religious issues, the main development of analytical philosophy of religion may be said to have begun in the 1950s with discussion of the “logical positivist” challenge to the cognitive significance of religious language. Most analytical philosophers then held, or were strongly tempted to hold, as an empiricist principle, that every (logically contingent) assertion, in order to have any cognitive meaning, must be verifiable or, more broadly, testable, in principle, by experience. It was charged, by Alfred Jules Ayer, Antony Flew, and others, that the affirmations of religious belief typically do not satisfy this criterion of meaning (A. Flew, R. M. Hare, and B. Mitchell in Brody 1974).

How, then, were the apparent truth claims of religions to be understood? Some were prepared, with Ayer,

to treat major religious assertions as mere expressions of emotion, without any cognitive significance. Others sought ways of understanding such assertions as empirically verifiable in principle. John Hick (in Brody 1974) argued, for instance, that “eschatological verifiability,” in a life after death, provides at least a partial solution to the problem. Still others, while granting that empirical testability is decisive for the meaning of typical factual assertions, sought to establish a different, and not merely emotive, type of meaning that could be ascribed to religious assertions. The most influential attempts of this type were inspired by the later writings of Ludwig Wittgenstein, particularly by his account of “language games” and their relation to forms of life.

The Wittgensteinian approach, as developed, for example, by Norman Malcolm (in Brody 1992) and D. Z. Phillips (1970), has generated very interesting studies of the relation of religious language to religious life. It is widely criticized, by some as giving inadequate weight to the apparent straightforwardly realistic intent of typical religious assertions, and by some as improperly shielding religious claims from rational criticism by relativizing them to religious language games. It remains, nevertheless, an important strand in contemporary discussion. Of all that has been done in analytical philosophy of religion, it is probably the discussion of religious language in general, and Wittgensteinian themes in particular, that have most interested professional theologians, perhaps because these themes have seemed more relevant than more metaphysical discussions to the work of interpretation and reinterpretation of traditions in which theologians are so much engaged.

Within analytical philosophy during the 1950s the verifiability criterion of meaning was already undergoing severe criticism and has since been virtually abandoned in anything like its original form. Many analytical philosophers continue to consider themselves empiricists and seek alternative ways of excluding claims that they regard as objectionably metaphysical. Many others, however, see the permanent contribution of analytical philosophy, not in a form of empiricism, or in any set of doctrines, but in a method, style, or discipline that can be applied to virtually all the historic issues of metaphysics and ethics and can be used in developing and espousing almost any of the classic philosophical doctrines.

The majority of work done in analytical philosophy of religion since the 1960s has been inspired by the later conception of analytical philosophy and has not focused on issues about religious language. It is characterized by metaphysical realism, taking the religious claims under

discussion to be straightforwardly true or false. (For defense of this stance, see, e.g., Swinburne 1977, chaps. 2–6.) Some have suggested calling it philosophical theology rather than philosophy of religion, because the principal subject of most of it is God rather than human religious phenomena, though atheists as well as theists have certainly been important participants in the discussion. On this basis, mainly since 1960, a very substantial body of literature, dealing with most of the traditional issues of philosophical theology and some new ones too, has been created.

Among the traditional topics the attributes of God received rather early analytical attention. (For general treatments see Swinburne 1977, chaps. 7–15; Kenny 1979; Wierenga 1989.) Analysis of the concept of God was easily seen as an appropriate subject for analytical philosophy, and issues about the attributes had been connected, since the Middle Ages, with problems about predication, an appealing point of entry into philosophical theology for those interested in the philosophy of language. According to some of the most influential medieval theologians, God is so different from creatures that positive attributes of creatures cannot in general be predicated of God univocally, that is, in the same sense in which they are predicated of creatures. How then can we predicate anything of God? Various Scholastic theologians developed various solutions, the best known being the theory of analogical predication of Thomas Aquinas. Analytical philosophers of religion have taken up the problem and some of the medieval views, along with more contemporary concerns—for instance, about the ascription of psychological predicates to a being who is supposed not to have a body. (Cf. Maimonides, Thomas Aquinas, and Alston in Brody 1992).

The two divine attributes that have received the most extensive analytical discussion are omniscience and eternity. The central issue about eternity is whether to understand it (as medieval and early modern theology generally did) as involving existence outside of time or rather as involving existence without beginning or end in time, as many contemporary thinkers have proposed. Critics of divine timelessness, such as Nelson Pike (1970) and Nicholas Wolterstorff (in Brody 1992), have questioned the compatibility of timelessness with God's consciousness or action or interaction with creatures. Eleanor Stump and Norman Kretzmann, however, have presented an influential defense of the traditional timeless conception (in Brody 1992), and the issue remains vigorously debated.

Omniscience and eternity are related topics, for one of the most discussed issues about God's knowledge concerns God's relation to time: Does God have complete knowledge of the future? In particular, does God know, infallibly and in every detail, how free creatures will use their freedom? Traditional theologies generally gave an emphatically affirmative answer to this question; but some modern philosophers and theologians have disagreed, arguing that the doctrine of total, infallible foreknowledge compromises the freedom of the creatures. The extensive analytical literature on this issue (e.g., in Fischer 1989) is continuous with older discussions, and opinion remains divided.

A related old debate, recently revived, concerns what has been called "middle knowledge": Does God know, completely and infallibly, what every actual and even merely possible free creature would freely do (or would have freely done) in every possible situation in which that creature could act freely? In the late sixteenth century, Luis de Molina, a Jesuit, proposed an ingenious theory of divine providence according to which God uses such subjunctive (and largely counterfactual) conditional knowledge to control the course of history without having to interfere metaphysically with the freedom of creatures. This theory of middle knowledge was widely embraced by Jesuits, but opposed by Dominicans, who argued that there cannot be such determinate conditional facts about everything that would be freely done by particular creatures in all possible circumstances. This historic controversy was introduced into current analytical discussion by Anthony Kenny (1979) and Robert Adams (1987), who have both defended the Dominican objection to middle knowledge; but the opposite position has been argued by a vigorous school of contemporary Molinists, including Alvin Plantinga (1974) and Alfred Freddoso (1988).

Regarding the relation of God to ethics, it was almost universally held in the 1960s that fundamental ethical principles must be independent of theology and that an acceptable theological account of the nature of ethical facts is impossible. Since then, however, it has come to be widely held by theists, and granted by many nontheists, that facts about God, if God exists, could play a central role in explaining the nature of ethics and that theistic philosophers should be expected to avail themselves of this possibility. The most discussed type of theological theory in this area is the divine-command theory of the nature of ethical obligation, or of right and wrong (Helm 1981). Several thinkers, such as Philip Quinn (1978), have tried to reformulate and explain the theory in such a way as to defend it against the traditional objections to it.

Adams (1987) has proposed a form of the theory that rests on semantical assumptions very similar to those of some of the most influential contemporary exponents of metaethical naturalism but employs different (theistic) metaphysical assumptions.

The grounds proposed for belief or disbelief in the existence of God have naturally claimed at least as much analytical attention as the attributes of God. This is a subject so intensively discussed for centuries that one might have expected little novelty in the treatment of it. But in fact investigations have been rather innovative, and the state of debate has changed significantly since 1960. One striking change is that the traditional arguments for the existence of God, then widely dismissed, even by theologians, as hopelessly discredited, have many defenders at the turn of the twenty-first century.

This is connected with a more general phenomenon, which is that analytical philosophers, especially those inclined to construct and defend constructive metaphysical theories, demand less of arguments than has commonly been demanded in the past. Virtually no one thinks any one “theistic proof” conclusive; but if arguments must be either conclusive or worthless, there would be little useful reasoning about any of the most important philosophical issues. Theistic apologists are accordingly less apt to seek a single “knockdown” proof than to try to show that several traditional (and perhaps also novel) arguments have something of value to contribute to a “cumulative case” for theism, an approach exemplified by Richard Swinburne (1979). Extensive work has been done interpreting, developing, and criticizing all the main types of theistic arguments. Those that have probably received the most attention and development are the “ontological” and the “teleological” (to give them their Kantian names).

The fallaciousness of any ontological argument and the contingency of all real existence had become such commonplaces, especially among empiricists, that it had a certain “shock value” when Norman Malcolm in 1960 published a defense of an ontological argument (reprinted in Brody 1992). Malcolm claimed to find in Anselm’s *Proslogion*, besides the famous argument of its second chapter, a second ontological argument in which it is not existence but necessary existence that figures as a perfection. Malcolm also held that necessary existence cannot be excluded from theology on general philosophical grounds. Whether a statement expresses a necessary truth, he argued, depends on the language game in which it figures; and a religious language game can treat the existence of God as a necessary truth. These two features

of Malcolm’s article foreshadow the main tendencies in the development of ontological arguments since then: (1) attention to more modal versions of the argument and (2) the attempt to rehabilitate the idea of necessary existence.

Ontological argument studies have been greatly influenced by the dramatic development of modal logic, which was gathering momentum in the 1960s and burst into the center of American philosophical consciousness in the 1970s. In 1962 Hartshorne published a modal proof of the existence of God relying only on the premises that God’s existence must be necessary if it is actual and that God’s existence is at least possible. Subsequent discussion has established that this proof, and related proofs from slightly slenderer assumptions, are valid in the system of modal logic (S5) most widely thought to be appropriate for the context. David Lewis (in Brody 1974) and Plantinga (1974) have given the argument a form that takes account of developments in modal predicate logic as well as modal propositional logic (or in *de re* as well as *de dicto* modality). The argument is still of limited value for proving the existence of God, because those who would otherwise doubt the conclusion are likely to doubt the possibility premise, given the rest of the argument. But the modal development of the argument is helpful in structuring discussion of questions about necessary existence.

In the 1950s it was the opinion of almost all analytical philosophers that the existence of a real being, such as God (as distinct from merely abstract objects, such as numbers), cannot be necessary in the strongest, “logical” sense. This opinion has come to be widely doubted, however, and the traditional view that God should be conceived as an absolutely necessary being has regained a following. (For contrasting views see Adams 1987, chaps. 13–14, and Swinburne 1977, chaps. 13–14.) Several factors have contributed to this change. The identification of necessity with analyticity, on which the rejection of necessary existence was commonly based, is under attack. W. V. O. Quine’s influential doubts about the adequacy of the notion of analyticity led Quine himself to skepticism about necessity. But others, influenced in some cases by an interest in necessity *de re*, have been inspired to seek a more robustly metaphysical conception of necessity. Since a conception of the latter sort was generally held by the great philosophers of the Middle Ages and the seventeenth century, a growing and more sympathetic understanding of those periods of the history of philosophy has also tended to undermine the most dismissive attitudes toward the idea of necessary existence.

The most popular argument for the existence of God in the eighteenth century was the teleological or design argument, usually in a pre-Darwinian form drawing its evidence largely from biological adaptations. This type of argument was discredited both by the devastating critique it received in David Hume's *Dialogues concerning Natural Religion* and by the development of an alternative explanation of the biological phenomena in terms of natural selection. A major rehabilitation of the design argument has been undertaken by Swinburne (1979). Instead of the biological evidence, he takes as his principal evidence the most pervasive, highest-level regularities in the universe. Since they constitute the most fundamental laws of nature, to which all scientific explanations appeal, he argues, there cannot be any scientific explanation of them. There may therefore be no viable alternative to a theological explanation for them, if they are to be explained at all. Deploying the apparatus of Bayesian probability theory, and responding to Hume's objections, Swinburne tries to establish that a theological explanation is indeed more plausible than no explanation at all. Swinburne's argument depends at some points on controversial metaphysical theses and has inspired an extended atheistic response by J. L. Mackie (1982); but the teleological argument has at least been shown to have much more philosophical life in it than had been thought.

The leading argument for atheism, aside from the various critiques of theistic arguments, has long been the argument from evil. The evils that occur in the world are incompatible, it is argued, with the existence of an omnipotent, omniscient, perfectly good God. In the earlier years of analytical philosophy of religion this was usually a charge of demonstrable, logical incompatibility; and attempts to provide theists with a "solution" to the "problem of evil" concentrated accordingly on trying to show the possibility of a perfect deity having permitted the evils. Borrowing a Leibnizian idea, for instance, Pike argued that for all we know, this might be the best of all possible worlds (in Adams and Adams 1990). Plantinga (1974) developed a much-discussed version of the traditional "free will defense," arguing that even if there are possible worlds containing less evil, and as much moral good, as the actual world, an omnipotent God may have been unable to create them because it may be that creatures (whether humans or angels) would not have freely done what they would have to do freely in order for one of those worlds to be actual. The adequacy of such theistic responses to the "logical" form of the argument from evil has been keenly debated, but it has probably become

the predominant view that the argument does not afford much hope of a tight, demonstrative proof of atheism.

There has therefore been increasing interest in probabilistic arguments from evil, as presented, for example, by William Rowe (in Adams and Adams 1990), whose thesis is that evils show theism to be implausible, or at least constitute evidence against theism, which might contribute to a cumulative case for atheism. Theistic responses to this type of argument must address issues of plausibility and not merely of possibility. Some have been methodological, attempting to show that the relevant probabilities cannot be determined, or that the explanatory structure of the situation keeps the evils from being even relevant evidence (e.g., Stephen Wykstra in Adams and Adams 1990). Others have tried to give plausible accounts of why evils might have been necessary for greater goods. One widely debated hypothesis, developed in different ways by Hick (in Adams and Adams 1990) and Swinburne (1979), for instance, is that evils, and possibilities of evil, play an essential part in making the world a context for the moral and spiritual development of free creatures.

All such explanations of why God would permit great evils have seemed to some morally or religiously objectionable. Among theists who take this view, Marilyn Adams has argued that we should accept that we simply do not know why God has permitted horrendous evils but that within a religion that affirms, as Christianity does, God's love for individuals who suffer them, it is important to have a coherent account of how God may be seen as redeeming them (Adams and Adams 1990). She points to traditional religious ideas of suffering shared with God or with Christ as suggesting how horrendous evils might be "defeated" by forming an organic whole with incommensurably great religious goods.

One of the more dramatic developments of the period under review is the development of a defense of the rationality of theism that professes not to be based on arguments or evidence. Plantinga maintains that belief in the existence of God can be "properly basic," a basic belief being one that is not inferentially based on any other belief (Plantinga and Wolterstorff 1983). It has been held by many that some beliefs (formed, perhaps, in sensation or memory) do not need inferential support from other beliefs for their justification. Plantinga argues that more beliefs than some have supposed are reasonably held without being based on the evidence of other beliefs and that there is no compelling reason to deny that some religious beliefs have this basic status. He suggests that religious beliefs not based on "evidence" constituted by other

beliefs may nonetheless be based on other sorts of “grounds,” which might be found, for example, in religious experience. Plantinga’s view (which he has dubbed “Reformed epistemology”) has been keenly debated. One of the most discussed issues is whether it allows an adequate basis for distinguishing between rational and irrational religious beliefs. (For a moderately critical view see R. Audi in Audi and Wainwright 1986).

A related but importantly different view has been developed by William Alston (1991). Religious experience has been a major subject of discussion in philosophy of religion (e.g., W. James, W. T. Stace, and C. B. Martin in Brody 1974; Wainwright, 1981), as it has been in modern theology. Not all of the discussion has been epistemological or focused on the justification of belief. Pike (1992), for instance, has written about the phenomenology of mysticism, arguing, against the older theory of Stace, that there are mystical experiences of theistic as well as non-theistic content. Alston’s approach is thoroughly epistemological, however, and he focuses on the experience of more ordinary religious believers rather than of those adepts typically singled out as “mystics.”

Relying on carefully discussed analogies with sense perception, Alston argues that in some circumstances experiences as of God addressing, or being present to, a person can reasonably be regarded as perceptions of God. His argument is placed in the context of a “doxastic practice” conception of the justification of beliefs. He argues that we are able to form and justify beliefs only in socially established practices in which we have learned to be responsive to such factors as experiential cues and communal traditions as well as to beliefs that we hold. In Alston’s view we have no choice but to rely on socially established doxastic practices, and it is presumptively rational to do so, even though we typically have little or no independent evidence of the reliability of the practice. He argues that this presumption of rationality applies also to religious doxastic practices that are socially established, and in particular to practices in which participants have learned to form beliefs of having perceived God in various ways. Alston offers vigorous rebuttals of several major objections to basing religious beliefs on religious experience. In his opinion the most serious problem for his view, which he treats at some length, is that posed by the existence of diverse religious traditions whose well-established doxastic practices lead them to form apparently conflicting beliefs on the basis of their religious experience.

For philosophy of religion as for contemporary theology, the problem of conflicting truth claims of different
