Another naturalistic approach focuses on game theory. Models drawn from game theory are now showing that some kind of justicelike reciprocation can evolve among humans, even when no prior planning is involved. To see this, let us introduce two important concepts. The first is the notion of a Nash equilibrium, which posits that if there are two players in a game who are fighting over a fixed sum, and if they together demand more than the sum, neither will get anything. Given that both players know what the other will do, what is the most rational move for this first player? Suppose, for instance, that there are 100 units to be divided and player 1 knows that player

2 will demand 70 units. Then the most rational demand for player 1 is 30 units. An equilibrium holds if the distribution is 30:70—player 1 cannot do better than this, and could do worse. The second notion is that of an Evolutionarily Stable Strategy, whereby no one mutation or variation can gain predominate over or eliminate all others in the population. Selection for rarity will lead to such an equilibrium because if the variation gets more common, it will be under heavier selection pressure, and conversely.

Now fairness would seem to demand that the two players agree to divide 50:50, but why should this result evolve given that it could be rational to go 30:70, given the greediness (but not irrationality) of player 2? The philosopher Brian Skyrms has shown that in fact only a 50:50 distribution is an evolutionarily stable situation. His insight is that if anyone coming into a population asked for less than 50 units, where the inhabitants asked for 50 units, then the invaders would do less well. If they asked for more than 50 units in such a population, they would always get nothing. Conversely, if the inhabitants asked for less than 50 units, the invaders asking for 50 units would spread. In his conclusion, where everyone asked for less than 50 units, one would always get less than one might have had. But if one asks for more, then too often one will end up getting nothing at all. So a kind of justice as fairness result comes out of the evolutionary process.

Suppose we grant all of this. You may still complain, legitimately, that we do not have morality. We have beings behaving as if they were moral. Morality, however, involves a sense of moral obligation. At this point, obviously, the Darwinian ethicist supposes—that is, makes an empirical assumption—that this sense of obligation is something put in place by selection to make us work together, to make us altruists who respect fairness. Normally we are self-centered. That is the way that selection has made us. So we look to our own needs when it comes to food and sex and so forth. But we are social animals also, and there are advantages to being social. So we have this moral sentiment that makes us reach beyond ourselves. Morality in this sense is an adaptation, just like any other.

Work is now proceeding at an empirical level showing how moral sentiments emerge in games of strategy. But, at the general level, the most obvious empirical support for the suggestion that ethics (substantive ethics) is an adaptation is that it fits in with the general Darwinian picture. We do have biological inclinations to selfishness—we want food and mates for ourselves—and so, if cooperation is of value, we need adaptations to let us break through the selfishness. A moral sense is just what

is needed. Substantive ethics is a kind of quick and dirty solution to the question of cooperation. It gets you to act quickly, even though (as with quick and dirty solutions) it might not always be the best answer.

Thinking of evolutionary ethics at the metaethical level also, we find that there has been renewed thought. Because the search for foundations seems so misguided—committing what Moore called the “naturalistic fallacy,” could it not be that the evolutionist is directed toward some noncognitivist “ethical skepticism,” where there simply are no foundations at all? This is the approach taken by Wilson collaborating with the philosopher Michael Ruse. Following up on the thinking of the late John L. Mackie, they suggest that ethics might be simply a collective illusion of our genes, put in place by natural selection to make humans into good cooperators. To this they add that the reason ethics works is that our biology makes us “objectify” our moral sentiments; thus, we are psychologically convinced that morality, despite its lack of real foundation, is more than mere subjective sentiment.

## EVOLUTIONARY PSYCHOLOGY

Human beings are evolved creatures. Our lineage stretches back through the first humans to have evolved roughly 150,000 years ago, through their hominid ances-

tors, all the way back to the common ancestor we share with all other forms of life on the planet. Many of our traits are the historical results of evolution. This holds as much for psychological traits such as the visual system, emotions, and some behavior-producing mechanisms as for physical traits such as the heart, eye, or hand.

In a broad sense, evolutionary psychology covers any inquiry that uses this fact about our biological heritage to illuminate our human psychology. Historically, Charles Darwin himself pursued this kind of inquiry, as did such disparate figures as Herbert Spencer, John Dewey, and Sigmund Freud. Contemporary scientific fields such as human ethology and evolutionary anthropology are also instances of evolutionary psychology in the broad sense.

More commonly, however, the term evolutionary psychology is used in a narrower sense to refer to a specific research program that deserves to be called a Kuhnian paradigm. This paradigm is most closely associated with the psychologist Leda Cosmides (1957–) and anthropologist John Tooby, who have been among its strongest and most vocal advocates; other prominent figures in this paradigm include David Buss (1953–), Martin Daly (1944–), Steven Pinker (1954–), Donald Symons (1942–), and Margo Wilson (1942–). The manifesto for this group is the 1992 volume *The Adapted Mind*. This specific paradigm has been the most controversial branch of the general evolutionary approach to psychology and is therefore the focus of this entry. Unless otherwise qualified, *evolutionary psychology* will here be used to refer to this specific paradigm. There are four distinctive theoretical commitments in this paradigm of evolutionary psychology.

### COMPUTATIONALISM

In keeping with most cognitive science and much contemporary psychology, evolutionary psychology construes the mind as an information-processing machine, which can be described in cognitive and computational terms. What is important about the mind is not what it is made of but what it does, namely, take in information from the environment, operate on internal representations, and produce behavior. The physical properties of the brain, such as its size and the amount of energy it requires, may have played some role in our evolution; but at least as important in evolution is what the mind does, and this is to be characterized functionally.

### ADAPTATIONISM

Organisms possess many traits that appear to have been designed to help them survive and reproduce—photo-

synthesis in plants, the vertebrate eye, and so on. Such traits increase the fitness of the organism, which essentially means they make it more likely for the organism to transmit its genes to future generations. These traits are adaptive.

Evolution by natural selection is the best explanation for the existence of complex and functionally integrated traits such as the eye. Natural selection works by preserving and modifying heritable mutations that increase their possessors' fitness. Suppose some organism is born with some novel and simple trait (due to random mutation) that gives it a slight fitness advantage over its conspecifics. The next generation will tend to have more such organisms, and so the new trait will spread throughout the population. The more common the trait becomes in the population, the more likely that some new, beneficial mutation will arise in organisms with that trait, in which case organisms with both mutations will become more frequent in the population, and so on. By accumulating many small, beneficial mutations, natural selection can build complex and well-designed traits. Traits that evolved because they increased their bearers' fitness are adaptations.

Two questions can be distinguished about any trait: first, whether it is an adaptation and, second, whether it is currently adaptive. The first is an historical question concerning the role of natural selection in the origin of the trait; the second concerns whether the trait at the present time *fits* the organism to its environment (strictly, whether the trait tends to increase the organism's genetic representation in later generations). Adaptations must have been adaptive when they evolved, but they need not be adaptive now. They may no longer fit the environment if it differs from the environment in which the trait evolved.

Evolutionary psychologists claim that the human mind contains many traits that are adaptations (but may no longer be adaptive in modern environments). The environment in which traits evolved is called the environment of evolutionary adaptedness (EEA). Note that *environment* is construed broadly in evolutionary theory, covering geographical, physical, biological, and social factors. In the case of human psychological evolution, the social environment must have been especially important. According to evolutionary psychologists, the human EEA was the Pleistocene era, which started about 1.8 million years ago and ended 10,000 years ago. They argue that there has not been enough time since then for selection to have produced any significant new adaptations. Adaptations take time to evolve, especially such complex adapta-

tions as psychological traits, and there have not been enough generations since the Pleistocene for new psychological adaptations to evolve.

Throughout the Pleistocene, human beings lived as hunter-gatherers in small-scale groups. Hence our adaptations are equipped to deal with this kind of environment but not necessarily modern environments, which are different in many salient ways. Our food preferences are a commonly cited psychological example. Humans enjoy and seek out foods high in sugar and fat. In the nutrient-poor environment of the Pleistocene, such preferences were adaptive since they helped our ancestors maximize their caloric intake. But they are no longer adaptive in modern environments in the developed world where such foods are all too readily available.

Since the mind/brain is an organ of tremendous complexity and sophistication, evolutionary psychologists argue that it must have evolved by natural selection. More than that, specific psychological mechanisms evolved to solve the suite of adaptive problems faced by our hunter-gatherer ancestors—problems of how to increase their genetic representation in future generations. This fact is crucial to understanding the mind, claim evolutionary psychologists, because it allows researchers to engage in reverse engineering. In an evolutionary functional analysis, evolutionary psychologists try to infer what adaptive problems our ancestors would have faced and what sorts of psychological mechanisms would be required to solve them on the basis of what is known about conditions in the human EEA. Through such an analysis they generate hypotheses about our psychological adaptations and then test for the presence of these adaptations in modern humans.

## MODULARITY

The third main theoretical commitment of evolutionary psychology follows naturally from the previous one. The mind is not a single, monolithic adaptation, argue evolutionary psychologists. Rather, the mind is comprised of many functionally distinct units dedicated to solving specific adaptive problems faced in the EEA. These distinct psychological mechanisms are modules.

When Jerry Fodor first developed the notion of a psychological module in *The Modularity of Mind* (1983), he characterized them as sharing a cluster of nine distinctive features. Evolutionary psychologists have focused on only a subset of these. The modules they propose are supposed to operate fast and automatically (without conscious effort). They are more or less informationally encapsulated from other psychological mechanisms—

they do not have full access to all the information stored elsewhere in the mind. Finally, they possess innate information about the adaptive problem they were designed to solve.

Fodor himself believed that modules would only be found at the functional periphery of the mind, handling input processes such as vision. More controversially, evolutionary psychologists claim not only that more central cognitive processes are modular but also that the mind is massively modular. Cosmides and Tooby (1992), for instance, claim that the mind must contain thousands of different modules, each of them dedicated to solving different adaptive problems (and subproblems) in the EEA.

Evolutionary psychologists have offered some general evolutionary arguments for why the mind should be largely comprised of modules rather than domain-general processes. First, the adaptive problems our ancestors faced were many and varied—foraging for food, selecting the best possible mate, avoiding incest with one's kin, and so on—and these require different sorts of solutions. A mind with domain-specific ways to solve these problems is faster, more efficient, and more reliable than a general-reasoning sort of mind. Therefore, modular minds would have been selected over general reasoners in our ancestral lineage, and our own evolved cognitive architecture should be massively modular.

The second argument for massive modularity is that only massively modular minds could have produced adaptive behavior. General reasoners could not have learned by themselves and in their own lifetimes the advantages of avoiding incest or helping kin, especially since what counts as error and success is not the same in all domains. Modular creatures with domain-specific knowledge of what to do and when to do it would have been fitter than general reasoners.

## UNIVERSALITY

The last main theoretical commitment of evolutionary psychology is that psychological adaptations are part of our universal human nature, with two exceptions: where a person lacks the adaptation because of mutation, and some cases of sex differences (in particular, adaptations concerning sexual reproduction). Evolutionary psychologists believe this about adaptations in general: Any trait that increases its bearer's fitness will tend to spread to fixation through a population, given enough time. Since our psychological adaptations evolved during the Pleistocene, there was enough time for them to become fixed in the entire human species.

Evolutionary psychologists have several defenses against the obvious rebuttal that human psychological nature looks anything but universal. First, they tend to downplay the massive cultural differences that anthropologists in the early to mid-twentieth century claimed to have found. Second, and a less ad hoc defense, evolutionary psychologists claim only that our psychological adaptations are universal, not that all our psychological traits are universal. Given that they also view complexity as the mark of an adaptation, however, this concession does not really grant the possibility of variation in complex psychological traits.

Their third, most interesting defense is that, even if we grant significant diversity across and between cultures, this diversity may still be produced by a common underlying mechanism. Evolutionary psychologists are interested not in behavior but in the psychological adaptations that produce behavior. An adaptation exposed to one set of environmental cues might produce a different behavior if it were exposed to a different set of cues.

One way a universal mechanism can produce diversity is a common psychological mechanism responding differently to different environmental cues. The linguistic work of Noam Chomsky, himself not an evolutionary psychologist, provides a classic example of this. According to the Chomskian tradition, the world's various languages are all underwritten by a basic universal grammar. All normal humans possess a modular language-acquisition device that enables us to learn the language of our native environment during a certain critical period of development. Although two humans may speak two different languages, they acquired, comprehend, and speak their own language with the same mechanisms.

A second way to get diversity from a universal mechanism is where a common developmental program produces different psychological mechanisms in different environments. For instance, some mechanisms may only develop in the presence of certain environmental cues at certain stages of development. In environments where those cues are lacking, or where different cues are present, the mechanism will not develop. Evolutionary psychologists have proposed both types of explanation of how an underlying common human nature can produce behavioral diversity.

Strictly speaking, then, when evolutionary psychologists claim that our evolved psychology is universal, they mean this in a restricted sense. It is not behaviors, beliefs, or desires that are supposed to be universal but only our psychological adaptations. In some cases even the psychological mechanisms themselves are not universal but

only the developmental programs that produce those mechanisms in the appropriate environments.

### SPECIFIC ADAPTATIONS PROPOSED BY EVOLUTIONARY PSYCHOLOGISTS

Evolutionary psychologists have proposed too many psychological adaptations to list here, but two examples should suffice. Cosmides and Tooby (in "Cognitive Adaptations for Social Exchange") proposed a module dedicated to detecting cheaters in social exchanges. This module was postulated to explain a puzzling pattern of results on the Wason selection task—a psychological test. Humans tend to perform very badly on this task when it is framed as an abstract logical problem but perform much better when it is framed as a problem for detecting potential social violations. According to Cosmides and Tooby, we should predict that humans have a dedicated cheater-detection module because detecting cheats was a serious adaptive problem for our ancestors in the EEA, and this module is invoked by the second but not the first frame in the Wason task.

The second example of a proposed psychological adaptation is even better known and comes from Buss (particularly in *The Evolution of Desire*). According to Buss, different reproductive strategies would have been successful for men and women in the EEA, and so men and women should have evolved different mating preferences. Men who preferred to mate with younger, more fertile women would have been more reproductively successful than other men. Conversely, women who preferred to mate with high-status men would have been more reproductively successful than other women. In a massive cross-cultural survey, Buss claimed to have shown that these preferences exist to this day.

### PROBLEMS WITH EVOLUTIONARY PSYCHOLOGY

Evolutionary psychology has been the subject of much critical scrutiny, from philosophy, psychology, and evolutionary biology. Each of its four main theoretical commitments is contentious, and the empirical case for many of its substantive claims has also been contested.

**PROBLEMS WITH COMPUTATIONALISM.** It is worth noting briefly that computationalism does have some critics in philosophy of mind. Such critics will thus be skeptical of evolutionary psychology since it assumes that the mind is computational in nature (at least, the parts of the mind of interest to evolutionary psychology). Critics of evolutionary psychology, however, have not tended to

challenge its computational assumptions since these are widely shared in cognitive science and contemporary philosophy of mind.

**PROBLEMS WITH ADAPTATIONISM.** Much more attention has been paid to the adaptationism of evolutionary psychology. Many biologists and philosophers of biology have looked upon adaptationist reasoning with suspicion since the biologists Stephen Jay Gould (1941–2002) and Richard Lewontin (1929–) published their famous critique *The Spandrels of San Marco and the Panglossian Paradigm*. Gould and Lewontin charged that adaptationist hypotheses about ancestral conditions are too speculative, often little more than *just-so* storytelling. Moreover, the dogmatic assumption that every trait must be an adaptation exaggerates the power of selection to overcome constraints imposed by development and population size. Finally, adaptationism neglects the other ways a trait might have evolved, in particular, that a trait might have evolved for one purpose and only later been co-opted for its current use.

For their part, adaptationists have denied the charge of dogmatism; their assumption that any particular trait is an adaptation is a heuristic one, which produces hypotheses about ancestral adaptive problems. These adaptationist hypotheses should be seen as forms of argument to the best explanation and, where possible, can and should be tested against the available empirical evidence.

The appropriateness of adaptationist reasoning is still a much debated question in evolutionary biology. Regardless of the answer to that question, however, the critique of Gould and Lewontin cannot be directly applied to evolutionary psychology. Evolutionary psychologists expressly admit that the original adaptive problem cannot be inferred from the present adaptiveness of a trait. They accept the standard distinction between the historical origin of a trait as an adaptation and its present status as adaptive or otherwise, and they believe that many adaptations are no longer adaptive.

Moreover, the reasoning in evolutionary functional analysis goes in the opposite direction to standard adaptationist reasoning. Adaptationism typically starts with an identifiable biological trait and works backward to hypotheses about the ancestral adaptive problems. By contrast, evolutionary functional analysis starts with hypotheses about the ancestral adaptive problems and predicts traits that should have evolved to solve them. If these traits can then be found in modern populations, the successful prediction corroborates the hypothesis about

ancestral conditions, and we have also made some new discoveries about modern psychology.

This last point, however, highlights a legitimate theoretical concern about the adaptationism of evolutionary psychology. For evolutionary functional analysis to succeed, hypotheses about ancestral conditions must meet two conditions: First, they must be sufficiently likely to be true (or else there is no point in testing predictions derived from them), and secondly, they must be detailed enough to suggest testable predictions.

Evolutionary psychologists can draw on three main sources of evidence when developing hypotheses about ancestral conditions: direct prehistorical evidence of actual conditions in the Pleistocene, the conditions faced by still-extant groups of hunter-gatherers, and our close relatives among the nonhuman primates (primarily the chimpanzee). There is some reason to doubt that any of these sources can provide good enough evidence to meet the two conditions just mentioned, for the prehistorical record is sparse, nonhuman primates have undergone their own evolutionary trajectories since they diverged from our common ancestor, and the lifestyles of extant hunter-gatherer populations have probably changed significantly since the Pleistocene. It is also debatable whether humans in general have stopped accumulating adaptations since the end of the Pleistocene, as evolutionary psychologists claim.

If these concerns are well placed, then our knowledge of ancestral adaptive problems is at too coarse a grain to entail detailed predictions about psychological mechanisms. Granted, we can be sure of very general statements—for instance, that our ancestors faced the ancestral problem of securing a suitable mate—but their very generality robs them of predictive power. All sexually reproducing organisms face this problem, and the adaptations they evolve to solve it vary dramatically. Such coarse adaptive problems cannot provide any predictions about specific psychological solutions in human beings.

Of course evolutionary psychologists deny that the limits to our knowledge of ancestral conditions are so great; hence, a main point of contention is how much skepticism is warranted by these limits. Evolutionary psychologists think it is still possible to produce sufficiently detailed hypotheses even with such limited evidence; their critics claim otherwise.

**PROBLEMS WITH MODULARITY.** As with adaptationism, the concept of modularity has been the subject of general controversy, this time in psychology. Since Fodor's 1983 book, the notion of a module has been

highly influential in cognitive science and psychology. There is broad agreement on the existence of at least some modules, notably, modules for language and for visual processing. The disagreement is over the amount of modularity in the mind as a whole.

Fodor himself from the start denied that the mind could be modular, except at the periphery. He later expanded these arguments into an assault on massive modularity in *The Mind Doesn't Work That Way*. According to Fodor, a massively modular mind would not be able to entertain thoughts with contents that cross the domains of each module—it would be epistemically bounded. For instance, if the mind contained separate modules for thinking about numbers, physical objects, other minds, and so on, it could not entertain a thought about both numbers and objects. A fortiori, it could not integrate information about these various domains in reasoning.

The human mind, however, does not appear to be epistemically bounded in this way, at least for central reasoning processes. Our mind is flexible in the sorts of thoughts it can entertain; moreover, it can use information from different domains flexibly in abduction. Suppose we are trying to predict the outcome of an upcoming election; potentially, information about almost anything might be relevant—facts about geography; meteorology; economics; psychology. Human minds seem able to integrate relevant information from any domain of thought.

At most, however, Fodor's arguments show only that the mind cannot be completely modular. There is need for some central workspace where information from the various modules can be integrated. But this does not show that even central processes might not be substantially modularized. In particular, it fails to show that the mind could not contain modules dedicated to solving specific adaptive problems as well as nonmodular components downstream.

A more pressing criticism is offered by Richard Samuels (in "Evolutionary Psychology and the Massive Modularity Hypothesis") against the evolutionary psychologists' arguments for massive modularity. Samuels distinguishes between two types of module: computational and Chomskian. Computational modules are, so to speak, distinct computers with their own proprietary mental programs. Chomskian modules, by contrast, are mentally represented bodies of innate, domain-specific information that are supposed to underlie our cognitive abilities in various domains. Crucially, Chomskian modules are not computationally isolated but, rather, merely

separate databases of information about the world. Various psychologists have posited the existence of such innate knowledge for domains such as intuitive physics, numbers, intuitive psychology, and universal grammar.

Samuels claims that the arguments from evolutionary psychology show the need for some domain-specific knowledge of the sort contained in Chomskian modules. Perhaps organisms do need substantial amounts of knowledge about the adaptive problems their ancestors faced in order to succeed at reproduction. This does not support the existence of the separate computational modules posited by evolutionary psychologists. All this domain-specific knowledge may be operated on by the same domain-general cognitive processes. It is one thing to argue that the mind must have a vast library of domain-specific information; it is another thing to show that it must also have a vast network of different computers dedicated to using that information.

**PROBLEMS WITH UNIVERSALITY.** Finally, there is room for debate about the evolutionary psychologists' argument that adaptations will generally be universal. There are known evolutionary mechanisms that can maintain alternative traits in a population, in particular, frequency-dependent selection. Frequency-dependent selection occurs when there is a set of alternative traits, no single one of which is the fittest overall. Rather, the fitness of any one of these traits depends on which traits are present in other organisms in the population and at what frequency. In some cases frequency-dependent selection can maintain polymorphism—that is, the presence of more than one alternative trait in a population—at a stable ratio in which each trait has equal fitness.

Evolutionary psychologists deny that such mechanisms would have produced true genetic polymorphism in humans. Rather than, say, two different sets of genes that produce two alternative traits, there would be a single set of genes that could itself produce the alternative traits (either randomly or in response to environmental cues, where these are available). Selection will favor this kind of adaptive plasticity over polymorphism.

Evolutionary psychologists have not provided a very good argument for this. They claim that sexual reproduction would disrupt complex adaptations unless both partners shared genes for all the adaptive traits in the population. The chief problem with this argument is that it is too strong, for it would disprove the possibility of complex genetic polymorphisms in any sexually reproducing species. Since there are several cases of genetic polymorphisms in different species, the argument cannot be sound.

## THE EMPIRICAL CASE FOR EVOLUTIONARY PSYCHOLOGY

All these problems with the theoretical commitments of evolutionary psychology would mean little in the face of good empirical results. If evolutionary psychologists could point to universal psychological adaptations discovered by evolutionary functional analysis, the paradigm could be declared a success, regardless of any theoretical misgivings. Assessing the empirical case for particular evolutionary psychological claims is well beyond the scope of this entry; moreover, any such assessment would be out of date even before it went to print.

What can be said here is that the empirical case remains fiercely contested. Buss has put forth what evolutionary psychologists consider their *textbook cases* in his *Evolutionary Psychology*; David Buller (1959–) challenges the empirical case for three of these putative adaptations in *Adapting Minds*. The empirical terrain here is still up for grabs and will probably continue to be so for some time.

## CONCLUSION

There are several reasons to be suspicious of the main theoretical commitments of the Cosmides and Tooby paradigm of evolutionary psychology. These reasons counsel caution about accepting uncritically the various empirical claims put forth by this paradigm. They do not prove that these claims are false, that they have not been adequately empirically supported, or that they will never be supported. To assess the claims of evolutionary psychology, our only recourse is to look to the data.

Finally, it must be stressed that the evolutionary psychology discussed here is only one paradigm within a broader field of inquiry that tries to integrate evolutionary and psychological research. Even if this specific paradigm is not entirely successful, this does not impugn the broader field itself. For human beings have evolved, and surely this fact should be relevant to psychology.

## EVOLUTIONARY THEORY

While the fixity of species was the generally accepted view before Charles Darwin, he was not the first to propose that evolution, understood as the transformation of one species into another, occurred. The ancient Greek philosopher Anaximander maintained that people had evolved from fish, and the zoologist and botanist Jean-Baptiste Lamarck (1744–1829), as well as Darwin's grandfather, Erasmus Darwin (1731–1802), were also proponents of evolution.

Lamarck, for instance, argued, in his *Philosophie Zoologique* (1809), that life resulted from ongoing spontaneous generation and that each lineage, beginning with simple forms, was driven by an inner tendency to complexity and perfection. On his view, more complex creatures belonged to older lineages, with our own the oldest. Adaptation and diversity was explained by the inheritance of acquired characteristics. Different environments caused organisms to have different needs in response to which they would use or not use their various organs: Use would cause an organ to develop, enlarge, and strengthen, whereas disuse would cause it to shrink, deteriorate, and eventually disappear. Lamarck believed that these changes were inherited by offspring, who would in their turn continue to adapt to their environment, thus leading to transformation of the lineage. The term *Lamarckism* (or

*Lamarckianism*) is now used to refer to the idea that a trait that was not inherited, but was acquired within the life of an individual, could be inherited by that individual's descendants. For the most part, this idea has been discredited, but there are cases in which something that satisfies the description occurs.

## DARWIN'S THEORY OF EVOLUTION

Darwin was not persuaded that evolution occurred by any of his evolutionist predecessors. The true history of his development of his ideas is controversial (Sloan 2005), but there were perhaps four main influences on him in this respect.

One was the *Principles of Geology* (1831), written by his mentor and friend, the geologist Charles Lyell (1797–1875), which Darwin read at the start of his famous five-year journey on the *Beagle* (1831–1836). Darwin was profoundly influenced by Lyell's methodological, as well as his factual claims. With respect to the former, Lyell was a uniformitarian. Broadly speaking, uniformitarianism is the view that the laws of nature have always been the same. For Lyell, this meant that geological features are to be explained by natural ("intermediate" not miraculous) processes that can still be observed to be in operation. Since he thought that these tended to bring about only slow and gradual change (e.g., a valley's formation from erosion), Lyell reasoned that the earth must be far older than the biblical 4,000 to 6,000 years. Although not a believer in evolution, Lyell also argued that investigation of the geological layers showed a continual introduction and extinction of species.

A second major influence on Darwin was his observation of the natural world, especially during his journey on the *Beagle*. His extensive collection of living and fossil animals, taken from many diverse parts of the world, and their analysis by experts in the relevant fields, convinced him (and through him, much of the scientific community) that, contra Lyell, neither fossil findings nor the present geographic distribution of species could be adequately explained other than by evolution. The task, as Darwin saw it, was to explain the evolution of species in a manner that was consistent with Lyell's uniformitarian principles.

At least by his own account (Darwin 1876/1958, p. 120) Darwin had help with this from a third major influence, *An Essay on the Principle of Population* (1798), written by the parson and social economist Thomas Robert Malthus (1766–1834). Malthus was no evolutionist; he believed that his understanding of population dynamics supported the view that populations could not change

much. His concern was the possibility of social improvement, but his social theory was driven by an observation that applied to all species: Unchecked increases in population always outrun the means of subsistence. As Malthus says:

Through the animal and vegetable kingdoms Nature has scattered the seeds of life abroad with the most profuse and liberal hand; but has been comparatively sparing in the room and the nourishment necessary to rear them. The germs of existence contained in this earth, if they could freely develop themselves, would fill millions of worlds in the course of a few thousand years.

(I.1.5, 6TH EDITION)

Malthus's message for the poor was that if they were to reduce their struggle for existence they must reduce their fecundity. According to Darwin, this struggle for existence between members of the same species suggested to him a mechanism by which populations could evolve.

A fourth influence on Darwin that may have been important was his familiarity with the artificial selection of plants and animals for breeding. Such selection showed that differential reproduction could produce a change in the distribution of characteristics in a population. It was believed that this had never produced a new species, and others had used this fact to support the basic fixity of species. However, Darwin argued that if so much change could be produced in the short time since human cultivation began, vastly more change could be produced given vastly more time. Of course, artificial selection involved human intentions; differential reproduction was guided by our choices and design still had a designer. Darwin's task remained that of finding a mechanistic process that could achieve similar, only much more impressive, results.

It is impossible to do justice here to the argument that Darwin assembled in support of his theory, but the main outline of his theory is remarkably simple. It begins with the observation that the individuals of a species vary slightly one from another. Since there are many more offspring born or plants germinated than can possibly survive, there is a struggle for survival within each species. Some of this is direct competition (e.g., for food or mates), but some is indirect (e.g., some individuals are better able to withstand disease or drought). The individuals that have variants that give them an advantage in this struggle will tend to survive longer and leave more offspring. And since offspring tend to resemble their parents, this means that beneficial characteristics will tend to

be inherited more frequently than less beneficial characteristics. Over time, this causes a population to be better adapted to its environment and, especially if the environment changes, leads to a gradual change in the character of a population. The relevant periods of time are enormous (“we have almost unlimited time,” “millions on millions of generations”) so that, eventually, a species can be transformed to such an extent that it would be a new species.

According to Darwin, the main idea for his theory was formed in 1838 when he first read Malthus, but he did not publish his *Origin of Species* until 1859. Even then he was pushed to publish to avoid being preempted by the self-trained naturalist Alfred Russel Wallace, who in 1858 sent Darwin a letter that proposed a similar theory. Darwin’s priority is well established, not only by the circle of scientists to whom Darwin had communicated his ideas but also in a summary of his theory sent in 1857 to the Harvard botanist Asa Gray. Darwin was the first to argue that natural selection was the principal cause of the diversity and adaptedness of organisms, and it was his extensive defense of the claim that evolution had occurred and could occur principally by means of natural selection that revolutionized biology.

Darwin’s theory differs significantly from Lamarck’s, but the views of the men were less distinct than those now attached to their names. Darwin did not believe in an inner tendency to complexity and perfection, and he argued that life had evolved just once or at most a few times. However, while he did not rate it as important as Lamarck did, he agreed that one mechanism of evolution was the inheritance of acquired characteristics.

Notice that Darwin’s theory mentions only processes that can still be observed to be in operation. These processes, as he describes them, are also mechanistic: They do not involve a guiding intelligence. There is, as it is nowadays put, design without a designer.

Darwin’s theory is also empirical and not, as sometimes alleged, tautological. The tautology problem was raised because the theory tells us that the fit will tend to leave more viable offspring than the unfit, although an individual’s fitness is defined in terms of probable reproductive outcome. However, the theory is not tautological. Individuals within a species might not vary, they might not produce more offspring than can survive, and offspring might not tend to resemble their parents. Moreover, these facts might not lead to evolution, since the outcome also depends on any countervailing forces.

## THE MODERN SYNTHESIS

In modern terms Darwin’s main thesis was that when there is heritable variation in fitness within species, species tend to evolve. While Darwin appealed to natural processes that can still be observed to be in operation, he did not adequately explain all such processes: In particular, he did not adequately explain inheritance or the origin of new variation, both of which are crucial to his theory.

The mechanism of inheritance was a problem for Darwin. His (pangensis) theory involved the idea, popular at the time, that the material responsible for inheritance was blended in offspring. If that were so, an advantageous new variant would be diluted—a popular metaphor here is that it is like a drop of white paint mixed in a can of red—with the result that its benefit, and selection for it, would probably be dramatically weakened. It was Darwin’s concern over this that inclined him in his later years to give more credence to Lamarckian inheritance.

Unfortunately, Darwin never knew of the work of the Austrian monk and botanist Gregor Johann Mendel (1822–1884), which provided experimental support for a particulate theory of inheritance. According to Mendel the material responsible for inheritance consisted of discrete units (now known as genes) that could be passed unchanged from one generation to the next. Mendel’s work was mostly ignored during his—and Darwin’s—lifetime, and it was not until it was rediscovered in 1900 that this major difficulty with Darwin’s theory was removed. The combination of Darwin’s theory of evolution by means of natural selection, Mendelian genetics, and mathematical population genetics is often referred to as the modern synthesis. (Some major figures in the development of the modern synthesis were T. H. Morgan, Ronald Fisher, Theodosius Dobzhansky, Julian Huxley, and Ernst Mayr.)

Explaining the origin of variation was also important; without a new source of variation, a population cannot change much beyond a redistribution of already existing characteristics. Biologists now understand how, despite a high degree of fidelity, genes are sometimes altered. Biologists construe the word *gene* in different ways, but a common construal is that a gene is a functional segment of the DNA molecules that constitute chromosomes. Alterations to such genes can occur when there are errors in copying them or when there is a crossing-over of segments of genetic material between matching pairs of chromosomes.

Crucially, the origin of new variation is random, not in the sense that any is as likely to occur as any other, but because whether a given mutation occurs is insensitive to whether it would be adaptive if it occurred. (This leaves open the question of whether there might be selection for an increase in the rate of mutation under some circumstances.) In this sense, mutation is random but selection is not random. Whether there is selection for a characteristic is sensitive to whether or not that characteristic is adaptive. Thus, selection is thought to be mechanistic, but not random or merely a matter of chance.

Darwin's and Mendel's theories form the basis of modern evolutionary theory, but neither has survived without modification. Darwin's support of Lamarckian inheritance has already been mentioned and a number of Mendelian principles have also been revised. For example, Mendel proposed that the units of inheritance were independently sorted during the formation of gametes (sperm and eggs), but it is now known that adjacent genes on a chromosome tend to stay together when gametes are produced (this is known as gene linkage). Since the early twentieth century, however, biology has provided overwhelming confirmation of the dual ideas that evolution occurs by means of (although not exclusively) natural selection and that inheritance involves (although not exclusively) genes that are usually passed unchanged from one generation to the next.

Some developments sometimes touted as radical revisions are better seen as refinements: For example, the theory of punctuated equilibrium, which proposes that long periods of stases in a lineage are punctuated by periods of rapid change, is consistent with Darwin's thesis that evolution occurs primarily through the gradual accretion of small changes: the rapid change of punctuated equilibrium is only rapid relative to the periods of stases: no major saltations are proposed.

## PHILOSOPHICAL ISSUES

No sharp line should be drawn between issues in theoretical biology and philosophy of biology. Some issues of interest to philosophers have already been touched on. The following is an outline of a few others of special interest to philosophers.

## THE ADAPTATIONISM DEBATE

Biologists agree that natural selection is an important mechanism of evolutionary change, but there has been disagreement over how important it is. The biologists S.J. Gould and Richard Lewontin (1979) accuse some biologists of too readily assuming that every trait has an adap-

tational explanation (i.e., of assuming that each trait was selected because it was adaptive or contributed to fitness). Although the debate involves certain conceptual issues, and philosophers play a role in clarifying it (e.g., see Sober 1993, chapter 5), it is principally an empirical debate, though with widespread (including methodological) implications.

Evolution (at least genetic evolution) is now said to occur if there is a change in the proportional representation of genes or combinations of genes in a population, counting each individual's genetic makeup just once. Microevolution consists of such change within a species; macroevolution consists of such changes when they result in new species. Biologists agree that much genetic evolution is due to natural selection, but it can also be due to other causes. For example, mutation and migration can bring about a change in frequencies in a population. So can drift.

It is notoriously difficult to define the word *drift*, but the first thing to note is that both zygote (fertilized egg) formation and the selection operating on the resulting individuals are stochastic (probabilistic nor deterministic) processes, and it is this that makes room for drift. Just as a series of tosses of a fair coin can by chance deviate from a fifty-fifty ratio, genetic drift can occur either as a result of a chance disproportionate sampling of genes during fertilization, or as a result of a chance deviation from probable outcomes in survival and reproduction among the resulting individuals.

The potential for drift is increased when the population is small or the force of selection is weak. So it is, for instance, thought to have special importance in allopatric speciation, in which a small portion of a population becomes geographically isolated from the rest, and competition between almost equally or equally adaptive genes or nongene "junk" DNA (neutral selection). While drift is often spoken of as an alternative to selection, it is an aspect of its stochastic nature (Brandon 2005). Nonetheless, if a trait predominates due to drift alone, it is wrong to say that this was because there was selection of the trait, let alone selection for it.

Besides mutation, migration, and drift, there are other ways in which the evolution of a trait can require explanations other than or besides adaptive explanations. For example, even traits that were selected may not have been selected because they were adaptive. They might have been selected because of their special association with adaptive traits. Gene linkage is a way this can happen. Pleiotropy, in which a single gene has multiple phenotypic effects, is another. When a neutral or maladaptive

trait has been preserved or proliferated in a population because of its link to a beneficial trait, it is called a piggy-back trait or free rider. There was selection of it, but not selection for it, and only in the latter case are traits considered adaptations (Sober 1984, pp. 97–102).

It is an issue to what extent natural selection has the power to produce ideally adaptive outcomes. How often, for instance, do gene-linked and pleiotropic traits get severed in the long run? To what extent is natural selection playing catch-up with an ever-changing environment? To what extent do developmental and phylogenetic constraints, or the necessity of climbing only local adaptive peaks, restrict its capacity to move around in design-space?

The answers to such questions have interesting methodological implications. Most obviously, if natural selection tends to produce ideally adaptive outcomes, it will be fruitful to try to understand evolutionary products as ideally adaptive solutions to problems posed by a selective regime. In contrast, to the extent that it does not, the fruitfulness of that strategy is more problematic, although the construction of what are known as optimality models could still be useful, for example, in determining to what extent natural selection was involved (Maynard-Smith 1978).

While important questions are engaged in the adaptationism debate, it has often been more rhetorical than substantial. So it is important to stress that behind the heat lays some basic agreement. Contenders agree that natural selection is not the only agent of evolutionary change but they also agree that it is the source of complex adaptive change. As Gould says, when trying to reverse the impression created by his rhetoric:

May I state for the record that I (along with all other Darwinian pluralists) do not deny the existence and central importance of adaptation, or the production of adaptation by natural selection? Yes, eyes are for seeing and feet are for moving. And, yes, again, I know of no scientific mechanism other than natural selection with the proven power to build structures of such eminently workable design.

(1997, p. 35)

## THE SOCIOBIOLOGY DEBATE

The main reason the adaptationism debate has been so heated was its connection with attempts to explain human behavior and psychological characteristics by appeal to evolutionary history. A bitter debate over

such attempts, one of the biggest scientific controversies of the twentieth century, began after the publication of *Sociobiology: The New Synthesis* (1975) by the Harvard entomologist Edward O. Wilson, and *The Selfish Gene* (1976/1989) by the English zoologist Richard Dawkins, which together marked the start of or brought into focus a new push by evolutionary theory into the domain of the social sciences.

Wilson's book discusses the social behavior of a wide range of species, beginning with ants and ending with humans. He suggests we should study ourselves as if we were anthropologists from Mars, bearing in mind evolutionary theory in doing so. He also offers bold and (as he acknowledges, speculative) adaptationist hypotheses regarding gender roles, the causes of war, religion, and such like. Dawkins explicitly distances himself from such claims, emphasizing (as Wilson also does to some extent) the significance of culture in our case. However, Dawkins does not refrain from colorful metaphors that undermine this distancing. In a famous passage, having talked about the origin of replicators in the primordial soup, he says:

Four thousand million years on, what was to be the fate of the ancient replicators? ... Now they swarm in huge colonies, safe inside gigantic lumbering robots, sealed off from the outside world, communicating with it by tortuous indirect routes, manipulating it by remote control. They are in you and in me; they created us, body and mind; and their preservation is the ultimate rationale for our existence. They have come a long way, these replicators. Now they go by the name of genes, and we are their survival machines.

(1976/1989, pp. 19–20)

The issues raised relate to what used to be known as the nature versus nurture debate. That debate, put crudely, concerned the extent to which our psychological propensities were due to nature (genes) or nurture (environment). So put, however, the debate is ill conceived, because every trait is necessarily the product of both genes and environment. A better way to understand the debate is that it concerns the extent to which differences among individuals are caused by differences in their genes or in their environments (or both). The suggestion was that we would find psychosocial differences among individuals in our species, as well as between our species and other species, that were due to differences in genes for which there had been selection.

The response was vitriolic. Even sympathizers were often concerned about political implications. Critics

blasted Wilson and Dankins—for being adaptationist, for proposing hypotheses that were neither tested nor testable, for being motivated by an ideological defense of the status quo, for being racist and misogynist, and for somehow being against free will and human dignity (e.g., see Rose, Lewontin, and Kamin 1984). They described the application of sociobiology to humans as “biological determinism” and proposed instead a position they called biological potentiality. The latter included the (patently true) claim that all our acts are within our biological potential and, something further, that there are no or virtually no significant task-specific psychological adaptations. On this view, evolution has endowed us with an impressive general-purpose intelligence and a capacity for culture and language, but it has done little else to shape our psychology. The latter is in a way the more absolute position: The claim that some social and psychological characteristics are (let alone may be) genetic adaptations is compatible with the claim that many are not. And those that are in part genetic adaptations might also be shaped by culture.

Evolutionary studies of human social and psychological characteristics now go under other names (e.g., evolutionary psychology). They remain controversial, but universities have increasingly devoted substantial resources to them. Today, the two sides have come together somewhat, with evolutionary theorists stressing the importance of culture, and with less emphasis on the other side on whether certain features are genetic adaptations as opposed to adaptations that can (whatever the basis of their heritability) usefully be understood by means of the concepts and methods developed in the context of evolutionary biology. Gene-culture coevolution has also become an important area of study. There is more discussion of how evolutionary studies should be conducted than whether they should be conducted (for more details, see Laland and Brown 2002). Nonetheless, the criticisms mentioned earlier are still repeated and are worth investigating.

The claim that some sociobiology is unduly adaptationist or inadequately tested is no doubt fair. However, there are poor practitioners in every field. Trivially, one should not too readily assume that a trait is a genetic adaptation, but one should not too readily assume that it is not either. Furthermore, the hypothesis, H1, that a given trait  $t$  is a genetic adaptation, competes with the hypothesis, H2, that  $t$  is not a genetic adaptation. So if one is not a scientific hypothesis because it cannot be tested, then the same must be true of the other.

Nor does it seem true that we cannot have evidence, one way or another, for such hypotheses. It is hard to assess claims regarding the evolutionary history of social behaviors and psychological characteristics, especially in the human case where ethical considerations constrain experiment more. However, relevant evidence can still be brought to bear. Consider the suggestion that male jealousy is an adaptation to the evolutionary problem posed by fertilization within the female (“Mama’s baby, Papa’s maybe”). To assess this claim, evolutionary psychologists appeal to analyses of fitness consequences, cross-cultural and cross-species comparisons, and relevant physiological findings (Barkow, Cosmides, and Tooby 1992). All such evidence can be put to poor use but it can also be put to good use. For example, cross-species physiological evidence relating to testes size and sperm competition suggests that human polyandry has been a significant factor. This evidence, while far from conclusive, helps (in combination with other evidence) to confirm rather than disconfirm the hypothesis, since it suggests that, had there been genes that predisposed human males to certain jealous behaviors, (*ceteris paribus*) there would have been significant selection pressure favoring those genes.

The criticism that sociobiologists are ideologically motivated attacks the scientists rather than the science. People try to fit new information to their preconceived ideas, and scientists are no exception. However, we can ask if, assuming we do not start from a racist or sexist perspective, an evolutionary study of racial or sexual differences will push us in that direction. Here it helps to distinguish between political consequences and logical implications. The former may be worrisome even if the latter are not, and this can muddy discussion. However, what is clear is that attempts to understand certain social and psychological characteristics as evolutionary adaptations need not be used to defend any racist or sexist status quo.

Suppose it were shown, for example, that women tend, on average, to give more priority to their children than to their careers than men do, and that this difference is in part due to a genetic adaptation. Or suppose it were shown that men tend, on average, to be more competitive and aggressive (even violent) in attempting to acquire power and status and that this difference is in part due to a genetic adaptation. It can be argued from this that men will continue to have more power in the public sphere. However, this is a prediction, not a justification, and it is based on an assumption of nonintervention. One could also argue on the basis of such claims that educators need to consider moderating such difference, that there ought

to be more work-based childcare, or that the human race would be better served if less aggressive women held more political power. It is not uncommon nowadays to see theorists from the left employ evolutionary theory to make their arguments (Singer 1999).

Finally, the issue of free will is a large one, but philosophers generally agree that it is a confusion to implicate it in this debate. It is a misunderstanding of the nature of the problem of free will to think that free will is enhanced by environmental as opposed to genetic causes of behavior. The problem of free will arises as soon as human choices are viewed in the context of their causes, whatever the nature of those causes. Nor is it right to see sociobiology or its descendants as committed to determinism. In general terms, determinism is the thesis that every event is causally necessitated by preceding conditions and the laws of nature. Neither sociobiology nor its descendants are committed to this or to variants that might plausibly be described as, more specifically, biological determinism. For instance, they are not committed to the view that if a person possesses a gene that was selected because it predisposes individuals to want multiple sexual partners then someone with that gene will be unable to resist the temptation to have multiple sexual partners. Desires need not be more irresistible for being genetic adaptations as opposed to cultural artifacts.

## CONCLUDING REMARKS

A general defense of the study of social and psychological characteristics from an evolutionary perspective is not the same as a defense of particular claims about social or psychological adaptation. It is consistent with the claim that such a study will fail to establish that there are any significant social or psychological adaptations. However, many think that this research will provide (and has already provided) valuable insights, relevant to many areas in philosophy. For example, the study of the evolution of altruism and the evolution of emotions are of interest to ethicists, moral psychologists, decision theorists, philosophers of mind, and political philosophers.

Darwinian evolutionary theory has had a profound impact on our understanding of our species and on our worldview, even putting to one side its role in the social sciences. While it is remarkably well confirmed by innumerable findings, and now coheres with our understanding of genetics in innumerable detailed ways, it remains controversial in the public sphere for this reason. Philosophers have played an important role in this debate as well, particularly in discussions of the nature of scientific theories.

This entry has left many issues relating to evolutionary theory untouched. A great many other issues are important as well. For example, what is the role of teleology in Darwinian biology? How does a historical science, like the study of evolution, compare to the other natural sciences? What is the implication of Darwinian evolution for the idea that species are natural kinds? How should living things be classified? How best can the intertwined concepts of selection, fitness, and drift be understood? What is selected in selection? Can memes evolve by means of natural selection? Can cultures? A number of these issues are discussed elsewhere in these volumes.

## EXISTENCE

Philosophical discussion of the notion of existence, or being, has centered on two main problems that have not always been very clearly distinguished. First, there is the problem of what we are to say about the existence of fictitious objects, such as centaurs, dragons, and Pegasus; second, there is the problem of what we are to say about the existence of abstract objects, such as qualities, relations, and numbers. Both problems have tempted philosophers to say that there are inferior sorts of existence as well as the ordinary straightforward sort, and they therefore often suggest that we use the word *being* to cover both kinds but restrict "existence" to "being" of the common, nonfictitious, nonabstract sort. (Sometimes the term *reality* is proposed for "existence" or for "being.") The problems of fiction and abstraction are different, however, for there are both real and fictitious abstractions. For example, the integer between two and four is real, but the integer between two and three is fictitious. On the other hand, there are both concrete and abstract fictions; for example, the winged horse of Bellerophon and the integer between two and three. Accordingly, philosophers have often dealt with the two problems in quite different ways and perhaps ought to do so.

While these are the two main problems, there are others, for example, that of what we are to say of the being of objects which have not yet begun, or have now ceased, to exist. The history of this subject, moreover, has been tangled with theological issues, to which it will be necessary to refer at certain points. Most of what follows will concentrate on the question of fictitious existence, with some consideration of past and future existence and with a final section on the being sometimes ascribed to abstractions.

## FICTIONS

**ANCIENT AND MEDIEVAL.** It is clear from Aristotle's earliest works that there was current among the Greeks a

sophism to the effect that whatever is thought of must exist in order to be thought of. Countering this, Aristotle distinguished between "to be A" (for instance, to be thought of) and "to be" without qualification. He made the same remark about the "being A" of that which has "ceased to be"; for instance, from "Homer is a poet" it does not follow that "Homer is." Some such distinction seems necessary, since among the A's that one can be is "dead" or "no longer existent." The Aristotelian view is not simple, however, for elsewhere he suggested that propositions equivalent to "Socrates is ill" and "Socrates is well" imply the plain "Socrates is"; "neither is true if Socrates does not exist at all."

The various facets of the Aristotelian position were reproduced by the Scholastics. They distinguished, for example, between *est secundi adiecti* ("is" added as a second element in a simple sentence, as in "Socrates is"), and *est tertii adiecti* ("is" added as a third element, as in "Socrates is ill"), a distinction made by Aristotle in substantially the same terms; they also had the rule that from "being A" we may infer plain "being." But the Scholastics questioned and qualified this rule with the other Aristotelian examples in mind; from *Chimaera est opinabilis*, "The chimera can be thought of," the plain *Chimaera est* does not follow, nor does *Caesar est* follow from *Caesar est mortuus*. Some predicates, they said, presuppose *esse simpliciter*, and some do not. (*Chimaera* itself, incidentally, they put in the first class, and were thereby led to say that even "The chimera is the chimera" is false—the chimera, since it "isn't," isn't anything, even the chimera.) In this connection they sometimes distinguished between "objective" and "formal" being; "objective" not having its modern sense but rather the opposite—for a thing to exist "objectively" it sufficed that it be an object of thought; "formal" being was, as it were, serious being.

Anselm's Ontological Argument for the existence of God hinged on this notion of "objective" being, which he called existence in the mind. The Psalmist's fool who says in his heart that God does not exist must in that very act be thinking of God, so that God exists in his mind. But by definition God is that than which nothing greater can be thought of (if this definition is objected to, we can simply say, "Never mind—that than which nothing greater can be thought of, whether you give this the name "God" or not, can be thought of, and therefore exists in the mind even of one who denies its existence anywhere else"). And to exist outside the mind as well as in it is a greater thing than to exist in the mind only; we can also think of a being that does this, so if it exists in the mind only, the *maximum cogitabile* is not the *maximum cogitabile* at all;

it is therefore self-contradictory to deny real existence to that than which nothing greater can be thought of. “Greater” in this argument means, in part, better, so it is no answer to say that of some things it might be better for them not to exist. If God is by definition everything that a being ought to be, then such a being ought to be, among other things, real; and to think of him as not being real is therefore to think of him as not being all that he ought, and thus is not to be really thinking of God. The thought of an unreal God is internally incoherent, so if God can be thought of at all (and the man who thinks he does not exist does think of him), he must, if we are to be consistent, be thought of as real. But it is clear that this type of argument, if valid, has other than theological applications; as Anselm’s opponent Gaunilo pointed out, there would be a similar contradiction in ascribing merely mental existence to the greatest (and best) conceivable island.

The notion of “weak” forms of being entered into another medieval theory, that of the “ampliation,” or widening, of the “supposition,” or reference, of certain terms in certain contexts. If we say “Some men are running,” it is understood that we mean some men now existing; but if we say “Some men were running” or “Some men will be running,” it will be enough to verify the former if some formerly existing men were running, and the latter if some men who will then exist will be running; and if we say “Some men are thought of as running,” it will do if some merely thought-of men (Sherlock Holmes and Dr. Watson, say) are thought of as running. The pool of objects on which we may draw to verify our statements may in some cases extend to objects whose being is comparatively shadowy yet is substantial enough for them to be genuine subjects of affirmative discourse.

It is noteworthy, however, that at least one medieval thinker, Thomas Aquinas, quite firmly refused to avail himself of the notion of substandard existence at a point where it might have been thought to be helpful: in dealing with objections to the doctrine of creation out of nothing. Creation out of nothing, Thomas insisted, is not creation out of a peculiarly tenuous material; to be created out of nothing is simply not to be created out of anything, and God himself is “created out of nothing” in this sense. But to be created (as God of course is not), yet not created out of anything, is to be given existence; and to what is existence given if there is literally nothing there to give it to? To give existence to nothing, surely, is just not to give existence to anything, and thus not to create at all. That there already are “creatables” whose capacity to exist in the full sense is made actual in their creation is explic-

itly denied; the only power involved is that of God to create, and creating is denied to be a genuine action on an object. All that Thomas could say positively is that the receiver of existence starts to be simultaneously with the giving of that existence—*Deus simul dans esse, producit id quod esse recipit: et sic non oportet quod agat ex aliquo praeexistenti* (*De Potentia Dei*, Q.2, A.1). Leibniz’s later talk of God as conferring actual existence upon a selected few of an infinite number of *possibilia*, each with its own eternally complete individuality, seems much less perceptive. Creating out of *possibilia* is not creation out of nothing at all.

**EIGHTEENTH AND NINETEENTH CENTURIES.** The rejection of halfway points between existence and nonexistence that characterized Thomas’s treatment of creation found wider applications in the works of the eighteenth-century philosopher Thomas Reid. In discussing “conception,” Reid distinguished this “operation of the mind” from others by the fact that whereas “the powers of sensation, of perception, of memory, and of consciousness [introspection] are all employed solely about objects that do exist, or have existed ... conception is often employed about objects that neither do, nor did, nor will exist” (*Essays on the Intellectual Power of Man*, Essay IV). It is important, he said, to “distinguish between that act or operation of the mind, which we call conceiving an object, and the object that we conceive.” The former always exists; the latter need not. The notion that it must has led some philosophers to interpose between the act and the object an entity called an idea, which is the “immediate” object of conception and exists even when the “remote” object does not. According to Reid’s view, there are no such entities, and “having an idea of” is just a circumlocution for “conceiving.”

The philosopher says, I cannot conceive a centaur without having an idea of it in my mind.... He surely does not mean that I cannot conceive it without conceiving it. This would make me no wiser. What then is this idea? Is it an animal, half horse and half man? No. Then I am certain it is not the thing I conceive.... This one object which I conceive is not the image of an animal—it is an animal. I know what it is to conceive an image of an animal, and what it is to conceive an animal; and I can distinguish the one of these from the other without any danger of mistake. (Ibid.)

Not only is there no reason to believe in the existence of “ideas” (apart from the sheer “prejudice” that all acts of

the mind must have existent objects); postulating them does not help, and only gives rise to an infinite regress.

In every work of design, the work must be conceived before it is executed—that is, before it exists. If a model, consisting of ideas, must exist in the mind, as the object of this conception, that model is a work of design no less than the other, of which it is the model; and therefore, as a work of design, it must have been conceived before it existed. (Ibid.)

The point that the idea or copy theory just does not help seems unanswerable. But Reid's own position has serious difficulties. Every act of conception, he said, "must have an object; for he that conceives must conceive something"; thus, to conceive nothing—not to conceive anything—is not to conceive at all. But if what is conceived—for example, a centaur—does not exist in any sense, is this not simply conceiving without any second term? The object of conception in all cases is something, as Reid claimed; it would therefore seem that "some-things" ("beings," "objects," in a wide sense) are divisible into two sorts, ones with existence over and above their mere objecthood, and ones without. Reid said as much when he spoke of a man as acquiring sufficient judgment to "distinguish things that really exist from things that are only conceived." Reid was trying to slip this statement past as if it were not the theory of weak and strong modes of "being." But if it is not, what is it? He said that men six feet tall and men sixty feet tall are both "things," even if he said it under his breath. The theory of weak and strong being is not easily avoidable, and in the present century it was stated in these terms in Bertrand Russell's early work and in Reid's terms by Alexius Meinong.

There is a rather different strand in postmedieval philosophy, starting perhaps with Pierre Gassendi. Replying to the Cartesian version of Anselm's Ontological Argument, Gassendi said that existence is not a "perfection," not because it is sometimes an undesirable property but because it is not a property at all; it is, rather, a prerequisite for the possession of any properties. In itself this looks like merely accepting one side of Aristotle's dilemma and ignoring the other (must a thing exist in order to possess the property of being thought of?). Later writers, however, took the thought further. David Hume, in particular, held that existence is a nugatory notion. "When after the simple conception of any thing we would conceive it as existent, we in reality make no addition or alteration on our first idea" (*Treatise of Human Nature*, Book I, Part 3, Sec. 7 and note). The notion of an existent God, man, or centaur is simply the notion of a God, a

man, or a centaur. The common view of judgment as "the separating or uniting of different ideas" is therefore mistaken; the judgment that God exists, for example, involves only one idea, that of God. The real difference is not that between a God and an existent God but that between conceiving God's existence (which is the same as conceiving God) and believing in his existence; this is a difference in our mode of thought, not in what is thought of. Immanuel Kant made the same point in his treatment of the Ontological Argument; existence, he said, is not a genuine predicate, and the conception of a hundred real dollars has no more "content" than that of a hundred merely possible dollars.

Hume's denial that the object of judgment is necessarily complex was taken further by Franz Brentano. Since the time of Aristotle, logicians had divided propositions or judgments into simple "existential" assertions and denials, of the forms "X is" and "X is not," and "predicative" ones, of the forms "X is Y" and "X is not Y," and had tended, when assimilating the two, to treat existential assertions as a special case of predicative ones—"X is" amounts to "X is existent" or "X is a being." Brentano reversed this, treating the difference between the two types as merely a difference in the complexity of what is asserted or denied to be—"X is Y" amounts to "XY is" and "X is not Y" to "XY is not" (for instance, "Horses don't fly" amounts to "Flying horses do not exist"). He avoided the infinite regress that would appear if "XY is" was further transformed into "Existent XY is," and "XY is not" into "Existent XY is not" by denying, with Hume, that existence is a feature of the object of thought. "X is" and "XY is" simply express the mind's acceptance of the concept X or XY, as opposed to the mere entertainment of it, and "X is not" and "XY is not" similarly express the mind's rejection of "X" and "XY."

An obvious objection to the theories of Hume, Kant, and Brentano is that they are concerned not with the notion of existence but with that of believing in something's existence, and the account given of this latter—that to believe that what is before the mind exists is simply to accept this object—is such that the notion of the object's existence apart from our belief disappears. It is like the account of "believing X to be good" that reduces it to "liking X"; the notion of X's being good, outside of its being believed to be so, vanishes. However it may be with beliefs about goodness, beliefs about the existence of things are surely true or false; and they are true only if the things in question exist in fact. Brentano's answer was to define what really exists as the object of right affirmative judgment, but this seems to reverse the

matter—the judgment that  $X$  exists is a right one if and only if  $X$  does exist.

However, the treatment of predicative judgments as complex existential ones can easily be disentangled from Brentano's subjectivism; and it is also found in writers, notably John Venn, whose interests were less in metaphysico-psychological questions than in developing formal logic by algebraic means. If we are to do this, it is natural to write "No  $X$  is a  $Y$ " as " $XY = 0$ " and to read this as " $XY$ 's are nonexistent." Similarly "Some  $X$  is a  $Y$ " becomes " $XY \neq 0$ "; "Some  $X$  is not a  $Y$ ," " $X\bar{Y} \neq 0$ " (writing " $\bar{Y}$ " for what is not a  $Y$ ; that is, "non- $Y$ "); and "Every  $X$  is a  $Y$ ," " $X\bar{Y} = 0$ ," or " $X$ 's that are not  $Y$  are nonexistent." This, as Brentano and John Venn observed, has the odd consequence of making both universal forms true of what does not exist, for if there are no  $X$ 's at all, there are none that are  $Y$  and none that are not  $Y$ , so that "No  $X$  is a  $Y$ " is true in the sense of " $XY$ 's are nonexistent" and "Every  $X$  is a  $Y$ " is true in the sense of " $X$ 's that are not  $Y$  are nonexistent." This is sometimes expressed as the dictum that the null (or empty) class is included in every class; the class of centaurs, for example, is included in that of tables because, since there are no centaurs at all, there are no centaurs that are not tables.

This leads to divergences from the scholastic rule that affirmative predications imply the existence of their subject while negative predications do not; and the late nineteenth-century discussions of this problem of the "existential import" of the Aristotelian predicative forms were very elegantly summed up by J. N. Keynes in his *Studies and Exercises in Formal Logic*. The scholastic rule, it should be noted, was subject to qualification in the light of the doctrine of "ampliation" already mentioned; "All centaurs are said to be musical," for example, was not falsified by there being no real centaurs because in this context the reference of "centaur" was extended to centaurs merely spoken of. A nineteenth-century counterpart of this doctrine was the theory of the "universe of discourse." "Existence," according to this theory, always means membership in some collection of objects taken as real for the purposes of the discussion, and this might be either the actual universe or, for instance, the world of Homeric mythology. Taken seriously, this would seem to be a variant of the theory of weak and strong modes of being.

Brentano's account of predicative judgments as complex existential ones is reversed in Alexander Bain's theory that all intelligible assertions of existence have complex subjects and therefore can be restated in the predicative form. For example, "when we say there *exists*

a conspiracy for a particular purpose, we mean that at the present time a body of men have formed themselves into a society for a particular object" (*Logic*, Book I, Ch. 3, Sec. 23), and in general, " $XY$ 's exist" = "Some  $X$ 's are  $Y$ 's." In the present century this view was enlarged upon by John Anderson. According to Anderson, statements are meaningful (and thus true or false) only if all terms occurring in them are real; that is, only if they have objects answering to them. This means, in view of the Bain-Anderson analysis of assertions of existence, that these terms must be implicitly complex and that the statements in which they occur must presuppose other statements in which this implicit complexity is made manifest; these in turn presuppose others, and so on without end. "All  $X$ 's are  $Y$ 's" (for instance, "All albinos are short-sighted") is meaningful only if there are  $X$ 's and  $Y$ 's (albinos and short-sighted individuals), and this condition is itself meaningful only if " $X$ " and " $Y$ " are implicitly complex—if an  $X$ , for example, is an  $AB$  (an albino is an animal with white hair and pinkish eyes), so that " $X$ 's exist" means "Some  $A$ 's are  $B$ 's" ("Some animals with white hair have pinkish eyes"); and similarly for these statements in their turn.

The apparent predicate "exists" disappears from this system, without any subjectivism (the plain " $X$ 's exist," or at all events " $XY$ 's exist," has been given a meaning, and not just "A judges that  $XY$ 's exist"). But the system completely wrecks such simple rules of construction as the one that if " $X$ " and " $Y$ " can both figure as terms in a meaningful sentence, so can " $XY$ " ("what is at once an  $X$  and a  $Y$ ").

**RUSSELL'S THEORY OF DESCRIPTIONS.** The most extensive and fruitful discussions of existence in the present century have been those initiated by Russell, in works written after his abandonment of the theory of weak and strong modes of being. On the meaning of "all" and "some" Russell stands squarely in the tradition of Venn: he reads "Some  $X$ 's are  $Y$ 's" as " $XY$ 's exist" and "All  $X$ 's are  $Y$ 's" as " $X$ 's that are not  $Y$ 's do not exist"; but he also insists, in the tradition of Kant, that "exists" is not a genuine predicate. For Russell the fundamental form of predication is the singular or "atomic" proposition, " $x \phi s$ ," where " $x$ " is a proper name of an individual and " $\phi s$ " is a genuine predicate or verb. "Lions exist" and "Tame lions exist" (or "Some lions are tame") are respectively analyzed as "For some individual  $x$ ,  $x$  is a lion" and "For some individual  $x$ ,  $x$  is a lion and is tame"; the predicates are "is a lion" and "is a lion and is tame"—"exist" has disappeared into the prefix, or "quantifier," "For some individual  $x \dots$ ." To predicate "exists" of an individual directly

named is meaningless; but Russell makes a sharp distinction between genuine, or “logically proper,” names and spurious ones. A genuine proper name (Russell usually takes the demonstrative “this” as an example) contributes nothing to the meaning of a sentence except the identification of some individual as its subject; in John Stuart Mill’s terminology, it “denotes” but does not “connote.” Anything it tells us about the individual, if it is being used as a genuine proper name, is no part of what is being said; and if there is no individual that it identifies, then nothing is being said at all. A singular, or “definite,” description of the form “the so-and-so,” or a grammatical proper name with the sense of such a description (such as “Scott” used to mean “the author of *Waverley*”), is quite a different matter. When analyzed, “the so-and-so,” like “some so-and-so” and “every so-and-so,” disappears into a complex of predicates and quantifying prefixes; for example, “The present king of France is bald” amounts to “For exactly one individual  $x$ ,  $x$  is now king of France, and for any  $x$ , if  $x$  is now king of France,  $x$  is bald.” “The so-and-so exists,” unlike “This exists,” has a perfectly clear meaning; it means “For exactly one individual  $x$ ,  $x$  is a so-and-so.”

This apparatus yields a neat solution to the Aristotelian problem of when “ $X$  is  $Y$ ” entails “ $X$  is” and when it does not. When “ $X$ ” is a genuine proper name, in Russell’s view, the question does not arise (“ $X$  is” being simply meaningless). But when it is a definite description or has the sense of a definite description, and the predicate is complex, it is often possible to read “ $X$  is  $Y$ ” in different ways; and whether it entails “ $X$  is” will depend on how it is read. For example, “The present king of France is not bald” may assert that someone is the present king of France but is not bald, which does entail that someone is the present king of France—that the present king of France exists; but if it means only that it is not the case that someone is the present king of France and is bald, then it does not entail either that there is or that there is not a unique present king of France. Similarly, “The present king of France is believed to be bald” may be read as asserting that someone is the present king of France and it is believed of this person that he is bald, and this does entail the existence of the present king of France; or it might merely mean that it is believed that someone is the present king of France and is bald, and this could be true even if there were in fact no present king of France. Where the whole means something of the form “Someone is the present king of France and ....” (the complexity, if any, coming after the “and”), the description “the present king of France” is said to have primary occurrence; where a whole sentence of this form is preceded by

or embedded in some qualifying context, the occurrence of the description is said to be secondary. Only primary occurrences of descriptions entail that there really is something answering to them; that is, that the thing described exists. Russell, incidentally, agrees with Jean Buridan that “The chimera is the chimera” entails “The chimera exists” and thus is false, although where “ $x$ ” represents a genuine proper name, “ $x$  is (identical with)  $x$ ” is always true.

The Russellian apparatus removes the necessity for postulating weak and strong modes of being, at least where definite descriptions are involved. We do not need to suppose, when we imagine the Hydra, that there is a Hydra that we imagine, even in a weakened sense of “is,” or that there is some real thing that we imagine to be the Hydra. Two prefixes, “I imagine that” and “For exactly one individual  $x$ ,” are involved here; and which governs which greatly affects the interpretation. “I imagine that for exactly one individual  $x$ ,  $x$  is a Hydra” makes one assertion, and “For exactly one individual  $x$ , I imagine that  $x$  is a Hydra” makes quite another; and neither assertion entails that for exactly one individual  $x$ ,  $x$  is a Hydra. The second form, indeed, asserts a relation between me and a certain real individual (the one which I imagine to be the Hydra); but the first form does not assert any relation between me and any individual whatever, real or imaginary—it just asserts that I imagine that there is such a thing as the Hydra.

These forms are sufficient to describe what might be going on; there is no need whatever to suppose that if I imagine that there is a real individual of such and such a sort, then there really must be an “imaginary individual” of whom I imagine these things; that is, there is no need whatever to twist the first form around to “For exactly one imaginary individual  $x$ , I imagine that  $x$  is the Hydra,” or to talk about “imaginary individuals” at all. There is, indeed, a merely imagined state of affairs involved, so that one might say that this solution merely removes the problem one step further. But the existence of states of affairs is part of a different problem, that of the existence of abstract rather than fictitious objects, and is, perhaps, soluble.

Russell’s insistence that “exists” has no sense in which it can be a genuine predicate—that is, in which it can attach directly to a genuine proper name—seems a little arbitrary and not at all essential to his position as a whole. As G. E. Moore has pointed out, all that follows from this position is that a sentence like “This exists” is bound to be true; and one like “This does not exist” is bound to be false, if it says anything at all (for if “This exists” were

false, “this” would not be picking out any object, and nothing would be being said). Russell’s own formal system does in fact contain predicates—for instance, “—is identical with itself”—which have just this property, and he uses such predicates to define the class of individuals, or “things,” that is, the “universal” class. He himself, moreover, reads the proposition “For some  $x$ ,  $x$  is in the universal class” (which follows from “For some  $x$ ,  $x$  is identical with itself”) as “At least one individual exists,” and he considers it a defect of *Principia Mathematica* that this proposition is provable in it. Such a proposition is scarcely avoidable in a system which has symbols for logically proper names; and its derivation is not, as some might fear, a revival of the Ontological Argument. “It is necessary that there should be something” does not mean or entail “There is something that ‘is’ necessarily,” any more than “There is bound to be someone who wins” entails “There is someone who is bound to win.” Nor can the Ontological Argument arise in its original form even if existence is a predicate, for it is blocked by the illegitimacy of the passage from “I am imagining that God really is” to “There is an imaginary God (a being in the mind) of whom I imagine this.”

Nevertheless, there is a genuine problem about contingent and necessary being in this context. One of Moore’s arguments for the meaningfulness of “This exists” is that it must have some meaning because “This might not have existed” often does have meaning and in general is true. The suggestion is that “This might not have existed” is analyzable as “It might have been the case that (it is not the case that (this exists)),” and this could have no meaning if its innermost component did not. The odd thing, however, is that when it is thus analyzed, the statement does not appear to be true. “It is not the case that this exists” is just “This does not exist,” but under what circumstances might this have been true, if “this” is being used as a genuine proper name? Under none at all, it would seem, according to Moore’s own argument above.

Some of Russell’s followers—Ludwig Wittgenstein in the *Tractatus* and F. P. Ramsey—have argued that in fact the only possible states of affairs alternative to the actual one are ones in which the objects that in fact exist have properties and relations different from those which they in fact have. This is to make all individuals what the Scholastics thought God was, “necessary beings.” However, the formulation “This need not have existed,” read as “It is not the case that (it is necessary that (this exists)),” does not seem open to these difficulties, since its verification does not require that there be states of affairs in

which we could truly say of the object in question “This does not exist”; it is enough if there are states of affairs in which nothing can be said of the object in question at all (for then not all states of affairs will be ones in which we can say of it “This exists,” that is, “This exists” will not be a necessary truth). This solution makes a distinction between “possibly not” and “not necessarily,” which in most logical systems are equivalent; however, it is possible to develop systems of modal logic in which they are not equivalent.

Russell’s distinctions also throw some light on Thomas’s problems about creation out of nothing. Thus, P. T. Geach claims that “God has created a man out of something” amounts to “For some  $x$  (God has brought it about that ( $x$  is a man))”; but in the case of creation out of nothing we have only “God has brought it about that (for some  $x$  ( $x$  is a man)).” In the first form, where “For some  $x$ ” governs “God has brought it about that,” what is said is that there is an already existing object on which God has so acted as to make it a man; in the second form, where “God has brought it about that” governs “for some  $x$ ,” it is not said that there is something that God makes into a man, but only that he brings to pass the state of affairs expressed by “Something is a man.” But it is only the creation of something under a certain description (“a man”) that could be construed in this latter way; the creation of individuals as such out of nothing (as opposed to their creation out of, say, “possible individuals”) still seems impossible, since they have no identity until they are “there,” and a divine “Let there be this man” would be senseless before that time.

## ABSTRACTIONS

Turning from the supposed existence of fictitious objects to that of abstract ones, it will be useful to make some preliminary grammatical distinctions. Besides the proper names of individuals, most languages contain common nouns, adjectives, and verbs that apply to various individuals without actually naming any of them, and abstract nouns which seem to name the qualities, relations, states, and actions of individuals as if they were themselves individuals of a tenuous sort. We may say that a verb “ $\phi$ s” applies to an individual  $x$  if in fact  $x$   $\phi$ s, that an adjective “ $A$ ” applies to  $x$  if in fact  $x$  is  $A$ , and that a common noun “ $C$ ” applies to  $x$  if in fact  $x$  is a  $C$ . Current logic tends to treat the verb form of a predicate as fundamental and adjectives and common nouns as always implicitly functioning as parts of verbal phrases like “is  $A$ ” or “is a  $C$ .” Where common nouns appear as grammatical subjects, as in “All men are liars,” and adjectives as

directly qualifying nouns, as in “All white men are liars,” a little twisting will usually set the word in the basic verb context (“Whatever is-a-man is-a-liar,” “Whatever is-a-man and is-white is-a-liar”). As verbs do not even look like names of objects, there are no very serious problems.

Abstract nouns, however, do look like names of objects, and so do common nouns in certain rather special uses, as in “Man is the noblest of animals” and “Man is a species.” The objects which they appear to name are sometimes called universals; here they shall be called abstract objects or abstractions. Numerals also appear to name abstract objects—numbers—and noun clauses like “that Caesar conquered Gaul” and equivalent phrases like “Caesar’s conquest of Gaul” also seem to name abstract objects—states of affairs or (in one use of the term) “propositions.” Other apparent names frequently used in recent times are phrases of the form “the class of so-and-so’s.”

Some of these linguistic suggestions were taken very seriously by Plato and others have been taken seriously by other writers, and it is now common to describe as Platonism the view that abstract objects “exist” in a perfectly literal sense as part of the “furniture of the universe” alongside tables and chairs. If the Platonist admits that their being has something peculiar about it, and perhaps calls it subsisting rather than existing, he will nevertheless say that there is a single being which both subsisting and existing objects possess. The opposed Aristotelian tradition is to say that there is no single being which is common to objects of all different categories (things, qualities, relations, etc.), and that they are not just different sorts of beings but rather that they “are” in different but related (“analogous”) senses of “are.” In the fundamental sense of “are,” only substances or things really “are”; qualities “are” also, but only in a secondary sense—their reality consists simply in their qualifying real things; the reality of relations consists similarly in their relating real things, and so on. On the Aristotelian view, one might say there are weaker and stronger senses of “be” but no sense so weak as to cover, unambiguously, the subjects of all the others. The view that there is no necessity to attribute existence in any sense to anything but concrete individuals is generally called nominalism (after the medieval view that “universals” are no more than empty names).

Most abstract nouns have verbs, adjectives, or common nouns related to them in meaning, and the nominalist’s problem could be described as that of paraphrasing statements ostensibly about abstract objects in such a way that the abstract nouns disappear into the

corresponding verbs or allied forms. Often this can be done quite easily. “Caesar is a member of the class of men” and “Caesar has the attribute of manhood,” or “Manhood characterizes Caesar,” seem no more than pompous ways of saying that Caesar is human (or human and male). Similarly, “The class of men is included in the class of mortals” and “Manhood is always accompanied by mortality” seem to mean simply that whatever is human is mortal. But other cases are trickier—“Red is a color,” for example. This means more than “Whatever is red is colored”; we may presume that all red things, and only red things, occupy a certain set of regions of space (or of space-time), so that it is true that whatever occupies these regions is colored (just as all red things are colored) but not that the occupation of those regions is a color—it is not a color but a location. “Being red is a way of being colored” is more like it, but “being red” and “way of being colored” are as nounlike in form (the one a name of one thing and the other a common noun applying to many) as “red” and “color” themselves. If we write “being red” as “redding” and “being colored” as “coloring,” we can perhaps say that “\_\_\_\_\_ing is a way of \_\_\_\_\_ing” builds a sentence out of two verbs just as “Whatever \_\_\_\_\_s, \_\_\_\_\_s” does and that the suffix “-ing” does not form real names but is an inseparable part of complexes like “\_\_\_\_\_ing is a way of \_\_\_\_\_ing.” But some might say that rather than be driven to ad hoc solutions such as this last, it is better to admit the existence of abstractions and be done with it.

In comparatively recent history both Platonism and nominalism have run into difficulties of a rather technical sort. Some of these, including special problems about the existence of classes and numbers, are discussed in the entry on Russell, Bertrand Arthur William.

### **Bibliography**

The key texts in Aristotle are *De Sophistici Elenchis* 167a1 ff.; *De Interpretatione* 19b18 ff. and 21a26 ff.; and *Categories* 13b16 ff. and 29 ff.

Anselm’s Ontological Argument is stated in his *Proslogium* and Monologium, and Gaunilo’s answer is in his *Pro Insipiente*;

Thomas's summary and answer are in his *Summa Theologiae*, 2; Descartes's variant is in his *Meditations*; Gassendi's criticism is in the Objections appended to Descartes's *Meditations*; and Kant's criticism is in his *Critique of Pure Reason*, Transcendental Dialectic, Book II, Ch. 3, Sec. 4. The key passages in Anselm, Descartes, and Kant are included in Charles Hartshorne and William L. Reese, *Philosophers Speak of God* (Chicago: University of Chicago Press, 1953).

For Thomas on creation out of nothing and problems arising out of the notion of "giving existence," see his *De Potentia Dei* Q. 2, A. 1, Objections 2, 7, 11, and 17 and answers. For comments on this, see Antonin Sertillanges, *L'idée de création et ses retentissements en philosophie* (Aubier, 1945), especially pp. 45–48; A. N. Prior, "Identifiable Individuals," in *Review of Metaphysics* 13 (1960): 684–696; and P. T. Geach, "Causality and Creation," in *Sophia* (1962): 1–8. Problems about the identifiability of as yet nonexistent individuals are also acutely discussed in Jonathan Edwards, *Freedom of the Will*, edited by Paul Ramsey (New Haven, CT: Yale University Press, 1957), Part IV, Sec. 8, and in G. E. Moore, *The Commonplace Books*, edited by Casimir Lewy (New York: Humanities Press, 1967), p. 329. Leibniz's solution in terms of preexistent *possibilia* is developed in his correspondence with Arnauld (edited by Geneviève Lewis, Paris, 1952), which arose out of his *Discourse on Metaphysics* (translated and edited by P. G. Lucas and L. Grint, 2nd ed., Manchester, U.K., 1963), and in the dialogue at the end of his *Theodicy* (translated by E. M. Huggard, London and New Haven, CT, 1952).

For Thomas Reid's views, see his *Essays on the Intellectual Powers of Man* (Edinburgh, 1785), Essay IV ("On Conception") and Essay VI ("On Judgment"). For Russell's early position, see *The Principles of Mathematics* (Cambridge, U.K.: Cambridge University Press, 1903), especially pp. 43 and 71. The best and most accessible treatment of Meinong's views is in J. N. Findlay, *Meinong's Theory of Objects* (Oxford, 1933; reprinted with additions, Oxford: Clarendon Press, 1963), Ch. 2.

For Hume, the key passage is in his *Treatise of Human Nature*, Book 1, Part 3, Sec. 7 and note; for Brentano, his *Psychologie vom empirischen Standpunkt* (Leipzig, 1874), Vol. I, Book II, Ch. 7, Sec. 15. J. N. Keynes's discussion of possible responses to the challenge of Brentano and Venn is in his *Studies and Exercises in Formal Logic* (London: Macmillan, 1884; 4th ed., London: Macmillan, 1906), Ch. 8. Bain's views are in his *Logic*, 2nd ed. (London, 1873), Book I, Ch. 3, Sec. 23, and are discussed in a footnote to J. S. Mill's *System of Logic*, 9th ed. (London, 1875), Book I, Ch. 5, Sec. 5.

Russell's later theories are most clearly developed in his 1918 lectures "The Philosophy of Logical Atomism" (included in *Logic and Knowledge*, London: Allen and Unwin, 1956), Lectures V and VI, and in Ch. 16 of his *Introduction to Mathematical Philosophy* (London: Allen and Unwin, 1919). The latter contains, on pp. 168–170, his splendid and rather Reid-like appeal for a "robust sense of reality," G. E. Moore's agreements and disagreements with Russell are in his Aristotelian Society paper "Is Existence a Predicate?" reproduced in his collected *Philosophical Papers* (London: Allen and Unwin, 1959). The same collection contains another relevant Aristotelian Society paper, "Imaginary Objects," which may be compared with pp. 243–245 of

Moore's *Commonplace Books*. F. P. Ramsey's development of the consequence that Russell's theory allows for no contingency of existence is in *The Foundations of Mathematics* (London: K. Paul, Trench, Trubner, 1931), p. 285; see also the ingenious argument on p. 155.

On the "grammatical" solution to the problem of universals, see Russell's 1924 essay "Logical Atomism," also included in *Logic and Knowledge*, and Tadeusz Kotarbiński's article "The Fundamental Ideas of Pansomatism," translated by David Rynin, in *Mind* 64 (1955): 488–500.

Much current discussion takes its start from W. V. Quine's paper "On What There Is," included in his *From a Logical Point of View* (Cambridge, MA: Harvard University Press, 1953).

## EXISTENCE AND ESSENCE

See *Essence and Existence*

## EXISTENTIALISM

Existentialism is not easily definable. Its protagonists have traced it back to Pascal, to St. Augustine, even to Socrates. It has been alleged in our time to be the doctrine of writers as various as Miguel de Unamuno and Norman Mailer. At first sight, characteristics of the doctrine are almost as various. That two writers both claim to be existentialists does not seem to entail their agreement on any one cardinal point. Consequently, to define existentialism by means of a set of philosophical formulas could be very misleading. Any formula sufficiently broad to embrace all the major existentialist tendencies would necessarily be so general and so vague as to be vacuous, for if we refer to a common emphasis upon, for example, the concreteness of individual human existence, we shall discover that in the case of different philosophers this emphasis is placed in contexts so dissimilar that it is put to quite different and incompatible uses. How then is existentialism to be defined?

## EXISTENTIALIST THEMES

Existentialism may perhaps be considered most fruitfully as a historical movement in which connections of dependence and influence can be traced from one writer to another. Thus, even if two writers who are both rightly called existentialist differ enormously in doctrine, they can be placed in the same family tree. But this only throws the question of definition one stage back. How do we select our philosophical pedigrees? The answer must be in

terms of a number of recurrent themes that are in fact independent of one another but have, as a matter of philosophical history, been associated in a variety of patterns. The key themes are the individual and systems; intentionality; being and absurdity; the nature and significance of choice; the role of extreme experiences; and the nature of communication.

**THE INDIVIDUAL AND SYSTEMS.** Søren Kierkegaard chose for his own epitaph the words “that individual.” The concept of the individual for Kierkegaard was contrasted both with the concept of philosophical system and with the concepts of the stereotype and the mass. Between these contrasts there is a connection. A philosophical system was for Kierkegaard an attempt to understand individual existence within a conceptual scheme of a kind that would exhibit a logically necessary connection between every individual part and the conceptual scheme of the whole universe. People in the mass, or those who live out a stereotyped role, are people who understand themselves in terms of some concept or concepts they happen to embody. In both cases the individual is secondary to the concept it embodies. In fact, however, what exists comes first; concepts are necessarily inadequate attempts to grasp individual existence, which always evades complete conceptualization. One of the difficulties in understanding what Kierkegaard and his later followers have meant by assertions of this kind is that none of their detailed arguments appear to entail their conclusion. Consider two of these arguments.

The first is a revival of Immanuel Kant’s argument against the so-called Ontological Proof. Like Kant, Kierkegaard argued that existence is not a property and that no concept of a given object entails the existence of that object. Also, Kierkegaard anticipated some modern writers in arguing that action and choice can be understood only if viewed from the standpoint of the agent rather than from that of the spectator. What is puzzling, however, is that Kierkegaard assumed that the notion of philosophical system is inextricably bound up with the viewpoint of the spectator and the refusal to admit that existence is not a property. In consequence, he concluded that justice can be done to the nature of the individual only if philosophical system building is condemned. The explanation for this particular line of thinking is that Kierkegaard equated the construction of philosophical systems with Hegelianism, and he interpreted Hegelianism as a form of rationalist metaphysics. It is noteworthy that some kind of metaphysical rationalism is almost always the background for existentialism. In countries where empiricism has a long history existentialism does

not seem to flourish, even in the form of a reaction to the prevailing moods of thought.

Thus, it is perhaps instructive to regard existentialists as disappointed rationalists. When they announce that reality cannot be comprehended within a conceptual system or, more particularly, that individual existence cannot be so comprehended, they identify the role of a conceptual system with the notion of an all-embracing set of necessary truths derived by deduction from some axiomatic starting point. It may seem, therefore, that existentialists are sometimes doing no more than reformulating the empiricist protest against rationalism (namely, that no matter of fact can be expressed as a necessary truth) in an unnecessary and misleadingly dramatic way. The drama, however, has at least one independent source.

The nineteenth century witnessed a series of very diverse protests against the notion that the universe is a total system, whether one presided over by a Creator God or a purely rational one developing in an evolutionary progress toward higher and higher goals. That the universe does not make sense, that there are no rational patterns discernible in it, is a theme central, for example, to Fëdor Dostoevsky’s *Notes from the Underground* (1864). Dostoevsky is often cited as a forerunner of existentialism precisely because in his disillusionment with rationalist humanism he stressed the unpredictable character of the universe and because his individuals appear face to face with pure contingency. Any established connection between things may break down at any minute. Order is a deceptive mask that the universe, especially the social universe, wears. The individual thus confronts the universe with no rational scheme by means of which he can hope to master it. Reason will only lead him to formulate generalizations that will, if he relies upon them, let him down.

Existentialism sometimes gives expression to this kind of view of the limitations of reason. But it is not thereby necessarily committed to irrationalism. At least some existentialist philosophers have been prepared to argue the case for the limits of reason on rational grounds—indeed, on grounds that are partly Kantian. Moreover, when existentialist philosophers speak of the limits of reason they are usually careful to explain that they wish in no way to trespass upon the territory of the natural sciences or of mathematics. Karl Jaspers goes so far as to accept positivism as a valid account of the sciences, illegitimate only when it aspires to give an account of reasoning as such. Moreover, Jaspers would claim that the areas with which existentialism concerns itself are not

outside the competence of reason but only demand that reason be understood in new and less restrictive ways.

The claims, therefore, that the individual cannot be comprehended within a rational system and that the universe which the individual confronts is absurd turn out to have a less striking content than might at first sight have appeared. What has led to their exaggeration is perhaps in part an association with two other philosophical traditions, phenomenology and the kind of philosophy that treats ontology as a central philosophical discipline. Each of these provides existentialism with characteristic themes, which will be considered below.

**INTENTIONALITY.** With the exception of Kierkegaard, existentialist philosophers often make use of a conceptual scheme derived from the phenomenologists Franz Brentano and Edmund Husserl and, through them, from René Descartes. In attempting to answer such questions as What is belief?, What is an emotion?, and What is an act of will? phenomenologists wished to combat the associationist psychology that aspired to explain beliefs and emotions in purely naturalistic terms. In contrast, phenomenology emphasized that belief is always belief that ... and anger is always anger about... . The object of belief or of emotion is not an object or a state of affairs in the external world. I may believe what is false or be angry about what did not in fact happen. So the object of belief or emotion is internal to the belief or emotion. It is, in the language of phenomenology, an intentional object.

Brentano concentrated on the isolated individual only in order to describe accurately the central features of believing, feeling, willing, and so on. Husserl treated the individual's consciousness of his own acts as having a primary role not unlike that which Descartes gave it. Among post-Husserl existentialists, notably Jean-Paul Sartre, the doctrine of intentionality is used to underline a fundamental difference between my knowledge of myself and my knowledge of others. Other people, so it is asserted, are viewed not as they are but as intentional objects of my perceptions, my beliefs, my emotions. But to myself I can never be such an object, nor am I in fact an object, and if they regard me as such their view of me is necessarily falsified. The obvious criticism of this is to say that the word *object* has been used as a pun. To say that my beliefs have intentional objects is to say neither that they are necessarily false nor that my beliefs about other people commit me to viewing them as things rather than people. But no existentialist writer is in fact making so simple a mistake. There is always some additional premise to the argument that provides a basis for the existentialist claim that to

make others the object of my perceptions or beliefs is to view them as other than they are. In the writings of Sartre and Simone de Beauvoir, for example, specific theses about the character of love and hate play an important role.

What is clear, however, is that although the doctrine of intentionality need not be understood in an existentialist way, this doctrine does add a dimension to the existentialist concept of the individual. Only through the notion of intentionality could the themes in Kierkegaard (which were partly an inheritance from the individualism of Protestantism and partly a reaction against G. W. F. Hegel) have become in Martin Heidegger part of a theory of knowledge and of a metaphysics.

**BEING AND ABSURDITY.** Existentialists, believing as they do that reality always evades adequate conceptualization, are especially apt to treat "Being" as a name, the name, in fact, of the realm which we vainly aspire to comprehend. "What the philosophers say about Reality," wrote Kierkegaard, "is often as disappointing as a sign you see in a shop window which reads: Pressing Done Here. If you brought your clothes to be pressed, you would be fooled; for only the sign is for sale" (*Either/Or*, 1843).

In Kierkegaard we get little or no systematic treatment of this kind of theme. In some of his successors, however, we find a systematic ontology, which owes more to the influence of scholastic metaphysics and of rationalism than it does to Kierkegaard. Heidegger took up Gottfried Wilhelm Leibniz's question, Why are there the things that there are rather than nothing? For Leibniz this question could be answered only by producing the Cosmological Argument for the existence of God. For Heidegger the question itself is misleading, because the posing of it relies upon an inadequate analysis of the notions of being and of nothing. Heidegger treats "Being" and "Nothing" as if they were both names, sometimes the names of powers, sometimes the names of realms. It is not that he is entirely unaware of the logical difficulties encountered in so doing. But he treats such difficulties as evidence of the exceptionally elusive character of Being and Nothing rather than as a sign of his own mistakes. He also accepts the fact that scientific thought never uses such concepts or language, but this he treats as a testimony to the inadequacy of science as a method for understanding reality and to the need for poetry and philosophy. He distinguishes Being (*Sein*) from beings (*die Seiende*) and from modes of being. At times his writing is

reminiscent of scholastic ontology, but it is more often aphoristic and oracular.

In Sartre, too, there is an implicit relation to metaphysical rationalism of the kind mentioned above. The thesis that existence is absurd, which is especially important in French existentialism, turns out to be a denial of the principle of sufficient reason. There is no ultimate explanation of why things are as they are and not otherwise. What is curious here is that on the one hand the fact that this is so is seen as a flaw in the nature of things. It belongs to what Heidegger calls their “fallenness”; the experience of it arouses in us anxiety and perplexity. Yet on the other hand that it is so is the guarantee of human freedom. Both German and French existentialists distinguish sharply between the beings that exist for themselves (*pour-soi*), which have consciousness and freedom, and the beings that exist in themselves (*en-soi*), which are simply things. Now, for existentialism all the important possibilities of human life are bound up with the fact of human freedom, so that to lament the absurdity of existence is in a way odd. But what this lament does reflect is the ambiguous attitude of existentialists to human freedom.

**FREEDOM AND CHOICE.** If any single thesis could be said to constitute the doctrine of existentialism, it would be that the possibility of choice is the central fact of human nature. Even the thesis that existence precedes essence often means no more than that people do not have fixed natures that limit or determine their choices, but rather it is their choices that bring whatever nature they have into being. As existentialists develop this thesis, they are involved in at least three separate contentions.

The first is that choice is ubiquitous. All my actions imply choices. Even when I do not choose explicitly, as I may not do in the majority of cases, my action bears witness to an implicit choice. The second contention is that although in many of my actions my choices are governed by criteria, the criteria which I employ are themselves chosen, and there are no rational grounds for such choices. The third is that no causal explanation of my actions can be given.

The first thesis is given varying interpretations. For Kierkegaard a person's actions will always form part of a coherent way of life: the aesthetic, in which pleasure is pursued, or the ethical, in which principles are treated as binding, or the religious, in which God is obeyed. Between these one must choose, and it is in this sense that behind any action there lies a choice. For Sartre it sometimes appears as if each separate action expresses an indi-

vidual choice. Even if I do not choose, I have chosen not to choose.

The second thesis is fundamental to existentialism. But it is plausible to hold that I am free to choose the criteria by which I discriminate true from false beliefs only if this contention is restricted to the field of morals and religions. Kierkegaard sometimes, although not always, allowed for this restriction.

The third thesis, which seems to be logically independent of the others, is often treated by existentialist writers as though it were entailed by the first two. This is less surprising when it is recognized that one of the impulses behind existentialism seems to be a dissatisfaction with the kind of nineteenth-century materialism which held that if human actions can be causally explained, then determinism is true in a sense that excludes the possibility of human agents' being responsible and free. However, instead of denying that causal explanation entails this kind of determinism, the existentialist takes the unnecessary step of denying the probability of causal explanations of human action.

**ANXIETY, DREAD, AND DEATH.** Kierkegaard argued that in certain psychologically defined moments truths about human nature are grasped. One such moment would be when we realize that we do not just fear specific objects but experience a generalized dread. Of what? Of nothing in particular. What is this nothing, this void we confront? Kierkegaard interpreted it in terms of original sin. Heidegger sees it as an ontological constituent of the universe. Sartre sees it as a confrontation with the fact of freedom, of our unmade future.

The variety of interpretations suggests that perhaps different experiences are being discussed or that the ratio of interpretation to experience may be too high. But stress on the extreme and the exceptional experience is common to all existentialism. Everyday experience, by contrast, is thought of as a conventionalized, predigested aid to complacency, conformity, and self-deception. Heidegger gives a very special place to the continuous awareness of one's own future death; Jaspers lays a more generalized stress on a range of situations in which the fragility of our existence is brought home to us.

**THE FORM OF COMMUNICATION.** Since the existentialist writer acknowledges the sovereignty of individual choice and the importance of the concrete situation, he cannot address himself to his audience in the manner of traditional philosophy, for *ex hypothesi* the reader has to make his own choices in the light of his own experiences.

Argument will be powerless unless the reader chooses to agree with the author's premises. As a matter of fact, existentialist writings do commonly argue with the reader. But Kierkegaard, for example, was usually careful to frame his arguments in a hypothetical way: "If you choose this starting point, then that logically follows ... ." He was also in the habit of writing different works under different pseudonyms, so that what the reader was confronted with would be a continuing debate between rival standpoints rather than a single argued case.

Later existentialist writers have developed in two differing ways. All the major existentialist philosophers have written systematic treatises. But they have also made large contributions to imaginative literature, and the content of existentialist philosophy makes it clear that dramatic dialogue, whether in plays or in the novel, is probably a form of expression more consistent with the author's intentions than deductive argument would be.

Such, then, are the shared themes of existentialism. But at this point one ought also to stress, even if briefly, the large differences that are compatible with the thematic resemblances between individual authors.

## EXISTENTIALIST AUTHORS

Since the major existentialist philosophers are all treated in separate articles, what is delineated here is their interconnections insofar as they influence one another and above all the way in which the same themes recur in quite different social and philosophical contexts.

Søren Aabye Kierkegaard elaborated all his fundamental doctrines in order to expound and to defend what he took to be true Christianity. The philosophers upon whom he drew were Hegel (though only to attack), Kant, Aristotle (purely as understood through the writings of Friedrich Trendelenburg), and the Platonic Socrates. In contrasting philosophy from Plato to Hegel with authentic Christianity, Kierkegaard emphasized the concepts of the individual, of choice, of dread, and of paradox. He thus originated all the fundamental themes of existentialism.

These themes have been put to a quite new use by Karl Jaspers, who is concerned with criticizing positivism rather than Hegelianism. He has undertaken this with a view to defending a generalized spirituality that Christianity shares with other religions, rather than to defending specifically Christian doctrines. Where Kierkegaard spoke of paradox, Jaspers speaks of contradictions, and in this he is influenced as much by Friedrich Nietzsche as by Kierkegaard.

Martin Heidegger, too, has felt the influence of Nietzsche. But St. Augustine and Husserl have also been important for his synthesis of existentialism and phenomenology. As a result of this synthesis Heidegger has outlined a systematic ontology which, as such, stands at the opposite pole to Kierkegaard's enterprise. Heidegger's world is one from which God is absent (in this, too, he contrasts with Kierkegaard), but he has denied that he is therefore an atheist. This has no doubt made it easier for theologians to utilize his writings but makes it all the more surprising that his key concepts should have been so easily integrated into yet another existentialist system, that of Jean-Paul Sartre.

In Sartre the concept of choice, which for Kierkegaard was a decision between fundamentally different ways of life, has become a ubiquitous presence behind every human action, and the being of people, which Heidegger has distinguished from the being of things in terms of the relationship of consciousness in its various modes to the world, is now defined essentially in terms of such choices.

Sartre brings together other threads from the earlier history of existentialism. He employs psychological analyses similar to Kierkegaard's analysis of dread but sets them out in terms borrowed from phenomenology. These analyses are carried through for their own sake in Sartre's philosophical writings but are put to work in his novels and plays. They are employed, too, in the novels of Simone de Beauvoir, whose moral and political writings also use the Sartrean concept of choice.

Of parallel psychological interest are the novels of Albert Camus, but the atheism that for Sartre is a consequence of his views of human nature and the world was basic in the thought of Camus. Human life is represented in the myth of Sisyphus, who was doomed eternally to roll up a hill a vast stone that would always fall back just as he was about to reach the top. The dignity of life derives from humankind's continual perseverance in projects for which the universe affords no foothold or encouragement.

Gabriel Marcel is linked to Sartre and Camus by his critique of their atheism. He is an existentialist in his stress on key experiences and on the impossibility of adequately conceptualizing the important features of human life. But the features upon which he lays stress are those of hope and relationship, and his philosophy derives from Josiah Royce's personal idealism and even from F. H. Bradley, rather than from any existentialist predecessors.

The range of views expressed by existentialist writers has made it all too easy for the most multifarious authors to claim the title and for the most widespread ancestry to be found for existentialism. Someone like Unamuno, whose book on the tragic sense of life belongs to the same climate as Kierkegaard and Dostoevsky, could scarcely for that reason be called an existentialist, but those influenced by him in Spain today might well make use of the term. Karl Heim, the German writer on the philosophy of physics, has defined existentialism so widely that almost everything not strictly in the area of science becomes the subject matter of existentialism. Such examples could be multiplied indefinitely. Therefore, it seems wise now to consider the diffused influence of existentialism in the fields of theology, politics, and psychoanalysis.

### EXISTENTIALIST THEOLOGIANS

There is a variety of theological systems which in some way are in debt to existentialism. The multiplicity of conclusions which theological writers have drawn from existentialist premises is perhaps testimony both to the ambiguity of those premises and to an underlying failure to analyze adequately some of the basic concepts involved.

**BARTH.** The earliest theological developments are to be found in Kierkegaard's thought, not surprisingly, since he was a theologian in his own right. When Karl Barth repudiated the optimistic liberal theologies of pre-1914 Protestantism, he did so in a commentary on the Epistle to the Romans (*Der Römerbrief*, 1919), which draws quite as heavily on Kierkegaard and Dostoevsky as it does on St. Paul. From Kierkegaard, Barth took the view that God is totally other than man. Finite reason cannot hope to grasp or comprehend infinite deity. From both Dostoevsky and Kierkegaard, Barth inherited the thesis that nature and human life are enigmatic, that nothing in the world is reliable.

Barth used these doctrines in two ways. In one direction he repudiated all attempts to find a rational foundation for Christianity, whether in the rational theology of Roman Catholicism or in the philosophical idealism of nineteenth-century Protestantism. In another he used his arguments to revivify the orthodox Protestant theory of the Reformation period. It is worth noting that although Barth repudiates the possibility of any rational ground for revelation, he has, like Kierkegaard, used philosophical argument when it suited his purposes.

**TILlich.** Paul Tillich, unlike Barth, used existentialist materials in constructing a system that has analogies with Heidegger's but, in contrast with Heidegger's, reaches theistic conclusions. As with Heidegger, the terms "Being" and "Not-being" or "Nothing" played a key role in his thought. God is Being-itself, but in Tillich's interpretation this characterization of God has a quite different sense from that which the same form of words would bear in medieval theology. For according to Tillich we discover "Being-itself" through self-affirmation; we discover that what we call "God" or "Being-itself" represents our ultimate concern with overcoming doubt and anxiety in the face of nothingness. The message of theology is that we can overcome the meaninglessness of contemporary existence by taking up certain types of attitudes to that meaninglessness. It is pertinent to ask whether Tillich was trying to provide Christian conclusions with a new set of existentialist premises from which they may validly be derived or was trying to provide those Christian conclusions with a new sense, which enabled him to repeat some of the traditional forms of language but gave them a quite unorthodox meaning. Support for the latter alternative can be derived from the fact that Tillich was quite content to admit that the God of traditional theism does not exist. What remains unclear is whether the word *God* is an appropriate name for the concept of Being-itself as it figures in Tillich's thought.

**BULTMANN.** Rudolf Bultmann, by contrast with Tillich, is avowedly concerned with reconstructing Christianity. Bultmann is a historical critic of the New Testament who believes that in the New Testament a genuinely existentialist message is distorted by being presented in terms of a prescientific cosmology. This cosmology, Gnostic in origin, is a myth from which the kernel of the gospel must be extracted. The Gnostic cosmology pictures a three-tiered universe with human life on the earth occupying a place midway between the divine realm above and the powers of darkness below. The message concealed is that men are poised between the possibility of an "authentic" (Heidegger's term) human existence, in which the individual faces up to the limits of human existence and especially his own death, and the possibility of inauthentic existence, in which the individual retreats from death and *Angst* and *Sorge* and so becomes their victim. The charge made against Bultmann by orthodox theologians is that he turns Jesus Christ into a mere precursor of Heidegger. Bultmann's reply is that his interpretation of the gospel is still distinctively Christian because of his insistence that the decision in which man chooses between authentic and inauthentic existence is one that the rational man

does not have the power to make for himself. But here either Bultmann is bringing in a supernaturalism that he otherwise disowns or he means simply that the choice of authentic existence is an action of which no account can be given in terms of the life of “rational man,” of inauthentic existence. But to suppose that the traditional Christian assertion of the need for grace and the necessity of Christ’s work is even a disguised version of the Heideggerian account of the choice of authenticity seems highly implausible.

Two of Bultmann’s followers, Wilhelm Kamlah and S. N. Ogden, have argued that there is a deep inconsistency between Bultmann’s Heideggerian themes and his Christian interpretations. Kamlah has argued that not only belief in the historical Jesus but also belief in a God who intervenes in history is inconsistent with Heidegger and draws atheistic conclusions. Ogden, who remains a Christian, believes that the role of the historical Jesus must be less important than either Bultmann or traditional orthodoxy suggests if justice is to be done to existentialism. It is notable that for all the writers of this kind, existentialism is above all else a characterization of the human condition as such, sharing much of the generality and the theoretical character of the Hegelian doctrines which Kierkegaard condemned.

Bultmann’s references to God always appear to be external to his central concerns. When his critics ask him how he justifies belief in and speech about God, he tends to reply in traditional Christian terms that have little to do with existentialism. This perhaps provides some confirmation of the view that existentialism is in fact a theologically neutral doctrine. Its neutrality derives from its stress on ultimate commitment and the unjustifiable character of any particular commitment. If the only justification for *any* belief is, in the last analysis, that I have chosen to believe, then the same justification is equally available for all beliefs, whether theistic or atheistic. But insofar as existentialism is a doctrine about human nature, its themes are very close to those of traditional theology, and it is therefore not surprising, quite apart from any impulses originating from Kierkegaard’s special concerns, that most existentialist philosophers have taken up well-defined positions in relation to theology.

An existentialist vocabulary is often used by theological writers who are not in any strong sense existentialists. So the Russian Orthodox thinker Nikolai Berdyaev and some Catholic theologians, in their discussions of anxiety, guilt, and man’s relation to God, have used existentialist concepts. But these uses reflect the fashionable

character of existentialism rather than any of its philosophical characteristics.

## EXISTENTIALISM AND POLITICS

As in theology so also in politics existentialism appears to be compatible with almost every possible standpoint. Kierkegaard was a rigid conservative who viewed with approval the monarchical repression of the popular movements of 1848; Jaspers was a liberal; Heidegger was for a short time a Nazi; and Sartre was over a long period a Communist Party fellow traveler. However, at least three systematic political themes can be discerned in existentialism.

The first is a form of religious humanism designed to counteract what is believed to be an unsatisfactory value system at the basis of modern society. Both Jaspers and Marcel maintained that the growth in technology and bureaucracy was creating in Europe a cult of mediocrity, conformism, and loss of individuality, with the inner life of the individual sacrificed to external forms. Heidegger, too, saw the individual as threatened by impersonality. But although Jaspers and Marcel pleaded for a greater recognition of transcendent and religious values in general, neither had a specific program of social reform to offer.

Second, the existentialist stress on commitment and irrationality of choice has sometimes been used in support of irrationalistic extremism. The most notorious but not the only example is Heidegger’s brief excursion into politics. Needless to say, advocates of Nazism tend to ignore the existentialist stress on the importance of the individual.

Commonly, existentialism may be associated with communism, and this is largely due to the influence of Sartre. However, Sartre has occupied more than one position. His prewar writings contain scarcely any reference to politics. During the war and immediately after, his political aims—those of a radical democrat—were expressed in terms that seem largely independent of his existentialism. At that time, in his analysis of political activity he found himself at odds with orthodox Marxism because Marxism offered causal explanations of behavior that Sartre wanted to explain in terms of choices and purposes. But in his later writings he has accepted a Marxist framework for both political theory and political practice and has presented existentialism as merely a corrective to a too rigid and too deterministic Marxism. Yet his account of political life is, in fact, still far more psychological than any a Marxist would give.

## EXISTENTIALISM AND PSYCHOANALYTIC TOPICS

There are several points at which existentialism touches on psychiatric themes. Karl Jaspers originally practiced as a psychiatrist, and in *Allgemeine Psychiatrie* (1913) he criticized ordinary scientific psychology and the psychotherapy based upon it. He did so on the ground that what he regards as the positivistic approach of conventional psychotherapy is unnecessarily and misleadingly deterministic. It treats the actual outcome of the patient's life as the inevitable outcome. Jaspers concedes that scientific examination will not reveal the fact of human freedom of choice. The personality available for empirical scrutiny is simply what it is, but the assumption that there is nothing to personality but what empirical scrutiny will reveal is groundless and arbitrary. Behind the empirical self there is, in Jaspers's view, a true self of which we are made aware in what Jaspers calls "boundary-situations"—that is, in situations of an extreme kind where we confront despair, guilt, anxiety, and death. In these moments of awareness we realize our own responsibility for what we are, and the reality of freedom of choice is thrust upon us.

The name "existential psychiatry" has been taken, however, by another tradition of thought, which derives from Heidegger and whose most important exponent is Ludwig Binswanger. Binswanger, who calls his system of analysis *Daseinsanalyse*, criticizes two of Sigmund Freud's central concepts. Freud saw the neurotic symptom of the adult as caused by a past traumatic event, the memory of which has been repressed into the unconscious, from where it exerts its causal power upon present behavior. According to Binswanger, however, the neurotic symptom is to be explained not in terms of the content of the patient's unconscious but in terms of his mode of consciousness, and the key concept involved in the explanation is not that of causality but that of meaning. When an adult reacts to a situation neurotically it is because his consciousness confers upon that situation a meaning he does not recognize as deriving from the nature of his own consciousness. Certainly, past traumatic events are relevant. But they are relevant precisely because in them a like meaning was given to a like situation. Attention is thus focused upon the patient's whole mode of consciousness, the way in which he approaches, attends to, and comprehends the world. The explanation of behavior lies in the present, in the mode of consciousness, not in the past or in the unconscious.

Binswanger's understanding of the different possible modes of consciousness is derived directly from Heidegger. He speaks of "Being-in-the-world" and its modes and

of the contribution of existentialist philosophy to psychiatry as consisting in the a priori analysis of all possible modes of "Being-in-the-world." He very largely discounts the biological determination of human behavior, although he allows it a minor role. But he tends to insist on interpreting behavior, even at the biological level, in terms of the meaning it has for the agent.

This emphasis is reiterated by Sartre, who uses the doctrine of intentionality to criticize all causal theories of emotion and behavior. Sartre attacks both the James-Lange theory of the emotions and the Freudian theory of the unconscious because he holds that they cannot allow for the intentional (in the Husserlian sense) and purposive aspects of emotion and behavior. It has already been suggested that it is unclear why Sartre believes that if emotions, for example, must be understood in terms of their intentional object and aim, they cannot also be explicable in causal terms. Like Binswanger, Sartre approves of much in Freudian technique, and in his writings on Charles-Pierre Baudelaire and Gustave Flaubert he has emphasized the formative experiences of early childhood. Perhaps his most extensive treatment of these themes is his book on Jean Genet (*Saint Genet: Comédien et martyr*, 1952).

Both Sartre's earlier and his later writings have been utilized by R. D. Laing in the study of schizophrenia (*The Divided Self*). Sartre's account of experiencing another person as a free agent for whom one exists only as an object and by whom one is reduced to the status of an object (in *L'être et le néant*, III, 1943) is used by Laing to throw light on case histories of the kind where the decisive actions of another person have resulted in a loss of identity on the part of the patient. Laing's work does, in fact, strongly suggest that Sartre has sometimes offered us not, as he purports to do, a description of what is basic to human consciousness as such but a description of certain abnormal types of consciousness, to which we are all sometimes prone but which become dominant in mental illness. However, Laing himself does not make this criticism of Sartre and has used in the study of normal family life some of the concepts that Sartre elaborates in the *Critique de la raison dialectique* (1960).

## CRITICISM AND EXPLANATION

The suggestion that existentialism is a form of disappointed rationalism has already been made. It may now be extended to the charge that existentialism's dissatisfaction with the concepts of traditional rationalist metaphysics has been insufficiently radical. If the thesis that the universe is absurd is simply a denial that the universe

has a Leibnizian sufficient reason, then it relies as much as Leibniz did on the adequacy of the concept of a sufficient reason. When the existentialist could profitably have questioned the very terms with which the rationalist characterized the world, he has all too often simply taken over the rationalist scheme of concepts and denied what the rationalist affirmed. Moreover, he has mistaken his own denials for a positive characterization of the nature of things.

It has also been suggested that the existentialist often makes the same logical points against rationalism that the empiricist did but invests them with more drama. Perhaps the explanation of this is that the discovery that there are no sufficient reasons or ultimate justifications, of the kind offered by rationalist metaphysics and allied types of theology, is not private to existentialist philosophers. Questions of ultimate justification remain unimportant and unexamined by most people so long as social life is relatively stable and social conflict is not disruptive. When, however, the conventional supports of civilized life are withdrawn, as they have been too often in Europe since 1914, ordinary people are forced to ask questions about justification that normally do not arise for them. The loneliness and self-questioning of a Kierkegaard become far more common. Moreover, people find that their normal responses are put in question; deception and self-deception become pressing topics. What were publicly approved acts with established utilitarian justifications become signals into a darkness where there are no answering lights.

It is a commonplace that it is people living in loneliness and doubt who provide the characters for existentialist novels, but it is less remarked that the existentialist's conceptual psychology rests equally upon examples drawn from extreme situations. How, indeed, could it be otherwise for those who assert that it is only in extreme situations, in what Jaspers calls boundary situations, that authentic human nature is revealed? But existentialist writers remain open to the criticism that they treat the exceptional as the typical. Indeed, because the contrast between the exceptional and the typical has been obliterated, the force of the notion of the boundary situation tends to be lost.

When existentialists come to construct their own systems, the most obvious criticism they are subject to is that they are insensitive to the syntactic and semantic properties of the language they employ. So Kierkegaard spoke of a dread of nothing in particular as though this implied that such dread had an object whose name was "Nothing." So Heidegger hypostatizes Being and Nothing

as substantial entities. So Jaspers discards the traditional framework for metaphysics but writes of "the transcendent" as though this were an expression whose meaning raised few difficulties. A. J. Ayer accused Sartre of a systematic misuse, in his ontology, of the verb "to be."

Ayer suggested that when a philosophical criticism of existentialism has been carried through it is not improper to ask for a sociological explanation of its use and vogue. He himself pointed to the fact that German existentialism followed on the defeat of 1918, whereas French existentialism is a sequel to 1940. But, in fact, Sartre took up all his main existentialist positions before 1939. And the purely philosophical ancestry of later existentialism must be allowed for.

This is not to say that we should look for an account of existentialism only in terms of philosophical antecedents. It would be more illuminating to see existentialism as the fusion of a certain kind of dramatization of social experience with the desire to resolve certain unsolved philosophical problems. The unsolved problems are those of traditional epistemology and metaphysics. In the period between Descartes and Francis Bacon, on the one hand, and Kant and Hegel, on the other, certain philosophical problems were posed but not solved. Within the framework of assumptions in which they were posed they could not, in fact, have been solved. Foremost among these assumptions is that the whole of knowledge has to be reconstructed out of the epistemological resources of the single, isolated knowing subject. Also, there is the search for first principles, based either upon an indubitable, because logically undeniable, proposition or upon an incorrigible set of reports of immediate experience. There is the treatment of the first principles as axioms and their employment as a basis for a deductive model within which all human knowledge is to be set forth. There is the invocation of God or Nature to bridge the gulfs too great for argument on its own.

Hegel abandoned all these assumptions, as Ludwig Wittgenstein did later on. But where Wittgenstein placed epistemological problems in the context of an understanding of language as a social phenomenon Hegel placed them, in the end, in the context of a metaphysical system. Those who rejected his system retreated to the epistemological assumptions of the earlier period, but with this difference: after David Hume and Kant they could no longer believe in guaranteed first principles. So Kierkegaard's choice between the ethical and the aesthetic reproduces the Kantian choice between duty and inclination but lacks its rational basis. More generally, Kierkegaard's individual resembles the Cartesian ego

without the *cogito*. Sartre inherited from phenomenology an explicit Cartesianism. In Sartre the individual as the knowing subject is the isolated Cartesian ego; the individual as a moral being is a Kantian man for whom rational first principles have been replaced by criterionless choices. Neither God nor Nature is at hand to render the universe rational and meaningful, and there is no background of socially established and recognized criteria in either knowledge or morals. The individual of existentialism is Descartes's true heir.

According to Marxist critics, especially Georg Lukács, the debased individualism of the existentialist is a symptom of the malaise of the bourgeois intellectual. Bourgeois man can no longer find his values incarnated in the social life that surrounds him; therefore, he makes a fetish of his own inner experience and tries by the fiat of his own choice to legitimate the values that in public life no longer appear to have validity. This theory of Lukács's has two central weaknesses: it appears to suggest a correlation between holding existentialist views in philosophy and having certain highly specific political and social attitudes, and it assimilates all existentialism to one rather restricted model. The suggested correlation is not warranted by the evidence, and the preceding discussion points to the dangers of assimilating different existentialisms too closely to one another.

A more relevant criticism might be phrased as follows. Certain philosophical attitudes are embedded in the matrix of existentialism; in general, existentialism embodies a distrust of metaphysical rationalism. Insofar as existentialist philosophers elaborate conceptual analyses in such fields as ethics and the philosophy of mind, their work can be understood and assessed in the same way as the work of analytical philosophers. Paradoxically, however, when they go beyond conceptual analysis it is usually not only to stress the inevitability of choice or the importance of dread but also to construct systems of the kind that existentialists originally protested against. The outcome of these systems on the whole lends further weight to the protests.

Finally, the doctrine of choice itself stands in need of closer scrutiny than existentialist philosophers have given it. This doctrine depends on the relationship between choice and criteria for judging between true and false and right and wrong. In existentialist writings this relationship remains, on the whole, unscrutinized.

## EXISTENTIALISM [ADDENDUM]

The development of "existentialism" in the last years of its leading French proponents, Jean-Paul Sartre and Maurice Merleau-Ponty, occurred in the areas of social philosophy and existential psychoanalysis in the case of Sartre and the philosophy of language and fundamental ontology for Merleau-Ponty. Partly in response to the latter's critiques, but chiefly as a result of his own political commitment, Sartre constructed a social ontology and a theory of history in his *Critique of Dialectical Reason*. Faithful to his existentialist emphasis on the primacy of the individual, but replacing his earlier philosophy of consciousness with one of praxis (roughly, purposive human activity in its historical and socioeconomic context), Sartre formulated a set of concepts, especially praxis, seriality, and the practico-inert, that respected the power of social forces to countermand, deviate, and reverse our undertakings without totally robbing the organic individual of existentialist freedom and responsibility. He allowed far greater play to the force of circumstance in assessing human action and underscored the determining power of family and early childhood experience in his massive existential biography of Gustave Flaubert, *The Family Idiot*. This last, combining the discourse of *Being and Nothingness* with that of the *Critique*, forms a kind of synthesis of Sartre's work.

At the time of his death in 1961 Merleau-Ponty was at work on a manuscript that has come to be known as *The Visible and the Invisible*, a work that some consider

his version of Martin Heidegger's "What Is Metaphysics?" It reveals a growing interest in an ontology that avoids the pitfalls of "philosophies of consciousness," with their subject-object relation, which has defined and limited philosophy in the West for centuries. Inspired by the painter's articulation of the world and building on the concepts of chiasm and flesh, introduced in his earlier *The Phenomenology of Perception*, Merleau-Ponty was moving beyond the boundaries of phenomenology to elaborate an "indirect ontology" in which language questioning being questions itself.

## EXISTENTIAL PSYCHOANALYSIS

"Existential psychoanalysis" is a trend in psychology and psychiatry best understood as a reaction against the theoretical and philosophical presuppositions of the psychologies based on natural science in general and of Freudian psychology in particular. The phenomenology of Edmund Husserl and the existentialism of Martin Heidegger, Jean-Paul Sartre, and Martin Buber, rather than the mechanistic worldview of natural science, are seen by existential psychoanalysts as providing the proper philosophical and methodological route to a more complete understanding of man. In its original form, therefore, existentialist psychoanalysis was not a countermovement to Freudian psychoanalysis, unlike Jungian or Adlerian psychoanalysis, for example. Its criticism always focused on the philosophical theory of man implicit in Sigmund Freud's work, and it offered itself as a philosophical complement to Freud. The main burden of its criticism is that a full understanding of the patient's experience and world is impeded if the patient is approached on terms derived from the hypotheses of natural science rather than on his own specifically human terms.

The pioneer of existential psychoanalysis, Ludwig Binswanger, sought to describe the experiential world of his patients with the help of the conceptual scheme of Heidegger's ontology of man's being. However, his work contained few major differences from Freud in therapeutic technique. Indeed, another existential analyst, Medard Boss, has claimed that existential analysis "enables psychotherapists to understand the meaning of Freud's rec-

ommendations for psychoanalytic treatment better than does his own theory” (*Psychoanalysis and Daseinsanalysis*, p. 237). The implication is, of course, that a fuller understanding of the patient will result in more efficacious treatment, but that the methods of treatment will not differ fundamentally from Freud’s. The result is to separate Freud’s dealings with his patients from the mechanistic scientific constructs by which he sought to explain psychic functioning.

However, those persons in the United States who call themselves or who are called existential psychoanalysts are a very heterogeneous group. Perhaps the most significant change in the United States is that existential psychoanalysis is seen by many practitioners as a substitute for Freudian psychoanalysis. The phenomenological method of describing and hence understanding the patient’s world is looked upon as itself a therapeutic measure, something far from the minds of the movement’s originators. Certain notions of Sartre or Buber concerning the existential encounter between human beings are taken as replacements for the classical analyst-patient relationship. On this point, Binswanger had simply argued that the full human meaning of the doctor-patient relationship be realized in therapy; he did not seek to eliminate the classical relationship. The result of these changes has been that almost any therapy that departs from the general Freudian mold is called existentialist—particularly those which place emphasis on unusual therapeutic intervention and those which reject the scientific element in psychoanalysis, for good and bad reasons. It is therefore essential to understand the philosophical core of the original movement.

### THE SUBJECT-OBJECT SPLIT

The shortcomings attributed to psychoanalysis emanate from the scientific tradition in which psychology has sought to place itself. Natural science since Galileo Galilei can be understood as a mode of approaching the world in which one aspect of the phenomenal world, the aspect of pure corporeality, is given the privileged position of basic substance, of primitive, irreducible fact. The notion of pure corporeality as the reality to which all phenomena are to be reduced is the concomitant of a dictate that the perceiver remove himself as much as possible from the world in the attempt to gain knowledge of that which is perceived. The roots of this dictate lie in the philosophy of René Descartes, which isolates the realm of consciousness from that of the body and the perceived world. Thus, the concept of pure corporeality is the product of a

methodological dictate: Keep the self out of its world as it investigates its world.

This famous Cartesian sundering of the world into two isolated regions, *res cogitans* (the thinking substance, the world of consciousness, purpose, telos, will, quality) and *res extensa* (the world of pure extended matter, undifferentiated, quantitative), has been attacked by phenomenologists and existentialists as the most disastrous event in four centuries of Western thought. Nevertheless, this subject-object split had the immeasurable value of disciplining a new kind of human self-awareness, in the air since the Renaissance: man’s awareness of his self-sufficiency and his urge to master nature, or the universe, which had revealed itself as a radical other. The split furthered man’s alienation from his world, but at the same time it gave him, in the methods and the objective attitude of natural science, the means to bridge the separation in action if not in philosophical comprehension.

But psychology, the most recent child of this attitude, is in a strained position. On the one hand it seeks to be objective, to take its place as one of the natural sciences along with biology, physics, and chemistry. On the other hand it seeks to study that which science since Descartes and Galileo has demanded be ruled out of the field of investigation—the soul, psyche, consciousness. Psychology is thus faced with the apparently self-contradictory task of investigating consciousness as part of the realm of the *res extensa*, although the *res extensa* is that which exists independently of consciousness. To investigate consciousness scientifically, psychology must eliminate from consciousness its essential element. Freud’s doctrine of the unconscious can be conceived of as an attempt to overcome this contradiction by viewing the essence of consciousness as that which lies in the realm of *res extensa*. His success is due to the fact that his scientific psychology, unlike others, does not reduce the experienced meanings in the field of consciousness to a level below the level of meaning. In Freudian psychology, meanings are reduced not to physiology or to objectively perceptible spatiotemporal processes, but to another kind of meaning, instinctual meaning.

All explanation involves the reduction of that which is explained to something taken as more basic. The ever-present danger is that that to which the phenomena are reduced may become so alien to the phenomena that there is no returning to them without circularly invoking previous knowledge. Freudian psychoanalysis seems to avoid this danger by focusing on a basic reality, instinctual meaning, which is not totally alien to the phenomena to be explained.

## INTENTIONALITY

Existential philosophy denies the subject-object split that defines the whole attitude of natural science. The mind, consciousness, is not a strange and unprecedented thing whose workings are somewhat more puzzling than those of its neighboring objects, the things of this world. Nor is it, as Descartes held, a distant spectator, alien and sufficient unto itself, moving like a ghost on Earth. For existential philosophy, the problem of how the mind reaches over to the object is a pseudo problem that results from the gratuitous and erroneous presupposition that consciousness can be understood independently, apart from that which it intends or is conscious of. Mind, or consciousness, is to be defined as simply this intentionality, this reference-to. Consciousness is not viewed as something that intends an object; consciousness is the intention.

Existentialist-phenomenological psychology maintains, therefore, that the phenomena with which psychoanalysis is concerned are intentional acts, conscious phenomena, not the nonintentional, nonreferring phenomena of the world of objects. Whereas other psychologies, in emulating science, stripped consciousness of that very quality that constitutes its essence, namely intentionality, the minimum level of reduction in psychoanalysis is an intentional act—instinct, a psychic act that intends pleasure.

However, the implications of the definition of consciousness as intentionality militate against the psychoanalytic notion of the unconscious. If consciousness is always consciousness of something, then what appears to consciousness is all of consciousness; there cannot, by definition, be an intentional act below the level of consciousness. To speak of “unconscious” acts is therefore a contradiction if the intentionality of these acts is to be preserved. If intentionality is not to be preserved, there is no contradiction; but then, of course, psychoanalysis would slip below the acceptable level of reduction. Thus Freud, according to existential philosophy, did not avoid the contradiction of placing the *res cogitans* in the *res extensa*, however brilliantly and extensively he refined his definitions of instinctual meaning.

## BEING-IN-THE-WORLD

The issue of intentionality springs directly from the work of Husserl, the founder of phenomenology. Husserl, as a pure phenomenologist, did not seek to discover anything about the natural world. He was concerned purely and simply with ascertaining the essence of phenomena as they appear to consciousness. The question whether these

phenomena correspond to the natural and real world he left to the explanatory disciplines of philosophy and science. Relations to the real human self he left to psychology. His student Heidegger, however, was interested in that oldest of philosophical questions, the nature of Being. For Heidegger, the essential structure of human being turns out to be an extension of the concept of intentionality. Just as consciousness is defined as consciousness-of, human being is characterized by Heidegger as being-in-the-world. The hyphens are deliberate; they represent an effort to undercut the subject-object split. Just as consciousness is not a separate entity that subsequently relates to objects, so man is not a separate being who then encounters his world. Rather, he is essentially in-the-world, he is his disclosure of world.

One essential that differentiates this basically human mode of being from that of the objectively known world is, for Heidegger, the element of possibility. The essence of man is always his possibilities, which he “has” in a more inclusive sense than the way an object has properties. An account of the factual content of an object can never express the essence of man, because that essence has yet to be his being as his own. Human time and space differ from “objective” time and space in that they are essentially related to man’s determination of himself and his world. The essence of man, for Heidegger, is his appropriation of his essence, his making it his own. Thus the categories that describe human being are not qualities, but matrices within which qualities are to be appropriated.

We have noted how psychoanalysis seeks to place the *res cogitans*, or intentionality, into the *res extensa*, or sphere of pure corporeality. Existentialists object to the way in which psychoanalytic theory attempts to give man an essence in the way that an object has an essence. For psychoanalysis instinct, or libido, constitutes a residue that is taken a priori as the irreducible limit of investigation. Man has instinct as an object has its essence. It is not to the credit of psychoanalysis that this instinct is an intentionality of a sort; the existentialists maintain that the whole notion of intentionality is perverted when one particular class of intentional acts is singled out a priori as the basis of all classes. The meaning of psychic acts, intentions, is to be arrived at on their own terms, phenomenologically; they are not to be given meaning, as are the objects of natural science. Since, for the existentialists, human existence precedes essence, the task of an existential psychoanalysis must be, in Sartre’s words, to uncover in each individual “a veritable irreducible; that is, an irreducible which would not be presented as the postulate of

the psychologist and the result of his refusal or his incapacity to go further.... This demand ... is based on the refusal to consider man as capable of being analyzed and reduced to original givens, to determined desires (or 'drives'), supported by the subject as properties [are] by an object" (*Being and Nothingness*, pp. 560–561). The task of existential psychoanalysis is to apprehend the essence of each individual's life and world. If existence precedes essence, the analyst must apprehend the matrix within which essence is yet to be determined in each individual. Sartre calls this matrix the original choice or original project; Binswanger calls it the transcendental category that is the individual's mode of being-in-the-world.

Thus the critique of Freudian theory offered by existential psychoanalysis differs from that of the various revisionists in that it questions the theoretical root of all major movements in contemporary psychology; the assumption that the study of man can be wholly a natural science, that the notion of *homo natura* (man as a creature of nature) most fully expresses the essence of human being. The practical implications for psychiatry involve, among other things, wresting the concepts of mental health and illness away from analogies with purely somatic medicine, and thereby redefining the overall goal of any psychotherapy.

## EXISTENTIAL PSYCHOANALYSIS [ADDENDUM]

Toward the conclusion of *Being and Nothingness* Jean-Paul Sartre proposes “existential psychoanalysis” as an alternative to the Freudian version that he had criticized. Respecting individual freedom and responsibility, its basic principle is that “man is a totality and not a collection” of drives and complexes. By a comparative hermeneutic of the complex, multilevel symbolic expressions of an agent’s actions it uncovers bad faith and ferrets out that fundamental project that gives unity and direction to our lives. It thereby renders possible “conversion” to an authentic existence, in which one can resist the need to create a substantialized self. Rejecting the hypothesis of an unconscious, this method relies heavily on pre-reflective consciousness and the distinction between what we prereflectively comprehend and reflectively know. The analyst’s empathetic understanding helps bring this comprehension to knowledge. Since all consciousness is practical, for Sartre, this transformation involves a reorientation of one’s way of being-in-the-world. Unfortunately, he concedes, “this psychoanalysis has not yet found its Freud.”

It has been observed that Sartrean analysis deals with a set of human needs that have nothing to do with Freudian drives, namely “relational needs for holding, mirroring, positive regard, and emotional responsiveness, and needs for the development of a coherent and flexible sense of ‘self’” (Cannon 1991, p. 1). Sartre’s later work underscores the enabling power of the third to mediate our identity and social efficacy. In social ensembles some third parties objectify and alienate, whereas others generate practical unity and effectiveness. Sartre argues that consciousness is intentional, not only in the traditional phenomenological sense that it constitutes objects, but in the existential sense that it sets goals and strategies to obtain them. Psychoanalytic interpretation unmask these goals and strategies.

Sartre has been accused of writing as if the human were born adult. But, in trying to understand Flaubert, he

claims that “everything took place in childhood” and devotes several volumes of *The Family Idiot* to chart the “spiral of personalization” by which the individual interiorizes and reexternalizes the structural relations into which it is born (its protohistory), the experiences of infancy and early childhood (its prehistory), and resultant “constitution” of its character and dispositions. At each stage the individual is in process of “making something out of what he or she has been made into.” Sartrean metatheory respects the objective possibilities of this individual’s situated being as it establishes “the way in which the child lives his or her family relations inside a given society.” The approach is familial.

Sartrean psychoanalysis assumed a social orientation in the 1950s and 1960s, as did his thought generally. It became a form of social critique, linked to the thesis that entire societies could suffer from “objective neurosis,” making it extremely difficult for its members to live authentic lives. His psychobiographies were prolonged instances of existentialist psychoanalysis conjoined to a kind of historical materialism, which he called the “progressive-regressive method.”

Although the concepts of bad faith and authenticity have entered popular discourse, Sartre’s psychoanalytic metatheory has yet to be adopted by professionals the way Heideggerian categories have been employed by Ludwig Binswanger, Medard Boss, and others.

## EXPERIENCE

As the average person understands the term *experience*, it means no more than familiarity with some matter of practical concern, based on repeated past acquaintance or performance. The experienced doctor or soldier knows his trade, not by the book merely, but by long practice under a variety of circumstances. The older philosophical meaning of the word differs but little from this, denoting as it does the capacity to do something, learned in the habit of doing it and guided rather by rule-of-thumb precept than by theoretical understanding (cf. the well-known passage in Aristotle, *Posterior Analytics* II, 19). It is in this fashion—by retention of individual memories and their gradual hardening into principle—that the craftsman acquires his skill, the scientist his knowledge, and the practical man his wisdom. But (save in the last case, perhaps) it represents at best only a stage on the way to real understanding in terms of universals and is thus by most ancient writers despised as a makeshift and uncertain form of knowledge. The mere empiric cuts, and continues to cut, a poor figure even into the modern period, though by that time associated, rather (as in Francis Bacon), with the trial-and-error experimenter in alchemy or medicine who endeavors by persistence alone to filch Nature's secrets without first gaining insight into its laws. The preference for rational certainty over mere empirical generalization is in fact endemic among philosophers and can be seen not merely in avowed rationalists (such as René Descartes), but also, for example, in those whose uneasiness over the principle of induction has led them to seek ways of validating it as the major premise for a quasi-deductive treatment of science.

The experience from which the empiric draws his conjectures is, of course, the homely and substantial experience of a world of public objects, which forms for all sane and unreflective persons the basis of ordinary life. It has been regularly insisted, however, since the earliest times, that experience in this sense is nothing ultimate: the alleged paradoxes of motion and change and the more familiar facts of perceptual error and illusion are enough (it is thought) to show that it cannot be straightforwardly identified with the real. Hence, in addition to the rejection of habit-learning as a road to knowledge, there arises that further prejudice against the deliverances of the senses and in favor of necessary reasoning from first principles, of which the Parmenidean distinction between the “ways” of truth and opinion is an early and famous example.

## THE “GIVEN”

The uncertainty of sense experience leads, by this route, to a further important conclusion. Since perceptual illusion and mistake seem essentially to be the fault of the observer, he must himself contribute something to his experience by way of inference, interpretation, or construction. Experience must, in part at least, be the work of the mind. For all that, the individual certainly does not create or invent his experience and in certain respects is powerless to alter it at will, it seems, therefore, equally undeniable that some part of it is simply “given” and is only thereafter subject to adulteration by its recipient. This given is generally referred to as the object of “bare” or “immediate” experience, in contrast to the more “solid” or developed experience of which it is held to be an essential ingredient. The legitimacy of the contrast is seldom, indeed, disputed, for though immediate experience has often been denounced as a myth, the usual motive for doing so has been to stigmatize it as a mere abstraction got by analysis and not something that could occur, psychologically, by itself. *All* experience, on this view, involves interpretation, and it is thus senseless to suppose any unvarnished, direct acquaintance with the given. But since it would be equally senseless to suppose an interpretation with nothing to interpret, it is commonly admitted that an “epistemic” given must nonetheless be present in experience, though impossible to view independently, since this would ipso facto be to construe it in some fashion under the auspices of thought.

For writers who accept either a psychological or an epistemic given, a number of problems arise. What does it consist of? What marks or features does it exhibit? How is it related to the everyday experience built upon it? And how, once the latter has been derived, is it possible to proceed from there to the realities that presumably underlie, occasion, and explain the whole? The last is essentially a metaphysical question, but the remainder (to which we here confine ourselves) are staple topics of epistemological dispute.

As to the content of immediate experience, there are characteristic differences of opinion. At one extreme lie the theories of direct realism, whose claim is that material objects are immediately given, so that no real difference arises between naked and clothed experience, sensation and perception, or for that matter appearance and reality; apart from perceptual error there is thus no “problem of knowledge” at all. At the opposite pole are the theories of William James and F. H. Bradley, for whom immediate experience presents only an undifferentiated mass of feeling or sensation in which nothing is discriminated or

related and in which even the contrast between subject and object has not begun to appear. Of this “blooming, buzzing confusion” (in James’s well-known phrase), it is obvious that nothing can be said, even to distinguish its modes. Ex hypothesi, it is merely the residue left after elimination of all processes involving association, memory, judgment, thought, and language; it is free from error because it says nothing; but as such, however indispensable, it has little to contribute to knowledge.

Writers in the empiricist tradition, less anxious to make knowledge the sole work of the mind, have been correspondingly averse to such unstructured versions of the experiential given, though the argument from illusion has equally deterred the majority from claiming direct acquaintance with a world of things. For most of them the given includes at least simple sense-qualities of color, taste, sound, and so on, together with organic sensations, feelings, and images, it being generally assumed that these are presented individually and even as “atomic” cognitive units (impressions, ideas, sense data, etc.) to a consciousness distinct from themselves. Beyond this, however, there is little agreement. Some have asserted, while others have denied, that spatial, temporal, causal, or other relations are given in this fashion. Some have been prepared to admit associative or sign material as part of the given; others have not. Visual impressions, for example, have been held (most notably by George Berkeley) to be initially two-dimensional; but in other writers (for example, H. H. Price) the claim is that they are presented in, or as having, depth. Images, memory impressions, and feelings have all been ascribed to the given, but again it is disputed as to whether all images belong in this category or only those of simple qualities (as with impressions of sense). There is similar contention as to whether the “pastness” of the memory image is intrinsic to it or imputed on the strength of some other feature, and whether, in general, the “inner” and “outer” character of feelings and images, on the one hand, and sense impressions on the other, are marks of the data themselves, or a construction imposed upon them.

### CRITERIA OF “GIVENNESS”

The foregoing differences and others like them are not, as they seem, due to want of regard for the facts, nor would closer attention suffice to dispel them. They arise from a failure in agreement as to the formal characteristics of “givenness” itself, and hence as to the criteria for its identification. What are these criteria? The commonest answers seem to be that the given is private; that it is adventitious (in Descartes’s sense); that it is simple, as

involving no element of thought or inference; and that it is incorrigible. Too often these tests are also assumed to coincide in yielding the same result or to be sufficient rather than necessary conditions for givenness. Many of the historic uncertainties surrounding the description of the given would appear to have arisen in this way.

Privacy, for example, is inconsistent with simplicity, inasmuch as every variety of thought and feeling, imagery, or sensory seeming is necessarily private, however obvious it may be that it belongs to a sophisticated rather than a primitive level of consciousness. Adventitiousness, as a criterion, would similarly include within the given all phenomena not under the subject’s voluntary control, including the appearance and causal behavior of objects, but excluding some part of his thoughts and feelings—though how much it seems impossible to say. In both cases the given seems too generously defined to serve as a foundation for knowledge. If the given is limited to experience uncontaminated by “inference,” the difficulty is to know what counts as such and hence where analysis is to stop. Even the lowliest amoeba can react to sensory cues and so “transcend the given,” but who is to say if it thinks or not?

The psychological given, on this showing, may well be accounted a myth. The epistemological arguments, however, are harder to put aside. Their main support has been the belief that the data they point to represent the only foundations for knowledge that could be called certain or incorrigible. The judgments of perceptual experience, concerning the existence, properties, and relations of objects, are all (it is said) subject to error, and so open to correction. But reports of what seems merely, of the presence of sense qualities to consciousness, make no such claim about real existence and so run no risk of mistake. The “sense datum” theories popular from 1900 onward, like their eighteenth-century predecessors, attempted to erect on this basis a theory of knowledge more stable and concrete than that underwritten by the necessary truths of rationalism. Their vogue has declined, however, and that for two reasons. On the one hand it has been argued that no sense datum statement, however guarded, can fail (if it says anything at all) to make some conceptual commitment that might later call for retraction; and on the other, that a great many factual statements are quite as certain as those they are alleged to depend on. Given a sufficiently straightforward case of perceptual contact with an object, there is no ground for treating it as a judgment based on the “evidence” of sense data, since it is beyond the power of any future evidence to enforce its withdrawal. It is as certain as anything could

be, and nothing is gained, therefore, by an appeal to supposedly more primitive certainties to provide it with support.

### ORDINARY EXPERIENCE

The above argument is not beyond question, but it illustrates the difficulties not merely of characterizing the sensory given but even of securing agreement as to its existence. It is more profitable, perhaps, to turn for a moment to those writers who, having accepted a given of some sort from the outset, have occupied themselves with the second stage of the problem, namely, the manner in which this given is elaborated into the fullness of ordinary experience. Here the issue lies chiefly between those who maintain (with John Locke, and still more, with Étienne Bonnot de Condillac) that the concepts employed in the construction of developed experience are themselves derived (by abstraction, association, composition, or induction) from immediate experience, and those who argue (as do all rationalists) that this elaboration depends on principles contributed by the mind a priori, and not first learned from experience itself. The rationalist does not thereby deny the fact of immediate experience any more than does the empiricist. His claim, rather, is that this experience does not make itself intelligible by any natural process and that it is only the logical activity of the mind that brings order and coherence into the result.

The most celebrated statement of this position is doubtless that of Immanuel Kant, for whom the “manifold” of sensory intuition, though spatiotemporally ordered insofar as it is presented at all, is unified into a world of empirical objects only insofar as it is brought under the a priori rules, or categories, of the understanding. Experience in the full sense is thus a synthesis, part given and part made, though in some of Kant’s idealist successors the creative aspect is so far emphasized at the expense of the given as to tend toward that extreme of rationalism in which the world of experience is construed as an exclusively mental product, with no element of “brute fact” in it at all. For the modern “logical empiricist” the position is, in effect, reversed, his typical doctrine being (as already noticed) that the content of all empirical propositions can be reduced without remainder to “protocols” recording actual or possible fragments of immediate experience.

But the attempt to reconstitute ordinary experience out of a mixture of sense data and formal logic, though long and ably sustained, has met in the end with little more success than the search for certainty that led to the introduction of these data in the first place. Recent work

on the subject has shown signs of impatience with this starting point and seeks to discredit it by attacking the whole distinction between sensation and perception—the two-level theory of experience—and the argument from illusion on which that distinction so largely depends. Whether this rejection of the traditional premises of the problem offers any hope of solving (or dissolving) it is a question that time alone can answer. If experience teaches anything, it is that success is unlikely; but then, even in philosophy (or so philosophy tells us), experience is not always or necessarily a reliable guide.

## EXPERIMENTATION AND INSTRUMENTATION

See Appendix, Vol. 10

### EXPLANATION

The three cardinal aims of science are prediction, control, and explanation, but the greatest of these is explanation. It is also the most inscrutable: Prediction aims at truth, and control at happiness, and insofar as one has some independent grasp of these notions, one can evaluate science's strategies of prediction and control from the outside. Explanation, by contrast, aims at scientific understanding, a good intrinsic to science, and therefore something that it seems one can only look to science itself to explicate.

Philosophers have wondered whether science might be better off abandoning the pursuit of explanation. Pierre Duhem (1954), among others, argued that explanatory knowledge would have to be a kind of knowledge so exalted as to be forever beyond the reach of ordinary scientific inquiry: it would have to be knowledge of the essential natures of things, something that neo-Kantians, empiricists, and level-headed practitioners of science could all agree was neither possible nor perhaps even desirable.

Everything changed when Carl Gustav Hempel formulated his deductive-nomological account of explanation. In accordance with the previous observation, that one's only clue to the nature of explanatory knowledge is science's own explanatory practice, Hempel proposed simply to describe what kind of things scientists tendered when they claimed to have an explanation, without asking whether such things were capable of providing true understanding. Since Hempel, the philosophy of scientific explanation has proceeded in this humble vein, seeming more like a sociology of scientific practice than an inquiry into a set of transcendent norms. In keeping with its mission as a branch of philosophy, however, the study of explanation pursues a particular kind of sociological knowledge: It is concerned almost exclusively with the ideal at which scientists take themselves to be aiming, and barely at all with the steps and missteps taken on the way to realizing the ideal.

As Hempel saw it, scientific explanation was of a piece with prediction, requiring the same resources and giving a similar kind of satisfaction. No doubt this modest view of the explanatory enterprise played a part in making the study of explanation acceptable in the climate of postwar empiricism. The story of explanation in decades since Hempel's time, however, is an expansionist one. Over the years philosophers of explanation have gradually required more resources for, and made grander claims for the significance of, explanation's role in science. (For a comprehensive overview of the philosophy of explanation from 1948 to 1988, with a full bibliography, see Wesley C. Salmon [1990].)

### THE DEDUCTIVE-NOMOLOGICAL ACCOUNT

Hempel's deductive-nomological (DN) account (Hempel and Oppenheim 1948) is intended to capture the form of any deterministic scientific explanation of an individual event, such as the expansion of a particular metal bar when heated, the extinction of the dinosaurs, or the outbreak of the U.S. Civil War.

According to Hempel such an explanation is always a deductive derivation of the occurrence of the event to be explained from a set of true propositions including at least one statement of a scientific law. (The event to be explained is called the explanandum; the set of explaining statements is sometimes called the explanans.) In other words, a deterministic event explanation is always a sound, law-involving, deductive argument with the conclusion that the explanandum event occurred.

Intuitively, the premises of a DN explanation spell out the relevant initial and background conditions, and the laws governing the behavior of the system in which the explanandum occurred. For example, Hempel cites the following argument as a typical DN explanation of the event of a thermometer's mercury expanding when placed in hot water:

The (cool) sample of mercury was placed in hot water,  
heating it,

Mercury expands when heated thus

---

The sample of mercury expanded

Because the law or laws that must be cited in a DN explanation typically cover the pattern of behavior of which the explanandum is an instance, the DN account is sometimes referred to as the covering law account of explanation.

One can see that the DN account is not intended to give the form of probabilistic event explanations; Hempel offers a separate account of probabilistic explanation, which will be discussed later on. The explanation of phenomena other than events is, by contrast, apparently amenable to the DN approach. Hempel suggests that a scientific law can be explained, for example, much like an event, by deducing it from premises including at least one other law. However, he finds himself unable to make good on this proposal, for reasons connected to the relevance problem discussed in the next section.

Many scientific explanations of events and other phenomena undoubtedly have the form proposed by the DN account: They are logical derivations from laws and other information. Hempel does not entirely satisfy himself, however, with answering questions of form. Taking one step beyond sociological humility, he advances a thesis as to why deductive, law-involving arguments should confer understanding, "[A DN explanation] shows that, given the particular circumstances and the laws in question, the occurrence of the phenomenon *was to be expected*; and it is in this sense that the explanation enables us to *understand why* the phenomenon occurred" (1965a, p. 337, emphasis in the original).

Scientific understanding, then, takes the form of retrospective expectation: One might say (loosely) that, whereas prediction is concerned with what one should expect in the future, explanation is concerned with what one should have expected in the past. Explanation is, then, put on a par with prediction and so made safe for empiricist philosophy of science. Hempel even goes so far

as to say that the difference between explanation and prediction is merely pragmatic (Hempel and Oppenheim 1948) though the DN account does not in itself entail such a thesis.

## OBJECTIONS TO THE DN ACCOUNT

Three kinds of objections to the DN account have been especially important for the subsequent development of the philosophy of explanation.

The first kind of objection, developed by Henry Kyburg, Salmon, and others, points to the DN theory's inability to account for judgments of explanatory relevance. The paradigm is the following argument, which satisfies all the DN account's criteria for a good explanation of the event of a particular teaspoon of salt's dissolving:

The teaspoon of salt was hexed (meaning that certain  
hand gestures were made over the salt),

The salt was placed in water,

All hexed salt dissolves when placed in water thus,

---

The salt dissolved.

The explanation appears to attribute the salt's dissolving in part to its being hexed, when in fact the hexing is irrelevant.

There are various responses to the counterexample that aim to preserve as much of the DN account as possible, for example, holding that the generalization about hexed salt is not a true law or imposing the requirement that a DN explanation use the most general law available.

Salmon's much less conservative reaction is to conclude that Hempel is wrong to think of explanation in terms of expectability, therefore of explanations as kinds of argument. The relation between the factors cited in an explanation and the explanandum itself, Salmon holds, is not epistemic, but ontic; it should be a physical relevance relation—a relation of statistical relevance, he first proposes (1970), or a relation of causal relevance, as he later comes to believe (1984). The faulty explanation of the salt's dissolving is to be discarded, argues Salmon, not because of some formal or logical defect, but because it cites an event, the hexing of the salt, that fails to bear the appropriate relevance relation to the explanandum.

Hempel himself declines (early in his career, at least) to give a DN account of the explanation of laws because of a related problem. Kepler's laws may be derived from a

single law that is simply the conjunction of Kepler's laws and Boyle's law. Such a derivation is clearly no explanation of Kepler's laws, writes Hempel, yet it satisfies the DN account's requirements: The premises are true and the argument is valid and law involving (Hempel and Oppenheim 1948).

The second important objection to the DN account is perhaps also the most famous. It shows, most philosophers would agree, that the DN account pays insufficient attention to the explanatory role of causal relations.

The height of a flagpole can be cited, along with the position of the sun and the law that light travels in straight lines, to explain the length of the flagpole's shadow. The DN account is well able to make sense of this explanation: It can be cast in the form of a sound, law-involving argument. However, now take this same argument and switch the premise stating the height of the flagpole with the premise stating the length of the shadow. One now has a sound, law-involving argument for the height of the flagpole that cites, among other things, the length of the shadow—thus, according to the DN account, one has an explanation of the height of the flagpole that cites, as an explainer, the length of the shadow. This consequence of the DN account—that the height of a flagpole can be explained by the length of its shadow—seems obviously wrong, and it is wrong, it seems, because a cause cannot be explained by its own effects.

A further famous example strongly suggests that effects can only be explained by their causes and the laws and background conditions in virtue of which they are causes. Suppose that the arrival of a certain kind of weather front is always followed by a storm and that a certain reading on a barometer is a sure sign that such a front has arrived. Then a barometer reading of this sort is always followed by a storm. The storm cannot be explained, however, by citing the barometer reading and that such readings are always followed by storms, though these two facts together satisfy the requirements of the DN account. A constant, robust correlation is not, it appears, enough for explanation. What is needed, as Salmon eventually concludes, is a causal relation.

At first Hempel resists the suggestion that facts about causation play any special role in explanation (e.g., see 1965a, §2.2). Over the years, however, due in part to the development of sophisticated empiricist accounts of causation, this has become a minority view.

The third class of objections to the DN account focuses on the account's requirements that every explana-

tion cite a law and that (except in probabilistic explanation) the law or laws be strong enough to entail, given appropriate boundary conditions, the explanandum. One way to develop the objection is to point to everyday explanations that cite the cause of an event as its explanation, without mentioning any covering law, as when one cites a patch of ice on the road as the cause of a motorcycle accident.

More important for the study of explanation in science are varieties of explanation in which there is no prospect and no need for either the entailment or the probabilification of the explanandum. Perhaps the best example of all is Darwinian explanation, in which a trait *T* of some species is explained by pointing to the way in which *T* enhanced, directly or indirectly, the reproductive prospects of its possessor. Attempting to fit Darwinian explanation into the DN framework creates a host of problems, among which the most intractable is perhaps the following (Scriven 1959): For every trait that evolved because it benefited its possessors in some way, there are many other, equally valuable traits that did not evolve, perhaps because the right mutation did not occur, perhaps for more systematic reasons (e.g., the trait's evolution would have required a dramatic reconfiguration of the species' developmental pathways). To have a DN explanation of *T*, one would have to produce a deductive argument entailing that *T*, and none of the alternatives, evolved. In other words, one would have to be in a position to show that *T* had to evolve. Not only does this seem close to impossible but also it seems unnecessary for understanding the appearance of *T*. One can understand the course of evolution without retrospectively predicting its every twist and turn.

Hempel is aware of the problem with Darwinian explanation. His response is to argue that there is no such thing: Faced with a choice between the DN account and Darwinian explanation, one should opt for the former and consider Darwinian stories to be at best partial explanations of traits (Hempel 1965c). He advocates a similar deflationary treatment of functionalist explanation in sociology and of historical explanations that are not entailments.

## THE INDUCTIVE-STATISTICAL ACCOUNT

Hempel's (1965a, §3) account of the probabilistic explanation of events, the inductive-statistical (IS) account, in many ways parallels the DN account of deterministic event explanation. Like a DN explanation, an IS explanation is a law-involving argument giving good reason to

expect that the explanandum event occurred. However, whereas a DN explanation is a deductive argument entailing the explanandum, an IS explanation is an inductive argument conferring high probability on the explanandum.

Hempel's example is the explanation of John Jones's swift recovery from a strep infection. The probability of a swift recovery without the administration of penicillin, Hempel supposes, is 0.1, while the probability with penicillin is 0.9. Citing Jones's infection, his treatment with penicillin, and the resulting high probability of recovery, then, confers a high probability on Jones's swift recovery; in the circumstances, one would expect Jones to recover swiftly. This inductive argument is sufficient, in Hempel's view, to explain the swift recovery.

Inductive soundness imposes one additional requirement with no parallel in deductive logic. Suppose one knows that Jones's strain of strep is resistant to penicillin. An inductive argument is said to be sound only if all relevant background knowledge is taken into account; consequently, an inductive argument for Jones's swift recovery must cite the infection's penicillin resistance. But once the new premise is added, the argument will no longer confer a high probability on its conclusion. This is what is wanted: There ought to be no inductive argument for swift recovery—one ought not to expect swift recovery—when the strep is known to be resistant.

Hempel imposes a similar requirement on IS explanations, which he calls the requirement of maximal specificity (for details, see Hempel 1965a, §3.4). In virtue of this requirement, it is not possible to explain Jones's swift recovery by citing treatment with penicillin when the infection is known to be penicillin resistant.

As with the DN account of explanation, a number of objections to the IS account have exerted a strong influence on the subsequent development of the philosophical study of explanation. Versions of both the relevance and the causal objections apply to the IS account as well as to the DN account. Two other important criticisms will be briefly described here.

The first is the complaint that it is too much to ask that explanations confer high probability on their explananda. In many ways, this is the analogue of the third objection to the DN account mentioned earlier; in the same paper that Michael Scriven (1959) expresses doubts about the existence of a DN treatment of Darwinian explanation, he describes the following example, best conceived of as an objection to the IS account. The probability that Jones contracts paresis, a form of tertiary

syphilis that attacks the central nervous system, given that he has untreated secondary syphilis, is low. However, only syphilitics contract paresis. It seems reasonable to cite untreated syphilis, then, as explaining Jones's paresis, though the explanation confers only a low probability on the explanandum.

The proponent of the IS account is committed to rejecting such attempts at explanation, as Hempel does, arguing that in such cases one has only a partial explanation of why the patient contracted syphilis. This is perhaps one of the most convincing of Hempel's defenses, but the paresis example is nevertheless widely regarded as posing a serious problem for the expectability approach to explanation.

A second objection to the IS account focuses on the requirement of maximal specificity. The requirement insists that all relevant background knowledge must be included in a probabilistic event explanation, but it does not require that relevant but unknown information be taken into account. In particular, if Jones's infection is penicillin resistant, but this fact is not known to the explainer, then the IS account deems the explainer's appeal to the administration of penicillin as a perfectly good explanation of Jones's swift recovery.

As J. Alberto Coffa (1974) argues, this is surely not correct. If the infection is resistant to penicillin, then the administration of penicillin cannot explain the recovery, regardless of what the explainer does and does not know. The requirement of maximal specificity makes probabilistic explanation relative to the explainer's epistemic situation, then, in a way that it appears not to be. This objection hits right at the heart of the expectability conception of explanation, suggesting that explanation is not an epistemic matter in the least. A third objection that is applicable to many accounts of probabilistic explanation will be raised in the following discussion of the statistical relevance account.

## THE STATISTICAL RELEVANCE ACCOUNT

In response to the DN account's relevance problem, Salmon suggests that the factors cited in an explanation must stand in a relation of statistical relevance (SR) to the explanandum. He does not intend this as a friendly amendment to Hempel's account, but as a radical reconceptualization of the nature of explanation: The function of an explanation, Salmon (1970) argues, is not to show that the explanandum was to be expected, but to describe factors—ideally, all the factors—statistically relevant to the occurrence of the explanandum.

From the beginning, statistical relevance is presented as an objective relation, that is, a relation holding independently of the explainer's background knowledge or other context. (Coffa's [1974] critique of the IS account, discussed earlier, discourages relativistic backsliding.) Salmon thus requires an account of probability that is both objective and broad enough to encompass any possible explanandum.

For breadth, he settles on frequentism, the view that the probability of an event type is equal to the frequency with which it occurs in a reference class of outcomes. For objectivity, he develops what he calls a homogeneity constraint on the reference classes that can be used as bases for explanatory probabilities. Such a constraint, he believes, is strong enough to determine a single, observer-independent probability distribution over any set of outcomes of interest. Salmon (1984) summarizes the theory of homogeneity; for further information, see the discussion of the reference class problem in the separate entry on probability and chance.

Statistical relevance is a comparative concept: To say that a factor *A* is statistically relevant to the occurrence of an event *E* is to say that the probability of *E* (or for the frequentist, of events of the same type as *E*) in the presence of *A* is greater than the probability of *E* in the absence of *A*. Thus, the determination of a relevance relation requires not only a reference class—a class of outcomes all of which occurred in the presence of *A*—but a contrast class, a class of outcomes all of which occurred in the absence of *A*. The contrast class is not normally homogeneous. Thus for Salmon, the contrast probability must be a weighted sum of different homogeneous probabilities, each corresponding to a different way that *A* might have been absent, and giving the probability of *E* when *A* is absent in that way.

Perhaps inevitably, if not inescapably, Salmon arrives at the view that a full SR explanation is a complete table of relevance, describing not only factors that are present and statistically relevant to the explanandum but also factors that are absent but would have been statistically relevant if they had been present. He further adds to the table all the alternatives to the explanandum *E* with respect to which there existed homogeneous probabilities, and a list of all the factors that would have been relevant to these alternatives, if they occurred. Consequently, the information proffered in an SR explanation of an event *E* not only explains the actual occurrence of *E* but would also explain any occurrence of an event of the same type, even if different relevant factors were present, as well as the occurrence of any alternative to *E*.

As something of a corollary to this view, Salmon holds that negatively relevant factors—factors that lower the probability of the explanandum—are as explanatory as positively relevant factors and that all factors should be mentioned regardless of their degree of relevance. Salmon's not discriminating among these factors is perhaps best understood as follows. Seeing that a factor is statistically relevant to the explanandum is an explanatory end in itself. That the factor makes a particular kind of change—positive or negative, large or small—to the total probability of the explanandum would be important only if appreciating the value of the total probability were also an explanatory end. However, it is not; knowing which relevance relations hold is all that matters.

Four objections to the SR account are considered here. First, for all Salmon's justifications, an SR account seems to contain too much information. To explain *E* when *A* was absent, why is it necessary to know that, had *A* been present, it would have been relevant? Why is it further necessary to know what would have been relevant to the occurrence of some alternative to a type *E* event that did not in fact occur? This information does not appear to be directly relevant to the explanatory task at hand, that of explaining *E* itself.

Second, the SR account seems vulnerable to the causal objection to the DN account; it seems to hold that *A* is explanatorily relevant to *E* whenever *A* is correlated with *E*, when in fact it is necessary that *A* be a cause of *E*. The barometer reading is statistically relevant to the storm in the example described earlier, but it does not thereby explain the storm.

Salmon is well aware of this problem and proposes that only certain kinds of statistical relevance relations are explanatory, namely, those that survive a screening off test. A factor *A* that is correlated with *E* is screened off from *E* by another factor *B* if, conditional on *B*, *A* makes no difference to the probability of *E* (just as, for example, conditional on the presence of the front, the barometer reading makes no difference to the probability of the storm), but conditional on *A*, *B* does make a difference to the probability of *E*. When there is some *B* that screens off *A* from *E*, Salmon says that *A* is not genuinely statistically relevant to *E*. And *A*'s relevance will indeed disappear in a relevance table that also cites *B*. Note that Salmon's treatment does not make an explicit appeal to causal facts. Whether all problems concerning the role of causation in explanation can be solved in this way is unclear.

A third objection dogs all the probabilistic accounts of explanation to be considered in this entry. Suppose that I strap a small but unreliable bomb to one wheel of

your car. The probability that the bomb detonates is 50 percent, in which case your tire goes flat. The trigger fails, but you drive over a nail and your tire does go flat. The bomb has increased the probability of the flat, but it plays no role in its explanation. (Does the presence of the nail screen off the presence of the bomb? No, if it is assumed that the nail's effect is, like that of the bomb, probabilistic.) Sometimes statistically relevant factors are explanatorily irrelevant. Finally, it is not easy to see how the SR account might be generalized to give an account of the explanation of phenomena other than events.

### THE UNIFICATION ACCOUNT

Michael Friedman (1974) suggests that, while the logical empiricists' official account of explanation is the expectability account, they have an unofficial account, too, on which to explain a phenomenon is to see it as an instance of a broad pattern of similar phenomena. Hempel himself occasionally writes in this vein, "The understanding [explanation] conveys lies ... in the insight that the explanandum fits into, or can be subsumed under, a system of uniformities represented by empirical laws or theoretical principles" (1965a, p. 488). Friedman formulates what he calls a unification account of explanation, a particularly global version of this conception of explanation as pattern subsumption, on which a phenomenon is explained by the system of subsuming laws that best unifies all the phenomena there are. Philip Kitcher (1981, 1989) amends and extends Friedman's account in various ways.

The unifying power of a theory is proportional, on both Friedman's and Kitcher's accounts, not only to the number of phenomena that can be subsumed under the theory but also to the simplicity of the theory. (Kitcher imposes some additional desiderata.) The theory that best unifies all the phenomena, then, might be said to yield the most for the fewest: The most derivable phenomena for the fewest number of basic principles. It is characteristic of the unificationist position to insist that only the most unifying theory has full explanatory power, but this view does not in itself preclude the possibility of partial explanation by more weakly unifying theories.

Why be a unificationist? Friedman suggests that the virtue of the most unifying theory is that it reduces to a minimum the number of fundamental incomprehensibilities, that is, unexplained explainers. Perhaps a more common justification for unificationism is that suggested by Hempel: To understand something is to fit it into a wider pattern. Add that the wider the pattern, the more

powerful the explanation, and one is well on the way to unificationism.

Many of the virtues of the unification account stem from the great versatility of the pattern subsumption relation. A subsuming pattern need not be exceptionless, so not only probabilistic explanation but also other forms of nondeductive explanation fit the unification mold. Darwinian explanation, for example, can be seen as accounting for a trait by seeing it as part of a widespread pattern of adaptedness in the biological world—though Kitcher (1989, §5), for one, resists this view of evolutionary explanation, and indeed, argues that all explanations can be formulated as deductive arguments. More inclusively, Kitcher argues that unificationism supplies an effective account of mathematical, as well as scientific, explanation. For some further claimed advantages of the unification over the causal approach, see Kitcher (1989, §3).

Unificationism promises to give a powerful and subtle account of explanatory relevance. For example, an explanation of a teaspoon of salt's dissolving that cites the law "all hexed salt dissolves in water" is rejected as insufficiently unifying, because the law is both more complex and covers fewer phenomena than the law "all salt dissolves in water." More interesting, the unificationist can give an account of why many of the low-level details of the implementation of biological, psychological, economic, and social mechanisms seem to be irrelevant to understanding those mechanisms' behavior; the details, however, have yet to be worked out (Kitcher 1984).

Two important classes of objections stand in the way of the unification approach to explanation. First is the familiar question concerning the role of causation in explanation. Can the unification account explain why explanation so often, perhaps always, seems to follow the direction of causation? One might think not: The explanation of a flagpole's height in terms of the length of its shadow seems to cite just as unifying a pattern as the explanation of shadow length in terms of pole height—the same pattern, in fact.

Kitcher (1981) takes up the challenge, arguing that the unification account reproduces the asymmetries in explanation usually put down to something causal. On his view, a unifying pattern is an argument pattern. Since arguments have a direction, the pattern in which the pole height explains the shadow length is distinguished from the pattern in which the length explains the height. The unifying power of each must, therefore, be assessed separately. To solve the problem, the correct comparison is not between the unifying power of these two argument

patterns, but between the unifying power of the pattern that wrongly explains pole height in terms of shadow length and that of the pattern one usually cites to explain the height of a flagpole.

Kitcher calls this latter argument pattern an origin and development pattern and claims that it is instantiated by, and so subsumes, every account one gives of the properties of a thing that describes its origin and development, as when, for example, one tells the story of the construction and erection of the flagpole. The pattern is enormously general, then, and so easily wins the right to explain the height of the flagpole. Having argued, in effect, that unificationist explanation tends to proceed in the direction of causation, Kitcher then makes the dramatic claim that it is the order of explanation that determines the order of causation; one's causal beliefs depend on and reflect one's explanatory practice.

The second objection to explanatory unificationism is that it makes explanation an overly global matter. How one phenomenon is to be explained depends, according to the unificationist, on what best unifies all the other phenomena, therefore on what the other phenomena are. To many writers, it seems that finding an explanation does not require, even in principle, knowledge extending to all corners of the universe. A more moderate or local unificationism is possible, of course, but another natural place to look for locality is in the causal approach to explanation.

## THE CAUSAL APPROACH

In 1965 Hempel could regard the idea that there is something causal to explanation over and above the exceptionless regularities cited by a DN explanation as lacking a "precise construal" (1965a, p. 353). Since that time philosophers have come to see claims about causal relations as having a rich empirical content that goes far beyond mere regularities and their instantiation (see Spirtes et al. [2000]), though the tradition began well before Hempel made his remark, with Reichenbach [1956]). Even metaphysical empiricists, then, can agree that there is a distinctive causal approach to explanation. Thanks to the development of sophisticated but wholly empiricist accounts of causation (again beginning with Reichenbach), they can go further and in good conscience endorse the causal approach.

Strong arguments suggest that the causal approach is correct. The first and most persuasive is the equation of causal and explanatory direction suggested by the flagpole/shadow and barometer/storm examples. The second is the observation that a requirement of causal relevance

between explainers and the explained will deal with the problem of the hexed salt and similar cases. The third is that one can give a cause for a phenomenon without being able to predict it. In those counterexamples to the DN and IS accounts where grounds insufficient for prediction nevertheless seem to be sufficient for explanation—the explanation of paresis by syphilis and of a trait's evolution by its conferring a certain benefit—the force of the explanation might well be thought to lie in the aptness of the cited cause. The causal approach is now dominant in the philosophy of explanation.

The most important divide within the causal approach concerns the nature of the causal relation called on to do the explanatory work. Salmon (1984) invokes a notion of causation close to fundamental physics and declares the explanation of an event to consist of the sum total of causal influences on the explanandum in this fundamental level sense.

Such an account, however, appears to count far too many events as explanatorily relevant. As Salmon concedes, though a baseball causally influences the window that it shatters, and so rightly counts as a part of the explanation of the shattering, so do the shouts of the ball players, which cause the window to vibrate even as it is struck by the ball. The shouts, too, then, will be counted on Salmon's approach as a part of the explanation of the shattering. However, they are surely (except perhaps in some unusual cases) irrelevant.

A popular response to this worry begins with the observation that, while it is correct to say that the ball caused the window to shatter, it is not correct to say that the shouts caused the window to shatter. Such locutions suggest that there is another kind of causal relation, distinct from Salmon's fundamental physical relation, that holds between the ball and the shattering but not between the shouts and the shattering.

How can it be that Salmon's relation holds between the shouts and the shattering but the new causal relation does not? One response is that Salmon's relation is based on a faulty theory of causation, but this is not the answer normally given. Rather, the new causal relation is understood as relating events at all levels, whereas Salmon's causality relates events only at the lowest level.

The high-level event of the shattering is the event that would have occurred no matter what the physical details of the shattering, that is, no matter which shards of glass flew where. The low-level event is the event individuated by all the shattering's physical details; this event only occurred, then, because the window shattered in

exactly the way that it did. (Some writers call high-level events states of affairs or facts and hold that events proper are always low level.)

When one asks for an explanation of the shattering, one is normally asking for an explanation of the fact that the window shattered, not that it shattered in exactly the way it did. Thus, one asks for the causes of the high-level event, not the low-level event. Even though the low- and high-level events are coextensive in space and time, it seems that there are causes of the former that are not among the causes of the latter, namely, the events that determine, given that the shattering occurred, exactly how it occurred. These detail-determining events, because they are not causes of the explanandum, the shattering, do not explain it (for more on the potential for different causal relations between low- and high-level events, see Bennett 1988).

The idea, in short, is that there are many different levels of explananda, corresponding to different levels of eventhood, and different causal relations at all these different levels. Salmon's fundamental physical causation, then, is only one among many different levels of causation. Add this conception of causation as a multilevel relation to the causal approach to explanation, and one gets a theory on which the explainers of an event depend on the level of the event. (This level dependence of the explanation is also characteristic of the DN, IS, and SR accounts.)

The best-known multilevel theory of causation is the counterfactual account. If the shouting had not happened, the high-level shattering event would still have occurred, but because it would have happened in a different way, the low-level shattering event would not have occurred. Thus, the high-level shattering does not, whereas the low-level shattering does, counterfactually depend on the shouting. On a counterfactual approach to causation, this implies that the shouting is a cause of the low-level shattering but not the high-level shattering, and so, taking this multilevel relation as the explanatory causal relation, that the shouting does not explain the high-level shattering, even though—as its causation of the low-level shattering shows—it is connected causally to the shattering in Salmon's sense. For this approach to explanation, but based on a more sophisticated counterfactual account of causation, see David Lewis (1986); for a different though related multilevel approach, see James Woodward (2003).

An alternative to the multilevel approach is a two-factor approach to causal explanation, on which all explainers of an event must causally influence that event

at the fundamental physical level, as prescribed by Salmon, but on which they must pass in addition a further test for explanatory relevance. Salmon (1997) himself suggests, late in his career, that the further test might be one of statistical relevance; only the causal influences that change the probability of an event explain the event. Michael Strevens (2004) suggests a different two-factor approach.

An advantage of the two-factor approach is the relatively modest demands it makes of the metaphysics of causation, transferring as it does much of the burden of determining explainers to the further test for relevance. What, then, to say about claims apparently stating the existence of high-level causal relations, such as “The ball's hitting the window, but not the players' shouting, caused the window to shatter”? Strevens (2004) suggests that locutions of this form are in fact causal-explanatory claims, asserting the explanatory relevance of certain causal influences (compare Kitcher's theory of causation mentioned earlier).

Despite the popularity of the causal approach, it is relatively undeveloped. For example, little has been written about the causal explanation of laws; it is usually said that they are explained by describing their underlying mechanisms, but not every law explicitly concerns causes and effects. Equally, not every event explanation appears to involve the delineation of causes. For examples of both kinds of worry, see Kitcher (1989, §3).

Work on the causal approach to probabilistic event explanation is more advanced. Two main currents can be distinguished in the literature. The first springs from the idea that probabilities themselves have the character of dispositions and are able to cause the events to which they are attached. The probability of one-half that a tossed coin lands heads, for example, is interpreted as a statistical disposition that causes the coin (in most cases) to land heads about one-half of the time (Fetzer 1981).

The second current flows from the idea that other events or states of affairs can cause events by making a difference to the probabilities of those events. This view is compatible with the dispositional view of probabilistic causality, but it is compatible also with its rejection. Paul Humphreys writes that “chance is literally nothing” (1989, p. 65) and so cannot cause anything itself, but that events nevertheless cause other events in an indeterministic world by making a difference to their probabilities. Because probability itself is impotent, Humphreys holds that the kind of difference a cause makes to the probability of its effect is irrelevant. It does not matter whether the change in probability is positive or negative, large or

small (compare with the SR account). Whatever the change, the factor responsible for the change is a cause and so ought to be cited in an explanation of the effect.

Peter Railton (1978) offers an account of probabilistic explanation that makes room for both conceptions of the relation between probability and causation. On what Railton calls his DNP account, an event is explained by deriving its exact probability from the appropriate initial conditions, background conditions, and laws. Formally, a DNP explanation resembles, as its name suggests, a DN explanation, except that it is the probability of the explanandum, not the explanandum itself, that is deduced. In contrast to Hempel's IS account of probabilistic event explanation, the DNP account does not require a high probability for the explanandum, and because it asks for an accurate derivation of the exact probability, it requires, like the SR account, that an explanation cite all factors probabilistically relevant to the explanandum, whether known or unknown, and (though Railton does not give a criterion for relevance) no irrelevant factors. Perhaps most important of all, the DNP account is, unlike Hempel's various accounts, open to a causal interpretation: The factors that make a difference to the probability, and even the probability itself, can be considered causes of the explanandum, and the explanation successful precisely because it specifies these causes.

An important lacuna in causal accounts of probabilistic explanation is a detailed treatment of probabilistic explanation in sciences such as statistical mechanics and evolutionary biology, where there is some possibility at least that the underlying processes producing the usual explananda are approximately deterministic. The consensus is to regard such explanations as not genuinely probabilistic; Railton (1981) suggests that they can be reinterpreted as reporting on the robustness of the underlying processes with respect to the event to be explained, that is, the processes' tendency to produce the same kind of outcome given a variety of initial and background conditions.

## OTHER ISSUES

This entry will conclude with a brief sketch of some issues concerning scientific explanation not mentioned earlier. First is the question of pragmatics in explanation. Most writers hold that pragmatics affects the explanatory enterprise in only one, relatively minor, way: When an explanation is transmitted from one person to another, the act is subject to the usual pragmatics of communication. This position on pragmatics dovetails with the majority view that the explanatory facts are not essen-

tially communicative; explanations exist independently of anyone's intention to explain anything to anyone else.

Both Bas C. van Fraassen (1980, chapter 5) and Peter Achinstein (1983) dissent from this majority, holding that there is no explanation without communication and finding in the pragmatics of communication an account of many facets of explanatory practice. However, this literature has yet to answer the question why science treats explanations as preexisting facts to be discovered, rather than as entities created in the act of communication.

Second, it is an open question whether there is a single standard for evaluating scientific explanations that has remained constant since the beginning of modern science, let alone for the entire history of human explanation. The accounts of explanation in this entry assume, of course, a positive answer, but most work on explanation lacks a substantial historical dimension.

A third issue is idealization in explanation: While almost every account of explanation surveyed earlier requires that explanations contain no false representations of reality, the practice of using idealized models in scientific explanation is widespread. These models deliberately misrepresent the nature of the systems they describe; the ideal gas model, for example, represents gas molecules as having zero volume, but despite this distortion of the facts, it is considered to explain certain behaviors of real gases. Some writers regard idealization as a temporary or practical measure, out of place in a perfected science. Strevens (2004) suggests that on both the unificationist and a certain causal approach to explanation idealizations can be seen as serving a genuine and enduring explanatory role.

See *Relations, Internal and External*

## EXTRINSIC AND INTRINSIC PROPERTIES

An "intrinsic property" is one whose possession by an object at a time involves nothing other than the object (and its parts) at that time; an "extrinsic property" is one whose possession at a time involves something else. We might say, therefore, that the properties of being red and round are intrinsic to this ball, but the properties of being in Rhode Island, being less than five feet away from a tree, and having once been owned by my sister are extrinsic to it.

Peter Geach has made a corresponding distinction among changes. There is change whenever "F(x) at time *t*" is true and "F(x) at time *t*" is false. Socrates will change when he puts on weight; he will also change when he comes to be shorter than Theaetetus merely in virtue of Theaetetus's growth. Changes of the second kind—intuitively less genuine—Geach calls "mere Cambridge changes," without proposing a rigorous criterion. We might define a mere Cambridge property as a property, change in an object's possession of which is a mere Cambridge change. Mere Cambridge properties are plausibly taken to be the same as extrinsic properties.

The matter is important, among other things, for the clear statement of a Humean view of the world. For a Humean there is in principle a description in intrinsic terms of the state of the world at any one time that is both complete and free of implications for the state of the world at any other time. "Solidity, extension, motion; these qualities are all complete in themselves, and never point out any other event which may result from them" (Hume, *Enquiry*, sec. 8, 1). It is not clear, however, that what Hume says can be true: The motion of an object is hardly free of implications about the state of the world at other times. (If an object at place *p* is said to be moving at time *t*, this is standardly in the sense that, at other times more or less near to *t*, the object is in other places more or less near to *p*.) We may have to decide between complete description and a purely intrinsic one.

Two extreme views are that all properties are really intrinsic and that all properties are really extrinsic. Gottfried Wilhelm Leibniz holds the first: “There are no purely extrinsic denominations.” His insistence resulted in the drastic denial of the reality of relations and, most notably, of space and time; it has not been widely accepted. A moderate version of the opposite view, that all properties are really extrinsic, might be held by someone, like Karl Popper, who believes that physical properties are essentially dispositional. Both extremes, in different ways, represent a sense that the nature of one thing cannot be divorced from the nature of others. Confidence in a firm distinction between the intrinsic and the extrinsic, on the other hand, is more characteristic of an optimistic Humean.

It is not easy to give a precise characterization of intrinsic properties, and there may not even be a unique idea, so to speak, waiting to be characterized. We might try saying that extrinsic properties are relational properties and intrinsic properties nonrelational. But many intuitively intrinsic properties still in some way involve a relation—squareness involves a relation among the sides of an object. Can we say that intrinsic properties are those that do not involve a relation to anything that is not a part of the object? This is perhaps the clearest criterion, but it may still be incapable of capturing all our intuitions at once. The power to open locks of kind *k*, for example, apparently involves a relation to external things of a certain kind—which would seem to make it extrinsic. Yet it is a property that a key can have if it is, so to speak, alone in the world—which would seem to make it intrinsic.

It may be helpful to invoke a distinction between relational descriptions of a property and descriptions of a relational property. But that distinction is itself perplexing. Is “possessing what is actually Jane’s favorite intrinsic property” a relational description of a first-order property or a description of second-level relational property?

Philosophers have argued in many cases that apparently intrinsic properties are in fact extrinsic. Terms such as *old*, *great*, and *imperfect*, John Locke says, “are not looked on to be either relative or so much as external denominations,” but they conceal a tacit relation (*Essay*). More worrying are challenges even to the idea that primary qualities, like size and shape, are intrinsic. The size of the ball is, we may think, intrinsic to it. We can describe

a scenario where everything else in the universe is twice its actual size while the ball remains the same. But can we properly distinguish this from a scenario where the rest of the world is the same but the ball is half its actual size? Some will argue that length is relational, and the two scenarios make a distinction without a difference: size, after all, is extrinsic. Others will argue instead that even if our descriptions of size are relative, for example, to standard measures, what is described is still an absolute and intrinsic property.

Are any or all of a person’s mental properties intrinsic to her? The question is in part about the limitations of methodological solipsism. If Jane could not possess the property of thinking of Bertrand Russell if Russell did not exist, then that property must be extrinsic to her. Some will try to segment referential thought into an internal and an external component; but if that proposal fails, referential thought will typically be extrinsic to the thinker. (Another option is that the thinker, or her mind, extends more widely than her body—and actually includes Russell.) One might argue a similar point with respect to thought about properties as well as about individuals. (A brain that has never been out of a vat does not know what a meter is.) Maybe there are very few mental properties intrinsic to a person; or maybe we should think again about what the notion of the intrinsic is, and what exactly it is supposed to do for us.

## FAITH

In discourse concerning religion, “faith” has two rather different meanings. As a trusting and confident attitude toward God, faith (*fiducia*) may be compared with trust in one’s fellow human beings. As a cognitive act or state whereby men are said to know God or to have knowledge about him, faith (*fides*) may be compared with our perceptual awareness of our material environment or our knowledge of the existence of other persons. This article will deal with the notion of faith as putatively cognitive, as this has operated in Western religious thought.

### FAITH IN CLASSIC CATHOLIC AND PROTESTANT THOUGHT

**THOMAS AQUINAS.** The key thinker for the discussion of faith in Roman Catholicism is Thomas Aquinas, who wrote on the nature of faith in his *Summa Theologiae*. Thomas’s main points may be summarized as follows:

(1) Faith is belief in revealed truths. Ultimately the object of faith is God himself, who is not, however, known by the human mind in his divine simplicity but only discursively and by means of propositions. These revealed truths are authoritatively presented in the creeds. Thus, to have faith means to believe the articles of faith summarized in the credal affirmations of the church.

(2) In its degree of certainty, faith stands between knowledge (*scientia*) and opinion. It ranks below knowledge, for although the objective cause of faith—divine truth—is in itself more certain than the product of any human reasoning, yet faith’s grasp of its object—since it lacks cogent demonstration—is less certain than rational knowledge. On the other hand, faith ranks above opinion, for while opinion is accompanied by doubt and by fear that the opposite opinion may be true, faith is firm and free from all such hesitations.

(3) The objects of faith on the one hand, and of sight and demonstration on the other, are different: “the object of knowledge [*scientia*] is something seen, whereas the object of faith [*fides*] is the unseen.” There can thus be no faith concerning matters that are objects of rational knowledge, for knowledge excludes faith.

However, some truths may be objects of faith to one person and of knowledge to another. In particular, some of the preliminary articles of faith—such as the existence, unity, and incorporeality of God—are capable of being philosophically demonstrated and are revealed as objects of faith only for the sake of those many who are unable to follow the path of abstract reasoning. Those matters that are of faith absolutely are above reason—incapable of being arrived at by human reasoning, however expert.

Thomas's account of the relation between faith and reason is, accordingly, that they apprehend different sets of truths, the truths of faith being above reason. However, this statement must be qualified by adding that there is an area in which faith and reason overlap, since the basic theological propositions—those of natural theology—are held to be both demonstrable and revealed.

(4) Faith is “an act of the intellect assenting to divine truth at the command of the will moved by the grace of God.” That is to say, whereas in knowledge the intellect is moved to assent by the object itself, known either directly or by demonstrative reasoning, in faith the intellect is moved to assent “through an act of choice, whereby it turns voluntarily to one side rather than to the other.” Faith does not, however, represent an arbitrary or unmotivated decision. It is a response, under the influence of divine grace, to certain external evidences, particularly miracles. As such, it is sufficiently determined by the evidence to be rational and yet sufficiently undetermined and free to be meritorious.

**MODERN CATHOLICISM.** The doctrine of faith in modern Catholicism is essentially Thomist, although a fuller apologetic context is developed than was necessary in the medieval period. Faith is defined by the first Vatican Council (1870) as “a supernatural virtue, by which, guided and aided by divine grace, we hold as true what God has revealed, not because we have perceived its intrinsic truth by our reason but because of the authority of God who can neither deceive nor be deceived” (*Constitution on Faith*, Ch. 3). Such a definition provokes a query, for faith, characterized as belief in various truths on divine authority, presupposes a knowledge both that God exists and that he has revealed the propositions in question. How is this prior information gained? The question is answered by the doctrine of the *preambula fidei*. The preambles to faith consist in the acceptance of God's existence, established by philosophical proofs, and of the validity of the biblical revelation and the authority of the Catholic church as the divinely appointed guardian of revelation. These latter are authenticated by a variety of

visible signs, such as miracles, fulfillments of prophecy, holy lives, and the growth and durability of the church. The believer's appreciation of the weight of this evidence is not an exercise of faith but of reason: “The use of reason precedes faith and must lead us to it” (Denzinger, *Enchiridion* No. 1626, cf. No. 1651). Thus, the whole structure of belief rests originally upon the historical evidences of miracles and other manifestations of divine activity that do not establish the articles of faith themselves, but rather the fact that the omniscient God has revealed these articles. Although it is denied by Catholic apologists, the comment of John Locke in his *Essay concerning Human Understanding* would still seem pertinent: “Though faith be founded on the testimony of God (who cannot lie) revealing any proposition to us, yet we cannot have an assurance of the truth of its being a divine revelation greater than our own [rationally acquired] knowledge; since the whole strength of the certainty depends upon our knowledge that God revealed it.”

It should be noted that in some of the more recent Catholic discussions, such as that by Eugène Joly in the article “Faith” in the *Twentieth Century Encyclopedia of Catholicism* (Paris, 1956), there is a tendency to move beyond a narrowly propositional conception of faith and to be hospitable to the idea of an encounter with God mediated through man's religious experience.

**PROTESTANTISM.** For Martin Luther (1483–1546), the chief moving spirit of the Reformation, faith was not primarily belief in the church's dogmas but rather a wholehearted trust in the divine grace and love revealed in Jesus Christ. Thus, Luther considered faith as primarily *fiducia* rather than *fides*. Indirectly it included all the fundamental Christian beliefs, but Luther's main emphasis was upon faith as a total reliance upon God's omnipotent goodness. He was not concerned with the logically prior question of our knowledge that God exists. In this he was at one with the biblical writers, who were so vividly conscious of the reality and presence of God that their writings take his existence for granted. In the Bible, as in the thought of Luther, faith is not the belief that God exists, that he is three in one, and so on, but is an attitude of trust and self-commitment to him. In a distinction that Luther himself drew, it is not belief *that* but belief *in*.

John Calvin (1509–1564), the first and greatest systematizer of Reformed theology, gave greater prominence to the cognitive aspect of Christian faith, defining it in the *Institutes* as “a firm and certain knowledge of God's benevolence toward us, founded upon the truth of the freely given promise in Christ, both revealed to our minds

and sealed upon our hearts through the Holy Spirit.” That to which faith responds is the Bible as the inspired Word of God: “there is a permanent relationship,” Calvin says, “between faith and the Word.” Thus, in Reformed theology acceptance of the authority of Scripture replaces the *preambula fidei* of Thomism.

The philosophical question raised by this conception of faith is similar to that raised by the Roman Catholic conception: what is the nature of our knowledge that the God whom we are invited to trust in fact exists, and that he has inspired the writings which he is alleged to have inspired?

Two subsequent Protestant contributions to some extent address themselves to this question. In the early nineteenth century Jakob Friedrich Fries, influenced by Friedrich Heinrich Jacobi in the previous century, described faith as *Ahnung* (or *Ahndung*), by which he meant an unconceptualized feeling, hunch, or presentiment as to the reality of the supernatural. Friedrich Schleiermacher also regarded faith as a kind of feeling (*Gefühl*), a sense of absolute dependence upon a higher reality. In a different vein altogether Søren Kierkegaard, the father of modern existentialism, emphasized the objective uncertainty of the religious realm, which can be entered only by a leap of faith. He stressed the tremendous risk involved, like being “out upon the deep, over seventy thousand fathoms of water.”

## MODERN THEORIES OF FAITH

The Thomist doctrine contains most of the elements that have, in varying proportions, characterized subsequent theories of faith. The Thomist analysis treats faith as (*a*) a form of propositional belief but as (*b*) belief that rests upon weaker evidence than scientific knowledge, and (*c*) regards it as requiring an act of will.

**VOLUNTARIST THEORIES.** Nearly all subsequent epistemological discussions of faith assume that it is a cognitive attitude directed toward religious propositions. Widespread in modern discussions is the rationalist definition of faith as (to quote a typical formulation) “very firm belief, either unsupported or insufficiently supported by evidence” (C. J. Ducasse, *A Philosophical Scrutiny of Religion*, New York, 1953, p. 74). Some such definition as this is used by a large number of religious philosophers as well as by many of those who reject religious belief.

How, from the believer’s point of view, is the evidential gap supposed to be filled? Here the voluntarist theme, first stressed by Thomas, reappears.

**Pascal.** In the famous Wager passage in his *Pensées* (No. 233) Blaise Pascal (1623–1662) recommends a purely voluntarist route to religious belief, assuming that reason can find no grounds on which to determine whether there is a God. One must decide to believe or to disbelieve; and regarding the decision as a wager, it is prudent to decide to believe. One will then gain eternal life and felicity if God indeed exists and will lose nothing if he does not; whereas if one decides to disbelieve, one will gain nothing if he does not exist but will forfeit eternal life if he does.

**William James.** The idea briefly adumbrated by Pascal appears in an elaborated form in William James’s well-known essay “The Will to Believe” (1895). He points out that there are cases in which we may come into contact with some aspect of reality only by acting, prior to any adequate evidence, as if it existed; in these instances our faith helps to bring its object into being. For example, in the realm of personal relationships faith in an individual’s good will or honesty may on occasions elicit these qualities when otherwise they would have been wanting. Precursive faith of this kind is justified by its subsequent verification rather than by prior evidence.

James then proceeds to consider religious faith. Here we have what is for many people a living, momentous, and—James emphasizes—a forced option, for to refuse to say “Yes” to the claim of religion is in effect to say “No” to it. It is to miss the good that follows from believing the religious gospel, if it be true, as decisively as if one had positively rejected it. Therefore we have the right to choose for ourselves between the risk of falling into error by adopting a faith that may turn out to be false, and the risk of missing our highest good by failing to adopt a faith that may turn out to be true.

Furthermore, James adds, the Judeo-Christian religious hypothesis refers specifically to a personal God; and in our dealings with a cosmic Thou, as with our fellow humans, a venture of faith on our part may be necessary if we are to establish any positive relationship. To respond as a person to another person involves showing a certain trustfulness and willingness to “give the benefit of the doubt” and thereby anticipate proof and verification. It may be that God can or will disclose himself only to one who shows such an initial faith and is willing to venture in trust beyond what has been established by scientific proof or philosophical demonstration. In other words, it is possible that in order to gain the religious knowledge upon which our personal good depends, we must give rein to our “passional” desire to believe. Hence, James concludes, we cannot reasonably be required to adopt a

methodology that would prohibit us from finding this good: For “a rule of thinking which would absolutely prevent me from acknowledging certain kinds of truth if those kinds of truth were really there, would be an irrational rule.”

James’s argument has been criticized at a number of points, chief among them being the following:

(1) His basic assumption is that there are no grounds of either reason or evidence which might lead one to accept or reject the “religious hypothesis.” There is nothing to make it significantly more probable either that there is or that there is not a God; and in such a situation, says James, we are entitled to follow our desires. But many, both theists and atheists, claim that there are substantial arguments or evidences for (or against) the existence of God, and that we ought to attend to these rather than to our personal predilections. Furthermore, whatever conclusion we arrive at should be held only with the degree of conviction that is warranted by the evidence.

(2) The “precurative faith” that helps to create that in which it believes, although a genuine phenomenon, is irrelevant to belief in the existence of God or in the reality of eternal values; for if these exist, they exist independently of man’s belief or lack of belief in them. In the social situations James cites, our willingness to trust someone in advance of proof of his trustworthiness may help to make him trustworthy but does not bring him into existence, and faith in the existence of a divine creator of the universe cannot bring such a being into existence.

(3) James’s argument ought not to be applied only to our current live options, since “live option” is a psychological category having no necessary relation to the truth or falsity of hypotheses. We ought to heed equally every momentous and forced option. However, we cannot act upon them all, since they demand incompatible responses. We shall act, then, only upon that which we should most *like* to be true. So stated, the “right to believe” argument stands revealed as an invitation to wishful thinking.

(4) From the side of religion, an unfavorable comparison is made between the kind of faith recommended by James and that already possessed by the religious believer. James presumes a complete absence of grounds for belief and, in this situation, he proposes a prudent gamble. However, the religious believer—as we meet him, for example, in the pages of the Bible—is convinced that he is aware of God acting toward him in and through the events of the world around him, so that at all times he is

having to do with God and God with him. His concern is to draw others into this direct awareness of God, rather than to induce them to make James’s gamble.

*Tennant.* F. R. Tennant (1866–1958) has provided the fullest recent voluntarist apologetic for theistic faith. Faith in general, according to Tennant, is the conative element in the acquisition of knowledge. In every advance from sense data to the perception of an ordered world or from the projection of a scientific hypothesis to its observational verification, as in every successful voyage of discovery or in the invention of some new kind of machinery, there must be not only an act of theorizing or of insight but also a sustained effort of will that carries the operation through to completion. In both of these respects religious cognition shares a common structure with knowledge in the sciences and in personal life. First, there is the creation of a hypothesis: Scientific hypotheses satisfy the inclination to explain the structure and order of the universe by quantitative laws, while theological and ethical hypotheses satisfy the inclination toward teleological explanation. Second, there is the volitional investment, the venture of faith, which may eventually be rewarded with a dividend of verified knowledge. The faith venture in secular contexts is continuous in kind with that of the religious prophets and apostles. Thus, faith is the indispensable volitional component within the process of acquiring knowledge, and it plays a basically similar role in both religion and nonreligious life.

However, the kinds of verification that are possible in science and religion are importantly different, although Tennant wavers between stressing their similarity and their dissimilarity. Scientific verification consists in observing that predictions deduced from a hypothesis are fulfilled in the experimenter’s observations. Religious verification, on the other hand, consists in the valuable effects of faith in the life of the believer—in strengthening him as a moral agent and in his attainment of heroic life. Thus, while scientific verification leads to objective certainty, or at least to a high degree of objective probability, religious verification leads only to subjective certitude. “Nevertheless,” Tennant adds, “verification such as religion claimed for its faith will satisfy most men.”

It is noteworthy that the basic features of the classic Thomist analysis of faith reappear, although in a very different setting, in Tennant’s theory: (1) Faith, as acceptance of the religious hypothesis, is propositional. (2) Faith is of the same cognitive order as scientific knowledge but is based upon a lower degree of evidence. (3) Faith is not concerned with the material world itself, which is an object of knowledge, but with its teleological

meaning. (4) Faith is distinguished by the conative element within it from ordinary belief and knowledge. Whereas the act of will can, in Thomism, appeal for rational justification to such external evidences as miracles and fulfilled prophecies, in Tennant's philosophy it appeals to a comprehensive teleological argument for the existence of God.

This propositional and voluntarist tradition, which has so largely dominated the scene since the time of Thomas, has been criticized on the following grounds: (a) Actual religious faith is not, from the believer's point of view, analogous to a scientific hypothesis but with a weaker verification. It is a direct awareness of God, with its own assurance that is not dependent upon philosophical argument. (b) As (putatively) a direct awareness of God, faith is not primarily a form of propositional belief; rather, it is a form of religious experience. Theological beliefs naturally grow out of it but are not themselves the primary objects or content of faith.

**FAITH AND FREEDOM.** A very important connection has long been recognized between faith and what may be called the cognitive freedom of the human mind in its relation to God. The first writer to note this connection was the second-century Christian writer Irenaeus, who said, "And not merely in works, but also in faith, has God preserved the will of man free and under his own control" (*Adversus Haereses*, IV, 37, 5). The theme is continued in Augustine and in Thomas's view that faith is a sufficiently free act to be meritorious. Pascal stated that God's self-revelation in the Incarnation took a deliberately veiled form, so that no one could be compelled to find God in Jesus Christ, and yet so that all who were willing to find God there might do so: "... willing to appear openly to those who seek him with all their hearts, and to be hidden from those who flee from him with all their hearts, he so regulates the knowledge of himself that he has given signs of himself, visible to those who seek him, and not to those who seek him not" (*Pensées*, No. 430). Søren Kierkegaard also spoke of the divine incognito in the Incarnation. The same theme is continued by the twentieth-century Protestant theologian Emil Brunner and by many other writers.

The basic thought behind this emphasis, at any rate in the modern writers, is that God, having created man as personal, always acts toward him in ways that respect and preserve man's freedom and responsibility. For this reason God does not reveal himself to man in his unveiled glory, for in a direct, unmediated awareness of infinite perfection man's frail moral autonomy would be

destroyed. Therefore, the divine presence is always mediated through the events and circumstances of a world that God has created to be a relatively independent sphere of interaction with his human creatures. Man's personal autonomy is protected by the fact that he can become conscious of God's activity toward him only by an un-compelled response of faith. Thus, men are not only free to obey or disobey God; they also have the prior and more fundamental freedom to be conscious of God or to refrain from being conscious of him. The human mind displays a natural tendency to interpret its experience religiously, but this tendency acts only as an inclination that can be resisted and inhibited. Man is thus cognitively free in relation to God. Faith is the correlate of freedom and is related to cognition as free will is to conation.

**FAITH AS INTERPRETATION.** Closely related to this emphasis upon man's cognitive freedom is a contemporary theory that regards faith as the interpretative element in religious experience—that which constitutes it as *religious* experience in distinction from any nonreligious experiencing of the same field of data. Here "interpretation" does not mean intellectual interpretation or theory construction, but something more akin to the interpretative processes which take place in sense perception. From the point of view of epistemology, faith is thus analogous to the phenomenon of "seeing as," which was brought to the attention of philosophers by Ludwig Wittgenstein in his *Philosophical Investigations* (II, xi). We may look at a puzzle picture, seeing it now as a meaningless disarray of lines and now as the outline of, say, a human face. This is an instance of purely visual interpretation. But the concept of "seeing as" can be expanded into that of "experiencing as," referring to the way in which a situation apprehended through our sensory apparatus as a whole is experienced as having some particular kind of significance; that is, as rendering appropriate some particular dispositional response on our part. To cite religious examples, when the Old Testament prophets experienced the events of contemporary Israelite history as mediating the presence and activity of God and as speaking a divine imperative to them, they were undergoing a religious mode of "experiencing as." Again, the apostles whose witness constitutes the message of the New Testament saw, but were not compelled to see, Jesus as the Christ. Indeed, it is always true of the religious mode of "experiencing as" that the data in question are in themselves ambiguous and capable of being responded to either religiously or naturalistically. More strictly, the two types of interpretation are not alternatives on the same level but are different orders of significance found in the same field of data.

The religious significance of events includes and transcends their natural significance. Those events the prophets saw as acts of God can also be seen as having proximate natural or human causes; and the person of Christ, seen by Christian faith as divine, is depicted in the New Testament as being at the same time genuinely human. From a theological point of view, this systematic ambiguity, which is the precondition of faith, serves to protect man's freedom and autonomy as a finite personal being in relation to the infinite God.

### Bibliography

The article on πίστις by Rudolf Bultmann and A. Weiser in Vol. VI of Kittel's *Theologisches Wörterbuch zum Neuen Testament* (Stuttgart, 1959) treats authoritatively the various biblical concepts of faith: It was translated by Dorothea M. Barton as *Faith* (London, 1961). Historical treatments of the idea of faith occur in D. M. Baillie, *Faith in God* (Edinburgh, 1927) and W. R. Inge, *Faith* (London, 1909). The distinction between faith as trust and as cognition is developed in Martin Buber, *Zwei Glaubensweisen* (Zürich, 1950), translated by Norman P. Goldhawk as *Two Types of Faith* (London, 1951). The cognitive aspect of Christian faith is defined in John Calvin, *Institutio Christianae Religionis* (Basel, 1536; 5th ed., 1559), translated by F. L. Battles as *Institutes of the Christian Religion*, 2 vols. (London, 1861). Thomas's teaching on the nature of faith occurs in *Summa Theologica* (II–II, 1–7), translated by Anton C. Pegis in *The Basic Writings of Saint Thomas Aquinas*, Vol. II (New York, 1945). Thomas's teaching on the relation between faith and reason is contained in *Summa Contra Gentiles* (I, 3–8), which was translated by Anton C. Pegis as *On the Truth of the Catholic Faith* (Garden City, NY, 1955–1957).

Contemporary Roman Catholic discussions of faith include G. D. Smith, "Faith and Revealed Truth," in *The Teaching of the Catholic Church* (New York, 1956), Vol. I and Eugène Joly, *Qu'est-ce que croire?* (Paris, 1956); the latter was translated by Illtyd Trethowan as *What Is Faith?* (New York, 1956). Also see H. J. D. Denzinger, *Enchiridion Symbolorum* (Freiburg, 1952).

Protestant neoorthodox conceptions of faith are represented by Karl Barth, *Kirchliche Dogmatik* (Zürich, 1932), Vol. I, Part 1, translated by G. T. Thompson as *The Doctrine of the Word of God* (Edinburgh: Clark, 1936); H. F. Lovell Cocks, *By Faith Alone* (London, 1943); and F. Gogarten, *Die Wirklichkeit des Glaubens* (Stuttgart, 1957), translated by Carl Michalson and others as *The Reality of Faith* (Philadelphia, 1959).

The conception of faith as *Ahnung* occurs in F. H. Jacobi, *David Hume über den Glauben, oder Idealismus und Realismus* (1787), in *Werke* (Leipzig, 1815), Vol. II; and J. F. Fries, *Wissen, Glaube und Ahnung* (Jena, 1805), edited by Leonard Nelson (Göttingen, 1905). See also R. Otto, *Kantisch-Fries'sche Religionsphilosophie und ihre Anwendung auf die Theologie* (Tübingen: Mohr, 1909), translated by E. B. Dicker as *The Philosophy of Religion* (London: Williams and Norgate, 1931).

Christian existentialist views of faith occur in Søren Kierkegaard, especially in *Philosophical Fragments*, translated by David F. Swenson (Princeton, NJ, 1936) and *Concluding Unscientific Postscript*, also translated by David F. Swenson (Princeton, NJ, 1941); and in G. Ebeling, *Das Wesen des Christlichen Glaubens* (Tübingen, 1959), translated by Ronald Gregor Smith as *The Nature of Faith* (London, 1961).

The classic attempt to base faith on a moral foundation is in Kant's *Critique of Practical Reason*. W. R. Sorley, *Moral Values and the Idea of God* (Cambridge, U.K., 1918); D. M. Baillie, *Faith in God* (Edinburgh 1927); and J. Baillie, *The Interpretation of Religion* (Edinburgh, 1929) contain more recent endeavors to the same end.

Modern voluntarist theories of faith are found in William James, *The Will to Believe* (New York: Longman, 1897); James Ward, *Essays in Philosophy* (London, 1927); and F. R. Tennant, *Philosophical Theology*, Vol. I (Cambridge, U.K., 1928) and *The Nature of Belief* (London, 1943).

The view that faith operates not only in religion but also in many other spheres of life has an extensive literature, including Arthur Balfour, *The Foundations of Belief* (London, 1885); W. R. Inge, *Faith* (London: Duckworth, 1909); B. H. Streeter, ed., *Adventure: The Faith of Science and the Science of Faith* (London, 1927); Alan Richardson, *Christian Apologetics* (London, 1947); Raphael Demos in the symposium *Academic Freedom, Logic and Religion* (New York, 1953); and H. R. Niebuhr, *Radical Monotheism and Western Culture* (New York: Harper, 1960).

J. H. Newman's Illative Sense theory (*A Grammar of Assent*, London, 1870) is discussed in M. C. D'Arcy, *The Nature of Belief* (London, 1945). Paul Tillich's view of faith as "ultimate concern" occurs in *Dynamics of Faith* (New York: Harper, 1957).

The conception of faith as the interpretative element in religious experience is expounded in J. H. Hick, *Faith and Knowledge* (Ithaca, NY, 1957).

**John Hick (1967)**

### FAITH [ADDENDUM]

This entry focuses on the various ways in which recent philosophers working within or in reaction to the scriptural traditions have construed the relationship between faith in God and the belief in God's existence. The entry will also touch on different views regarding the question of whether faith is, can be, or should be, *rational*. How-

ever, a full treatment of the issue of faith and reason is beyond the scope of this entry.

There are several different camps of views regarding the relationship of *faith in God* and *belief in God's existence*. One camp holds that faith is not belief, because it is, so to speak, higher than belief; faith is *knowledge* of God. Thus, Dewey Hoytenga (1991) holds that faith is a knowledge of God that comes through direct acquaintance. According to John Hick (1957), faith is the interpretive element within religious experience that results in an awareness or knowledge of God. On this view, a person who merely believes that God exists does not really have faith at all. And, on this view, faith is rational, in the sense that it is based on a religious experience of a certain sort.

A second camp follows Thomas Aquinas in treating faith in God as basically equivalent to belief in God's existence. In his book *What Is Faith?* (1992), Anthony Kenny recognizes that there are different senses of the term *faith*, but he suggests that in at least one of its senses, faith is equivalent to belief in God's existence. Hence, in discussing the issue of whether faith is rational, Kenny focuses primarily on the question of whether it is rational to believe in God's existence.

A third camp holds that faith in God has nothing to do with belief that God exists. Such philosophers sharply distinguish *faith in God*, from a belief *that* God exists. On this view, faith is a commitment of some sort, such as ultimate concern (Paul Tillich 1958) or hope in some divine end (Louis Pojman 1986). To a large degree, the motivation for such a conception is the claim that what is most crucial about genuine religious devotion is somehow fundamentally noncognitive, or perhaps, "non-propositional," that is, having nothing to do with the proposition "God exists." On this view, faith is an affective or emotional matter, or a matter of the will; it is not a cognitive or intellectual affair. For Tillich, in some sense the question of the rationality of faith cannot properly arise, because faith is an ultimate commitment that cannot be adjudicated by anything prior or external to itself. And, for Pojman, it can be rational to have faith even if it is *not* rational to believe in God's existence.

In response to this camp, many writers have argued that belief or faith *in* something generally presupposes some kind of *belief that* some proposition is true. In order to commit oneself to God, or to trust God, or to have hope in some divine end, etc., one must have some kind of belief that God exists. Nicholas Wolterstorff (1983) points out that even if it is granted that what is most important about religious devotion is noncognitive, or

even, nonpropositional, it does not follow that religious devotion is altogether noncognitive. Hence, the fourth camp, which holds that although faith is not identical with belief, faith involves or requires at least some kind of belief in God's existence. On this view, the issue of the rationality of faith cannot be completely divorced from the question of whether it is rational to believe in God's existence.

Philosophers within this camp differ on what precisely is involved in faith aside from belief in God's existence, and also on the nature and degree of that belief. Richard Swinburne holds that faith involves doing certain actions to achieve good purposes, whilst relying on the belief that God exists to provide what one wants or needs. For Swinburne, because the evidence that supports the belief in God's existence is strong but inconclusive, it is the role of faith to fill the gap between what the evidence warrants and what the religious believer believes. Paul Helm (2000) agrees that faith involves trust, but he also ascribes to a Lockean view that belief, as well as trust, should be proportionate to the evidence. Thus according to Helm, the more evidence one has that God exists, the greater degree of trust is appropriate.

Still others suggest that faith consists in a kind of practical assumption that God exists. Robert Audi (1991) proposes that to have faith is to assume that God exists as a practical rule for living. According to Audi, one can have this kind of faith so long as one does not actually believe that God does *not* exist. Joshua Golding (1990) proposes that faith be viewed as the pragmatic assumption that God exists, *for purpose of living a religious life*. For Golding, in order to have pragmatic faith, one must at least have the belief that there is at least some live probability that God exists. On either of these latter views, so long as God's existence has not been conclusively refuted or disproved, there might be pragmatic considerations that make it rational or justifiable to have faith. Such pragmatic considerations might include the potential benefits, spiritual, moral, or otherwise, that might accrue to the faithful, especially if it turns out that God does indeed exist.

## OTHER VIEWS

Worthy of mention is another view that does not fit neatly into any of the above camps. William Lad Sessions (1994) claims that there is no single substantive concept of faith that applies univocally to everything reasonably labeled "faith" in all religious traditions (or even sometimes within certain traditions). Faith is an "analogical" concept whose various instances resemble one another in

various ways, without there being a single feature or set of features common to them all. According to Sessions, it is impossible to pin down what is “faith.” However, this is almost a foregone conclusion if one takes under consideration the entire range of world religions. Sessions also concedes that adherents of different religions as well as adherents of the same religion will continue to argue over which sense of faith is the most true to a given tradition or set of texts, as well as over the question of whether faith is rational and if so in what sense. Thus despite Sessions’s useful taxonomy, it appears that debates among the above camps are not likely to cease in the near future.

Finally, consider views of faith in Judaism and Islam. The Hebrew word for faith is *emunah*. Interpreting the notion of *emunah* (faith), some Jewish philosophers have emphasized intellectual assent to propositions, whereas other thinkers have emphasized volitional or affective commitment. Perhaps the most well-known discussion of this issue in the twentieth century is by Martin Buber. In his book *Two Types of Faith* (1951), Buber claimed that the Christian view of faith is “an acknowledgement of God’s existence,” and that the Jewish view is “trust in God.” A superficial reading might lead one to think that, for Buber, the Jewish view of faith belongs in the third camp above, namely, that faith has nothing to do with a belief that God exists. However, such a reading is mistaken. While Buber claims that for Judaism the fiduciary aspect of faith is primary, he does not claim that beliefs are irrelevant to faith, or that somehow, one could have trust in God without believing that God exists. Hence, Buber more properly belongs in the fourth camp described above.

Another notable claim made by Buber is that, for Christianity, faith is primarily an *individual* matter; for Judaism, faith is primarily a *communal* matter. Buber argues that for Christianity, a relationship with God is initiated when and if a person decides to adopt Christian faith, that is, to acknowledge God. Of course, there can be a group of Christians who form a Christian community, but the primary act of faith is carried out by individuals. However, in the case of Judaism, God has already established a covenantal relationship with the people of Israel, in which he has made certain commitments to them as a people. Thus the primary act of faith, that is, trust in God, is the Jewish response to God’s commitment to the Jewish people. Perhaps Buber’s point is borne out by the fact that for centuries the primary liturgical expression of Christian faith has been in the singular, that is, “*credo in unum deo*,” which translates as “I believe in one God.” In the Jewish liturgy, the primary liturgical expression of

faith is in the plural, “*Hear O Israel, the Lord our God, the Lord is One.*”

Islam treats faith or *iman* as a religious duty or virtue. According to a well-known *hadith* (Islamic legend), Mohammed made a sharp distinction between *islam* (submission) and *iman* (faith). To accept *islam* is to testify that there is no God but Allah, and that Mohammed is his prophet; to pray, give charity, keep the fasts, and make the pilgrimage. To have *iman* is to believe in God, his angels, his messengers, and the last day of judgment. The Koran itself (49: 14) makes clear that one can be a *muslim* without having *iman*. Merely testifying to God’s existence and Mohammed’s prophecy makes one a *muslim*, but not one who has *iman*. The implication is that *iman* goes well beyond mere belief in God’s existence, and that it involves an active trust in God. Islamic theologians have debated the issue of what kind of belief qualifies a person as a *muslim*. If one believes, but sins, or believes insincerely, does one truly belong in the Muslim community? Over the centuries, different schools of thought adopted different positions on these questions. However, it is difficult to find a discussion among recent Islamic writers directly on the question of what is the precise relationship between *iman* and belief in God’s existence.

## FALLACIES

A fallacy, in the strict sense, is an invalid form of argument. Thus fallacy, or unsoundness in reasoning, is distinguished from simple falsity in that a single statement or belief may be false, but what is fallacious is the transition from a set of premises to a conclusion. However, this distinction is often slurred over; and we call other kinds of mistakes or confusion that are more or less closely related to faults in reasoning fallacies, in an extended sense. Indeed, we sometimes give the title of "fallacy" to what is little more than a particular type of false belief. At the same time, we usually count as fallacies only those invalid forms of argument, or related kinds of error, that are plausible and into which people frequently and easily fall. Fallacy is different from sophistry, which is the deliberate use of unsound reasoning or of related errors. A fallacy used with intent to deceive or to win an argument unfairly, to carry conviction without justification, or to defeat proper discussion becomes a sophistic device.

This article will survey and classify the main kinds of fallacies, explaining and illustrating many that have been traditionally recognized and named, and noting especially those that are of particular importance in philosophy; and it will touch on the conditions in which fallacies flourish and the means by which they may be avoided or detected.

In classifying fallacies, we shall take first fallacies in the strict sense, forms of argument in which the conclusion does not follow from the premise or premises. These are divided into formal fallacies, errors in the formal reasoning itself, and informal fallacies, in which the reasoner either argues invalidly without using any precise logical form or goes wrong in putting a thought or an ordinary language statement into logical form or in translating back from logical form into thought or ordinary language. (It is a consequence of this division that if anyone commits an informal fallacy, there would be a formal fallacy somewhere in the argument that would be obtained if his intended premises, conclusion, and intermediate steps were put correctly and consistently into some logical form; but it is useful to distinguish informal fallacies in order to indicate how the mistakes have occurred.)

Next we shall take fallacies in nondeductive reasoning and in observation. We cannot speak accurately of fallacies in this case, since we no longer have strictly valid arguments with which to contrast them; but in a looser way we can contrast good procedures and patterns of reasoning that confirm hypotheses with ones that fail to confirm or are likely to produce errors.

Third, we shall examine fallacies in discourse. Such faults as inconsistency, circularity, prejudice, irrelevance, and unfair interrogation—which include some of the best-known fallacies—are not mistakes in reasoning from premises, or evidence, to a conclusion but are to be condemned on some other ground. Philosophical fallacies do not constitute a special group apart from those already mentioned, but some of these have been singled out for special notice.

### FALLACIES IN THE STRICT SENSE

**FORMAL FALLACIES.** Formal fallacies may be arranged by reference to the logical systems, or parts of a logical system, whose valid argument forms they mimic or distort.

*Hypothetical and disjunctive reasoning.* Hypothetical and disjunctive reasoning is systematized by the calculus of propositions. The  $p$ ,  $q$ , and other terms in the forms given below stand for variables that range over complete statements or propositions, and the phrases "If ... then" and "Either ... or" stand either for the corresponding truth operators or for any operators that, with respect to the arguments into which they enter, obey substantially the same calculus. The following fallacies are common in reasoning of this kind.

*Asserting the consequent:* If  $p$  then  $q$ , and  $q$ , therefore  $p$ .

*Denying the antecedent:* If  $p$  then  $q$ , and not  $p$ , therefore not  $q$ .

*Converting a conditional:* If  $p$  then  $q$ , therefore if  $q$  then  $p$ . For example, "If this equation holds, so does that one; therefore, if that equation holds, so does this one."

*Negating antecedent and consequent:* If  $p$  then  $q$ , therefore if not  $p$  then not  $q$ . For example, "If the nations disarm, there will be peace; so if the nations do not disarm, there will not be peace."

These invalid forms of argument are plausible partly because they are distortions of valid forms. The first two are distortions of *modus ponens* (If  $p$  then  $q$ , and  $p$ , therefore  $q$ ) and *modus tollens* (If  $p$  then  $q$ , and not  $q$ , therefore

not  $p$ ). Similarly, the third and fourth both mimic the valid form transposition (If  $p$  then  $q$ , therefore if not  $q$  then not  $p$ ). However, concrete arguments of these invalid forms may also be explained as informal fallacies due to ambiguity (discussed under “Ambiguous Words and Phrases” below). An expression that actually asserts only a proposition of the form “If  $p$  then  $q$ ” may be wrongly taken as asserting “ $q$  if and only if  $p$ ,” and if each of the conditionals above were replaced by the corresponding biconditional, each fallacy would become a valid form of argument.

It is also easy to fall into these fallacies when one is working in a field in which corresponding statements of the forms “If  $p$  then  $q$ ” and “If  $q$  then  $p$ ” are frequently both true or both false. This is the case in certain areas of mathematics, and indeed this fact is used in the procedure for discovering proofs that is sometimes called geometrical analysis. We assume the truth of what we wish to prove, and work out its consequences; if among these we find something that is already known or that can be proved independently, we try to construct a proof by retracing the previous steps. We assume that  $p$ , we deduce in a series of steps that  $q$ , we prove independently that  $q$ , and hence, reversing the previous deduction, that  $p$ . However, this final proof will be valid only if each of the steps in the analysis is reversible. Geometrical analysis is a useful heuristic procedure because this is often the case, but this utility in many geometric arguments may tempt us to assume, wrongly, that such steps are always reversible and that wherever we have established “If  $p$  then  $q$ ,” we are entitled to infer, from this alone, “If  $q$  then  $p$ .”

Another common fallacy is that of *asserting an alternative*: Either  $p$  or  $q$ , and  $p$ , therefore not  $q$ . This is a distortion of the disjunctive syllogism (Either  $p$  or  $q$ , and not  $p$ , therefore  $q$ ). However, concrete examples may also be explained as due to the ambiguity of disjunctive expressions, for if “Either  $p$  or  $q$ ” were replaced by the strong disjunction “Either  $p$  or  $q$  but not both,” this would be a valid form of argument.

There are also fallacies that are distortions of De Morgan’s rules. Thus, “Not both  $p$  and  $q$ ” is equivalent to “Either not  $p$  or not  $q$ ,” but we may invalidly infer from it “Both not  $p$  and not  $q$ ”; and from “Either not  $p$  or not  $q$ ” we may invalidly infer “Not either  $p$  or  $q$ .”

*Use of arguments.* If a conclusion follows validly from a premise or set of premises, we can use this fact correctly in either of two ways. Given that the premises are true, we can infer that the conclusion is true; or, given that the conclusion is false, we can infer that at least one

of the premises is false. However, these correct inferences may be replaced by the following fallacious ones:

- (1) The conclusion is true; therefore the premise is true (or therefore all the premises are true).
- (2) The premise (or at least one of the premises) is false; therefore the conclusion is false.

The first of these can contribute to confusion between the confirmation of a hypothesis and a proof of it; for when a hypothesis is confirmed, a conclusion drawn from it as a premise is found to be true, and the fallacy would make us infer from this that the hypothesis is itself true.

- (3) The conclusion is false; therefore all the premises are false.

We might take as a variant of the above inference a fallacy noted by Aristotle and inappropriately named *non causa pro causa*. In this variant, an assumption is rejected because an argument in which it is used as a premise leads validly to a false or self-contradictory conclusion. This unsatisfactory conclusion is not due to this assumption, however, and would have followed from the other premises used without this assumption. In practice, one may slip into such an improper *reductio ad absurdum* (or *ad falsum*) either through not noticing that other premises besides the assumption are used, or through too easily taking them to be correct.

There are also fallacious ways of using the fact that an argument is invalid, such as:

- (4) The argument from this premise (or these premises) to that conclusion is invalid; therefore the conclusion is false.

Examples of the first and fourth fallacies in the use of argument can also be explained in another way. The correct inference in each case is that the conclusion is not supported by the proposed argument, and we may confuse “not supported” with “false.” Indeed, where the conclusion is the subject of controversy and we have previously had both arguments tending to show that it is true and arguments tending to show that it is false, the demolition of a supporting argument will shift the balance between the opposing views and will leave our reasons for denying this conclusion relatively stronger than they were before.

*Traditional logic.* The *simple conversion of an A-proposition* (or universal affirmative) is a common fallacy having the form “all  $P$  are  $Q$ , therefore all  $Q$  are  $P$ .” For example, having agreed that whatever is conceivable is logically possible, we are liable to infer from this that any-

thing that is logically possible is conceivable. An equivalent error is the negating of terms in an A-proposition, that is, arguing from “All  $P$  are  $Q$ ” to “All not- $P$  are not- $Q$ ”: “Whatever is conceivable is logically possible; therefore, anything that is not conceivable is not logically possible.”

A similar fallacy is the *conversion of an O-proposition*: “Some  $P$  are not  $Q$ , therefore some  $Q$  are not  $P$ .” An example is “Some states with parliamentary government are not democratic; it follows that there are genuinely democratic states which lack parliamentary government.”

We can give a complete list of the possible formal fallacies in the traditional syllogism and sorites because the following set of four rules (one of them in two parts) is such that every argument that has the form of a syllogism or a sorites is valid if it obeys all these rules and is invalid if it breaks any of them.

- Rule I. Not more than one premise may be negative.
- Rule II. If one premise is negative, the conclusion must be negative, and vice versa.
- Rule III. Each middle term must be distributed at least once.
- Rule IV. If a term is distributed in the conclusion, it must be distributed in the premise in which it occurs.

In interpreting these rules, we take the subjects of universal propositions and the predicates of negative propositions to be distributed, and the subjects of particular propositions and the predicates of affirmative propositions to be not distributed.

There are, then, the following possible formal fallacies:

- Two negative premises.
- Negative conclusion with no negative premise.
- Negative premise with no negative conclusion.

*Undistributed middle.* A middle term is not distributed in either of the premises it is meant to connect.

*Illicit major.* The major term, the predicate of the conclusion, is distributed in the conclusion but not in its premise.

*Illicit minor.* The minor term, the subject of the conclusion, is distributed in the conclusion but not in its premise.

Fallacies of the last three kinds are the most common and important. The argument “All machines work in accordance with causal laws, and all human beings work

in accordance with causal laws; therefore all human beings are machines” commits the fallacy of undistributed middle because the middle term, “things that work causally,” is undistributed in each of the premises as the predicate of an affirmative proposition. This fallacy is more plausible if the reasoning is expressed hypothetically: “Machines are causally determined, so if human beings were causally determined, they would be mere machines.”

The fallacy becomes yet more plausible if the argument is extended to form a sorites: “Machines are causally determined, and they are not morally responsible for what they do; therefore, if human beings were causally determined, they would be no more morally responsible than machines are.” The syllogism “All matters of taste are subjective, and no moral judgments are matters of taste; therefore no moral judgments are subjective” contains the fallacy of illicit major, for the term *subjective* is distributed in the conclusion but not in its premise. The fallacy is not obvious here, and it is still less obvious in the sorites “Matters of taste are subjective, but we do not dispute about matters of taste; since we do dispute about moral judgments, they cannot be subjective.” However, the fallacy may be easily seen in an argument of the same form on another subject, such as “All birds are egg-layers; no insects are birds; therefore no insects are egg-layers.” Similarly, the argument “All Victorian Gothic buildings have nonfunctional features, and they are all ugly; therefore all buildings with nonfunctional features are ugly” is an example of the fallacy of illicit minor, for the term “buildings with nonfunctional features” is distributed in the conclusion but not in its premise.

There are fallacies that consist in the mishandling of complex (conjunctive and disjunctive) terms. These include distortions of the De Morgan rules for terms, corresponding to fallacies noted above. Thus, it is fallacious to argue from “No policy will both defend freedom and insure peace” ( $PeDI$ , which is equivalent by obversion to  $Pa\overline{DI}$ ) to “Every policy both fails to defend freedom and fails to insure peace” ( $Pa\overline{DI}$ ).

Two traditionally recognized fallacies are the *fallacy of the accident* and the *converse fallacy of the accident*, which is also called the fallacy *a dicto secundum quid ad dictum simpliciter*. The latter consists in going invalidly from a qualified statement to an unqualified one—for example, in arguing from “It is always wrong to take another person’s property without his permission” to “It is always wrong to take another person’s property.” (It is similarly fallacious to go from a statement qualified in one way to a like statement qualified in another way; both

these errors, when they occur in moral reasoning, amount to neglect of the principle that circumstances alter cases.) Considered formally, the converse fallacy of the accident consists in invalidly dropping a conjoined term, in arguing from “All  $PQ$  are  $R$ ” to “All  $P$  are  $R$ .” It is always fallacious to drop a conjunct from a distributed term, and we might therefore extend the traditional name to cover all cases of this sort. But what, then, is the fallacy of which this is the converse? Adding a conjunct to a distributed term is generally valid, but it is always a fallacy to add a conjunct to an undistributed term—for example, to argue from “Some snakes are poisonous” to “Some snakes native to Madagascar are poisonous”—and we may give this fallacy the traditional name of the fallacy of the accident. However, supposed examples of this are often really examples of the converse fallacy.

Parallel with the fallacies of dropping a conjunct from a distributed term and adding a conjunct to an undistributed term are the fallacies of dropping a disjunct from an undistributed term (All  $P$  are  $Q$  or  $R$ , therefore all  $P$  are  $Q$ ) and adding a disjunct to a distributed term (No  $P$  are  $Q$ , therefore no  $P$  are  $Q$  or  $R$ ).

**Relational arguments.** We may recognize certain arguments involving relations as being valid on account of some formal feature of these relations, such as symmetry or transitivity. There will then be a kind of fallacy that consists in treating a certain relation as if it had some formal feature that it does not have. Thus, it is fallacious to argue “Even an experienced doctor may be unable to distinguish diphtheria at an early stage from tonsillitis, or tonsillitis from an ulcerated throat; even an experienced doctor, therefore, may be unable to distinguish diphtheria at an early stage from an ulcerated throat,” because the relation “is indistinguishable from” is not transitive. This invalid argument is plausible because this nontransitive relation can be confused with the transitive one “is exactly like.”

**Multiple and nonextensional operators.** In multiply quantified statements, the order of two successive universal quantifiers can be changed. Thus, “Every man is always selfish” (which we can symbolize as  $\Pi m \Pi t Smt$ —“For every man, for every time, that man is selfish at that time”) is equivalent to “At every time all men are selfish” ( $\Pi t \Pi m Smt$ ). Similarly, “Someone at some time is selfish” ( $\Sigma m \Sigma t Smt$ ) is equivalent to “There is a time at which someone is selfish” ( $\Sigma t \Sigma m Smt$ ). However, “Every man is sometimes selfish” ( $\Pi m \Sigma t Smt$ ) is not equivalent to “Sometimes every man is selfish” ( $\Sigma t \Pi m Smt$ —“There is a time such that every man is selfish at that time”); the latter implies the former but not vice versa. It is, therefore, a

fallacy to change the order of successive quantifiers from universal-particular to particular-universal. Aristotle would have been guilty of this fallacy if he had argued directly from “Every activity aims at some good” to “There is a good at which every activity aims.”

There are similarly invalid ways of changing the order of successive operators one or both of which are not quantifiers. “It is certain that someone will win” (which may be symbolized as  $\forall x Wx$ ) does not imply “There is someone who is certain to win” ( $\exists x VWx$ ), although the invalid inference from the first to the second is facilitated by the fact that “Someone is sure to win” is ambiguous between the two. George Berkeley’s central argument (in Section 23 of the *Principles of Human Knowledge* and in the first of the *Three Dialogues*) contains an example of this fallacy. He showed, correctly, that a statement which we can formulate as follows is necessarily false: “There is something which someone truly believes not to be thought of” ( $\Sigma m \Sigma m Bm NTx$ ). However, he thought he had demonstrated the necessary falsity of the different statement “Someone truly believes that there is something which is not thought of” ( $\Sigma m Bm \Sigma x NTx$ ). Berkeley argued invalidly from the denial of the former statement to the denial of the latter, and so to the conclusion that it is absurd to maintain that material objects exist unconceived.

We should recognize, then, a *fallacy of rearranging operators*. Indeed, we could bring under this heading many fallacious forms of argument. Thus, the fallacies due to distortions of De Morgan’s rules noted above consist in reversing the order of negation and conjunction, or of disjunction and negation. The invalid argument from “You are not obliged to resign” to “You are obliged not to resign” reverses the order of the deontic operator and negation; the fallacious “logical” proof of determinism, “Necessarily either you will go or you will stay; so either you will go necessarily or you will stay necessarily,” reverses the order of the modal operator and disjunction; and so on.

Some operators set up nonextensional contexts, contexts in which terms or propositions that are extensionally equivalent cannot be validly substituted for one another. Whereas “Mrs. Jones shot the man in her bedroom,” together with the fact that the man in her bedroom was her husband, entails “Mrs. Jones shot her husband,” “Mrs. Jones intentionally shot the man in her bedroom” does not similarly entail “Mrs. Jones intentionally shot her husband.” And even if “ $p$ ” is logically equivalent to “ $q$ ,” “Smith believes that  $p$ ” does not entail “Smith believes that  $q$ .” It is still a matter of dispute how such

contexts should be explained and classified, and what kinds of substitution are valid in each sort of context; however, we can recognize, as a further type of fallacy, *extensional substitution in nonextensional contexts*.

**INFORMAL FALLACIES.** Many informal fallacies are due to ambiguity or vagueness of expressions used to make statements. If the terms used are vague or ambiguous, the expressions in which they are used will be correspondingly vague or ambiguous. However, the whole expression may be vague or ambiguous even if the terms are not, principally because a sentence form may be indeterminate as to the logical form it represents. We may, therefore, distinguish fallacies that arise from the ambiguity or vagueness of expressions in representing logical form from those that arise from other sorts of ambiguity or vagueness. Ambiguity or vagueness is not in itself a fallacy, but it may lead to fallacy. For example, someone may move invalidly from one assertion to another, but not notice that he has made any move at all because he uses the same ambiguous expression for his premise and for his conclusion. Or he may use an ambiguous expression to assert a premise, and thus infer a conclusion that would follow from one possible sense of that expression but does not follow from the sense he intends to assert. Or, having validly inferred a certain conclusion, he may assert a different conclusion, using an expression ambiguous between the validly derived conclusion and the one asserted.

*Indeterminacy of expressions.* A sentence such as “Men are unwise” may be ambiguous between “All men are unwise” and “Some men are unwise.” It suffers from suppressed quantification. Similarly, if someone says “Courage and wisdom go together” (or “always go together,” or “are constantly conjoined”), is he saying that all the courageous are wise, that all the wise are courageous, or both of these? Some philosophical terminology is ambiguous in just this way. If we say that one thing is a criterion of another, do we mean that it is a necessary criterion, a sufficient one, or both? Such indeterminacy may facilitate an invalid move from one meaning to the other, and in actual cases we may be unable to decide whether an arguer has committed the formal fallacy of simply converting an A-proposition or the informal fallacy of going from one sense to the other of an ambiguous expression.

Conditional expressions are often similarly indeterminate. “You will succeed if you make an effort” may say what it would be literally taken as saying ( $m \supset s$ ), but with a different emphasis or in a different context it may

mean “You will succeed only if you make an effort” ( $s \supset m$ ), or perhaps the conjunction of these two ( $s \equiv m$ ). Disjunctive expressions, while they are commonly used to express a weak disjunction, can be ambiguous between weak and strong disjunction; but logicians have themselves often fallen into a fallacy in supposing that whenever two disjoined terms are mutually exclusive, either necessarily or as a matter of fact, the disjunction is itself a strong (exclusive) disjunction. The truth is that when the disjoined terms are known to exclude one another, it makes no practical difference whether the disjunction itself is weak or strong.

The name of the *fallacy of division* has been given, by some modern writers, to attempts to argue from the premise that something is true of some whole, or of some class considered collectively, to the conclusion that the same is true of the parts of that whole, or of the class considered distributively (that is, of each of its members); and the name of the *fallacy of composition* has been given to arguments in the reverse direction. Either of these fallacies may be covered by an ambiguity of the word *all* between its collective and its distributive sense. This ambiguity of *all* leads us to commit the fallacy of division when we argue, for example, from the fact that all the citizens are strong enough to resist a tyrant (meaning that the citizen body considered as a whole has sufficient strength to do this) to the conclusion that all the citizens are strong enough to resist a tyrant (meaning that every citizen, considered individually, has sufficient strength to do this). We are in this case arguing from the statement made by a sentence in which “all” is used collectively to the statement made by the same sentence when “all” is used distributively. We are committing the fallacy of composition when we argue from the premise that every man can decide how he will act to the conclusion that the human race can decide how it will act (for example, with regard to the rate of increase of population or the choice between war and peace). In this case we move from the distributive to the collective sense of “all” in “All men can decide on their actions.” This, or a similar fallacy, is committed whenever we assume, without adequate reason, that we can speak about groups in the same ways in which we can speak about their members, that we can speak of a nation having a will or interests, or of a society having problems. Of course, it may be possible to do this; there may be predicates applicable (in the same sense) to a group and to its members, but this cannot be assumed without evidence. It may also be possible to introduce a different but useful sense in which a predicate normally

applied to individuals may be applied to a group; but if so, the new sense must be explained.

However, what Aristotle called the fallacies of division and composition are different from these. He was speaking about changing the ways in which words are combined; for example, from “John is able-to-write while he is not writing” to “John is able to write-while-he-is-not-writing.” In all such cases there is an ambiguity that conceals a fallacy of rearranging operators (the former example may be symbolized as  $\Sigma tKMWatNWat$ —“At some time both it is possible that John is writing at that time and John is not writing at that time”—and the latter as  $M\Sigma tKWatNWat$ —“It is possible that at some time both John is writing at that time and John is not writing at that time”). The ambiguity of “All the men pushed, but could not move the stone” is really of this sort; the first clause is symbolized in one sense as  $\Sigma t\Pi mPmt$ —“There is a time such that every man pushed at that time”—and in another sense as  $\Pi m\Sigma tPmt$ —“For every man, there is a time such that the man pushed at that time.” There need not be any question of ascribing the activity of pushing to a totality of men. In either case there are only individual pushings; but the statement in one sense says that these were simultaneous and in the other sense it does not. This contrast might also be referred to as a distinction between collective and distributive senses. There are, therefore, at least two distinct pairs of fallacies that have been called fallacies of composition and division, but if we speak about collective and distributive senses we tend to run the two pairs together.

Ordinary language seems to lend itself to ambiguities about operator order. Does “You can fool all of the people some of the time” mean that there are times at which the whole populace can be deceived ( $\Sigma tM\Pi mDmt$ —using  $M$  for “It is possible that” and  $Dmt$  for “that man is deceived at that time”)? Or that every person is occasionally foolable ( $\Pi m\Sigma tMDmt$ )? Does “You can fool some of the people all of the time” mean that some people are capable of being permanently deceived ( $\Sigma mM\Pi tDmt$ ), or that at every time it is possible to fool some people ( $\Pi t\Sigma mMDmt$  or  $\Pi tM\Sigma mDmt$ , these two being perhaps equivalent)?

However, in all the cases considered here, and in some of those to be considered in the next subsection, it may be questioned whether we should say simply that the fallacy is due to ambiguity or vagueness. We may fail to distinguish two kinds (or forms) of situations because we use the same expression to describe them, but it could also be that we use the same expression because we commonly fail to distinguish the two things. Informal falla-

cies, as considered here, are due to confusion as much as to ambiguity. We can conveniently explain them in terms of the ambiguity of various expressions, but we should not assume that the linguistic fact of ambiguity (or vagueness) is the sole or the primary cause of these errors.

*Ambiguous words and phrases.* Ambiguity is extremely common, but it is likely to lead to fallacy only in cases in which the different meanings of a word or phrase are close enough to be confused. One fallacy that can then arise is that of the *ambiguous middle*, that is, an argument may appear to have the form of a syllogism, but the expression we take as standing for a middle term may have different meanings in the two premises. For example, an authority on theology is more likely than other people to be right about theology, and a learned divine is an authority on theology. Does it follow that a learned divine has a better than ordinary chance of being right about theology? Not if the phrase “an authority on theology” means in the second premise an authority on the body of theological assertions but in the first premise means an authority on that which theological assertions are about. In such cases there is really no term common to the two premises, and therefore there is no genuine syllogism. There are also similar fallacies in which an expression is used in different senses in a premise and in the conclusion. Ambiguity often gives rise to these fallacies when the meaning of a word is fixed by its context, and the two different contexts give the word two different meanings. All these are instances of equivocation.

Some words are systematically ambiguous in a troublesome way. An observation may be either what is observed or the observing of it; a perception may be either a perceiving or what is perceived. There are similar indeterminacies about “experience,” “sensation,” and “belief.” Such ambiguities constantly create difficulties in epistemology, the philosophy of science, and philosophical psychology.

There are also forms of speech that tempt us to confuse what we can say about words with what we can say about the corresponding things. A cause necessarily produces an effect, but only in the sense that it would not be called a cause if it did not. Similarly, murder is necessarily wrong, but not in the sense that there is a necessary connection or a rationally discoverable link between the kind of act called murder and its being wrong.

Sometimes when words are not ordinarily ambiguous, we perversely make them so; for example, by giving a word, in addition to its ordinary meaning, another meaning that is borrowed from a cognate word or a sim-

ilarly formed word. If John Stuart Mill confused “is desirable” (meaning “ought to be desired”) with “can be desired,” deriving this second sense from the use of “is visible” to mean “can be seen” and “is audible” to mean “can be heard,” he was making a mistake of this kind. Similar results are produced by an idiosyncratic use of language. It is hard to keep to a sense specially assigned to a word, and we are always liable to slip back into some more conventional use. When a psychologist has redefined “learning” in relation to some special procedure by which “learning” can be measured, he or his readers may think that what he then discovers is true also about learning in its ordinary, much broader sense.

Such unwarranted generalization, considered formally, exemplifies the fallacy *a dicto secundum quid*; in practice, however, it is aided by various ambiguities and confusions. Thus, the words *class* and *set* may be confined to finite collections or may embrace infinite ones as well. We are liable to argue from the fact that something holds for all finite classes or sets to the conclusion that it holds for all classes or sets, including infinite ones, partly because the words are ambiguous, partly because we fail to notice that the wider concept is a different one, and partly because we generalize from specimen cases and choose specimens that are more easily visualized but are not fully representative.

As we have noted, errors may arise not only from ambiguity as such but also from the confusing of things that, although similar or related, are different. A classic example of this, of great importance in philosophical discussion, is the confusing of separation with distinction. Thus the distinction between analytic and synthetic statements may be attacked, fallaciously, on the ground that actual statements are difficult to assign, without reservations, to one category or the other. Confusion here is due partly to failure to see what sorts of things are being distinguished—not verbal forms, not sentences, but ways of using sentences to make statements.

When this obscurity is removed, however, we may still have to defend the distinction against the critic who says that because of indeterminacies in the use of component words, every concrete use of a sentence in order to make a statement lies somewhere between being analytic and being synthetic. Even if this critic were right, this would in no way count against the distinction. Indeed, such a status makes it particularly important to draw the distinction, in order to expose the common fallacy of arguing from a statement in which words are so used as to make the statement analytically true to a synthetic statement made by the same words in a different sense (as

might be done with the statement “A change in the moral code means social disintegration”).

This confusion can also be used in the opposite way. It may be argued that because two things can be distinguished, they must be separate—for example, to argue that since we can distinguish a motive from a cause, things that have causes cannot have motives, or that a person’s having a certain motive cannot be a cause of his action.

## FALLACIES IN NONDEDUCTIVE REASONING AND IN OBSERVATION

Outside the sphere of deductive reasoning, we can speak of fallacies only in an extended sense. For example, we can contrast genuine confirmation of hypotheses with something that is mistaken for it, probable arguments that give some support to their conclusions with ones that do not, and, in general, techniques and procedures that tend to give correct results with ones that tend to produce error. However, it would be pointless and misleading to call a piece of inductive reasoning, say, fallacious, merely because its conclusion turned out to be false.

**INDUCTION AND CONFIRMATION.** We may note two fallacies *about* induction or confirmation: the mistaking of confirmation for proof, and the demanding of proof where no more than confirmation is possible. There are also fallacies *in* induction and confirmation. Where scientific or commonsense reasoning follows the lines of one of the eliminative methods of induction, failure to observe the requirements of that method will count as a fallacy. Thus, in reasoning along the lines of the method of agreement, it will be a fallacy to conclude that there is a causal relation between the phenomenon *P* and a certain feature *A*, merely because occurrences of *P* are repeatedly found to be accompanied or preceded by occurrences of *A*, without trying to discover other possibly relevant features common to these occurrences of *P* or, what amounts to the same thing, without trying to find occurrences of *P* that are as relevantly diverse as possible and then seeing whether *A* is present in them all. Thus, it is fallacious to conclude that William is allergic to strawberries from the evidence that his allergic symptoms have repeatedly appeared after he has eaten strawberries, if William has eaten strawberries only in one particular house, at a particular sort of gathering, and so on.

Similarly, in reasoning along the lines of the method of difference, it will be a fallacy to conclude that *A* is even an indispensable part of a sufficient condition for *P* from

a comparison of a case in which *P* and *A* are both present and a case where they are both absent, without checking that the two cases are otherwise relevantly alike, that no likely-to-be-relevant feature except *A* differentiates the case in which *P* occurs from the one in which it does not. In other words, it is fallacious to use a control case that differs from the experimental case in some unwanted respect. Thus, it is fallacious to infer that John's having recovered more rapidly than James is due to a drug that was given only to John, if John was also told that he was having a new treatment and the doctors and nurses all took special care of John because they were interested in the experiment. There can be correspondingly unsound experimental procedures, and corresponding errors in reasoning, in applications of the method of concomitant variation.

*Post hoc ergo propter hoc* is traditionally listed as a fallacy; but much respectable inductive reasoning would fall under this heading, and it is not to be condemned because it is not deductively valid. We argue, reasonably, that the one likely-to-be-relevant change causes the result that follows. We are, in effect, taking the "before" situation as the control case and the "after" situation as the experimental case. This is a fallacy only if we ignore other likely-to-be-relevant changes.

All such mistakes can be summed up as consisting in failures to test the hypothesis in question—that *A* is (in some sense) the cause of *P*—that is, in failure to look for what, if the hypothesis were false, would be most likely to reveal its falsity. If *A* is not the cause of *P*, we are most likely to reveal this by finding cases of *P* so diverse that *A* is not present in them all, or a control case so like the experimental case that *P* occurs in both, or occurs in neither, in spite of *A*'s being present in one and absent from the other.

Another inductive fallacy is to take a hypothesis as being confirmed by observations to which it is irrelevant, when without this hypothesis our other knowledge and beliefs would explain what is observed equally well. Further, since it is a basic principle of inductive reasoning that alternative hypotheses should be considered, and that to confirm one hypothesis we must eliminate its rivals or show them to be improbable, it is a fallacy to take a hypothesis as being confirmed by observations that are equally well confirmed by an intrinsically more probable alternative hypothesis—for example, to take the Michelson-Morley experiment as confirming the theory of relativity without eliminating the FitzGerald-Lorentz contraction and the emission hypothesis of the velocity of light.

We may add a fallacy of saving hypotheses. It is certainly a fault for a thinker to be so attached to a hypothesis that he notices only evidence that agrees with it and ignores or denies unfavorable evidence. Popular superstitions of all kinds are protected by this fallacy, but it is also common among scientists, historians, and philosophers. It may also be a mistake, when one finds evidence that is *prima facie* unfavorable, to introduce supplementary ad hoc hypotheses in order to protect the original one from falsification. Carried to an extreme, this procedure constitutes a linguistic change that makes the original hypothesis analytically true, and it can generate the fallacy described above of oscillating between an analytic and a synthetic use of the same expression. In less extreme cases, how can we systematically mark off this error from the respectable procedure of interpreting new observations in the light of an established theory? Perhaps in two ways: first, in the respectable procedure, we are working with a hypothesis that is already well confirmed, but it is a fallacy to "save" a hypothesis for which there is no strong independent support; and second, even if the original hypothesis was well confirmed, it may be appropriate to consider, after it has been "saved" by additional hypotheses (after the new observations have been interpreted in the light of the original hypothesis) or has been modified and qualified in various ways, whether some alternative hypothesis would account better for the whole body of evidence.

**ANALOGY.** All arguments from analogy are fallacious in the sense that they are not deductively valid. However, we often want further to distinguish weak analogies from strong ones and to suggest that a weak analogy is completely fallacious but that a strong analogy has at least some force. In an analogy we compare two things, *A* and *B*; we find some resemblances, say *X*, *Y*, *Z*, between them; and then we argue that since *A* has some further feature *P*, it is likely that *B* also has this feature. We are inclined to say that if the points of resemblance *X*, *Y*, *Z* are few or trivial, the analogy is weak or far-fetched, but that it is a strong analogy if there are many important points of resemblance. An alternative way of looking at the distinction is that to use this analogy is implicitly to frame and then use the hypothesis that all things that have the features *X*, *Y*, *Z* also have the feature *P*. The analogy will be weak if we already have evidence that falsifies this hypothesis or makes it implausible, but it will be strong if we have no such evidence and what we know about *A* somehow constitutes good inductive evidence for a connection between *X*, *Y*, *Z*, and *P*.

**CLASSIFICATION.** Faults in classification can in several ways give rise to fallacies in either the strict or the extended sense. If things are classified under headings where they simply do not belong, the classification implicitly asserts false propositions which may be used as premises in arguments that, even if formally valid, will therefore give no real support to their conclusions. If a classification is based on unimportant resemblances, this may give rise to weak analogies and to the framing of unlikely hypotheses, and inductive reasoning that uses such a classification—in the methods of agreement and difference, for example—will give an appearance of support to conclusions that are not really supported by the evidence as a whole. Again, if the division of a class into subclasses is not exhaustive, it may be wrongly taken to be so, and this will provide a false premise for a disjunctive argument. Thus, if we divide trees into conifers and deciduous trees, we may infer that since eucalypts are not conifers, they are deciduous. Similarly, a division that is not exclusive may be wrongly taken to be so; the same division of the class “trees” may lead us to infer that larches, being conifers, are not deciduous.

Two important fallacies concerned with classification arise from the attempt to draw sharp distinctions where the facts show a continuous (or near continuous) gradation. Is a man bald if he has one hair on his head? or two? or three? And so on. Just what degree of mental disorder is to count as insanity? One fallacy consists in assimilating every intermediate case to one or the other of the extremes and is exemplified in the black-and-white thinking that divides people into normal individuals and lunatics or states into peace-loving nations and warmongers. The contrary, and more subtle, fallacy consists in arguing that because there is no break in the gradations, there is no distinction even between the extremes—concluding, for example, that we are all insane—as if the problem about when a man is bald showed that there is no difference between a man with a completely smooth scalp and one with a full head of hair.

**STATISTICS.** We can deal here only with some elementary mistakes in statistical reasoning. One of these consists in paying attention to simple frequencies or proportions rather than to correlations. If a high proportion of atheists are honest, this in itself does not indicate any sort of causal connection between atheism and honesty; the first thing to discover is whether the proportion of honest people is higher among atheists than among nonatheists. Similarly, the frequency of persons who have both mathematical ability and artistic talent may be small in the population as a whole; but if only one person in ten

has mathematical ability and only one in ten has artistic talent, then only one in a hundred would have both, even if there were no natural opposition between these gifts. Before we conclude that these abilities tend to occur separately, we must find whether artistic talent is more or less common among the mathematically able than among the rest of the population.

Another common statistical fallacy consists in directly inferring a causal connection from a positive correlation: given a positive correlation between cigarette smoking and lung cancer, it is a further question whether this is to be explained by a causal connection between them. An associated fallacy of confusion, which is becoming more common, is simply not to talk about causation but to use the word *correlation* as if it meant causal connection, for example, to infer predictions and practical recommendations directly from correlation statements. Another fallacy is the neglect of the requirements of significance. Essentially, this consists in taking as causally informative, or as representative of a similar correlation in a larger population, a correlation within a sample that could equally well be explained as a chance result. This is, therefore, an instance of the neglect of alternative hypotheses.

Even when there is good statistical evidence for a causal connection between two features *A* and *B*, it is a mistake to conclude immediately that one, say *A*, is the cause of the other without having considered and excluded the possibilities that *B* may tend to produce *A*, that *A* and *B* may be joint effects of some other cause, and that there may be causation in more than one direction. For example, a positive correlation between poverty and ill health might be due to the fact that poverty causes ill health, to the fact that ill health diminishes earning capacity and wastes resources, to the fact that stupidity, idleness, or drunkenness tends to produce both poverty and ill health, or to a combination of more than one of these causal tendencies.

**PROBABILITY.** Fallacies in reasoning about probability arise mainly from failure to attend to the fact that a probability is relative to certain evidence and changes as the evidence changes. The best-known is the gambler's fallacy. For example, since it is unlikely that a penny will fall heads up five times in a row, the gambler reasons, when it has fallen heads four times, that it is unlikely to fall heads at the next throw. But although the probability of five heads, relative to the knowledge that an unbiased penny is tossed in a random manner five times, is  $1/32$ , the probability of this result, relative to the conjunction of this

knowledge with the knowledge that it has fallen heads on the first four throws, is  $1/2$ .

**OBSERVATION.** It is questionable whether we should follow Mill and speak of fallacies of observation. Many of the items so described consist of errors in reasoning rather than in observation, and so fall under other headings. We may, however, note the following principles:

First, there are errors of nonobservation, which may be due to deficiency of one's senses or sense apparatus, to carelessness, or to the tendency to see only what we want to see. This may include the nonobservation that is one way of saving hypotheses.

Second, any of the above-mentioned causes may equally produce misobservation.

Third, it is impossible to separate, and difficult even to distinguish, observation from interpretation: we always have some conceptual framework, some expectations that determine how we shall observe what we observe. For example, we expect an object that looks like an adult human being to be between five and six feet tall, and we therefore tend to see any such object as being at a distance that would agree with this. The actual material to which our prior concepts are applied may not conform to them, however, and then we may make wrong judgments through using these concepts. Also, if we do not realize how observation and interpretation are mixed together, we may give the authority of an observed fact to a judgment that really rests on our preconceptions.

Fourth, our perceptual mechanisms automatically allow for factors that have been constant or to which it is inconvenient to attend, and errors arise when allowances are made for what is no longer there; for example, the illusion that the land is moving when we first go ashore after becoming used to the rolling of a ship.

Fifth, we may in perception confuse relations, say of comparison, with intrinsic qualities. This explains the illusions of contrast. For example, if after having had one's left hand in cold water and one's right hand in hot water, one puts both hands into lukewarm water, the lukewarm water feels hot to the left hand and cold to the right hand because it really is *hotter than* the left hand (or than what it has just been feeling) and *colder than* the right hand (or than what it has just been feeling).

Sixth, we may mislocate what we observe. In particular, we have a tendency to project and to treat as objective, as belonging to some external state of affairs, the feeling that the state of affairs arouses in us (the *pathetic fallacy*) or to mistake connections within our thoughts

for connections between the corresponding objects. There is no room here for a full discussion of perceptual illusion and observational error, but it seems that many varieties of these can be explained by reference to one or more of these principles.

## FALLACIES IN DISCOURSE

**INCONSISTENCY.** A position or a system of thought cannot be sound if it contains incompatible statements or beliefs, and it is one of the commonest objections to what an opponent says that he is trying to have it both ways. Inconsistency has many possible sources, but one that is of special importance in philosophy is the case in which a thinker, in order to solve one problem or deal with a particular difficulty, denies or qualifies a principle he has previously adopted, although in other contexts he adheres to the principle and uses it without qualification.

Inconsistency is a formal feature and can be formally checked, although it may also be concealed by the use of different expressions with a single meaning. It is not the same as invalidity, however; indeed, any argument with incompatible (or self-contradictory) premises will be formally valid. It is particularly important to detect inconsistencies in a set of premises, for an argument with inconsistent premises, even though valid, gives no support to its conclusion; and using one is not a satisfactory way of establishing anything or of convincing an audience.

On the other hand, it is a formal fallacy to suppose that because your opponent has tried to have it both ways, he cannot have it either way—that every part of an inconsistent position must be false.

**PETITIO PRINCIPII.** An argument that begs the question, that uses the conclusion as one of the premises, is always formally valid. A conclusion cannot fail to follow from a set of premises that includes it. This is also a fallacy only in the extended sense that such an argument gives no support to its conclusion. One kind of *petitio principii* consists in arguing in a circle, when one proposition is defended by reference to another, and the second is defended by reference to the first. For example, we may argue that a certain historian is trustworthy because he gives a balanced account of some episode, but also rely on that historian's account in order to decide what actually occurred in this episode, and hence to decide what would be a balanced account of it.

The larger and more complex a circle of argument is, the harder it is to detect the fallacy. One result of circularity is that the propositions that have been proved from

one another appear to have been conclusively established, although no empirical evidence has been given for either of them. This can create an illusion that there are synthetic propositions that have no need of empirical support. This may be combined with a fallacy of confusion, of failing to distinguish the coherence or consequential character of a system from its truth—a confusion that has developed into the coherence theory of truth and that is still encouraged by some eccentric uses of the word *true* or of such a phrase as “true within the system.”

Circularity is common in moral reasoning, and here, too, it may make us think that moral conclusions can be rationally established without reliance on observations, intuitions, choices, or decisions. The exposure of such circularity compels us to give a more adequate account both of how moral judgments are to be supported and of how they are to be interpreted.

**A PRIORI FALLACIES.** Under the heading of a priori fallacies Mill listed a number of natural prejudices, including the popular superstition that words have a magical power and such philosophical dogmas as that what is true of our ideas of things must be true of the things themselves; that differences in nature must correspond to our received (linguistic) distinctions; that whatever is, is rationally explicable; that there is no action at a distance; that every phenomenon has a single cause; and that effects must resemble their causes. These are all errors, but we can go further and recognize a general a priori fallacy, which consists in trying to base knowledge of fundamental synthetic truths on anything other than empirical evidence. These examples illustrate how once we start looking for a priori truths, we are led to try to distill them from language or from our ideas (giving each of these an authority to which it is not entitled), or to confuse continuity with intelligibility and necessity, or to dignify with the title of a priori truths what are no more than sweeping generalizations from the simplest and most familiar observations.

More generally still, we can recognize a fallacy of prejudice, which consists in believing without evidence, in adopting or adhering to views on any subject without any relevant reason. It is worth noting that adopting a method of argument (other than a deductively valid form) is tantamount to adopting an assertion. For example, regularly to judge the rightness of actions by their utility is tantamount to adopting the principle that whatever maximizes utility is right; and, again, regularly to argue that because a statement cannot be verified, it is meaningless is tantamount to adopting a verifiability the-

ory of meaning. This is a particularly easy way of committing the fallacy of prejudice.

**IGNORATIO ELENCHI.** The fallacy of *ignoratio elenchi* consists in missing the point, in arguing for something other than what is to be proved. However, we can speak in this way only if the context somehow determines what is to be proved. In the first place, the context may be a discussion between *A* and *B*, and *B* will commit this fallacy if he claims to be replying to what *A* has said but fails to come to grips with *A*'s argument—for example, if he tries to disprove some proposition that *A* has not asserted either as a premise or as a conclusion. *B* is also guilty of this fallacy if he bluntly denies something that *A* has claimed to prove but does nothing to rebut *A*'s proof. Alternatively, it may be a thinker's general position or some long line of argument that makes it imperative for him to establish some point, and makes him guilty of irrelevance if he establishes something else instead.

There are a number of common and important types of irrelevance in discussion. If the question is whether a certain view is true or false, it is irrelevant to argue that adopting this view will be beneficial or pernicious. Thus, a body of religious doctrine may be irrelevantly defended on the ground that it makes people happier or better behaved. Similarly, the origin of a belief is in general irrelevant to the question of its truth; but if the fact that a belief is widely held has been used as evidence of its truth, then this reasoning may be relevantly rebutted by showing that the belief has come to be held for reasons or from causes that are independent of its truth. The truth of the belief and the account of its origin are in this case alternative explanatory hypotheses. That a view is held by certain people is also in general irrelevant to its truth, so that appeals to authority are usually examples of *ignoratio elenchi*. Cases in which the authority appealed to can be independently shown to be an authority in the sense of being likely to be well-informed about the point at issue are exceptions. Irrelevancy shades into prejudice; we may readily accept the doctrines of “our party” and reject those of “the enemy.” In this, there may also be present a fallacy of confusion, in that we treat factual beliefs as if they were items of another category—principles to which we can adhere or subscribe, or which we can reject, by choice.

Another form of irrelevance is the *tu quoque*, or “two wrongs” technique. If some action or view of one's own is criticized, one may reply by attacking some action or view of one's critic that is equally hard to defend. The *argumentum ad hominem* is similar—we reject what

someone says on the irrelevant ground that he is in no position to say it. However, an *argumentum ad hominem* may quite properly point to an inconsistency, and may validly establish the limited conclusion that this man cannot consistently hold this view—a conclusion that may be of special interest in a moral discussion, where the problem may well be that of finding a policy that is both coherent and acceptable.

Related fallacies of irrelevance have been named *argumentum ad verecundiam* (appeal to authority or to feelings of reverence or respect), *argumentum ad personam* (appeal to personal interest), and *argumentum ad populum* (appeal to popular prejudice). Sometimes an *argumentum ad ignorantiam* or *ad auditores* is grouped with these, but these names seem to refer not to any specific fallacy but to the use of any unsound argument that is likely to deceive the actual audience.

**FALLACIES OF INTERROGATION.** There are two forms of the *fallacy of many questions*. In one, two or more questions are asked together, and a single answer is demanded to all of them. This is fallacious in that it unfairly prevents the person asked from giving different answers to the different questions. In the second form, the question asked has a presupposition that the answerer may wish to deny but which he would be accepting if he gave anything that would count as an answer. Thus, an answer of either “Yes” or “No” to the question “Have you left the party?” would be an admission of having been a party member, and any answer to the question “Why does such-and-such happen?” presupposes that such-and-such does happen. There is no fallacy, however, in merely asking a question that has a presupposition; the fallacy lies in demanding an answer in the narrow sense, in not permitting or in discouraging a reply that denies the presupposition. Again, it is an instance of the fallacy of prejudice to ask a question that has a presupposition without first investigating whether that presupposition is correct.

**FALLACIES IN EXPLANATION AND DEFINITION.** Just as a circular argument fails to give support, so a circular explanation fails to explain. There are concealed circularities of explanation; for example, some mental performance is explained by reference to a faculty, but further inquiry shows either that to say that this faculty exists is only to say that such performances occur or that, although more may be meant, there is, apart from such performances, no evidence for the existence of the faculty. Words like “tendency,” “power,” “disposition,” and “capacity” lend themselves to circularities of this sort.

Similarly, a circular definition, in which the term to be defined recurs within the definiens, fails in its task. If it is intended as a stipulative definition, it fails to assign a meaning; and if it is intended as a reportive definition, it fails to inform anyone of the meaning with which the word is used.

Stipulative definitions can create ambiguity when we assign one meaning to a word but also retain another meaning. This amounts to an assertion that the two meanings go together, disguised as the innocent procedure of stipulation. Persuasive definition is an instance of this in which the retained meaning is an emotive one.

It is a fallacy, in the extended sense, to use words without meaning. But it is not a fallacy not to have defined one’s terms, provided that they have a meaning that is known to the audience and is precise enough for the purpose in hand. On the contrary, since it is impossible to define all one’s terms, it is a fallacy in discourse to demand that in all terms should be defined; a demand for definition can be a sophistic device for preventing the discussion of substantive issues.

## PHILOSOPHICAL FALLACIES

**THE NATURALISTIC FALLACY.** What G. E. Moore called the *naturalistic fallacy* is the identifying of goodness with any natural characteristic, such as pleasantness or being the object of desire. If there is a distinct property, goodness, it will of course be an error to identify it with any other feature, even if the two are coextensive, and this would be an example of the refusal to distinguish what we cannot separate; however, it must first be shown that there is such a property as Moore’s goodness. Alternatively, if it is a question of how the word *good* is commonly used, then it would be an error to say that it is used to convey some natural description. However, if the naturalist is not trying to report the ordinary use, but is saying that this ordinary use is somehow unsatisfactory (and also that there is no such property as the one of which Moore speaks) and is therefore proposing a different use, where is his mistake? It is true that if he redefines “good” as the name of some natural characteristic, but still also uses the word in its ordinary evaluative or prescriptive sense, he will be slipping into a fallacy of ambiguity; but a consistent ethical naturalist may be committing no fallacy at all.

**ARGUING FROM “IS” TO “OUGHT.”** An error exposed by David Hume, but still frequently committed, is that of arguing from premises that contain only descriptive terms, and no copula except “is,” to a conclusion that con-

tains an “ought.” This is a fallacy in the strict sense; arguments of this sort cannot be valid, but they are often made plausible by the ambiguous use of such words as *reasonable*, *fitting*, *authority*, *desirable*, *beneficial*, *courageous*, *temperate*, *just*, *right*, and *good* itself, any one of which may be used first in a purely descriptive sense and then interpreted in a sense that is partly descriptive and partly prescriptive. A currently popular version of this fallacy combines it with one or more of the a priori fallacies. Since our concept of, say, courage or our ordinary use of the word *courage* combines a certain natural description with a certain prescription or evaluation, it is concluded that behavior that conforms to this natural description must be recommended or valued in just this way; that is, the move from *is* to *ought* is covered by an appeal to the supposed authority of our language or our ideas.

**CONFUSING RELATIONS WITH THINGS OR QUALITIES.** A group of philosophical errors that is less well known than the two just mentioned but at least as widespread and harmful consists in identifying a quality with a relation, in treating a relation as if it were an intrinsic quality of one of its terms, or in constructing fictitious entities out of relational situations. Presented linguistically, this means that a term is treated as standing both for a thing or a quality and for a relation, and this, like other ambiguities, can make synthetic connections appear necessary. Thus, an idea or a sense datum is supposed to be an object of which someone can be aware and to have this relation—someone’s being aware of it—as part of its nature. This conflation generates a supposed matter of fact about which one can have infallible knowledge and thus gives rise to the pseudo problem of bridging the gap between this direct and infallible knowledge and ordinary fallible knowledge of objects that do not have being known built into their natures. Similarly, minds (or consciousness) have been treated as things that have as part of their nature the relation of being aware of something, and this generates difficulties in philosophical psychology. Also, errors that the naturalistic fallacy was meant to cover are better dealt with in this category. Goodness may be both treated as an intrinsic quality (natural or non-natural) of, say, states of affairs and identified with or taken as logically including the relation of being pursued, aimed at, or recommended; indeed, it seems that it is just such a conflation of features that makes a quality non-natural. Similarly, beauty may be both treated as an intrinsic quality and identified with or taken as logically including such relations as pleasing or being admired.

**CATEGORY MISTAKES.** Philosophers now carefully distinguish different uses of language, different “language games”; the contrasting error is to confuse different ways of using words, to treat a term that belongs to one category as if it belonged to another. However, the concept of a *use* of language is itself ambiguous. In distinguishing uses, we may be noting differences that lie within language, differences in the relations between words and things, differences in the things to which our expressions apply; and it will be a mistake to confuse one kind of distinction with another. There is also a tendency to think that, at least in philosophy, we cannot employ this distinction between words and things; this view is supported by a variant of Berkeley’s fallacy: Since we cannot talk about something except by using words in relation to it, it is supposed that we cannot talk about things as they are, apart from relations to words.

#### AVOIDANCE AND DETECTION OF FALLACIES

Popular discussions of fallacies rightly lay great stress on the psychological or emotional aspect of fallacious arguments. Under the influence of violent passions, thinking becomes more purely associative and less consequential, and we are more than usually ready not only to employ arguments, however unsound, that appear to support whatever cause we espouse but also to extend our favor to anything linked, however loosely, with what we already like, respect, or admire, and to extend our hostility to anything linked with what we already dislike, despise, or fear. Ridicule can also be used to brush aside relevant considerations and to condemn a person or a view without a hearing. All sorts of attachments, passions, and emotional prejudices can foster fallacies, and one of the chief means for the avoidance or detection of fallacies is to consider a problem calmly.

Precise formal statement often helps in the detection not only of fallacies in the strict sense but also of inconsistency, circularity, and irrelevance. However, since it is too laborious a task to state all our reasonings formally, we can use this device only when we already have reason to suspect a fallacy. Also, in cases involving equivocation or a category mistake, there is a danger that inaccurate formulation will conceal the fallacy instead of exposing it.

As Richard Whately remarked, “a very *long* discussion is one of the most effective veils of Fallacy; ... a Fallacy which when stated barely ... would not deceive a child, may deceive half the world if *diluted* in a quarto volume” (*Elements of Logic*, p. 151). Consequently, an important weapon against fallacy is condensation,

extracting the substance of an argument from a mass of verbiage. But this device too has its dangers; it may produce oversimplification, that is, the fallacy *a dicto secundum quid*, of dropping relevant qualifications. When we suspect a fallacy, our aim must be to discover exactly what the argument is; and in general the way to do this is first to pick out its main outlines and then to take into account any relevant subtleties or qualifications.

### **Bibliography**

The pioneer work on fallacies is the *De Sophisticis Elenchis* of Aristotle. Medieval and later logicians followed and expanded his account. Many textbooks on logic include a chapter on fallacies. Jeremy Bentham, throughout his writings, paid much attention to fallacious reasonings by which views that he opposed were supported, and he collected many of them in *The Book of Fallacies*, which is in Vol. II of his *Works*, edited by J. Bowring (Edinburgh, 1843). Richard Whately, in Ch. 3 of his *Elements of Logic* (London, 1826), gave a much improved classification and analysis of fallacies. John Stuart Mill devoted Book V of *A System of Logic* (London, 1843) to an account of fallacies, developing a new classification and concentrating on a priori fallacies (prejudices) and mistakes in observation and generalization. Augustus De Morgan, in Ch. 13 of *Formal Logic* (London, 1847), rejected the attempt to list all possible ways of going wrong but gave a penetrating and well-illustrated analysis of many of the traditionally listed fallacies. Arthur Schopenhauer, in "The Art of Controversy," in *Essays from the Parerga and Paralipomena*, translated by T. B. Saunders (London, 1951), described stratagems that may be used in disputes, that is, both sophistic devices and ways of countering them. H. W. B. Joseph included in *An Introduction to Logic* (London, 1906) an appendix on fallacies based on the Aristotelian account. M. R. Cohen and Ernest Nagel, in Ch. 19 of *An Introduction to Logic and Scientific Method* (New York, 1934), emphasized abuses of scientific method. R. H. Thouless in *Straight and Crooked Thinking* (London, 1930), Susan Stebbing in *Thinking to Some Purpose* (Harmondsworth, U.K., 1939), and W. W. Fearnside and W. B. Holther in *Fallacy—The Counterfeit of Argument* (Englewood Cliffs, NJ, 1959), gave lively and readable accounts, illustrated with many examples of popular errors and of sophistry in practice, concentrating on political and social debate and propaganda, and stressing the emotional basis of a great deal of fallacy.

## FARADAY, MICHAEL

(1791–1867)

Michael Faraday, the British chemist and physicist, came from a poor family and had no formal schooling beyond the elementary level. While a bookbinder's apprentice, he became interested in chemistry and electricity. Faraday took notes on a series of lectures given by Sir Humphry Davy, the leading British chemist, presented them to Davy, and soon afterward, at the age of twenty-one, was appointed laboratory assistant to Davy at the Royal Institution (London). He became director of the laboratory in 1825 and Fullerian professor of chemistry at the institution in 1833. His early scientific work in chemistry included the discovery of several new compounds and the liquefaction of chlorine and other gases. In 1831, Faraday discovered electromagnetic induction, or the creation of electric currents in a conductor by changing currents or moving magnets in the vicinity; this phenomenon is the basis of the electrical generator. This was followed by a series of investigations demonstrating with greater certainty than had been previously achieved the identity of the nature of the electricity generated by friction, voltaic cells, electromagnetic induction, and other means. Extensive experiments in electrochemistry led Faraday to the enunciation of his laws of electrolytic decomposition in 1833. The source of the power of the voltaic pile, or battery, was the object of his subsequent research. He investigated the electrical properties of insulators, or dielectrics, in 1837. In 1845 he discovered that the plane of polarization of light was rotated on passing through a transparent diamagnetic substance in the direction of externally applied lines of magnetic force. At the same time he began his investigation of diamagnetism. In his last years he suffered from loss of memory, and he ceased his researches in 1855. He was a member of a small Christian sect, the Sandemanians, and was noted for his gentleness of character.

Faraday is generally regarded as one of the greatest of all experimental scientists. The truth of this, adequately attested to in the three-thousand-odd paragraphs of the *Experimental Researches in Electricity*, should not be allowed to obscure the fertility of his imagination and conceptualizing powers and the guiding role of theoretical principles in sustaining his persistent research. His most important contribution to physics is probably the

concept of lines of force, which was the beginning of the development of field theory. The accepted approach to electro-dynamical phenomena at the time was to express the forces between charges mathematically as direct actions at a distance, an approach that was to prove unfruitful. Faraday was not trained in the mathematics necessary for this tradition. In order to represent the action of electromagnetic induction, he envisaged the space surrounding magnets to be filled with lines of magnetic force representing everywhere the direction of the force that would be experienced by a magnetic pole introduced from outside in the manner of the lines formed by iron filings sprinkled on a paper resting on a magnet. The lines of magnetic force have not only direction but also sense—that is, a north magnetic pole is pushed one way along them, and a south pole is pushed in the opposite sense; furthermore, their concentration near a given point represents the intensity of the magnetic force at that point. Each such line forms a closed loop, beginning or ending nowhere, but in the case of a magnet passing through its substance from one pole to the other. In these terms the law of electromagnetic induction may be expressed: “The quantity of electricity thrown into a current is directly as the amount of curves intersected” (*Experimental Researches in Electricity*). In James Clerk Maxwell’s famous words:

Faraday, in his mind’s eye, saw lines of force traversing all space where the mathematicians saw centres of force attracting at a distance: Faraday saw a medium where they saw nothing but distance: Faraday sought the seat of the phenomena in real actions going on in the medium, they were satisfied that they had found it in a power of action at a distance impressed on the electric fluids. (Preface to the first edition of the *Treatise on Electricity and Magnetism*)

In most of Faraday’s researches the concept of lines of force was used merely as a “representative aid” and was not meant to include “any idea of the nature of the physical cause of the phenomena.” This cautiousness was a mark of Faraday’s methods; in the choice of terminology to describe new phenomena, for example, he carefully attempted to avoid suggesting anything more than they warranted. However, at times Faraday allowed himself to speculate, and in 1852 he considered “the possible and probable *physical existence* of such lines” (“On the Physical Lines of Magnetic Force”). On the basis of arguments that can be characterized only as suggestive (such as that the magnetic lines are curved), he hypothesized that magnetic lines of force have physical existence and contrasted

this with gravitation, where there was no evidence that the lines of force are anything but abstract and ideal. In a charming talk published in 1846 (“Thoughts on Ray-Vibrations”) Faraday speculated that the atoms of matter might be simply point centers of force, as Roger Joseph Boscovich had suggested in the eighteenth century, or, in Faraday’s terms, points from which lines of force spread into space. The extension of the atom may be identified with the extent of these lines, so that each atom would occupy all space and atoms would be mutually penetrable. Light might consist of vibrations in these lines, possibly obviating the need for an ethereal medium for its propagation; on the other hand, he suggested elsewhere that the lines might represent a condition of the ether, “for it is not at all unlikely that, if there be an ether, it should have other uses than simply the conveyance of radiations.”

Faraday’s geometric-intuitive representation was in particular rejected by the Continental electro-dynamicists, and in 1846 Wilhelm Weber developed a theory of forces acting directly at a distance between charges that included the phenomena of electromagnetic induction. The validity of the lines of force concept was vindicated by the theoretical researches of William Thomson and particularly of Maxwell, who regarded his task to be putting Faraday’s ideas into mathematical notation. It was with this motive that Maxwell developed his electromagnetic field theory, which, reinterpreted in quantum terms, remains the accepted theory of electromagnetic action and which was the prototype of all the field theories that dominate physics today. Maxwell’s early representation of the lines of magnetic force as vortexes in the ether spinning about these lines as axes was in part suggested by Faraday’s discovery of the magnetic rotation of the plane of polarization of light. The existence of this magnetic effect upon light had confirmed others in their speculations that light was some sort of propagated electromagnetic phenomenon, and the rotation of the plane of polarization suggested to Thomson and Maxwell that magnetism was in some way a rotatory effect, or, in contemporary terminology, the magnetic field is a pseudovector field.

Faraday was one among many who gave adumbrations of the generalized principle of conservation of energy, the clear expression of which is credited to Julius Mayer, James Joule, and Hermann von Helmholtz. His convictions regarding the interconvertibility of forces led him, from Hans Christian Ørsted’s generation of magnetism by an electric current, to seek that generation of a current from magnetism that he found. In a lecture of 1834, Faraday spoke explicitly of this mutual convertibil-

ity, but he did not proceed further to specify how he conceived of the “forces” or “powers” that might be conserved or to discover quantitative relations. In connection with his investigations in 1840 of the source of the action of the voltaic pile he cited this principle against the contact theory, according to which the mere contact of two metals was the source of the current so that there would be a “creation of power” out of nothing, and in favor of the chemical theory, which found the source in the chemical actions occurring in the pile.

### Bibliography

Faraday's work in electricity, including electrochemistry, is to be found in his *Experimental Researches in Electricity*, 3 vols. (London: R. and J. E. Taylor, 1839, 1844, 1855); his chemical work is collected in *Experimental Researches in Chemistry and Physics* (London: R. Taylor and W. Francis, 1859). Of particular interest are the speculative papers “Thoughts on Ray-Vibrations,” in *Philosophical Magazine* 28 (1846): 345–350, reprinted in the *Experimental Researches in Electricity*, Vol. III, pp. 447–452, and “On the Physical Lines of Magnetic Force,” in *Royal Institution Proceedings* June 11, 1852, reprinted in *Experimental Researches*, pp. 438–443. The standard biography is H. Bence-Jones, *The Life and Letters of Faraday*, 2 vols. (London: Longmans, Green, 1870). See also L. P. Williams, *Michael Faraday* (New York: Basic, 1965). A brief and lucid treatment of the development of his researches is given by John Tyndall in *Faraday as a Discoverer* (London: Longmans, Green, 1868).

## FARIAS BRITO, RAIMUNDO DE (1862–1917)

Raimundo de Farias Brito was the philosophic forerunner of Brazilian modernism. A profound sense of crisis underlies the work of Farias Brito. Individual existence is a precarious struggle against despair and death, and social order is threatened by moral disintegration and anarchy. Knowledge of man's role in his world is necessary to confront this crisis. Intellectual pursuit of the truth is the primary ethical obligation. Lacking certainty, man establishes a relative morality through conviction, involving both philosophy and religion. Metaphysics attempts to embrace the truth theoretically through formulation of

worldviews; religion embraces the truth practically through acceptance and appropriation of a given worldview. This free acceptance of common convictions creates community, informing and giving thrust to the total culture of which it serves as a focus. The theoretical task is a permanent activity of the human spirit; the practical task, a permanent necessity. Convinced that modern philosophy was not adequate to its task, largely because of its predominantly skeptical mood grounded in phenomenalism, Farias Brito hoped to establish a new dogmatism capable of providing convictions that could give both courage for withstanding suffering and despair and the bases for reestablishing social order and direction. There was a transition in his thought from an early attempt to provide grounds for a naturalistic religion, inspired by German monism, to the articulation of his philosophy of spirit, influenced by French spiritualism. The naturalism is expressed in an incomplete series of volumes titled *A finalidade do mundo* (1895–1905). The new series, *Filosofia do espírito* (1912–1914), was initiated after Farias Brito had moved to Rio de Janeiro in 1909 to accept the chair in logic at Colégio Pedro II.

The spirit, “a live principle of action, capable of modifying ... the order of nature; ... of dominating itself; ... of exercising dominion over things” is the “foundation of all reality and the basis of all experience.” Psychological data are therefore indispensable to the metaphysician. Physiological psychology deals solely with the physical base of spirit; psychology proper ought to be concerned with subjective psychic phenomena. Its method is introspective, direct introspection supplemented by indirect introspection, a study of the manifestations of consciousness through which men achieve expression and communication. “Transcendent psychology” is the method employed for utilizing psychological data in metaphysics. From the felt fact of human existence, it is possible to rise to the level of transcendence, seeking knowledge concerning essence. The introspective operation of the individual consciousness reveals two facets of experience—consciousness itself and that which is presented to consciousness; both constitute existential reality. Through abstraction and analysis of each, pure consciousness is seen to have priority. Understanding man as essentially conscious spirit, the method of “transcendent psychology,” leads to the postulation of divine spirit.

## FASCISM

"Fascism" was the ideology of the movement that, under the leadership of Benito Mussolini, seized power in Italy in 1922 and held power until the Allied invasion of Italy in World War II. Mussolini was a socialist until 1915, and fascism is a paradoxical but potent mixture of extreme socialist, or syndicalist, notions with a Hegelian or idealist theory of the state.

An attempt to provide fascism with a fully articulated theory was made by an Italian neo-Hegelian philosopher of some distinction, Giovanni Gentile, who was converted to fascism after Mussolini's coup. But as a former liberal and collaborator of Benedetto Croce, Gentile was opposed by the anti-intellectual wing of the Fascist Party, and his draft for a manifesto of fascist ideology was rewritten by Mussolini himself and published in 1932 in the *Enciclopedia italiana* as *La dottrina del fascismo*. However, no adequate conception of fascism could be derived from these theoretical sources alone; the actual behavior of the Italian fascists during their twenty years of power must also be taken into account.

The word *fascism* is often used, especially by left-wing writers, not only for the Italian doctrine but also for the similar, if more fanatic, national socialism of Adolf Hitler and for the altogether less coherent ideologies of Francisco Franco, Juan Perón, Ion Antonescu, and other such dictators. But however justifiable the wider and looser use of the word, the present article is confined to the system and ideology that called itself *Fascismo* and that flourished in Italy under Mussolini.

Gentile in his two books *Che cosa è il fascismo* (1925) and *Origini e dottrina del fascismo* (1929) stressed, as one might expect, the Hegelian elements in fascism. He argued that fascism was essentially idealistic and spiritual. Whereas liberalism, socialism, democracy, and the other progressive movements of the nineteenth century had asserted the rights of man, the selfish claims of the individual, fascism sought, instead, to uphold the moral integrity and higher collective purpose of the nation. And

whereas liberalism saw the state simply as an institution created to protect men's rights, fascism looked on the state as an organic entity that embodied in itself all the noblest spiritual reality of the people as a whole. Fascism opposed the laissez-faire economics of capitalism and the bourgeois ethos that went with it. But fascism equally opposed socialism, which preached class war and trade unionism and thus served only to divide the nation. Fascism could tolerate no organized sectional groups that stood outside the state, for such groups pressed the supposed interests of some against the true interests of all. Hence, in place of trade unions, employers' federations, and similar organizations, fascism set up corporations that were designed to integrate the interests of particular trades, industries, professions, and the like into the wider harmony of the state.

Fascism, said Gentile, understood all the defects of bourgeois capitalism that had led to the rise of socialism, but fascism revolutionized society in such a way that the socialist critique was no longer relevant. For fascism replaced the old, competitive, hedonistic ethos of liberalism with an austere, stern, rigorous patriotic morality in which "the heroic values of service, sacrifice, indeed death itself were once more respected." Fascism did not deny liberty, but the liberty it upheld was not the right of each man to do what he pleased but "the liberty of a whole people freely accepting the rule of a state which they had interiorised, and made the guiding principle of all their conduct."

Fascism was proud of its comprehensive nature, of its totalitarian scope. For fascism, Gentile argued, was not just a method of government; it was a philosophy that permeated the whole will, thought, and feeling of the nation. "The authority of the state," Gentile wrote, "is absolute. It does not compromise, it does not bargain, it does not surrender any portion of its field to other moral or religious principles which may interfere with the individual conscience. But, on the other hand the state becomes a reality only in the consciousness of individuals." The state was "an idea made actual."

When Mussolini revised Gentile's draft for his *La dottrina del fascismo*, he retained most of the neo-Hegelian idealistic talk about the ideal nature of the state, but he had more to say about fascism's debts to the more extreme and fanatic elements of the nineteenth-century left wing. Mussolini named Georges Sorel, Charles Péguy, and Hubert Lagardelle as "sources of the river of Fascism." From these theorists, especially from Sorel, Mussolini derived the idea that "action is more important than thought"; by "action" he meant, as Sorel meant, vio-

lence. The extremists of the anarchist movement in the nineteenth century were obsessed by what they called *la propagande par le fait* (propaganda by deed); this “deed” tended to take the form of indiscriminating acts of revolutionary violence, such as throwing bombs into crowded cafés. The exhilaration of this policy soon blinded several of its champions to the end they were supposed to be pursuing—overthrowing the state—so that anarchism produced a movement of revolutionary disciplinarianism that Mussolini recognized as the source of his own inspiration.

Fascism was thus a movement that not only accepted, but also rejoiced in, violence. It had no patience with parliamentary or democratic methods of changing society. Indeed, Mussolini believed that the violent seizure of power, such as his own movement accomplished when it marched on Rome in 1922, was a necessary part of the moral rejuvenation of the nation; it was needed in order to create that “epic state of mind” (a phrase of Sorel’s) that fascism prized so highly. Thus rejoicing in violence, fascism was, as Mussolini explained, hostile to all forms of pacifism, universalism, and disarmament. Fascism frankly acknowledged that “war alone keys up all human energies to their maximum tension, and sets a seal of nobility on those persons who have the courage to fight and die.” The fascist state would have nothing to do with “universal embraces”; it “looked its neighbour proudly in the face, always armed, always vigilant, always ready to defend its integrity.” Schemes such as that of the League of Nations were anathema to fascism.

With some reason Mussolini also claimed that fascism derived historically from the nationalistic movement of the nineteenth century. Nationalism, he insisted, owed nothing to the left. The German nation was not unified by liberals but by a man of iron, Otto von Bismarck. The nation of Italy, too, had been created by such men as Giuseppe Garibaldi, a man of revolutionary violence; the first great prophet of Italian unity was Niccolò Machiavelli, the archenemy of liberal, pacifist scruples. Mussolini had the highest regard for the author of *The Prince*. Machiavelli’s desire to rekindle in modern Italy all the military virtues and military glory of ancient Rome was also Mussolini’s ambition, but Mussolini’s version of Machiavelli’s dream was a much more vulgar one, and his achievements would have struck Machiavelli as tawdry, shabby, and corrupt.

Mussolini argued that it was the Italian state that had created the Italian nation. Indeed, it was the state, as the expression of a universal ethical will, which created the

right to national existence and independence. Mussolini rejected the racism that was so central a feature of Nazi teaching in Germany. “The people,” he wrote, “is not a race, but a people historically perpetuating itself; a multitude united by an idea.” It must be recorded in favor of fascism that it never taught race hatred, and even when Mussolini entered the war on Hitler’s side and introduced anti-Semitic legislation to please his ally, the Italian fascists were far from zealous in the enforcement of the laws against Jews.

Indeed, Mussolini’s glorification of war and violence had never more than a limited success with the Italian people. Accustomed to rhetoric and appreciative of any kind of display, the Italians accepted the showier side of fascism more readily than the “austere, heroic way of life” that it demanded. Slow to conquer the backward Ethiopians in Mussolini’s colonialist war against Abyssinia in 1935, the average Italian conscript soldier was even less eager to meet the Allied forces in World War II. Likewise, despite the cruelty of Mussolini’s henchmen to his numerous political prisoners, there was never in Italy anything approaching the genocide that was faithfully enacted by Hitler’s followers in Germany; even at its worst fascism never robbed the Italians of their humanity.

Mussolini earned a reputation, even among critical foreign observers, for the “efficiency” of his administration; he was popularly supposed abroad “to have made the Italian trains run on time.” This achievement was largely mythical, for economic growth was minimal, but Mussolini was able, by forbidding strikes and subordinating industries to his state corporations, to prevent any of the more easily discernible manifestations of economic disorder. In any case his rule was never a mere personal dictatorship. He built up a powerful party with an elaborate hierarchy of command that served him much as the Soviet Communist Party served Joseph Stalin. Fascism was in a very real sense the dictatorship of a party, and the effectiveness of the party organization in a country by no means notable for good organization was one secret of fascism’s twenty years of success.

## FATHERS OF THE CHURCH

See *Patristic Philosophy*

## FECHNER, GUSTAV THEODOR (1801–1887)

Gustav Theodor Fechner, the German philosopher, was the founder of psychophysics, and a pioneer in experi-

mental psychology. He was born in Gross-Saerchen, Prussia, and studied medicine at the University of Leipzig, where he passed his examinations at the age of twenty-one. His interests, however, led him into physics, and by 1830 he had published more than forty papers in this field. He also wrote a number of poems and satirical works under the pseudonym of "Dr. Mises," which he also used for some of his later metaphysical speculations. A paper on the quantitative measurement of electrical currents (1831) led to his appointment as professor of physics at Leipzig. Fechner's incipient interest in psychology is shown in papers of 1838 and 1840 on the perception of complementary colors and on subjective afterimages. His experiments on afterimages, however, had tragic consequences. As a result of gazing at the sun he sustained an eye injury, and his subsequent blindness led to a serious emotional crisis. Fechner resigned his professorship in 1839 and virtually retired from the world.

A seemingly miraculous recovery, three years later, stimulated Fechner's interest in philosophy, particularly in regard to the question of the soul and the possibility of refuting materialistic metaphysics. In a work titled *Nanna oder das Seelenleben der Pflanzen* (Nanna, or the soul-life of plants; Leipzig, 1848) he defended the idea that even plants have a mental life. This book is indicative of the panpsychistic bent of Fechner's thought, which was the major cause of the direction taken by his further work.

### PSYCHOPHYSICS

In 1848 Fechner returned to the University of Leipzig as professor of philosophy. His desire to substantiate empirically the metaphysical thesis that mind and matter are simply alternative ways of construing one and the same reality was the main motivation for his pioneering work in experimental psychology. His *Elemente der Psychophysik* (Leipzig, 1860) was intended to be an outline of an exact science of the functional relations between bodily and mental phenomena, with a view to showing that one and the same phenomenon could be characterized in two ways. Fechner divided his new science of psychophysics into two disciplines: inner psychophysics, which studies the relation between sensation and nerve excitation; and outer psychophysics, to which Fechner's own experimental work was devoted and which studies the relation between sensation and physical stimulus. Psychophysics became one of the dominant fields within experimental psychology.

Fechner's work on the relation between physical stimuli and sensations led to a mathematical formulation

that he called the law of intensity, which states that the intensity of a sensation increases as the logarithm of the stimulus, that is, by diminishing increments. When Fechner realized that his principle corresponded to the findings of E. H. Weber (1795–1878), he called it Weber's law, a name now reserved for the vaguer statement that a barely noticeable difference in stimulus has a constant ratio to the stimulus. Fechner's studies in psychophysics included a number of classical experiments on the perception of weight, visual brightness, and distance.

### PANPSYCHISM

Fechner's psychological studies were meant to confirm his theory of panpsychism. He maintained that the whole universe is spiritual in character, the phenomenal world of physics being merely the external manifestation of this spiritual reality. That which *to itself* is psychical is *to others* physical. In his *Atomenlehre* he argued that physics requires us to regard atoms only as centers of force or energy, as Gottfried Wilhelm Leibniz had argued; it is not necessary to suppose them to be material or extended. These atoms are only the simplest elements in a spiritual hierarchy leading up to God. Each level of this hierarchy includes all those levels beneath it, so that God contains the totality of spirits. Consciousness is an essential feature of all that exists, but this assertion does not mean, as Leibniz had supposed, that every physical entity or phenomenon has its own soul. Only certain systems, namely, organic wholes, give evidence of possessing souls, and those bodies that do not are only the constituents of besouled bodies. The evidences of soul are the systematic coherence and conformity to law exhibited in the behavior of organic wholes. Fechner regarded Earth, "our mother," as such an organic besouled whole. The stars and the physical universe as a whole are also bodies of this kind. God is the soul of the universe; He is to the system of nature as that system is *to itself*.

To regard the whole material universe as inwardly alive and conscious is to take what Fechner called the "daylight view" (*Tagesansicht*). To regard it as inert matter, lacking in any teleological significance, is to take what he called the "night view" (*Nachtansicht*). Fechner ardently advocated the daylight view and hoped that it could be supported inductively by means of his psychophysical experiments. But he also argued for the daylight view on pragmatic grounds, offering the sort of arguments that William James later found highly congenial. Fechner urged that any hypothesis that cannot be positively proved but that does not contradict scientific findings be accepted if it makes us happy. The antimate-

rialistic daylight view is such a hypothesis. Fechner also defended his theory by means of analogical arguments. When certain qualities are found to be present in several types of objects, we are justified in assuming hypothetically that these objects share other, undetected qualities. Entities which exhibit the sort of order that our own bodies do may therefore be assumed to be alive and inwardly spiritual as we are.

### IMMORTALITY

Fechner's argument for immortality is based on the observation that many individual experiences that are forgotten or unnoticed may later be recalled into consciousness. If the soul as a whole is treated on the analogy of its individual experiences, then, since these do not vanish utterly but often return in the form of memory, the soul itself may likewise continue to exist in God's memory. Mind and body are not parallel aspects of some third substance, as in Benedict (Baruch) de Spinoza; they are identical. The persistence of mind is therefore no more difficult to entertain than the persistence of the material universe itself, which is only the outward manifestation of an all-inclusive soul.

### AESTHETICS

Between 1865 and 1876 Fechner turned his attention to aesthetics. He published a paper on the golden section, the supposedly ideal proportion, and several papers on the controversy over two Hans Holbein paintings of the Madonna. These two paintings, one in Dresden, the other in Darmstadt, were the subject of serious debate among art critics and aestheticians. Fechner hoped to settle the question of their relative excellence by means of a public preference poll when the paintings were exhibited together.

The desire to put aesthetics on an empirical, scientific footing and to bring philosophical speculation into some sort of accord with experimental science is shown further in Fechner's *Vorschule der Aesthetik* (Propaedeutic to aesthetic; Leipzig, 1876), a work of considerable significance for the history of experimental aesthetics. In the preface to this work Fechner stated that previous aestheticians such as Friedrich Schelling and G. W. F. Hegel had theorized "downward" from universal principles to particulars. Fechner proposed to reverse this procedure, to build aesthetic theory "from below," on a foundation of empirical evidence. The word *beauty*, he maintained, denotes the approximate subject matter of aesthetics. It is a word applicable to everything that has the property of arousing pleasure directly and immediately. (Pleasure

aroused by thoughts of the consequences of an object is nonaesthetic.) Our experiences of aesthetic pleasure are simple, unanalyzable psychic atoms. The aim of an experimental aesthetics is to discover the objects that produce such atoms, that is, the causal laws connecting aesthetic experiences with the characteristics of outer objects.

**EXPERIMENTAL METHODS.** Fechner suggested three experimental methods for carrying out this program: the method of selection or choice, the method of production or construction, and the method of measuring common objects. The first of these methods is illustrated by Fechner's experiments with rectangles. Ten rectangles of varying dimensions but equal areas were spread at random on a table. The subject was asked to make a selection, ranking the rectangles in the order of his aesthetic pleasure and displeasure. A record was kept of his responses, with allowance being made for variation in hesitation of response. Fechner's results seemed to support the hypothesis that there exist certain ratios of length to width that possess specific aesthetic value. Most of the people tested tended to reject as unpleasant both the square or nearly square and the extremely elongated figures, with the largest number of favorable responses going to the rectangle whose proportions were 34:21. Fechner took this as empirical confirmation of the special aesthetic status of the golden section.

In the second of Fechner's methods, the subject was confronted, for example, with four vertical lines of various lengths and asked to place a dot over each line at the distance that seemed to him most aesthetically pleasing. The results were that the average distance was proportional to the length of the line. This experiment was referred to as the "inquiry into the letter 'i.'" Fechner's third experimental method involved measuring such objects as books, visiting cards, and so on, and here too he found the ratio of the golden section in a large percentage of cases.

**LAWS OF PSYCHOLOGICAL AESTHETICS.** A number of psychological laws formulated by Fechner are relevant to aesthetic experience. His principle of aesthetic threshold states that a stimulus must acquire a certain intensity before it can produce pleasure or pain. The effect will then increase gradually until it reaches a maximum point, whereupon it will decrease to the point of indifference. In the case of pleasure but not in that of pain, the effect may, after the maximum is reached, change to its opposite. Aesthetic reinforcement refers to the fact that several conditions of pleasure may, when combined, produce a total satisfaction greater than the sum of these conditions

taken separately, for example, melody and harmony in music, meaning and rhythm in poetry. The principle of "uniform connection within the manifold" states that we prefer objects which are both unified and complex over objects which are homogeneous or excessively diverse. The principle of "absence of contradiction" claims that harmony and truth are aesthetically preferable to disagreement, contradiction, or error. Vagueness and ambiguity are aesthetically displeasing, as the principle of "clarity" announces. The recollection of an event portrayed in some aesthetic object may bring pleasure or displeasure, depending on whether the event reminds us of something pleasant or unpleasant: the principle of "aesthetic association." The principle of "minimum effort" states that pleasure is derived from the smallest possible expenditure of energy relative to a given end in view and not simply from the minimum expenditure of energy as such.

## CONCLUSION

These "laws of the mind" illustrate the spirit of Fechner's philosophizing. He was one of the most versatile thinkers of the nineteenth century, laboring to reconcile an idealistic view of reality with the methodology of modern science and, in so doing, providing some of the groundwork for further developments in a number of areas of experimental psychology. His somewhat fantastic metaphysical speculations disclose a mind of poetic sensitivity, whose visions, however, he insisted on subjecting to scientific scrutiny.

## FĚDOROV, NIKOLAI FĚDOROVICH (1829–1903)

Nikolai FĚdorovich FĚdorov was a Russian religious philosopher. From 1854 to 1868 he taught history and geography at district schools in Russia. From 1869 to 1872 he worked at the Chertkovskaia Library in Moscow, and from 1874 to 1898 he worked at the libraries of the Moscow Public and Rumiantsev Museums. For a quarter

of a century he defined the spiritual atmosphere of this latter library, infusing it, in the words of his contemporaries, with the traditions of the “philosophical school.” Many talented men of Russian science and culture used to gather in the catalogue room of the library where FĚdorov served to converse with the “Moscow Socrates.” In the 1880s and 1890s FĚdorov met with Vladimir Sergeevich Solov’ev, who called FĚdorov’s teaching “the first progress the human spirit has made on the way of Christ.” In that time period FĚdorov also carried on his religio-philosophical dialogue and debate with Lev (Leo) Nikolaevich Tolstoy.

Starting in 1851 FĚdorov expounded his ideas first orally, and then, starting in the second half of the 1870s, in large works and articles. After FĚdorov’s death, his disciples V. A. Kozhevnikov and N. P. Peterson prepared for publication a three-volume collection of the philosopher’s works under the title *Filosoviia obshchego dela* (The Philosophy of the common cause; the first two volumes were published in 1906 and 1913, respectively; the third volume remained unpublished).

In the evolutionary process FĚdorov discerned a tendency to the birth of consciousness and reason, which, beginning with man, were called to become the instruments, no longer of an unconscious, but of a conscious and morally and spiritually oriented perfecting of the world. “In us, nature begins not only to be conscious of itself but also to control itself.” Man is both the crown of evolution and its agent; the labor of the cosmicization of being lies on his shoulders. In opposition to the existing parasitical and exploitative relation of man to the natural environment, which is leading civilization to the brink of catastrophe (“A civilization that exploits but does not restore can have no other result than its own end”), FĚdorov advanced the idea of the *regulation of nature*, which unfolds in a series of tasks. This series comprises the prevention of natural disasters (earthquakes, floods, droughts, etc.), the regulation of climate, the control of cosmic processes, labor directed at the conquest of death, and—as the climax of this regulation of nature, the focus of all of its efforts—the return to a new transfigured life of all those who have departed into nonbeing, infinite creative work in a renewed Universe.

FĚdorov gave his teaching both a natural-scientific and a religious foundation. Basing his thought on the patristic tradition (St. Basil the Great, St. Gregory the Theologian, and Gregory of Nyssa), he developed an actively Christian anthropology: God, in creating man in His image and likeness, acts in the world first and foremost through man, and through him He will realize the

central ontological promises of the Christian faith, such as the raising of the dead, the transfiguration of their nature, and the entry into the immortal, creative eon of being, the Kingdom of Heaven. He propounded the idea of divine humanity, the collaboration of the divine and human energies in the work of salvation, and argued that the prophecies of the Revelation have only a conditional significance. Will the end of history be catastrophic, leading to the Last Judgment with the consequent division of humankind into a handful of the saved and a vast multitude of the eternally damned? Or will it be radiant, where all will be saved (the apocatastasis)? This depends on people themselves, on whether the world's movement will continue on its false, antidivine vector or whether it will redirect itself to the ways of God.

FĚdorov also gave the idea of the regulation of nature a religious interpretation. Based on the sense of the profound moral responsibility of man for the fate of the entire earth, of the entire cosmos, and of the entire creation, regulation represents the fulfillment of the biblical commandment that man be lord of the earth. "Restoration of the world to that splendid beauty of incorruption that it possessed before the Fall"—that is how the philosopher of the universal task defines God's assignment to the "sons of men."

A successful outcome of history, which becomes a "work of salvation," presupposes, according to FĚdorov, the necessity of a new fundamental choice that is associated with the imperative of the evolutionary ascent of humanity. He exposes the defects of a one-sided technological development that improves machines and mechanisms but that leaves man's nature untouched and vulnerable, entirely at the mercy of the vagaries of the external environment. As an alternative, he advances the idea of organic progress that is oriented toward the transformation of the physical substance of conscious beings. As a result of this transformation, man himself, without the aid of technology, will be able to fly, to see far and deep, to build his tissues from elementary materials of the environment like plants under the effect of sunlight (here, FĚdorov anticipates what V. I. Vernadskii would later call *autotrophism*), and to create necessary organs for himself or change his existing organs as a function of the medium of his habitation and action (the notion of "fullness of organs"). According to FĚdorov the body, the receptacle of the soul, must be made wholly subordinate to the consciousness; the body must be regulated and spiritualized. Spirit must achieve total power over matter, leading to a state where the forces of decay, corruption, and death are limited and finally expelled from being.

FĚdorov envisaged a radical change in philosophy. This change would consist in the rejection of abstract thought and passive contemplation, in a transition toward the definition of the values of the necessary order of things, toward the development of a plan for humanity's transformative activity. He proclaimed the inseparability of ontology and deontology ("truth is only the path to the good") and the necessity of a projective thought (the project connects the ideal and reality and seeks ways toward a practical realization of the supreme idea). He advanced the principle of the integrity and universality of knowledge ("all people must be knowers and all things must be an object of knowledge"), and he spoke of the transformation of gnoseology into *gnoseo-urgy*. He called his system *supramoralism*, establishing the foundations of a "mature," "filial" morality ("we are all brothers according to love for the fathers").

Here, he did not limit the laws of ethics to the sphere of human relationships, indicating the dependence of the moral principle in man and in society on the material and natural order of things. Unkindred and unbrotherly attitudes, he emphasized, are rooted in the depths of post-lapsarian, mortal being, which is based on the law of the succession of generations, with mutual devouring, expulsion, and struggle. And therefore only one thing can guarantee the attainment of "universal kinship": the conquest of the forces of death in the external world (by means of natural-cosmic regulation) and in man himself (by means of psycho-physiological regulation). Convinced of the incompleteness of altruistic morality (where the self-sacrifice of some presupposes the eternal egotism of others), FĚdorov offers the formula, "[N]ot for oneself and not for others, but with all and for all." He resolved the antinomy of individualism and collectivism through the principle of *sobornost* (communalism or all-togetherness), affirming the latter as the foundation of the perfect social organization (society "according to the type of the Trinity").

FĚdorov also interpreted the meaning of culture in the light of the idea of immortality and the raising of the dead. He viewed culture as an attempt at an "imaginary raising from the dead," as an impulse to preserve the memory of that which had lived in the past. He put a high value on museums and libraries as centers of the universal human memory. He dreamed of a radical expansion of the activity of museums and libraries, of their transformation into centers of collection, investigation, education, and training, around which associations of scholars would be grouped, associations of "specialists in all domains of human knowledge." By becoming an instru-

ment of the universal task, the museum, according to Fëdorov, was to animate knowledge with a heartfelt feeling of kinship, with a spirit of love for fathers and ancestors, thus serving the restoration of the brotherly connection of people.

Fëdorov's philosophy is at the origin of the Russian religio-philosophical renaissance and helps to define the fundamental themes of the latter. His philosophy is the source of the actively evolutionary noospheric thought of the twentieth century (N. A. Umov, V. I. Vernadskii, and A. L. Chizhevskii). Various talented representatives of Russian literature were influenced, at different times and to different degrees, by *The Philosophy of the Common Task*: Fëdor Mikhailovich Dostoevsky and Tolstoy, Valerii Briusov and Vladimir Maiakovskii, Nikolai Kliuev and Velimir Khlebnikov, Mikhail Prishvin and Maksim Gorky, Andrei Platonov and Boris Pasternak. Fëdorov's theurgic aesthetics (the transition from an "art of imitations" to the creative work of life to the liturgical synthesis of the arts) exerted an influence on the philosophical-aesthetic quests at the end of the nineteenth century and the beginning of the twentieth century (Solov'ëv, Belyi, Viacheslav Ivanovich Ivanov, V. Chekrygin, P. Filonov, and others).

## FEELING

*See Emotion*

## FEINBERG, JOEL

(1926–2004)

Joel Feinberg was a noted moral, social, political, and legal philosopher. He was born in Detroit, Michigan. After his military service in World War II, Feinberg earned bachelor's, master's, and doctoral degrees at the University of Michigan (Ann Arbor). His doctoral dissertation was titled "Naturalism and Liberalism in the Philosophy of Ralph Barton Perry" (1957).

It was not until 1960, when Feinberg was thirty-three years old, that he published his first philosophical essay. During the next four decades, while Feinberg taught at Brown, Princeton, UCLA, Rockefeller, and Arizona, his scholarly output was prodigious. Within a few years of his arrival at the University of Arizona, the philosophy department there attracted several other prominent philosophers and become one of the most highly regarded programs in the United States. Feinberg was honored by his philosophical peers in 1981 by being elected president of the Pacific Division of the American Philosophical Association. In 1988, he was one of the first individuals to be designated Regents Professor at the University of Arizona.

Liberalism was Feinberg's focus throughout his long and distinguished career. During the 1980s, he wrote his *magnum opus*, the four-volume, 1,397-page *Moral Limits of the Criminal Law*. Feinberg's aim in this work (which he called his "tetralogy") was "to make the best possible case for liberalism" with respect to the moral limits of the criminal law (*Harm to Others*, p. 15). He thought of himself as "vindicat[ing] the traditional liberalism derived from [John Stuart] Mill's *On Liberty* [1859]" (*ibid.*). Although Feinberg had no legal credentials (other than having been a Liberal Arts Fellow at Harvard Law School

in 1963–1964), he has already influenced American law. At least one state supreme court has cited him as a persuasive authority. (See *Armstrong v. Montana*, 296 Mont. 361, 989 P.2d 364 [1999] [holding that a Montana statute prohibiting physician assistants from performing abortions violated the privacy, equal-protection, and bill-of-attainder provisions of the Montana constitution].)

Feinberg begins his tetralogy with what he calls a presumption in favor of (individual) liberty. This presumption means that “[l]iberty should be the norm; coercion always needs some special justification” (*Harm to Others*, p. 9). He then sketches a number of “liberty-limiting principles,” each of which states a reason—but not a necessary or a sufficient condition—for coercing individuals. The question he sets for himself is which of these principles, if any, are valid. Here, for example, is the harm principle:

It is always a good reason in support of penal legislation that it would probably be effective in preventing (eliminating, reducing) harm to persons other than the actor (the one prohibited from acting) and there is probably no other means that is equally effective at no greater cost to other values. (*Harm to Others*, p. 26 [italics in original; footnote omitted])

Feinberg endorses two liberty-limiting principles: the harm principle and the offense principle. He rejects two others: legal paternalism and legal moralism. Volume one of his tetralogy, *Harm to Others*, elaborates and defends the harm principle. Volume two, *Offense to Others*, elaborates and defends the offense principle. Volume three, *Harm to Self*, elaborates and rejects legal paternalism. Volume four, *Harmless Wrongdoing*, elaborates and rejects legal moralism.

Legislators who are guided by Feinberg’s liberalism, with its normative commitments to individual liberty and personal autonomy, would prohibit and punish only harmful or seriously offensive conduct (but not necessarily *all* of such conduct). An example of seriously offensive conduct would be a pornographic billboard that individuals cannot reasonably avoid. Feinbergian (ideal) legislators would not punish conduct solely on the ground that it is harmful to the actor. That is legal paternalism, which is an affront to personal autonomy. Nor would they punish conduct solely on the ground that it is immoral. That is legal moralism. It is important to understand that Feinberg’s rejection of legal moralism does not rest on moral skepticism, nihilism, relativism, or subjectivism. One can be a moral objectivist—a believer in objective moral values—and still hold that it is improper for legislators to

enforce a single “true” morality. Feinberg’s aim is practical: to “guide the legislator by locating the moral constraints that limit his options” (*Harm to Others*, p. 4). It is “a quest not for useful policies but for valid principles” (*Harm to Others*, p. 4).

The four volumes together make a powerful case for “the liberal position” on the moral limits of the criminal law. Feinberg does not argue for liberalism directly by appealing to “moral primitives” or “self-evident truths” (*Harm to Others*, p. 17). Instead, he adopts the *argument ad hominem* technique. This type of argument consists in appealing to values, beliefs, and convictions his readers are presumed to have or to judgments they are presumed to make. Feinberg’s objective is to persuade these readers that the liberal position on the moral limits of the criminal law systematizes their values, beliefs, convictions, and judgments better than any alternative. It is a search for coherence, not foundations. In effect, he is trying to show his readers that they are—already, unwittingly—liberals.

Among the areas in applied or practical ethics to which Feinberg made important contributions are abortion and animal rights. In his influential 1979 essay “Abortion,” he sought to structure the debate over the morality and legality of abortion by (as he later put it) “locating crucial but implicit presuppositions, centrally affected interests, critical distinctions, and so on” (*Freedom and Fulfillment*, p. viii). In an essay published in 1971, four years before Peter Singer’s celebrated *Animal Liberation* appeared, Feinberg argued that animals are “among the sorts of beings of whom rights can meaningfully be predicated and denied” (*Rights, Justice, and the Bounds of Liberty*, p. 166). Feinberg was not arguing that animals do in fact have rights. He was arguing that it is not incoherent—as many people had thought—to ascribe rights to them. This was an important step in what became a powerful case for including nonhuman animals in the moral community. By clarifying the concept of a right, Feinberg was able to show that certain denials of rights were ill-founded. To Feinberg, “[c]onceptual clarification is the most distinctively philosophical of enterprises” (*Harm to Others*, p. 17). Clear thought leads to or is an indispensable part of sound moral judgment.

Feinberg’s work, taken as a whole, is best characterized as social philosophy—interpreted broadly to include moral, political, and legal philosophy. In addition to the moral limits of the criminal law, he was interested in and made original contributions to the understanding of responsibility, punishment, desert, mental illness, rights,

justice, liberty, civil disobedience, freedom of expression, paternalism, autonomy, and fulfillment. His textbook *Reason and Responsibility: Readings in Some Basic Problems of Philosophy*, which appeared in 1965 (the twelfth edition was published in 2005), is among the best-selling philosophy textbooks of all time. Feinberg proved that original, important philosophical work is compatible with textbook writing. He was ever the teacher. Late in life, he published a delightful little book entitled *Doing Philosophy: A Guide to the Writing of Philosophy Papers* (1997).

It is fitting that Feinberg wrote a book on writing, for his writing style is justly famous and much emulated. His writing is clear, simple, and penetrating—at times even beautiful—despite the complexity of the issues and concepts with which he grappled. Several generations of philosophers have admired and learned from Feinberg, both substantively and stylistically. Many of his students went on to prominent careers of their own, in law or philosophy or both. In 1994, one of his most accomplished students, Jules Coleman, and a former colleague, Allen Buchanan, published an aptly titled collection of critical essays devoted to Feinberg's work: *In Harm's Way: Essays in Honor of Joel Feinberg*.

## Bibliography

### WORKS BY FEINBERG

*Doing and Deserving: Essays in the Theory of Responsibility.*

Princeton, NJ: Princeton University Press, 1970. This volume collects essays published between 1960 and 1969 (inclusive). The essays concern such concepts as act, cause, harm, punishment, desert, and blame. Feinberg thought of these essays as “straddling ethics, philosophy of mind, and philosophy of law.”

*Social Philosophy.* Foundations of Philosophy Series, edited by Elizabeth Beardsley and Monroe Beardsley. Englewood Cliffs, NJ: Prentice-Hall, 1973. This highly regarded monograph concerns itself with “philosophical questions about social relations.” Among the concepts investigated are freedom, coercion, legal rights, human rights, and social justice. This book is where Feinberg introduced the concept of a liberty-limiting principle that figured so prominently in his later work.

*Rights, Justice, and the Bounds of Liberty: Essays in Social Philosophy.* Princeton, NJ: Princeton University Press, 1980. This volume collects essays published between 1964 and 1978 (inclusive). The essays concern such concepts as liberty, harm, offense, legal paternalism, and rights. Feinberg thought of these essays as dealing with “hard cases for the application of the concept of a right.”

*The Moral Limits of the Criminal Law, Vol. 1: Harm to Others.* New York: Oxford University Press, 1984. This is the first volume of Feinberg's “account of the moral constraints on legislative action.” Feinberg discusses the concept of harm; its relation to such concepts as interests, wants, hurts,

offenses, rights, and consent; hard cases for application of the concept of harm; and various problems involved in assessing, comparing, and imputing harms.

*The Moral Limits of the Criminal Law, Vol. 2: Offense to Others.* New York: Oxford University Press, 1985. Feinberg discusses the concept of offense (as a mental state distinct from harm) and some of its applications, including pornography, obscenity, and “dirty words.”

*The Moral Limits of the Criminal Law, Vol. 3: Harm to Self.* New York: Oxford University Press, 1986. Feinberg discusses legal paternalism, personal autonomy, and the concept of voluntariness.

*The Moral Limits of the Criminal Law, Vol. 4: Harmless Wrongdoing.* New York: Oxford University Press, 1988. Feinberg discusses legal moralism: the view that “[i]t can be morally legitimate to prohibit conduct on the ground that it is inherently immoral, even though it causes neither harm nor offense to the actor or to others.”

*Freedom and Fulfillment: Philosophical Essays.* Princeton, NJ: Princeton University Press, 1992. This volume collects essays published between 1975 and 1991 (inclusive). The essays concern such concepts as wrongful life, abortion, freedom of expression, bad samaritanism, moral rights, and absurd self-fulfillment. Despite the title, Feinberg thought of these essays as dealing with “problems about rights.”

*Doing Philosophy: A Guide to the Writing of Philosophy Papers.* Belmont, CA: Wadsworth, 1997.

*Problems at the Roots of Law: Essays in Legal and Political Theory.* Oxford: Oxford University Press, 2003. This volume collects essays published between 1992 and 2003 (inclusive). The essays concern such concepts as natural law, moral rights, entrapment, criminal attempts, government subsidies for the arts, and evil. As the title implies, Feinberg thought of these essays as dealing with “basic questions” in the philosophy of law.

### Works on Feinberg

Coleman, Jules L., and Allen Buchanan, eds. *In Harm's Way: Essays in Honor of Joel Feinberg.* Cambridge, U.K.: Cambridge University Press, 1994. This volume contains critical essays by Allen Buchanan, Shelly Kagan, Richard J. Arneson, David Lyons, David A. J. Richards, Thomas Morawetz, Jules L. Coleman, Jean Hampton, John Martin Fischer and Mark Ravizza, Jeffrie G. Murphy, Joan McGregor, Robert F. Schopp, Sanford H. Kadish, Holly M. Smith, and Hyman Gross.

*Keith Burgess-Jackson (2005)*

## FEMINISM AND CONTINENTAL PHILOSOPHY

Continental philosophy has been a significant force in the development of contemporary feminist thought. Many feminists have turned to the work of continental philosophers because the topics explored by these philosophers are germane to the kinds of questions feminists pursue.

Since Hegel continental philosophy has been concerned with questions of ethics, metaphysics, consciousness, and experience. Continental philosophy has occupied a prominent position in contemporary feminist philosophy because it examines these issues so central to feminist concerns.

## EXISTENTIALISM AND PHENOMENOLOGY

The publication of Simone de Beauvoir's *The Second Sex* in 1949 marks the beginning of the contemporary feminist movement. De Beauvoir's work is rooted in two prominent continental philosophies, existentialism and phenomenology. The theme of her book is summarized in her famous statement that one is not born a woman, one becomes one. This statement and the analyses ensuing from it reveal the influence of both existentialism and phenomenology at the very beginning of the contemporary feminist movement. Existentialists such as Jean-Paul Sartre emphasized the ontological complexity of our existence as consciousness in bodies. Existential philosophers explored the themes of freedom and oppression, objectification, and the social construction of consciousness. Feminists such as de Beauvoir adapted these themes to the analysis of the situation of women in society. Existential feminists have described female bodily experience as socially constructed. They have analyzed the structures of society that perpetuate patriarchy and the oppression of women.

The influence of phenomenological thought has also been decisive. Husserl's phenomenological philosophy was rooted in an examination of how phenomena appear to consciousness. The phenomenological approach of Husserl, Heidegger, and Merleau-Ponty grounded philosophy in lived experience. For feminists this approach has provided a means of challenging a conception of objectivity that many theorists believe grounds Western philosophical thought and that many feminist philosophers identify as masculinist. It has fostered the development of feminist theory that arises from the distinctive lived experiences of women. Feminist phenomenologists explore how living in a female body in modern society produces a consciousness unique to women. They emphasize human subjectivity and the role of language in creating social reality. Their goal is to develop a feminist consciousness of oppression (Bartky 1990). Exploring the boundaries of that consciousness is the hallmark of feminist phenomenology.

In contemporary feminist thought the approaches of phenomenology and existentialism have merged in femi-

nist analyses of the body. Feminist philosophers such as Iris Marion Young (1990) examine the phenomenon of the female body in patriarchal society. Young explores aspects of women's lived experience—pregnancy, for example—that are unique to women. Her point is that women's bodily experience is different from that of men and that this difference effects women's consciousness under patriarchy. Young argues that existential phenomenology exhibits an adherence to the subject/object dualism. Young's goal is to replace this dualism with an understanding that erases the difference between the inner and the outer. She wants to develop a position that corrects this error without abandoning the advantages of existential phenomenology.

## MARXISM

In the 1960s many feminists were attracted to Marxist philosophy as a vehicle for feminist theory. There were several reasons for the convergence of feminism and Marxism. First, Marxism was the oppositional philosophy of the time; to be opposed to the status quo in this time period almost necessarily entailed a Marxist stance. Second, Marxism, like feminism, was concerned with oppression. Although Marx was not himself concerned with the oppression of women, his theory of the oppression of the proletariat seemed to many feminists to have much to contribute to the attempt to develop a theory of the oppression of women.

The aspect of Marx's theory that became most influential in feminist thought was his theory of the standpoint. Marx argues that the standpoint of the proletariat in capitalism affords it a privileged understanding of its social structure; in his view the proletariat's position as the oppressed class allows it to see the true reality of capitalism. As a social determinist, Marx asserts that knowledge is governed by the subject's historical/material position. Yet he also claims that the knowledge produced by those in the oppressed class is the only true knowledge; the knowledge of other classes, in contrast, is "partial and perverse."

Feminists such as Nancy Hartsock (1983) and Dorothy Smith (1987) have used Marx's theory of the standpoint to analyze the position of women in society. They argue, first, that women, like the proletariat, are an oppressed class. Their thesis is that the bourgeoisie's oppression of the proletariat parallels men's oppression of women. Patriarchy, like capitalism, is a system of oppression in which the dominant class, men, hold the oppressed class, women, in subjection. Second, feminist-standpoint theorists argue that the activity of women in

society—child-rearing, child-bearing, and housework—creates a particular reality for women. Like Marx, they argue that the social actor's activity creates her knowledge. Finally, they contend that the knowledge produced by the standpoint of women is truer than that produced by men. Following Marx, they argue that the knowledge of the oppressed class of women reveals the truth of patriarchy, whereas that of the ruling class of men is partial and perverse.

Feminist standpoint theory has been a major component of contemporary feminist thought. Hartsock's *Money, Sex, and Power* (1983) advanced the thesis that the distinctive activity of women in society provides them with a privileged access to reality. Her analysis of how the feminist standpoint is produced through the practices distinctive of women in society became the basis for extensive analyses of that standpoint. Dorothy Smith's analysis of the "lifeworld" of women extends the concept of the standpoint into an analysis of the everyday life of women. Combining standpoint theory with a phenomenological approach, Smith argues for an analysis of the everyday life of women as constitutive of their social reality.

But feminist standpoint theory has also raised questions for feminist thought. As feminists moved from a consideration of the difference between men and women to the differences among women, the concept of the feminist standpoint became problematic. Feminists questioned how one feminist standpoint could account for the variety of women's experiences. Feminists also began to question the epistemology of the standpoint. If, as Marx claims, all knowledge is perspectival, then how can one perspective be "truer" than another? Standpoint theorists have difficulty answering either of these questions.

## POSTMODERNISM AND POSTSTRUCTURALISM

Since the 1990s one of the principal influences in feminist thought has come from the predominantly French philosophies of postmodernism and poststructuralism. Inspired by the work of Friedrich Nietzsche, postmodern and poststructuralist philosophers have questioned not just aspects of Western thought but its very foundation. Rejecting the Cartesian subject and the pursuit of universal knowledge, these thinkers have fundamentally altered the project of philosophy. Many feminists have been attracted to these theories because they provide a radically new way to understand the feminine and its place in Western philosophy. Postmodernism and poststructuralism, by redefining truth as plural rather than universal,

provide the possibility of overcoming the inferiority of women that has pervaded Western thought.

The widely acknowledged inspiration for postmodern thought is the work of Nietzsche. The object of Nietzsche's attack is the tradition of Western thought beginning with the Greeks. Two aspects of his thought have been particularly relevant to feminism. First, truth, for Nietzsche, is relational and perspectival. It is a "mobile army of metaphors" that is harnessed for use by those in power. Second, Nietzsche questions the centerpiece of modern Western philosophy, the subject. By undermining the subject/object dualism that provides the grounding for the subject, Nietzsche calls into question the autonomy of the subject and its place in the constitution of knowledge.

The radical quality of Nietzsche's thought has resonated with many feminists. For those feminist philosophers claiming that the "man of reason" informing Western thought has excluded women from the pursuit of truth, Nietzsche's approach provided a mean of further articulating this claim and of exploring an alternative.

Two theorists whose work is rooted in that of Nietzsche have played a significant role in contemporary feminist philosophy. The work of Michel Foucault, although controversial, has had a significant impact on contemporary feminism. Like Nietzsche, Foucault takes on the two pillars of Western thought: truth and the subject. For Foucault truth is constituted through discourses; it is specific to the discourse in which it operates. It follows that the universal truth of the Western tradition is a fiction created, itself, by a particular discourse. For Foucault standards for what constitutes truth are not universal but, rather, internal to particular discourses. The most radical element of Foucault's thought, however, is his declaration of "the death of man." Foucault argues that the autonomous, constituting subject of modern philosophy (the Cartesian subject) is a creation of a particular discourse at a particular time and, most significantly, is now in eclipse. For Foucault discourses create specific kinds of subjects; there is no universal subject but only the subjects constituted by particular discourses.

Feminists have found Foucault's work extremely useful. His theory of the death of man has obvious feminist implications even if Foucault did not explore them. "Man"—the rational, autonomous, self-constituting subject—has been a problem for many feminists. Exposing this concept as the product of historically located discourses and thus vulnerable to change eliminates these problems. Feminists have also used Foucault's work to explicate how the subject "woman" is created by the dis-

courses of patriarchal society. In the highly influential *Gender Trouble* (1990), Judith Butler uses a postmodern approach to explicate how the identity “woman” is constituted. Butler argues that this identity is a fiction created by the actions of women who perform that identity. She advocates a feminist politics that eschews the identity “woman” and instead creates “gender trouble,” the destabilization of the gender structures of society. Feminists have also used Foucault’s thought to challenge the “truth” about woman, enshrined in Western philosophy and science. Using a Foucaultian approach, feminists have explicated how truths are established and sedimented into their discursive foundation.

The work of Jacques Derrida has also provided the basis for feminist philosophical investigations. Derrida’s “deconstructive” approach, like that of Nietzsche and Foucault, constitutes a fundamental critique of Western rationalism. Derrida’s strategy of deconstruction focuses on language and its construction of a monolithic reign of truth. Derrida attacks what he calls the “metaphysics of presence,” the presuppositions informing the tradition of Western philosophy. His goal is to examine the elements of Western rationalism and expose them as an elaborate construction rather than as absolute truth. He does so by “deconstructing” its basic concepts—that is, examining the presuppositions that inform those concepts and the consequences that flow from them.

Feminist philosophers such as Luce Irigaray, Julia Kristeva, and Helene Cixous have employed a Derridean perspective to deconstruct the dualisms that found Western philosophy. Questioning the masculine definitions of rationality and truth on which Western thought is grounded, these feminist philosophers have argued for a distinctively feminine way of writing as a counterweight to the norms of male-dominated discourse. If, as Derrida claims, we are constituted by language, then we need another language to resist this constitution. The goal of these philosophers is to redefine “woman” and the feminine in ways that are not structured by Western dualisms.

Postmodern and poststructuralist philosophy have provided a rich addition to feminist philosophy. They have allowed feminists to examine the relationship between language and the status of women in radically different ways. But postmodern feminism has also been strongly criticized within the feminist community. Its critics have argued that postmodernism, by rejecting absolute truth, is a form of relativism, even nihilism. Without some conception of truth, these critics claim, feminists cannot proclaim the truth of the oppression of women. They further argue that postmodernism deprives

feminism of a political stance, a necessary component of feminism. The defenders of postmodern feminism counter that their outlook does not preclude politics but, rather, offers a different understanding of the political. They point to the revolutionary force implicit in Derrida’s deconstruction and the “local” rather than universal resistance advocated by Foucault. But the controversies over postmodernism and feminism show no signs of abating.

## CRITICAL THEORY AND HERMENEUTICS

Although they do not represent as pervasive an influence as postmodernism, both critical theory and hermeneutics have also found a following among feminist philosophers. The work of Jurgen Habermas has influenced the writings of both Nancy Fraser and Seyla Benhabib. These theorists find Habermas’s philosophy attractive because, although it is critical of Enlightenment rationalism, it nevertheless provides a normative basis for an alternative conception. Partly inspired by Marxism, Habermas’s approach entails both a critique of social norms and an alternative vision of a society without oppression. Focusing on the communicative basis of society, Habermas envisions a polity characterized by undistorted communication. Feminists who embrace this view argue that it provides an appropriate basis for feminist politics.

The hermeneutics of Hans-Georg Gadamer has also attracted feminist attention. Although Gadamer is usually viewed as a conservative, some feminists drawn on his writings. Like Habermas, Gadamer attacks the Enlightenment conception of a single path to truth, arguing that there are many paths other than that of reason and logic. Gadamer also challenges the hegemony of the autonomous, rational subject, emphasizing instead the way in which languages create the “horizon of meaning” in which we live. For Gadamer, “horizons” are perspectives in which we are all located, positions from which we understand the world. Like other approaches rooted in language, Gadamer’s approach has allowed feminists to analyze the linguistic constitution of social reality, and, in particular, the historical context that informs that reality. Linda Alcoff (1996) and Lorraine Code, for example, argue that feminists can employ Gadamer’s approach to articulate an understanding of knowledge that is engaged, situated, and feminist.

## FEMINISM AND PRAGMATISM

Pragmatist feminists hold some or all the following conceptual commitments, which are rooted in classical pragmatism:

- (1) A rejection of foundationalist and essentialist notions of reality and truth, in favor of an understanding of reality as the result of mutually constitutive transactions between agents and their environments and of truth as good knowing that it enables an inquiry to grow
- (2) A recognition that chance and uncertainty are parts of one's world, not (necessarily) signs of one's incomplete understanding of that world
- (3) A rejection of sharp dichotomies separating theory from practice, self from world, mind from body, fact from value, and reason from emotion

(4) A view of inquiry as experiential and experimental: Inquiry springs from experience, and its findings must have the capacity to improve on experience, for the individual or for society

(5) Respect for the philosophical value of ordinary, everyday experience—including experiences that characterize women's lives

(6) Cognizance that the community of inquirers plays a central role in inquiry and a commitment to improving the goodness of inquiry by actively increasing the perspectives represented in the community

(7) An understanding of ends, aims, and values as experimental: subject to revision in light of new experiences

(8) A recognition that democracy provides a model of intellectual and moral growth for society and the individual possessing the greatest capacity to promote justice

Feminist strands of pragmatism stand in the somewhat unusual position of having been part of their parent tradition virtually since that tradition emerged in the late nineteenth century. However, only in the 1980s did an explicitly, self-consciously pragmatist feminist philosophical movement emerge.

### EARLY FIGURES

The pragmatist movement counted women and feminists among its members from the early days; many were associated with the classical pragmatist John Dewey as his colleagues and as his students. These theorists worked almost exclusively at the margins of academic philosophy, as educators and school administrators, policy makers, and social activists. While their outsider status was not always chosen, their decisions to work in the community as teachers, policy makers, and community workers nevertheless embody a pragmatist commitment to creating philosophy that works to ameliorate the problems of everyday life—not simply the problems of philosophy.

Among women who contributed to the emergence of pragmatist thought in explicitly feminist ways, perhaps none exerted greater influence on subsequent pragmatist feminism than Jane Addams (1860–1935), a social activist, theorist, and founder of the Hull House settlement. Her choice to theorize with, rather than about, the people of the neighborhoods surrounding Hull House embodied a pragmatist understanding that inquiry transforms both inquirer and inquired; she and the other resi-

dents of Hull House produced both theory and public policy that began in, and returned to, the problems of the people of their community. Addams's feminism was rooted in her understanding that women are, by enculturation if not by nature, different from men, and that such differences constitute actual assets—in city government, for instance. There, women's experiences as homemakers and mothers directly prepare them for the associated tasks of running a city. Addams's long association with Dewey significantly shaped the intellectual development of both theorists, particularly in the areas of democracy and education.

Charlotte Perkins Gilman (1860–1935), a contemporary of Dewey and an acquaintance of Addams, shared with them a debt to the evolutionary theory of Charles Darwin. All three understood evolutionary theory to assert that humans have both a capacity and an obligation to improve the conditions of their world through reflection on concrete experience; they also understood that value concepts like improvement, progress, and the good themselves evolve as a result of reflection and action; they are not fixed and timeless. Gilman's *Women and Economics* (1998) offers an evolutionary account of human social development that argues for the necessity (indeed, inevitability) of women's evolution as workers and public figures; only as women so develop will humans realize their social and intellectual potential. Gilman argued for transformations of domestic life to enable women to take their place in the world of work: public kitchens and day care centers, for instance. She saw these proposals echoed in organizations and programs for working women developed at Hull House.

Several early women pragmatists worked as educators. Ella Flagg Young (1845–1918), Elsie Ripley Clapp (1879–1965), and Lucy Sprague Mitchell (1878–1967) studied with Dewey—in some cases, when they were already mature thinkers who exerted an influence on him. All three worked actively to develop pragmatist models of education that emphasized experiential, student-oriented, community-based learning: Young, as general supervisor of the Laboratory School at the University of Chicago; Mitchell, as a researcher and founder of the Bank Street School in New York; and Clapp, as the head of a community school system in Arthurdale, West Virginia, the first New Deal community in the United States.

## CONTEMPORARY THEORISTS

Contemporary pragmatist feminists, like feminists working in other traditions, have undertaken two separate but

related projects: reclaiming forgotten or neglected work of early women/feminist pragmatists and advancing pragmatist thought by developing new, explicitly feminist versions of it. In the first category, *Pragmatism and Feminism* (1996), by Charlene Haddock Seigfried, presents a systematic exposition of the contributions of early women pragmatists, documenting the lines of influence running among Addams, Clapp, Mitchell, Young, and Dewey. As Seigfried points out, such recovery work transforms both the history of pragmatist philosophy (restoring important voices that were lost) and its conceptual frameworks (engendering a reconceptualization of pragmatist positions that incorporates feminist contributions) (p. 6). Illustrative of this transformation is the work of Marilyn Fischer and Judy D. Whipps (2003), who elucidate the importance of Addams's work for the pragmatist tradition in their edited collection of her writings on peace.

Theorists working on the second task—developing feminist versions of pragmatist thought—draw on the (implicitly and explicitly) feminist and antiracist thought of several earlier pragmatist thinkers, including Addams, Dewey, W. E. B. Du Bois (1868–1963), and Alain Locke (1886–1954). Seigfried's *Pragmatism and Feminism* also marks the most significant early contribution to this project; it lays out a broad, flexible research agenda in epistemology, ethics, and sociopolitical philosophy to be undertaken by pragmatists and feminists using “a pragmatic hermeneutics of cooperation” and aimed at “changing the theoretical analyses and concrete practices of both” (1996, p. 4).

Much pragmatist feminist development has been in the area of feminist epistemology. Theorists here ground their work in the pragmatist emphasis on the primacy of experience and the experiential nature of knowing. Inquiry begins in the problems of ordinary life and possesses a melioristic function; this naturalistic epistemology is grounded in pragmatist thinkers such as Dewey and should not be conflated with Willard Van Orman Quine's naturalized epistemology.

Pragmatist feminist theorists also emphasize the pragmatist commitment to undermine or dissolve traditional dualisms between self and world, mind and body, and theory and practice. Shannon Sullivan challenges the self-world dichotomy to develop a Deweyan feminist understanding of humans as “transactional,” where transaction is understood as “an active and dynamic relationship between things such that those things are co-constitutive of each other” (2001, p. 12). This gives rise to a conception of truth as “transactional flourishing”:

truth and objectivity are conceived not in terms of transparency to reality, but as characteristics of transactions that enable both humans and their environments to flourish.

Pragmatist feminists have developed conceptions of reason, rationality, and objectivity that recognize the inherently collective, relational nature of these concepts—and that thus acknowledge their ethical, social, and political dimensions along with the epistemological. Lisa Heldke (1990) conceives a “coresponsible model” of objectivity grounded in responsibility to the inquiry community; on this model, inquiry becomes more objective as it acknowledges, fulfills, and expands responsibility to an increasingly pluralistic community. Reflecting the pragmatist commitment to problems of ordinary life, she develops the model through an analysis of food making, conceived as a “thoughtful practice”—a categorization that eschews the traditional division drawn between theoretical and practical activity.

Another significant body of work has developed in social and political philosophy. Theorists here utilize pragmatist understandings that social and moral ends are themselves subject to revision in light of new experience and that intelligent inquiry has melioristic potential and the pragmatist commitment to democracy, understood as a way of living emphasizing collective experimentation to transform current social realities. In *The Task of Utopia* (2001) Erin McKenna develops a pragmatist feminist concept of utopia, which understands it not as a fixed state, but as a characteristic of a (democratic) community’s collective inquiry and education process. Such a utopia is necessarily open-ended, its aims always in principle subject to revision.

Pragmatist feminists deepen classical pragmatist notions of community, which emphasize the importance of pluralism for democracy and inquiry; and of personhood, which reject liberal notions of the individual in favor of a relational, transactional model. Feminists show why the perspectives of marginalized persons must be explicitly sought, if people’s democratic communities are to continue to grow, promote justice, and create more reliable understandings of social reality. Whipps (2004) draws from Addams a form of communitarianism that rejects the radical individualism characteristic of its contemporary forms and recognizes the (messy, multiplicitous) ways selves are constituted through the interactions of daily life in the diverse community. And in *Deep Democracy* (1999) Judith Green creates a model of democratic practice as experimental. Her “radical critical pragmatism ... engage[s] with liberalism, communitari-

anism, postmodernism, critical theory, feminism, and cultural pluralism” (p. x), not simply to identify the weaknesses of these other traditions, but also to draw on these expanded resources to address concrete problems of democracy, most notably racial, economic, and sexual injustice.

## FEMINISM AND THE HISTORY OF PHILOSOPHY

The beginning of the twenty-first century was witness to an emergent transformation of the history of philosophy. While still the subject of intense debate within philosophy, the dominance of the image of the history of philosophy as a succession of “master thinkers” whose texts provide the historical background to contemporary philosophical debates has begun to wane. As philosophers come to embrace the historiography of philosophy and accept that attention to the past is not a simple process of reading past masters, methodological issues have become central to the history of philosophy and questions are being raised concerning the canonization of both theorists and texts, the conceptual role of history in philosophy, the accessibility of the past, and the role of interpretation.

Feminist history of philosophy has played a significant role in this transformation. From its outset, feminist historians of philosophy have raised issues of canon formation and have developed new and productive reading strategies in their efforts to attend both to women and to the role of the feminine in the history of philosophy. These efforts to understand the apparent absence or denigration of women and of the feminine have led to interpretive strategies that have value beyond feminist concerns and have contributed to the transformation of contemporary history of philosophy.

Feminist attention to gender in the history of philosophy has led to the recovery of lost or silenced women philosophers, as well as having called into question models of philosophy and philosophical concepts emerging from a privileging of the masculine. As feminists came to understand the extent to which privileged concepts such as reason and justice revolve around the denigration of so-called “feminine” traits, they began not only to question the division between reason, emotion, and imagination in the history of philosophy, but also to search for and develop interpretive strategies that would not perpetuate such divisions.

### ATTENTION TO WOMEN

Feminist attention to women in the history of philosophy has raised issues concerning canon formation. Until the mid- to late twentieth century, much of contemporary history of philosophy proceeded along a model of “master thinkers” in which only the truly great minds of philosophy are considered worthy of attention. Admittedly there has been significant debate within the various tra-

ditions of philosophy as well as between different historical periods concerning which philosophers are indeed worthy. In addition, even when there is general agreement about the canonization of such philosophers as René Descartes, David Hume, Immanuel Kant, and Plato, there remains significant contestation concerning which aspects of their corpus are most central, with Descartes’s *Meditations*, for example, receiving far more attention than his *Passions of the Soul* in twentieth-century analytic history of philosophy.

As feminist philosophers of history contest the “great man” model of history, they have begun to demonstrate the importance of a richer approach to the history of philosophy. The recovery of women philosophers like Elisabeth of the Palatine, Jane Addams, Mary Astell, Sor Juana Inés de la Cruz, Jacqueline Pascal, Anna Maria van Schurman, and Mary Wollstonecraft has begun to transform modern prejudices about the history of philosophy. Since there were hundreds of women who contributed to philosophy, their absence from contemporary histories brings to the foreground the complex values that inform the narratives of philosophy and determine which questions and styles count as philosophical and whose voices are sufficiently influential to be chronicled. Feminist historians of philosophy have demonstrated, for example, how the nineteenth century move to excise from the canon work judged to be motivated by religious faith resulted in numerous philosophical schools and philosophical styles, and with them the work of many women, being excluded from the domain of philosophy. Feminists have also pointed out that if we limit our definition of philosophy to that work done only in the academy and the seminary, then we will exclude those locations, such as the convent and the salon, where women are most likely to be found in certain historical periods.

These investigations of the roles of women in philosophy have led to an enriched appreciation of the workings of the canon. For instance, feminist attention to the philosophy of Princess Elisabeth and the impact of her philosophical influence on Descartes has led to a renewed appreciation not only of *Passions of the Soul*, but of Elisabeth’s philosophy in its own right and of her influence on Descartes’s philosophy. Such feminist work details Elisabeth’s efforts to develop a unique philosophical position that does not divorce reason from the body, but defends a rich interaction between the body and the mind without reducing one to the other or denying Descartes’s intuition that thought is not determined by extension. Thanks to such work feminist historians of philosophy have been able to uncover lines of influence between Elisabeth’s

thought and Descartes's *Passions*, arguing for a subtle yet important shift in his ideas concerning the role of embodiment upon the mind resulting from their correspondence. In this way, recovery of the work of women philosophers and the feminist desire to undo the denigration of faculties and traits (such as the body) that have been associated with the feminine go hand-in-hand with a rereading of the canon.

Feminist attention to women has also included a chronicling of philosophers' perceptions of woman. Through this lens feminists have uncovered a systematic perception of woman and the feminine as inferior and man and the masculine as the true form. This has led philosophers of sexual difference such as Luce Irigaray to argue that woman has been defined not in terms of true difference, but in terms of lack according to an A (male) / -A (female) logic, a logic well illustrated by Hegel's claim that women while educable, are not capable of activities like science or philosophy that demand a universal faculty. In such a schema, woman and the feminine receive no positive definition, no true difference, but are merely an inferior inversion of the masculine. These investigations have led to the contention that the very concepts of philosophy—reason, justice, virtue—have themselves been inscribed by this conception of man and thereby by the masculine as the true form.

### PHILOSOPHICAL IMAGINARY

Feminist attention to gender thus presents as an issue central to philosophical investigation the question of whether the central categories of philosophy are formed through an exclusion or denigration of the feminine. Genevieve Lloyd's early study of the "maleness" of reason demonstrated that conceptions of rationality have privileged traits historically associated with masculinity and required control or transcendence of those traits historically associated with the feminine such as the body, the emotions, and the passions. Michèle Le Dœuff has referred to the often unacknowledged linkage of concepts, images, and metaphors in philosophical texts as the philosophical imaginary. She argues that this imaginary often inscribes values historically associated with masculinity onto dominant philosophical conceptions of reason and argues that this is not an instance of an individual philosopher's sexism that can be ignored or excised for it is at the core of the values from which the category emerges.

This scholarship has led to various efforts to identify and refigure the role of "the feminine" in the texts of canonized philosophers and to examine the specifically fem-

inine sites of philosophy. These reading strategies are diverse. Some, like Annette Baier's work on Hume or Barbara Herman's analysis of Kant, return to the canonical texts to tease out new or overlooked resources for revaluating the role of embodiment, imagination, and the affective life. Others turn to the work of "recovered" women philosophers to trace alternatives to dominant models of philosophy. Catherine Villanueva Gardner, for example, argues that a complex notion of sensibility and a rhetorical style that exemplifies sensibility can be found in the work of women philosophers such as Wollstonecraft, Catharine Macaulay, Christine De Pisan, George Eliot, and Mechthild of Magdeburg that provide a rich conception of the role the passions play in moral philosophy. Another reading strategy is to provide correctives to histories of philosophy that have ignored topics like the emotions or the imagination as does Susan James (1997) in her account of the passions in seventeenth-century philosophy. Yet another style of feminist reading can be found in the work of Luce Irigaray who focuses on the moments of instability in philosophical texts caused by the contradictory effort to achieve universality through a denial of sexual difference. It is her goal to open the historical texts of philosophy to contemporary feminist concerns not simply to confront what has been repressed, but to rethink it.

Feminist attention to the philosophical imaginary and the lessons learned from the canonization of particular philosophical styles, has led to sensitivity to the rhetorical dimensions of philosophical writings, as well as to an appreciation of their affective dimensions. But such attention to style also means a rich situating of the history of philosophy and a realization that the writings of the past are not transparent. The meanings and affective resonance of philosophical texts are neither in the control of the author nor the contemporary interpreter of the text, but involve a complex interplay between the author's cultural context and the concerns of the contemporary reader. In this way, mainstream efforts to excise the figural in order to uncover the literal truth of canonical texts give way in feminist rereadings to an appreciation of the role of imagination in philosophy and better understanding of how reason, imagination, and emotion are interwoven in the practice of philosophy. This attention to rhetoric and affect is another dimension of the feminist rejection of conceptions of reason divorced from the "feminine."

In such attention to neglected aspects of historical texts, feminists are motivated by our own feminist wonder at the relation between reason and emotion in the

play of the canon and a feminist inspired desire to find a place in-between mind and body. In this sense, our desires are enacted in our reading strategies.

## FEMINIST AESTHETICS AND CRITICISM

As artists in the late 1960s and early 1970s started to produce explicitly feminist works, critics and historians of the various arts began to examine a previously unnoticed gender bias in the Western artistic tradition. Feminists discern this bias on two levels.

First, feminist critics charge that canonical artworks represent women and men in markedly different ways, a difference evident in the organization and scenarios of the works themselves. Whereas men are typically portrayed as strong, active, heroic, and playing important historical roles, women are nearly always shown as weak, inert, and vulnerable; in domestic or nurturing roles; identified with nature; and as sexually available for men's needs. This is perhaps most evident in the visual arts where representations of passive, anonymous, and vulnerable female nudes dominate many historical periods. Drawing on semiotics, psychoanalysis, and Marxist theory, feminists sought to expose and analyze manifestations of gender bias in structural features of traditionally admired artworks. One of the most influential concepts developed in this early period of criticism is the notion of "the male gaze" (Mulvey 1975). Although it is sometimes mistaken for an empirical description of individuals' actual viewing practices, "the male gaze" in fact refers to the viewpoint that many pictures adopt toward women, portraying women as passive objects of sexual desire.

Second, feminists argue that fully addressing gender inequality in the arts also requires questioning the canon; that is, those works traditionally deemed artistically excellent that form the core of a given discipline. Feminists are skeptical of the canon for two reasons. First,

although women make up roughly half of the population, they are almost entirely absent from the pantheon of great artists. Second, the kinds of artifacts traditionally produced by women—for example, quilts, pottery, needlework, and weaving—have not been taken seriously as art but rather have been relegated to the diminished categories of “decorative arts” or “crafts.” The coincidence of pervasive gender inequality in the world with the exclusion of women’s artifacts from the canon suggests that the canon might be shaped by more than purely aesthetic concerns. But what exactly is the relationship between unequal social relations and women’s lack of representation in the canon? What explains the paucity of great women artists and the underestimation of artifacts customarily produced by women?

Some feminists, most notably Linda Nochlin (1971), argue that social, economic, and institutional barriers have prevented women from making art. For instance, in much of Europe in the nineteenth century women were not allowed to attend life-drawing classes and so lacked the training and practice necessary to adequately represent the human form. Although such obstacles and lack of opportunity surely contributed to the canon’s one-sided configuration, this explanation has difficulty accounting for two facts: First, despite these adverse conditions, some women have been making oil paintings, sculptures, and the like for centuries, yet none number among the canon of great artists, and second, women still encounter discrimination in the contemporary art world (Guerilla Girls 1998). The historical explanation also has trouble accounting for the exclusion of *kinds* of artifacts conventionally produced by women.

Such questions prompt a need to examine traditional understandings of art. Might the prevailing standards of artistic excellence be tainted by biases that help explain why women and the artifacts they customarily produce have been excluded from the ranks of artistic greatness? At this point feminist philosophers and theoreticians enter the conversation to scrutinize the philosophical canon itself and analyze established theories of art, artistic talent, and aesthetic experience and value.

In their critical examination of the Western philosophical tradition feminists uncover and analyze previously unnoticed gender biases in theories of art from Plato onward. Some contend, for instance, that central aesthetic concepts such as “genius” and “masterpiece” have been traditionally gendered male (Battersby 1989). Others argue that influential theories of aesthetic perception implicitly take men’s experience as their model by favoring sight and hearing, which customarily play a

prominent role in men’s lives, and by underestimating the aesthetic importance of those senses integral to the social roles assigned to women, namely touch, smell, and taste (Korsmeyer 2004). Finally, many feminist philosophers are critical of a cluster of theories and concepts that assume or attempt to justify the autonomy of art and of aesthetic appreciation and evaluation (for an overview, see Devereaux 1998). For example, some maintain that the common insistence on art’s segregation from practical concerns results in the art-craft distinction and hence in the systematic depreciation of the sorts of artifacts customarily produced by women. Others make the case that the related doctrine of aesthetic formalism, which restricts artistic value to a work’s formal features, departs in practice from purely formal concerns by reflecting masculine preferences for particular themes (such as the female nude). In these ways feminists argue that the presumed disinterestedness and universality of aesthetic judgment in theories following Immanuel Kant mask standards of evaluation that are partial to men’s experience, preferences, and sensibilities.

Once the sources of this undervaluation of women’s artistic efforts have been uncovered and analyzed, feminists then aim to delineate the positive means to overcome it. Besides providing women with opportunities in the art world, the prevailing conceptions of art and standards of artistic excellence must be revised. On this point most agree, yet several different solutions can be distinguished.

## PERSPECTIVISM

One approach calls for the outright abandonment of the problematic concepts, methods, and categorizations of traditional aesthetics. Artistic autonomy, aesthetic formalism, the art-craft distinction, presumptions of a disinterested aesthetic attitude, and concepts of talent or genius are all to be rejected in favor of a perspectivism that embraces a pluralistic conception of art and artistic value (Hein and Lauter 1993). This approach eschews all pretension to universal standards of aesthetic excellence, leaving no standpoint from which to adjudicate between differing understandings of art and aesthetic experience. In practice this has led some art historians and critics to reject the notion of artistic canons altogether and to replace talk of art with that of visual or material culture (Pollock 1999).

One concern is that this perspectival approach risks rendering any notion of artistic value meaningless, a result that is particularly unwelcome given feminists’ efforts to demonstrate the artistic merit of women’s arti-

factual efforts. Another worry is that one ought not mistake the discriminatory and faulty use of concepts such as genius or of methods like formalism for inherent features of these concepts, methods, or standards themselves. It does not follow from the fact that the so-called universal voice of aesthetic judgment has surreptitiously been biased toward masculine concerns that the very ideal of universality in aesthetic judgment is inherently gender biased. Indeed, that traditional theories of art have been criticized for their *bias* is evidence of feminism's reliance on the notion of impartial standards of artistic excellence.

## REVISIONISM

Some feminists warn against the assumption that all of aesthetic theory has been tainted by gender bias (Felski 1998) and point to developments in philosophical aesthetics, such as the critique of disinterestedness, that are continuous with feminism's aims (Silvers 1998). Others show how at least aspects of certain ideals such as artistic autonomy are actually useful for feminism (Devereaux 1998). These developments suggest that feminism might be compatible with traditional theories of art and aesthetic experience, provided that these theories are purged of their masculine biases. This could motivate reevaluation of those canonical works that cater to male-defined assumptions about women, on the one hand, and would allow these theories and their central concepts to be adapted to the kinds of objects customarily produced by women, on the other hand. In practical terms this approach would mean integrating women's artistic efforts into the canon, a process that some historians and critics have already begun (Guerilla Girls 1998).

## DIFFERENCE AESTHETICS

Still, some insist, incorporating women into the canon misses what is distinctive about their art. Likewise, they contend, traditional aesthetic theories cannot be adequately modified to capture the uniqueness of women's experience, preferences, values, sensibilities, and modes of expression. Instead, a variety of alternative aesthetic concepts and theories of art indigenous to women is proposed (Battersby 1989, Frueh 1998, Robinson 2001, Barwell 1993, Donovan 1993, French 1993, Lorraine 1993). Some French feminists like Irigaray and Kristeva, for instance, argue that women imagine, express themselves, and experience art somatically or experimentally, and that these distinctive methods require standards, concepts, and definitions of art that differ radically from the traditional ones (See Korsmeyer, 2004, Chapter 6, for

an overview). In practical terms, this could lead to the formation of separate women's canons in each of the arts.

Critics charge that this approach rests on false essentialist assumptions about woman's nature and overlooks important differences between women such as ethnicity, race, class, sexual orientation, ability, and age, to name only a few (Felski 1998). Some also worry that separate principles and criteria of artistic excellence and aesthetic experience risk leaving the canon with its biases in tact while ghettoizing women's art (Nochlin 1971, Pollock 1999).

The debate about how to deal with gender bias in artworks, canon formation, and traditional theories of art is lively and ongoing. Many of the disputes rest on the question of how, if at all, gender matters to the production, appreciation, and evaluation of art. Besides these unresolved questions, all approaches face new challenges such as the insistence that one cannot divorce feminist struggles from those of other disenfranchised groups. For these reasons, feminist aesthetics does not involve a particular stance or methodological commitment but, rather, unites a variety of approaches toward the common goal of ending women's subordination in the arts and discourses about the arts.

## FEMINIST EPISTEMOLOGY

Feminist epistemology emerges from reflection on feminist inquiry. Core themes in feminist epistemology can be understood by considering a *prima facie* tension between two distinct strands of feminist research, one critical and one constructive. The critical strand aims to expose male bias in research while the positive strand aims to construct theories that are avowedly feminist and that bring women’s experiences and interests to the center of inquiry. Most disciplines have come under critical scrutiny for male bias. Forms of bias identified include:

(1) Marginalizing women or women’s interests. For example, economic theory is charged with making women’s economic contributions invisible, political theory with overlooking power relations in the family, and evolutionary theory and anthropology with privileging male activities.

(2) Producing theories that naturalize and thus reinforce oppressive gender relations. Primatology and sociobiology are among the disciplines that have been charged with such bias.

(3) Embedding gendered metaphors that bias theory selection.

(4) Presupposing cognitive styles that arise from male psychosocial development. This charge is laid against philosophy, scientific method, and theories of moral development.

A puzzle immediately arises, however: If such research is bad because biased, then how can the constructive strand of feminist research escape a similar charge of bias and hence of epistemic fault? The puzzle deepens still further: Epistemic norms, including norms of objectivity, have themselves been charged with male bias. A charge of bias seems, however, to require a commitment to the value of objectivity. This puzzle is called “the bias paradox” (Antony 1993, pp. 114–115) and provides the context in which core themes in feminist epistemology can be understood. These are: the ideological role of epistemic norms; the importance of situated knowledge; the role of values in inquiry; and the nature of objectivity.

### THE IDEOLOGICAL ROLE OF EPISTEMIC NORMS

Feminists have charged epistemic norms with being male biased. MacKinnon’s analysis of the stance of objectivity as involving two components—distance and *aperspectivity*—is representative: “To perceive reality accurately, one must be distant from what one is looking at and view it from no place and at no time in particular, hence from all places and times at once” (MacKinnon 1989, p. 97).

To the extent that a putative knowledge claim can be shown to be the product of the inquirer’s social situation, that claim is undercut as knowledge: “If social knowledge can be interpreted in terms of the social determinates of the knower, it is caused. Therefore its truth value, in this definition of the test for truth, is undercut. If it has a time or place—or gender—it becomes doubtful because situated” (MacKinnon 1989, p. 98).

*Aperspectivity* is alleged to be a “strategy of male hegemony” (MacKinnon 1982, p. 57) that maintains gender relations in three ways: by being implicated in the objectification of women, by masking male bias in research, and by deauthorizing women as knowers. According to MacKinnon, *aperspectivity* lends support to the (false) belief that women are by nature fitted to the

position of eroticized subordination prescribed by current gender relations. Men project onto women the qualities (e.g., docility and submissiveness) that they desire women have. When such projection is accompanied by the social power to make women behave as desired and to silence contesting conceptions of social reality, women come to have the properties men ascribe to them. The stance of objectivity allows men to assume that the regularities they observe are objective and to overlook the exercise of power that produced them. In this way, aperspectivity masks the fundamentally prescriptive nature of gender norms and thus lends stability to the oppressive relations constitutive of gender.

Aperspectivity also enables mainstream research to evade critical scrutiny. Even though, given the theory-dependence of method, all research requires presuppositions, mainstream theoretical presuppositions will typically not need to be articulated and defended. Since the beliefs that feminists contest are relatively entrenched, it will tend to be feminists and not mainstream researchers who are called on to defend the presuppositions of their research. Thus, credibility is differentially apportioned between feminist and mainstream views on gender.

In addition, norms that disparage knowledge claims that can be explained as the result of the inquirer's social location are incompatible with feminist method, including the method of consciousness raising. While the formats of consciousness-raising groups—a grass-roots phenomenon chiefly of the 1960s and 1970s—differed, they focused on recounting women's day-to-day experiences, especially of intimate relationships, and on their emotional responses to those experiences. In women's often-inchoate responses to their day-to-day experiences were found the resources with which to understand women's social position. Given that this method starts out from a detailed examination of women's lived experience an experience both available because of and constitutive of women's gender subordination, it finds social location to be an epistemic asset rather than a liability. Different epistemic frameworks offer different accounts of when and how social location is an epistemic asset. This is the subject of the next section.

## SITUATED KNOWLEDGE

Feminist standpoint theory begins from the Marxist assumption that material life shapes consciousness, and it draws an analogy between the position of the proletariat under capitalism and women under patriarchy. Just as the proletariat has a privileged standpoint from which to

understand the nature of capitalist social relations, there is an epistemically privileged *standpoint* from which to understand the nature of patriarchal social relations. The basis of this standpoint lies in the sexual division of labor. Key features of women's relation to material life that Hartssock argues provide the grounds for the feminist standpoint are women's domestic labor and their role in childbearing and rearing; the experience of female embodiment, including pregnancy and lactation; and the relational self-conception that object relations theorists argue is the result of girls being raised by mothers with whom they can share gender identification. The standpoint is identified as feminist rather than as women's standpoint to signal that the understanding it embodies must be struggled for and does not arise simply in virtue of occupying a subordinated social position.

Patricia Collins defends a black feminist standpoint, which she argues generates its own epistemology that emphasizes experience over book learning, dialogue in assessing knowledge claims, and relations of care and personal accountability. She finds the grounds for a black feminist standpoint in black women's experience of multiple oppressions.

Standpoint theorists reject any conception of objectivity that disparages beliefs that are to be explained by the social location of the believer as merely caused and hence as not truth tracking. They thus resolve the bias paradox by claiming that feminist perspectives provide insight into social relations that are obfuscated by dominant nonfeminist perspectives.

Standpoint theory is charged with valorizing oppression, with being unable to explain which standpoints have epistemic privilege without circularity, and with presupposing an overly simple and exclusionary conception of gender. Feminist postmodern charges standpoint theory with essentialism; that is with making false and exclusionary generalizations about women and their experiences. Feminist postmodernism challenges the stability of the category of woman: One is never simply a woman, but always a woman of some particular race, ethnicity, class, sexuality or historical and national location. Gender is constructed differently at each of these intersectional nodes of identity: One cannot extract from these complex and shifting social categories the single variable *gender*. Destabilizing the category *woman* undercuts the possibility of a feminist standpoint; moreover, given there is no in principle limit to the fragmentation of social categories, positing a black feminist standpoint likewise risks making false and exclusionary generalizations about black women.

The epistemic resources and liabilities of social location and other aspects of situated epistemic agency (embodiment, specifically human cognitive architecture, and so on) can be recognized without embracing the notion of epistemic privilege characteristic of standpoint theory in its initial formulations. Sandra Harding argues for multiple standpoints and views, each as a source of questions rather than a source of privileged answers. Lorraine Code calls for an epistemology that takes subjectivity into account; that is, for an epistemology that studies the psychology, interests, and social-cultural locations of inquirers. Likewise, feminists influenced by naturalized epistemology call for the empirical study of those features of our situated epistemic agency that enable one to truth-track and those that prevent one from doing so. Naturalized epistemologists view epistemology as the empirical study of knowers; thus, instead of offering a priori defenses of epistemic norms, they defend a posteriori norms of inquiry designed to help human agents—that is, finite embodied, social, agents—reliably to truth track. These tailored epistemic norms might be different for dominants and for subordinates. Whether and when such norms must recommend insulating political values from inquiry is a question to be settled empirically.

### VALUES AND INQUIRY

Values and interests are recognized as influencing the choice of research questions, as contributing to the ways knowledge is applied, and as constraining research methods, especially those used in research involving human subjects. There is, however, widespread skepticism about according values and interests any role in *justification*. Inquiry aims at the truth and, the skeptic presses, nonepistemic considerations can only distract from this truth-seeking goal. Permitting moral and political values to influence theory choice leads to wishful thinking and totalitarian constraint on free inquiry.

Feminist epistemologists respond that it is a mistake to see epistemic and nonepistemic values as in competition so that inquiry must be governed *either* by epistemic values *or* by nonepistemic values. Given the underdetermination of theory by evidence, so that a body of evidence counts in support of a theory only given background assumptions, and given the pragmatics of inquiry, which aims not just for truth but for *significant* truth (where significance is a function of the interests motivating the research question), inquiry will be porous to nonepistemic values. These can enter into choice of background assumptions, of explanatory concepts, and of methodological frameworks. What matters is whether the

values and interests that enter contribute to the goal of discovering significant truths and whether they are themselves defensible.

Because of their commitment to transforming gender relations, feminists are alert to background assumptions about gender that shape inference from a body of data and that shape choice of explanatory categories (e.g., the use of *dominance* to name a unified trait in primate research). This awareness has provided the platform from which to mount successful critiques of sociobiology, among other disciplines. Helen Longino argues for framework assumptions, including preference for models that allow for ontological heterogeneity and for complex multifaceted interaction over linear relations because only such models can allow one to represent complex human potentialities. This is no defense of wishful thinking: The claim being made is not that humanist political commitments determine which of two equally empirically supported theories to accept but, rather, that these commitments enjoin one to have models that enable such potentialities to be represented *if* they exist.

### OBJECTIVITY REVISITED

Even though it is generally accepted that the concept of objectivity has functioned ideologically to deauthorize women as knowers, feminist epistemologists are unwilling to abandon the notion. Some argue that the conception of objectivity found in mainstream epistemology must be radically overhauled and others that mainstream epistemology has the resources to develop a conception of objectivity that is fully compatible with feminist epistemological projects both critical and constructive. A number of alternative feminist accounts of objectivity have been developed in the literature.

Naturalized epistemology rejects any conception of objectivity as requiring presupposition or bias-free inquiry. Given the theory-dependence of method, the success of inquiry depends on presuppositions. Thus, not only is the injunction to eliminate bias impossible to meet, inquiry without presuppositions would get nowhere. Inquiry based on presuppositions can yet be objective: One needs to distinguish the good biases from the bad: Good biases enable one to truth-track; bad biases prevent one from doing so. Presupposition-rich methods can yield knowledge just in case the presuppositions are approximately true.

Working within standpoint theory, Harding (1993) defends “strong objectivity” based on the notion of reflexivity: Subjects of knowledge must themselves become objects of inquiry. Their interests and social posi-

tions must be acknowledged and the presuppositions that flow from them investigated. Communities of inquiry must be made democratic for *epistemic* as well as political reasons. Drawing on postmodernist perspectives, Sandra Haraway reaches similar conclusions claiming that “feminist objectivity means quite simply “situated knowledges” (Haraway 1991, p. 188). Only situated knowers who acknowledge the partiality of their perspectives and their responsibility in adopting them can be held accountable for their knowledge claims. To achieve objectivity, Haraway advocates combining these partial located perspectives through power-sensitive conversation and through a politics of solidarity.

Longino argues that objectivity is not a property of individuals and their methods of inquiry but, rather, of communities and their structure. A community of inquiry is objective just in case it facilitates transformative criticism. In order to do this, the community must be democratically structured: It must have publicly recognized forums for critique and change in response to that critique; it must have publicly recognized standards for evaluating theories and standards that respect both cognitive and social values; and it must be characterized by equality of intellectual authority. Longino’s account is procedural: Communities structured in the right way generate knowledge. She claims that this enables her to avoid begging the question about which standpoints are privileged and to avoid the naturalized epistemologist’s assumption that some knowledge claims can be taken for granted. It is controversial, however, whether an account of equality of intellectual authority can, without presupposing the truth of at least some contested claims, simultaneously rule out those holding “irrelevant positions”—Longino cites New Age “crystallogology” and creationism (1993, p. 118)—recognize the legitimate authority of expertise and not exclude those whose expertise has been denied for economic and political reasons.

All four accounts of objectivity recognize the importance of social relations and institutions in the production of knowledge; thus, feminist epistemology makes an important contribution to social epistemology—that family of theories that investigates epistemic dependencies and the role of social factors in knowledge and justification—by drawing critical attention to the political dimensions of the social.

## FEMINIST ETHICS

Feminist ethics is a diverse and growing body of philosophical work, initially based in the recognition that most canonical accounts of morality neglected, distorted, and/or trivialized women's moral perspectives while either ignoring or defending unjust power imbalances between women and men. Feminist ethicists have largely agreed that women's invisibility in canonical ethical theories—even leaving aside the overtly misogynist statements that also litter the tradition—is not only morally objectionable in and of itself, but also profoundly distorts many of the arguments and conclusions therein. Perhaps the most nearly unanimous claim of feminist ethicists has

been that what passes for a human ideal in much of mainstream philosophical ethics is in fact a male or masculine ideal—and that such bias leads us into error not simply about women, but about morality itself.

In general, feminist ethicists suspect that, in ethical theory as in other disciplines of thought and research, what has been portrayed as the human experience is in fact (at least in significant part) the distillation of a very specific experience—namely, that of highly privileged white men who relied on the exploited labor of others (typically men and women of lower economic classes and/or of despised ethnicities, as well as women of their own class and ethnicity) to enable them to pursue higher inquiry. These relationships of unjust privilege and group-based oppression, although they need not characterize human experience, in fact have done so throughout the period of time (including the present) during which Western moral philosophers have developed and refined their theories. These oppressive conditions shape people's moral beliefs, values, priorities, and characters at deep levels.

The task of feminist ethicists is to try to correct for existing biases in moral theory while also developing new theories, concepts, and strategies that will forge a path away from oppression and toward more just and humane social relationships. Bringing a feminist perspective to moral philosophy has included critiquing and reinterpreting both canonical male authors (such as Immanuel Kant, Plato, Friedrich Nietzsche, Aristotle, and David Hume) as well as reclaiming underappreciated female and/or feminist foremothers (including Simone Weil, Iris Murdoch, and Simone de Beauvoir). An early emphasis on criticizing sexist biases in traditional moral theories has given way to the formulation of new theories which, though their degree of engagement and continuity with canonical theories varies widely, all share an understanding of both gender oppression and women's perspectives as fundamental to human experience.

For feminist ethicists, where one stands in a social world pervasively structured by oppression always matters in understanding and evaluating one's moral beliefs and responsibilities. Such analysis is rendered more complex by the fact that gender is only one of many bases for oppression and privilege. Many feminist ethicists (again, like feminists in other disciplines) have devoted significant attention to the intersections among different forms of oppression, including but not limited to oppression on the basis of race, of economic class, of age, of physical and mental ability, and of sexual orientation. A central question for feminist ethicists is *how* one's positions within

these and other oppressive systems—especially the kinds and degrees of power, authority, privilege, and entitlement that these positions afford one in various particular contexts—shape both one’s moral character and one’s moral responsibilities. This focus on power relationships and on their effects on moral life means that the boundary between feminist ethics and feminist social and political philosophy is often a fluid one.

### CARE, RELATIONSHIP, AND WOMEN’S LABOR

One vital step toward remedying any masculinist bias in moral theory is to investigate and understand women’s points of view. The research of educational psychologist Carol Gilligan (1982) was an important early inspiration for feminist ethicists’ efforts to take seriously and learn from women’s moral perception and reasoning. Based on her research interviewing males and females about moral dilemmas (both real and imagined), Gilligan argued that there are two distinct moral perspectives (or “voices”) loosely associated with men and women respectively.

The justice perspective begins with a conception of persons as separate individuals who need moral rules to govern their interactions with each other, and in particular to safeguard a realm of autonomy within which each individual may act and make decisions without undue interference from others. Moral decision making is most centrally a matter of impartially adjudicating conflicts between individual rights and interests, and of seeing to it that one’s actions conform to certain universal rules of conduct. According to Gilligan, the justice perspective is more prominent in the moral voices of males than in those of females.

The care perspective, in contrast, begins with a conception of persons as embedded in social relationships in which they bear different and sometimes conflicting responsibilities to one another. Here, the priority is on creating and preserving connections and on avoiding and ending suffering. One’s primary responsibility is to respond to the needs of individuals located in concrete, particular situations, often by strengthening the relationships that support those individuals. Gilligan found that the care perspective is expressed most prominently and most frequently by women and girls, and urged that theorists pay due attention and respect to this perspective, rather than seeing it as an inferior and immature form of moral reasoning.

Since the 1990s, an early tendency to identify feminist ethics with care ethics has receded as feminist ethics itself grows more diverse and wide-ranging. Nonetheless,

some of the themes that Gilligan highlighted continue to occupy a central place in the thinking of many feminist ethicists. One such theme is what is sometimes called a relational conception of the person. Annette Baier (1985) usefully captures this concept by describing persons as essentially “second persons”; that is, beings whose subjectivities are formed and maintained in and through connections with others. Feminist ethicists typically focus on persons as participants in relationships both public and intimate, as inhabitants and co-constructors of social roles and identities. Many have sought to reconceive and expand vital moral concepts such as autonomy, rights, respect, responsibility, and equality in ways that centrally incorporate such a relational understanding of persons.

When theorizing begins with a vision of persons as inextricably located in and shaped by relationships, the fact that many of those relationships are oppressive ones naturally comes to play an important role in the theorizing. Feminist ethicists have emphasized not only how people ought ideally to behave, but also the personal, social, and political conditions that would enable people to develop their characters and behave responsibly—and in particular, to how relations of oppression can cripple and distort the moral capacities of persons (both those who suffer from oppression and those who benefit from it). Identifying and possibly repairing the moral damage of oppression has been an important theme in feminist ethics; in such work, a key challenge is always to distinguish the important (and often neglected) values and insights of oppressed people from the moral damage of oppression itself.

The centrality of relationship, the importance of valuing women’s perspectives, and the question of oppression’s moral damage all converge in feminist ethicists’ discussions of the labor that has most centrally characterized women’s experience over the centuries. This might be called the work of relationship itself—of caring and nurturance, of tending to others’ intimate emotional and physical needs (including for love, food, cleanliness, clothing, and the like) both inside the home as wives and mothers and outside of the home in professions such as nursing and teaching. Thus, in feminist ethics, due respect for the role of emotion in moral reasoning has been supplemented by attention to emotional labor: its importance to human well-being, its invisibility in some received ethical theories, and its disproportionate and often exploitative allocation to women (Bartky 1990, Calhoun 1992).

Sara Ruddick’s influential *Maternal Thinking* (1989) attempted to reclaim the work of mothers as involving

particular forms of moral reasoning that are vital not only to the work of raising children, but to efforts to create and sustain a just and livable world. Virginia Held argued in *Feminist Morality* (1993) that the relationship between mother (or “mothering person”) and child—rather than contractual relations or market transactions—should be considered the central or paradigmatic human experience and the basis for a feminist account of morality. While other feminists have been more wary of taking mothering either as paradigmatic of women’s experience or as a model for morality itself, most feminist ethicists grant that having primary responsibility for the intimate care and nurturing of children seems likely to shape women’s moral perspectives in deep and pervasive ways that are worthy of philosophical attention.

Peta Bowden (1997) argues against attempts to formulate universal principles to govern caring. Instead, care must be understood and elaborated through detailed attention to examples; she discusses motherhood, nursing, friendship, and citizenship as substantively different caring practices. In contrast to the canon’s highly idealized emphasis on relations among persons considered as equal in freedom and power, another area of feminist analysis in care-based ethics is the dependencies that accompany certain stages and conditions of life, including childhood, illness, old age, and various physical and mental disabilities. Feminist discussions of such dependencies (such as that of Kittay 1999) focus attention on the ineluctable facts of human vulnerability and interdependence, as well as on inequalities both between caregivers (or “dependency workers”) and those for whom they care, and between caregivers and non-caregivers in various communities.

Feminist ethicists have also drawn on women’s experiences challenging, or at least moving outside of, traditional feminine roles as nurturers of children and men. Important forms of ethical insight and practice emerge from alternative or resistant female lives, particularly from the bonding of women with each other in friendship (Friedman 1993) and/or love (Card 1995, Calhoun 2002) and from feminist networks and communities. Work in this vein tends to ask what values, virtues, and capacities are necessary for women to maintain their own well-being under patriarchy as well as to challenge and resist oppressive structures. While Marilyn Frye (1983, 1992) would likely resist a characterization of her work as part of ethics, her work on vital concepts such as arrogance, loving perception, whiteness and racism, oppression, humanism, and lesbianism has been enormously

influential for many who are working to articulate resistant feminist moral values and practices.

## ISSUES, CONCEPTS, AND METHODOLOGIES

Feminist ethicists have extensively discussed concrete normative issues that are clearly gender-related: abortion, rape and sexual consent, sexual harassment, marriage, pornography and hate speech, prostitution, surrogate or contracted motherhood, reproductive technologies, homophobia and heterosexism, domestic labor and intrafamilial justice, and welfare policy, to name only a few. These discussions have often focused not only on whether or not the practice in question is morally legitimate but also—for instance, in the case of rape and other forms of misogynist violence—on exposing its role in maintaining women’s political subordination and in forming women’s and men’s moral subjectivities. They have also brought a feminist perspective to bear on other concepts and attitudes that are less obviously gender-related, but for which an understanding of gender and power is illuminating. These include gratitude (Card 1996), shame (Bartky 1990), trust (Baier 1994), paternalism (Sherwin 1992), self-respect (Dillon 1997), guilt (Bartky 2002), and evil (Card 2002).

The feminist ethics lexicon also includes novel concepts developed specifically as part of the project of analyzing and finding ways to move beyond oppression and privilege—for example, María Lugones’s (1987) concept of “world-traveling,” which she recommends to feminists and others who seek to replace arrogance with love, identification, and loyalty in their relations to women who occupy different social “worlds.” Finally, feminist ethicists have developed ambitious new conceptions of morality’s nature, purposes, and sources of authority, such as Margaret Urban Walker’s (1998) “expressive-collaborative” model of morality (as distinct from the “theoretical-juridical” model that she thinks more typical of mainstream moral theory).

Whatever the specific topic at hand, certain methodological approaches and themes cut across much of what goes under the rubric of feminist ethics. Feminist ethics is typically characterized by a resistance to excessive idealizing in moral theory, especially to idealizing that obscures the pervasive relationships of dependence and of unequal freedom and power that moral life calls upon us to navigate responsibly. As Claudia Card puts it, feminist ethics generally errs on the side of “peeling back rather than donning veils of ignorance” (1991, p. 25). Relatedly, many (though certainly not all) feminist ethicists are wary of

attempts to formulate universal and highly articulable rules or principles in ethical theory, tending instead to draw more limited conclusions based on detailed analyses of particular socially located experiences. Particularly since the 1990s, feminist ethics has developed a fairly consistent focus on the *practices* of morality, on how moral concepts are actually used and deployed in various contexts: what we do with rights, how we take and assign responsibility, for what and to whom we hold ourselves and others accountable.

Not surprisingly, then, many feminist ethicists emphasize the necessity of ongoing real (rather than hypothetical or idealized) conversation and dialogue as important to revealing, justifying, and/or challenging people's moral practices and agreements. What matters is not only what is said, but who is thought to be entitled to say it: As Margaret Urban Walker puts it, "Feminist ethics pursues questions about *authority*, *credibility*, and *representation* in moral life and in the practice of moral theorizing itself" (1998, p. 54).

Some longstanding themes in feminist ethics continue to be refined and taken in new directions. Some feminist ethicists, like Joan Tronto (1993), have continued to develop and refine a care-based approach. In *Moral Boundaries*, Tronto urges that we renegotiate the boundary between morality and politics and endorse care not as a form of "women's morality," but rather as a political virtue that can aid in redistributing power and transforming the public sphere. Several themes—a relational conception of persons, the need to repair oppression's moral damage and to articulate practical modes of resistance—combine in Hilde Lindemann Nelson's (2001) discussion of identities as narratively constructed. Nelson argues for the importance of oppressed people developing "counterstories" that can resist and ultimately replace the damaging and undermining stories told about them by dominant groups. Such "narrative repair" is especially vital, in Nelson's view, because who one takes oneself to be, and who others take one to be, affects how freely one can act. Perhaps reflecting the maturation of the field itself, as well as its longstanding focus on persons as embodied beings proceeding through a life cycle, some feminist ethicists (Walker 1999, Bartky 2002) have turned their attention to aging—particularly to the strengths, natural and humanly arranged vulnerabilities, and specific forms of inequality that confront elderly women.

Finally, a global focus in feminist ethics, already well underway in the work of such feminists as Uma Narayan (1997) and Martha Nussbaum (2000), also finds expression in Alison Jaggar's (1998) attempt to enlarge the pos-

sibilities for egalitarian and inclusive global feminist dialogue. In discussing the challenges facing feminists who would respectfully communicate and cooperate with each other across vast global divisions of power, resources, and accorded authority, Jaggar exemplifies and develops several ongoing themes in feminist ethics. Among these are a suspicion of idealization (in Jaggar's case, of "romanticizing discursive utopias"), a corrective emphasis on actual dialogue and on questions of authority and silencing therein, and a relentless attention to the effects of power dynamics on women variously located in multiple matrices of domination.

## FEMINIST LEGAL THEORY

Feminist legal theory is the study of the philosophical foundations of law and justice; informed by women's experiences, its goal is to transform the legal system and the understanding of it to improve the quality of jurisprudence and women's lives. Feminists working in law share the convictions that the historical and continuing exclusions of women from the law's protective domain have injured women and that the exclusion of women from the study of law has limited both the understanding of law and its ethical compass. Feminists have accordingly sought to transform the rules and principles governing particular areas of law—torts, criminal law, constitutional law—so as to make them more responsive to women's needs and more reflective of women's perspectives. Feminist legal theorists examine the conse-

quences—both for women and for jurisprudence—of the exclusion of women's input into our shared understanding of the law's philosophical foundations. Toward that end feminists have examined competing philosophical understandings of the nature of law, have attempted to show how they fail to reflect women's perspectives, and have attempted in each case to reinvigorate them by centralizing rather than marginalizing women's experiences.

Some feminist legal theorists—sometimes called liberal feminist scholars—argue that women's lives will be most improved by simply extending to women what are widely regarded as two of the central promises of law in a liberal regime: first, the promise of "formal equality," the idea that the state's legal institutions will "treat like causes alike"; and second, the promise to each individual of a wide a sphere of individual autonomy. Women, liberal feminists argue, are "like men" in all the ways that should matter to the state and accordingly should be treated, wherever possible, in precisely the same way as men by the law. Women and men are the same in their abilities: Women, like men, can engage in the professions and trades, wage war, fairly serve on juries, administer estates, and vote responsibly, and the law must accordingly not discriminate on the basis of a false claim of difference and must also forbid discrimination against women in the private sector on the basis of such false claims (Williams 1984).

Similarly, women and men are the same in their needs: Women, like men, need protection against violence, meaningful work and civic participation, and, most important, the freedom to develop their individual life plans. The law should therefore extend to women the same protection against private violence and the same sphere of autonomy it extends to men (McClain 1992). By pursuing the logic of these applications of fundamental liberal principles to the law's treatment of women, liberal feminist legal theorists have contributed to widespread changes in the relations of women, men, and the state, ranging from the institution of bans on private and state discrimination on the basis of gender to the expansion of women's reproductive freedom and choices so as to maximize their social and political autonomy.

As critics of liberal feminism have pointed out, however, women are not "like men" in all ways, and as a consequence a rigid application of liberal premises to the sometimes distinctive situation of women will often backfire. Where women are unlike men, the blanket insistence on equal treatment will sometimes impoverish actual women, albeit toward the admirable end of a gender-blind utopian society (Becker 1987). Equal distri-

bution of property at the time of divorce, for example, will impoverish the majority of divorcing women who have less earning potential than their husbands. The equal refusal of an employer to grant maternity or parental leave upon the birth of a child will disproportionately hurt female workers, who, because of their greater biological role in the process of reproduction, will need more time out of the workplace than will men if they are to enjoy the same rights as men to be both workers and parents (Littleton 1987). The refusal of the state to extend the protection of social security to career homemakers treats women and men similarly but disproportionately harms women because women are disproportionately represented in the ranks of unpaid domestic labor.

At the professional level, tenure policies and partnership tracks, equally applied, hurt women more than men, because of the differing reproductive cycles of the two sexes. To take an extreme and only partly hypothetical example, a state that failed altogether to criminalize rape would on one level treat men and women similarly and thereby abide by the liberal mandate of equal treatment, but women would obviously be disproportionately harmed by such a regime. In all of these cases, the even-handed application of legal rules harms women because of the very real differences in women and men's economic, political, and social conditions.

Partly in response to the perceived theoretical and practical inadequacies of liberal feminist legal theory and partly as a response to work in other fields on the differences between men and women's psychological lives, a number of feminists in legal studies, sometimes called difference or cultural feminists, have sought to place at the center of inquiry not the many ways in which women and men are the same or similar but, rather the ways in which women and men are different. This focus on difference has in turn led to three promising areas of inquiry. First, difference feminists in legal studies have put forward a modified or quasi-liberal theory of equality sometimes called an acceptance theory (Littleton 1987). According to this view, the state's moral (and constitutional) obligation to treat citizens equally entails the state's obligation not only to provide equal treatment of the sexes wherever the sexes are similarly situated but also to provide different treatment wherever necessary to ensure an equal acceptance of differences, so that those differences, whatever their origin, do not cause women harm. Because women (but not men) get pregnant, bear children, and lactate, for example, the law must fashion rules of employment and civic engagement that will facil-

itate the acceptance of those differences in the public and economic spheres, whether or not that in turn requires different or similar treatment of the sexes in various legal regimes. Since women engage in more unpaid domestic labor, the liberal mandate of equality demands that family law, divorce law, and social security law should develop in ways that will render that difference harmless.

Other difference feminists have put forward a related critique of liberalism itself, sometimes called the "dependency critique" (Kittay 1999, Fineman 1995). The conception of human nature on which liberal norms of justice and equality (and the vast bodies of law they imply) typically rests is that citizens of a liberal polity should be treated as fundamentally independent and autonomous. But this conception of our nature is transparently and badly flawed: All human beings are dependent upon caregivers for their very lives for a good part of their early childhood and continue to require care throughout adolescence so as to become the autonomous citizens, independent entrepreneurs, moral agents, and free individuals so valued by various strands of liberalism and so vigorously protected by our fundamental, constitutional law. Further, all of us require care when we are elderly, likewise undercutting the dominant understanding of the independent individual at the heart of liberal theory. Almost all women and many men spend a very high percentage of their adult lives providing this care, in private and for no compensation when done within the family, or for very low wages when done through labor markets.

The disproportionately greater amount of caregiving labor done by women throughout history tends to be invisible within a liberalism that steadfastly insists on individual autonomy; hence, legal regimes that depend upon or aspire to those liberal values are often irrelevant or harmful to women and to the children and elders that depend upon them. The result in practical terms is often the impoverishment of women and dependents; the jurisprudential and philosophical result is a set of moral ideals for law and legal justice that badly undercuts the aspirations and needs of much of the world's populations (West 1996). A liberalism enriched with a feminist regard for the centrality of caregiving labor, for the moral and ethical perspectives such labor both demands and partly produces, and a fuller understanding of the dependencies and interdependencies of our social and biological lives would enhance women's well-being and the strength of both legal and political philosophy (McClain 1992).

Difference feminists have tried to explicate the distinctive harms women suffer that have little or no corre-

late in men's lives, on the assumption that by virtue of their difference, among other things, the harms that women suffer often go unnoticed as well as unaddressed (West 1996). Women suffer from sexual assault, sexual harassment, and sexual violence in greater numbers and in different ways than men do. Women suffer unwanted and nonconsensual pregnancies; men do not. Whatever the reason, women world-over are more engaged in childraising, and consequently are more harmed than men by the loss of children in custody disputes and are more vulnerable than men to the threat of such loss, which significantly weakens their economic bargaining position both in the family and at the point of divorce. If women are to enjoy legal protection against these and other gender-specific harms, the laws governing the social interactions that occasion these harms must be responsive to the existence and the different nature of the harms that women differentially and distinctively experience.

Radical feminist legal theory, sometimes called dominance feminism, is also an attempt to fashion a feminist theory of law that avoids the pitfalls of liberal feminist legal theory, but it does so in a different way. The central question for feminists working in law, according to radical feminist theorists, is not whether women and men are fundamentally alike or different but how the state might foster the greater empowerment of women. Women are unlike men in one significant respect: women as a group lack power (MacKinnon 1989). Liberal feminists are wrong to downplay or disregard that difference, and difference feminists are wrong to focus on any other differences. A focus on the differential treatment of women by the state, whether with the liberal feminists' aim of eradicating those differences, expanding upon them, as difference feminists wish, will be at best distracting. Disempowerment, not discrimination, and not difference, is the source of the problem, and patriarchy, not law, is the source of women's disempowerment. Law reflects patriarchal influences, but patriarchy also exists independent of law. Consequently, law can be and should be employed to end it.

Loosely reflecting the logic of critical legal scholars' Gramscian analysis of the relation of law and market capitalism, radical feminists have sought to highlight the nonlegal ways in which patriarchal power is created and reinforced in culture and then legitimated by legal rules and institutions. Women are disempowered, for example, by the violence done them through rape, sexual harassment, and street hassling as well as other forms of sexual assault. That disempowerment is then underscored through the distorting messages and the attacks on

women's self-esteem occasioned by pornography, the culture of romance, and other societal influences, all of which aim to render that disempowerment in some sense voluntary and all of which render problematic the liberal feminist insistence on expanding individual autonomy as a means for improving women's well-being. Absent feminist intervention, the law's role in this process of disempowerment and cooptation is largely to legitimate those harms: The constitutional doctrine of privacy, laws governing and only partially regulating rape and domestic violence, and the constitutional protection accorded to even extremely damaging assaultive speech all trivialize or render invisible the harms women sustain and reinforce the tendencies that cause them. Law does not itself cause these harms, but it contributes to a culture that tolerates them.

There is, however, nothing necessary about the handmaidenlike role of law in sustaining patriarchy; it only reflects current distributions of sexual and gendered power. Arguably, all of these forms of patriarchal power, and certainly those employing violence, can and should be prohibited by law. The law legitimates a good bit of the disempowerment occasioned by rape by underregulating it, but that can be changed: Rape laws can be expanded, and enforcement of those laws strengthened; to do both would go a long way toward undermining patriarchy. The goal of radical feminist theory is to employ the law in precisely this utterly conventional way toward the unconventional goal of first prohibiting and then eradicating the violence that sustains a patriarchal cultural regime.

Finally, a number of feminists engaged in legal theory have sought to appropriate the tools of postmodern analysis to free liberal, difference, and radical feminist legal theory from the presumed dangers of their essentialist premises. Two distinct projects have emerged from this effort, one critical and one reconstructive. First, postmodernists have joined with African-American, lesbian, and other arguably marginalized feminist legal scholars in an attempt to criticize the consciously or unconsciously racist or heterosexist assumptions in feminist legal theory, thus laying the groundwork for the emergence of a feminist jurisprudence strengthened by its recognition of women's racial, sexual, ethnic, and cultural differences (Harris 1990). Critical-race feminist legal theorists have contributed the most to this project. Theoretical and empirical scholarship has accordingly shown the ways in which, for example, feminist writing on rape and rape law has failed to attend to the experiences of African American women, whose understanding of rape is informed by a history of the use of rape law as an instru-

ment of terror by the white state and by rape as an instrument of terror by men. These critics also point to the ways in which feminist writing on difference, care, and caregiving has failed to attend to the extent to which African American women have provided such care to whites for no or little pay. Likewise, critical-race theorists and writers in the civil rights traditions fail to attend to the different experiences of women and men in communities of color: for example, the communal censoring of African American women who try to theorize or even describe experiences of domestic violence or sexual violence in communities of color. Feminist race scholars writing in law have urged the adoption of the perspective of persons at the “intersection” of various “axes of subordination” to best understand the ways in which these modes of social interaction injure those most vulnerable to multiple forms of marginalization (Crenshaw 1991).

Second, postmodernist feminists have joined with cultural critics and “queer theorists” from other disciplines in an attempt to highlight the ways in which perceived differences between the genders and between sexual orientations are themselves socially constructed rather than biologically mandated (J. Williams 1989, Halley 2002). The aim has been partly to free feminism from false and essentialist stories or metanarratives of women’s disempowerment and partly to redirect feminist legal reforms. Postmodern feminists, for example, have been attempting to redirect the law of sexual harassment, largely a product of radical feminism theorizing, away from its current focus on sexuality and toward a more pluralistic understanding of the various harms, whether sexualized or not, that women and men suffer in the workplace (Shultz 1998). This is in part in response to the postmodern complaint that radical feminism and hence sexual harassment law have wrongly relied on a grand metanarrative of women’s sexual disempowerment by men and in part a response to a concern that sexual-harassment law may encourage or rest on homophobic responses to what might be harmless socio-sexual gestures in workplaces (Halley 2002).

Both projects—the enrichment of traditional feminist theory with the perspectives of African American and other ethnic minority women, and the challenge to the narratives of female sexual disempowerment at the heart of sexual harassment law and radical feminism—both resonate with long-standing feminist (as well as postmodernist) goals: the first in its insistence on respecting and honoring the voices of outsiders, including those women who find themselves “outside” mainstream feminist discourse, and the second in its insistence on locating

within culture, rather than nature, the causes of women’s oppression and the key to ending it.

## FEMINIST METAPHYSICS

Metaphysics seems to be one of the least relevant, most foreign, and inhospitable disciplines of philosophy in relation to feminist projects and concerns. Traditional metaphysicians have tried to answer questions about the basic structure of reality, about what kinds of beings exist, about the nature of time and causation, and they have probed difficulties like free will and determinism, the

nature of universals and particulars and the like. None of these issues seems directly pertinent to feminism, and their abstract formulation and universalist perspective strike some feminists as deeply suspect. Nonetheless feminist metaphysics has emerged as a distinct and lively field in feminist theory. And there are important connections between feminist work on certain metaphysical issues and mainstream metaphysics.

Feminist metaphysics revolves around three core issues: essentialism and anti-essentialism about sex/gender, theories of the self or the subject, and realism versus social constructionism (a version of the realism/anti-realism controversy in mainstream philosophy). Each of these issues is central to Simone de Beauvoir's *The Second Sex*, which is rightly seen as the primary intellectual source for twentieth-century developments in continental and analytic feminist theory. Beauvoir oriented her pioneering work toward ontology and essentialism by defining woman as the Other (in relation to man). At the same time she sketched out the first detailed and comprehensive social constructionist account of gender. And she was centrally concerned to retrieve the possibility of subjectivity, agency, and transcendence for women.

Beauvoir's legacy has been developed in two major directions. In broad strokes continental feminist theory is anti-essentialist about sex and gender, and skeptical about the unity and coherence of the self or subject. Continental feminist theory tends to derive both anti-essentialism and anti-realism about sex/gender from a social constructionist view of sex/gender. In contrast analytic feminist theory tends to distinguish among these positions, holding, for example, that socially constructed categories and entities are real, and perhaps even constituted by essential properties. Analytic feminist theory is more hospitable to essentialism about sex and gender, and open to the possibility of non-androcentric theories of the self. These are generalizations, however, as we can see by considering the fact that Luce Irigaray, a pioneer of continental feminist theory, has developed an essentialist theory of sexual difference.

Feminist preoccupation with the questions of essentialism and the nature of the self rather than other metaphysical topics is neither coincidental nor arbitrary. Both of these issues are directly relevant to feminist politics because of their implications regarding the possibility of individual agency and effective shared activity toward political change. For example, Naomi Zack (1997, 2005) points out the consequences of anti-essentialism about gender for collective agency on behalf of women. If women share nothing in common as a group, then on

what basis can they forge a group identity, and on what basis can they find common goals? Other feminists, like Diana Meyers (1997, 2002), are troubled by the claim that there is no self or subject because of the implications of that position for the possibility of individual resistance to patriarchal norms, and for collective political agency. Similarly the feminist debate concerning social constructionist and realism/anti-realism is intended to reveal the arbitrariness and contingency of oppressive social and political structures in order to allow for the possibility of political change and an end to oppression. This entry explores the development of feminist metaphysical thinking about sex/gender essentialism, the self or the subject, and social constructionism and realism.

### ESSENTIALISM AND ANTI-ESSENTIALISM IN FEMINIST THEORY

The feminist discussion of essentialism usually begins with a distinction between sex differences, which are the biological markers that distinguish females from males, and gender differences, which are the cultural or psychological features that distinguish women from men. Some feminists question the distinction between biology (or nature) and culture underlying the sex/gender distinction. They argue that there is cultural intervention in the production of two sexes from a more complex biological reality. In making this argument, they reject an essentialist account of sex because there are no biological features that demarcate human beings into just two kinds that correspond to female and male. See the discussion in Anne Fausto-Sterling (2000), and the essentialist account of sex differences by Linda Alcoff (2005). In addition, Sally Haslanger (2000) has argued that a major project of feminist metaphysics is the unmasking of putatively natural categories or properties as social.

A similar argument is made against gender essentialism; namely, that there are no biological, psychological, or cultural properties that are common to all women and not shared by any men. Let's call this the commonality problem. Moreover, women of color (and others) have pointed out that the psychological and cultural properties that some feminists propose as essential to all women in fact exclude many women. Let's call this the exclusion problem. Elizabeth Spelman (1998) and bell hooks (1981) made important contributions in articulating these problems. The doctrine of intersectionality was developed by Kimberle Crenshaw (1991) to respond to both the commonality problem and the exclusion problem. Intersectionality is the idea that feminists need to attend to the multiplicity of identities that can and do

characterize individuals (race, class, and sexual orientation) in order to avoid the problems of exclusion and commonality. However, the concept of intersectionality is problematic to the extent that it fractures the unity of women, and leads to skepticism concerning whether any useful program for political change can reflect the interests of a heterogeneous collection of individuals.

Feminists have responded to anti-essentialist arguments by developing approaches to essentialism that respect the problems of commonality and exclusion without fracturing the unity of women. There are two basic approaches. A materialist approach to gender essentialism, developed in different ways by Haslanger and Monique Wittig (1997), among others, begins with the body, and the way that bodies are hierarchically ordered in and by patriarchal (and racist, ageist) societies. Gender is a material, embodied state and bodies are classified by societies into hierarchical relations. Being gendered is a relational property because gender categorization is dependent upon how bodies are perceived by others rather than upon the possession of any intrinsic biological or psychological property. Being gendered is also a political property in the sense that it carries with it a position in a hierarchical social structure. The materialist approach meshes with the intersectionality perspective because it allows that bodies can be classified in multiple ways according to overlapping social hierarchies; for example, racialized bodies that are men occupy a different social niche from racialized bodies that are women. Able-bodied women occupy a different position from disabled women and so on. On this approach the identities of being a woman and being a man necessarily have positions in a hierarchical grid of social power relations; if patriarchy did not exist then neither would women and men.

Alternatively Natalie Stoljar (1995) makes the case for understanding woman as a cluster concept rather than an Aristotelian universal. In a related development Naomi Zack (1997) argues that that being a woman is a relational, disjunctive property shared by all women. Like the materialist approach these accounts emphasize the features common to all women, but select features that are sensitive to the problem of exclusion. Unlike the materialist approach to gender essentialism these views do not make oppression intrinsic to being a woman. They also do not provide a conceptual grid for other identities like race, or sexual orientation as the materialist approach does. Tracing the similarities and dissimilarities between gender and other social categories and identities, like race and sexual orientation, is a major theme in feminist writ-

ing on essentialism and anti-essentialism. Although the question of gender essentialism remains contested within feminist theory, dogmatic anti-essentialism is no longer a criterion for adequate feminist theorizing.

Finally, some philosophers frame the discussion of gender essentialism in terms different from those we have been considering. Rather than try to determine whether or not there are any properties common to all women, we might wonder whether or not being gendered is essential to the identity of individual women and men. Essentialism in this sense is not about kind membership but rather concerns the issue of whether or not any of an individual's properties constitutes her as the individual she is, and if so, whether or not being a woman is one of an individual's constitutive properties. In different ways, Anthony Appiah (1990) and Charlotte Witt (1992, 1995) explore essentialist theories of gender by focusing on the relationship between an individual's identity and his or her gender rather than the question of what all women or all men have in common.

As mentioned in the introductory text of this entry, one reason for the persistence of the issue of essentialism in feminist theory is the political requirement that women be identifiable as a group with common interests, and who suffer shared injustices. Group identity is politically necessary; mere strategic essentialism does not seem to be sufficient as a basis for political change. For similar reasons the issue of the subject or the self is central to feminist metaphysical thinking. Despite the shortcomings of traditional accounts of subjectivity, it is hard to conceptualize a politically adequate view of agency without some account of the subject who acts.

## FEMINIST ACCOUNTS OF SUBJECTIVITY

Traditionally to be an agent one must be a self or a subject, and not a thing or an object that is acted upon. But feminists have catalogued serious deficiencies with the way in which traditional philosophers have described the self. These deficiencies include the tendency to identify the self or subject with reason in contrast with the emotions and the body; the tendency to associate agency with autonomous individuals rather than connected, relational selves, and the characterization of the subject as unified and coherent. The last criticism is the most radical as it rejects the very notion of a consistent self or subject rather than pointing out deficiencies with traditional characterizations of unified subjects.

The rejection of the unified and coherent subject or self is related to one strand of anti-essentialist argument

as we see in Judith Butler's work. Not only does Butler (1990) reject all forms of sex/gender essentialism, but also she does so as part of a rejection of the metaphysics of substance. And the rejection of the metaphysics of substance, the denial that individual, persisting beings exist entails the rejection of subjects in so far as they are characterized as unified individuals that persist through time. Some feminists find the dissolution of stable subjectivities liberating because of the possibilities for innovation, creativity, and performance that this view endorses. Other feminists find the rejections of stable subjects inadequate to the requirements of political resistance and change. Recall that the possibility of agency is based upon the existence of subjects who are agents. Agents can resist patriarchal norms, and can band together to effect political change.

However even those feminists who accept the importance of unified and coherent subjects criticize traditional notions of the self. For example, Susan Babbitt (1996) is critical of the philosophical tradition that centers subjectivity on reason, and defines reason as exclusive of emotions, imagination, perception, and other faculties associated with the body. And theories of the subject, which are mentalistic, also have come under feminist scrutiny. In response feminists like Moira Gatens (1996) have worked to define a bodily notion of subjectivity, which is more adequate to feminist understanding of the importance of embodiment in explaining human agency. Feminists have also developed a relational theory of the self, which interprets agents as constituted by their relations to others, and as embedded in concrete historical and cultural horizons.

The idea of the subject as relationally constituted and historically embedded is more adequate to feminist projects than the traditional idea of subjectivity. However, it is also problematic in relation to the idea of autonomy, which is an important constituent of many theories of moral and political agency. Moral and political subjects or agents act autonomously in some sense of the term. There appears to be tension between the requirement of autonomy on the one hand, and the feminist notion of a relational and embedded subject. If subjects are formed in and by particular cultures, and if their being is determined by their relations to other subjects and also in and by their relations to cultural and historical institutions, then in what sense do they choose and act autonomously?

Feminists like Diana Meyers (1997, 2002) have worked to specify criteria for a notion of autonomy that both recognizes the concrete causal formations of subjectivity, and carves out a reasonable zone for autonomous

decision making. In this way, feminists have absorbed the lessons of contingency from social constructionism without giving up the important ethical and political norm of autonomy. Other feminists like Marilyn Frye (1983, 1989, 1996, 2000, 2005) question whether the ideas of individual choice, individual autonomy and individual selves are the central notions that feminists need to understand the structures of patriarchy. They argue against the focus on individual subjectivity and choice not because there are no individual subjects but because focus on the individual subject and her choices obscures the horizon of oppression against which and within which choice operates. It reflects a political commitment to individualism, which does not provide an adequate framework for feminist politics.

## GENDER, SOCIAL CONSTRUCTIONISM, AND REALISM

Most feminists reject a biological, deterministic conception of gender. Instead they see gender as constituted and defined by social norms, practices and institutions. Since social norms, practices and institutions vary in different cultures, and also differ in the same culture at different historical periods, it seems to follow that gender is indeterminate and variable rather than fixed and stable. As we have seen some feminists think that the social construction of gender, in itself, rules out the possibility of gender essentialism because of the variety of cultural norms and their fluctuations through history. We have seen that not all feminists agree with that position. A related issue concerns the reality of gender, which can be understood as a local dispute within the realism/anti-realism debate in the philosophy of science.

Some feminists, influenced by postmodernism and continental philosophy, hold that gender is not a real and determinate category, but a designation whose meaning is indeterminate and unstable. Both Butler (1990) and Drucilla Cornell (1993) have developed views along these lines. An antirealist view of gender has the positive attribute of allowing for immediate liberation for both individuals and groups through novel and creative performances of gender. If you think that gender is performed, enacted, created through behavior in unstable patterns and novel directions, then there is no difficulty in rejecting oppressive structures and stereotypes. Even those who choose to enact conventionally appropriate gender roles can miss the mark and fail to do so exactly. One tension in this position concerns the appropriate understanding of the subject, the agent who enacts liberatory behavior, since

anti-realists about gender tend to also reject the notion of the unified, coherent subject.

Other feminists accept the social constructionist thesis about gender, but do not conclude that gender categories are unreal, unstable or indeterminate in meaning. The division between natural entities and artificial or social entities (however we might wish to draw this distinction, and indeed even if we reject it) does not require us to place only natural entities on the side of reality. On the contrary, socially constructed identities like gender and race are fully determinate and very real in their effects on individuals and communities. One tension in this position concerns the autonomy of individuals who are the product of very real social norms and institutions. If we are constructed causally as women and men, then how can we act autonomously to resist patriarchal norms? One response to this issue is to distinguish between the social construction claim interpreted as making a causal claim (which raises the specter of determinism) and the social construction claim interpreted as a view about the social constitution of gender norms (which does not have any implications for determinism). Gender norms are socially constituted through cultural practices and social institutions, but it is up to the individual to accept or to resist them.

Feminist metaphysics is a robust field within feminist philosophy that also contributes in important ways to recent work in feminist social and political theory. Feminist metaphysics also contributes to mainstream metaphysical thought especially in the topics of subjectivity, autonomy and agency; and social ontology, social constructionism and essentialism.

## FEMINIST PHILOSOPHY

The rubric "feminist philosophy" applies to work in many philosophical subareas, often spanning several disciplines. The work is united by its authors' commitment to feminism in some form and by their belief that an engagement between feminism and philosophy will have both theoretical and practical benefits for everyone.

Some work in feminist philosophy focuses on philosophical issues that have arisen in the course of feminist political activism. Not surprisingly, much of this work is in political philosophy or ethics. Some work in feminist political philosophy consists of the articulation and defense of feminist theory, whereas other work examines the relationships between feminist political theory and other more general political theories, like liberalism and socialism. Much early work in feminist ethics dealt with issues in practical ethics that were of particular concern to women, such as abortion and affirmative action.

Throughout the 1980s and 1990s, however, feminist philosophers increasingly drew from other areas of philosophy to gain clarity about basic concepts in feminist theory and abstract foundational issues. Feminist work in metaphysics, for example, takes up such issues as the ontological status of categories like "gender" and "race," the basis of personal and cultural identity, the nature of truth, and the nature of freedom and autonomy. Feminist work in epistemology has been concerned, *inter alia*, with the relationship between practical and theoretical knowledge, the nature of intuition, the role of trust and other emotions in the achievement of knowledge, the social construction of expertise, and the nature of objectivity. Feminist philosophers of science ask such questions as why science has so often been enlisted on the side of sexism, and why so few women enter scientific fields, even today. Other burgeoning fields of feminist philosophy are feminist legal theory and feminist aesthetics.

Feminist philosophers have also been interested in understanding the ramifications of the historical exclusion of women from the discipline of philosophy. This exclusion has several forms: First, women have had very little opportunity, until very recently, to engage in systematic philosophical study; second, women and gender relations have received very little philosophical attention from the male authors who dominate the philosophical canon; and third, when women are discussed in the canonical literature, they are almost with exception represented as intellectually and morally inferior to men. Feminist philosophers have been concerned to document, analyze, and explain these various exclusions. Some feminist philosophers, including, prominently, many feminist philosophers of science, have concluded the methods and central concepts of traditional Western philosophy have been corrupted by an "androcentric" bias—a pervasive presumption that distinctively male characteristics and experiences provide appropriate normative standards for the whole human race. Other feminist philosophers argue the problem is a matter of grossly false assertions about women that can be excised without affecting traditional methods or concepts. Feminist historians of philosophy have also been engaged in the "uncovery" of female philosophers not properly recognized either in their own times or in the present.

As a result of these sorts of investigations, many feminist philosophers have concluded that there is a need for distinctively feminist methodologies and have been engaged, along with feminist theorists in other disciplines, in developing such methodologies. Typically, these methodologies focus on ways of knowing that have been denigrated or excluded by mainstream philosophy and thus emphasize the cognitive value of the emotions, of practical experience, and of social interaction.

Feminist philosophers come from a wide variety of intellectual backgrounds and invoke a variety of figures and texts. While feminist philosophers do not all agree about how deeply sexist the field is, they do agree that there is much in the institutional culture of academic philosophy that is inimical to women. Feminist philosophers work for reforms individually and collectively through informal professional networks and through such organizations as the American Philosophical Association's Committee on the Status of Women and the Society for Women in Philosophy.

## FEMINIST PHILOSOPHY OF SCIENCE

Feminist philosophy of science arises at the intersection of feminist interests in science and philosophical studies of science. Feminists have taken an active interest in the sciences both as a key resource in understanding and contesting sexist institutions and systems of belief, and as an important locus of gender inequality and source of legitimation for this inequality. Feminist practitioners in many sciences, especially in the life and social sciences, typically engage two lines of critique: They document inequalities in the training, representation, and recognition of women in the sciences, and they identify myriad ways in which, far from eliminating the contextual biases of a pervasively sexist society, standard scientific methodologies frequently reproduce them in the content of even the most credible and well-established scientific theories.

The work of feminist philosophers of science is continuous with these critiques. Some feminist philosophers contribute to the analysis of androcentrism in the content and practice of particular sciences, in some cases linking these to inequities in the role played by women in science. The form these analyses take necessarily varies with the type of science in question. Critiques of disciplines concerned with an overtly gendered subject matter—the social and behavioral sciences and some branches of the life sciences—draw attention to ways in which unexamined, often stereotypic, assumptions about gender roles, relations, and identities delimit the subject of inquiry, define categories of analysis and description, shape

assessments of plausibility that define the range of hypotheses to be taken seriously (e.g., in comparative evaluation), and inform judgments about the bearing of evidence on these hypotheses. Women may be simply left out of account; behaviors, patterns of practice or development, and values and roles associated with men may be treated as normative for the population as a whole; where women diverge from male-defined norms they may be treated as deviant, immature, or anomalous; gender differences may be assumed irrelevant or, alternatively, taken as a given, a parameter for analysis rather than a variable; and the description and analysis of gendered subjects may be structured by conceptual categories that embody highly specific (ethnocentric) assumptions about the form that gender roles, identities, institutions, and values may take. In short, critiques in these domains call attention to ways in which the social and behavioral sciences (including ethology) are pervasively androcentric in content (see Bleier 1986, Haraway 1989, contributions to Harding and Hintikka 1983, Longino and Doell 1983, Tuana 1989, Wylie et al. 1990).

When the subject domain of a science is not overtly gendered, as in the case of most natural and life sciences, it may be projectively gendered, as when gendered categories are used to describe natural phenomena or when scientific categories have (gendered) social meanings (Potter 1988). And even when the subject is not characterized in gendered terms, feminist critics find that the enterprise and practice of science may be conceptualized in gendered terms, metaphorically characterized as the domain of men or as exemplifying masculine qualities of intellect and disposition (see Keller 1985). Whether or not these metaphors directly shape the content of science or, indeed, accurately characterize the practice of a majority of scientists, they do articulate and reinforce a conception of scientific inquiry that aligns it with attributes that are valorized as masculine (see Martin 1988).

The philosophical significance of these discipline-specific critiques lies in the questions they raise for our understanding of science, specifically, its objectivity, the role of values and interests in science, the status of scientific evidence and of extant methodologies for developing and evaluating scientific theory. If androcentrism is pervasive in much that is accepted as ‘good,’ even exemplary, science—if it is by no means limited to examples of manifestly ‘bad’ science (from Harding 1986)—then feminist critiques of science challenge us to rethink the relationship between what Longino has described as “contextual” and “constitutive” values (these correspond roughly to standard distinctions between cognitive or epistemic con-

siderations “internal” to science and the noncognitive, sociopolitical factors that many believe are properly “external” to science).

In taking up these questions the interests of feminist philosophers of science intersect with themes central to postpositivist philosophy of science. Feminist critiques of specific sciences illustrate, and draw attention to the implications of, central antifoundationalist claims about the complexity and contingency of scientific practice. If scientific theories are routinely (indeed, perhaps, necessarily) underdetermined by all available evidence, and if hypotheses are never evaluated independently of one another and the evidence supporting (or refuting) them is always itself richly interpreted (the theses of holism and the theory-ladenness of evidence), then it seems unavoidable that nonevidential values and interests, features of the “external” context of science, must play a role not only in the formulation but also in the evaluation of hypotheses. The contribution of discipline-specific feminist critiques is the insight that these contextual factors may include gendered interest, values, and social structures.

Although feminist philosophers are sometimes charged with advocating an untenable, “cynical,” and self-defeating relativism (Haack 1993) because of their insistence that social factors such as gender shape the practice and results of science, in fact neither feminist critics within the sciences nor feminist philosophers of science show much sympathy for extreme forms of social constructivism or contextualism on which epistemic considerations are reduced to social, political factors. Harding’s (1986) discussions of a “postmodern” epistemic stance and some of Haraway’s (1989) reflections on hybrid constructions of nature may be seen to move in this direction. But Harding was explicitly “ambivalent” about postmodern options at the time she proposed them and has since elaborated a thesis of “strong objectivity” according to which an understanding of the standpoint (the social location, interests, values) of epistemic agents serves as a resource in producing and evaluating “less partial and less distorted” knowledge claims (1991). Haraway has likewise elaborated the concept of “situated knowledges” with the aim of capturing the sense in which it is reasonable to require “a no-nonsense commitment to faithful accounts of a ‘real’ world” while yet acknowledging the radical historical and social contingency of all knowledge production (1991).

In a similar vein, while Keller reaffirms the value of psychodynamic analyses of the masculine orientation of science (e.g., as elaborated in Keller 1985), she distances herself from strong sociological theses and argues the

need for feminist analyses of science that attend to “logical and empirical constraints” and account for the “technological prowess” that makes scientific claims so compelling for scientists and for the world at large (1992, p. 3). The central preoccupation of feminist philosophers of science who elaborate a positive account of scientific inquiry is to understand the ways in which the (gendered) standpoint of epistemic agents and epistemic communities shapes inquiry while yet making sense of constraints imposed by constitutive values such as the standard requirements of epistemic adequacy, reliability, internal coherence, and consistency.

A number of positions have been explored in this connection. Feminist standpoint theory is one such approach. Harding’s (1991) formulation draws on the earlier proposals of feminists, such as Hartsock (1983), who are influenced both by Marxist-derived epistemologies and by psychoanalytic theory, and on the work of black and minority feminist theorists who draw attention to the insights afforded by subdominant status (Collins 1991, Narayan 1988). The central thesis of standpoint theory, as developed by feminist theorists, is that the empirical evidence to which epistemic agents have access, their powers of discernment and breadth of understanding, may be both enhanced and limited by their social location and associated experience, values, and interests. For example, those who must understand a dominant world of privilege from which they are excluded as well as the subdominant world(s) of which they are members may well be better situated to understand both worlds, in empirical detail and with critical precision, than those who are beneficiaries of systemic privilege. The epistemic partiality and authority of knowledge claims, and therefore the effective assessment of their epistemic adequacy, is thus contingent on understanding the conditions under which they are produced and authorized, the standpoint of epistemic agents and communities.

A number of feminist philosophers of science have argued that the social dimensions of scientific practice (including but not limited to its gendered dimensions) can be understood in terms compatible with a modified empiricism. Longino’s (1990) carefully worked distinction between contextual and constitutive values provides a framework for identifying the various points at which epistemic considerations leave room for the play of social factors, institutional context, political commitment, and personal interests in the formulation of descriptive categories, the interpretation of data as evidence, and the evaluation of hypotheses against evidence. At the same time she accords constitutive (epistemic) values a central

role, arguing that standards of rational acceptability can be identified that are independent of individual interests and that the social nature of science (e.g., institutional structures that encourage rigorous critical scrutiny of knowledge claims) serves as much to protect scientific knowledge from idiosyncratic bias as to render it vulnerable to such bias.

In a similar vein Nelson (1990) argues that an empiricist theory, which grounds knowledge in evidence and construes evidence in experiential terms, is compatible with a feminist reconceptualization of the agents of inquiry as communities, not abstract individuals, which are historically situated and of socially specified form. Sophisticated feminist empiricisms offer an account of epistemic virtues that transcend standpoint-specific interests—the virtues of empirical adequacy, reliability, scope of applicability, and explanatory power, which different standpoints help or inhibit us from realizing—without invoking an untenable (asocial) foundationalism.

Despite significant philosophical differences between proponents of these positions, feminist philosophers of science share an ambition to develop an account of science that resolves (or circumvents) the polarized debate between objectivists and rationalists on one hand and constructivists and relativists on the other. This is conceived both as a contribution to postpositivist philosophy of science, in which the terms of debate are most clearly articulated, and to feminist theory, where questions about the proper grounds for evaluating knowledge claims are a matter of immediate practical concern.

## FEMINIST PHILOSOPHY OF SCIENCE: CONTEMPORARY PERSPECTIVES

Feminists are a very diverse lot, but one thing they all share is a commitment to gender equality and a determination to bring it about. Feminist philosophers of science, along with feminist historians and sociologists of science and feminist scientists themselves, have focused especially on science, investigating both the ways science has helped to perpetuate gender inequality (their critical investigations) and the ways science can now help to eliminate it (their constructive investigations).

## CRITICAL INVESTIGATIONS

Feminists' critical investigations have dealt with fields as diverse as primatology and molecular biology, economics and medical research, and their claims have been jarring. For example, feminists have documented a history of misogyny in both psychology and biology. In psychology, a dominant theme has been the inferiority—the intellectual, social, sexual, and even moral inferiority—of women to men (Marecek 1995, Wilkinson 1997). In biology, a host of research projects have aimed to “explain” the origins and manifestations of these presumed inferiorities in terms of what is largely unchangeable: genes, brain structure, and hormonal structure (Schiebinger 1989, Fausto-Sterling 1992, 2000). Feminists have argued that other sciences, as well, have supported this view of women's inferiority: for example, the historical sciences (such as archaeology), with their modes of representation of the past, modes of representation marked by heroic exploits and spectacular accomplishments of men counterpoised with lackluster doings or outright invisibility of women (Conkey and Williams 1991). And they have argued that still other scientific fields have perpetuated or added to the problems of inequality women confront, but in different ways than by documenting women's inferiority. Neglecting women's needs and priorities in the employment and household sectors in economic model-building, they have claimed, has had dire effects on public policy relating to women (Waring 1992, Ferber and Nelson 1993, Nelson 1996). And neglecting women in both basic and clinical research until well into the 1990s, they have added, has had dire effects on women's health care (Rosser 1994, Weisman and Cassard 1994, Schiebinger 1999). Other scientific fields that have figured prominently in feminists' critical investigations are anthropology, sociology, and political science, and even—with regard to their past and sometimes even present exclusionary practices—the physical sciences and mathematics (Kramarae and Spender 1992, Stanton and Stewart 1995, Schiebinger 1999, Kourany 2002).

## CONSTRUCTIVE INVESTIGATIONS

Feminists' constructive investigations have been the site of considerable controversy, far more so than their critical investigations. It is agreed all around that science will aid the cause of equality for women if science works to replace prevailing ignorance and prejudice and misinformation about women with more adequate perspectives. But just how is this to be done?

**THE METHODOLOGICAL APPROACH.** Many feminist scientists have pointed out that a great deal of sexist science is, by the lights of traditional scientific methodology, simply *bad* science. Thus, they have taken to task mainstream authors of androcentric and sexist scientific work for failing to abide by accepted standards of concept formation, experimental design, interpretation of data, and the like (Bleier 1984, Hubbard 1990, Fausto-Sterling 1992). If such standards were rigorously followed, they have suggested, the problem of sexism and androcentrism in science would be, at the very least, much reduced. Feminist health researchers, for example, have pointed out that until the 1990s diseases such as heart disease that affect both sexes were defined as “male diseases,” studied primarily in white, middle-aged, middle-class males, and clinically handled accordingly. As a result, heart disease in women (who, as it turns out, differ from men in symptoms, patterns of disease development, and reactions to treatment) was often not detected and not properly managed when it was detected. Such problems could be—and ultimately were—handled simply by following accepted methodological procedures such as designing clinical studies with groups of subjects that were more nearly representative of the patient population at large (see, for example, Rosser 1994 and the special report on “Women's Health Research” in *Science* 1995).

Other feminist scientists have explored ways of reforming traditional scientific methodology. Margrit Eichler (1988 and 1980), for example, has developed batteries of detailed sex- and gender-related guidelines concerning such aspects of research as concept formation, research design and instrumentation, and data interpretation to help scientists screen sexism and androcentrism out of their research, and the Biology and Gender Study Group (1988) conceptualizes such procedures as a new kind of experimental control to deal with gender bias. Feminist scientists have also explored new pedagogies to reform scientists themselves: for example, cooperative rather than competitive pedagogical methods and ones that take full note of the experiences of women and the contributions of women scientists (Rosser 1995).

All of these suggestions can be rationalized by appeal to the ideal of value-free science. According to this ideal, scientific investigations must be kept strictly free of ethical or political commitments. Since sexism and androcentrism embody social values, they simply do not belong in science. Indeed, they bias science and thereby jeopardize science as an impartial resource in the struggle for social justice. On this view of science, the *only* legitimate strategy for eliminating sexist and androcentric bias is to

press for stricter adherence to the canons of scientific inquiry on the part of individual scientists. This view, that good method will yield science undistorted by sexism or androcentrism, can be called the methodological approach.

**THE SOCIAL APPROACH.** Few feminist philosophers of science accept the individualistic and formalistic conception of science implicit in the methodological approach. Some of them, along with some feminist scientists, have opted instead for a social approach unallied with the ideal of value-free science. They argue that no scientific method, however rigorous and however rigorously applied, can be guaranteed to screen out the various values and interests that scientists from their different social locations (race, gender, class, and so on) bring to their research. Scientists' values and interests can and do determine which questions they investigate and which they ignore, can and do motivate the background assumptions they accept and those they reject, can and do influence the observational or experimental data they select to study and the way they interpret those data, and so on. As a result, changes must be sought in the communities that generate our scientific knowledge if the knowledge generated is to aid the cause of equality for women. After all, scientific communities have historically been dominated by men—men who have been raised within sexist and androcentric societies and trained within sexist and androcentric scientific traditions; men who, moreover, profit from this sexism and androcentrism. Small wonder, then, that sexist and androcentric values have shaped the scientific knowledge generated by these communities.

But if changes should be made in the communities that generate our scientific knowledge, exactly what should be the nature of these changes? Here advocates of the social approach differ. Feminist-standpoint theorists argue that women—who also have been raised within sexist and androcentric societies and trained within sexist and androcentric scientific traditions—are still in a better position than their male counterparts to uncover and critique sexist and androcentric scientific perspectives and replace them with more adequate perspectives (are still in a better position, for example, to uncover and critique sexist assumptions about the sexual division of labor in prehistory made by male archaeologists and replace them with questions and hypothetical answers suggestive of new lines of research). “They have less to lose by distancing themselves from the social order; thus, the perspective from their lives can more easily generate fresh and critical analyses” (Harding 1991, p. 126, and cf. 1986). The upshot is that women's perspectives should

not only be welcomed into scientific communities, but they should also be privileged over men's perspectives, at least in gender-relevant areas of research, if the knowledge generated by those communities is to be an adequate basis for social justice.

Feminist empiricists such as Helen Longino and her followers, on the other hand, argue that standpoint theorists fail to take note of the diversity of perspectives of both women and men. There are women, for example, who have participated in research that is damaging to women, and there are men who have done just the opposite (see, for example, the diversity of perspectives in the special report on “Women's Health Research” in *Science* 1995). As a matter of empirical fact there simply is no one standpoint shared by all and only women, and hence, no “women's standpoint” especially conducive to uncovering and correcting prevailing ignorance and prejudice and misinformation about women. If science is to provide us with more adequate views about women, Longino urges, scientific communities must finally be made into inclusive places where women and feminist perspectives are given an equal though not a privileged hearing. More specifically, scientific communities will have to have public venues for criticism, publicly recognized standards by reference to which criticism can be made, “uptake” of such criticism (that is, the criticism will have to be taken seriously and responded to), and “tempered equality” of intellectual authority among all parties to the debate, among whom “all relevant perspectives are represented” (Longino 2002, pp. 128–135; and cf. 1990). Only if scientific communities are organized in these ways, says Longino, will the necessary “transformative criticism” of our current views of women be possible. But Longino gives us no reason to believe—and certainly no empirical evidence to suggest—that organizing scientific communities in these ways *will* issue in that transformative criticism, that is, will dispel the ignorance and prejudice and misinformation about women of which we are now possessed.

**THE POLITICAL APPROACH.** This motivates yet another approach different from both the methodological and social approaches—what might be called the political approach. Like the methodological approach, the political approach recognizes that sexism and androcentrism must be rooted out of science if science is to replace prevailing ignorance and prejudice and misinformation about women with more adequate perspectives, but unlike the methodological approach, the political approach also recognizes that rooting sexism and androcentrism out of science is tantamount to implanting egal-

itarian social values into science. Again, like the social approach, the political approach recognizes that social values inevitably enter into science, but unlike the social approach, the political approach recognizes that we as a society have a definite say—through funding priorities and restrictions, for example—as to what these social values will be. Indeed, given that science is both a profound shaper of society and a profound beneficiary of society, these social values should be chosen so as to meet the needs of society, including the justice-related needs of society.

Under the political approach, in short, our scientific views (and hence, ultimately, our generally accepted knowledge) of women would no longer be plagued by sexism or androcentrism simply because those would be the morally justified political conditions under which scientific research would be conducted (Kourany 2003, Anderson 1995, 2004). But would this political structure for science jeopardize science's objectivity? That is to say, would it render science's resultant "knowledge of women" not genuine knowledge at all?

**THE NATURALIST APPROACH.** Feminist naturalists provide a possible answer. A naturalist approach to the philosophy of science rejects a priori prescriptions about the conduct of inquiry or the composition of scientific communities. This approach advocates instead a close look at successful scientific practice in order to identify those of its features that contribute to and explain its success (Antony 1993, 1995). Such observation shows, feminist naturalists point out, that egalitarian social values need not compromise the objectivity of science any more than do other features of scientific communities such as competitiveness, deference to authority, or the desire for credit for one's accomplishments.

Indeed, such observation shows, feminist naturalists point out, that egalitarian social values can be *aids* in the acquisition of objective knowledge: when these values are allowed to influence science (for example, by motivating particular lines of research or the maintenance of particular social structures), that science can actually be more developed and more empirically adequate than before (Wylie and Nelson 1998, Campbell 2001). And when we reflect on the effects of feminism in science during the last three decades—the wide-ranging critiques of traditional science in such fields as psychology, sociology, economics, political science, archaeology, anthropology, biology, and medical research, and the new research directions and results forged in the wake of these critiques—when we reflect on the effects of feminism in sci-

ence during the last three decades, the claims of these feminist naturalists seem especially convincing. Egalitarian social values in these cases have seemed to yield better rather than worse science, more objective rather than contaminated science (Schiebinger 1999; Creager, Lunbeck, and Schiebinger 2001).

Feminist naturalism, however, faces at least one large problem, one that stems from a problem for naturalized epistemology in general: It threatens to eliminate the normative in favor of the descriptive, and in doing so, eliminate the grounds for normative critique. It is impossible, after all, to say a priori which values will be aids and which will be hindrances to the acquisition of objective knowledge. Racism and sexism and egalitarian social values, all are possible aids or hindrances to the acquisition of objective knowledge, and all must be empirically tested to see which they are. There is at least the suggestion, therefore, that any of them will do if only they can prove their mettle in scientific research. So if, for example, a close comparative study of German science before, during, and after the Third Reich discloses that Nazi social values produced the best scientific results, the most abundant and most empirically successful science, then Nazi social values would be "good" values and should therefore be welcomed into science. Or if such a study discloses that Nazi social values produced a science just as good as the others, but no better, then it should be a matter of complete indifference whether Nazi social values or the other sciences' values should find their way into science. In short, feminist naturalists do not tell us what considerations, other than empirical adequacy, ought to govern our choice of social values. Some feminist naturalists emphasize that social values are empirically tested by an interrelated *system* of facts and values (Nelson 1990, 1993; Anderson 1995, 2004; Campbell 1998), but it is unclear whether this move is sufficient to address the general problem.

## THE CONTRIBUTION TO PHILOSOPHY OF SCIENCE

Feminists have pursued still other approaches in their constructive investigations of science, but what do they, or the critical investigations that preceded them, have finally to do with *philosophy of science*?

Nearly a half-century ago, Thomas Kuhn, Paul Feyerabend, Stephen Toulmin, Norwood Russell Hanson, and others issued a challenge to philosophers of science to make their field more relevant to actual science. That challenge, over time, has elicited a number of useful responses: first, efforts to "historicize" philosophy of sci-

ence, to make philosophy of science relevant to the actual development of science, both past and present; and second, efforts to “socialize” philosophy of science, to make philosophy of science relevant not only to science’s conceptual products but also to the actual knowledge-productive social practices that have led to those products. But very few efforts have thus far been made to “societize” philosophy of science, to make philosophy of science relevant to the ways in which science interacts with the wider society in which it occurs, the ways in which science both shapes and is shaped by that society. The unit of analysis for philosophy of science has tended to remain (an historical, social) science-in-a-vacuum. Feminist philosophers of science, in collaboration with feminist historians and sociologists of science and feminist scientists themselves, provide philosophers of science with a start to a societized philosophy of science.

First, feminists *have* situated science within its wider social context when philosophizing about science. Indeed, feminists have been especially concerned with the social consequences of science—in particular, the ways science has all too frequently perpetuated and added to the problems of inequality women confront. This concern with science’s social consequences has led feminists to scrutinize those features of science that help to shape its social consequences—not only the research strategies of scientists but also their social location and training, the social as well as epistemic values that inform their practice, and the funding priorities that direct their research. What’s more, in all this feminists have been motivated, not only by the need and desire for understanding, but also by the need and desire for social change, and they have explored social/political/epistemic initiatives intended to bring about that change—new funding priorities for science, for example, or new kinds of recruitment or training programs, or new social or epistemic values.

In short, feminist philosophers of science, in collaboration with feminist historians and sociologists of science and feminist scientists themselves, have been pursuing a comprehensive analysis of science-in-society and a comprehensive plan of action to bring about needed change in both science and society. This is the first way in which feminists have given us a start to a societized philosophy of science—by giving us a ready-made example of such philosophizing.

In addition, the ready-made example of societized philosophy of science that feminists have given us can be generalized—this is the second way in which feminists have given us a start to a societized philosophy of science.

Indeed, science has all too frequently perpetuated and added to other kinds of inequality besides gender inequality—inequality relating to race and sexual orientation and physical ability and disability, for example. And science has all too frequently perpetuated and added to other kinds of social problems besides those relating to inequality—problems relating to the environment, for example, and problems relating to the inability to achieve peaceful coexistence among nations. What’s more, with different kinds of funding priorities, or different kinds of recruitment or training programs, or different kinds of social or epistemic values, or the like, science can not only cease to put obstacles in the way of solutions to these problems, but more effectively help to bring those solutions about. So there is much descriptive and normative philosophical work to be done on many fronts, philosophical work that can, at least in part, be modeled on the work already done by feminists.

Finally, the work done by feminists provides not only a generalizable example of societized philosophy of science, but it provides important additional resources as well—insights concerning the relations between epistemic values and social values and the place of social values in science, for example, insights concerning what makes for scientific objectivity and what threatens it, insights concerning the ultimate goals of science and the methods that are appropriate to them, and the like. This is the third way in which feminists have given us a start to a societized philosophy of science.

## FEMINIST SOCIAL AND POLITICAL PHILOSOPHY

Within the enormously varied and fluid field of feminist social/political philosophy and political theory, several foci can be identified: analyses of women's oppression; explorations of differences among women and their implications for feminism; critiques of political philosophers and retrieval of little-known women philosophers; reanalyses of central concepts in political philosophy; analyses and recommendations on practical political issues.

### A COMMON THEORETICAL BASIS FOR FEMINISM?

Whether there is anything that cuts across these different areas of work and the varieties of theoretical perspectives is not entirely clear. If feminism is to have a common basis it would seem necessary to say that whatever the disagreements, all agree that women are oppressed, or at least subordinated to men, and that to eliminate this requires not only legal changes of a kind that have mostly been achieved in the developed world, but more pro-

found changes in society and consciousness. However, even these modest generalizations are suspect to post-modernist feminists who eschew talk of “women” because the term conceals so many differences among women, and who are skeptical of claims to truth and objectivity.

Indeed, the question of differences—both between women and men, and among women—has been a consuming issue throughout the history of feminism. In first-wave feminism, whether women and men had distinct natures (beyond the biological) was the dominant theoretical question, with early feminists like Mary Wollstonecraft and Harriet Taylor basing their call for women’s rights on the claim that women had the same capacity for reason as men. Utopian socialists and Marxists agreed, deepening the critique of naturalistic justifications of the hierarchy between women and men, with a call to end class inequality as well. By the time of second-wave feminism, most educated people agreed that whatever differences exist between women and men were largely social in origin and certainly not sufficient to explain women’s subordination. Even among feminists, however, this view was not universal and for a period this disagreement consumed considerable attention. Nevertheless, the question of “differences” that dominated second-wave feminism and beyond was differences among women and how they affected the feminist project.

The issue was not discussed directly in those terms at first. Feminists assumed that women could all be said to be treated unfairly, or to be oppressed, the particular word chosen reflecting different political theoretical perspectives, but most shared an optimistic assumption of commonality expressed in slogans like *Sisterhood Is Powerful*. The issue of differences among women emerged implicitly, however, in debates regarding how to understand women’s subordination. The standard labels for the competing political and philosophical perspectives on the roots of oppression and how to end it, best explicated by Alison Jaggar, are liberal feminism, Marxist feminism, radical feminism, and socialist feminism. There has also been much rich discussion of how to conceive oppression that is independent of these labels, by Iris Young, for example.

## CRITIQUES AND REVISIONS OF LIBERALISM

Liberal feminism is liberal theory as adapted by criticisms that women had been left out. By and large, liberal feminists in the United States and Western Europe accept the terms of the dominant political discourse such as methodological individualism, the centrality of the values

of individual freedom and choice, the focus on legal and political change, such as securing the legal right to abortion and the passage of an Equal Rights Amendment, and a faith in education to eradicate prejudice. They believe that the dominant political and economic system, that is, capitalism, is compatible with equal opportunities for women, but that many existing social arrangements need to be changed. In particular, they argue that it is unjust that the care of children should be exclusively women’s responsibility and they call for arrangements to make possible sharing of childcare, like part-time work. Liberal feminists accept sexual freedom as a matter of individual right, but it is not central to their concerns, nor are differences among women along the lines of race/ethnicity, class, or sexuality.

The extension of the concept of justice from the public sphere to the family, traditionally understood as private, is one of the most distinctive features of feminist thought. While feminists differ on the importance of the notion of privacy, they point out that what counts as the private depends on the public, that is, legislation, and question many aspects of this fundamental distinction. Independence is another central concept and value that feminists question, pointing out that humans are all interdependent and that some people’s independence is actually dependent on the invisible or undervalued labor of others, usually women. Feminists have also reconceived the concepts of autonomy and obligation in more relational terms, have debated the adequacy of rights talk for feminist concerns, have proposed that rights be extended to groups, and have explored positive and negative dimensions of power. The social contract tradition within liberalism, particularly Thomas Hobbes, has been radically reconceived by Carole Pateman as in actuality a sexual contract.

Most of these criticisms of liberal political philosophy are still within liberal feminism, but a broader sense of liberalism that encompasses social-welfare liberalism. Since it is these latter types of liberalism that have been influential in East and Central Europe, along with strains of liberalism that recognize collective goods like the family and the nation, many of the Western feminist critiques of liberalism do not apply there. As Nanette Funk shows, in those contexts feminists have needed to insist on individual rights versus the common good and neutral universalistic rights versus gendered and nationalistic conceptions. Western European and American feminists have also disagreed on these issues because they have disagreed about the source and centrality to political theory of differences between women and men.

In the 1980s and 1990s, an approach known as “difference feminism” was very influential, according to which universalistic gender neutral ideals and policies did not do justice to women’s specific roles and capacities. Some went so far as to hold that these differences between women and men were biologically based, but most accepted a psychoanalytic approach to understanding the origins of psychological sex differences rooted in the fact that women are the primary caretakers of children; they paid little attention to class, race/ethnic and historic variations among women and men. Given male/female differences, whatever the source, they held that citizenship should be reconceived and accommodations for women should be made in law and public policy, such as pregnancy and maternity leave. Other feminists favored gender neutral policies such as disability and parenting leave.

Feminist philosophers have brought to light little known women philosophers such as Christine Di Pisan who had the idea of the body politic before Hobbes, and have examined classic and contemporary political philosophers with feminist eyes. Their purpose is not simply to expose sexist assumptions but to explore how central these are to the theory. Sexism is seen as ineliminable from the political theories of Aristotle, Jean-Jacques Rousseau, and Georg Hegel, for example. John Locke is credited by some with opening the door to feminism, but others, such as Lorene Clark, argue that Locke’s theory is fundamentally inconsistent; while political obligation is said to rest on free, equal, and rational individuals consenting to a limited government, Locke’s theory requires that women be subordinate in the family and society in order to guarantee his other aim, the preservation of private property. Hence, Locke’s theory cannot be rewritten in universal terms. Not all feminist critiques of political philosophers have been so devastating. For example, according to Susan Moller Okin, though Rawls assumed the traditional sexual division of labor in his theory of justice, and did not extend the sphere of justice into the family, his theory does not depend on this sexist limitation and would be stronger without it.

### MARXIST, RADICAL AND SOCIALIST FEMINIST PERSPECTIVES

Many feminists, particularly outside the United States, have found Marxism a useful tool for understanding women’s oppression. Although focused on economic exploitation, Marxism does not deny other forms of oppression, like sexism or racism, or reduce them to the economic, (except for the crudest of “Marxists”), but it gives them less explanatory primacy. According to Marx-

ism each exploitative mode of production, such as feudalism or capitalism, is distinctive in its mode of exploitation and each gives rise to certain distinctive forms of government, religion, culture, and family. Thus relations between women and men will vary in different modes of production. While women’s lot in life is better in capitalism than in feudalism or slave societies, Marxist feminists generally maintain that sexism has certain benefits for capitalism, such as allowing socially necessary caring labor to be unpaid, and hiding the (un)(der)employment of women. They have debated the relations between sexism and capitalism, such as whether housework is exploited in a Marxist sense, whether women can be said to constitute a class and how domination and alienation at work contribute to the hierarchical construction of gender. For a sample, see the debate between Wally Secombe and Margaret Coulson et al. in the *New Left Review* (1975). Some feminist uses of Marxism involve quite significant revisions of Marxism, and in Europe some call this radical feminism.

Implicit in a Marxist approach is that women share certain common interests, but that women of different economic classes also have fundamentally different interests; and, moreover, that these are likely to be most important to them. For example, all women need the legal right to birth control and abortion, but poor women need public funding to exercise this right. The greatest problem facing women around the world is extreme poverty, according to the World Health Organization, but women capitalists profit directly from this poverty, while many others benefit from poor women’s cheap labor. The political and strategic implications are that all women should unite to secure their common cross-class interests, but that working class women need to work with working class men to secure their specific economic interests, and that ultimately the elimination of women’s oppression requires the end of capitalism.

Radical feminism, the youngest and most fluid of feminist theoretical perspectives, was developed by feminists who saw liberalism’s goal of equality for women as not nearly radical enough and Marxism’s focus on the economic as blind to the specific oppression of women by men of all classes. The very notion of politics, they held, must be radically reconceived. “The personal is political,” they proclaimed. Some radical feminists like Catherine MacKinnon attempted to develop a theory in which sex replaced class as the primary category with which to understand history and current societies, seeing most societies as profoundly misogynist. Whether they share this overarching theory or not, radical feminists see dif-

ferences among women such as race/ethnicity, class or nationality as less important than what unites them — oppression by men, particularly sexual violence, focusing attention on the outrageous prevalence of rape and its use as a weapon of war, on trafficking and sexual slavery, and on pornography, Andrea Dworkin's work being the most notable on the latter. Most radical feminists are deeply skeptical about the pleasures of sexual liberation for women, focusing instead on the dangers and coercion of heterosexual sex in a male dominated universe, although some sexual liberationists might also fall within the radical feminist camp. Many have connected violence against women to violence against other species and nature, universally associated with women, and some have evolved into "difference feminists," echoing those first-wave feminists who argued for women's suffrage on the grounds that women were more moral than men.

"Socialist," as distinct from Marxist, feminism is best understood as a synthesis of Marxism and radical feminism. Maintaining that women's oppression in capitalist society is a function of both the economic system, capitalism, and the sex/gender system, which they called patriarchy, socialist feminists like Heidi Hartman refused to give primacy to one over the other. Many saw as sexist the Marxist emphasis on wage labor rather than on all kinds of labor, especially women's unpaid caring labor, and on the relations of production, rather than on what they called the "relations of reproduction" (sexuality and parenting). To correct this deficiency Ann Ferguson proposed a concept of "sex-affective production." While its synthesis is attractive, the theory gives rise to questions as to whether the oppression of women requires a "system" (patriarchy) to explain it, and if so, why doesn't racism or heterosexism, require a system to explain them, and what exactly a "system" means anyway. Some socialist feminists tried to accommodate racism by adding a race/ethnicity system, but questions remain regarding the meaning of "system," how the systems are related, and how the theory differs from simple pluralism.

In the twenty-first century, as Nancy Holmstrom explains, "socialist feminism" is often used more broadly to refer to any theory that tries to integrate class and sex, as well as other aspects of identity such as race/ethnicity in a coherent way, however exactly they are related. On this broad definition, it would encompass perspectives that either go by other names such as materialist feminism, womanism and black feminism or that have no theoretical labels of any kind. Which term a feminist uses to describe herself indicates where she wishes to position herself within certain debates or else signals certain com-

mitments, but is not necessarily a "grand theory" in competition with liberal, Marxist/socialist or radical feminism. Although "materialist feminism" was introduced by Christine Delphy and Colette Guillaumin as a competing grand theory, and the label has recently been used by feminists wishing to engage with postmodernism, it fits within this broad definition. "Womanist" was introduced initially by some women of color who felt that "feminism" is too one-dimensional and who wished to indicate solidarity with men of color as well as women. "Black feminist," particularly as developed by Patricia Hill Collins, is a position whose insights stem from the particular experiences of African-American women.

### RETREAT FROM GRAND THEORY

Most feminists in the early twenty-first century, especially in the United States, eschew the word socialist, both because of negative associations and because of an anti-theoretical mood brought on by postmodern criticisms of "totalizing narratives." Instead of one overarching feminist theory, feminists prefer to rest on the concept of intersectionality, to use Kimberle Crenshaw's useful descriptive term. Racism, sexism, classism, and heterosexism are seen as overlapping forms of oppression, similar in some ways, different in others, none of which is more important politically or theoretically than the others. But if being a woman cannot be separated from being a particular kind of woman, black or white or gay or working class, then this seems to imply that there can be no theory of women's oppression as such. And this suggests there is no basis for feminism, a theory and political movement for all women, but rather only for particular kinds of women, for example for black women. Moreover, the same logic can be carried further. Black women are also of a particular nationality, class, sexual orientation, (dis)ability. Thus, this seems to lead to a dead-end theoretically.

A hopeful assumption widespread among twenty-first-century feminists is that while commonalities cannot be assumed, they can be found, unity can be forged, despite the differences among women, but only with strong political commitment and efforts to seek commonalities. It entails accepting, negotiating and transcending differences and first of all, it means really listening. Implicit in this approach is the assumption that the various kinds of differences—"identities"—are on a par: race/ethnic, class, sexual orientation, (dis)ability. To give any order of importance is mistaken and oppressive.

This sounds promising for feminist political philosophy in that it could provide a common basis for femi-

nism, without denying differences. However, whether this approach to overcoming or at least bridging differences is applicable to all the different kinds of difference depends on whether or not they are inherently antagonistic. A plausible example is sexuality. Despite what social conservatives say, heterosexuality is not threatened by homosexuality. Neither the existence of heterosexuals nor their happiness is compromised by acceptance of different kinds of sexual and emotional desire. On the other hand, class differences are more problematic. Imagine a conversation between two women, a sweatshop owner and her employee. However much they talk and negotiate and understand each other's position, how is the difference between them to be overcome? Since classes are socially constituted by their antagonistic relationship of interest and power, those relations between members of different classes will persist.

Other feminist philosophers have been more involved with ethical theory, particularly care ethics, than with wholesale analyses of oppression, assuming that sufficient commonalities exist among women to justify their analyses and policy recommendations. Nel Nodding's approach starts with a characterization of the best of familial relations and then applies the lessons learned there to broad social policies regarding welfare, education, and criminal justice. Especially since the September 11, 2001, terrorist attacks, issues of war, peace, and terrorism have received a lot of attention, but Sara Ruddick connected mothering to peace politics early on. Many feminist philosophers have turned their attention in recent years to global gender issues, and have debated whether human rights, capabilities, or a care ethics is the most fruitful approach. Postcolonial feminists like Chandra Mohanty pay particular attention to the ways in which colonialism and imperialism work together with patriarchal structures and ideology to subordinate women. Within global feminism, differences among women are again a problematic issue, as the controversy around Okin's critique of multiculturalism attests.

## FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTHE (1651–1715)

François de Salignac de la Mothe Fénelon, the French bishop and author, was born in Périgord of an ancient noble but impoverished family. He received his education in Cahors and then in Paris, where he entered the seminary of Saint-Sulpice and was ordained priest about 1675. First in Paris and then in Saintonge he was made responsible for securing the conversion of Protestants, and in this, especially after the revocation of the Edict of Nantes (1685), he had to offset the effects of brutal military repression. He was certainly firm and successful, but opinions vary on how gentle he was. By 1689 he enjoyed the favor of Bishop Jacques Bénigne Bossuet and Mme. de Maintenon and had been appointed tutor to Louis XIV's grandson, the duc de Bourgogne.

Fénelon's association with Mme. Guyon, the exponent of quietism, dramatically changed his career. In 1694, mainly on Bossuet's initiative, she was censured by an official inquiry and temporarily put under his supervision at Meaux. Both Fénelon and Mme. de Maintenon were implicated with Mme. Guyon in a devotional group, but when Bossuet consecrated Fénelon archbishop of Cambrai in 1695 it seemed that he had averted potential scandal by using promotion as a pretext for removal. Fénelon, however, had become personally committed to mysticism and the doctrine of pure love (the disinterested love of God, divorced from any act of will, or even concern for one's salvation). Learning that Bossuet planned a crushing (and unfair) attack on Mme. Guyon and, through her, on all mysticism, Fénelon tried to forestall him by publishing a reasoned defense of mystical spirituality, *Les maximes des saints* (1679). Bossuet then embarked on a campaign of slander, falsification, and

corruption, which resulted in Fénelon's banishment from the court (1697) and his condemnation by the pope (1699). Fénelon, who had always been fragile in health, remained in exile at Cambrai, conscientiously ruling his war-ravaged diocese, earning a reputation for sanctity, and pursuing a relentless, and ultimately successful, struggle against Jansenism in high places.

Though he owed much of his early success to Bossuet, whom he had at first admired, Fénelon was by temperament so different that a subsequent breach was inevitable. In his attitude to the theater Fénelon had a breadth and humanity of outlook that led him to praise Jean Racine and even Molière, who had been mercilessly attacked by Bossuet (*Lettre à l'Académie*, 1714). Fénelon had been deeply influenced by Greek culture, and much of his thinking bore the mark of Plato. He combined sensitivity and idealism with a strong vein of practicality, but he echoed neither the authoritarianism nor the moral grimness of Bossuet.

In philosophy Fénelon was enthusiastic rather than original. In 1687 he undertook for Bossuet a *Réfutation du système de la nature et de la grâce* against Nicolas Malebranche, but he soon espoused a form of Cartesianism—best represented in his *Traité de l'existence de Dieu* (1712 and 1718)—that came very close to Malebranche's position. Fénelon also wrote *Lettres sur divers sujets de métaphysique et de religion* (1718).

His early *Traité de l'éducation des filles* (1687) is humane and sensible, arguing that to neglect the education of one half of the human race can only have adverse effects on the other. Basing his system firmly on Christian teaching, he emphasized the need for a moral education deriving from love of virtue, rather than from fear of punishment. In addition to general literacy and elocution, Fénelon advocated the teaching of such practical matters as sufficient knowledge of law to enable women to protect their much-abused interests.

Fénelon's principle of developing rather than repressing character appears in *Télémaque*, written for his pupil about 1694 and semiofficially condemned on publication (1699). The transparent veil of Homeric legend does nothing to conceal the author's detestation of royal absolutism in its contemporary manifestations. Wars of aggression fought in the name of national prestige, territorial aggrandizement and extravagant luxury at court are condemned, not only for the misery they cause for impoverished subjects, but also as evils in themselves. For Fénelon a good king is one whose people enjoy prosperity based on industry and commerce and who accepts the duty of ensuring not only their material but also, through

his example, their moral welfare. Fénelon's fundamental political axiom was that kings and their policies are subject to and judged by the moral law, as embodied in Christian teaching, and that the true interests of a state can never conflict with this law. Similar views occur in the *Dialogues des morts*. Had it not been for the premature death of the duc de Bourgogne (1712), Fénelon's teaching, so contrary to Louis XIV's practice, might well have become official policy.

## FERGUSON, ADAM

(1723–1816)

Born in Logierait, Scotland, to a parish minister, Adam Ferguson was educated first at the local parish school, then at grammar school in Perth, then at St. Andrews (MA 1742), and finally studied divinity at the University of Edinburgh (1743–1745). In Edinburgh he befriended many leading figures in moderate circles, including fellow divinity students Alexander Carlyle (1722–1805), William Robertson (1721–1793), and Hugh Blair (1718–1800) and older members of the Select Society including his close friend, David Hume. In 1745 he cut his studies short, was ordained, and became deputy chaplain (eventually chaplain) preaching in Gaelic to the Highland Black Watch Regiment. He returned to secular nonmilitary life in 1754 and became a mainstay of the Edinburgh intelligentsia, succeeding Hume as the librarian of the

Faculty of Advocates (1758–1759), then (also with Hume's assistance) became professor of natural philosophy at the University of Edinburgh (1759–1764) and finally professor of pneumatics and moral philosophy (1764–1785).

Ferguson's international reputation was secured with the publication of his masterpiece, *An Essay on the History of Civil Society* in 1767. The *Essay* was quickly followed by the *Institutes of Moral Philosophy* (1769), a popular textbook used in moral philosophy curricula in America, Germany, and Russia. Now famous, Ferguson traveled extensively and engaged vigorously with the philosophical and political issues of his day, particularly the American Revolution, which he criticized in its revolutionary practice in a pamphlet against Richard Price (*Observations on the Nature of Civil Liberty* [1776]) and the settlement of which he sought as secretary to the Carlisle Commission (1778). Ferguson continued his publishing successes with the philosophical history *History of the Progress and Termination of the Roman Republic* (1783) and later, after his retirement from Edinburgh, the *Principles of Moral and Political Science* (1792). His intellectual engagements hardly dampened until his death, and in addition to his books he published a significant number of pamphlets.

His contemporaries were impressed by his intelligence and his distinctive temperament. Carlyle described Ferguson as having “a dignified reserve” in conversation filled with “dark allusions,” and as jealous yet with a “boundless sense of humor” in private company. A nineteenth-century biographer nicknamed Ferguson the “the Scottish Cato” due to these qualities of character appropriate to the Scots advocate of republican Stoical virtue.

Like many of his contemporaries, Ferguson brought a wide range of scientific, anthropological, and historical resources to bear on moral and politics in a characteristically Scottish fusion of mid- and late Stoicism, natural law theory, history, natural science, and the natural sciences of man (including pneumatics or the physical history of mind). His *Essay on Civil Society* was built on a stadial theory that divided human societies according to their means of subsistence, social organization, and equality (among other variables). At the same time, Ferguson stressed that although morals should be fully informed by natural science and social history, it had a special provenance: what one ought to do in regard to good and evil and virtue and vice.

So far, nothing in Ferguson's theory was unique and he drew on many of his Scottish contemporaries—

notably Hume, Adam Smith, and Thomas Reid—for his arguments. What was distinctive was how Ferguson used this framework to think about the relation between morals and politics. For Ferguson virtue was thoroughly intertwined with political *virtù* in the tradition of Niccolò Machiavelli and Baron de Montesquieu. Francis Hutcheson had stressed the civic and social character of morality, but Ferguson drew on Montesquieu's arguments in *Spirit of the Laws* (1748), that laws and social institutions create a virtuous citizenry, and on his definition of political liberty as virtuous action in and through good laws, to interweave civic morality with the new sciences of man. For Ferguson, like Montesquieu, the growth of virtue was neither isomorphic with material progress nor necessarily antithetical to it: Virtue can be found in different times and places. But unlike Montesquieu and like Smith, John Millar, and numerous other Scots, he always assumed in the background a theory of historical stages, not as linear progress but as a means to analyze nations and peoples both synchronically and diachronically, and as a species of conjectural history to be used as an analytic framework for comparing progress, wealth, equality, virtue, and other variables. On the one hand, the optimal setting for virtue and equality was a small, republican meritocracy of social and political equals actively contributing to the common good. On the other hand, Ferguson also stressed that ancient, simple military societies tended to be impoverished, violent, and “rude,” lacking many of the sociable virtues admired in a commercial society. The problem was, then, given the different forces that can affect a nation morally—its size, its prosperity, its historical stage, and its laws—how to maximize virtue and minimize vice?

Ferguson's diagnosed this problem as endemic to his contemporaries thinking about morals and politics. Hume (and later Smith and Millar) argued that commerce was a fundamental civilizing force and gave rise to a liberal progressive society superior to societies that preceded it. Still, Hume recognized the virtue of small, egalitarian societies. Ferguson thought that Hume and Smith confused material prosperity with wealth and this showed in their moral recommendations. Obviously, material prosperity was desirable, and once attained it was difficult to forego, but prosperous nations are often corrupt and there was no guarantee from the progress of history that they would not become luxurious and despotic. The focus should be on a broader conception of wealth that included moral and political virtue.

So what sorts of laws and civic institutions prevent moral corruption and reinforce virtue in large, wealthy

societies? Ferguson focused throughout his career in his books and pamphlets on the importance of citizens' militias, that is, defense by ordinary citizenry as opposed to professional soldiers. His service in the Black Watch during the Jacobite uprising of 1745–1746 made him aware firsthand of the difficulties a standing army in a commercial society had in quelling rude but fierce Highland militias. Most of the Edinburgh intelligentsia—including Smith and Hume—supported a Scottish militia. Ferguson thought that the issue was philosophically pivotal and that Smith's lukewarm support for the militia was a symptom of the conflict in his theory between virtue and wealth. He believed that militias are paradigmatic egalitarian, socially activist institutions. Any soldier can rise in a militia through merit, and military and social virtue are rewarded and reinforced in local organizations where citizenry know one another, rely on one another, and are responsible for their actions. Complex, prosperous societies need such invigorating, egalitarian social institutions to be wealthy in a broader sense, to avoid moral corruption, and so to be vigilant against tyranny. They also are a bulwark against the deadening effect of the division of labor, which is driven forward by commerce but not morality. Active social institutions allow the moral vigor of rude society, above all the early Roman republic, to be infused in commercial societies when people cannot, or even do not want to, return to a prior state.

Ferguson's works were particularly popular in Italy, France, and Germany and influenced, among others, Gottfried Lessing, Christian Garve, and Friedrich Schiller. He also influenced Karl Marx in particular (with his criticisms of progressivism and the division of labor) and modern sociology in general, above all through the proliferation of the idea of civil society.

## FERGUSON, ANN

(1938–)

Ann Ferguson, a socialist-feminist philosopher (PhD, Brown University, 1965; BA, Swarthmore College, 1959) teaches philosophy and women's studies at the University of Massachusetts at Amherst. Her political support for a democratic socialism grew out of sustained involvement with the civil-rights movement, the anti-Vietnam War movement, the new left, and the women's liberation movement in the United States.

Ferguson is best known for her critique of male dominance and her formulation of the concept of sex/affective production (1989). She contends that Marxist accounts of class oppression and radical feminist accounts of heterosexist exploitation do not properly account for (a) the social energies involved in parenting, sexuality, and affective bonding and (b) the unequal, exploitative production and exchange of services between men and women in a patriarchal society (1991). Critiquing Sigmund Freud, Ferguson claims that affective bonding and sexual desires aim primarily not at biological reproduction but rather at connecting with other humans, queer or straight.

In early work, Ferguson highlighted women's potential as a revolutionary class. In *Sexual Democracy* (1991), she developed a materialist-feminist multisystems theory of oppression: that race, class, and gender function as dominant, semi-independent categories, and thus that the ideal of sisterhood is obstructed by race, caste, class, and sexual identities. Her advocacy of "gynandry" (1991), a play on "androgyny" (1977), not only critiques the ideology of the theory that gender roles naturally complement each other, but also calls for revaluing feminine strengths and for building a society free of patriarchal

oppression. In her vision, the feminine is not a fixed gender trait. In her important aspect theory of the self, Ferguson noted that it is misguided to speak of one essential core self; it is more helpful to note that "one's sense of self and ... values" are context-dependent (1991, p. 105).

Expanding on her aspect theory of the self, Ferguson (1996) proposed building bridge identities as a strategy to counter positive- and essentialist-identity politics. Bridge identities "attempt to refuse the fixed identities given us by gender, race, class, and sexual differences" (1998a, p. 207) and reconstitute identities politically (1998b). For instance, when a feminist researcher from the global North wishes to network with people in the global South who are relatively disadvantaged, by self-questioning she can put her privileged position in check even to the point of destabilizing her identity. But by building a bridge identity, she can begin to recognize participants as *subjects* of resistance rather than as *objects* of knowledge (1998b). Ferguson (1998a) argues for a transitional feminist morality in which prostitution is defined as a morally risky practice, rather than, as most feminists define it, as a morally forbidden practice. In formulating a viable feminist ethico-politics, she affirms the political stance of subjects of resistance: sex workers who demand unionization and decriminalization. With a bridge-identity politics that refuses fixed identities of race, gender, etc., a feminist coalition could consistently support sex workers' rights locally and oppose trafficking in women internationally.

Ferguson exudes a passion for feminist coalitional and solidarity work with people who face marginalization due to capitalist, racist, or patriarchal forces. Her work is informed par excellence by the rich dialectical interplay of theory and practice.

## FERRARA, FRANCIS SYLVESTER OF

See *Sylvester of Ferrara, Francis*

## FERRI, LUIGI (1826–1895)

Luigi Ferri, the Italian epistemologist and historian of philosophy, was born in Bologna. He studied at Paris and was professor of the history of philosophy at Florence and at Rome. A self-styled disciple of Terenzio Mamiani, Ferri contributed to Mamiani’s journal, *La filosofia delle scuole italiana*, and continued editing the journal, under the title *Rivista italiana di filosofia*, from the death of Mamiani in 1885 until his own death in Rome in 1895.

Ferri’s philosophizing moved within the framework of Italian ontologism, which saw in man the capacity for a direct and “intuitive” relationship with the Absolute (Being or God), but his interest focused principally on the psychological conditions in which this relationship takes shape. His investigations, therefore, had as their object man’s interior experience, the “inner (or intimate) sense” of which Maine de Biran spoke. To the latter Ferri owed his basic inspirations. Reproving associationist psychology for reducing the spirit, or self, to an associative mechanism that takes no account of the activity of consciousness, Ferri tried to bring to light the function of this activity. He saw this activity as a kind of force or energy that “by making itself its own object, determines its modes according to rules proper to itself, proposes goals, directs and oversees its own work, and frees itself finally from the influence of sensation and emotive impressions so as to find truth with the intellect and to reproduce in itself, with ideas and the evidence of experience, the world of phenomena.”

Ferri used the term *dynamism* to refer to the conception that the substance of both the physical and the spir-

itual worlds is energy and that in both of these worlds energy is regulated by the same laws of conservation. Thus there is a “permanence in the quantity, quality, and relationships of the spiritual world” just as there is a permanence in the amount of matter and energy. Ferri also held that only the energy regulating the spiritual world is known or immediately given to man in the act of consciousness; the actions of energy operating in the external world are known to man only indirectly, that is, by the effects they have upon this act through sense perception. The unity of the universal energy is, however, the sole theme of metaphysics.

## FERRIER, JAMES FREDERICK (1808–1864)

James Frederick Ferrier, the Scottish metaphysician, was born in Edinburgh into a wealthy family of lawyers. After studying at the universities of Edinburgh and Oxford, he spent some months in Germany. He settled in Edinburgh

in 1832 as an advocate, becoming active in the intellectual circle of Sir William Hamilton, which included Thomas De Quincey and “Christopher North” of *Blackwood’s Magazine*. Under this stimulus Ferrier contributed to *Blackwood’s* between 1838 and 1843 the eleven long articles that fill most of the second volume of his *Lectures and Remains* (2 vols., Edinburgh and London, 1866). In 1845 he was appointed professor of moral philosophy and political economy at the University of St. Andrews. Ferrier issued a drastically revised version of his philosophy in the *Institutes of Metaphysic* (Edinburgh and London, 1854; 2nd ed., 1856). The *Institutes* was to some extent affected by Ferrier’s commitments in the political and ecclesiastical struggles that then divided Scotland. This social influence is still more marked in the pamphlet defending his position, *Scottish Philosophy, the Old and the New* (Edinburgh, 1856). Meanwhile, Ferrier elaborated, until incapacitated in 1861, on an impressive series of lectures on Greek philosophy, posthumously published as Volume I of *Lectures and Remains*.

The first seven *Blackwood’s* articles constitute a unitary work on the philosophy of consciousness. Its starting point is a critique of Thomas Brown’s doctrine that it is wrong to regard states of mind, such as emotions, as objects of consciousness. Brown argued that to speak of being conscious of feeling angry is the same thing as to speak of feeling angry. Ferrier pointed out that there is a marked difference between speaking of someone as boiling with rage and speaking of him as being conscious of the boiling rage within him. In the latter case, instead of looking outward at the injustice and brooding on the affront, he looks inward at the consequent irritation in his heart and ceases to brood.

Thus far Ferrier was merely making an intelligent use of the doctrine of the inverse variation of feeling and knowledge proposed by his friend Sir William Hamilton. But as Hamilton noted with approval, Ferrier then went beyond the customary limits of British philosophy by asking what is involved in the shift from unself-conscious anger to self-conscious anger. This self-knowledge does not arise straightforwardly out of ordinary experience. The use of the first personal pronoun, which is the mark of self-knowledge in the proper sense, is something that cannot be learned from the experience of other people and their talk in the same imitative way as the use of a word like *table* can. The indubitability of self-knowledge arises just because it is not based on observation in the same way that our knowledge of mountains is. Therefore, Ferrier concluded, there is something anomalous about the foundations of self-knowledge. What is it?

In his four *Blackwood’s* articles on the subject of sense perception, contributed between 1841 and 1843, Ferrier gave his problem a definite form by limiting it. To gain light on the nature of self-knowledge he looked into the foundations of the ordinary distinction between act of sense and object of sense. Ferrier’s discussion is brilliantly original. The key to the difficulty is that as long as we view each sense field in isolation, no proper distinction can be drawn between the act and the object of sense. Within the visual field alone vision does not stand out as empirically separable from the colors seen; within the tactual field the effort of feeling presents itself as indistinguishable from the solids felt. But when the sense fields are viewed in correlation with one another, seeing separates itself from the colors seen as being connected with something tangible but not visible: the eye. Similarly, feeling distinguishes itself from solidity by being vested in an organ of touch revealed by vision rather than by touch. Ferrier thus argued that the key to self-experience is the peculiar experience of appropriating one’s own body in the sense of correlating one’s own sense organs. This is reminiscent of Maurice Merleau-Ponty and Jean-Paul Sartre. Like them, Ferrier developed the theme of human freedom, first by reference to the contrast between reflective experience and prereflective experience, then by reference to the contrast between the experience of one’s own body and the experience of foreign bodies.

Ferrier was stimulated by Friedrich Schelling and G. W. F. Hegel, but there is a distinctive originality to his position in his attempt to give life and definiteness to their ideas by viewing them in terms of the problems of philosophy posed by Hamilton and Thomas Brown. As De Quincey said, Ferrier’s philosophy is “German philosophy refracted through a Scottish medium.”

Ferrier’s highly original early efforts have been overshadowed for posterity by the respectable academic contributions of his later life. In his *Institutes of Metaphysic* he moved from a “phenomenological” standpoint, inherited from Thomas Reid by way of Hamilton and Victor Cousin, to a narrowly a priori point of view which, distinguishing sharply between necessary and contingent truth, would restrict philosophy to necessary truth. As a result, the *Institutes of Metaphysic* omits the analysis of self-knowledge and the experience of one’s own body that distinguishes the *Blackwood’s* articles, confining itself to well-worn doctrines that can be expounded in an a priori way, such as the Cartesian *cogito* and a verifiability principle not unlike that of modern positivism. But Ferrier’s later work should not be underestimated. It contains remarkably illuminating discussions of the relations of

universals and particulars (rather like that in Henry Mansel), which is carried further in the *Lectures on Greek Philosophy*. In this work there is also an extremely impressive analysis of the experience of change and movement that in one way anticipates Henri Bergson and in another way looks back to Hegel.

Ferrier's later work was very influential in the late nineteenth century in the English-speaking world and to some extent in France. In particular, the *Institutes of Metaphysic* provided Shadworth Hodgson with his starting point and most of his leading ideas. Ferrier's early work, unfortunately, escaped notice in the nineteenth century, but a reevaluation of it has begun.

## FEUERBACH, LUDWIG ANDREAS

(1804–1872)

Ludwig Andreas Feuerbach, the German philosopher, theologian, and moralist, was born in Landshut, Bavaria. He studied theology at Heidelberg and Berlin and then, in 1825, under the influence of G. W. F. Hegel, transferred to the faculty of philosophy. He received his doctorate in 1828 at Erlangen, where he remained to teach as docent until 1832. In 1830 he published anonymously at Nuremberg a work—*Gedanken über Tod und Unsterblichkeit*—that created a minor scandal by interpreting Christianity as an egoistic and inhumane religion. When his authorship of this book became known, he was dismissed from

the faculty. In 1836 he retired to Bruckberg, where he lived on a modest pension from the Bavarian government, income from his writings, and revenue provided by his wife's interest in a pottery factory.

Between 1836 and 1843 he collaborated with Arnold Ruge on Ruge's *Hallische Jahrbücher für deutsche Wissenschaft und Kunst*, in which many of Feuerbach's most important early writings on religion and philosophy first appeared. He broke with Ruge when the latter began collaboration with Karl Marx on the *Deutsch-Französische Jahrbücher*, although he contributed to the one issue of that journal. He reappeared briefly in academic life in 1848–1849, lecturing to audiences of intellectuals and workers at Heidelberg at the request of students, for whom he had become a symbol of liberal thought.

With the failure of the Frankfurt Assembly and the defeat of liberalism in Germany, Feuerbach retired once more to Bruckberg, where he devoted himself to the study of the natural sciences, the composition of a monumental *Theogonie* (Leipzig, 1857), and a voluminous correspondence with friends and admirers all over Europe. In 1860 his wife's pottery factory failed, and Feuerbach removed his family to Nuremberg, where he was forced to live off the generosity of his friends. In 1867 he suffered the first of a number of strokes that finally killed him.

### WORKS

Feuerbach's most important works—"Zur Kritik der Hegelschen Philosophie" (in the *Hallische Jahrbücher*, 1839), *Das Wesen des Christentums* (Leipzig, 1841; translated by M. Evans [George Eliot], London, 1854), *Grundsätze der Philosophie der Zukunft* (Zürich and Winterthur, 1843), and *Das Wesen der Religion* (Leipzig, 1846)—were produced in his early years. They were meant to expose the contradictions in Hegelian philosophy, to establish the "illusionistic" character of all religious belief, and to plead for a "new philosophy," based on anthropology and physiology, that would provide the foundation of a naturalistic-humanistic ethic. His criticism of Hegelianism served as the point of departure for the so-called left Hegelians, of whom Marx and Friedrich Engels were the most important representatives.

**CRITICISM OF HEGELIANISM.** Feuerbach's critique of Hegelianism proceeded not from sympathy for "obtuse materialism," under which term he grouped Newtonian science, empiricism, and positivism alike, but rather from his discovery of contradictions in Hegel's own system. The resolution of these contradictions would, he

believed, allow the establishment of a “new philosophy,” which, while remaining thoroughly materialistic, would accommodate those insights into the operations of human consciousness that constituted Hegelianism’s definitive contribution to human self-knowledge.

Feuerbach viewed Hegelianism as the culmination of modern rationalism, and he believed that “the secret of Hegel,” as of all rationalism, lay in an essentially religious spirit concealed beneath an apparent denial of all transcendence. This hidden religious element accounted for the degradation of the material world, of man, and of the senses that was characteristic of Hegel’s metaphysics, ethics, and epistemology, respectively. In Hegel’s thought, however, the means were provided for finally transcending all of the religious residues in modern philosophy. For Hegel’s attempt to sustain simultaneously the primacy of intellect and the necessity of reason’s realizing itself in matter results in the negation of the Hegelian system itself in the interest of a materialistic metaphysics, a humanistic ethics, and a sensible (*sinnliche*) epistemology, the bases of the “philosophy of the future.”

**DEVELOPMENT OF MODERN PHILOSOPHY.** Feuerbach believed that modern philosophy had followed a pattern of development set by theology. The attempt of theology to establish the relationship between the sensible attributes of God and the extrasensible sphere in which he exists necessarily led to pantheism, which makes matter an attribute of God or defines God (as did Benedict de Spinoza) as “extended essence” and thus ends by deifying matter itself. In fact, pantheism is “theological atheism,” the discovery by theology that matter is the sole reality, and hence it foreshadows the ultimate self-dissolution of religion.

Empiricism had already discovered that matter was the sole reality, but only in a practical, not in a theoretical, sense, for in making “mere” matter the sole reality it was unable to deal with the data of human consciousness. Rationalism, however, of which idealism was the necessary outcome, underwent a secularized development from theism as a divinization of spirit to pantheism as the self-dissolution of spirit. Idealism was nothing but an attempt to salvage God by vesting full epistemic authority in consciousness, intellect, or reason at the expense of the senses. Yet because it was overtly secularist, rationalism had to account for the world discovered by the senses. It could do this only by affirming, as Immanuel Kant did, an absolute hiatus between the world of intellect, to which it ascribed all truth, and the world of sense, to which it granted reality. Hegel tried to close this gap between truth

and reality, but he could do so only by extending the Cartesian divinization of Reason to the world as a whole. The result was a transition from Kantian “rational theism, theism rationalized” to Hegelian “pantheistic idealism.”

**REASON IN HEGEL.** In affirming the rationality of the real and the reality of the rational, Hegel, according to Feuerbach, elevated reason to the status of “absolute essence.” Then, to account for the existence of the spatiotemporal world, he had to hold simultaneously that matter is the negation of thought and that thought can only “realize itself” by becoming matter. To Feuerbach this showed that on Hegel’s own terms “thought presupposes, without being aware of it, that truth is reality, sensibility independent of thought.” On the one hand Hegel viewed sensibility as “an attribute of the idea,” whereas on the other he maintained that it is “an attribute without which thought has no truth”; that is, he had to hold that it is “at one and the same time central and marginal, essence and accident.”

According to Feuerbach, idealism knew implicitly that “truth, reality, and sensibility are identical,” but it suppressed this truth in order to subordinate the sensible world to an absolute being endowed with the attributes of the human ego, that is, with consciousness and reason. This led idealism to assert that the thinking of the absolute being is real, whereas that of the finite sensible being, man, is not. According to Hegel, human reason is nothing but the self-revelation of the absolute being to itself. Thus, Feuerbach exclaimed, Hegel “alienates and expropriates from man his typical essence and activity!”

**PRIMACY OF HUMAN CONSCIOUSNESS.** Feuerbach’s own “new philosophy” began with the axiom “Only a sensible being is a real, true being,” standing the Hegelian position on its feet so that its truth could be seen aright. “The true relation of thought to being is only this,” he wrote in the *Vorläufige Thesen*: “being is the subject, thought the predicate. Thought is a product of being, not being of thought. ... The essence of being as being is the essence of nature.” The consciousness deified by Hegel, like the reason deified by René Descartes and Kant and the Matter deified by Spinoza, “is our ego, our intellect, our essence: and this God is no God in itself, but only the appearance of ourselves to ourselves.” Hence, the lasting contribution of idealism to philosophy is its analysis, under the aspect of an examination of the absolute being, of the operations of human consciousness, the reality of which is denied by simple empiricism. Hegelianism, like all metaphysics, is nothing but “esoteric psychology.”

**MATERIALISM AND IDEALISM.** Unlike conventional materialism the new philosophy granted ontological and epistemological status to consciousness and intellect, and unlike idealism it accorded reality to matter. But it deified neither matter nor consciousness. For according to Feuerbach, it is wrong to say, with the materialist, that “man is distinguished from the brute *only* by consciousness”; in fact, “in a being which awakes to consciousness, there takes place a qualitative change, a differentiation of the entire nature.” Yet this “qualitative change” in no way justifies the idealist contention that man is consciousness alone, “for as man belongs to the essence of Nature,—in opposition to common materialism; so Nature belongs to the essence of man,—in opposition to subjective idealism.”

**MAN.** Every attempt to specify the essence of man by deriving his material from his spiritual nature, or vice versa, is therefore mistaken, in Feuerbach’s view. The task of philosophy is to encounter man in his situation, as that part of nature endowed with consciousness which seeks to realize its own peculiar essence through specific kinds of relationships with the rest of nature and with other members of its species. Feuerbach’s philosophy assumed only that “I am a real, sensible essence: the body is constituted of my essence; indeed the body in its totality is my ego, my existence itself.” It recognized that man’s essence reveals itself quintessentially in the impulse toward union with other men: “The essence of man is contained only in community, in the unity of man with man—a unity which however is founded only on the reality of the differences between I and thou.” To comprehend human action and thought one must take account of man’s capacity to transcend the limited responses of the lower animals to their environment.

Philosophy, properly studied, then, is “the complete, coherent, and absolute resolution of theology into anthropology.... “It takes man as the culmination of the natural process and defines him as “universal essence” and then concentrates on the study of the totality of his responses to the rest of the world. Among these responses will be found the passions, especially the emotion of love, the impulse toward “union” with the “other” that is peculiar to man. The capacity to create communities of shared emotive contents is the secret of man and therefore the secret of all thought and action; for what men are really seeking in every imagined absolute is nothing but the “unity of I and thou.”

**RELIGION.** All of this is assumed in Feuerbach’s studies of religion and lies at the base of his “unmasking” of

Christian beliefs in *Das Wesen des Christentums*, his most celebrated work.

Feuerbach regarded religion as one of the forms of human thought and action by which man raised himself above the animal. Beginning with the assumption of D. F. Strauss that religion, myth, ritual, and dogma tell us more about the inner lives of individual people than about their presumed object of worship, Feuerbach tried to determine the purely human significance of all mythological thought. He professed to be a uniformitarian in religious matters—that is, he denied that past religious experiences differ from those that can be observed in the present—thus anticipating the approach to religious experience of both William James and Sigmund Freud. Like them, he claimed to be rigidly empirical in method. “I found my ideas on materials which can be appropriated through the senses,” he wrote in the 1843 preface to *Das Wesen des Christentums*; “I do not generate the object from the thought, but the thought from the object; and I hold that alone to be a proper object which has an existence beyond one’s brain.... I am nothing but a natural philosopher in the domain of the mind.”

His study led him to conclude that religion is a form of the projective spirit in man, the means by which man “projects his being into objectivity, and then again makes himself an object to this projected image of himself thus converted into a subject; he thinks of himself not as an object to himself but as an object of an object, of another being than himself.” Thus, religion is “the dream of the human mind”; properly understood, it is a dream of human, not divine, development: “it is and can be nothing else than the consciousness which man has of his own—not finite and limited—but infinite nature.” Man, then, unlike the animal, is self-transcending, and religion is one of man’s means of objectifying his own essence in ideal terms, of spinning out visions of what he might be. For example, the Christian idea of the Incarnation is nothing but a reflection of the dream of man to become God and the realization that this can be achieved only through a transcendent love of one’s fellow man.

Religious feelings thus depend on an alienation of man from himself. Religion generates belief in an objective “other” in which all of man’s best qualities are vested, his worst qualities being designated as the true human essence. Philosophy must therefore “destroy an illusion” that deprives man of the power of a free life as well as a genuine sense of truth and virtue, “for even love, in itself the deepest, truest emotion, becomes by means of religiousness merely ostensible, illusory, since religious love gives itself to man only for God’s sake, so that it is given

only in appearance to man, but in reality to God.” In short, for Feuerbach religion is the uncontrolled and unconscious exercise of a human faculty that with the aid of the sciences of anthropology, physiology, and psychology can be controlled, raised to consciousness, and turned toward the attainment of genuine health, well-being, and community here on earth. For “the consciousness of God is nothing but the consciousness of the species.”

## INFLUENCE

Feuerbach was little concerned with political polemics, for which Marx and Engels vehemently criticized him, but his work served as an inspiration for those who were trying to work out a realistic program of reform in Germany during the middle decades of the century. Many of his dicta became dogmata for the radical movement, as for example the 1850 statement: “The doctrine of foods is of great ethical and political significance. Food becomes blood, blood becomes heart and brain, thoughts and mind-stuff. Human fare is the foundation of human culture and thought. Would you improve a nation? Give it, instead of declamations against sin, better food. Man is what he eats” (quoted in Höffding, *History of Modern Philosophy*, London, 1900, Vol. II, p. 281). But his main concern remained the mystery of the transformation of “human fare” into human thought. This mystery was the basis of his naturalistic humanism, which Marx and Engels regarded as merely a vestige of the old idealism. According to Marx’s “Theses on Feuerbach,” Feuerbach resolved “the essence of religion into the essence of *man*,” and Marx protested that “the essence of man is no abstraction inherent in each separate individual. In its reality it is the ensemble of social relations.” The judgment was basically correct. Feuerbach, though he resolved Hegelianism into psychology, made of consciousness itself a mystery, if not a miracle.

By 1850 Feuerbach’s star had already set. The future of materialism in Germany lay with mechanists such as Ludwig Büchner on the one hand and with Marx on the other. Engels was right in saying, “With one blow, [Feuerbach] pulverized the contradiction [of idealism] and without circumlocutions ... placed materialism on the throne again.” But he was also right in noting that Feuerbach “stopped halfway; the lower half of him was materialist, the upper half idealist.” Feuerbach’s “destruction” of Hegelianism was less important than the way he carried it out, since this destruction was the sport of almost every significant thinker in the Germany of his day. But because he generated materialism out of Hegel himself, Feuerbach

provided the means by which German thought could become “scientific” while still indulging its overriding interest in historical processes. Thus, his work inspired both Marx and Engels, but it also laid the foundation for that phenomenological anthropology that has made him a source of information and insights for such modern philosophers as Martin Heidegger, Jean-Paul Sartre, and Karl Barth.

## FICHTE, JOHANN GOTTLIEB

(1762–1814)

Johann Gottlieb Fichte was a German philosopher. The most original and most influential thinker among the immediate successors of Immanuel Kant, Fichte was the first exponent of German idealism. He set the agenda for the philosophical work of the generation of Friedrich Wilhelm Joseph Schelling and Georg Wilhelm Friedrich Hegel and exerted tremendous influence on German cultural life in the final decade of the eighteenth century and the first decade of the nineteenth century. Fichte undertook pioneering philosophical work on a number of topics, including the primacy of the practical over the theoretical, the nature and development of self-consciousness, the status and function of one's own body, the original discovery of the other person, the integration of freedom and nature, and the separation of law and morality.

### LIFE

Fichte was born on May 19, 1762, in the village of Rammenau in Saxony (in today's eastern Germany). Through the support of local benefactors, he received an education that would have been beyond the means of his family, who were ribbon weavers. He attended the Princely Latin School at Porta (Schulpforta) (1774–1780), studied theology and law at the universities of Jena, Wittenberg, and Leipzig under difficult financial circumstances and without taking a degree (1780–1784), and served as a private tutor in Leipzig, Eastern Prussia, and Zurich (1785–1793).

In 1790, upon studying Kant's *Critique of Pure Reason* (1781) and *Critique of Practical Reason* (1788), he became an enthusiastic adherent and supporter of Kant's critical philosophy. When Fichte's first publication, *Attempt at a Critique of All Revelation* (1792), appeared, in part, anonymously, it was widely assumed to be a work

by Kant, whose public clarification of the authorship launched Fichte's meteoric philosophical career. He was offered a professorship in philosophy at the University of Jena, where he began teaching in the summer semester of 1794. Fichte's widely attended lecture courses and the publications based on them turned German academic philosophy for a brief period into a world-historical movement on a par with the French Revolution and literary Romanticism.

In 1799 Fichte lost his professorship in Jena over charges of atheism, based on his published view that God was nothing but the moral order of the world. He spent most of the remaining years of his life in Berlin where he initially supported himself by giving private and public lecture courses and later received a professorship at the newly founded university (1810–1814), at which he also served as Dean (1810) and Rector (1811–1812). Between 1804 and 1808 Fichte gave several popular lecture series in Berlin, that were also published, in which he presented a scathing diagnosis of the cultural and moral ails of his time along with a fervent call for spiritual and political renewal. The most famous of these works, the *Addresses to the German Nation* (1807–1808, published in 1808), arose as an act of public resistance against the Napoleonic occupation of Prussia, Fichte's adopted homeland. The work's call for autochthonous culture and politics was repeatedly instrumentalized in the nineteenth and twentieth centuries for nationalist and socialist thought and politics. Fichte died on January 29, 1814, from hospital fever, which he had contracted from his wife of twenty years, who had been working as a nurse during the uprising against Napoleon.

#### “THE FIRST SYSTEM OF FREEDOM”

From his chance rise out of poverty and obscurity and his vehement early support of the French Revolution, which brought him a reputation as a Jacobin, through his daring breakaway from academic and religious traditions, to his eloquent agitation for liberation from Napoleonic rule, Fichte struggled all his life for freedom from tutelage of all kinds and for radical self-determination. The theoretical counterpart to this unrelenting project of self-liberation is what Fichte himself termed *the first system of freedom*—a comprehensive account of natural and cultural reality in which the concept of freedom serves to ground and integrate the key aspects of human existence (cognition and volition) as well as their corresponding worlds (the sensible or the natural and the supersensible or the spiritual). Unlike Kant, who had correlated and connected nature and freedom as different but comple-

mentary domains, each with its own principles, Fichte subordinates all of nature to freedom, turning the material world into nothing but the arena for the exercise of free self-determination under self-given laws of acting. With nature relegated to a merely instrumental status, the conditions and principles of social and cultural life receive primary consideration. Fichte's systematic treatment of law, morality, religion, history, and politics as the main spheres for the actualization of freedom is grounded in a detailed account of the deep structure of the human subject.

Throughout, Fichte follows Kant's transcendental or Copernican turn. But he deepens as well as widens his predecessor's dual focus on the conditions of the possibility of experience and the conditions of the possibility of morality into a highly integrated inquiry into the structural requirements of consciousness of all kinds and of all kinds of objects. In order to stress both the rigorous scientific character of his investigations and their merely preparatory status for everyone's own practice of freedom, Fichte abandons the traditional designation, *philosophy* or *love of wisdom*, replacing it with the coinage *Wissenschaftslehre*, or *Science of Knowledge*. The term is not a reference to epistemology in the modern sense but to the protoscience that is to achieve a metaknowledge of the conditions of the possibility of all object-knowledge and that then refers everyone to their own experience for the contingent content of such formally functioning consciousness. In a wider sense all parts of Fichte's projected and partially executed philosophical system are termed *Science of Knowledge*. But Fichte preferentially employs the term for his various presentations of the *first philosophy*, which contains only the basic principles of all knowledge and its objects.

Insisting on the freedom of genuine philosophical thought from any fixed letter and on the need for direct, oral philosophical communication, Fichte worked out some fifteen different presentations of his core philosophy over a period of twenty years, of which he himself published only the first one. As a result of this unique practice of continued production but discontinued publication of his main philosophical work, the full extent and content of Fichte's thinking after 1800 remained, for the most part, unknown to his contemporaries and was recognized and became influential only with the partial publication of Fichte's literary remains in the nineteenth century and their integral edition by the Bavarian Academy of Sciences over almost half a century starting in the early 1960s.

## THE “I” AS THE PRINCIPLE OF PHILOSOPHY

In the early presentations of the Science of Knowledge, dating from 1794 through 1799, Fichte terms the unitary unconditional ground of theoretical and practical knowledge and of its object domains, *the I*. The nominalized first person pronoun serves to designate the principle for the derivation (*deduction*) of the basic features of the subject and its world or worlds. Fichte’s strategy is to elucidate the necessary conditions under which the subject is able to achieve consciousness of itself, or self-consciousness. Among those conditions are the application of a set of categorial concepts (such as cause and effect) that assure the law-governed structure of the objects in space and time and the individuation of the subject as an intelligent being among other such beings. In particular, Fichte aims to show that the subject’s practical relation to the world by way of volition and action is a necessary condition, even for its theoretical relation to the world through thinking and knowing. Fichte’s defense of the systematic primacy of practice over theory is counterbalanced by the recognition that all practice in turn stands in need of some guidance through the cognition of the ends to be pursued.

In the original presentation of the Science of Knowledge from 1794–1795 (*Science of Knowledge with the First and Second Introductions*), the basic distinctions between the subject and the object and between the theoretical and the practical are generated by means of a transcendental dialectic involving the progressive but never completely achieved elimination of the contradictions to be found among the three chief capacities of the I as absolute I, theoretical I, and practical I.

As absolute I, the I is the unconditional ground of everything in the I and for the I, including everything that is not I (Not-I). Fichte employs the term *positing* for the generic, preconscious, and spontaneous activity of the I in bringing about the most basic structure of the subject as well as the object. He distinguishes the threefold absolute activity of the I’s positing itself, positing its other (the Not-I), and positing the mutual determination of I and Not-I. As theoretical I, or as subject of cognition, the I posits itself as determined through the Not-I. The subject thereby conceives of itself as bound by the properties of the object to be cognized. The contradiction between the active nature of the absolutely positing I and the passive nature of the I of theoretical cognition is resolved through the I’s third capacity as practical I, which consists in the I’s striving to completely determine the Not-I and to have all determination of the I be the I’s self-determi-

nation. To be sure, for Fichte, the striving of the practical I toward the status of the absolute I—to determine everything and to be determined only by itself—is an infinite process in which the absolute I serves as an unobtainable ideal (*idea*).

In Fichte’s reconstruction of the principal constitutive features of consciousness, the key factors of Kant’s transcendental philosophy (apperception, space, time, categories, imagination, ideas of reason) are gathered into a *history of consciousness* that stretches from minimal self-awareness in undifferentiated feeling through the workings of the imagination in theoretical understanding to the practical self-consciousness of striving reason. Fichte’s completion of Kant’s transcendental idealism does away with the existence of unknowable things in themselves and provides a maximally internalist account of the determination and self-determination of the I. The only remaining externalist concession is the appeal to the I’s inexplicable experience of being held in *check* by what is subsequently objectified, according to the I’s own laws, as a world of things seemingly existing independently of the theoretical I.

When his initial transcendental account of the I was widely mistaken for referring to an individual person rather than to the set of structural requirements for personhood, Fichte provided important methodological clarifications and doctrinal expansions in his *New Presentation of the Science of Knowledge (Foundations of Transcendental Philosophy [Wissenschaftslehre] nova methodo; 1796–1799)*. In particular, he stressed the difference between the transcendental, supra-individual I of the Science of Knowledge and the empirical, individual I of ordinary cognition and life; he argued for the reconstructive, experimental, and hence artificial nature of the transcendental account of the I; and he maintained that the ultimate evidence for the transcendental-idealist reduction of everything to the I’s clandestine absolute activity was the fundamental, extraphilosophical belief that absolute freedom from all foreign reality and complete self-determination were the essence and end of human existence.

Among the doctrinal additions of Fichte’s alternative presentation of the Science of Knowledge are the systematically prominent position of the will and the foundational role accorded to interpersonal relations (intersubjectivity) in the constitution of the subject and its relation to the world. Fichte’s transcendental philosophy of the I now presents itself as a theory of the principal forms and conditions of practical activity (willing and doing), into which the main features of cognitive activity

and the world of objects to be cognized are integrated. More specifically, Fichte argues that the mutual requirement of willing and knowing threatens to involve the I's theoretical–practical double nature (*duplicity*) in a vicious circle: Willing an end requires prior cognition of the object to be willed while knowing an object requires a prior engagement of the will in the course of which objects first come into view. Fichte resolves the circle by postulating a nonempirical, prepersonal, and hence pre-deliberative willing that comes with its own knowledge of what do—a type of willing modeled on Kant's notion of pure practical reason in which knowing the morally good and willing it are supposed to coincide. This move transposes the I from its embeddedness in the natural world into the moral realm of the pure will and entails its individuation among a community of finite rational agents.

The grounding of the I's theoretical as well as practical activities in original, self-determined volition points to the strictly moral core of human subjectivity in Fichte. What lends reality and objectivity to the I's pervasive activity of positing and determining is not some external physical or metaphysical entity but the I's own unconditional laws for the exercise of its spontaneity and freedom. In Fichte's ethical idealism the physical world has reality as the sphere for the exercise of our moral obligations.

In his most popular and accessible work, *The Vocation of Man* (1800), Fichte summarizes his philosophy of freedom in a dramatic portrayal of the course of human insight: from initial doubt about how to reconcile the competing claims of freedom and determination in human affairs through the intermediary stage of (merely theoretical) knowledge, for which everything and everyone is but a product of the I, to the concluding stage of practical knowledge and the faith associated with it, which reconciles freedom and determination by reconceiving the latter as moral self-determination.

## THE I AND THE ABSOLUTE

Fichte's subsequent popular lectures and publications in the philosophy of history, culture, and religion (1804–1808) continued to stress the practical and specifically the moral dimension of human existence. In his continuing work on the Science of Knowledge (1801–1814) Fichte explored in ever-new attempts and with changing terminological and conceptual means the possibilities as well as the limitations of human knowledge and human freedom. In critical distance to the contemporary turn toward an affirmative philosophy of the absolute in philosophers such as Friedrich Heinrich

Jacobi, Schelling, and Hegel, Fichte stressed the epistemological strictures of any ascent from the transcendental to the metaphysical. While de-emphasizing the self-sufficiency of the I and abandoning much of his earlier terminology of the I, he nevertheless insisted on the close linkage—and the ultimate identity—of the absolute and the absolute I and on the I's function as the basic mode (*I form*) of theoretical and practical subjectivity.

For the later Fichte, the absolute is not some higher being apart from our self-determined existence as knowers and doers but that which sustains and animates our theoretical and practical activities as the unfathomable ground of their dynamics and laws. In order to avoid any objectivist misunderstanding of the subject's origination in the absolute, Fichte replaces the latter's appellation as *being* with that of *life*, understood as sheer activity, without a distinct bearer and a resultant product. For the later Fichte, human existence—more specifically, its normative accomplishment of knowledge of what there is and ought to be—is the one and only manifestation (*appearance* or *image*) of the absolute while everything else has being only secondarily, as possible object of cognition and volition. Moreover, the authentic manifestation of the absolute is the absolute's self-manifestation as such. The ultimate knowledge to be achieved is the philosophical or metaknowledge that knowledge is but the appearance of the absolute and that the absolute appears only as knowledge.

For Fichte this ultimate insight, which completes the Science of Knowledge, involves at once the self-limitation of knowledge over and against the absolute, of which knowledge is but an image, and the self-affirmation of knowledge as being the absolute itself in the latter's external mode (*existence*). Accordingly, the insight achieved by the Science of Knowledge is not some abstract, rare cognition but results from the lived identification of the subject with its absolute ground and results in a manner of thinking and acting animated by the inner presence of the absolute. Moreover, on Fichte's account, the thinking and acting in light of the absolute does not occur automatically but depends on the subject's free decision and sustained effort to radical reflection and its decision and effort to engage in conduct corresponding to the insight achieved. Thus, the speculative efforts of the Science of Knowledge aim beyond science and knowledge at practical wisdom and at the moral activity resulting from it—an ultimate confirmation of the intellectual and moral freedom of the subject.

Despite some appearances to the contrary, which are due to occasional metaphysically charged terminology

(*God, being*), the late presentations of the Science of Knowledge, when considered in their entirety, show Fichte arguing for the essentially practical nature of the absolute as absolute will and as the animating principle of the moral order. Thus, the later Fichte exhibits a striking continuity with the ethical orientation of his earlier speculative philosophy and, beyond that, with the moral agenda of Kant's critical philosophy.

## PHILOSOPHY OF LAW AND ETHICS

Given its unique combination of systematic rigor, argumentative concentration, and freely varied presentation, Fichte's foundational work on the Science of Knowledge initially met with incomprehension; soon became marginalized by the work of his followers, Schelling and Hegel; and even in the early twenty-first century, in the context of detailed historical scholarship and extensive textual analysis, defies summary assessment and doctrinal reconstruction. By contrast, Fichte's work on the applied part of the Science of Knowledge, which consists of the philosophy of law and ethics, has always been more widely appreciated and quite influential.

Fichte's *Foundations of Natural Law* (1796–1797) integrates the theory of right and political authority into a systematic account of the I's individuation and socialization. Fichte argues that a subject can only possess self-consciousness if a number of conditions are met that take the form of the subject's implicit self-ascription (*positing*) of increasingly specific nonrelational and relational properties. To begin with, the subject has to ascribe to itself the faculty of free efficacy along with a sphere of objects, the world of sense, in which the efficacy can be exercised by bringing about change in the objects. Moreover, the subject's practical activity in the world of sense requires its self-ascription of a material object (*body*), by means of which it can act upon the material world.

In a crucial and highly original next step, Fichte argues that a further requirement for the subject's self-conscious, practical activity in the empirical world is its initiation into the rational standards of knowing and doing, which in turn leads to the presupposition of another, already fully functioning, subject and specifically to the latter's influencing the first subject to discover and engage its potential for theoretical–practical rationality. Moreover, the required influence has to be such that the constitutive freedom of the subject to be influenced is not infringed upon but rather called upon and made to emerge. The required influence is not physical but a *determination to self-determination* or the encouraging appeal (*summons* or *solicitation*) to act freely and rationally.

Fichte terms the soliciting subject's attitude of acknowledgment and respect toward the solicited subject's full human potential an act of *recognition* and moves on to inquire into the necessary condition for the possibility of continued mutual recognition between individual subjects. This condition is the *relationship of law*, in which each subject freely limits the exercise of its free efficacy in the world of sense through the concept of the possible freedom of the other individual subject—under the condition that the latter does the same.

Unlike Kant, Fichte does not subordinate the sphere of law under that of morals but defends a strict separation of law and morality. To be sure, for Fichte, the concept of law—the concept of the mutual recognition of free agency—represents a necessary condition of self-consciousness. But becoming part of a political state and following its laws is not an unconditional command of practical reason, as in the “Metaphysical First Principles of the Doctrine of Right” in Kant's *Metaphysics of Morals* (Immanuel Kant, *Practical Philosophy*. Translated and edited by Mary J. Gregor. General introduction by Allen Wood. Cambridge, U.K.: Cambridge University Press, 1996: 455–456.), which was published only after Fichte's work (1797). In Fichte, the validity of the law and that of its subsequent specifications as state law, family law, and cosmopolitan law is contingent upon the agreed-upon and continued practice of recognitional conduct on the part of all individual subjects involved. Accordingly, Fichte's account of the powers of the state is designed to assure the continued observance of mutual recognitional conduct.

With the philosophy of law and its postulation of the transcendental conditions of sociality relegated to an extension of theoretical philosophy, practical philosophy in Fichte completely coincides with ethics or the doctrine of our unconditional moral duties as opposed to our contingent legal obligations. Moreover, Fichte's ethics, published as *The System of Ethics* in 1798, differs widely in scope and structure from the “Metaphysical First Principles of the Doctrine of Virtue” of Kant's *Metaphysics of Morals* published in the preceding year. While Kant had focused on the systematic presentation of particular duties and had limited more general considerations to comparatively brief introductory sections, Fichte provides a detailed derivation of the principle of morality along with the basic conditions of its application. The treatment of ethics in the narrow sense, or the presentation of particular duties, is limited to the work's brief concluding section.

Fichte's chief ambition in practical philosophy is to overcome what he perceives to be the emptiness and formalism inherent in a Kantian ethics focusing on the moral criterion (*categorical imperative*) of the possible universality of subjective principles of action (*maxims*). By contrast, Fichte integrates the formation and execution of moral willing into the overall structure of practical subjectivity. The factual starting point of Fichte's real or material ethics is the subject's original self-experience as willing or as engaged in conceptually mediated efficacy in the world of sense. Its normative end point is the absolute freedom of the subject or radical self-determination. Under conditions of human finitude, this goal can only be approximated. Morality provides the direction and the motivation of the finite subject toward its infinite destination.

In his effort to lend content and specificity to moral obligation, Fichte positions the free will of the practical subject under the influence of a unitary but twofold *drive*: the *pure drive* that represents the claims of pure practical reason to radical self-determination and the *natural drive* that represents the demands of our nonrational nature. Fichte considers the *moral drive* to be a mixed drive in which the natural drive provides the content and the pure drive contributes the impetus for acting or the motivation. Fichte further argues for a pre-established harmony of sorts between the natural drive and the pure drive such that in each and every situation there is one and only one action that is both proposed by the natural drive and sanctioned by the pure drive. According to Fichte, the specific duties are detected by a non-sensory feeling of immediate practical certainty (*conscience*). The principle of morality can therefore be put into the following formula, which is empty by itself and refers everyone to their own conscience for its completion: Do in each case your duty and do it for duty's sake.

## PHILOSOPHY OF HISTORY, EDUCATION, AND RELIGION

Compared with the unprecedented systematic rigor and highly abstract reasoning pervading the presentations of the Science of Knowledge in its foundational as well as applied parts, Fichte's historically influential contributions to the philosophy of history, education, and religion are popular works conceived and executed with the explicit intent of exercising moral and political influence on listeners and readers—whose abilities, preconceptions, and contemporary experiences have therefore entered into the design of these works. Accordingly, Fichte's popular works call not only for philosophical

analysis but also for historical knowledge and exegetical skill in assessing the complex relation between their claims and their contexts.

Fichte's philosophy of history, presented in the *Characteristics of the Present Age* (1804–1805, published in 1806) and supplemented by the *Addresses to the German Nation* (1807–1808), constructs the ideal course of history as a linear progress in the governance of humankind in five stages: from blind but clandestinely rational instinct through irrational authority to anarchical intellectual, moral and political freedom—the *present age*, according to Fichte—on to incipient, freely exercised rationality, and finally to the complete reign of rational freedom. The transition from the present age of *complete sinfulness* to genuine freedom and true enlightenment is to be brought about by education and specifically by educational reform at all levels—from instituting compulsory public primary schools to a structural and curricular reform of the university, of which Fichte was a major theoretician and practitioner. Fichte's high regard for public education is also reflected in the three lecture courses that he gave on the moral and political role of the public intellectual (*vocation of the scholar*) at the beginning, toward the middle, and toward the end of his academic career (1794, 1805, 1811).

Fichte's philosophy of religion, presented as *The Way Towards the Blessed Life* (1806), recasts the speculative core of the Science of Knowledge in the form of a popular ontology identifying life with love and bliss. Fichte distinguishes five world views, each correlated to a specific standpoint and associated with a specific affect: the standpoint of sensibility and its enjoyments: that of objective legality (merely formal morality) and its love of formal freedom; that of higher morality and the self-satisfaction it affords; that of religion and the blessed life it entails: and that of science (*viz.*, the Science of Knowledge), which adds no viewpoint of its own but unites the preceding ones by lending them clarity and by transforming the mere faith in the absolute into envisioning it through the self-immersion of reflection into the absolute.

## ASSESSMENT

The immediate, immense, but short-lived influence that Fichte had on the course of German culture and philosophy around 1800 is augmented by the long-term and more clandestine effects that his original thinking on the nature of subjectivity and the relation between theory and practice exercised on such diverse philosophers as Arthur Schopenhauer, Karl Marx, Martin Heidegger, and

Jürgen Habermas. With several of his later works only now available for the first time, Fichte is very much a philosopher still to be discovered. His early work on the system of freedom is a tour de force in radicalized Kantianism while his later work on the absolute and its appearance as knowledge and will is a serious competitor to Schelling's and Hegel's claims of having brought to completion German idealist philosophy.

## FICINO, MARSILIO (1433–1499)

Marsilio Ficino, the founder of the Florentine Academy, was born the eldest son of a physician in Figline, near Florence. He studied the humanities, philosophy, and medicine in Florence but apparently did not obtain an academic degree. About 1456 he began to study Greek. In 1462 he received from Cosimo de' Medici a house in

Careggi, near Florence, and several Greek manuscripts; this is regarded as the date the Platonic Academy of Florence was founded. Having earlier taken minor orders, Ficino was ordained in 1473; he held several ecclesiastic benefices and became a canon of Florence Cathedral in 1487. After the expulsion of the Medicis from Florence in 1494, Ficino, who had been closely associated with several generations of the family, apparently retired to the country. He was honored after his death in a funeral oration delivered by a chancellor of the republic of Florence.

Ficino became interested in Platonist philosophy at an early age, presumably through studying Augustine. His earliest extant writings also show familiarity with Aristotle and his commentators and with Lucretius. Among Ficino's Latin translations from the Greek, the first that attained a wide circulation was his version (1463) of the works attributed to Hermes Trismegistus. Ficino's translation of Plato, the first complete rendering of all his dialogues in any Western language, was begun in 1463, probably completed in 1469, subsequently revised, and first printed in 1484. His influential commentary on Plato's *Symposium* was written in 1469; the other Platonic commentaries, some of them extensive, belong to different periods of Ficino's life. The translation of and commentary on Plotinus was begun in 1484 and printed in 1492. Translations of Porphyry, Iamblichus, Proclus, and other philosophers appeared in 1497. Ficino's chief philosophical work, *Theologica Platonica de Immortalitate Animarum* (Platonic theology—on the immortality of the souls) was written between 1469 and 1474 and was printed in 1482. Aside from this work and his commentaries, the most important source for Ficino's philosophy is his letters, which he began to collect around 1473 and finally published in 1495. Important also are his apologetic treatise *De Christiana Religione* (1474) and his work on medicine and astrology, *De Vita Libri Tres* (1489), which is often wrongly referred to as *De Vita Triplici*.

Ficino's work as a translator of and commentator on Plato and the Neoplatonists, and his avowed intention of reviving Platonism, led many older historians to treat his doctrine merely as a repetition of ancient Neoplatonism. More recently, however, a closer study of his known and unpublished works has shown that in restating the doctrines of Plato and his ancient followers, Ficino showed a good deal of originality. In addition, his writings show the influence of medieval and Byzantine Platonism, early Italian humanism, and also the tradition of scholastic Aristotelianism, which had a strong impact upon his terminology and method. He was familiar with Dante

Alighieri and other Italian poets and wrote or rewrote several of his own works in the Tuscan vernacular.

Ficino was the founder and for many years the head and guiding spirit of the Platonic Academy of Florence, which has remained famous as a symbol and institutional center of Renaissance Platonism. The academy was not a firmly established institution in the manner of later academies but a rather loosely organized spiritual community of friends. We hear of informal discussions between the older members of the circle and of philosophical banquets celebrated on Plato's birthday. There were recitals of edifying orations before a small audience, private readings of Plato and other texts given by one or a few younger disciples, and public lectures on Plato and Plotinus delivered in a church or auditorium. Distinguished visitors from other Italian cities and abroad called upon Ficino or participated in the meetings, and Ficino's correspondence served as a vehicle both for maintaining contact with the members of the academy and for arousing the interest of strangers in the academy's activities. The catalog of his pupils, which he gives in one of his letters, and the list of the persons with whom he was in correspondence, whom he mentions, or who owned the manuscripts and printed editions of his writings are ample evidence of the wide influence he exerted during his lifetime.

Ficino's writings present a highly complex system of ideas, embroidered with similes, allegories, and lengthy quotations from his favorite authors. We can mention but a few of his more important and influential doctrines.

### HIERARCHY

In his description of the universe, Ficino took from Neoplatonic and medieval sources the conception of a great hierarchy in which each being occupies its place and has its degree of perfection, beginning with God at the top and descending through the orders of the angels and souls, the celestial and elementary spheres, the various species of animals, plants, and minerals, down to qualityless prime matter. In spite of Ficino's indebtedness to earlier schemes, it appears on closer examination that his hierarchy differs in significant details from those of his predecessors. It is arranged in a final scheme of five basic substances: God, the angelic mind, the rational soul, quality, and body. This scheme comes fairly close to that of Plotinus but differs from it in various ways. Above all, quality did not constitute a separate level of being for Plotinus, who instead assigned separate places to the sensitive and vegetative faculties of the soul. It can be shown that Ficino intentionally revised the Plotinian scheme,

partly to make it more symmetrical and partly to assign the privileged place in its center to the human soul, thus giving a kind of metaphysical setting and sanction to the doctrine of the dignity of man, which he had inherited from his humanist predecessors. The soul is truly the mean of all things created by God, Ficino tells us. It is in the middle between higher and lower beings, sharing some of its attributes with the former and some with the latter.

Ficino was not satisfied with a static hierarchy in which each degree merely stands beside the others and in which the relationship of degrees consists only in a continuous gradation of attributes. He was also convinced that the universe must have a dynamic unity and that its various parts and degrees are held together by active forces and affinities. For this reason, he revived the Neoplatonic doctrine of the world soul and made astrology part of a natural system of mutual influences. Since thought for Ficino has an active influence upon its objects, since love is an active force that binds all things together (as in Plato's *Symposium*), and since the human soul extends its thought and love to all things, from the highest to the lowest, in Ficino's writing the soul becomes once more and in a new sense the center of the universe. The soul is the greatest of all miracles in nature because it combines all things, it is the center of all things, and possesses the forces of all things. Therefore the soul may rightly be called the center of nature, the middle term of all things, the bond and juncture of the universe.

### CONTEMPLATION

Ficino's cosmology, which was very influential during the sixteenth century, offers some points of intrinsic interest; however, it constitutes only one side of his thought. The other and even more profound component is his analysis, based on direct inner experience, of the spiritual or contemplative life, and analysis that links him with some of the medieval mystics and, again, with Neoplatonism. In the face of ordinary daily experiences, the mind finds itself in a state of continuous unrest and dissatisfaction, but it is capable of turning away from the body and the external world and of concentrating upon its own inner substance. Thus purifying itself of things external, the soul enters the contemplative life and attains a higher knowledge, discovering the incorporeal world that is closed to it while it is engaged in ordinary experience and in the troubles of the external life. Ficino interpreted this contemplative life as a gradual ascent of the soul toward always higher degrees of truth and being, an ascent that finally culminates in the immediate knowledge and

vision of God. This knowledge of God represents the ultimate goal of human life and existence—in it alone the unrest of our mind is satisfied—and all other modes and degrees of human life and knowledge must be understood as more or less direct and conscious preparations for this end. In accordance with Plotinus, Ficino was convinced that this highest experience could be attained during the present life, at least by a few privileged persons and for a short while, although he never explicitly claimed to have attained this state himself.

In describing the various states and the ultimate goal of inner experience, Ficino used a twofold terminology, and in this he was influenced by St. Augustine and by the medieval philosophers. The ascent of the soul toward God is accomplished with the help of two wings, the intellect and the will; accordingly, the knowledge of God is accompanied and paralleled on each level by the love of God; and the ultimate vision, by an act of enjoyment. Ficino also considered the question of whether intellect and knowledge or will and love are more important in this process, and although he seemed to come to different conclusions in different parts of his writings, in general he leaned toward the superiority of will and love over intellect and knowledge. Yet the question was not so important for him as might be expected, since he regarded the knowledge of God and the love of God as merely two different aspects or interpretations of the same basic experience—namely, the contemplative ascent of the soul toward its ultimate goal.

This experience and the manner in which it is interpreted hold the key to both Ficino's metaphysics and his ethics. It is the inner ascent of contemplation, through which the reality of incorporeal things—of the ideas and of God himself—is discovered and verified. Since this inner ascent constitutes the basic task of human existence, Ficino was not interested in specific moral precepts or in casuistry, but only in the general identification of the human good and man's moral excellence with the inner life. His whole moral doctrine, as expressed in his letters, may be said to be a reduction of all specific moral rules to a praise of the contemplative life. He who has attained this life is exempt from the blows of fortune; and, animated by his inner certainty and insight, he will know and do the right thing under any given circumstance.

Intimately related to the doctrine of the contemplative life are two other theories of Ficino's, both of great historical importance: his theory of the immortality of the soul and his theory of Platonic love.

## IMMORTALITY

Ficino's main work, *Theologia Platonica de Immortalitate Animarum*, consists for the most part of a series of arguments in support of the soul's immortality. It appears from a famous passage twice repeated in Ficino's writings that, in direct contrast with the teachings of the Aristotelian philosophers of his time, he considered this doctrine the central tenet of his Platonism. It is true that the immortality of the soul had been defended by Plato and Plotinus, by Augustine and many other Christian writers, and that Ficino borrowed many specific arguments from them. It may also be granted that Averroes's doctrine of the unity of the intellect in all people, which had been widely discussed and often accepted by Aristotelian philosophers from the thirteenth to the fifteenth century, made a defense of individual immortality imperative. In addition, the humanists had attached great importance to the individual human being, his experiences, and his opinions; and the belief in personal immortality was, as it were, a metaphysical counterpart of this individualism and an extension of it into another dimension.

Yet it seems evident that for Ficino the doctrine of immortality was a necessary complement and consequence of his interpretation of human existence and of the goal of human life. If it is our basic task to ascend, through a series of degrees, to the immediate vision and enjoyment of God, we must postulate that this ultimate goal will be attained, not merely by a few persons and for a short while but by a great number of human beings and forever. Otherwise, man's effort to attain this ultimate end would be in vain, and the very end for which he had been destined would remain without fulfillment. Thus, man would be unhappier than the animals, which do attain their natural ends, and this would be inconsistent with the dignity of the place man occupies in the universe. Moreover, if a natural end corresponding to a natural desire implanted in all men could not be attained, this would contradict the perfection of the order of nature and the wisdom of God, who created that order. In his "Platonic Theology," and in other parts of his writings, Ficino never tired of repeating these and similar arguments. It seems obvious that they reflect the real intent and motivation of his thought, for his whole interpretation of human life as a contemplative ascent toward God would lose its meaning unless this ascent were to find its permanent fulfillment in the eternal afterlife of the immortal soul. This alone would explain why the doctrine of immortality assumed such a central place for him. All other arguments are merely auxiliary to this central one.

Ficino's doctrine of immortality, and his arguments for it, made a profound impression on many thinkers of the sixteenth century; and it may very well be due to his indirect influence that the immortality of the soul was formally pronounced a dogma of the Catholic Church at the Lateran Council of 1512.

### THEORY OF LOVE

Of equal historical importance, although different in character, is Ficino's doctrine of human love. In this doctrine, as in many of his others, Ficino combined elements from several different sources and traditions. He took over and reinterpreted Plato's theory of love as expressed in the *Symposium* and *Phaedrus*, and combined it with other ancient theories of friendship that were known to him primarily through Aristotle and Cicero; he also tried to identify it with the Christian love (*caritas*) praised by St. Paul. He even added some touches from the tradition of medieval courtly love as it was known to him through Guido Cavalcanti, Dante, and other early Tuscan poets. This doctrine of love, which exercised a tremendous influence during the sixteenth century, and for which Ficino himself coined the terms *Platonic love* and *Socratic love*, was first expressed by him in his commentary on Plato's *Symposium* and further developed in many of his letters and other writings. The term *Platonic love* means love as described by Plato, according to Ficino's interpretation; more frequently, he spoke of it as divine love. The basic point is that he regarded love for another human being as merely a preparation, more or less conscious, for the love of God, which constitutes the real goal and true content of human desire and which is turned toward persons and things by virtue of the reflected splendor of divine goodness and beauty that may appear in them. Ficino insisted that true love or friendship is always mutual. A genuine relationship between two people is a communion founded on what is essential in man, that is, it is based in each of them on his original love for God. There can never be only two friends; there must always be three—two human beings and one God. God alone is the indissoluble bond and perpetual guardian of any true friendship for a true lover loves the other person solely for the sake of God. True love and friendship between several persons is derived from the love of the individual for God; it is thus reduced to the basic phenomenon of the inner ascent, which constitutes the core of Ficino's philosophy.

It appears from Ficino's letters that he considered true friendship in this sense to be the bond that united the members of his academy with each other and with

himself, their common master, and that he liked to think of the academy not merely as a school but as a community of friends. This conception of Platonic love was to exercise a strong influence on Italian and European literature throughout the sixteenth century. Many lyric poets spoke of their love in terms that reflected the influence of Ficino, as well as that of the old Tuscan poets and Petrarch; and there was a large body of treatises and lectures on love that derived much of their inspiration, directly or indirectly, from Ficino's commentary on the *Symposium*. In this literature the concept of Platonic love was separated from the philosophical context in which it had originated with Ficino, and so it became more and more diluted and trivial. For this reason, the notion of Platonic love has acquired a slightly ridiculous connotation for the modern reader. Yet we should try to recapture its original meaning, remembering that the true meaning of an idea is best understood in the context of the thought in which it originated and which, in a sense, made its formulation necessary. If we trace Platonic love back to its origin in Ficino—back to the context of an individual's love of God—it may still seem a strange and remote concept, but we shall at least understand that it had a serious content and that it was related to the central ideas of his philosophy.

A further aspect of Ficino's thought that requires mention is his conception of religion and of its relationship to philosophy. Ficino was a priest and a canon of Florence Cathedral; he had an adequate knowledge of Christian theology; and he even wrote an apologetic treatise on the Christian religion as well as several other theological works. There is not the slightest doubt that he intended to be orthodox, although some of his doctrines may seem to have dubious implications and although he was in danger of an ecclesiastical condemnation for the views on astrology and magic expressed in his work *De Vita* (1489). He insisted on his Christian faith and submitted to the judgment of the church. He was even willing to abandon the opinions of his favorite Platonist philosophers when they seemed to contradict Christian doctrine. Thus, we are not surprised to find that he regarded Christianity as the most perfect of all religions.

At the same time, he saw some merit in the variety of religions and insisted that any religion, however primitive, is related indirectly to the one true God. In his implicit tolerance toward other religions, Ficino came very close to a concept of natural religion, a position that made him a forerunner of Herbert of Cherbury, the deists, and other advocates of a universal religion. Divine worship, he said, is almost as natural for men as neighing

is for horses or barking is for dogs. A common religion of all nations, having one God for its object, is natural to the human species. This religion, which is again based on man's primary knowledge and love of God, is not shared by the animals but is peculiar to man, a part of his dignity and excellence and a compensation for the many defects and weaknesses of his nature.

As to the relation between religion and philosophy, Ficino was convinced that true religion (that is, Christianity) and true philosophy (that is, Platonism) are in basic harmony with each other; and he was inclined to treat them as sisters instead of trying to make one subservient to the other. He believed that it is the task of Platonic reason to confirm and support Christian faith and authority, and he even considered it his own mission, assigned to him by divine providence, to revive true philosophy for the benefit of true religion. He believed that those who will not be guided by faith alone can be guided toward truth only through reason and the most perfect philosophy.

In the light of this relationship, the continuity of the Platonic tradition assumed a new significance for Ficino. Since this tradition was thought by him to go back to Hermes and Zoroaster, whose apocryphal writings Ficino treated as venerable witnesses of early pagan theology and philosophy, he considered the tradition to be as old as the religious tradition of the Hebrews. Thus, the religious tradition of the Hebrews and Christians, and the philosophical tradition of the Hermetics and Platonists, seemed to run a parallel course in human history from the early beginnings through antiquity and the Middle Ages down to the modern period. It is in accordance with this view of Ficino's that Augustinus Steuchus, a Catholic theologian of the sixteenth century, wrote his *De Philosophia Perenni* (On the perennial philosophy; 1542).

## INFLUENCE

Ficino's influence was considerable, both during his lifetime and for a long time afterward. As a metaphysician in the proper sense of the word, Ficino added an element to Florentine culture that had been largely absent from it before and left a new imprint on that culture that was to last for several generations. Among his associates and pupils we find Cristoforo Landino, author of the *Camaldulensian Disputations* and of an influential commentary on Dante's *Commedia*, and Lorenzo de' Medici, famous not only as a statesman but also as one of the best Italian poets of his century. Whereas Giovanni Pico della Mirandola developed an independent position, another pupil, Francesco da Diacceto, carried the Platonic tradition of

Ficino into the first decades of the sixteenth century; and later in that century, Platonic philosophy was cultivated both at the new Florentine Academy of 1540 and at the University of Pisa. This Platonist climate of opinion in Florence and Pisa accounts for some of the opinions and preconceptions of Galileo Galilei. In the rest of Italy, poets and prose writers drew on Ficino's theory of love, and theologians and philosophers upon his doctrine of immortality as well as some of his other ideas. His influence appears in the works of such leading philosophers as Francesco Patrizi and Giordano Bruno: Even thinkers who opposed his views, such as Pietro Pomponazzi, were impressed with his learning and acumen.

During his lifetime, Ficino's influence was already growing, through his correspondence and through the circulation of his writings, in most European countries. His admirers included Johannes Reuchlin and John Colet, Gaguin and Jacques Lefèvre d'Étaples. During the sixteenth century his writings were reprinted, collected, read, and quoted all over Europe. His medical and astrological treatises were especially popular in Germany. In France, he was repeatedly quoted and plagiarized by Symphorien Champier, and admired in the circles of Queen Marguerite of Navarre and of the Pléiade. There, some of his writings and his Latin translations of Plato were translated into French. Elements of his Platonism appear in Carolus Bovillus and Postel, and not so much in Peter Ramus as in his mortal enemy Jacques Charpentier. Even in René Descartes there are strong elements of Platonism. Outside of France, Desiderius Erasmus, Thomas More, Sebastian Fox Morcillo, Paracelsus, Cornelius Agrippa, and finally Johannes Kepler exemplify the importance of Platonism in sixteenth-century thought, an importance that is closely linked with the writings, translations, and commentaries of Ficino.

In the seventeenth century, after Galileo and Descartes, the speculative cosmology of the Renaissance was no longer possible within the framework of a natural science based on experiments and mathematical formulas. The influence of Platonism persisted, however, in the metaphysics and epistemology of Benedict de Spinoza and Gottfried Wilhelm Leibniz, Nicolas Malebranche and George Berkeley; and it gained a new life in the school of Cambridge Platonists. And, since the authority of Plato himself remained a powerful force with many thinkers, we find even in Immanuel Kant and Johann Wolfgang von Goethe several theories associated with the name and prestige of Plato (and Plotinus) that actually belong to his Florentine translator and commentator. Samuel Taylor Coleridge wrote in his autobiography that as a youth he

read Plato and Plotinus, together with the commentaries and the *Theologia Platonica* of the illustrious Florentine. It was only in the nineteenth century that Ficino lost even this anonymous or pseudonymous influence, after a new school of philological and historical criticism had begun to make a rigorous distinction between the genuine thought of Plato and that of his successors and commentators in late antiquity and during the Renaissance. On the basis of this distinction, it has become possible again to understand Ficino's thought in its own right—to appreciate its indebtedness to sources other than Plato, its close connection with the thought and scholarship, art and literature of its time, and its own peculiar style and originality.

### Bibliography

Of Ficino's main works, only the commentary on Plato's *Symposium* has been reprinted in modern editions. See *Marsilio Ficino's Commentary on Plato's Symposium*, translated and edited by Sears R. Jayne, Vol. XIX, No. 1, in *The University of Missouri Studies* (Columbia, MO, 1944), and *Commentaire sur le Banquet de Platon*, edited by Raymond Marcel (Paris, 1956). For the others, the Basel editions of his collected works, *Opera Omnia*, 2 vols. (1561 and 1576), are still the only source; the second edition is slightly more complete and has been reprinted more recently (Turin, 1959). Also see *Supplementum Ficinianum*, edited by Paul Oskar Kristeller, 2 vols. (Florence, 1937), with lists of manuscripts and editions and a chronology of Ficino's works, and P. O. Kristeller, *Studies in Ficino's Thought and Letters* (Rome, 1956), with a number of papers discussing Ficino's life, sources, influence, and thought. Aside from the commentary on the *Symposium*, only the short *Five Questions concerning the Mind* (from Ficino's *Letters*) has been translated into English, by Josephine L. Burroughs, in *The Renaissance Philosophy of Man*, edited by Ernst Cassirer and others (Chicago: University of Chicago Press, 1948), pp. 193–212.

For Ficino's life and the history of the Platonic Academy, see Arnaldo Della Torre, *Storia dell'Accademia platonica di Firenze* (Florence, 1902), which is still indispensable, and Raymond Marcel, *Marsile Ficin* (Paris, 1958).

For discussions of Ficino's philosophy, see Giuseppe Saitta, *La filosofia di Marsilio Ficino* (Messina: Principato, 1923; 3rd ed., Bologna: Fiammenghi and Nanni, 1954); Sears R. Jayne, *John Colet and Marsilio Ficino* (London: Oxford University Press, 1963); Paul O. Kristeller, *Il pensiero filosofico di Marsilio Ficino* (Florence: Sansoni, 1953), translated by Virginia Conant as *The Philosophy of Marsilio Ficino* (New York: Columbia University Press, 1943)—the Italian edition is superior because of its additional indexes and original text quotations.

Also see Michele Schiavone, *Problemi filosofici in Marsilio Ficino* (Milan, 1957), and Ernst Cassirer, *Individuum und Kosmos in der Philosophie der Renaissance* (Berlin and Leipzig: Teubner, 1927; reprinted Darmstadt, 1962),

translated by Mario Domandi as *The Individual and the Cosmos in Renaissance Philosophy* (New York: Harper and Row, 1963).

Ficino's influence on the theory and iconography of Renaissance art has been discussed by Erwin Panofsky—*Idea* (Leipzig and Berlin: Teubner, 1924; 2nd ed., Berlin: Hessling, 1960) and *Studies in Iconology* (New York: Oxford University Press, 1939; reprinted, New York: Harper and Row, 1962)—and by E. H. Gombrich and others; see especially André Chastel, *Marsile Ficin et l'art* (Geneva: Droz, 1954). For a discussion of Ficino and magic, see D. P. Walker, *Spiritual and Demonic Magic from Ficino to Campanella* (London: Warburg Institute, University of London, 1958).

Literature on the influence of Ficino's theory of love includes A. M. J. Festugière, *La philosophie de l'amour de Marsile Ficin et son influence sur la littérature française du XVIe siècle* (Paris: Vrin, 1941); John C. Nelson, *Renaissance Theory of Love* (New York: Columbia University Press, 1958). See also Nesca A. Robb, *Neoplatonism of the Italian Renaissance* (London: Allen and Unwin, 1935), and Raymond Klubansky, *The Continuity of the Platonic Tradition during the Middle Ages* (London: Warburg Institute, 1939 and 1950).

## FICTIONALISM

A fictionalist is one who aims to secure the benefits of talking *as if* certain kinds of things exist—numbers, moral properties, possible worlds, composite objects, or whatever—while avoiding commitment to believing in their existence. This understanding of fictionalism is broad and ecumenical, and it should be noted that *fictionalism* is frequently used in the recent literature to refer to one or other of the more specific doctrines that this entry discusses.

### 1. FICTIONALISM AND FICTIONS

Consider paradigm cases of works of fiction such as J. R. R. Tolkien's *Lord of the Rings* or Charles Dickens's *Christmas Carol*. On some occasions, such works of fiction are taken as the object of philosophical enquiry and explanation. In that case, as one would expect, there are competing philosophical accounts of the nature of fiction—competing answers to such questions as the following: whether hobbits exist; whether it is true that Ebenezer Scrooge was visited by Marley; how, or why, people come to rejoice in Scrooge's redemption, or whether *Lord of the Rings* might have existed if Tolkien had not. On other occasions, however, works of fiction (in general) are invoked to explain (by analogy) various philosophically interesting discourses that are not obviously works of fiction or intended to be. In that case, certain answers to questions about the ontology and language of works of fiction are taken as given, and the workings of other discourses are accounted for by analogy with works of fiction so construed—hence the use of the term *fictionalism* to describe accounts of this sort. Fictionalists need not explicitly propose an analogy with works of fiction. The link between works of fiction and fictionalism is best forged as follows.

There are three natural and plausible theses about fictions that fictionalists typically wish to transfer to the discourses that are the targets of their explanations. Firstly, a thesis of vindication: Fictional discourses do not call for elimination or rejection, nor may they be simply ignored. We should neither discourage novelists from writing stories nor prohibit literary critics from dis-

cussing fictional characters: Fiction fulfills some function in our lives and calls for a philosophical account that acknowledges that function. Secondly, an ontological attitude: We should not accept the existence of characters and kinds that are paradigmatically fictional. For instance, we should not believe in the existence of hobbits or Ebenezer Scrooge. Thirdly, a semantic thesis: It is not the case that any sentence that appears to be about fictional entities both (a) entails the existence of a fictional entity and (b) is literally true. This thesis is particularly important in the case of those sentences of the fictional narrative that are paradigmatically correct or true according to the fiction—for example, "Some hobbits live underground" and "Scrooge is the employer of Bob Cratchit." These sentences appear to entail the existence of fictionalia such as hobbits and Scrooge, and they appear to be true, so that anyone who accepts both these appearances will seemingly be committed to believing in the existence of hobbits and of Scrooge.

Fictionalists turn these theses about fiction into claims about the discourse for which they are accounting. Characterizing fictionalism this way enables us to distinguish fictionalism about a discourse (*F*-talk, say) from the most eminent rival approaches to interpretation and ontology—namely, eliminativism, realism, and reductionism. Firstly, the fictionalist's thesis of vindication says that we are well motivated in persisting in our use of *F*-talk because it serves some characteristic function or purpose that cannot effectively or efficiently be replicated if we abstain from *F*-talk. In contrast, the *eliminativist* characteristically denies that *F*-talk is so vindicated and proposes to abstain from its use. Secondly, the fictionalist's ontological attitude is that we ought not to accept the existence of *F*s. Thus the fictionalist is no *realist*—assuming that realists about *F*-discourse must believe in *F*s. We should also expect the realist to reject the characteristic semantic thesis of fictionalism and so to insist that there are *F*-sentences that both (a) entail the existence of *F*s and (b) are literally true. Thirdly, the fictionalist does not accept the existence of *F*s and so, a fortiori, does not accept the conjunctive thesis that the *F*s exist and (for some *G*) are identical with the *G*s. This separates the fictionalist from ontological reductionists, who assert this conjunctive thesis.

### 2. FICTIONALIST STRATEGIES OF INTERPRETATION

As has been seen, the fictionalist wishes to exploit the thesis that no sentence of fictional discourse both (a) entails the existence of any fictional entity and (b) is literally

true. Different general strategies of fictionalist interpretation correspond to different ways of rejecting (a) or of rejecting (b). To spell out these strategies, let us focus on the kind of sentence that may look like a counterexample to the view of fiction on which the fictionalist is drawing—one that appears to entail the existence of a fictional entity:

- (1) Some hobbits live underground.

The first kind of fictionalist strategy proceeds from denial of the entailment component (a) of the thesis. It claims that the sentences do not have the existential consequences that they appear to have. If this claim is secured, then in order to avoid unwanted existential commitment, the fictionalist need not deny that the sentences in question are true. This entry distinguishes three versions of this strategy, modeled on different accounts of the nature of fiction:

(A1) **NONFACTUALISM (RELATED TERMS: NONCOGNITIVISM, EXPRESSIVISM, INSTRUMENTALISM)**. The sentences of the fictional narrative are not used with the kind of illocutionary force or intent that is required in order for them to state a propositional, genuinely truth-evaluable content. The proper use of the sentence is in a kind of illocutionary act that precludes assertion or presenting the content of a belief. Accordingly, sentences so used are not truth-apt and lack the kinds of content that can be, or properly entail, any existential proposition. In fictional narratives, perhaps the crucial illocutionary act is that of fictionalizing or pretending. The nonfactualist strategy of interpretation is familiar from the moral and aesthetic cases, where fact-stating is contrasted with evaluating or attitude-expressing, but is also applied in certain instrumentalist approaches to (portions of) mathematics and science. The locus classicus of ethical nonfactualism is the emotivism of A. J. Ayer (1936, ch. 6). For an instrumentalism about infinitary portions of mathematics see David Hilbert’s article “On the Infinite” (1983). Simon Blackburn presents a list of nonfactualist (expressivist) suggestions about a further range of discourses as background to his own nonfactualism (quasi-realism) about morals and modals (1984, chs. 5–6).

(A2) **NONEISM (RELATED TERM: MEINONGIANISM)**. Sentences such as (1) may be used assertorically, they have propositional content, but they do not entail the existence of hobbits because, generally, propositions of particular quantification (some *As* are *Bs*) do not entail the existence of those things over which they quantify. On this view, it is consistent to hold, in general, that there are some things that do not exist and, in particular, that

among some of the things that do not exist are hobbits that live underground, or infinitely many prime numbers or worlds that have talking donkeys as parts. A comprehensive, noneist fictionalism would treat all apparently existential quantification in the true propositions of the discourse as particular quantification, and would treat all such particular quantification as quantification that is not existentially committing. The locus classicus of noneism is Richard Routley (1980; see also McGinn 2000, ch. 2).

(A3) **PARAPHRASIS**. Sentences of the fictional narrative are elliptical expressions of propositions that do not entail the existence of fictionalia; correspondingly, sentences of *F*-discourse do not entail the existence of *Fs*. One prominent development of this thought has it that sentences such as (1) express propositions in which nonfactive operators take position of widest scope—operators of modality, conditionalization, or consequence operators invoking a story (or theory). For example:

- (1\*) According to the Tolkein stories, some hobbits live underground;

or,

- (1\*\*) The Tolkein stories entail that some hobbits live underground.

The modal fictionalist introduced in Gideon Rosen’s article “Modal Fictionalism” (1990) claims that one can have all the benefits of talking about possible worlds without the ontological costs by interpreting apparently existential claims about a plurality of worlds as claims about what is the case according to the plurality of worlds hypothesis advanced by David Lewis (1986). (Armstrong 1989 puts forward a related view; for discussion, see Lycan 1993). In the philosophy of mathematics, Geoffrey Hellman’s (1989) modal structuralism is a proposal to treat apparently existential claims about numbers as claims about what would follow from the hypothesis that certain structures are instantiated. The presentism of A. N. Prior (1957) incorporates a proposal to paraphrase away apparent reference to past and future times by translation into a medium of tensed operators.

The second kind of fictionalist strategy proceeds from refusal to accept the component thesis (b)—that the sentences in question are literally true. A choice then presents itself. One might proceed by multiplying kinds of truth and make out the case that there is a feature of nonliteral truth or relativized truth that can be attributed to the “correct” sentences of the discourse. Thus, it might be held that (1) is fictively true or (in a metalinguistic analogue of an earlier proposal) is true-in-the-Tolkein-

stories but not literally true or true simpliciter. Going the other way, one might stick with only one univocal notion of (literal) truth but refuse to ascribe (univocal) truth to (1) or any other correct existential sentence of the fiction. Here only the latter, better-charted path will be explored. If the fictionalist refrains from holding that any existential sentence is true, she may treat those sentences as expressing the existential propositions that they appear to express without having immediate cause to worry that unwanted existential commitment will ensue. Three versions of this strategy are as follows:

(B1) **PRESUPPOSITIONISM.** When sentences containing special fictional terms occur outside the scope of a story operator (“According to T ...”) they simply lack a truth-value. This view might be supported by the contention that in order for some such sentences to be true or false, the existential presuppositions invoked by the use of the narrative—presupposition of the existence of hobbits and other kinds of things—would have to be fulfilled. For such a view of sentences involving predications to empty definite descriptions see P. F. Strawson’s essay “On Referring” (1971).

(B2) **AGNOSTICISM.** The problematic existential sentences of the discourse may properly be used to assert the existence of *Fs* and do have a determinate truth-value. But people are not, and perhaps cannot be, in a position to judge what that truth-value is, and certainly not in a position to assert any such sentence. The most famous agnostic fictionalism is that of Bas C. Van Fraassen (1980) on the unobservables of microphysical theory. Rosen and Cian Dorr (2002) proposed agnosticism about the existence of the composite objects—entities that have other entities as parts—which people’s ordinary talk is about.

(B3) **ERROR THEORY.** The problematic existential sentences are assertoric of the existence of *Fs* and do have determinate truth-value, and one is justified in holding that these sentences are systematically false. J. L. Mackie (1977) famously reads Locke as an error-theorist about secondary properties and develops a parallel error theory of morals. Mackie interprets ordinary moral judgements as requiring the existence of “objective prescriptivity”—states of affairs that give reasons for action independently of the agent’s motivations—and thus as systematically false. However, Mackie goes on to recommend that one persevere with moral discourse in order to secure the benefits of social cooperation. The moral fictionalism of Richard Joyce (2001) develops this position, suggesting that people should cease to believe moral claims while

continuing to utter sentences such as “Kicking babies is wrong,” provided they do not do so with assertoric force.

Error theories about mathematics abound. Hartry Field (1989) construes the existential sentences of mathematical theories as entailing the existence of abstract objects. On epistemological grounds one should hold these sentences false. But, Field maintains, because reference to mathematical entities can be removed from the best physical theories, one is entitled to continue using theories that contain mathematics and is motivated to do so because it offers significant shortcuts in inference and calculation. Other mathematical error theorists develop positions that are not committed to such dispensability of quantification over abstract entities. Joseph Melia (2000) claims that mathematical sentences can convey useful information about the concrete part of the world, even though they are often false through entailing the existence of abstract objects.

When the fictionalist proceeds along any of the (b)-route strategies, she will typically offer as an alternative to truth some other subsidiary norm that the “correct” sentences satisfy and in terms of which the success or characteristic function of the discourse is to be explained. What the norm is will differ from discourse to discourse. For example, Van Fraassen’s refusal to hold true the existential sentences of microphysical theory, and the theories that entail them, is combined with the views that the good theories in which they feature are good because they are empirically adequate and that one can explain their success without ascribing truth to them. Similarly, Field holds that mathematical “goodness” is not truth but membership of a nominalistically conservative theory (compare Rosen and Dorr 2002 on the atomistic adequacy of ordinary composite object talk). However, the fictionalist who proceeds along the (b)-route in withholding the ascription of truth may not feel compelled to appeal to any norm other than truth. The alternative is to maintain that the discourse could still fulfill its function if people limited themselves to believing or holding true only its *nonexistential* claims.

It is not the case that all versions of fictionalism are presented explicitly as versions of these strategies. Often other explanatory resources are prominent (e.g., quasi-assertion, games of make-believe, and metaphor. See Yablo 2001, Walton 1990). However, it is suspected that in order to avoid relevant ontological commitment, fictionalists must eventually commit to one of the semantic strategies presented here.

### 3. ISSUES FOR THE FICTIONALIST STRATEGIES OF INTERPRETATION

A fictionalist strategy of interpretation will succeed only if:

- (1) It avoids the ontological commitments that it is intended to avoid;
- (2) it secures the benefits that motivate persistence with use of the discourse; and
- (3) it makes intelligible whatever distinctive semantic devices that it invokes in order to escape ontological commitment.

Nonfactualist fictionalism faces its primary challenges over points (2) and (3). In particular, if apparently existential sentences do not, at bottom, state propositions, then how are nonfactualists to square whatever linguistic properties they ascribe to those sentences with the role of the sentences as premises in inferences? This point bites hard when the target discourse is one that functions as an inferential medium as, notably, portions of mathematics and scientific theory do with respect to observation statements.

Noneist fictionalism faces the sharpest challenge of all under point (3), for it has been held that the pivotal claim of noneism—that there are things that do not exist—is unintelligible. Moreover, there is a particular methodological challenge to be faced by all fictionalists that the noneist in particular seems to invite. Suppose that a fictionalist succeeds in avoiding commitment to some problematic realm of objects. It would smack of absurdity if their strategy could be applied globally, to free everyone of all ontological commitments whatsoever—even in cases where those commitments were not undesirable. The fictionalist who holds that some but not all discourses can be treated fictionally needs a principled way of drawing the line.

Paraphrastic fictionalists who invoke nonfactive operators immediately face a dilemma over point (3). If the operators in question are taken as primitive, that is at least an ideological cost of the theory; but if the (modal, consequence, or conditional) operators in question are interpreted in standard ways, then they may generate commitment to entities such as models (sets) or possible worlds. But these semantically induced entities may either be, or share problematic features with, the entities that the fictionalist is trying to avoid—thus contravening (1). For example, a fictionalist about numbers who is suspicious of abstract objects had better not end up invoking other abstract objects in order to explain what “according to standard arithmetic” means. Along the first horn of the

dilemma the question arises again, as it did for the nonfactualist, of how to account for the (perhaps crucial) inferential role of the sentences. Often it seems that one could do so if the existential sentences were interpreted as existence-entailing; the paraphrastic fictionalist has to demonstrate that her alternative construal can do the same work.

Another difficulty arises when the nonfactive operator chosen is of the sort “According to T,” where T is a philosophical theory the fictionalist holds to be false. (Rosen-style modal fictionalism is an example of a fictionalist theory that invokes such an operator.) It seems reasonable to ask the fictionalist why any philosophical theory—especially one the fictionalist holds to be false—should play such a central role in her account of the discourse. In addition, it may be asked why the fictionalist chooses to use the particular theory that she does. What distinguishes that theory from other philosophical falsehoods?

The various route (b) strategies that withhold ascription of literal truth face their most immediate difficulty over (2). Can the characteristic function of the discourse really be secured if all of the intuitively correct sentences are held to have some feature that is weaker than truth or if only the nonexistential intuitively correct sentences are held to be true? A question that lies just beyond this one is whether proper strictures of charitable interpretation will permit an interpretation of the discourse that ascribes such powerful existential entailments and then sets the standard of truth so high (and so distinct from the operating standards of correctness) that the users of the discourse systematically fail to meet them.

### 4. HISTORICAL POSTSCRIPT

These contemporary fictionalist views have many historical antecedents. The phenomenalist strand of empiricist thought, as represented, for example, in John Stuart Mill’s *An Examination of Sir William Hamilton’s Philosophy* (1979 [1865]) is paraphrastically fictionalist when it suggests the translation of ordinary material object talk into counterfactual claims about sensations. The nonfactualist strand of empiricist thought, which is often discerned in Hume (1978), can be viewed as suggesting fictionalism about a wide range of cases from the external world to the self. More specifically the notion of paraphrase, and its function in avoiding ontological commitment, is prominent in the thought of Jeremy Bentham in the nineteenth century and in that of W. V. Quine in the twentieth century. Arguably, this style of fictionalism also surfaces in Bertrand Russell’s doctrine that classes are “logical fic-

tions,” eliminable through contextual definition, and in his famous general treatment of definite descriptions (1956). Finally, in the early twentieth century, Hans Vaihinger (1924) proposes that one should accept atomic theory, theology, and many other discourses, without believing them. Vaihinger presents his views as a reading of Kant, though recent commentators have stressed his affinities with pragmatist thought.

## FICTIONALISM, MATHEMATICAL

See *Nominalism, Modern*

## FIDEISM

*Fideism* is the view that truth in religion is ultimately based on faith rather than on reasoning or evidence. This claim has been presented in many forms by theologians from St. Paul to contemporary neoorthodox, antira-tionalist writers, usually as a way of asserting that the fundamental tenets of religion cannot be established by proofs or by empirical evidence but must be accepted on faith. Some forms of fideism denigrate or deny the value of reason and science, and these amount to a kind of irrationalism, as indicated in David Hume’s ironic statement at the end of his essay “Of Miracles”:

[The] *Christian Religion* not only was at first attended with miracles, but even to this day can-

not be believed by any reasonable person without them. Mere reason is not sufficient to convince us of its veracity; and whoever is moved by *Faith* to assent to it, is conscious of a continued miracle in his own person, which subverts all the principles of his understanding, and gives him a determination to believe what is most contrary to custom and experience. (*Essay concerning Human Understanding*, edited by L. A. Selby-Bigge, Oxford, 1951, p. 131)

### EXTREME FIDEISM

Extreme fideists such as J. G. Hamann and Søren Kierkegaard have praised Hume's formulation as a proper characterization of religious orthodoxy.

Starting with St. Paul's contention that the central doctrine of Christianity was nonsensical by Greek philosophical standards and with Tertullian's announcement *credo quia absurdum* (I believe that which is absurd), there have been theologians who have insisted that religious truths are contrary to those that might be supported or justified by reasonable evidence and that rational activities are not proper means to arrive at such truths. Some have insisted that there are suprarational or extrarational ways, such as mystical or revelatory experiences that provide the "knowledge" of fundamental truths. Such writers have tended to ignore rational arguments or standards, and often, as St. John of the Cross did, they have offered means by which one could train oneself to escape the confines of rationality in order to intensify religious experience and belief.

Others have tried to show the inability of reason to establish any fundamental or absolutely certain truth. Usually employing skeptical arguments, they have contended that ultimate principles are open to question or rational standards, and also that these standards can themselves be questioned. In view of this, they have contended, basic truths are to be accepted on faith. Michel Eyquem de Montaigne, Pierre Charron, and other so-called Christian skeptics set forth this form of fideism.

Others, such as Pierre Bayle, Kierkegaard, Félicité Robert de Lamennais, and Lev Isaakovich Shestov, went further and asserted that religious truths were of such a nature that they were contrary to the kinds of assertions that were probable, plausible, or even possible on rational or reasonable standards and that such truths could therefore be believed or accepted only on faith. Bayle insisted that religious tenets were not only above and beyond reason but also in opposition to it and that the strongest faith was that which denied the truths based on natural

light and embraced those most incomprehensible to or contrary to reason. Kierkegaard first accepted the type of skepticism developed by Bayle and Hume about rational knowledge and then insisted that the fundamental tenet of Christianity, the Incarnation, is not only contrary to rational evidence but even a self-contradiction on rational standards: "No knowledge can have for its object the absurdity that the eternal is the historical" (*Philosophical Fragments, or A Fragment of Philosophy*, p. 50). Kierkegaard held Hamann's view that Hume had summed up the nature of religious belief—that it really is contrary to reason, custom, and experience. For Kierkegaard the very absurdity of the Christian claim makes it worthy of belief, and it is only by total commitment, or "the leap into faith," that it can be accepted. There can be no reasons for the leap, no justification for it. In the words of Bayle's opponent, Pierre Jurieu (also an irrationalist), all the believer can say is, "I believe it because I want to believe it."

In the twentieth century, among the fideists who advanced Kierkegaard's view, one of the most striking was the Russian Orthodox theologian Shestov, who insisted that the rejection of all rational standards is a part of true belief. In a commentary on Fëdor Dostoevsky he contended that the refusal to accept that  $2 + 2 = 4$  and the ability to believe that  $2 + 2 = 5$  are intimately connected with attaining religious truth.

### MODERATE FIDEISM

In contrast to irrationalist or antirationalist fideism, a more moderate kind has developed, especially within the Christian Augustinian tradition. Rather than insisting that all ultimate certitude rests on faith in contrast to reason, this tradition has admitted that faith precedes reason in establishing certain fundamental truths but that reason and evidence can play some role both in the search for these truths and in the explanation and comprehension of them. The Augustinian slogan, *credo ut intelligam* (I believe in order to know), places the primary emphasis on faith. However, as Augustine's philosophical dialogues show, the recognition of the basic fideistic element may be (and perhaps must be) preceded by a rational search for truth. Once rational inquiry has revealed the need to accept some fundamental principles or beliefs on faith, then it may be possible to show that these commitments are reasonable, probable, or plausible. Purported proofs of the existence of God, metaphysical systems interpreting what is accepted on faith, and historical and psychological evidences about the nature of religion and its effects on believers can all be offered as rational explanations or even justifications of what has already been accepted on faith.

Blaise Pascal's presentation in the *Pensées* illustrates this form of fideism. He forcefully argued that the natural capacities of man are inadequate to lead him to any completely certain truth. A man can show that it is unreasonable or unwise to be an atheist but not that it is reasonable to be a theist. Once one has realized the human predicament—man's fundamental need for ultimate truths and his inability to find them—then one is ready to hear God and to accept his revealed Word on faith alone. Once one has faith, one can see the force of the apologetic and psychological evidence for the truth of the Christian religion. Such evidence might then constitute "good reasons" for believing what one has already accepted fideistically.

### FIDEISM IN PHILOSOPHY

A nonreligious analogue of moderate fideism appears in various skeptical philosophical views, such as those of Hume, Bertrand Russell, and George Santayana. Hume's contention that it is belief that "peoples the world," and that everybody lives within his own private belief system, could be considered as a kind of fideism. The ultimate presuppositions by which we live cannot be justified by reason or evidence and are accepted not on religious faith but (to use Santayana's term) on "animal faith." Russell, in his *Human Knowledge*, insisted (on the basis of Hume's arguments) that the fundamental assumptions of science cannot be justified but must be accepted on faith. However, even if one has the mystical skeptical experience Santayana described, of seeing all in doubt, it is still rational investigation that led Hume and his successors to the recognition of the belief factor involved in rational activities. Having discovered this, Hume then showed that one can study the causes of beliefs and that beliefs can be explained even though they can never be justified; working from the basis of a set of "reasonable" beliefs, one can evaluate other beliefs in terms of psychological factors. The philosophical tradition emanating from Hume, then, can be considered as a kind of fideism, sharing some of the characteristics of the moderate fideism of the Augustinian tradition.

### CONTEMPORARY DEVELOPMENTS

At present irrationalistic fideism, especially of the Kierkegaardian variety, is extremely popular, especially among Protestant theologians (partly in reaction to liberal, rationalistic theological tendencies of the nineteenth century). Many theologians have been concerned with man's apparent inability to find any ultimate answers through science, secular political movements, and so forth, and his need to base his ultimate commitment on

faith alone. The existentialist stress on the fundamental absurdity of man's world is part of this movement. The official Catholic position from the time of the Council of Trent to the present remains opposed to the central fideistic thesis, that ultimate beliefs can be established not by reason or evidence but only by faith. However, in a world in which so many optimistic, "reasonable," scientifically supported views have been undermined by the cataclysmic events of the twentieth century, fideism may provide one of the main avenues to some kind of significant belief for the present age. William James's analysis, in his "Will to Believe," of the psychological need for commitment and belief despite the lack of evidence may represent much of the present mood. The religious fideists, however, find James's own faith too tepid, and they seem to be moving more and more to the irrationalist fideism of Kierkegaard, Dostoevsky, and Shestov.

## FIELD, HARTRY

(1956–)

Hartry H. Field was born in Boston. He received his BA in Mathematics at the University of Wisconsin (1967) and his Ph.D. at Harvard (1972) working under Hilary Putnam and Richard Boyd. He has taught at Princeton, USC, CUNY Graduate Center, and NYU, where he is currently Silver Professor of Philosophy. Field is the recipient of, among other awards, a Guggenheim Foundation Fellowship (1979–1980) and the Lakatos prize (1986) for his book *Science without Numbers* (1980). He was elected in 2003 to the American Academy of Arts and Sciences.

Field has made significant contributions in a number of areas. He is best known for his work in philosophy of mathematics and on a variety of issues connected with realism and with the notion of truth. In philosophy of mathematics, Field has defended a version of fictionalism: a view according to which mathematics, which he takes at face value as asserting the existence of numbers, pure sets, and so on, is literally false and cannot be interpreted via a nonliteral reading in such a way that it works out true. Field sees the central argument in favor of realism about mathematics to be its indispensability for formulating and making use of scientific theories, and he proposes to answer this argument by giving an account of the use of mathematics in the sciences that does not require that the mathematics be true: If T is a nominalistic physical theory (roughly, one that makes no mention of mathematical entities), and M is a mathematical theory used to derive consequences from T (an example of such a theory might be a version of set theory that allows

one to treat the objects of T as urelements and that allows the vocabulary of T to appear in the comprehension axioms) then M is said to be conservative over T if any such consequences, if entirely stated in the vocabulary of T, are already (semantic) consequences of T—that is, true in any model of T.

Field points out that people have always expected mathematics to be conservative over physical theories, and that in fact there is good reason to believe it is. The importance of this observation is the following. Suppose P is a physical theory that, like most such theories, is not nominalistic. It may be possible to find a nominalistic theory N, from which one can derive P via definitions and mathematics. It will then follow that P and mathematics are jointly conservative over N. This at least suggests that N captures all the physical content of P, and that the mathematics (together with P itself) is simply a convenient device for drawing out the consequences of N. Following (and significantly extending) techniques familiar to decision theorists and others under the title of "measurement theory," Field succeeded in constructing a natural nominalistic N for the case where P is a form of Newtonian gravitation theory.

Field's project of extending this result to all of physics has stimulated widespread interest in a number of issues. To name just one, Newtonian gravitation, and any theory remotely like it, requires an N that quantifies over sets of points, which may be identified with regions of space; the sense of consequence in which anything about N provable in P + mathematics is already a consequence of N is second-order consequence, thought of as the complete logic of the part-whole relation. This raises interesting questions, both about the extent to which first-order approximations to Field's result are available or convincing, and about whether one can speak about second-order consequence while continuing to be a fictionalist about mathematics. Indeed, the latter question arises for first-order consequence, despite that it is coextensive with a syntactic notion—because a fictionalist about mathematics ought to be a fictionalist about, for example, the claim that a given theory is syntactically consistent. Field has responded to this question with an interesting theory of (purely) logical necessity as a *sui generis* kind of necessity, one that is not explained in terms of models or possible worlds.

Field's earliest work on truth, the essay "Tarski's Theory of Truth" (1972), appeared at a time when Putnam and others were trying to argue for a form of scientific realism that stressed, as against, for example, Thomas Kuhn, the continuity of reference across changing scientific theories. Integral to this view was a conception of reference that

made it a nontrivial question how use of the word “water” brings it about that “water” refers to the particular chemical compound it does, and thereby a nontrivial question, what brings it about that “Water tastes good,” as uttered by an American, is true (beyond the fact that it does taste good). This conception, which sometimes goes (as do many other views) under the name “correspondence theory” (of reference or of truth), contrasts with the “deflationist” idea according to which “‘water’ refers to water (in English)” is nothing more than a straightforward consequence of a natural definition of “refers in English.” In this paper and later related essays, Field forcefully articulated what has turned out to be the most persuasive argument in favor of the need for a correspondence theory: namely, that human success in interacting with the world using language requires a systematic explanation of a kind a deflationist is unable to supply.

It turns out that deflationists have some at least initially plausible responses to this argument, and in fact Field has been increasingly sympathetic to deflationism. One topic he has addressed is what the theory of meaning looks like from a deflationist perspective, given that deflationism needs to sever the apparently intimate connections between meaning and reference. Another has been what a deflationist (or anyone else—but the problem is particularly pressing for deflationists) is to make of situations where it seems correct to say that “there is no fact of the matter”; these include not only areas where philosophers have traditionally debated about realism, but also in borderline cases involving vague expressions like “bald.” Field has presented an appealing picture in which one both abandons excluded middle, and introduces a “determinately” operator into the language. The “determinately” operator is not given a semantics; it is rather understood both through its connections with degrees of belief, and through its relations to a natural non-truth-functional conditional. Field shows that such a language allows one consistently (despite the presence of the “determinately” operator) to introduce a truth predicate  $T$  such that the Tarski sentences (written using the new conditional) work out to be theorems; in fact “ $T(A)$ ” is everywhere substitutable for “ $A$ .”

## FIELDS AND PARTICLES

Broadly speaking, a field is a collection of properties ascribed to regions of space (one might also speak of the region itself as being “the field”); if the properties are quantifiable then the field is a mathematical function of spatial coordinates,  $\Phi(x,y,z)$ . Examples include the temperature at each point of a room, the velocity at each point of a fluid, the gravitational potential, and the electromagnetic field. In contrast—and broadly speaking—particles are entities of which positions are ascribed (and which lack any relevant internal structure). While these will do as broad characterizations, they are inadequate in a number of ways.

### CLASSICAL FIELDS

For instance, one could say that a field theory ascribes positions (and field strengths) to the parts of a field, as a particle theory treats particles. Worse, one can reformulate particle theories (e.g., Isaac Newton, 1642–1727, and Immanuel Kant, 1724–1804) as theories that ascribe mobile particle-sized regions of repulsion to space: as a field theory according to the intuitive distinction. Hence a useful formal characterization adopts the practice of physicists and takes the difference between field and particle theories to be that the former associates infinitely many “degrees of freedom” (kinematically independent variables—the values of  $\Phi$  at each point) with finite regions of space, but the latter only finitely many (the positions and momenta of a finite number of particles in a finite region).

The problem with the broad and formal characterizations of the field is that they ignore historically important distinctions. For instance, Aristotle's (384–322 BCE) plenum (i.e., space full of matter, with no vacuum) ascribes different properties—gravity here, levity there—to regions of space, but one would like to distinguish the modern concept of a field from the ancient plenum. Newton's (1687) gravitational field ascribes to every point of space a quantitative disposition for bodies to move (absent other bodies, if a body were at a point a distance  $r$  from a body of mass  $M$  then it would have acceleration proportional to  $M/r^2$ ), which distinguishes it from the ancient plenum. But understood literally, Newtonian gravity is a force that acts at a distance without mediation, hence Newton took it as a purely mathematical, “effective” description of some unknown underlying physics (which he sought in vain; in the early twenty-first century it is believed to be general relativity). Indeed, arguably the modern conception of the field is of something physical that mediates the long-range interactions between bodies. If so, Michael Faraday's (mid-nineteenth-century) arguments for the reality of the electromagnetic field are crucial. For instance, he distinguished physical from merely mathematical fields according to whether changes propagate at a finite speed or not (i.e., “through” the medium or not).

The atomists (especially Democritus, 460–370 BCE) rejected the plenum, arguing that the physical world could be understood in terms of atoms moving in the void. However, general rejection of the vacuum meant that this idea did not become the foundation of useful science until Descartes (1596–1650); and while he believed in the plenum, he envisioned it to be composed of particles of varying sizes. Although Descartes failed to derive quantitative consequences from atomism, his successors, up to the present, have found it one of the most fruitful ideas in physics.

## QUANTUM FIELDS AND QUANTUM PARTICLES

In the twentieth century, quantum field theory (henceforth “QFT”) was developed, and experimentally tested with unprecedented accuracy, particularly in particle accelerators. Classical fields can be decomposed into a sum of waves of different amplitudes (as a chord can be decomposed into different notes), which means, intuitively speaking, that quantum fields can be decomposed into a sum of waves with quantized (i.e., whole number) amplitudes. In quantum mechanics a wave(-function)

represents a particle (its probability distribution in space), so there is a natural equivalence of a quantum field with a system of quantum particles, with the whole number amplitude of a wave in the decomposition representing the number of particles with that wavefunction. Thus because amplitudes become quantized, QFT is the best theory of both fields and subatomic particles.

However, the particle interpretation is only approximate: The field-particle distinction does not really dissolve in QFT. First, quantum mechanical superposition means that a quantum field may contain an indeterminate number of particles (e.g., two with some probability and three with another), which conflicts with the intuitive idea of a particle. Second, an accelerating observer will decompose a field into waves differently from a nonaccelerating observer; in particular, when the nonaccelerating observer says the field contains no particles, the accelerating observer will say that it does (these are known as “Rindler” particles). There is no contradiction, because if the accelerating observer captures a particle, he or she thereby changes the field to a state that all observers agree contains particles. All the same, the concept of a “particle” does not allow for the absence or presence of particles to be frame-dependent. Finally, there is a theorem that in relativistic QFT it is impossible to localize particles to any finite region; if so, they don't fit the intuitive idea of a particle at all.

According to formal definitions, QFT is a field, not particle theory, because it involves infinitely many degrees of freedom—a fact with profound consequences in quantum mechanics, which are obscured by the particle interpretation. Infinite degrees of freedom mean that there are many quantum versions of a field, some of which may not allow a particle decomposition at all (technically, there are unitarily inequivalent representations of the canonical commutation relations). One might think that observations of particles in the world show that the particle version is the correct one, but because of the Haag-Hall-Whitman theorem there are reasons to think that realistic fields have no particle formulation (technically, there may be no Fock representation of an interacting field). If so, the appearance of particles is presumably explained by the correct version suitably approximating a system of particles. Specifically, there are field states arbitrarily close to states of particles infinitely far apart.

Quantum mechanics can also treat a system of particles, which is (modulo the previous discussion) a field for which the particle content is always definite. Beyond the fact that quantum particles are represented by wavefunc-

tions, there are important differences in the “identities” of classical and quantum particles that the following analogies illustrate. Classical particles are like badges with different pictures on them; the pictures make them distinguishable entities. Some quantum particles—bosons—are like money in the bank: Nothing distinguishes two of the dollars in an account from each other. Other particles—fermions—are like memberships in a particular club: Like money, one membership isn’t any different from another; but unlike dollars, one can only have a single membership. (Technically, fermions satisfy the “exclusion principle”: there can be at most one particle in any state.) To distinguish bosons and fermions, they are called “quanta”; however, these analogies fail to reveal that quantum mechanics allows other kinds of particles—“quarticles”—that differ from both quanta and classical particles.

## FILMER, ROBERT

(c. 1588–1653)

Robert Filmer, the English political writer and theorist of the divine right of kings, was an early expositor of the patriarchal account of the state and of society. He was a country gentleman of the county of Kent but also

belonged to the intellectual society of London and had some connection with the Court. He was an associate of prominent lawyers and historians, such as John Selden and Sir Henry Spelman, of the orthodox clergy, and of the Jacobean poets and literati too, including George Herbert and possibly John Donne. His absolutist views on political matters may have been acquired while he was at Trinity College, Cambridge, or at the Inns of Court and were developed well before the outbreak of the Civil War between the king and Parliament in 1642. In this he resembles Thomas Hobbes, his contemporary, but Filmer wrote his works for circulation in manuscript among his London acquaintances and the manor houses of Kent rather than for publication in print. Although his family was engaged on the side of the king in the struggle with Parliament in the 1640s and although he himself suffered considerable losses, Sir Robert never actually fought with the royalist forces and even pleaded neutrality, which has since been looked upon as inconsistency in the conduct of an extreme defender of royalist claims. His neutrality did not prevent his being sent to prison for a time.

Filmer’s importance in the history of thought rests almost entirely on the fact that John Locke’s work on political theory, the famous *Two Treatises of Government*, was directed against him, though it was not published until 1689, nearly forty years after Filmer’s death. It has only recently been shown how extensive was Locke’s preoccupation with Filmer, in the second of his treatises as well as in the first. But the social theorists of the present day are also interested in Filmer’s thinking as an expression of traditional patriarchal attitudes toward authority and social structure. The relationship between Locke and Filmer has become the classic example of a rationalist-critical political system (the Lockean) confronting an ideological-determinist outlook (the Filmer view).

It has not been possible, however, to see in Filmer simply a “codifier of unconscious prejudice,” as he has been called. He was remarkably enlightened in some of his views, especially as to witchcraft, and wrote with surprising urbanity rather as a critical reviewer of the political works current in his time than as the solemn expositor of outraged orthodoxy. Those of his works he himself had printed, mainly reviews of Aristotle, John Milton, Hugo Grotius, and Hobbes, are brief and pointed, and it is, perhaps, significant that he refused to publish the only concerted exposition of his political theory, the famous *Patriarcha; or the Natural Power of Kings* (London, 1680), from which all the others derive. He may have thought his political theory too extreme in its earlier, positive form.

*Patriarcha*, which was composed for the gentry of Kent in the 1630s, asserts that every individual is absolutely bound to obey the political authority established in his country because that authority enjoys by divine decree the powers originally conferred on Adam at the creation over his wife, his children, and their descendants eternally. From this view of the Old Testament it follows that males are always superior to females, the elder to the younger, and that all humans are naturally—physiologically—related to each other. Society is a family, descended from one single male individual. All men are born, and always remain, unfree and unequal, and consent is irrelevant to political association. Political society is also universal, for there are no humans who are not descended from Adam. A prepolitical state of nature makes no sense at all, nor does any idea of a contract to replace such a condition by political society. Property as well as political power is distributed according to God's patriarchal decrees and belongs absolutely to the person who inherits it or to whom it has been given.

These social and political doctrines are original only in the sense that Filmer combined together many positions held by his predecessors, notably those of the French legal theorist Jean Bodin, those of the bishops of the Anglican Church, and especially those of its royal head, King James I. These views are acceptable only to a naively fundamentalist believer in the Christian scriptures, and Locke had no difficulty in demolishing all the “glib nonsense,” as he called it, about the kingship of Adam and its descent to the Stuart kings, to the usurper Oliver Cromwell, to any man or group lucky enough to seize power. Nevertheless, there was rather more to Filmer's “rope of sand” than Locke wished to admit, and in Filmer's shrewd remarks about the historical absurdities of a state of nature and in his very acute analysis of majority rule he raised difficulties that Locke never satisfactorily overcame.

Filmer demanded to know how an assembly convened for the purpose of making a universal contract could ever proceed to a valid vote of everyone with the right to vote. There would be bound to be absentees, and when it came to original multitudes voting to set up a government, the rights of some individuals would inevitably be overrun. What about servants, women, children, and the sick? Locke blandly responded by dogmatically asserting that in “one Body Politick the Majority have the Right to act and conclude the rest” (*Second Treatise*, 95). Filmer's doctrine of property seems to have impelled Locke into the formulation of the labor theory

of value, with all its enormous consequences in social thinking.

Filmer's doctrines by no means disappeared with the Glorious Revolution of 1688 and the victory of Lockean rationalism. His arguments were persuasively restated by Jonathan Boucher in championship of the Tories at the American Revolution, and again by George Fitzhugh in defense of the South in the 1850s. Filmer remains the most valuable literary source for traditional European preindustrial patriarchal political attitudes.

## FINK, EUGEN

(1905–1975)

Eugen Fink was born and first educated in Konstanz, where his reading in philosophic classics (Giordano Bruno, Kant, and Nietzsche) began in the Gymnasium. He took up the formal study of philosophy at Freiburg in 1925 during a period of extraordinary richness: Edmund Husserl, in the chair previously held by Wilhelm Windelband and Heinrich Rickert, was at his peak in both philosophic labor and renown when he retired in 1928; he was succeeded by Martin Heidegger—Husserl's own choice—after several years at Marburg. Fink's dissertation under Husserl was completed in December 1929 with Heidegger as coevaluator (*Korreferent*), at a point in time when a

long-smoldering break between Husserl and Heidegger was fully manifest.

On Husserl's retirement he chose Fink as second research assistant, alongside Ludwig Landgrebe—who had been Husserl's assistant since 1923. As Landgrebe turned to his Habilitation, he relinquished his assistantship with Husserl (March 1930), and Fink, who was just then entering more closely into Husserl's regimen of work, became not only sole assistant with Husserl in his retirement, but indispensable. Their daily walks in the hillside park near Husserl's residence and the tasks Husserl had Fink take up in furthering and consolidating Husserl's manuscript studies made for a unique philosophic collaboration. Husserl drove himself to produce manuscript after manuscript in an effort to present new work to the public to demonstrate the breadth, solidity, and relevance of his phenomenology in the face of Heidegger's ascendancy, and Fink worked at projects of integration, critique, and recasting so as to bring Husserl's massive output to coherence and philosophic clarity. In particular, he was able—as Husserl was not—to come to terms in phenomenology with Heidegger's thinking, along with that of others such as Hegel and Nietzsche, who had not really figured into Husserl's consideration. At the same time, Fink worked on writings that would counter two misperceptions: that transcendental phenomenology was a brand of idealism not much different from neo-Kantianism, and that Husserl's logic-driven abstractness was incapable of dealing with the existential trenchancy of actual life in the world.

Fink's essay in *Kantstudien* (1933), "The Phenomenological Philosophy of Edmund Husserl and Contemporary Criticism" (Elveton 2003), attempted to counter the first misperception, and was widely influential upon the French grasp of Husserl's phenomenology, most notably in the work of Gaston Berger and Maurice Merleau-Ponty. Unfortunately National Socialism's taking power in January of 1933 cut short Fink's providing a similar defense against the second misperception, influentially expressed in Georg Misch's *Lebensphilosophie und Phänomenologie: eine Auseinandersetzung der Diltheyschen Richtung mit Heidegger und Husserl* (1931). At the same time, Fink's Habilitation project, "Sixth Cartesian Meditation: The Idea of a Transcendental Theory of Method," was prevented from being pursued in that it purveyed "Jewish" philosophy, namely Husserl's. Fink recounts that, as he was not of Jewish background, Nazi authorities tried to get him to abandon his work

with Husserl. He would not, and as a result lost all prospects for an academic future in Germany. He remained with Husserl until Husserl's death in April 1938. During that time he managed to get but two articles published, the *Kantstudien* essay, appearing just as that journal was being "coordinated" to Nazi policy, and "What Does the Phenomenology of Edmund Husserl Want to Accomplish?" in *Die Tatwelt* (1934), a cultural review edited by one of the few resistance circles in Freiburg around the well-known political economist Walter Eucken. It was only in 1939, after Fink emigrated to Belgium subsequent to Husserl's death, that he was again able to publish his work; but that was not to last long.

Nevertheless, it was Fink's contribution to the ongoing final development of Husserl's phenomenological program that must be noted. The unpublished "Sixth Meditation" was read and reread by Husserl, bringing home to him the need to be theoretically self-critical about the status and character of transcendental assertions. More concretely, Fink's drafts of projects he was involved in with Husserl—paradigmatically exemplified in the two-volume German edition of the "Sixth Meditation" (Fink 1988)—showed how earlier formulations of transcendental phenomenology needed radical recasting in order for their philosophic sense to stand forth in coherence and relevance. Here one can see Fink's ability both to develop an integrative perspective on Husserl's work and to make the critical moves that would express the philosophic core of transcendental phenomenology, an ability for which Husserl valued Fink's "cophilosophizing" so highly.

Upon Husserl's death in 1938, the visit of the Belgian Franciscan, Herman Leo Van Breda, in search of materials for his dissertation, led to Van Breda's finding a way to move out of Germany all Husserl's manuscripts as well as his entire library. Van Breda also arranged for Malvine Husserl, now widowed, as well as Fink and Landgrebe, to emigrate to Louvain. This was accomplished by the spring of 1939, and the Husserl Archives were born; and, as it happened, Maurice Merleau-Ponty became the first visitor to consult Husserl's manuscript materials in its new home at the University of Louvain (April 1–6, 1939). Here Fink finally began university lecturing, and the work of transcribing and interpreting Husserl's shorthand manuscripts began anew, only to be ended in May 1940 with Germany's attack upon the Low Countries and the onset of a Europe-wide world war. By the end of that year, Fink and Landgrebe were back in Germany, excluded from university involvement.

After the war's end in 1946 Fink was given a beginner's position as lecturer at Freiburg University, and in 1948 finally took up there a newly established chair in *Philosophie und Erziehungswissenschaft*. Fink's work after the war was unlike that of others influenced by Husserl. Rather than explicate Husserl's writings, in the books of his own thinking he turned to developing the dimension of the phenomenological program that he found Husserl had left too implicit and unrealized, what he termed the "speculative" component of the program, the overarching philosophical sense of its findings (Fink 1957, 1958, 1960). He did, however, occasionally present essays on Husserl (Fink 1976) that were highly respected and accorded high authority—given his intimacy with Husserl's thinking; but these papers stood in some contrast to dominant interpretations other scholars made of phenomenology. Ultimately in his writings and lecturing Fink dedicated himself to ways of awakening listeners to philosophical questioning. Rather than establishing definitive theses, it was the ever-increasing radicality of realizing what lay in philosophical problems, what was at issue in them, that mattered most. He kept apart from the various postwar philosophical currents and avoided fostering a following of disciples. Heidegger was one who especially appreciated discussions with him, and his closest philosophical comrade was Jan Patočka, of unique renown and importance for his underground seminars in Prague under Communist rule.

## FIRST-ORDER LOGIC

First-order logic is a bag of tools for studying the validity of arguments. At base it consists of a family of mathematically defined languages called *first-order languages*. Because these languages are constructed to be "logically perfect" (in Gottlob Frege's phrase), we can guarantee from their grammatical form that certain arguments written in these languages are valid. Separately from this we can study how arguments in English or any other natural language can be translated into an appropriate first-order language. It was Gottfried Wilhelm Leibniz who in the 1680s first proposed to divide the study of arguments into a mathematical part and a translational part, though his notion of mathematical languages was barely adequate for the purpose. First-order languages first came to light in the work of Charles S. Peirce in the 1880s; his name for them was "first-intentional logic of relatives." It took some time to develop a satisfactory mathematical description of these languages. David Hilbert achieved this in his lectures at Göttingen in 1917–1922, which appeared in an edited form in his book *Grundzüge der Theoretischen Logik* with Wilhelm Ackermann. Many logicians reckon that the appearance of this book in 1928 marked the true birth of first-order logic.

### LOGIC AND ARGUMENTS

For purposes of this article an argument consists of one or more sentences of English, then the word "Therefore," and then a sentence. The sentences before "Therefore" are called the *premises* of the argument and the sentence at the end is called its *conclusion*. We say that the argument is *valid* if the conclusion follows from the premises, and *invalid* otherwise. Logic is the study of valid arguments. Typical questions of logic are: Which arguments are valid

and which are invalid? How can we construct valid arguments?

We shall study these questions with the help of first-order languages. First-order languages differ from natural languages in several ways. One is that their vocabulary and grammar are precisely defined. A second and equally important difference is that they contain expressions that we can interpret in a range of possible ways, and the range is determined by the grammatical form of the expressions.

Take for example the first-order sentence

$$(1) \quad \forall x (P(x) \rightarrow Q(x)).$$

The part in brackets,

$$(2) \quad (P(x) \rightarrow Q(x)),$$

is read “If  $P(x)$  then  $Q(x)$ ” and for the moment we can read “ $\forall x$ ” as “Whatever  $x$  may be.” Here there is no object named “ $x$ .” Rather, “ $x$ ” is a variable ranging over a class of possible objects. We call this class the *domain of quantification*, or more briefly the *domain*. The domain is not supplied with the sentence itself; when somebody uses the sentence to make a statement, we have to be told what domain the user of the sentence intended.

We also have to be told how the expressions “ $P(x)$ ” and “ $Q(x)$ ” are interpreted. For the whole sentence (1) to make sense, each of these expressions must translate into a *predicate*, that is, an English sentence with the variable “ $x$ ” standing where we could have put a name; for example

$$(3) \quad x \text{ is a town in Italy.}$$

$$(4) \quad \text{The number } 5 + 3 \text{ is equal to } x.$$

$$(5) \quad \text{The father of } x \text{ is a pianist.}$$

But there is a further requirement. It must be possible to paraphrase the predicate into the form

$$(6) \quad x \text{ is a member of } S$$

where  $S$  names a particular class of objects in the domain. For example the sentences (3)–(5) paraphrase as follows:

$$(3)' \quad x \text{ is a member of the class of towns in Italy.}$$

$$(4)' \quad x \text{ is a member of the class of numbers that } 5 + 3 \text{ is equal to.}$$

$$(5)' \quad x \text{ is a member of the class of individuals whose fathers are pianists.}$$

To see why this restriction is needed, consider my father-in-law Marcus Ward, who was born on July 4th. He used to reason:

$$(7) \quad \text{Americans celebrate July 4th. July 4th is the birthday of Marcus Ward. Therefore: Americans celebrate the birthday of Marcus Ward.}$$

This conclusion gave him constant pleasure. Unfortunately the argument is unsound. The predicate

$$(8) \quad \text{Americans celebrate } x$$

allows two paraphrases into class form:

$$(9) \quad x \text{ is in the class of events celebrated by Americans.}$$

$$(10) \quad x \text{ is in the class of days of the year celebrated by Americans.}$$

On the first paraphrase, the second premise of the argument breaks down; the event that the Americans celebrate is not Marcus Ward’s birthday. On the second paraphrase, the conclusion holds but not in the sense that pleased my father-in-law. Requiring a translation into classes is very effective for detecting ambiguities in arguments.

Returning to the sentence (1) we can interpret “ $P(x)$ ” and “ $Q(x)$ ” by saying what the classes in question are. So in an obvious notation, here is an interpretation of the first-order sentence above:

(11)	domain	the class of people now living
	$P$	the class of pianists
	$Q$	the class of musicians

On this interpretation the sentence (1) expresses that among all people now living, the pianists are musicians. Under this interpretation the sentence is true. Another possible interpretation is

(12)	domain	the class of people now living
	$P$	the class of musicians
	$Q$	the class of pianists

Under this second interpretation the sentence (1) is false; there are musicians who are not pianists. A crucial fact about first-order languages is that their sentences may change from true to false, or vice versa, when their interpretation is changed.

There are many first-order languages. Their common core consists of the following symbols, known as the *logical symbols*.

(13)

symbol	$\neg$	$\wedge$	$\vee$	$\rightarrow$
read as	'not'	'and'	'or'	'if...then'
alternative	$\sim$	$\&$		$\supset$

(symbol)	$\leftrightarrow$	$\forall x$	$\exists x$	$=$
(read as)	'if and only if'	'for all $x$ '	'there is $x$ '	'equals'
(alternative)	$\equiv$	$(x), \wedge x$	$(\exists x), \vee x$	

The third row of the table lists the commonest alternative notations, though in this entry we will use only the symbols on the top row.

Besides the logical symbols, each first-order language has its own collection of *nonlogical symbols*, sometimes known as *primitives*. These are symbols such as “ $P$ ” and “ $Q$ ” above. The nonlogical symbols need to be interpreted, and the language carries a rule specifying what kinds of interpretation are allowed. The set of all nonlogical symbols of a language, together with the information what kinds of interpretation are allowed, is called the *signature* of the language. An *interpretation* of the language consists of a domain and allowed interpretations of all the symbols in the signature of the language.

Below we shall see what kinds of nonlogical symbol a first-order language can have. But before we do that, we shall define a notion that brings us back to the difference between valid and invalid arguments.

Suppose  $L$  is a first-order language and  $\phi_1, \dots, \phi_n, \psi$  are sentences of  $L$ . Then the expression

(14)  $\phi_1, \dots, \phi_n \models \psi$

means that if  $I$  is any interpretation of  $L$  and all of  $\phi_1, \dots, \phi_n$  are true under  $I$ , then  $\psi$  is also true under  $I$ . We call the expression (14) a *semantic sequent*, or for short a *sequent*. We say that (14) is *valid* if it is true, and *invalid* otherwise. The sentences  $\phi_1, \dots, \phi_n$  are called the *premises* of the sequent, and  $\psi$  is called its *conclusion*.

An example of a valid sequent, using the kinds of symbol that we have already seen, is

(15)  $\forall x(P(x) \rightarrow Q(x)), \forall x(Q(x) \rightarrow R(x)) \models \forall x(P(x) \rightarrow R(x)).$

In any interpretation  $I$ , the first sentence of (15) expresses that the class assigned to “ $P$ ” is a subclass of the class

assigned to “ $Q$ ,” and the second sentence expresses that the class assigned to “ $Q$ ” is a subclass of the class assigned to “ $R$ .” If these two sentences are true then it follows that the class assigned to “ $P$ ” is a subclass of the class assigned to “ $R$ ,” and hence the conclusion of (15) is true under interpretation  $I$ . So (15) is valid.

Now suppose we have an argument written or spoken in English. Suppose also that we can find a suitable first-order language  $L$ , sentences  $\phi_1, \dots, \phi_n$  of  $L$  and an interpretation  $I$  of  $L$ , such that under the interpretation  $I$  the sentences  $\phi_1, \dots, \phi_n$  are translations of the premises of the English argument and  $\psi$  is a translation of its conclusion. Suppose finally that we have a proof that

(16)  $\phi_1, \dots, \phi_n \models \psi.$

is a valid sequent. Then via the translation from English to  $L$  our proof shows that if the premises of the argument are true, its conclusion must also be true. In short we have shown that the English argument is valid.

The following example appears as an exercise in Richard Whately’s logic textbook of 1826:

(17) A negro is a man; therefore he who murders a negro murders a man.

This argument seems to defy the logical tools available in 1826; in fact some years later Augustus De Morgan challenged the logicians of his age to develop a logic that does recognize such arguments. There is no record of how Whately expected his students to solve (17), but at least for first-order logic it is straightforward. The main step is to introduce symbols whose interpretations are predicates with two variables:

(18)

domain	the class of living beings (for example)
$N(x)$	$x$ is a negro
$M(x)$	$x$ is a man
$R(x, y)$	$x$ murders $y$

(We need the variables on the left side of (18) to distinguish between “ $x$  murders  $y$ ” and “ $y$  murders  $x$ .”) Again we insist that there is a translation into classes. For example we can paraphrase “ $x$  murders  $y$ ” by

(19) The pair of objects  $(x,y)$  lies in the class of all ordered pairs of objects such that the first murders the second.

Classes of this kind, whose members are ordered pairs, are called *relations*. Now Whately’s argument translates into first-order sentences as follows:

$$(20) \quad \forall x(N(x) \rightarrow M(x)) \models \forall x(\exists y(N(y) \wedge R(x,y)) \rightarrow \exists y(M(y) \wedge R(x,y))).$$

Here the premise has a form that we have already considered. We can read “ $\exists y$ ” as “There is something, call it  $y$ , such that,” and we can read “ $\wedge$ ” as “and.” So the conclusion says: For every living being  $x$ , if there is a negro  $y$  such that  $x$  murders  $y$ , then there is a man  $y$  such that  $x$  murders  $y$ . Now one can show that under every interpretation if the premise of (20) is true then the conclusion is true. So Whately’s argument is valid.

If we fail to find a translation of an English argument into a valid first-order sequent, this does not prove that the original argument was invalid. It could be that the argument is valid but a more powerful language than first-order is needed to show this. It could be that there is a suitable first-order sequent but we simply failed to find it.

PROPOSITIONAL LOGIC

Before we define the languages of first-order logic, we should examine a simpler logic called *propositional logic* or *sentential logic*. It uses the symbols  $\neg, \wedge, \vee, \rightarrow$  and  $\leftrightarrow$  but not  $\forall$  or  $\exists$  or  $=$ .

In “classical” propositional logic we consider meaningful sentences that are either true or false. We say that their *truth value* is Truth (T for short) if they are true, and Falsehood (F for short) if they are false. There are also “many-valued” propositional logics that allow three or more truth values; we shall not consider these.

If  $\phi$  is any sentence, we can form a new sentence  $\neg\phi$  by writing the negation sign “ $\neg$ ” immediately in front of  $\phi$ . We stipulate that  $\neg\phi$  is true if  $\phi$  is false, and false if  $\phi$  is true. For example

$$(21) \quad \neg \text{Today is Tuesday.}$$

expresses

$$(22) \quad \text{It is not true that today is Tuesday.}$$

We read the symbol “ $\neg$ ” as “not,” and  $\neg\phi$  is called the *negation* of  $\phi$ . Likewise if  $\phi$  and  $\psi$  are sentences, we can form a sentence  $(\phi \wedge \psi)$ , and we stipulate that  $(\phi \wedge \psi)$  is true if and only if both  $\phi$  and  $\psi$  are true. For example we can form

$$(23) \quad (\text{Today is Tuesday} \wedge \text{The paper is not yet finished}),$$

and this sentence expresses

$$(24) \quad \text{Today is Tuesday and the paper is not yet finished.}$$

The sentence  $(\phi \wedge \psi)$  is called the *conjunction* of  $\phi$  and  $\psi$ , and the sentences  $\phi$  and  $\psi$  are its *conjuncts*. We read the symbol “ $\wedge$ ” as ‘and.’

The remaining logical symbols of propositional logic have similar explanations. They all form new sentences from old ones, and in each case we stipulate the truth value of the new sentence in terms of the truth values of the old ones. The following table records these stipulations:

(25)	$\phi$	$\psi$	$\neg\phi$	$(\phi \wedge \psi)$	$(\phi \vee \psi)$	$(\phi \rightarrow \psi)$	$(\phi \leftrightarrow \psi)$
(i)	T	T	F	T	T	T	T
(ii)	T	F		F	T	F	F
(iii)	F	T	T	F	T	T	F
(iv)	F	F		F	F	T	T

We read the table as follows. Suppose for example that  $\phi$  is the sentence “Today is Tuesday” and  $\psi$  is the sentence “The paper is not yet finished.” If  $\phi$  is true and  $\psi$  is false, then we are in row (ii) of the table. In this row there is F below  $(\phi \wedge \psi)$ , and this tells us that the sentence

$$(26) \quad (\text{Today is Tuesday} \wedge \text{The paper is not yet finished})$$

is false. Likewise for the other rows and formulas.

We call  $(\phi \vee \psi)$  the *disjunction* of  $\phi$  and  $\psi$ ; the sentences  $\phi$  and  $\psi$  are its *disjuncts*. The symbol ‘ $\vee$ ’ can be read as ‘or.’ But notice that  $(\phi \vee \psi)$  is true when both  $\phi$  and  $\psi$  are true; so in some circumstances a safer reading of  $(\phi \vee \psi)$  is ‘Either  $\phi$  or  $\psi$ , or both.’

The symbol “ $\leftrightarrow$ ” can be read safely as “if and only if.”

There remains the symbol “ $\rightarrow$ ,” sometimes known as *material implication*. The one case where  $(\phi \rightarrow \psi)$  is false is where  $\phi$  is true and  $\psi$  is false, and this suggests reading  $(\phi \rightarrow \psi)$  as “If  $\phi$  then  $\psi$ .” In mathematical contexts this reading generally works well. But note that we also have T in the bottom two rows of the table below  $(\phi \rightarrow \psi)$ , so that this sentence counts as true whenever  $\phi$  is false, whether or not there is any connection between  $\phi$  and  $\psi$ . For example the following sentence is true on any day of the week:

$$(27) \quad (\text{Three plus three is two} \rightarrow \text{Today is Tuesday})$$

Likewise  $(\phi \rightarrow \psi)$  is true whenever  $\psi$  is true, and so the following sentence is also true on any day of the week:

(28) (Today is Tuesday  $\rightarrow$  Three plus three is six)

These properties of " $\rightarrow$ " are sometimes referred to as the *paradoxes of material implication*—though really they are not so much paradoxes as puzzles about how to translate " $\rightarrow$ " into English.

The symbols " $\neg$ ," " $\wedge$ ," " $\vee$ ," " $\rightarrow$ ," and " $\leftrightarrow$ " are known as the *propositional operators*. We can build up complex sentences by using the propositional operators any number of times. But first it is helpful to introduce so-called *propositional symbols*

(29)  $p, q, r, p_0, p_1, p_2, \dots$

which can stand as abbreviations of any sentence. Thus we can form sentences

(30)  $\neg p, ((p \rightarrow q) \wedge r), (p \vee \neg q), \neg\neg p_2$

and so on. The *sentences of propositional logic* are the propositional symbols and all the complex sentences that can be built up from them using the propositional operators. The table (25) tells us when each of these sentences is true, as soon as we know what truth values to assign to the propositional symbols in them. Take  $((p \rightarrow q) \wedge r)$ , for example. It uses three propositional symbols. Each of these three symbols could stand for a true sentence or a false one, and so there are eight possible cases that we can list as follows.

(31)

$p$	$q$	$r$
T	T	T
T	T	F
T	F	T
T	F	F
F	T	T
F	T	F
F	F	T
F	F	F

For each row we can evaluate the truth value of  $((p \rightarrow q) \wedge r)$  by starting at the propositional symbols and working

upwards to more complex sentences, reading values from the table (25). Thus:

(32)

$p$	$q$	$r$	$((p \rightarrow q) \wedge r)$				
T	T	T	T	T	T	T	T
T	T	F	T	T	T	F	F
T	F	T	T	F	F	F	T
T	F	F	T	F	F	F	F
F	T	T	F	T	T	T	T
F	T	F	F	T	T	F	F
F	F	T	F	T	F	T	T
F	F	F	T	T	F	F	F

(i) (iv) (ii) (v) (iii)

On the right the columns below the propositional symbols copy the truth values from the left side of the table. The column below a propositional operator gives the truth values of the sentence formed by introducing this operator; for example the table below " $\rightarrow$ " gives the truth values of  $(p \rightarrow q)$ . The numbers at the bottom of the table show a possible order for working out the columns. The final column calculated, number (v), gives the truth value of the whole sentence in each of the eight cases listed on the left. The table

(33)

$p$	$q$	$r$	$((p \rightarrow q) \wedge r)$				
T	T	T					T
T	T	F					F
T	F	T					F
T	F	F					F
F	T	T					T
F	T	F					F
F	F	T					T
F	F	F					F

is called the *truth table* of the sentence  $((p \rightarrow q) \wedge r)$ .

We say that a sentence of propositional logic is a *tautology* if its truth table has T in every row, and a *contradiction* if its truth table has F in every row.

Suppose  $\phi$  is a tautology and suppose also that we replace each propositional symbol in  $\phi$  by an English sentence (the same English sentence for each occurrence of the same propositional symbol), creating a sentence  $S$ . Then  $S$  must be true since the truth values of the English sentences will indicate a particular row of the truth table, and we know that the value in this row must be T since  $\phi$  has T in every row. Generally  $S$  will be a mixture of English and propositional operators. But we can translate  $S$  into a sentence  $S'$  of English, for example translating the propositional operators as suggested above but with due caution. Since  $S'$  is a translation of  $S$ , it has the same truth value, and we saw that this value has to be Truth. In short  $S'$  will be a necessary truth in English.

Here are some tautologies.

- (34)  $((p \wedge q) \rightarrow p)$
- $((p \wedge q) \rightarrow q)$
- $(p \rightarrow (p \vee q))$
- $(q \rightarrow (p \vee q))$
- $(p \rightarrow (q \rightarrow p))$
- $((p \rightarrow q) \rightarrow ((q \rightarrow r) \rightarrow (p \rightarrow r)))$ .
- $((p \rightarrow q) \wedge p) \rightarrow q$
- $((p \leftrightarrow q) \rightarrow (p \rightarrow q))$
- $(\neg\neg p \rightarrow p)$
- $((p \wedge \neg p) \rightarrow q)$
- $((p \rightarrow q) \rightarrow p) \rightarrow p$

A possible translation of the first of these tautologies into English is “If the light is broken and the switch is on, the light is broken.” This sentence has to be true in any situation in which each of the sentences “The light is broken” and “The switch is on” has a truth value, regardless of what these truth values are.

Suppose  $\phi$ ,  $\psi$  and  $\chi$  are sentences of propositional logic. As above, the expression

(35)  $\phi, \psi \models \chi$

is called a (semantic) *sequent*. We say that it is *valid* if in every case where  $\phi$  and  $\psi$  are true,  $\chi$  is also true. It’s easy to calculate from the truth tables of  $\phi$ ,  $\psi$  and  $\chi$  whether or not the sequent (35) is valid. As with tautologies we can

translate the sentences  $\phi$ ,  $\psi$  and  $\chi$  simultaneously into sentences of English, by choosing sentences to replace the propositional symbols and then paraphrasing to remove the propositional operators. The result is an English argument, if we write “Therefore” in place of  $\models$ . Suppose we have a proof that the sequent (35) is valid (for example, by truth tables). Then this proof shows that if the premises of the English argument are true, its conclusion must be true too. In this way we justify the English argument.

For example we can justify the English argument

- (36) If sending abusive e-mails is an offense, then Smith has just committed an offense. Sending abusive e-mails is an offense. Therefore: Smith has just committed an offence.

by proving that the following sequent is valid:

(37)  $(p \rightarrow q), p \models q$

In fact it is valid, as truth tables quickly show. Since this sequent corresponds to indefinitely many other English arguments too, we should think of it as a rule of argument rather than an argument in itself. Logicians sometimes express this point by saying that in logic we study forms of argument rather than individual arguments.

### TRANSLATING BETWEEN ENGLISH AND FIRST-ORDER LOGIC

Translations from first-order logic to English are generally straightforward; the problem is to make the English version digestible. But for assessing English arguments we need translation in the other direction, and this can be hazardous.

**NOUN PHRASES.** Proper names with singular meaning can go over into constants. For example the interpretation

(38)  $\begin{array}{l|l} a & \text{the Pyrenees range} \\ b & \text{France} \\ c & \text{Spain} \\ R(x_1, x_2, x_3) & x_1 \text{ is between } x_2 \text{ and } x_3 \end{array}$

(with any suitable domain supplied) allows us to make the translation

(39) The Pyrenees lie between France and Spain.

$$R(a, b, c)$$

Complex singular noun phrases such as “my father” are in general more complicated to translate. In first-order logic we are allowed to use function symbols, as  $F$  in the interpretation and translation

(40)	$a$	Lloyd George
	$b$	me
	$F(x_1)$	the father of $x_1$
	$R(x_1, x_2)$	$x_1$ knew $x_2$

(41) Lloyd George knew my father.

$$R(a, F(b))$$

But there is a catch. The requirement that first-order languages should be “logically perfect” implies that if “ $a$ ” names any element of the domain of an interpretation, the expression  $F(a)$  should also name an element of the domain. So the domain to be supplied for (40) above must contain not only me but my father, my father’s father, my father’s father’s father, and so on. Worse still, to adapt an example from Frege, if for any reason the domain contains the moon, it must also contain the father of the moon!

For such reasons, one hardly ever meets function symbols in first-order logic outside mathematical contexts. Even there caution is needed. For example in studying number fields one would like to have a “multiplicative inverse” function taking 2 to 1/2, 3 to 1/3, and so on; but 1/0 is undefined.

A common solution is to use, instead of a function symbol, a relation symbol with one more argument place:

(42)	$a$	Lloyd George
	$b$	me
	$P(x_1, x_2)$	$x_1$ the father of $x_2$
	$R(x_1, x_2)$	$x_1$ knew $x_2$

(43) Lloyd George knew my father.

$$\exists x(P(x,b) \wedge R(a,x))$$

This raises a further problem: If the implication that I have exactly one father plays any role in an argument using this sentence, then our translation by (42) fails to convey this implication. Here we need to call in Bertrand Russell’s analysis of definite descriptions.

According to Russell’s analysis, a sentence of the form “The  $X$  is a  $Y$ ” paraphrases as

(44) At least one thing is an  $X$ , at most one thing is an  $X$ , and everything that is an  $X$  is a  $Y$ .

We can translate this directly into first-order symbols, but the following paraphrase is neater:

$$(45) \quad \exists z(\forall x(x \text{ is an } X \leftrightarrow x = z) \wedge z \text{ is a } Y).$$

A major problem with Russell’s analysis is that it assumes we can choose the domain of the interpretation in such a way that it contains a unique  $x$ . But there are other requirements on the domain; all the quantifiers in the first-order sentence range over it. These requirements may clash. In everyday English we use the phrase “the  $X$ ” in situations in which there is one “salient”  $X$  (see for example David Lewis), and to do justice to this in a first-order translation we need to make explicit what makes a certain individual “salient.”

NOUN PHRASES THAT CONTAIN QUANTIFIER WORDS LIKE “EVERY.” We can handle some cases by paraphrasing:

(46)	$P$	the class of prime numbers greater than two
	$Q$	the class of odd numbers

(47) Every prime number greater than two is odd.

Every object, if it is a prime number greater than two, is an odd number.

$$\forall x(P(x) \rightarrow Q(x))$$

(48) Some prime numbers greater than two are odd.

$$\exists x(P(x) \wedge Q(x)).$$

If we wanted “some” to imply “more than one” in this example, we would need a longer paraphrase using “=“:

$$(49) \quad \exists x \exists y (P(x) \wedge Q(x) \wedge P(y) \wedge Q(y) \wedge x \neq y)$$

(“ $x \neq y$ ” is a standard abbreviation for “ $\neg(x = y)$ .”) Likewise we can express that there are at least three odd numbers:

$$(50) \exists x_1 \exists x_2 \exists x_3 (x_1 \neq x_2 \wedge x_1 \neq x_3 \wedge x_2 \neq x_3 \wedge Q(x_1) \wedge Q(x_2) \wedge Q(x_3))$$

Using “ = ” in analogous ways, first-order logic is equipped to express things like “There are exactly ten million Xs.”

**CONDITIONALS.** The nub of the paradoxes of material implication may be that in real life as opposed to mathematics, sentences play many roles besides being true or false. Paul Grice argued that when we make the appropriate distinction between “what is said” and “what is implicated,” there remains no difference in meaning between ‘If  $\phi$  then  $\psi$ ’ and  $(\phi \rightarrow \psi)$ . On the other side, Dorothy Edgington pointed out that

$$(51) ((p \rightarrow q) \vee (\neg p \rightarrow q))$$

is a tautology, and drew the following consequence of reading “  $\rightarrow$  ” as “If ... then”:

(52) ... if I reject the conditional “If the Conservatives lose, Thatcher [the leader of the Conservative party] will resign,” I am committed to accepting “If the Conservatives win, Thatcher will resign”!

She found this consequence implausible.

**ADVERBS.** Consider the argument

(53) Nadia accidentally poisoned her father. Therefore:  
Nadia poisoned her father.

The obvious first-order translations of “Nadia poisoned her father” don’t allow us to add further information like “accidentally” or “last Wednesday” or “with strychnine.” Peirce in 1892 suggested a way around this problem, namely to talk explicitly about actions. Thus:

(54) $n$	Nadia
$f$	Nadia’s father
$A(x_1, x_2)$	$x_1$ is an action that was performed by $x_2$
$P(x_1, x_2)$	$x_1$ is an action of poisoning $x_2$
$U(x_1)$	$x_1$ is accidental

$$(55) \exists x (A(x, n) \wedge P(x, f) \wedge U(x)) \models \exists x (A(x, n) \wedge P(x, f))$$

Donald Davidson and others have independently revived Peirce’s suggestion in connection with the semantics of natural languages.

Peirce comments that his translation consists in “catching one of the transient elements of thought upon the wing and converting it into one of the resting places of the mind.” This is more than idle whimsy. Peirce’s point is that in order to formalize arguments like (53), we sometimes need to introduce abstract objects—in his case, actions—into the domain.

A different kind of example to illustrate Peirce’s point is the sentence

(56) For every drop of rain that falls a flower grows.

(George Boolos.) Taken literally, this statement implies that there at least as many flowers as raindrops. If we wanted to make this explicit in order to draw out consequences in an argument, we would need to incorporate some set-theoretic apparatus for talking about cardinalities.

Arguments about past, present and future are another example of the same general point. Since sentences of first-order logic lack tense, the normal way to handle such arguments in first-order logic is to add points of time (or sometimes intervals of time) to the domain. Then in general we need to add to the premises of an argument some basic facts about time, for example that the ordering of time into earlier and later is a linear ordering. (One can use the axioms for linear ordering, (76) below.)

**NON-INDICATIVE SENTENCES.** Sentences of first-order logic are all in the indicative. They are not designed for giving instructions or asking questions. One place where this matters is the formalization of mathematical reasoning. Mathematicians often use imperatives:

(57) “Draw a triangle ABC and consider the midpoint of the side AB.”

“Assume there is a greatest prime.”

“Let  $x$  be a number between 0 and 5.”

First-order logic has no straightforward way of expressing these instructions. In 1926 Jan Łukasiewicz suggested we should regard such instructions as moves in a proof. For example the instruction “Assume  $\phi$ ” is an indication that we are going to prove the sequent (84) below by proving the sequent (83).

Most English sentences can be translated into first-order sentences in many different ways. The translation that we choose should be guided by the arguments that we are trying to formalize. Some philosophers have speculated that for each unambiguous English sentence  $S$

there is a first-order translation  $\phi$  that expresses the correct analysis of  $S$  into its most primitive components. If we knew these translations we could use them to formalize in first-order sentences any valid argument in English. A difficulty with this thesis is that (as we saw) analyses of English sentences for the purpose of justifying arguments may need to bring in whole ontologies of abstract objects: Sets, actions, points of time and space. Some philosophers would add possible worlds.

Most of the starred textbooks in the bibliography below give further advice about translating from English into first-order sentences.

### FIRST-ORDER SYNTAX

The signature of a first-order language consists of symbols of four kinds, though not every first-order language has all four kinds. The kinds are as follows:

(i) *Propositional symbols* as in section “Propositional Logic.”

(ii) *Relation symbols*, usually

$$P, Q, R, R_0, R_1, R_2, \dots$$

(iii) *Individual constant symbols*, or more briefly *constants*, usually

$$a, b, c, c_0, c_1, c_2, \dots$$

(iv) *Function symbols*, usually symbols such as

$$F, G, H, F_0, F_1, F_2, \dots$$

Each relation symbol and each function symbol has an *arity*, which is a positive integer. One normally requires that no symbol occurs in more than one of these kinds, and that no relation or function symbol occurs with more than one arity. If a function or relation symbol has arity  $n$ , we describe the symbol as *n-ary*. *Binary* means 2-ary.

A first-order language also has an infinite set of symbols called *variables*. Variables are usually chosen as lower case letters near the end of the alphabet:

$$(58) \quad u, v, w, x, y, z, v_0, v_1, \dots$$

The variables are not in the signature.

Given any signature  $\sigma$ , we define a first-order language  $L(\sigma)$  in terms of  $\sigma$ . We begin with the terms of  $L(\sigma)$ .

(a) Every constant of  $\sigma$  is a term of  $L(\sigma)$ .

(b) Every variable of  $L$  is a term of  $L(\sigma)$ .

(c) Suppose  $F$  is a function symbol of  $\sigma$ ,  $n$  is the arity of  $F$ , and  $t_1, \dots, t_n$  are terms of  $L(\sigma)$ . Then the expression

$$F(t_1, \dots, t_n)$$

is a term of  $L(\sigma)$ .

(d)  $L(\sigma)$  has no terms except as given by (a)–(c).

This definition is an *inductive definition*. Clauses (a) and (b) together form its *base clause*; they say outright that certain expressions are terms. Clause (c) is the *inductive clause*; it says that if certain expressions are terms then certain other expressions are terms too. Clause (d) tells us that if  $t$  is a term of  $L(\sigma)$  then  $t$  can be generated in a finite number of steps by using the base and inductive clauses.

A *metatheorem* of first-order logic is a theorem about first-order logic (as opposed to a theorem proved by means of first-order logic).

**METATHEOREM 1 (UNIQUE PARSING OF TERMS).** *If  $t$  is a term of  $L(\sigma)$  then exactly one of the following holds:*

(1)  $t$  is a constant of  $\sigma$ .

(2)  $t$  is a variable.

(3)  $t$  is  $F(t_1, \dots, t_n)$  where  $F$  is a function symbol of  $\sigma$ ,  $n$  is the arity of  $F$  and  $t_1, \dots, t_n$  are terms of  $L(\sigma)$ .

Moreover in case (3) if  $t$  is also  $G(s_1, \dots, s_m)$  where  $G$  is a function symbol of  $\sigma$  and  $s_1, \dots, s_m$  are terms of  $L(\sigma)$ , then  $F$  is  $G$  and  $n$  is  $m$  and  $t_1$  is  $s_1$  and ... and  $t_n$  is  $s_n$ .

See Stephen Kleene §17 for the proof. Thanks to unique parsing, we can distinguish three types of term. The first two types are the constants and the variables, and together they form the *atomic* terms of  $L$ . The third type of term consists of those of the form  $F(t_1, \dots, t_n)$ ; these are said to be *compound* terms. Broadly speaking the terms of  $L(\sigma)$  correspond grammatically to the singular definite noun phrases of a natural language.

The unique parsing lemma is used to justify certain types of definition and proof by induction. For example we can define, for each term  $t$ , the set  $V(t)$  of variables that occur in  $t$ , as follows:

(a) If  $t$  is a constant then  $V(t)$  is  $\emptyset$  (the empty set).

(b) If  $t$  is a variable then  $V(t)$  is the set  $\{t\}$ .

(c) If  $t$  is  $F(t_1, \dots, t_n)$  then  $V(t)$  is the union

$$V(t_1) \cup \dots \cup V(t_n).$$

(This is the set of objects that are in at least one of  $V(t_1), \dots, V(t_n)$ .) We say that a term is *closed* if it contains no variables.

Along similar lines we can define  $t(s_1, \dots, x_n/v_1, \dots, v_n)$ , which is the term got by taking the term  $t$  and putting the term  $s_1$  in place of each occurrence of the variable  $v_1$  in  $t$ ,  $s_2$  in place of each occurrence of  $v_2$  and so on; the replacements should be made simultaneously. For example if  $t$  is  $F(x, G(y))$  and  $s$  is  $G(z)$ , then  $t(s/x)$  is  $F(G(z), G(y))$  and  $t(y, t/x, y)$  is  $F(y, G(F(x, G(y))))$ .

Having defined the terms of  $L(\sigma)$ , we define the formulas of  $L(\sigma)$  as follows.

(a) Every propositional symbol of  $\sigma$  is a formula of  $L(\sigma)$ .

(b) If  $R$  is a relation symbol of  $\sigma$ ,  $n$  is the arity of  $R$  and  $t_1, \dots, t_n$  are terms of  $L(\sigma)$ , then the expression

$$R(t_1, \dots, t_n)$$

is a formula of  $L(\sigma)$ .

(c) If  $s$  and  $t$  are terms of  $L(\sigma)$  then the expression

$$(s = t)$$

is a formula of  $L(\sigma)$ .

(d) If  $\phi$  is a formula of  $L(\sigma)$  then the expression

$$\neg\phi$$

is a formula of  $L(\sigma)$ .

(e) If  $\phi$  and  $\psi$  are formulas of  $L(\sigma)$  then the four expressions

$$(\phi \wedge \psi), (\phi \vee \psi), (\phi \rightarrow \psi), (\phi \leftrightarrow \psi)$$

are formulas of  $L(\sigma)$ .

(f) If  $\phi$  is a formula of  $L(\sigma)$  and  $v$  is a variable of  $L(\sigma)$ , then the two expressions

$$\forall v\phi, \exists v\phi$$

are formulas of  $L(\sigma)$ . ( $\forall v$  is called a *universal quantifier* and  $\exists v$  is an *existential quantifier*.)

(g) Nothing is a formula of  $L(\sigma)$  except as given by clauses (a)–(f) above.

The obvious counterpart to Metatheorem 1 is true for formulas. It allows us to say that a formula is *atomic* if it comes from clauses (a)–(c) and *compound* if has one of the forms described in clauses (d)–(f). Also no expression of  $L(\sigma)$  is both a term and a formula.

The next definition will get its full motivation when we come to discuss satisfaction of formulas. Roughly speaking, a variable  $x$  can serve to name an object, unless it appears in one of the contexts “For all objects  $x, \dots x \dots$ ” and “There is an object  $x$  such that  $\dots x \dots$ ” (Here we recall that in first-order logic, ‘for all objects  $x$ ’ is written  $\forall x$  and “there is an object  $x$  such that” is written  $\exists x$ .) An occurrence of a variable in one of these contexts is said to be *bound*; an occurrence that is not bound is *free*. We say a variable is *free in*  $\phi$  if it has a free occurrence in  $\phi$ . A definition by induction of the set  $FV(\phi)$  of variables free in the formula  $\phi$  runs as follows:

(a) If  $\phi$  is atomic then  $FV(\phi)$  is the set of all variables that occur in  $\phi$ .

(b)  $FV(\neg\phi)$  is  $FV(\phi)$ .

(c)  $FV((\phi \wedge \psi)), FV((\phi \vee \psi)), FV((\phi \rightarrow \psi))$  and  $FV((\phi \leftrightarrow \psi))$  are all equal to

$$FV(\phi) \cup FV(\psi).$$

(d) If  $\phi$  is a formula and  $v$  is a variable, then  $FV(\forall v\phi)$  and  $FV(\exists v\phi)$  are both the set

$$FV(\phi) \setminus \{v\}$$

of all the variables that are in  $FV(\phi)$  and are not  $v$ .

A formula  $\phi$  is said to be a *sentence* if  $FV(\phi)$  is empty, in other words, if no variable is free in  $\phi$ . For example  $\forall x (P(x) \rightarrow Q(x))$  is a sentence, but  $(P(x) \rightarrow Q(x))$  is not a sentence since  $x$  has two free occurrences in it.

Unique parsing also allows us to define by induction the *complexity* of a formula  $\phi$ ,  $\text{comp}(\phi)$ , as follows:

(1) If  $\phi$  is an atomic formula then  $\text{comp}(\phi) = 0$ .

(2) For every formula  $\phi$ ,  $\text{comp}(\neg\phi) = \text{comp}(\phi) + 1$ .

(3) If  $\phi$  and  $\psi$  are formulas and  $n$  is the maximum of  $\text{comp}(\phi)$  and  $\text{comp}(\psi)$ , then  $\text{comp}((\phi \wedge \psi)), \text{comp}((\phi \vee \psi)), \text{comp}((\phi \rightarrow \psi))$  and  $\text{comp}((\phi \leftrightarrow \psi))$  are all equal to  $n + 1$ .

(4) If  $\phi$  is a formula and  $v$  is a variable then  $\text{comp}(\forall v\phi) = \text{comp}(\exists v\phi) = \text{comp}(\phi) + 1$ .

There is a similar definition for the complexity of terms. The chief use of complexity is in *proofs by induction on complexity*, which run as follows. We want to show that all formulas of a first-order language have a certain property  $P$ . So we show first that all atomic formulas have the prop-

erty  $P$ , and then we show that for every positive integer  $n$ , if all formulas of complexity  $< n$  have  $P$  then every formula of complexity  $n$  has  $P$  too.

One speaks of the *subformulas* of a formula  $\phi$  in two senses. First a subformula of  $\phi$  is a segment of  $\phi$  that is a formula in its own right. Second a subformula of  $\phi$  is a formula that occurs as a subformula of  $\phi$  in the first sense. For example the formula  $(P(x) \leftrightarrow P(x))$  has two subformulas of the form  $P(x)$  in the first sense, but only one in the second sense. It is easy to give a formal definition of the set of subformulas of  $\phi$  in the second sense, by induction on the complexity of  $\phi$ . Metatheorem 12 below uses subformulas in the first sense.

There are several useful conventions about how to write first-order formulas. For example

$$(59) \quad \phi \wedge \psi \wedge \chi$$

is strictly not a first-order formula, but we count it as an abbreviation of

$$(60) \quad ((\phi \wedge \psi) \wedge \chi).$$

In the same spirit the conjunction

$$(61) \quad (\phi_1 \wedge \phi_2 \wedge \dots \wedge \phi_n)$$

is an abbreviation for

$$(62) \quad (\dots(\phi_1 \wedge \phi_2) \wedge \dots \wedge \phi_n),$$

and the disjunction

$$(63) \quad (\phi_1 \vee \phi_2 \vee \dots \vee \phi_n)$$

is an abbreviation for

$$(64) \quad (\dots(\phi_1 \vee \phi_2) \vee \dots \vee \phi_n).$$

We count “ $\wedge$ ” and “ $\vee$ ” as binding tighter than “ $\rightarrow$ ” or “ $\leftrightarrow$ ,” in the sense that

$$(65) \quad (\phi \wedge \psi \leftrightarrow \chi), (\phi \rightarrow \psi \vee \chi)$$

are respectively abbreviations for

$$((\phi \wedge \psi) \leftrightarrow \chi), (\phi \rightarrow (\psi \vee \chi)).$$

Other useful abbreviations are

$$(66) \quad (x \neq y) \text{ for } \neg(x = y),$$

$$\forall x_1 \dots x_n \phi \text{ for } \forall x_1 \dots \forall x_n \phi,$$

$$\exists x_1 \dots x_n \phi \text{ for } \exists x_1 \dots \exists x_n \phi.$$

Also we allow ourselves to leave out a pair of brackets when they stand at the opposite ends of a formula.

Another useful convention is based on mathematical notation for functions. If  $\phi$  is a formula and all the variables free in  $\phi$  are included in the list  $v_1, \dots, v_n$ , we introduce  $\phi$  as  $\phi(v_1, \dots, v_n)$ . Then if  $t_1, \dots, t_n$  are terms, we write

$$(67) \quad \phi(t_1, \dots, t_n)$$

for  $\phi(t_1, \dots, t_n/v_1, \dots, v_n)$ , which is the result of putting  $t_i$  in place of each free occurrence of  $v_i$  in  $\phi$ , simultaneously for all  $i$  from 1 to  $n$ . (We shall revise this definition later.)

## INTERPRETATIONS OF FIRST-ORDER LANGUAGES

A first-order language is a language  $L(\sigma)$  for some signature  $\sigma$ . The signature  $\sigma$  determines the language  $L(\sigma)$ , but equally if we know the formulas of  $L(\sigma)$  we can recover  $\sigma$ . So if  $L$  is the language  $L(\sigma)$ , we could equally well say “formula of  $\sigma$ ” or “formula of  $L$ .” Likewise  $\sigma$ -structures, which we are about to define, can equally well be called  $L$ -structures.

We recall some set theory. If  $X$  is a set and  $n$  a positive integer, then an  $n$ -tuple from  $X$  is an ordered list  $(a_1, \dots, a_n)$  where  $a_1, \dots, a_n$  are members of  $X$ . We write  $X^n$  for the set of all  $n$ -tuples from  $X$ . An  $n$ -ary relation on  $X$  is a subset of  $X^n$ . An  $n$ -ary function on  $X$  is a function  $f: X^n \rightarrow Y$ , for some set  $Y$ , which assigns to each  $n$ -tuple  $(a_1, \dots, a_n)$  from  $X$  an element  $f(a_1, \dots, a_n)$  of  $Y$ .

Suppose  $\sigma$  is a signature. A  $\sigma$ -structure is a set-theoretic interpretation for the symbols in  $\sigma$ . More precisely a  $\sigma$ -structure  $A$  has the following ingredients:

- (a) A set (usually required to be nonempty) which is the domain of  $A$ , in symbols  $\text{dom}(A)$ .
- (b) For each propositional symbol  $p$  of  $\sigma$ , a truth value (T or F) which we write as  $p_A$ .
- (c) For each constant  $c$  of  $\sigma$ , an element  $c_A$  of  $\text{dom}(A)$ .
- (d) For each relation symbol  $R$  of  $\sigma$ , an  $n$ -ary relation  $R_A$  on  $\text{dom}(A)^n$ , where  $n$  is the arity of  $R$ .
- (e) For each function symbol  $F$  of  $\sigma$ , an  $n$ -ary function  $F_A: \text{dom}(A)^n \rightarrow \text{dom}(A)$ , where  $n$  is the arity of  $F$ .

**EXAMPLE 1 (ARITHMETIC AND ITS LANGUAGE).** For talking about the natural numbers

$$(68) \quad 0, 1, 2, \dots,$$

we use a first-order language called the *language of arithmetic*. Its signature  $\sigma_{\mathbb{N}}$  consists of one constant symbol  $\underline{0}$ , two function symbols  $+$  and  $\cdot$  of arity 2, a function symbol  $S$  of arity 1 and a relation symbol  $<$  of arity 2. The number structure  $\mathbb{N}$  is the following  $\sigma_{\mathbb{N}}$ -structure. The domain is the set of natural numbers. The constant  $\underline{0}$  stands for the number zero (i.e.,  $\underline{0}_{\mathbb{N}} = \underline{0}$ ). The function symbols  $+$  and  $\cdot$  stand for addition and multiplication of natural numbers, and  $S$  stands for the function “plus one.” The binary relation symbol  $<$  stands for the relation “less than” (i.e.,  $<_{\mathbb{N}}$  is the set of all ordered pairs of natural numbers  $(m, n)$  with  $m < n$ ). Following normal mathematical usage we write  $+$   $(x, y)$ ,  $\cdot$   $(x, y)$  and  $<$   $(x, y)$  as  $x + y$ ,  $x \cdot y$  and  $x < y$  respectively.

The structure  $\mathbb{N}$  interprets the closed terms of  $L(\sigma_{\mathbb{N}})$  as names of numbers. For example the term  $S(\underline{0})$  stands for the number 1, the term  $S(S(\underline{0}))$  stands for the number 2, and so on; we write these terms as  $\underline{0}$ ,  $\underline{1}$ ,  $\underline{2}$  and so on. Likewise the closed term  $\underline{2} + \underline{3}$  names the number 5.

We can use our earlier explanations of the first-order symbols in order to read any sentence of  $L(\sigma_{\mathbb{N}})$  as making a statement about  $\mathbb{N}$ . The following sentences are all true in  $\mathbb{N}$ :

$$(69) \quad \text{PA1. } \forall x (Sx \neq \underline{0}).$$

$$\text{PA2. } \forall x \forall y (S(x) = S(y) \rightarrow x = y).$$

$$\text{PA3. } \forall x (x + \underline{0} = x).$$

$$\text{PA4. } \forall x \forall y (x + S(y) = S(x + y)).$$

$$\text{PA5. } \forall x (x \cdot \underline{0} = \underline{0}).$$

$$\text{PA6. } \forall x \forall y (x \cdot S(y) = (x \cdot y) + x).$$

$$\text{PA7. } \forall x \neg(x < \underline{0}).$$

$$\text{PA8. } \forall x \forall y (x < Sy \leftrightarrow x < y \vee x = y).$$

The following *induction axiom* is also true in  $\mathbb{N}$ , though it is not a first-order sentence because the variable ‘ $X$ ’ ranges over sets rather than numbers.

$$(70) \quad \text{For every set } X \text{ of numbers,} \\ ((\underline{0} \in X) \wedge \forall x (x \in X \rightarrow S(x) \in X) \rightarrow \forall x (x \in X)).$$

Within  $L(\sigma_{\mathbb{N}})$  the closest we can come to this axiom is to give a separate axiom for each set  $X$  defined by a first-order formula. Namely let  $\phi(x, y_1, \dots, y_n)$  be any formula of  $L(\sigma_{\mathbb{N}})$ . Then we write the sentence

(PA.9)

$$\forall y_1 \dots \forall y_n (\phi(\underline{0}, y_1, \dots, y_n) \\ \wedge \forall x (\phi(x, y_1, \dots, y_n) \rightarrow \phi(S(x), y_1, \dots, y_n)) \\ \rightarrow \forall x \phi(x, y_1, \dots, y_n)).$$

The sentences of the form PA9 constitute the *first-order induction schema for arithmetic*. The infinite set of sentences PA1–PA9 is called *first-order Peano arithmetic*, or PA for short.

The situation with  $\mathbb{N}$  is typical. Given any signature  $\sigma$ , any  $\sigma$ -structure  $A$  and any sentence  $\phi$  of  $L(\sigma)$ , we can read  $\phi$  as making a statement about  $A$ . If this statement is true we say that  $A$  is a *model* of  $\phi$ , and we express this fact by writing

$$(71) \quad A \models \phi.$$

If  $\phi$  is false in  $a$  we write  $A \not\models \phi$ . It is an unfortunate fact of history that we use the symbol “ $\models$ ” both in (71) (which is not a sequent) and in semantic sequents such as (16) above and (72) below. One can avoid confusion by noting that in (71) there is a structure to the left of “ $\models$ ,” whereas in sequents the space to the left of “ $\models$ ” is empty or contains sentences.

## THEORIES AND THEIR MODELS

Let  $L$  be a first-order language. A set of sentences of  $L$  is called a *theory*. An  $L$ -structure  $A$  is called a *model* of  $T$  if it is a model of every sentence in  $T$ . The semantic sequent

$$(72) \quad T \models \psi$$

states that every model of  $T$  is a model of  $\psi$ ; when this holds, we say the sequent is *valid* and that  $\psi$  is a (*logical*) *consequence* of  $T$ . When  $T$  is a finite set, say  $\{\phi_1, \dots, \phi_n\}$ , we write the sequent (72) as

$$(73) \quad \phi_1, \dots, \phi_n \models \psi.$$

When  $T$  is empty, we also write the sequent as

$$(74) \quad \models \psi.$$

(74) says that  $\psi$  is true in every  $L$ -structure; when it holds, we say that the sentence  $\psi$  is *valid*, and that it is a *theorem*. Finally the sequent

$$(75) \quad T \models$$

expresses that  $T$  has no models.

We say that  $T$  is *consistent* if it has models, in other words if  $T \not\models$ . We say that  $T$  is *complete* if for every sentence  $\phi$  of  $L$ , at least one of  $\phi$  and  $\neg\phi$  is a consequence of

$T$ . So  $T$  is consistent and complete if and only if for every sentence  $\phi$  of  $L$ , exactly one of  $\phi$  and  $\neg\phi$  is a consequence of  $T$ .

Since a sentence of  $L(\sigma)$  is also a sentence of  $L(\tau)$  whenever  $\tau$  includes  $\sigma$ , we should check that the validity of a sequent depends only on the sentences in it, and not on the signature—otherwise our notation for sequents would need to mention the signature. The following metatheorem assures this. (It requires that every structure has nonempty domain. In a structure with empty domain,  $\exists x (x = x)$  is false; but adding a constant to the signature automatically excludes structures with empty domains and hence makes  $\exists x (x = x)$  a theorem.)

**METATHEOREM 2.** *If  $T$  and  $\psi$  are a theory and a sentence of  $L(\sigma)$ , and  $\tau$  is a signature extending  $\sigma$ , then (72) is valid for  $\sigma$ -structures if and only if it is valid for  $\tau$ -structures.*

A theory  $T$  is said to be *deductively closed* if  $T$  contains all its consequences. If  $S$  is any theory then the set  $T$  of all consequences of  $S$  is deductively closed and contains  $S$ ; we call  $T$  the *deductive closure* of  $S$ . When  $T$  is the deductive closure of  $S$  we say also that  $S$  is a *set of axioms* for  $T$ .

First-order theories commonly arise in one of two ways.

In the first way we have a first-order language  $L$  and an  $L$ -structure  $A$ , and we want to list the facts that we know about  $A$ . By the *complete theory* of  $A$  we mean the set  $T$  of all sentences of  $L$  that have  $A$  as a model. This set  $T$  is always deductively closed, consistent and complete. If we have a set  $S$  of sentences that are all true in  $A$ , then certainly  $S$  is consistent; if it is also complete, then  $S$  is a set of axioms for the complete theory of  $A$ . An ambition for logicians is to give sets of axioms for the complete theories of various mathematical structures. For many cases this is achieved. But in 1931 Kurt Gödel gave an indirect but astonishingly insightful proof that PA is not complete, so that it doesn't axiomatise the complete first-order theory of  $\mathbb{N}$ . (See entry on "Gödel's Theorem.")

The second common source of first-order theories is the definitions of classes of mathematical structures. For example a linearly ordered set is a structure in a signature containing a binary relation symbol  $<$ , which is a model of the three sentences:

$$(76) \quad \begin{aligned} &\forall x \forall y \forall z (x < y \wedge y < z \rightarrow x < z) \\ &\quad \forall x \neg (x < x) \\ &\quad \forall x \forall y (x < y \vee y < x \vee x = y) \end{aligned}$$

The structure  $\mathbb{N}$  forms a linear ordering, since all of (76) is true in  $\mathbb{N}$ . This theory (76) is a direct translation into first-order notation of the usual informal definition of linear orderings.

## FORMULAS AND SATISFACTION

The formula  $x < \underline{3}$  is neither true nor false in  $\mathbb{N}$ , because the variable  $x$  lacks an interpretation. The interpretations of the symbols of  $\sigma_{\mathbb{N}}$  are fixed in  $\mathbb{N}$ , but the interpretations of the variables are not. The same holds for any first-order language  $L$ , any  $L$ -structure  $A$  and any formula  $\phi$  of  $L$  in which some variables are free.

By an *assignment* in the structure  $A$  we mean a function  $\alpha$  whose domain is a set of variables and which assigns to each variable in its domain an element of  $A$ . If  $t$  is a term and  $\alpha$  is an assignment in  $A$  whose domain includes all the variables in  $t$ , then  $A$  and  $\alpha$  together tell us how to treat  $t$  as the name of an element of  $A$ , and we write this element  $t_A[\alpha]$ . For example if  $A$  is  $\mathbb{N}$  and  $\alpha$  is an assignment in  $\mathbb{N}$  with  $\alpha(x) = 4$ , and  $t$  is the term  $x + \underline{5}$ , then  $t_{\mathbb{N}}[\alpha]$  is  $4 + 5$ , in other words 9.

When  $t$  is a closed term,  $t_A[\alpha]$  is independent of  $\alpha$  and we write it simply as  $t_A$ .

Similarly we can use assignments to interpret the free occurrences of variables in a formula. (The bound occurrences need no interpretation; they are part of the apparatus of quantification.) For example in  $\mathbb{N}$ , any assignment  $\alpha$  with  $\alpha(x) = 4$  interprets the formula  $x < \underline{5}$  as making the statement that 4 is less than 5, which is true. We express the fact that this statement is true by writing

$$(77) \quad \mathbb{N} \models (x < \underline{5})[\alpha].$$

More generally if  $\alpha$  is an assignment in  $A$  which makes assignments to all the variables free in  $\phi$ , then

$$(78) \quad A \models \phi[\alpha]$$

states that  $\phi$ , interpreted in  $A$  by means of  $\alpha$ , is true. When (78) holds we say that  $\alpha$  *satisfies*  $\phi$  in  $A$ . We write

$$(79) \quad A \not\models \phi[\alpha]$$

if  $\alpha$  fails to satisfy  $\phi$  in  $A$ .

There are two reasons for introducing the notion of “satisfying.” The first is that it allows us to use formulas with free variables in order to express properties of individual elements or sequences of elements in a structure. For this application another notation is helpful. Suppose  $\phi(x_1, \dots, x_n)$  is a formula of  $L$  and  $\alpha$  is an assignment that assigns elements to at least the variables  $x_1, \dots, x_n$ . Write  $a_i$  for  $\alpha(x_i)$ . Then instead of “ $A \models \phi[\alpha]$ ” we also write

$$(80) \quad A \models \phi[a_1, \dots, a_n].$$

We read this statement as “ $a_1, \dots, a_n$  satisfy  $\phi$  in  $A$ .”

The second reason for introducing satisfaction is that (as Alfred Tarski pointed out) it allows us to give a fully precise mathematical definition of the relation “ $A \models \phi$ ,” by first defining the relation “ $A \models \phi[\alpha]$ .” The first step of the definition is to define  $t_A[\alpha]$  by induction on the complexity of  $t$ ; we omit details. This done, the definition of “ $A \models \phi[\alpha]$ ” goes by induction on the complexity of  $\phi$ . We give some typical cases and leave the remainder to the reader.

(a) For every propositional symbol  $p$ ,

$$A \models p \text{ if and only if } p_A \text{ is T.}$$

(b) If  $R$  is a relation symbol of arity  $n$  and  $\phi$  has the form  $R(t_1, \dots, t_n)$ , then

$$A \models \phi[\alpha] \text{ if and only if } ((t_1)_A[\alpha], \dots, (t_n)_A[\alpha]) \text{ is in } R_A.$$

(c)  $A \models (\phi \wedge \psi)[\alpha]$  if and only if  $A \models \phi[\alpha]$  and  $A \models \psi[\alpha]$ .

The clauses for quantifiers need some further notation. Suppose  $\alpha$  is an assignment whose domain includes all the variables free in  $\phi$  except perhaps  $v$ , and  $a$  is an element of the structure  $A$ . Then we write  $\alpha(a/v)$  for the assignment  $\beta$  whose domain is the domain of  $\alpha$  together with  $v$ , and such that for each variable  $x$  in the domain of  $\beta$ ,

$$(81) \quad \beta(x) = \begin{cases} \alpha(x) & \text{if } x \text{ is not } v, \\ a & \text{if } x \text{ is } v. \end{cases}$$

(d)  $A \models \forall v\phi[\alpha]$  if and only if for every element  $a$  of  $\text{dom}(A)$ ,  $A \models \phi[\alpha(a/v)]$ .

(e)  $A \models \exists v\phi[\alpha]$  if and only if there is an element  $a$  of  $\text{dom}(A)$  such that  $A \models \phi[\alpha(a/v)]$ .

Tarski’s definition of “ $A \models \phi[\alpha]$ ” goes by induction on the complexity of formulas, as above. But by standard set-theoretic methods we can convert it to an explicit set-theoretic definition and hence prove the following metatheorem:

**METATHEOREM 3.** *There is a formula  $\theta$  of set theory such that*

$$\theta(\sigma, A, \phi, \alpha)$$

*is true in the universe of sets if and only if  $\sigma$  is a signature,  $A$  is a  $\sigma$ -structure,  $\phi$  is a formula of  $L(\sigma)$  and  $A \models \phi[\alpha]$ .*

We would like to know that  $\phi(y/x)$  says the same thing about an object  $y$  as  $\phi(x)$  says about an object  $x$ . More precisely, we would like to know the following:

**METATHEOREM 4.** *Suppose  $\phi(x)$  is a formula of the first-order language  $L$ ,  $t(y)$  is a term of  $L$ ,  $\alpha$  is an assignment whose domain includes  $y$ , and  $\beta$  is an assignment with  $\beta(x) = t_A[\alpha]$ . Then*

$$A \models \phi(t/x)[\alpha] \text{ if and only if } A \models \phi[\beta].$$

Unfortunately this metatheorem is false unless we make certain adjustments. For example let  $\phi(x)$  be the formula  $\exists y (x \neq y)$  which says that there is something else besides  $x$ , and let  $t$  be the variable  $y$ . Then  $\phi(t/x)$  is the everywhere false sentence  $\exists y (y \neq y)$ , not a formula saying that there is something else besides  $y$ . The quantifier  $\exists y$  has captured the variable  $y$  when we substituted  $t$  for  $x$  in  $\phi(t/x)$ .

There is a remedy. Given any formula  $\phi$  and any term  $t$ , we define  $\phi(t//x)$  as follows. For each variable  $v$  occurring in the term  $t$ , choose another variable  $v'$  that doesn’t occur in either  $t$  or  $\phi$ , taking different variables  $v'$  for different  $v$ . Form the formula  $\phi'$  by replacing each bound occurrence of each variable  $v$  in  $\phi$  by an occurrence of  $v'$ . Finally take  $\phi(t//x)$  to be  $\phi'(t/x)$ . (A more precise account would say how we choose the variables  $v'$  and would explain the relevance of the logical equivalence (90)(i) below.) Then  $\phi(t//x)$  is said to come from  $\phi$  by substituting  $t$  for  $x$  “without clash of variables.” For simplicity of notation we now redefine  $\phi(t/x)$  to mean  $\phi(t//x)$ , thus throwing away the ladder we climbed up. After this redefinition, Metatheorem 4 is true.

Some authors avoid this redefinition by forbidding the use of  $\phi(t/x)$  when  $\phi$  contains a quantifier that captures a variable in  $t$ .

## SOME METATHEOREMS OF FIRST-ORDER LOGIC

The metatheorems in this section are mostly immediate from the definitions. We state them because they have useful applications.

**METATHEOREM 5.** *If  $\phi$  is a first-order sentence then the sequent  $\phi \models \phi$  is valid.*

**METATHEOREM 6 (MONOTONICITY).** *If  $\psi$  is a sentence and  $T$  a theory in a first-order language, and  $U$  is a subset of  $T$  such that the sequent  $U \models \psi$  is valid, then the sequent  $T \models \psi$  is valid.*

**METATHEOREM 7 (CUT).** *If  $T$  is a theory and  $\phi, \psi$  are sentences, all in a first-order language, and the sequents*

$$(82) \quad T \models \phi, T \cup \{\phi\} \models \psi$$

*are both valid, then the sequent  $T \models \psi$  is valid. (The sentence  $\phi$  is “cut.”)*

There are a number of metatheorems expressing properties of particular logical operators. The three below are only a sample.

**METATHEOREM 8.** *Suppose  $T$  is a first-order theory and  $\phi$  is a first-order sentence. Then the sequent  $T \models \phi$  is valid if and only if the sequent  $T \cup \{\neg\phi\} \models$  is valid.*

**METATHEOREM 9.** *Suppose  $T$  is a first-order theory and  $\phi$  and  $\psi$  are first-order sentences. If*

$$(83) \quad T \cup \{\phi\} \models \psi$$

*is valid, then*

$$(84) \quad T \models (\phi \rightarrow \psi)$$

*is valid. Also if*

$$(85) \quad T \models \phi, T \models (\phi \rightarrow \psi)$$

*are both valid then*

$$(86) \quad T \models \psi$$

*is valid.*

The first half of Metatheorem 9 is sometimes called the Deduction Theorem. The second half is one form of a rule traditionally called Modus Ponens.

**METATHEOREM 10.** *Suppose  $T$  is a first-order theory,  $\phi(x_1, \dots, x_n)$  is a first-order formula and  $c_1, \dots, c_n$  are  $n$  distinct constants that occur nowhere in either  $T$  or  $\phi$ . Then if either of the following sequents is valid, so is the other:*

$$T \models \phi(c_1, \dots, c_n).$$

$$T \models \forall x_1, \dots, \forall x_n \phi.$$

Our remaining metatheorems describe important properties of first-order logic as a whole.

**METATHEOREM 11.** *Let  $L$  be a first-order language and  $\phi(v_1, \dots, v_n)$  and  $\psi(v_1, \dots, v_n)$  formulas of  $L$ . Then the following are equivalent:*

(a) *For every  $\sigma$ -structure  $A$  and all elements  $a_1, \dots, a_n$  of the domain of  $A$ ,*

$$A \models \phi[a_1, \dots, a_n] \text{ if and only if } A \models \psi[a_1, \dots, a_n].$$

(b)  $\models \forall v_1 \dots \forall v_n (\phi(v_1, \dots, v_n) \leftrightarrow \psi(v_1, \dots, v_n))$ .

*When these conditions (a) and (b) hold, we say that  $\phi$  and  $\psi$  are logically equivalent, and we write this as  $\phi \equiv \psi$ .*

Logical equivalence is an equivalence relation on formulas. Here are some logically equivalent pairs:

$$(87) \begin{array}{ll} \text{(a)} \ (\phi \vee \psi) & \equiv \neg(\neg\phi \wedge \neg\psi) \\ \text{(b)} \ \neg(\phi \wedge \psi) & \equiv (\neg\phi \vee \neg\psi) \\ \text{(c)} \ \neg(\phi \vee \psi) & \equiv (\neg\phi \wedge \neg\psi) \\ \text{(d)} \ (\phi \wedge (\psi \vee \chi)) & \equiv ((\phi \wedge \psi) \vee (\phi \wedge \chi)) \\ \text{(e)} \ (\phi \rightarrow \psi) & \equiv (\neg\phi \vee \psi) \\ \text{(f)} \ (\phi \leftrightarrow \psi) & \equiv ((\phi \wedge \psi) \vee (\neg\phi \wedge \neg\psi)) \end{array}$$

Equivalences (a), (b) and (c) are examples of a group of equivalences that go by the name of *De Morgan's Laws*.

**METATHEOREM 12.** *Let  $L$  be a first-order language and suppose  $\phi$  and  $\phi'$  are logically equivalent formulas of  $L$ . Let  $\psi$  be a formula of  $L$ , and let  $\psi'$  come from  $\psi$  by replacing a subformula of  $\psi$  of the form  $\phi$  by a copy of  $\phi'$ . Then  $\psi'$  is logically equivalent to  $\psi$ .*

Metatheorem 12 together with equivalences (a), (e), and (f) tells us that, given any first-order formula  $\phi$ , we can remove all occurrences of the symbol “ $\leftrightarrow$ ”, and then all occurrences of the symbols “ $\vee$ ” and “ $\rightarrow$ ”, and so find a formula logically equivalent to  $\phi$  in which none of these symbols occurs. So there would be no loss of expressive power if we removed these symbols from the language. By a similar argument we could make do with “ $\vee$ ” and “ $\neg$ ”, discarding “ $\wedge$ ”, “ $\rightarrow$ ” and “ $\leftrightarrow$ ”.

Other choices of symbol are open to us. For example we can introduce the symbol “ $\perp$ ” as an atomic formula; since it has no variables it is a sentence, and we stipulate that its truth value is  $F$  in all structures. This symbol “ $\perp$ ” is logically equivalent to  $\neg\forall x(x = x)$ , or more generally to  $\neg\phi$  where  $\phi$  is any valid sentence. We pronounce “ $\perp$ ” as

“absurdity”; some computer scientists read it as “bottom.” Given the logical equivalences

$$(88) \quad \begin{aligned} \neg\phi &\equiv (\phi \rightarrow \perp) \\ (\phi \wedge \psi) &\equiv \neg(\phi \rightarrow \neg\psi) \end{aligned}$$

we see that in the presence of “ $\perp$ ” and “ $\rightarrow$ ” we can drop “ $\neg$ ,” “ $\wedge$ ,” “ $\vee$ ,” “ $\leftrightarrow$ ” from the language.

A formula with no quantifiers is said to be *quantifier-free*. By a *literal* we mean a formula that is either atomic or the negation of an atomic formula. By a *basic conjunction* we mean either a literal or a conjunction of literals; likewise a *basic disjunction* is a literal or a disjunction of literals. A quantifier-free formula is said to be in *disjunctive normal form* if it is a basic conjunction or a disjunction of basic conjunctions; it is in *conjunctive normal form* if it is a basic disjunction or a conjunction of basic disjunctions.

**METATHEOREM 13.** *Every quantifier-free formula  $\phi(x_1, \dots, x_n)$  is logically equivalent to a quantifier-free formula  $\phi^{dnf}(x_1, \dots, x_n)$  in disjunctive normal form, and to a quantifier-free formula  $\phi^{cnf}(x_1, \dots, x_n)$  in conjunctive normal form.*

We illustrate Metatheorem 13:

$$(89) \quad \begin{aligned} \neg(p \leftrightarrow q) &\equiv (\text{by (f)}) \\ \neg((p \wedge q) \vee (\neg p \wedge \neg q)) &\equiv (\text{by (c)}) \\ \neg(p \wedge q) \wedge \neg(\neg q \wedge \neg p) &\equiv (\text{by (b)}) \\ (\neg p \vee \neg q) \wedge (p \vee q) &\equiv (\text{by (d)}) \\ ((\neg p \vee \neg q) \wedge p) \vee ((\neg p \vee \neg q) \wedge q) &\equiv (\text{similarly}) \\ (\neg p \wedge p) \vee (\neg q \wedge p) \vee (\neg p \wedge q) \vee (\neg q \wedge q) &\equiv \\ (\neg q \wedge p) \vee (\neg p \wedge q) & \end{aligned}$$

Here follow some important logical equivalences involving quantifiers.

$$(90) \quad \begin{aligned} (g) \quad \forall x \phi &\equiv \neg \exists x \neg \phi \\ (h) \quad \exists x \phi &\equiv \neg \forall x \neg \phi \\ (i) \quad \forall x \phi &\equiv \forall y \phi' \text{ if } y \text{ doesn't occur in } \phi \text{ and } \phi' \\ &\quad \text{comes from } \phi \text{ by replacing } x \\ &\quad \text{by } y \text{ everywhere} \\ (j) \quad (\forall x \phi \wedge \psi) &\equiv \forall x(\phi \wedge \psi) \text{ if } x \text{ is not free in } \psi \\ (k) \quad (\forall x \phi \vee \psi) &\equiv \forall x(\phi \vee \psi) \text{ if } x \text{ is not free in } \psi \end{aligned}$$

A formula is said to be *prenex* if it is quantifier-free or consists of a string of quantifiers followed by a quantifier-free formula. The (possibly empty) string of quantifiers at the front of a prenex formula is called its *quantifier prefix*.

**METATHEOREM 14 (PRENEX FORM THEOREM).** *Let  $L$  be a first-order language and  $\phi(x_1, \dots, x_n)$  a formula of  $L$ . Then there is a prenex formula  $\psi(x_1, \dots, x_n)$  of  $L$  that is logically equivalent to  $\phi$ .*

To prove the prenex form theorem, one establishes ways of moving a quantifier in a formula “outwards.” Equivalences (j) and (k) above are typical examples, and there are corresponding equivalences with  $\exists$ . If the variable  $x$  does occur free in  $\psi$ , we first use equivalence (i) to change  $x$  to another variable not occurring in  $\psi$ .

## CONSTRUCTION OF MODELS

One way to show that a theory  $T$  is consistent is to build a model of  $T$ . Depending on what  $T$  is, this can call for a good deal of ingenuity. A number of logicians have studied how, by analysing  $T$  itself, we can make the process more systematic. The approach described below follows suggestions of Jaakko Hintikka.

Let  $L$  be a first-order language and  $T$  a set of sentences of  $L$ . For simplicity we assume  $L$  doesn't have  $\vee$ ,  $\rightarrow$  or  $\leftrightarrow$ . We say that  $T$  is a *Hintikka set* if it has the following properties:

(H1) If  $(\phi \wedge \psi)$  is in  $T$  then both  $\phi$  and  $\psi$  are in  $T$ ; if  $\neg(\phi \wedge \psi)$  is in  $T$  then at least one of  $\neg\phi$  and  $\neg\psi$  is in  $T$ .

(H2) If  $\neg\neg\phi$  is in  $T$  then  $\phi$  is in  $T$ .

(H3) For every closed term  $t$ ,  $(t = t)$  is in  $T$ .

(H4) If  $(s = t)$  and  $\phi(s/x)$  are both in  $T$  then  $\phi(t/x)$  is in  $T$ .

(H5) If  $\exists x \phi(x)$  is in  $T$  then for some constant  $c$ ,  $\phi(c)$  is in  $T$ ; if  $\neg\exists x \phi(x)$  is in  $T$  then  $\neg\phi(t)$  is in  $T$  for every closed term  $t$ .

(H6) If  $\forall x \phi(x)$  is in  $T$  then  $\phi(t)$  is in  $T$  for every closed term  $t$ ; if  $\neg\forall x \phi(x)$  is in  $T$  then for some constant  $c$ ,  $\neg\phi(c)$  is in  $T$ .

(H7) If  $\phi$  is an atomic sentence then  $\phi$  and  $\neg\phi$  are not both in  $T$ .

**METATHEOREM 15.** *If  $L$  is a first-order language,  $A$  is an  $L$ -structure and every element of  $A$  is named by a constant, then the set of all sentences of  $L$  that are true in  $A$  is a Hintikka set.*

**METATHEOREM 16.** *If the first-order language  $L$  has at least one constant and  $T$  is a Hintikka set in  $L$  then  $T$  has a model.*

We sketch the proof of Metatheorem 16. Let  $C$  be the set of all closed terms of  $L$ . Define a relation  $\sim$  on  $C$  by:  $s \sim t$  if and only if  $(s = t)$  is in  $T$ . Then we can show, using (H3) and (H4), that  $\sim$  is an equivalence relation on  $C$ . Write  $\bar{t}$  for the equivalence class of the closed term  $t$ , and  $C^\sim$  for the set of equivalence classes  $\bar{t}$ . Since  $L$  has at least one constant,  $C^\sim$  is not empty. We shall build an  $L$ -structure  $A$  whose domain is  $C^\sim$ . For each constant  $c$  we take  $c_A$  to be  $\bar{c}$ . If  $F$  is a function symbol of arity  $n$  and  $t_1, \dots, t_n$  are closed terms, we define  $F_A(\bar{t}_1, \dots, \bar{t}_n)$  to be the equivalence class

$$(91) \quad F(t_1, \dots, t_n)^\sim.$$

We can use (H4) to justify this definition. An argument by induction on complexity shows that for each closed term  $t$  of  $L$ ,  $t_A$  is  $\bar{t}$ . If  $R$  is a relation symbol of arity  $n$  and  $t_1, \dots, t_n$  are closed terms, we define

$$(92) \quad (t_1^\sim, \dots, t_n^\sim) \text{ is in } R_A \text{ if and only if } R(t_1, \dots, t_n) \text{ is in } T.$$

Again this definition is justified by an argument involving (H4). This completes the definition of the structure  $A$ .

Now we prove, by induction on the complexity of  $\psi$ , that for every sentence  $\psi$  of  $L$ , if  $\psi$  is in  $T$  then  $A \models \psi$ , and if  $\neg\psi$  is in  $T$  then  $A \models \neg\psi$ . A typical clause is where  $\psi$  is  $\exists x \phi(x)$ . If  $\psi$  is in  $T$  then by (H5) there is a constant  $c$  such that  $\phi(c)$  is in  $T$ . Since  $\phi(c)$  has lower complexity than  $\exists x \phi(x)$ , the induction hypothesis shows that  $A \models \phi(c)$ . So  $A \models \exists x \phi(x)$ . On the other hand if  $\neg\exists x \phi(x)$  is in  $T$ , then by (H5) again and induction hypothesis,  $A \models \neg\phi(t)$  for every closed term  $t$ , so that  $A \models \neg\phi[t_A]$ . Since all elements of  $A$  are of the form  $t_A$ , this shows that  $A \models \neg\exists x \phi(x)$ . Thus  $A$  is a model of every sentence in  $T$ , proving the metatheorem.

As an example we shall show that the sequent

$$(93) \quad \forall x \neg(P(x) \wedge \neg Q(x)), \forall x \neg(Q(x) \wedge \neg R(x)) \models \forall x \neg(R(x) \wedge \neg P(x))$$

is not valid. ((93) is the sequent (15) but with the conclusion reversed and “ $\rightarrow$ ” removed in favour of “ $\neg$ ” and “ $\wedge$ .”) We begin by noting that by Metatheorem 8, the sequent is valid if and only if the theory consisting of the sentences

$$(94) \quad \forall x \neg(P(x) \wedge \neg Q(x)), \forall x \neg(Q(x) \wedge \neg R(x)), \neg\forall x \neg(R(x) \wedge \neg P(x))$$

is inconsistent. So we can show the invalidity of (93) by constructing a model of these three sentences. We aim to build a Hintikka set that contains the sentences.

Property (H5) of Hintikka sets and the hypothesis of Metatheorem 16 alert us that we may need to call on constants. Maybe  $L$  has no constants; maybe it has constants, but they are all used in sentences of  $T$  that make their use for (H5) and (H6) impossible. So as a first step we allow ourselves to add new constant symbols to the language when needed. Metatheorem 2 tells us that this expansion of  $L$  makes no difference to the consistency of  $T$ . The added constants are called *witnesses*, since in (H5) the sentence  $\phi(c)$  serves as a witness to the truth of  $\exists x \phi$ .

We begin by writing the sentences (94):

$$(95) \quad \begin{aligned} &\forall x \neg(P(x) \wedge \neg Q(x)) \\ &\forall x \neg(Q(x) \wedge \neg R(x)) \\ &\neg\forall x \neg(R(x) \wedge \neg P(x)) \end{aligned}$$

At this point we apply the second part of (H6) to the third sentence. This requires us to introduce a witness, say  $c$ . A Hintikka set containing  $\neg\forall x \neg(R(x) \wedge \neg P(x))$  needs to contain  $\neg\neg(R(c) \wedge \neg P(c))$ , so we add this to the diagram. We notice that by (H2) a Hintikka set containing this new sentence must also contain  $(R(c) \wedge \neg P(c))$ , so we add this too. Next (H1) tells us that a Hintikka set containing  $(R(c) \wedge \neg P(c))$  must also contain  $R(c)$  and  $\neg P(c)$ , so we add these below. Then by the first part of (H6) we also need to add  $\neg(P(c) \wedge \neg Q(c))$  and  $\neg(Q(c) \wedge \neg R(c))$ , so we add them.

$$(96) \quad \begin{array}{l} \forall x \neg(P(x) \wedge \neg Q(x)) \\ \forall x \neg(Q(x) \wedge \neg R(x)) \\ \neg\forall x \neg(R(x) \wedge \neg P(x)) \\ | \\ \neg\neg(R(c) \wedge \neg P(c)) \\ (R(c) \wedge \neg P(c)) \\ | \\ R(c) \\ \neg P(c) \\ | \\ \neg(P(c) \wedge \neg Q(c)) \\ \neg(Q(c) \wedge \neg R(c)) \end{array}$$

Here we meet a problem. The Hintikka set that we are constructing contains  $\neg(P(c) \wedge \neg Q(c))$ , so by the second

The expression (100) is called a *syntactic sequent*. When we are discussing a particular proof calculus  $\mathcal{C}$ , we can drop the subscript from  $\vdash_{\mathcal{C}}$  and write simply  $\vdash$ ; the symbol “ $\vdash$ ” is read as “turnstile.”

In many proof calculi a formal proof of a sequent is a formalisation of an argument that one might use in order to persuade someone that the sequent is valid. For example the *natural deduction* calculus proposed by Gerhard Gentzen in 1934 is designed to make the same moves as are used in “natural” mathematical arguments. But in general a formal proof need not have any visible connection with arguments. The main requirements on a proof calculus  $\mathcal{C}$  are as follows.

(a) Whenever a syntactic sequent (100) holds, the corresponding semantic sequent (99) is valid. A proof calculus satisfying this condition is said to be *sound*.

(b) Whenever a semantic sequent (99) is valid, the corresponding syntactic sequent (100) holds. A proof calculus satisfying this condition is said to be *complete*.

(c) A computer can identify those arrays of symbols that are formal proofs in  $\mathcal{C}$ , and for each formal proof and each finite semantic sequent, the computer can calculate whether or not the proof is a formal proof of the sequent.

Soundness says that  $\mathcal{C}$  doesn’t prove any sequent that it ought not to; completeness says that  $\mathcal{C}$  does prove any sequent that it ought to.

All the proof calculi commonly taught to undergraduates are both sound and complete. There is one main exception: the resolution calculus is limited to proofs of sequents of the form

$$(101) \quad \forall x_1 \dots \forall x_m \phi \vDash$$

where  $\phi$  is quantifier-free and in conjunctive normal form. Computer science students who study this calculus also learn how to reduce more general proof problems to this form. Also some Hilbert-style calculi are only able to prove sequents of the form  $\vDash \psi$ .

If a proof calculus  $\mathcal{C}$  is sound and complete, then finite sequents with  $\vDash$  are valid if and only if the corresponding sequents with  $\vdash_{\mathcal{C}}$  are also valid. It follows that all the metatheorems of section 8 using  $\vDash$  remain true when they are stated with  $\vdash_{\mathcal{C}}$ . But the versions with  $\vdash_{\mathcal{C}}$  generally have direct proofs using syntactic properties of the proof calculus  $\mathcal{C}$ . Sometimes these direct proofs (particularly proofs of the Deduction Theorem) play a role in

proving that  $\mathcal{C}$  is complete. One deathtrap for unwary teachers is the Cut rule, Metatheorem 7. This is very easy to prove directly for some calculi, for example natural deduction. But for the truth tree calculus below, the truth of the Cut rule is a deep fact equivalent to Gentzen’s cut elimination theorem; a syntactic proof of it is a major enterprise.

The entry “Proof Theory” contains much more information about proof calculi. For example it discusses how one can translate proofs in one proof calculus into proofs in another. If two proof calculi translate into each other in this way, then clearly soundness and completeness theorems for one calculus carry over to the other calculus too. This is probably the main reason why logicians often talk about “the completeness theorem” as if there was a single theorem for all proof calculi, when strictly each complete proof calculus has its own completeness theorem.

We introduced a kind of proof calculus when we discussed the construction of models. Suppose we have a tree diagram in the style of that section, showing that there is no Hintikka set containing the sentences

$$(102) \quad \phi_1, \dots, \phi_n, \neg\psi.$$

Then in view of Metatheorem 8 we count this diagram as a formal proof of the sequent

$$(103) \quad \phi_1, \dots, \phi_n \vDash \psi.$$

The proof calculus based on Hintikka sets in this way is called *truth trees*.

The truth tree calculus is sound by Metatheorem 15. In order to establish that the calculus is complete, we must show the following: If it is not possible to construct a closed truth tree in a finite number of steps starting from  $\phi_1, \dots, \phi_n, \neg\psi$ , then it is possible to construct a truth tree starting with these sentences, in which one branch forms a Hintikka set (so that it has a model by Metatheorem 16). We have to bear in mind that a branch might go on forever. In fact if  $L$  has infinitely many closed terms, then (H3) implies that every Hintikka set in  $L$  must be infinite. In this case the conditions (H1)–(H7) impose infinitely many separate requirements on a Hintikka set, and we have to be sure that we construct our branches in such a way that each of these requirements will eventually be faced and met if possible. This can be arranged.

## DECIDABILITY

When the signature  $\sigma$  is finite, we can assign natural number values to the symbols of  $L(\sigma)$  and thereby

express each formula of  $L(\sigma)$  as a finite sequence of natural numbers. (In fact this is possible, though less tidy, when  $\sigma$  is countably infinite.) Hence it makes sense to apply notions of computability theory to  $L(\sigma)$ . Thus we say that a set  $X$  of finite sequences of numbers is *computably enumerable* (abbreviated to *c.e.*) if a computer can be programmed to output all and only the sequences in  $X$ . Also we say that  $X$  is *computable* if a computer can be programmed to output Yes if a sequence in  $X$  is input, and No if a sequence not in  $X$  is input. These notions carry over immediately to theories in  $L(\sigma)$ . We say also that a theory  $T$  is *decidable* if the set of its logical consequences is computable. A procedure for computing whether any given sentence is a consequence of  $T$  is called a *decision procedure* for  $T$ .

Now suppose we have a proof calculus  $\mathcal{C}$  for  $L$  that meets the conditions (a), (b) and (c) of section 10. Then  $\mathcal{C}$  is sound and complete, so that we have the equivalence

(104)  $\phi$  is a consequence of  $T$  if and only if:

There is a finite subset  $U$  of  $T$  and there is  $P$  such that

[ $P$  is a formal proof in  $\mathcal{C}$  of the sequent  $U \vDash \phi$ ].

By property (c) of  $\mathcal{C}$ , the relation in square brackets is computable. It follows that if  $T$  is computably enumerable, we can program a computer so that it (i) lists all possible finite subsets  $U$  of  $T$ , all sentences  $\phi$  of  $L(\sigma)$  and all formal proofs  $P$  in  $\mathcal{C}$ , (ii) tests, for each  $U$ ,  $\phi$  and  $P$ , whether or not  $P$  is a proof of  $U \vDash \phi$ , and (iii) outputs  $\phi$  whenever the answer to (ii) is Yes. This computer will output all and only the logical consequences of  $T$ . We have shown:

**METATHEOREM 17.** *If  $T$  is a c.e. theory in a first-order language with finite signature, then the set of consequences of  $T$  is also c.e.*

An important corollary is:

**METATHEOREM 18.** *Suppose  $T$  is a complete, consistent, and c.e. theory in a first-order language with finite signature. Then  $T$  is decidable.*

To compute whether  $\phi$  is a consequence of  $T$ , list all the consequences of  $T$ ; eventually either  $\phi$  or  $\neg\phi$  will appear in the list. This is not a practical method. But when this abstract argument shows that  $T$  is decidable, one can usually find a much better decision procedure.

An important case is to determine whether a given sentence  $\phi$  is a consequence of the empty theory, that is, whether  $\phi$  is a theorem of first-order logic. By a result proved by Alonzo Church in 1936, the set of theorems of

first-order logic (say, in a signature with at least one relation symbol of arity at least 2) is not computable. But if we restrict  $\phi$  to come from some appropriate class of sentences, the picture changes. Suppose for example that  $\phi$  is in propositional logic. Then we can construct a truth tree to determine whether  $\neg\phi$  has a model, and after a finite number of steps the truth tree will have ground to a halt in the sense that there are no new sentences that we can add to it. If all its branches are closed, there is no model of  $\neg\phi$ ; if at least one branch remains open, it gives us a Hintikka set and hence a model of  $\neg\phi$ . This provides a decision procedure for propositional sentences.

In fact the truth tree procedure allows us to test for theoremhood every first-order sentence of the form  $Q_1Q_2\phi$  where  $Q_1$  is a string of universal quantifiers,  $Q_2$  is a string of existential quantifiers and  $\phi$  is a quantifier-free formula with no function symbols.

A formula is said to be *universal* if it is quantifier-free or consists of a string of universal quantifiers followed by a quantifier-free formula. Thoralf Skolem proved that the problem of determining whether a given first-order sentence has a model can always be reduced to the problem of determining whether a certain universal first-order sentence has a model:

**METATHEOREM 19.** *Let  $L$  be a first-order language with finite signature  $\sigma$ . There is a computational procedure which, given any sentence  $\phi$ , will find a universal first-order sentence  $\phi^{sk}$  with the following properties:*

(a)  $\phi^{sk}$  is in a signature got by adding function symbols and constants to  $\sigma$ .

(b) Every model of  $\phi^{sk}$  is a model of  $\phi$ .

(c) Every  $\sigma$ -structure that is a model of  $\phi$  can be made into a model of  $\phi^{sk}$  by adding suitable interpretations for the new function symbols and constants.

In particular  $\phi$  has a model if and only if  $\phi^{sk}$  has a model.

We can illustrate Skolem's idea. Let  $\phi$  be the sentence

(105)  $\forall x \exists y \forall z \exists w R(x, y, z, w)$ .

Then for  $\phi^{sk}$  we can take the sentence

(106)  $\forall x \forall z R(x, F(x), z, G(x, z))$ .

The function symbols  $F$  and  $G$ , and the functions they represent in a model of  $\phi^{sk}$ , are called *Skolem functions*.

Thus if we want to determine whether  $\phi$  is a first-order theorem, one way to proceed is to find  $(\neg\phi)^{sk}$  and determine whether it has a model or not. There is no

guarantee that this approach will settle the question; the importance of Skolem's theorem is mainly theoretical.

## FISCHER, KUNO

(1824–1907)

Kuno Fischer, the German philosopher and historian of philosophy, was born at Sandewalde in Silesia. He studied philology at Leipzig and theology and philosophy at Halle. In 1850 Fischer was appointed *Privatdozent* in philosophy at the University of Heidelberg, but his pantheistic views caused his dismissal three years later. In 1856 he qualified as *Privatdozent* at the University of Berlin, and in the same year he was invited to Jena as professor of philosophy. In 1872 he returned to Heidelberg, where he taught with great success until 1903.

Fischer's major work is his *Geschichte der neueren Philosophie* (1852–1877). This widely reprinted history of modern philosophy owed its success in large part to Fischer's splendid gift for exposition. Endowed with a remarkable capacity for sympathetic understanding, Fischer was able to reproduce the great philosophical systems in a literary form of exemplary brilliance and clarity, as well as to unravel their basic themes and subtlest ramifications and to illuminate and reconstruct them systematically. At the same time, he sought to place these systems in their larger cultural and historical context and thus to understand the historical development of philosophy as the progressive self-knowledge of the human mind.

Fischer was the author of the first large German monograph on Immanuel Kant, *Kants Leben und die*

*Grundlagen seine Lehre* (Mannheim, 1860), and it is from Fischer that Neo-Kantianism received its decisive impulse.

Apart from Kant, G. W. F. Hegel was the chief object of his interest. In its equating of logic and metaphysics, Fischer's *System der Logik und Metaphysik oder Wissenschaftslehre* (Stuttgart, 1852) exhibited the strong influence of Hegel. In this work an attempt was also made to bring Hegel's principle of dialectical development into harmony with modern evolutionism in the sense of a teleological idealism. Fischer held that the dialectical development ran from Being through Essence to purpose. The system of logical and, at the same time, metaphysical categories that he outlined culminated in the idea of finality, which guaranteed a purposeful development that goes beyond the merely given. In the second edition (Stuttgart, 1865), Fischer attempted to mediate between Kant and Hegel and to do justice not only to Hegelianism but also to Kantianism and empiricism.

Arthur Schopenhauer also influenced Fischer. In the study *Das Verhältnis zwischen Willen und Verstand im Menschen* (Heidelberg, 1896), Fischer distinguished between the will that is guided by knowledge and the unconscious volition that precedes all knowledge and conscious behavior. He also claimed that just as the essence of nature is "force," so the essence of man is "will" and the essence of the body is the manifestation of volition.

Fischer was also an extremely productive literary aesthete. His conception of art is to be found in his early publication *Diotima: Die Idee des Schönen* (Diotima: the idea of the beautiful; Pforzheim, 1849). In this work Fischer defined the aesthetic attitude as one of "playing," characterized by a concentration and uniting of all our faculties. He devoted later works to the origin and development of humor and to the classical poetry of William Shakespeare, Gotthold Ephraim Lessing, Johann Wolfgang von Goethe, and Friedrich Schiller.

## Bibliography

### ADDITIONAL WORKS BY FISHER

Fischer's chief work is the *Geschichte der neueren Philosophie* (Stuttgart, Mannheim, and Heidelberg, 1852–1877).

Originally published in six volumes (on René Descartes, Benedict de Spinoza, Gottfried Wilhelm Leibniz, Kant, Johann Gottlieb Fichte, and Friedrich Schelling), it was later extended to ten volumes, with a second volume on Kant, one on Schopenhauer (1893), and one on Hegel (1901); and it also included Fischer's early work on Francis Bacon and his school (Leipzig, 1856). Other writings include *Kleine Schriften*, 8 vols. (Heidelberg, 1888–1898), which contains *Über den Witz* (On humor), *Über die menschliche Freiheit* (On human freedom), *Das Verhältnis zwischen Willen und Verstand* (The relationship between will and understanding), and other essays. See also *Philosophische Schriften* (Philosophical writings), 6 vols. (Heidelberg, 1891–1892; 6th ed., 1908–1909).

English translations of Fischer's works include the following: J. Oxenford, *Francis Bacon* (London, 1857); J. P. Mahaffy, *A Commentary on Kant's "Critique of the Pure Reason"* (London and Dublin, 1866); F. Schmidt, *Benedict Spinoza* (Edinburgh, 1882); J. P. Gordy, *Descartes and His School* (New York, 1887); W. S. Hough, *A Critique of Kant* (London: S. Sonnenschein, 1888).

### WORKS ON FISHER

For literature on Fischer, see Hugo Falkenheim, *Kuno Fischer und die literarhistorische Methode* (Berlin, 1892); Wilhelm Windelband, *Kuno Fischer* (Heidelberg, 1907), a memorial address; and Ernst Hoffmann, *Kuno Fischer* (Heidelberg, 1924).

## FISHER, R. A.

(1890–1962)

Ronald Aylmer Fisher was a titan who bestrode two signature disciplines of twentieth-century science: population genetics (or the mathematical theory of evolution), of which he was a cofounder and principal architect, and mathematical statistics, in which he played a pivotal role. On the one hand, he led a revolution that replaced the Bayesian approach of inverse probability with one based solely on direct probabilities (i.e., probabilities of outcomes conditional on hypotheses). On the other hand, he unequivocally rejected the conception of statistics as decision making under uncertainty that his own work inspired. This rift in the new statistical orthodoxy has never healed. Thus, Fisher's conception of probability was at once frequentist and epistemic, his approach to statistics at once inferential and non-Bayesian, and the chief question his life's work poses is whether a consistent theory can be built along these lines.

After excelling in mathematics at the secondary level, Fisher won a scholarship to Cambridge University in 1909 and graduated in 1912 as a Wrangler (i.e., with hon-

ors) in the Mathematical Tripos, then spent another year at Cambridge studying statistical mechanics and quantum theory under the astronomer James Jeans. In the 1911 paper (unpublished at the time) “Mendelism and Biometry,” he pointed the way to a synthesis of Mendelian genetics and Darwinian evolution.

Fisher received two important job offers in 1919: one as chief statistician under Karl Pearson at the Galton Laboratory of University College, London, and the other a temporary position at the Rothamsted (Agricultural) Experimental Station. Fisher was already on famously bad terms with Pearson, so he accepted the Rothamsted offer, leaving him free to develop his own non-Bayesian approach to statistics free of Pearson’s supervision. Over the next fifteen years Fisher developed a world renowned Department of Statistics at Rothamsted that became a training ground for many statisticians who disseminated his new methods far and wide. Fisher’s “golden age of invention” at Rothamsted ended in 1933 when Karl Pearson retired and his department was split into a Department of Statistics, with Egon S. Pearson (Karl’s son) as head, and a Department of Eugenics, with Fisher as head. Relations between the two departments were never cordial. Further details may be found in the biography by Fisher’s daughter, Joan Fisher Box (1978), who gives excellent sketches of his many and varied contributions as well as his side of the many protracted debates in which he engaged.

### FISHER AND THE BAYESIANS

Although weaned on inverse probability at school (Fisher 1950, 27.248), Fisher came to regard Bayesian solutions as vitiated by the arbitrary and subjective character of prior distributions not squarely based on frequency data. Replying to criticism by Karl Pearson of a Bayesian solution he had proposed in his earliest published paper, he noted that the solution favored by Pearson “depends almost wholly upon the preconceived opinions of the computer and scarcely at all upon the actual data” (Fisher 1971–1974, 14.17). This led him to emphasize the need to “allow the data to speak for themselves,” an injunction some of his followers carry to the extreme of deliberately ignoring, for example, all prior information bearing on the efficacy of a new medical treatment. To the Bayesians’ palliative that whatever errors of estimation arise from use of an inappropriate prior will become negligible with accumulating data, he retorts that “it appears more natural to infer that it should be possible to draw valid conclusions from the data alone and without *a priori* assumptions.” Then he adds, “we may question whether

the whole difficulty has not arisen in an attempt to express in terms of the single concept of mathematical probability, a form of reasoning which requires for its exact statement different though equally well-defined concepts” (Fisher 1950, 24.287).

Of the alternative measures suitable for “supplying a natural order of preference” among competing estimates or hypotheses, Fisher recommended the likelihood function (LF) or the data distribution qua function of the unknown parameter(s) of one’s model. Or, when the LF is undefined (i.e., when the probability of the observed outcome conditional on the alternative hypotheses cannot be computed from the model), significance tests are in order. Now the LF provides only relative probabilities and is nonadditive, but the logarithm of the LF is additive and this allows one to combine evidence from different (independent) sources. The value of the unknown parameter that maximizes the LF—the so-called maximum likelihood estimate (MLE)—when it exists and is unique, must then be the best supported value. Fisher’s first task was to provide a rationale for this evidential use of the LF, which Pierre Simon de Laplace and Carl Gauss had drawn as a corollary of Bayesian conditioning, but that, from Fisher’s perspective, “has no real connection with inverse probability” (*Statistical Methods for Research Workers* in Fisher 2003, p. 22).

### THEORY OF ESTIMATION

The first thing that struck him is that, unlike the uniform prior Thomas Bayes and Laplace seemed to conger out of ignorance, the MLE is invariant. That is, if a problem is reparametrized as  $\zeta = g(\theta)$ , then the MLE of the new parameter,  $\zeta$ , is  $g(\hat{\theta})$ , writing  $(\hat{\theta})$  (throughout) for the MLE of  $\theta$  (De Groot 1986, p. 348). At the same time, he noted, unbiased estimators—those whose mean is equal to  $\theta$ —are noninvariant, an unbiased estimator of  $\theta$  being a biased estimator of  $\theta^2$  or  $\theta^{-1}$ . His requirement of invariance is, in reality, a requirement of consistency, namely, that one’s estimates and inferences do not depend on which of several equivalent forms of a problem one adopts. This already brings Fisher closer to the position of his protagonist, Harold Jeffreys, or that of Jeffreys’s worthy successor, Edwin T. Jaynes. Nor did it ever occur to Fisher, as it did to Jeffreys and Jaynes, to use an invariant prior to represent, not pure ignorance, but a state of knowledge that is unaltered by a specifiable group of transformations. Knowing, for example, no more than that  $\theta$  is a scale parameter, a suitable prior—the Jeffreys prior—would be one invariant under changes of scale.

However, Fisher was not satisfied with this justification of MLEs, but insisted that “the reliance to be placed” on one “must depend on its frequency distribution.” (Fisher 1950, 10.327) Thus, Gauss had shown that the arithmetic average (or sample mean) of a set of normally distributed errors of known variance,  $\frac{\sigma^2}{n}$ , is itself normally distributed about the population mean,  $\mu$ , with variance  $\mu^2/n$ . Since a normal distribution is determined by its location parameter,  $\mu$ , which locates the bell-shaped density curve along the  $x$ -axis, and its scale parameter,  $\sigma^2$ , which measures the spread, the variance presents itself as the uniquely suitable measure of the concentration of any estimator whose distribution is normal or asymptotically normal about the estimated parameter. What Fisher claimed to show in his seminal 1922 paper, “On the Mathematical Foundations of Theoretical Statistics” (Fisher 1971–1974: paper 18; Fisher 1950, paper 10), is that MLEs are the most concentrated. He dubbed such estimators of (asymptotically) smallest variance efficient.

One source of tension in Fisher is that his use of likelihood implies the irrelevance of outcomes that might have been but were not observed, and, at various places, he explicitly endorses this implication (*Statistical Methods and Scientific Inference* in Fisher 2003, pp. 71, 91; hereafter *SMSI*). For if as he says “the whole of the information supplied by a sample ... is comprised in the likelihood” (p. 73), the LF of the outcome actually observed, all other points of the sample space must be irrelevant. However, the sampling (or frequency) distribution of an estimator,  $T$ , depends on the whole sample space, and its use to compare estimators therefore violates this likelihood principle.

In the course of his investigation of the large-sample properties of MLEs, Fisher uncovered a class of statistics a knowledge of which renders all other statistics irrelevant for inferences about  $\theta$ , and so he termed them *sufficient* for  $\theta$ . In the classic 1922 paper, he showed that sufficient estimators are asymptotically efficient, thus linking a purely logico-informational requirement—that of utilizing all the information supplied by the data—with a performance characteristic—that of having maximal precision. In fact, he virtually equated the property of not wasting information with efficiency. Then he could describe the statistician’s job succinctly in purely cognitive terms as that of effecting the maximum information-preserving reduction of the data (Fisher 1950, 26.366). Such a maximal reduction is called a minimal sufficient statistic and is mathematically a function of every other sufficient statistic. Philosophers will recognize sufficiency as a close relative of Rudolf Carnap’s requirement of total

evidence, and Fisher remarks that “our conclusions must be warranted by the whole of the data, since less than the whole may be to any degree misleading” (Fisher 1950, 26.54).

Fisher’s claim that maximal likelihood estimation is “unequivocally superior” to all other methods (Fisher 1950, 24.287) would then be vindicated, at least for large samples, by showing that MLEs are sufficient (hence, asymptotically efficient). His proof of this in the 1922 paper was less than rigorous, as he candidly admitted (Fisher 1950, 10.323), and he offered improved versions in sequels to that paper. In the 1934 paper “On Two New Properties of Mathematical Likelihood,” CMS paper #.24, he presented a new criterion of sufficiency, namely, that the LF factors as

$$(1) \quad p(x|\theta) = g(T, \theta)h(x)$$

which allows one to recognize a sufficient statistic at sight. This was of great importance because the property of utilizing all the information in one’s data can be applied to estimators based on small samples. And Fisher’s experimental work in genetics and agronomy (at Rothamsted) had impressed on him the great practical importance of statistical methods applicable to small samples, and, hence, of exact tests or estimates based on exact, as opposed to approximate, sampling distributions. In this he was also strongly influenced by W. S. Gosset’s 1908 discovery of the exact distribution of the statistic,

$$n^{1/2}(\bar{x} - \theta)/s$$

where

$$s^2 = (n-1)^{-1} \sum_{i=1}^n (x_i - \bar{x})^2$$

is the sample variance, which could then be used to test hypotheses about normal means using a small sample when the variance of the measurements is unknown. Thus, he came to view large sample theory, concerned with the never-never world of asymptotic behavior, as a mere preliminary to the study of small samples (*SMSI*, p. 163).

To facilitate the study of small samples, he introduced a quantitative measure of information. His leading idea was to measure the information an experiment with outcome variate  $X$  conveys about an unknown parameter  $\theta$  by the precision (or inverse variance) of an MLE of  $\theta$ . Earlier work of Karl Pearson and Francis Ysidro Edgeworth, the two leading figures of the British school of statisticians of the generation preceding Fisher’s, had

linked the precision of an estimator to the second derivative of the logarithm of the LF,  $\ln p(x|\theta)$ , where  $x = (x_1, \dots, x_n)$ , which one denotes  $L(x|\theta)$ , or even by  $L(\theta)$ . For example, to find the MLE of a binomial parameter,  $p$ , noting that the LF and its logarithm have the same maxima, one solves the likelihood equation,

$$0 = L'(p) = \frac{x}{p} - \frac{n-x}{1-p},$$

the observed relative frequency of successes. Taking the second derivative, one finds:

$$L''(p) = -\left(\frac{x}{p^2} + \frac{n-x}{(1-p)^2}\right)$$

whereupon replacing  $x$  by its mean,  $np$ , reduces this to:

$$-E[L''(p)] = \frac{np}{p^2} + \frac{n(1-p)}{(1-p)^2} = \frac{n}{p(1-p)}$$

the variance of  $p$ . “This formula,” he declares, “supplies the most direct way known to me of finding the probable error of statistics,” adding (with critical reference to Pearson) that “the above proof [not shown here] applies only to statistics obtained by the method of maximum likelihood” (Fisher 1950, 10.329).

Now one might hope to show that the Fisher information, defined by

$$(2) \quad I_n(\theta) = -E[L''(x|\theta)]$$

imposes an upper limit on the precision of any estimator of  $\theta$  for any given sample size  $n$ . To make a long tangled story short, Edgeworth proved special cases of this using the Schwarz inequality and Fisher extended his results (see Hald 1998, pp. 703–707, 716–719, 724–726, 734), offering a proof (again less than rigorous) that  $V(T) \geq 1/I_n(\theta)$ . The first rigorous proofs came in the 1940s (Cramer 1946, p. 475; De Groot 1986, p. 425) and a general form of this so-called Cramer-Rao inequality reads:

$$(3) \quad \text{var}(T) \geq m'(\theta)^2/I_n(\theta)$$

where  $m(\theta) = E(T) = \int T(x)p(x|\theta)dx$ . One’s assumptions are that the density is defined for a nondegenerate interval that does not depend on  $\theta$  and has (finite) moments up to second order. When  $m(\theta) = \theta$ , so that  $T$  is unbiased, (3) simplifies to  $\text{var}(T) \geq 1/I_n(\theta)$ , as anticipated by Edgeworth and Fisher. Estimators that achieve this minimum variance bound are called MVB estimators, and this con-

dition effectively replaces asymptotic efficiency since it applies to samples of all sizes. Cramer then proved (1946, pp. 499ff) that if an efficient (or MVB) estimator  $T$  of  $\theta$  exists, then the likelihood equation has a unique solution given by  $T$ , and that if a sufficient estimator of  $\theta$  exists, any solution of the likelihood equation will be a function of that estimator. These results round out Fisher’s small sample theory of estimation.

Fisher used his factorization criterion (1) for sufficient statistics to show that the distributions admitting a sufficient statistic are precisely those of the form:

$$(4) \quad p(x|\theta) = F(x)G(\theta)\exp[u(x)v(\theta)]$$

provided that the range of  $X$  does not depend on  $\theta$ , as it does for the uniform distribution on  $[0, \theta]$  with  $\theta$  unknown. Called the exponential class, (4) includes almost all the other distributions that figure prominently in applied probability and statistics, including the normal, Poisson, beta, gamma, and chi-squared distributions (and there is also a multiparameter form of (4)). Thus, the class (4) occupies a position of central importance, akin to that of the central limit theorem. Using a clever change of variable in the condition for equality in (3), Jaynes (2003, p. 519) shows that the exponential class is also the class of maxent distributions, those yielded by the principle of maximizing the (Shannon) entropy subject to one or more given mean value constraints. Thus, as Jaynes proclaims, “if we use the maximum entropy principle to assign sampling distributions, this automatically generates the distributions with the most desirable properties from the standpoint of ... sampling theory (because the sampling variance of an estimator is then the minimum possible value)” (520). Once again, the fruits of Fisher’s own investigations drew him closer to the objectivist Bayesian position that he so vigorously opposed. Indeed, the maximum entropy formalism can be used to generate either data distributions or prior distributions and is supported by the kinds of consistency properties Fisher also endorsed. Mathematics makes strange bedfellows!

Fisher information defined by (2), or, equivalently, by  $I_n(\theta) = E[L'(x|\theta)^2] = \text{var}[L'(x|\theta)]$ , also plays a prominent role, as one would expect, in Fisher’s theory of experimental design. Given multinomial data with category counts  $a_1, \dots, a_k$  and category probabilities  $p_1(\theta), \dots, p_k(\theta)$  that depend on a parameter  $\theta$ , the Fisher information for a sample of one is:

$$(5) \quad I(\theta) = \sum \frac{1}{p_i} \left( \frac{dp_i}{d\theta} \right)^2$$

Examples arise in genetics, especially linkage. For example, one may wish to compare the information about the linkage parameter  $\theta$  (the recombination fraction) yielded by a double backcross,  $AB/ab \times ab/ab$ , with that given by a single backcross,  $Abab \times Abab$ . Under the former mating, the genotypes  $AB/ab$ ,  $Ab/ab$ ,  $aB/ab$ ,  $ab/ab$  occur among the offspring with probabilities  $\frac{1}{2}(1 - \theta)$ ,  $\frac{1}{2}\theta$ ,  $\frac{1}{2}\theta$ , and  $\frac{1}{2}(1 - \theta)$ , and so

$$I(\theta) = \frac{2}{1-\theta} \left( -\frac{1}{2} \right)^2 + \frac{2}{\theta} \left( \frac{1}{2} \right)^2 + \frac{2}{\theta} \left( \frac{1}{2} \right)^2 + \frac{2}{1-\theta} \left( -\frac{1}{2} \right)^2$$

$$= \frac{1}{\theta(1-\theta)}$$

while for the single backcross one similarly finds  $I(\theta) = 1/2\theta(1 - \theta)$ , or half the information yielded by the double backcross. Further refinements arise when there is dominance in one or both factors (see Edwards 1992, pp. 148–149). For more examples, see chapter 11 of *The Design of Experiments* (in Fisher 2003; hereafter *DE*) and Kenneth Mather's *The Measurement of Linkage in Heredity* (1938).

## SIGNIFICANCE TESTS

One comes, at last, to Fisher's second important measure for ordering hypotheses, namely, significance tests. The earliest significance tests were aimed at distinguishing a hypothesis of chance from one of cause or design (Hald 1998, §4.1). For example, is the perfect agreement of the wrong answers of two students on a multiple choice test due to collusion or a mere coincidence? In the usage of Laplace, one compares the probability of such agreement on the two hypotheses and when this probability is "incomparably greater" on the hypothesis of design, "we are led," he says, "to disbelieve" that of chance. Laplace readily extended this reasoning to the separation of "real" from "spurious" physical causes, as when he concluded that "the actual disposition of our planetary system," by which he meant that all six planets and their satellites move in the same direction as the earth and have inclinations to the ecliptic within a small neighborhood of zero, "would be infinitely small if it were due to chance" and so indicates a "regular cause" (§4.4). In the same vein, Gustav Kirkhoff concluded that the perfect coincidence of the sixty dark lines in the solar spectrum of iron with sixty bright lines of the spectrum obtained by heating iron filings in a Bunsen burner could not be due to chance but indicated the presence of iron in the sun.

In such cases, the probability of agreement on the hypothesis of design may be only qualitatively defined, but the logic is essentially that of a likelihood ratio test. Nor did Laplace speak in terms of rejecting the hypothesis of chance or prescribe a threshold of improbability beyond which belief gives way (or should give way) to disbelief. He took as his test criterion the tail area probability, that is, the probability of a deviation at least as large as that observed (Hald 1998, p. 25). Moreover, a low probability of observing so large a deviation by chance points to some alternative explanation that, however, need not be formulated beforehand. Rather, "by letting the remarkable feature [of the data] determine the statistic used in the test, we concentrate implicitly on an alternative hypothesis" (p. 67).

Fisher embraced most but not all these features. The *locus classicus* of his account is the famous treatment of the tea-tasting lady who claims to be able to tell whether milk or tea was added first to a mixture of the two (*DE*, chapter 2). Every serious student of inductive reasoning should read and reread this chapter with infinite care. Of great importance, too, is the fourth chapter of *SMSI*, "Some Misapprehensions about Tests of Significance."

To begin with, a significance test is, emphatically, not a decision rule (*DE*, §12.1; *SMSI*, §4.1), the differences between them being characterized as "many and wide" (*SMSI*, p. 80). Thus opens Fisher's trenchant critique of the Neyman-Pearson theory of testing. In choosing a test statistic, "the experimenter will rightly consider all points on which, in the light of current knowledge, the hypothesis may be imperfectly accurate, and will select tests ... sensitive to these possible faults, rather than to others" (p. 50).

However, Fisher is clear that the hypothesis one chooses to test may be suggested by one's data (p. 82). Thus, in tossing a coin, the outcome may lead one to test the hypothesis that the coin is fair, that the trials are independent, or that the same coin was tossed each time. Each test will require a different reference set and a different measure of deviation from the null hypothesis. This point is further illustrated by examples from genetics, where departures from posited 9:3:3:1 Mendelian ratios for a hybrid cross may be due to linkage, partial dominance in one of the factors, linked lethals, or other causes. In such cases, the partitioning of the chi-squared statistic into orthogonal components allows one to pinpoint the source(s) of such a discrepancy (for illustrations of this method, see Mather 1938, chapter 4). This practice is markedly at odds with the Neyman-Pearsonite insistence on predesignating all the elements of a test. Fisher goes on

to draw three more such contrasts between significance testing and the acceptance sampling paradigm that informs the Neyman-Pearsonite theory.

First, in acceptance sampling, the population of lots from which one is sampling is well defined and one has a real sequence of repeated trials, “whereas the only populations that can be referred to in a test of significance have no objective reality, being exclusively the product of the statistician’s imagination through the hypothesis which he has decided to test” (*SMSI*, p. 81). Thus, a test is possible where no repetition of one’s experiment is contemplated. However, Fisher’s hypothetically infinite populations lead a shadowy existence and, as Jaynes (2003) remarks, it is hard to see how such imaginings can confer greater objectivity on one’s methods.

Second, decisions are final, and conclusions are provisional. And, third, “in the field of pure research, no assessment of the cost of wrong conclusions ... can conceivably be more than a pretence, and in any case ... would be inadmissible and irrelevant in judging the state of scientific evidence” (*DE*, pp. 25–26; also see *SMSI*, pp. 106–107). Still, Fisher could easily have admitted the relevance of cost functions to the planning of an experiment and still deny their relevance to the weighing of the evidence that results.

The main thrust of Fisher’s critique of the Neyman-Pearsonite theory, however, was to deny that the significance level, which measures the strength of the evidence against the null hypothesis of no difference, can be identified with the frequency with which the null hypothesis is erroneously rejected—with the Neyman-Pearsonite’s “type I error probability” (*SMSI*, pp. 93–96). Varying Fisher’s more complicated example, J. G. Kalbfleisch and D. A. Sprott (1976, p. 262) consider the composite hypothesis  $H$  that at least one of  $m$  coins is fair ( $m > 1$ ). Each coin is tossed ten times, and if each shows 0, 1, 9, or 10 heads (with at least one showing 1 or 9), one can quote an exact significance level of  $22 \times 2^{-10} = 0.0215$  against the fairness of each coin, hence evidence no stronger than this against  $H$ . (Intuitively, the evidence that all the coins are biased can be no stronger than the evidence that any particular one of them is biased.) However, the frequency of rejecting  $H$  using this criterion, even when  $H$  is “truest” (i.e., when all the coins are fair) is only  $.0215^m$ , which, even for moderately large  $m$ , is much smaller than  $.0215$ . This leads Kalbfleisch and Sprott to conclude, with Fisher, that “the frequency with which a true hypothesis would be rejected by a test in repetitions of the experiment will not necessarily be indicative of the strength of the evidence against  $H$ ” (p. 263). More generally, it may be

nearly impossible to obtain strong evidence simultaneously ruling out all the simple constituents of a composite hypothesis (*SMSI*, p. 93), which prompts Fisher to conclude that “the infrequency with which, in particular circumstances, decisive evidence is obtained, should not be confused with the force, or cogency, of such evidence” (p. 96).

Fisher, like Laplace, refrains from imposing a universal critical level of significance and almost always reports exact significance levels or tail area probabilities, but, unlike Laplace, he does speak of rejecting hypotheses, even though in most instances this is just shorthand for “regard the data as discordant or inconsistent with the hypothesis.” Nevertheless, this language invited confusion with the different decision theoretic approach of Jerzy Neyman and Egon Pearson, and, in fact, misled generations of textbook writers, who regularly graft the Neyman-Pearson account of testing onto Fisher’s and paper over the many and wide differences between them.

Fisher’s crucial departure from Laplace is to construe significance levels as evidence against the null hypothesis. Like Karl Popper, he steadfastly refuses to concede that evidence sufficient to reject the null hypothesis at a stringent level of significance is evidence for the alternative hypothesis of interest. However, his own practice belies his precept. In testing for genetic linkage, rejection of the hypothesis of independent assortment is routinely followed by estimation of the recombination fraction, that is, the degree of association. And in the example of the tea-tasting lady, his language is that the lady “makes good her claim” when she classifies all the cups presented to her correctly (*DE*, p. 14). The reason he gives for denying that an experiment can do more than disprove the null hypothesis (p. 16) is that the alternative hypothesis that the lady can discriminate “is ineligible as a null hypothesis to be tested by experiment, because it is inexact.” That reason is rather question-begging. The real reason, one suspects, is that Fisher wanted to be able to disprove a null hypothesis without providing evidence for any alternative hypothesis. The possibility of such purely negative significance tests has been at the heart of the controversies that have swirled about this topic (see Royall 1997, chapter 3, especially §3.9).

For Laplace, as it was seen, significance tests are extensions of likelihood ratio tests to rather amorphous ill-defined alternatives. And for Fisher, too, they come into play when the LF is unavailable—a point that seems to have been lost on Neyman and Pearson, whose methodology assumes that outcome probabilities conditional on the alternative hypotheses can be computed

from the model. However, for Fisher, the logic of a test is a probabilistic form of *modus tollens*. A hypothesis is rejected when the outcome it entails does not occur; similarly, it is rejected at a stringent level of significance when an outcome it predicts with high probability does not occur. And this eliminativist logic applies whether or not alternative hypotheses have entered the arena.

Kalbfleisch and Sprott (1976) also strongly insist that the alternative to, say, a null hypothesis of homogeneity may be too amorphous to admit specification. Significance tests allow one to postpone the hard work of formulating such an alternative until a significance test has demonstrated the need for one. No doubt, there are strong arguments on both sides and the issue may be considered unresolved. An interesting case in point is provided by the maximum entropy method wherein the signs and magnitudes of the deviations from expected values indicate a new mean value constraint that then leads to a new maxent distribution. The presence of such an additional constraint is indicated when the entropy of the current maxent distribution lies sufficiently far below the maximum allowed by the current mean value constraints. Ultimately, however, one must agree with Gossett (see Royall 1997, p. 68) that one cannot securely reject a hypothesis or a model unless or until one has a better fitting one to put in its place (compare de Groot 1986, p. 523).

Critics of significance testing have also questioned the use of tail areas, which as Fisher admits, “is not very defensible save as an approximation” (*SMSI*, p. 71), for it appears to make the import of what was observed depend on possible outcomes that were not observed. Actually, in cases where the measure of deviation is a continuous variate, like Pearson’s chi square or Gossett’s  $n^{1/2}(\bar{x} - \mu)/s$ , the probability of a deviation exactly as large as that observed is nil and so one has no choice but to use a tail area. However, more to the point, tail areas give (approximately) the proportion of possible outcomes that agree with the hypothesis of cause, design, or efficacy as well as that observed, and this provides a sort of absolute standard of comparison, one that even allows one to compare the strength of the evidence in favor of hypotheses in disparate fields. In any case, the Laplacean logic of significance testing, which views such a test as an index of the evidence in favor of some hypothesis of design, averts a host of interpretive difficulties and fits well with a form of argument—the piling up of improbabilities—that occurs across a broad spectrum of the sciences.

## CONCLUSION

No article of reasonable length could hope to touch on more than a fraction of Fisher’s vast output and the many thorny issues raised therein. Nothing has been said here, for example, about Fisher’s notorious third measure of uncertainty, namely, fiducial probabilities. A good place to start is with the example of Gossett’s t-test (*SMSI*, pp. 84–86). Turn next to the critique of the fiducial argument by A. W. F. Edwards (1992, §10.5), and then to the excellent papers by Teddy Seidenfeld (1992) and Sandy L. Zabell (1992). Oscar Kempthorne somewhere remarked that it would require at least ten years of preliminary study before attempting a definitive account of Fisher’s work in statistics alone, but the effort would be well repaid. The same may be said of his work in genetics and evolution.

One may view Fisher as a “foiled circuitous wanderer,” for his heroic attempts to construct a comprehensive alternative to the Bayesian account of inductive reasoning drew him ever more firmly back into the Bayesian position he started from and then rejected. The question one must address, however, is not whether Fisher would ultimately have returned to the Bayesian fold had he lived, say, another decade, but whether the consistency requirements he endorsed force one “back to Bayes.” As it has been seen, his position is close to the objectivist Bayesianism of Laplace, Jeffreys, and Jaynes at many points (see Zabell 1992, p. 381 and notes 42 and 56). At the same time, it has to be admitted that Fisher created almost single-handedly the conceptual framework and technical vocabulary all statisticians, whether Bayesian or non-Bayesian, utilize. For sheer fertility of invention, Fisher has few equals in the history of the mathematical sciences.

## FISKE, JOHN

(1842–1901)

John Fiske, the American philosopher and advocate of evolutionary theory, was born in Hartford, Connecticut, and baptized Edmund Fisk Green. He changed his name to John Fisk shortly after his mother remarried in 1855 (the *e* was added in 1860). He grew up in Middletown and attended the Congregational Church, but he became dissatisfied with orthodox Christianity and found himself drawn to the philosophical and theological implications of modern science. He early declared himself an "infidel," meaning by the word "non-Christian" rather than atheist. While he was a student at Harvard, he was punished by the college faculty for reading Auguste Comte in church.

Fiske's main philosophical work, *Outlines of Cosmic Philosophy*, developed from lectures given at Harvard in 1869 and 1871, and was completed in London during 1873 and 1874. In it he acknowledged himself a disciple and expositor of the philosophy of Herbert Spencer, the importance of which, he believed, would in time be seen

to surpass that of Isaac Newton. This judgment did not appear extravagant to Fiske, since Spencer's law of evolution was "the first generalization concerning the concrete universe as a whole." According to Fiske's formulation of this law, "The integration of matter and concomitant dissipation of motion, which primarily constitutes Evolution, is attended by a continuous change from indefinite, incoherent homogeneity to definite, coherent heterogeneity of structure and function, through successive differentiations and integrations." He illustrated the law's operation at great length with examples drawn from organic processes, the nebular origin of the solar system, comparative philology, and the development of civilization.

Fiske maintained that at some time in the past, human evolution had reached a stage in which man's brain alone continued to evolve; ultimately, a level was achieved at which the individual's brain continued to develop after his birth. This process, which necessitated a period of prolonged infancy accompanied by the evolution of strong parental affection, provided the physical setting for the evolution of the resulting family into clans and society; for the origin of morality in the altruism demanded by family care; and for cultural progress, through the enhanced receptivity of yet developing minds. Prolonged infancy was the cornerstone of an evolutionary explanation of civilization; indeed, Fiske believed that this theory was his most important contribution to philosophy.

Fiske aimed to show the unity of all knowledge, the inevitability of progress, and the ultimate harmony of science and religion. He appealed to the law of evolution to accomplish the first two aims and to "Berkeleyan idealism" to accomplish the third. All knowledge is "relative" in the sense that it consists only of classifying and discovering regularities among phenomena. What underlies and creates our experience or phenomena Fiske calls the "Unknowable," "Deity," and "Absolute Power." This "Deity" is the only proper concern of religion, while the regularities discoverable among the phenomena in which Deity manifests itself are the scientist's laws of nature. Thus Fiske's "cosmic theism" reconciles religion and science. Religious dogmas that intrude upon the scientist's world of phenomena are vestiges of primitive, anthropomorphic stages of religious development. Miracles must therefore be rejected, and the doctrine of special creation must give way to Charles Darwin's theory of natural selection. Pantheism, which according to Fiske identifies Deity with the phenomenal world, is rejected, since Fiske's Deity is an "unconditioned existence" which is

“something more than the universe.” He rejects Comte’s Religion of Humanity as a mere conceit. Materialism is rejected because it is at least conceivable that matter is reducible to mind or feeling, but inconceivable that feeling should evolve from matter; thus, the view that Deity is “Spirit” is plausible.

The major difference between Fiske and Spencer is Fiske’s greater emphasis on the religious implications of evolutionary philosophy. Whereas Spencer was guarded, Fiske was unambiguous in calling what lay behind the phenomenal world “Spirit,” and he took pains to prove that it was a plausible object of earnest religious contemplation. A further difference between the two thinkers is that Fiske, unlike Spencer, brought evolutionary philosophy to the defense of social conservatism, in the belief that inevitable progress obviated the need for radical social and religious change.

Fiske greatly enjoyed living in Cambridge, Massachusetts, and as late as 1878 he retained the hope of gaining a permanent position at Harvard in either the department of history or that of philosophy. He declined job offers from other universities, but at Harvard he could obtain only temporary positions as a lecturer and as assistant librarian of the college. Early in life Fiske sought to make a living from his writing. Later he was always short of money and tried to make ends meet by going on the lecture circuit; however, he achieved genuine popularity both as a writer and lecturer only in the last decade of his life.

Throughout his life Fiske retained an earnest religious attitude, which he expressed in his later popular lectures in terms more and more conciliatory toward New England Protestantism. Thus “The Unseen World” (1876), the title essay of his first collection of essays, merely urged that science could not refute the immortality of the soul and that “a simple act of trust” in immortality was not unreasonable. In “The Destiny of Man” (1884), another title essay, Fiske said that the human soul was not merely the end product, but the goal of the great evolutionary process contrived by God. Finally, in *Through Nature to God* (1899), Fiske argued, in reply to T. H. Huxley’s Romanes lecture “Evolution and Ethics” (1893), that nature is not morally indifferent but, on the contrary, that evolution “exists purely for the sake of moral ends.” He also argued that science offered confirmation of the existence of God and of immortality.

After 1887 Fiske wrote nearly twenty volumes on American history. He was never an original philosopher, but through his clear writing and well-phrased public lectures he helped to advance American religious liberalism.

He was a competent popularizer of Darwin’s theory of evolution at a time when most religious writers were attacking evolution with frenzy.

## FLORENSKII, PAVEL ALEKSANDROVICH (1882–1937)

Pavel Aleksandrovich Florenskii was a Russian philosopher, theologian, art theoretician, and scientist-polymath. He was born January 22, 1882, of a Russian father and Armenian mother, and died on December 8, 1937. Florenskii lived in the Caucasus, mainly in Tiflis (Tbilissi), Georgia, until 1898, when he entered the Department of Physics and Mathematics of Moscow University. Endowed with many talents, he was invited to stay at the university after graduation for further studies in mathematics, but declined and instead entered Moscow Theological Academy in 1904. By then he was already known as an active member of the Russian Symbolist movement; he published poetry, essays, and philosophical articles, and he corresponded with Andrey Bely—a leading Symbolist poet and theorist—regarding basic

theoretical problems of Symbolism. In 1908 Florenskii graduated from the Academy and stayed there as a professor of philosophy. In 1911 he was ordained a priest. Between 1906 and 1914 he wrote his magnum opus, *The Pillar and Ground of the Truth*, that became one of the principal texts of Russian religious philosophy. It is also a very unusual text, a modernist masterpiece that is at once a theological treatise (bearing the subtitle *An Essay of Orthodox Theodicy*), an exposition of a new philosophical system, a cycle of lyrical letters to a friend (it is divided into “Letters,” not chapters, with each letter accompanied by a period engraving with a motto), and an endless chain of digressive studies on all kinds of subjects. Essentially, *An Essay of Orthodox Theodicy* is an itinerary of a spiritual journey; and because the journey is undertaken by a philosopher, it includes the creation of a philosophy.

#### FLORENSKII'S EARLY PHILOSOPHY: SOPHIOLOGY

The philosophy that is expounded in the book is a system of metaphysics of All-Unity. In Russian philosophy this kind of metaphysics was introduced by Vladimir Solov'ev. Its basic concept represents a specific transrational principle of inner form that ensures a perfect unity of a manifold such that any part of the latter is identical to the whole. The principle is an ancient aporetic philosophical paradigm that originated in pre-Socratics, was later articulated in Neoplatonism, and then carefully elaborated by Nicolas of Cusa. It made its last appearance in Western metaphysics in Schelling's thought. Solov'ev's contribution to this philosophical tradition consisted in making the concept of All-Unity the guiding principle of a comprehensive philosophical system. The main new element introduced by Solov'ev was the linking of All-Unity with the biblical and Gnostic mythologem of Sophia, the Wisdom of God. As a result, Solov'ev's metaphysics of All-Unity was articulated as a metaphysics of Sophia (sophiology). Florenskii accepts the connection between Sophia and All-Unity but otherwise does not follow Solov'ev and hardly ever mentions him. *The Pillar* presents a new, different kind of sophiology.

One may single out two lines in the history of the mythological Sophia, both deriving from the Wisdom books of the Bible. One included Gnostic and later Western mystical doctrines, with Valentine, Heinrich Seuse, Jacob Boehme, and Emmanuel Swedenborg as the chief exponents; whereas the other, found in Eastern Christianity, manifested itself in cultic forms, such as consecration of churches to Sophia and icon-painting. Solov'ev drew upon the Western tradition, whereas Florenskii

upon the Eastern one. Further elaboration, turning Wisdom of God into a metaphysical concept, is also independent of Solov'ev. The association of All-Unity with Sophia is based on the fact that, ontologically, they both are intermediate realities between God and the empirical world. Such reality was traditionally conceived as “the world in God” or, according to Greek patristic writings, the system of divine logoi (ideas, designs) of all created things.

Florenskii made this conception of Christian Platonism still more Christian by linking each human person to God's love of this person. This love further coincides with the divine logos or God's idea of this person, and represents a monad of Leibnizian type; thus there is a noumenal love-idea-monad corresponding to each person and implementing his or her connection to God. Love also connects all these love-idea-monads with one another, and taken together, they form a loving and *eo ipso* living being. Sophia is this noumenal, meta-empirical, living and loving being. Analyzing love, Florenskii finds that it means a certain kind of identity of lovers, their “consubstantiality in God.” Thus any two monads belonging to Sophia are consubstantial by virtue of their love, which implies that all parts of Sophia are identical both to one another and to the whole, while at the same time retaining their individual differences. This means in turn that Sophia is the perfect unity of a manifold—that is, All-Unity.

The concept of Sophia as a noumenal loving being and community of monads connected by love forms the basis of the Platonist ontology in Florenskii's early philosophy. Florenskii's epistemology is also Platonist at this stage. The key to the epistemology of *The Pillar* is given in the epigraph of the book, which is a quotation from St. Gregory of Nyssa: “Knowledge is achieved by love.” As in Florenskii's ontology, the main principle here is love: Cognition is a kind of communion of the knower and the known, it implies building up their unity and consubstantiality, and this implies, in turn, that genuine cognition is achieved only in love and by love. Such treatment, integrating epistemology into ontology, is opposite to the mainstream of Western metaphysics and especially to Kantian and post-Kantian philosophy that insisted on the primacy of epistemology and subsumed ontology under it. Accentuating this opposition to the extreme, Florenskii depicts the entire history of European thought as a dramatic conflict between Platonism and Kantianism.

### FLORENSKII'S LATE PHILOSOPHY: "CONCRETE METAPHYSICS"

*The Pillar and Ground of the Truth* made Florenskii famous, but it was a milestone rather than an exhaustive treatment of his ideas. In it he tried to follow strictly the Church doctrine and thus had to put aside many themes that were important for him, above all, his ideas of the symbol and its role. Florenskii considered symbol as a constitutive element and building block of reality, and invariably defined his outlook as symbolist. He began to develop this view already in his early texts and returned to it after the publication of *The Pillar*. He conceives and nearly completes a broad project of symbolistic philosophy called *concrete metaphysics*, a kind of all-embracing synthesis resulting in a detailed symbolist picture of Being and the Universe. Originally, symbol was conceived by Florenskii in the classical Platonic and Schellingian way, as an inseparable union of the phenomenal (sensuous) and noumenal (intelligible), joined in perfect mutual expression (the Schellingian *Einbildung*).

In Florenskii's concrete metaphysics the concept of symbol acquired new features—along with his entire worldview that should now be described as Christian Neoplatonism. Firstly, the structure of symbol became layered, as a set of concentric spheres, with the one in the center corresponding to the perfect union of the symbol's phenomenal and noumenal components, whereas the outer spheres represented increasingly imperfect expressions of the noumenon in the phenomenon. Secondly, the inner mechanism of symbol was now seen as a dynamic union of phenomenal and noumenal energies. Energy became the basic new element in Florenskii's late philosophy, which he treated in unwavering Neoplatonist terms.

Concrete Metaphysics was intended to provide a systematic description of reality as formed by symbols of various kinds. In many aspects it resembles Ernst Cassirer's contemporaneous theory of symbolic forms. The description had to consist of studies devoted to definite kinds of symbols. Its basic criteria for distributing symbols into types or classes are anthropological and correspond to human perceptive modalities; the main classes of symbols analyzed by Florenskii are visual (spatial) and acoustic (verbal). The study of visual symbols includes, first of all, a specific model of the Cosmos. In this model, the physical Universe is complemented by a noumenal yet equally spatial world; contacts and transitions between the two worlds include death as well as phenomena of religious and mystical experience, and the boundary between the two worlds is regulated by the cult. Another

vast domain of visual symbols is provided by the plastic arts. Florenskii made detailed studies of this domain; he developed a theory of reverse perspective used in icons and then more general theory of space as it figures in works of art; from 1921 to 1924 he expounded these theories in lecture courses in Vkhutemas, one of the main centers of the Russian avant-garde art of 1920s. As for the studies of acoustic symbols, they include mainly Florenskii's philosophy of language, a specific feature of which is the idea of occult energies present in the word. Other parts of Concrete Metaphysics that merit mention are the outlines of the philosophy of technics, based on the idea of the projection of human organs.

Florenskii's late philosophy is presented in numerous works, nearly all of which were created in the decade from 1914 to 1924. Many of the studies planned were not completed. After 1917 the Theological Academy was closed, and Florenskii started working in applied physics and engineering. As he never relinquished his Christian faith, he was persecuted, being arrested in 1928 and again in 1933. After the second arrest he was sent first to the Far East and then, in 1934, to the concentration camp in the Solovetsky islands in the White Sea. In 1937, in the campaign of mass murders, he was shot. Most of his works written after 1917 remained unpublished until the 1980s and 1990s; when they gradually became known, it was discovered that they contain pioneering ideas in many fields—for example, in semiotics—and some bold predictions, such as the existence of the genetic code.

## FLORENTINE ACADEMY

“Florentine Academy,” or Platonic Academy of Florence, is the name usually applied to the circle of philosophers and other scholars who gathered around Marsilio Ficino, under the auspices of the Medici, in Careggi, near Florence, between 1462 and 1494. These scholars were engaged in the study and discussion of the works of Plato and his followers and of Platonic philosophy. The name “academy” was adopted in memory of Plato. There is no direct link between this Platonic Academy and other academies active in Florence at a later date.

According to Ficino, the academy was founded by Cosimo de’ Medici because his enthusiasm for Plato had been aroused by the lectures of Gemistus Pletho at the time of the Council of Florence (1438). In 1462 Cosimo placed a villa in Careggi at the disposal of Ficino, the promising young son of his physician, and lent him several Greek manuscripts of Plato and other ancient philosophers, assigning him the task of studying, translating, and interpreting these writings. This event may be considered the founding of the Florentine Academy. Unlike most later academies, Ficino’s Platonic Academy had no formal organization, charter, or fixed membership, and its activities must be inferred from contemporary sources, mainly the letters and other works of Ficino and his associates.

The chief products of the academy are the numerous writings of Ficino and his associates. Whether the public lectures given by Ficino on Plato, Plotinus, and St. Paul were considered part of the work of the academy we do not know. Its activities probably included some regular readings of the Platonic texts and some lectures about them, and surely Ficino gave individual instruction to some of his pupils. On many occasions he addressed edifying sermonlike speeches to his gathered friends and pupils, and this fact, along with a few others, suggests a

link between the academy and some of the lay religious associations of the same period. The most famous events of the academy are the banquets celebrated on Plato’s reputed birthday, November 7, in 1468 and in 1473, and perhaps in other years. The banquet of 1468 provided the setting for Ficino’s commentary on Plato’s *Symposium*. The academy also held discussions on philosophical and other subjects on numerous occasions, and it was customary for learned or otherwise distinguished visitors to Florence to attend some of the meetings. The study in which Ficino talked to his pupils contained a painting that represented the globe, with the crying Heraclitus and the laughing Democritus on either side. The often repeated story that Ficino kept an ever-burning lamp before a bust of Plato must be rejected as a legend.

There is no philosophical doctrine common to the Florentine Academy distinct from that of Ficino, but the thought of all its members was influenced to a greater or lesser degree by his teachings. The circle included such philosophers as Giovanni Pico della Mirandola and Francesco Cattani da Diacceto, and such philosophically inclined scholars and poets as Cristoforo Landino, Lorenzo de’ Medici, Angelo Poliziano, and Girolamo Benivieni, to mention only some of the better-known members whose writing showed the impact of the academy. The meetings of the academy became famous during its own time, and its intellectual influence, through its visitors and through Ficino’s correspondence, spread to the rest of Italy and Europe. Thus, in spite of its informal and fluctuating character, the academy became, and has remained in history and tradition, the most tangible center of Renaissance Platonism.

There is a close link between Ficino’s philosophical doctrine and the structure of the academy as he conceived it. Following the model of the ancient philosophical schools, Ficino considered the academy as a community of friends, and his philosophy included an elaborate theory of friendship that he identified with Platonic love. The members of the academy were, he felt, linked with each other and with their master through a “divine” friendship that was based on their common concern with the contemplative life and with the spiritual ascent toward the knowledge and enjoyment of God.

The goal of the academy was philosophical and, in a broader sense, spiritual and cultural rather than political. Although Ficino and the academy were closely identified with four generations of Medici rulers, it cannot be proved that he was their political tool or that his personal and scholarly attachments were limited to their partisans. Nonetheless, although Ficino lived until 1499 and

remained active as a scholar throughout his later years, we hear next to nothing of the activities of the academy after 1494, the year in which the Medici were expelled from Florence, Poliziano and Pico died, and Ficino's published correspondence stopped. There is no direct evidence that the meetings of the academy were discontinued, but it is easy to understand that the illness and old age of its leader, the death of some of its most prominent members, and the political and religious climate that prevailed in Florence after 1494 must have put an end to the academy or at least reduced its activities to a strictly private character.

## FLOROVSKII, GEORGII VASIL'EVICH (1893–1979)

Georgii Vasil'evich Florovskii was a Russian clergyman, theologian, patrologist, and historian of culture. A descendant of several generations of Orthodox priests, Florovskii graduated from the Department of History and Philology of Novorossiyskii University in Odessa (1916), and taught in Odessa until January 1920, when he emigrated to Sofia, Bulgaria. There he became a member of a group of five Russian émigrés who, in 1920 and 1921, founded the so-called Eurasianism. The Eurasian doctrine was first presented in the collective work "Exodus to the East," for which Florovskii wrote three articles.

"Exodus to the East" presented what was essentially a cultural morphology of Oswald Spengler's type (i.e., the

botanized view of history as a process of development and interaction of ethnic and cultural organisms) and a geopolitical theory stating that, because Europe had exhausted its spiritual energies, Russia should break with it and cultivate cultural and political ties with Asia. Eurasianists sharply criticized European civilization and argued that in all principal aspects Russia belongs neither to the European nor to the Asian world; rather, it occupies its own continent "Eurasia" and has its own type of culture that borrowed much from the Mongols in the thirteenth to the fifteenth centuries—when Russia was their vassal state. In politics, they propounded the principle of *ideocracy*, very close to that of the one-party rule in Bolshevik Russia.

During the next several years, Eurasianism became popular among young Russian émigrés, evolving from a cultural theory into a political movement that had a pro-Soviet orientation and engaged in secret activities. Florovskii made a significant contribution to the initial form of the Eurasianist doctrine that gravitated toward philosophy of history and philosophy of culture. However, as early as 1923 he began to object strongly to his fellow Eurasianists' growing tendency toward ethnic and geopolitical concerns, favoring instead the opposite orientation toward Orthodox Christianity. This line was rejected by other Eurasianist leaders and, as a result, Florovskii left the movement. In 1928 he published the article "The Eurasian Temptation," in which he presented a profound critical analysis of Eurasianism, and in later years he invariably minimized the scale of the Eurasian episode in his biography.

### NEOPATRISTIC SYNTHESIS

From 1922 to 1926 Florovskii lived in Prague, where he received a doctorate in philosophy for his study on Alexander Ivanovich Herzen's philosophy of history and wrote a number of essays on Russian cultural history, including works on Fyodor Dostoyevsky, Fyodor Tytchev, and Mikhail Gershenzon. In September 1926 he moved to Paris to become Professor of Patristics at the St. Sergius of Radonezh Theological Institute that was founded in 1925 and developed quickly into the leading Orthodox theological school. Though a self-taught theologian, Florovskii found in patristics his true calling. He focused on the Greek Fathers of the Church and developed brilliant survey courses, marked by a pioneering presentation of the subject. The teachings of the Greek Fathers also became the cornerstone of the theories that he started to develop in philosophy of culture, theology, and ecclesiology.

At the core of these theories was the concept of *Neopatristic Synthesis*. According to its main thesis, a permanent creative renewal of ties with patristic thought is a necessary condition for Christian culture; in fact, such a renewal defines the mode of the latter's existence. This thesis has manifold implications. Firstly, it is a restatement of the basic tenet of the Orthodox doctrine that establishes a permanent and all-embracing normative role of the Tradition of Fathers. Secondly, it is a polemic reformulation of the claim that Greek philosophy—rather than theology—is an eternal source for all subsequent philosophical thought, so that keeping ties with it is necessary for philosophy of all ages. And thirdly, it is a viable premise for constructing a new philosophy or theology of culture of the archeological type—that is, one based on the permanent generating and productive role of a certain source. Florovskii's theory stated that Greek patristics made Hellenism not simply Christian or Christianized, but “ecclesianised” (*votserkovlenny*)—integrated into the life of the Church with all its mystical and sacramental dimensions. This new transfigured Hellenism replaces the old pagan one and should serve as the generating source of a new “ecclesianised,” Christocentric culture. The principle of this culture is a *sui generis* creative traditionalism, which is open to all contemporary problems and tries to solve them, drawing upon Fathers not for ready answers, but for the mental, cultural, and spiritual attitudes required to meet the challenge.

Seeing in the concept of Neopatristic Synthesis an original and universal criterion, Florovskii applies it to many cultural phenomena. He elaborates a critique of German Idealism and of the mainstream European metaphysical tradition in general, charging them with gnosticism and a mere continuation of the primordial pagan, untransfigured Hellenism. This critique of European thought (likened by himself and others to the philosophy of Charles Renouvier) did not gain much popularity.

By contrast, Florovskii's discussion of the Russian intellectual tradition in the *Ways of Russian Theology* (1937)—which he described as an “attempt at an historical synthesis”—became a widely acknowledged masterpiece. The book is a systematic and enormously erudite exposition of Russia's cultural and spiritual evolution from the fifteenth century until the Bolshevik revolution; many of its sections are of independent value as brilliant critical essays. In his conceptual analyses Florovskii strictly applies the criterion of Neopatristic Synthesis, which renders most of his assessments mercilessly critical. In particular, Russian religious-philosophical renaissance and its main figures—such as Pavel Aleksandrovich

Florensky and Nikolai Aleksandrovich Berdyaev—are severely reprimanded. Another such figure, Fr. Sergius Bulgakov, the dean of St. Sergius Institute and author of a controversial teaching about Sophia Divine Wisdom, became Florovskii's target during the so-called “Dispute over Sophia,” a heated debate over Bulgakov's teaching in émigré theological circles in the mid-1930s.

## THE ECUMENICAL MOVEMENT

Another important dimension of Florovskii's work was his participation in the Ecumenical Movement. During his Paris period, he was ordained as a priest and took an active part in inter-religious contacts. Beginning with the Edinburgh Conference of 1937, he was a member of various ruling bodies of the Movement, playing a significant role in its formative period and recognized as a leading Orthodox voice in theological discussions. In connection with this activity, he produced a significant number of texts on the Church, its nature and tasks. Taken together, these texts form a self-consistent ecclesiology that eventually became widely known and influential. In September of 1948 Florovskii moved from Paris to the United States to take up the position of Professor of Dogmatic Theology and Patristics at St. Vladimir's Orthodox Theological Seminary in Crestwood, New York. The concluding American period of his biography is chiefly that of brilliant teaching career: at St Vladimir's (until 1955), Columbia University (1951–1956), Harvard University Divinity School (1956–1964), and Princeton University (1964–1972). During these years, his reputation as a theologian and church historian reached its peak. Although Florovskii was not a founder of a school, his numerous disciples include many prominent personalities—and not only from the Orthodox world. He can be considered as the most influential Orthodox theologian of the last decades of the twentieth century.

## FLUDD, ROBERT

(1574–1637)

Robert Fludd, or Flud, also known as Robertus de Fluctibus, was an English physician, author, and occultist. The son of Sir Thomas Fludd, paymaster to Queen Elizabeth I's forces in France and the Low Countries, Fludd was born at Milgate House, Bearsted, Kent. At the age of seventeen he entered St. John's College, Oxford, then a center of high Anglicanism. After taking his M.A. degree in 1598, Fludd spent some years abroad, studying medicine. On returning to Oxford, he entered Christ Church. He took the degrees of MB and MD in 1605, but had considerable difficulty obtaining from the College of Physicians the right to practice medicine, which was not granted until 1606. It was alleged that he had spoken with contempt of Galen. Nevertheless, he was admitted as a fellow of the College of Physicians in 1609.

As a London doctor Fludd prospered; he was able to provide himself with an amanuensis, to whom he dictated his numerous treatises. His first book, *Apologia Compendiaria Fraternalitatem de Rosea Cruce* (1616), was a defense of the ideas of the "Fraternity of the Rosy Cross." About the origins and character of the Rosicrucian Fraternity there is considerable dispute. Although allegedly introduced into Europe in the fifteenth century, Rosicrucian ideas, in fact, derive from two anonymously published tracts written by the Lutheran theologian Johann Valentin Andreä in the early seventeenth century. These, for motives that are somewhat obscure, purported to be of fifteenth-century origin. Whether, even in the seventeenth century, there actually was a Rosicrucian Society as described by Andreä remains a matter of dispute. But these tracts provided a common point of reference for like-minded occultists.

It is impossible to take Fludd seriously as a philosopher; however, he did give expression to a system of ideas that was very influential in the seventeenth century. This can most succinctly be described as an attempt to uphold allegorical interpretation of the Bible, and the established pseudosciences—astrology, chiromancy, alchemy, and sympathetic magic—against the scientific spirit.

Fludd attacked scientific inquiry mainly in its Greek form, as represented in Aristotle and Galen, but certainly

with an eye on what was happening around him. His point of departure was St. Paul's attack upon philosophers who try to discover the truth by their own efforts rather than by the interpretation of what God has chosen to reveal. Fludd's criticism of science can be summed up in the familiar phrase: "What is true isn't new; what is new isn't true." He argued that so far as science has any truth in it, it teaches doctrines that careful interpretation will reveal in Genesis (Like Henry More, Fludd was greatly influenced by cabalistic writings). For the most part, however, the teachings of science have to be rejected. Fludd attacked Aristotle's meteorological writings, for example, because Aristotle gives a naturalistic account of lightning and thunder; whereas lightning, according to Fludd, "is a fire burning from the face and presence of Jehovah."

Yet, strangely enough, there is a good deal of contemporary science incorporated into Fludd's work. His contemporaries, he complained, demanded "ocular demonstrations" of divine truths and he used the thermometer—the invention of which is sometimes ascribed to him—and the lodestone for that purpose. Like many of his fellow occultists, Fludd had a passion for diagrams, and some of his optical diagrams remained in physics textbooks up to the twentieth century.

His general approach, however, is cosmogonical, in the manner of the mythmaker, rather than cosmological, in the manner of the scientist. His ideas are most fully presented in *Utriusque Cosmi, Maioris Scilicet et Minoris, Metaphysica, Physica atque Technica Historia* (An account, metaphysical, physical, and technical, of both worlds, greater and lesser), which was published as a series of volumes from 1617 to 1621, and was even then left unfinished. Fludd makes great play with the general concepts of light (heat) and darkness (cold)—hence his interest in optics; rarefaction and condensation—hence the thermometer; sympathy and antipathy—hence the lodestone. His theory can be described in this way: in the beginning God created a void by withdrawing into himself (contraction), and the void appeared as darkness because God is light. Expanding again as light into the void, God created all the substances of the world. Thus, the world we live in is ruled partly by light (God) and partly by darkness (the kingdom of the devil). Since everything is of the same nature—that is, a mixture of light and darkness—there are secret sympathies and secret antipathies everywhere, marked by signs that the adept can discover with God's help. The practice of medicine depends entirely on understanding these forces, as do the practices of chiromancy and astrology.

Fludd's works were published in Latin, and circulated on the Continent, where they attracted a considerable amount of attention. In 1623 Marin Mersenne attacked Fludd as an "evil magician"; and when Fludd replied, Pierre Gassendi, at Mersenne's request, criticized his occultism at length. Fludd also engaged in controversy with Johannes Kepler, who had criticized Fludd in the appendix to his *Harmonice Mundi* (1619).

### **Bibliography**

Fludd's works were brought together as *Opera* (Gouda, 1638); *Philosophia Moysaica* appeared posthumously in an English version—Fludd's own—in London (1659); his short alchemical essay "Truth's Golden Harrow" was published in *Ambix*, Vol. III, Nos. 3 and 4 (April 1949), 91–150, with an introduction by C. H. Josten.

James Brown Craven, in *Doctor Robert Fludd, the English Rosicrucian* (Kirkwell, U.K., 1902) summarizes Fludd's works enthusiastically, but without much insight. Craven's book includes details of the Fludd–Mersenne–Gassendi controversy.

Other writings on Fludd include Serge Hutin, *Robert Fludd: Le Rosicrucien* (Paris, 1953) with a bibliography; Walter Pagel, "Religious Motives in the Medical Biology of the Seventeenth-Century," in *Bulletin of the Institute of the History of Medicine* 3 (4) (1935): 265–312; Robert Theodore Gunther, *Early Science in Oxford*, Vol. XI (Oxford, 1937); Sherwood Taylor, "The Origins of the Thermometer," in *Annals of Science* 5 (2) (December 1942): 129–156; Lynn Thorndike, *History of Magic and Experimental Science*, Vols. VII and VIII (New York: Macmillan, 1958). See also Denis Saurat, *Milton: Man and Thinker* (London: Dent, 1944), Ch. 3, pp. 248–267.

## FODOR, JERRY A. (1935–)

Jerry Fodor is the most significant philosopher of mind in the last fifty years. A student of Hilary Putnam, he joined him, Noam Chomsky, and others at MIT in the early 1960s and became the philosopher most responsible for the "cognitive revolution" that replaced the behaviorism that had dominated much of philosophy and psychology since the 1920s, replacing it with a computational approach derived from the work of Alan Turing. In this way he hoped to provide a basis for a naturalist and realist account of mental processes that rendered them amenable to scientific study. Indeed, he is one of the few

philosophers who has combined philosophical and empirical psychological research, publishing work in both domains, and developing at least two theories that have become highly influential in each: a computational/representational theory of thought processes ("CRTT") and a "modularity" theory of perception and linguistic processing.

CRTT is an effort to salvage what Fodor (1975) regards as essential to the familiar "belief/desire," or "(propositional) attitude" psychology with which people routinely explain each other's behavior, as when one explains someone's crossing a road in terms of a desire to meet a colleague. As the name emphasizes, the theory has two parts. According to the computational part, each attitude involves a computationally specifiable relation to a syntactically specifiable representation in a "language of thought" entokened in the agent's brain. For example, *judgment* might be the output of perceptual and reasoning systems that serves as the input to decision making. For the "representational" part, Fodor (1998) argues at length against popular "prototype," "conceptual role" and "holistic" theories of content, and defends instead an "atomistic," "informational," "asymmetric dependency" theory according to which, (i) *ceteris paribus*, tokenings of symbols causally co-vary with phenomena that they thereby mean; and (ii) tokenings caused by phenomena they don't mean *depend* upon (i), but (i) doesn't depend upon them. For example, "horse" means *horse* if (i) it's a *ceteris paribus* law that "horse" tokens are caused by horses, and (ii) nonhorses (e.g., distant cows) causing "horse" tokens depends on horses doing so, but not *vice versa* (1991). Thus, Jones's judgment that horses fly might consist in a sentence, "Horses fly," playing the aforementioned judging role in her brain, where "Horses" and "flies" are each asymmetrically dependent upon the respective phenomena in the world. In this way Fodor hopes to defend intentional realism, in contrast to the widespread eliminativism about the mental, and mere instrumentalism about psychology, that renders psychological ascription a matter of mere "interpretation," such as one finds in the work of Willard Quine, Donald Davidson, Daniel Dennett, and Paul and Patricia Churchland. (Fodor's [1983, 1998] account of representation also leads him to claim that virtually all concepts expressed by single morphemes in natural language are innate, rejecting the empiricism also associated with these figures.)

CRTT is a species of functionalism, or the view, due originally to Putnam, that mental states are to be individuated by their causal relations, for example, to inputs, outputs, external phenomena, and each other, in ways

analogous to the individuation of a program in a computer (1968). Since different physical phenomena can realize these relations, functionalism naturally gives rise to cross-classificatory *layers* of explanation: one level of causal relations may be “multiply realized” by different mechanisms at lower levels (1968, 1975). Specifically, the *intentional level* of a cognitive psychology may be implemented at a lower level by various computational *syntactic* processes, which in turn may be implemented by different physical mechanisms—brains in the case of people, transistors in the case of machines. For this reason, intentional psychology enjoys a considerable “autonomy” from levels of explanation closer to the brain, for example, neurophysiology. However, although the laws and explanations at the intentional level are not *reducible* to laws and explanations at the lower levels, Fodor presumes that they “*supervene*” on them.

One of Fodor’s (1986) main arguments for CRTT is that it promises to account for the sensitivity of human beings to indefinitely many properties that are not “transducible” by sense organs, in particular, to arbitrary non-physical and/or nonlocal properties, such as being a morpheme or a noun phrase, a crumpled shirt, a grieving widow, or a collapsing star. These sensitivities are particularly impressive given that they seem to be (i) *productive* and (ii) *systematic* (1987): that is, people seem capable of discriminating stimuli of indefinite logical complexity, such as *being a crumpled shirt that was worn by the thief who stole the cat that chased the rat ...*; and anyone capable of thinking one logical form is capable of thinking logical permutations of it: for example, one can think *John loves Mary* if and only if one can think *Mary loves John* (1987). Fodor (1968, 1987, 1988) argues that non-CRTT accounts, such as behaviorism, Gibsonianism, and purely connectionist accounts are either vacuous or empirically inadequate for this task. What one needs is a system that can exploit internal processes of logical combination, inference and hypothesis confirmation, which presuppose at the least the resources of a CRTT.

However, Fodor (1983) has also been a critic of the “New Look” theories of perception, such as one finds in the work of Jerome Bruner, Thomas Kuhn, and Nelson Goodman, which emphasize how people’s background expectations color their perceptions. Against this view, Fodor calls attention to the fact that the very perceptual illusions that New Look theorists prize actually tell against their case: for many of these illusions do not disappear even when one knows better, suggesting, along lines developed by Zenon Pylyshyn, that visual perception occurs in a “cognitively impenetrable module,” that

is “informationally encapsulated” from the “central” system whereby we reason and fix our beliefs. Fodor argues for a similar view of linguistic perception.

By contrast, the central system is “Quinian” (i.e., computed over the totality of beliefs, as when people settle on a theory that is, for example, simplest and most conservative overall) and “isotropic” (every belief is potentially relevant to the confirmation of every other, as when radio waves confirm the age of the universe). This leads Fodor (1983, 1999) to somewhat pessimistic conclusions regarding the tractability of central reasoning to a Turing-style CRTT, which depends upon exploiting *local* syntactic features of representations. Although CRTT is necessary for an adequate theory of mind, it may not be sufficient.

## FOLK PSYCHOLOGY

Among the more remarkable qualities of human beings is that they describe and explain their own minds and behavior. People are self-explainers and self-understanders. By and large, though not invariably, of course, people's efforts to understand themselves are couched in a familiar language: the language of belief, desire, intention, hope, and so forth—the language of intentional mental states. Perhaps just as remarkable is that people are “mindreaders” (Nichols and Stich 2003). In everyday commerce people attribute—sometimes unself-consciously, sometimes painfully and with great difficulty—to others intentional mental states.

Humans are social creatures—competitive and cooperative—and the practice of attributing intentional mental states is, by and large, the vehicle whereby they come to understand others and others come to understand them, and so, this practice is fundamental to efforts to navigate the social world. One is often able to anticipate or to predict what another will do via the command of what one takes the other person to believe and to desire. Whether the arena is chess or rock-paper-scissors, arms negotiations or freeway driving, the human capacity to characterize others in terms of such intentional mental states is often what determines whether plans succeed or fail. Not surprisingly, this scheme of intentional characterization is applied retrospectively in the explanation of the behavior of others and in the explanation and, often, the justification of one's own behavior to others. So, for example, why did Achilles, after earlier refusing to return to the battle, suddenly rejoin it? One may say that Achilles wants desperately to avenge the death of Patroklos, and he believes that killing Hektor, and so reentering the fray, is the best way to accomplish this aim. In less lofty instances, one can explain why the dog lover ran upon seeing Fido (the dog lover believed the dog was rabid), and why a dear friend refused to return repeated phone calls (the dear friend is angry and wants to stew a bit longer). This commonsense framework of mentalistic understanding, this scheme of intentional description, explanation, and prediction, among many other uses, has come to be termed *folk psychology*.

## UNDERSTANDING FOLK PSYCHOLOGY

An intuitively compelling and seductive understanding of the nature of folk psychology might be seen to be offered by René Descartes. At the end of the *Second Meditation*, he famously writes, “I know plainly that I can achieve an easier and more evident perception of my own mind than of anything else” (1988, p. 86). In short, nothing is more easily known by or to the mind than itself. Just by looking within, and by, as we say, introspecting, I can know that I believe certain things to be the case, that I desire this or that to be so, and that I behaved as I did because I believed and desired as I did. This mentalistic characterization, made manifest to me in the first person, is then applied to the characterization of the minds and behavior of others. One upshot of such a view is that the description and understanding of the mental and intentional action are unlike the efforts to understand other natural phenomena.

This view of the human capacity to describe and to understand the mental has proved exceedingly unpopular with both philosophers and psychologists over the past six decades or so. Wilfrid Sellars (1956) pioneered an alternative account of the mentalistic talk of human beings. Sellars tells a story, a *myth*, he terms it, according to which at a time in human prehistory people understood their conspecifics in purely behavioral or observational terms and without appeal to the language of intentional mental states. Then, something of a savant, named “Jones,” came to posit unobservable theoretical entities that served to explain the behavior of others. *Belief*, *desire*, and *intention*, are explicitly introduced as theoretical terms to explain why it is that, for example, Tom is behaving as he is. Finally, this theory came to be applied in the first person, to oneself. The point of the myth is not, of course, that it is historically accurate; rather, the point is that people's mentalistic talk needn't be viewed, as it was on the Cartesian model, as picking out entities or states to which people have some special, privileged, access.

This Sellarsian picture has produced a conception of folk psychology that has come to be extremely influential: the “theory-theory” account of folk psychology. In part the result of dominance of functionalist accounts of the mental, the “theory-theory” has it that folk psychology is an empirical theory of mind and behavior (Lewis 1972, Morton 1980, Churchland 1981). And, in this way, folk psychology is “protoscience” (Rudder Baker 1999). *Belief*, *desire*, and *intention* are theoretical terms whose meaning and reference are secured by their place in a vast network

of implicit folk psychological laws. One such law might be stated as follows: If S desires or intends that *v*, and believes that *k* is necessary for *v*, then, *ceteris paribus*, S tries to bring it about that *k*. Another such law might be: If S believes that *p* and believes that if *p* then *q*, then, *ceteris paribus*, S comes to believe that *q*. (The entry thus far has emphasized intentional mental states, but it should be noted that qualitative states—pains, itches, visual imaginings—fall within the purview of folk psychology.) The human capacity to engage in folk psychologizing points, then, to a constellation of psychological laws that relate behavior, internal states, and stimuli. Belief, desire, intention and the rest of the mentalist vocabulary are theoretical posits of a folk theory of mind.

In an important essay, “What Is Folk Psychology?” (1994) Stephen Stich and Ian Ravenscroft point out that there is a good deal of ambiguity in discussions of folk psychology. They characterize a sense of “folk psychology” according to which that term picks out a theory that is implicit in the everyday talk about the mental. This sense they term an “external account” of folk psychology, because such a view (largely the conception described above) carries with it no commitment to the claim that folk psychology is “an internally represented knowledge structure or body of information” (1994, p. 460). Folk psychology in this sense “ain’t in the head” (p. 460), and so is not implicated in an informative account of just how it is that people in fact have the capacities to predict, to explain, or to describe the minds and behavior of their fellows. A second account of folk psychology Stich and Ravenscroft term *internal*. In this sense of “folk psychology,” it is an internally represented theory that explains how it is that people predict, describe, and explain in the psychological realm. Stich and Ravenscroft go on to muster powerful arguments for the claim that this distinction has important implications for the eliminativist-vindicationist debate.

## THE ELIMINATIVIST CHALLENGE

Historically, many of the chief philosophical issues surrounding folk psychology have been engaged in the effort to characterize the nature and status of folk-psychological explanation. For it is one immediate consequence of the theory-theory that folk psychology might be false in the way that any empirical theory might be false. Vindicationists argue that folk psychology is, in broad terms at least, a correct theory of mind and behavior. Eliminativists argue that folk psychology is plausibly a false theory. As a causal explanatory account of mind and behavior, folk psychology awaits replacement by some

nonintentional robustly scientific account of behavior (Churchland 1981, Stich 1983). The theory of mind and behavior implicit in one’s everyday talk is just false, the eliminativist alleges.

Thus the eliminativist-vindicationist debate hinges upon the anticipated relationship between folk psychology and scientific psychology/neuroscience. Because both of these aim to explain what is intuitively—though, controversially—the same class of explananda, if people are to regard folk psychology as, by and large, a correct account of human behavior, then they are presumably committed to thinking that the cognitive sciences will, in some way, serve to vindicate the ontology and explanations of folk psychology (Kim 1989).

A notable advocate of this brand of vindicationism, Jerry Fodor (1987), has argued that a scientific psychology will count as vindicating folk psychology just in case it postulates states that (1) are semantically evaluable; (2) have causal powers; and (3) are found to conform to the tacit laws of folk psychology. Each of these has given rise to eliminativist complaint.

Insofar as intentional content figures essentially in folk psychological explanation, it may seem a quick matter to demonstrate that such explanations are not respectable:

- (1) The causes of behavior supervene upon the current, internal, physical states of the organism.
- (2) Intentional mental content does not supervene upon such states.
- (3) The science of psychology is concerned to discover the causes of behavior.
- (4) Therefore a causal explanatory psychology will not trade in the intentional idiom.

If this argument were correct, folk psychological explanations would be deeply suspect, because appeal to such explanations would be irrelevant to the causal explanation of behavior. The argument is, however, suspect on many fronts. One might dispute the sense of “behavior” in (1) and with it the notion the respectable explanation must be “individualistic” (Burge 1986). In addition, one might grant that whereas truth-evaluable content is “wide,” and so fails to supervene upon internal states of the subject, there is a kind of content, “narrow content,” that respects individualist scruples.

Content-based objections such as those above focus upon the puzzling status of intentional properties in a physical universe; many theorists point to the allegedly irreducible nature of intentional mental content as a way

of undermining the integrity of folk psychology (Churchland 1986). Another family of eliminativist worries points to matters structural. It is, for example, claimed that if certain connectionist models of humans' cognitive architecture are correct, then there will literally be no states or events that play the causal role intentional mental states are understood to play in folk psychology. Folk psychology appears committed to the view that mental states are "functionally discrete" internal states with a certain causal profile (Ramsey, Stich, and Garon 1991). Yet, on connectionist models there are no such discrete internal states with the causal roles that belief, desire, and so on are presumed to play in folk psychology.

If these objections are given some taste of the eliminativist assault, they serve as well to highlight an assumption held by many vindicationists and eliminativists alike: folk psychology possesses, in Fodor's terminology, "causal depth" (1987, p. 6). It posits unobservable states and events in aid of the causal explanation of observed phenomena. The explanations of folk psychology are, then, structurally informative insofar as they aim to offer information about the structure of causal relations that hold between behavior, stimuli, and unobservable internal states. Only on such a supposition is it plausible to suggest that folk psychological states and events will go the way of caloric and phlogiston. And this is why many vindicationists hold that the survival of folk psychology demands that there be some scientific level of the description of human cognitive architecture that mirrors the folk psychological one.

Much hinges upon the resolution of this dispute. If the eliminativist is correct, there are no beliefs and desires, and so no intentional actions. It is, for example, just false that human beings often intend to do what they most desire. Nothing would appear to remain of people's conception of themselves as deliberators and actors. While this may strike one as incredible, the eliminativist will insist that this is but another case in which what the folk have taken to be patently obvious turns out to be radically false.

Even so it has been argued that, more than incredible, eliminativism is self-refuting or pragmatically incoherent (Rudder Baker 1987). The charge here is not that the eliminativist thesis is self-contradictory or internally inconsistent. Rather the claim is that there is no perspective from which the doctrine can be coherently put forth. For if eliminativism is true, there are no actions. Yet the eliminativist asserts the truth of eliminativism, and assertion is certainly an action. Moreover, the eliminativist asserts eliminativism because she takes it to be a correct

or true thesis, one amply supported by available evidence. But what sense can be made of the notion of justification or even truth without the intentional framework of folk psychology? This argument is sometimes developed in concert with the suggestion that folk psychological principles are not contingent regularities but are, rather, normative principles that are true a priori.

## FOLK PSYCHOLOGY STRIKES BACK

Whatever the merits of the foregoing lines of argument, the *prima facie* oddity that attaches to eliminativism suggests that whereas it is one thing to assert that intentional mental states will not figure in the ontology of some ideal cognitive science, it is another to assert that there are no intentional mental states. In hopes of saving the folk psychological phenomena, an alternative conception of the nature of folk psychology rejects the assumption that folk psychology does offer such informative causal explanations. Rather, folk psychological explanations are silent about the internal mechanisms and processes of cognition and behavior. Because its explanations are not informative in the ways that a cognitive science aims to be informative, folk psychological explanation is not in competition with a scientific psychology, and so folk psychology might be regarded as immunized against scientific advances.

In an extremely influential series of papers, Daniel Dennett (1987) advocates something like this view. According to him, folk psychological explanation and prediction proceeds via the assumption of rationality. When one predicts what an agent will do in various circumstances, the question asked amounts to: What is it rational for her to do, given that she believes and desires as she does? To be, in Dennett's terminology, an "intentional system"—to be such as to have beliefs truly attributable to one—is to be a system whose behavior is so predictable. Folk psychological description, then, does not aim at the description of internal processes and mechanisms. And, whereas an empirically informative cognitive science will reject the intentional idiom, folk psychological explanation is adequate in its own preserve. Even so, it is not easy to see how this brand of instrumentalism about the intentional makes folk psychological description anything more than a *façon de parler*.

Other philosophers who offer various versions of this approach emphasize that many of the folk explanations that people regard as true bear no easy relationship to science (Chastain 1988, Horgan and Woodward 1985, Horgan and Graham 1991). One may, for example, explain why Ajax slipped by the ramparts by pointing out

that the ground was slimy. In such a case, one is in command of a tacit law to the effect that slimy surfaces are apt to produce slippings. But sliminess and slipperiness are certainly not scientific kinds; it seems likely that no science will make appeal to such kinds. Still, it would be mad to insist that such explanations are false, and that the description of surfaces as slimy is no more than a colorful way of speaking.

Such explanations can survive most any developments in the sciences. People, moreover, are likely to regard the more informative scientific account of the phenomena as a way of spelling out and so vindicating the folk “slimy/slippery” account. With such folk explanations all that is demanded is that there be some more basic account of the properties/processes one characterizes in terms of “sliminess” and “slipperiness.” The source of the robustness of such explanations is precisely their relative uninformativeness. Indeed, folk recognize that sliminess and slipperiness do not play any deep or informative role in the causal explanations in which they figure. Rather, their role would appear to be something like the following: There’s *something* about the surface picked out as “slimy” that causes events picked out as “slippings.” So, just by virtue of their offering scant information about the relevant causal processes, they are insulated from any serious threat of elimination posed by developments in the sciences.

It is, then, urged that we adopt a similar position as to the status of folk psychological explanation. Just as there are slimy things, there are beliefs and desires. And just as it is true that Ajax slipped because the ground was slimy, so it is true that Achilles behaved so because he believed and desired as he did. It should, nonetheless, be noted that this appealing conclusion has been secured at some considerable price: folk psychological explanations, though serviceable for everyday purposes, are about as superficial as causal explanations can be. It is not all apparent that, for example, people’s conception of ourselves as reasoners and actors—a conception that appears to implicate certain views as to the nature of mental processes—can withstand so deflationary a reading. One might well conclude that this gives everything to the eliminativist but what she wants.

Finally, Michael Bishop and Stephen Stich argue that both eliminativists and vindicationists, in developing their arguments, make use of favored theories of reference to establish the conclusion that the terms of folk psychology either do or do not refer, and from this they draw the further conclusion that beliefs do or do not exist. Bishop and Stich point out that neither the elimi-

nativist nor vindicationist bothers to defend the claim that his or her favored theory of reference is the correct account, one that would sanction a transition from a claim about reference to a claim about existence or nonexistence. The upshot of this argument is that neither eliminativists nor vindicationists have a right to make claims about the existence or nonexistence of folk psychological states and entities on the basis of the considerations they adduce.

## SIMULATION VERSUS THEORY

In response to the unpalatable alternatives described above (folk psychology is gravely at risk of elimination, or folk psychology is exceedingly unlikely to be eliminated by virtue of its uninformativeness) some have suggested that it is the theory-theory account of folk psychology itself that demands reevaluation. This reevaluation of the nature and status of folk psychology can assume a number of different forms. By far the most influential of these accounts is the simulation account of folk psychology. Jane Heal (1986), Robert Gordon (1986), and Alvin Goldman (1989) have resuscitated the view that people’s folk psychological capacities are mediated by the simulation of others. In the effort to understand others, people make adjustments for their cognitive and affective constitutions and, then, using these as inputs, allow their own psychological mechanisms to run “offline.” In prediction, simulated beliefs and desires are attributed to the psychological subject of interest.

Advocates of the account claim that simulation is a far simpler and more psychologically plausible account of folk psychologizing. In this way, simulation is, in the language of Stich and Ravenscroft, a response to an internal theory-theory account. What explains, according to simulationists, the human capacity to describe, explain, and predict the mental states and behavior of others is not an internally represented theory, but rather just the capacity to engage in simulation. In this regard, it is important to note the much of the original impetus behind the development of a competing simulation account of folk psychology was to blunt the force of eliminativist argument. For if psychology is not a theory it cannot be a false theory. So, it seems that on a simulationist account the eliminativist worry cannot be raised. But, as Stich and Ravenscroft (1994) point out, even if human folk psychological capacities may not be subserved by an internally represented theory, it may nonetheless be that eliminativism threatens folk psychology on an external reading.

## FONSECA, PETER

(1528–1599)

Peter Fonseca, the neo-Scholastic Aristotelian philosopher, was born at Proença-a-Nova, Portugal, and died at Lisbon. He entered the Society of Jesus at the age of twenty, completed philosophical and theological studies in that order, and spent most of his life as a professor of philosophy at Coimbra, where he was the leader of a group of scholars who produced a famous series of textbooks (*Cursus Conimbricensis*). Fonseca has been called the Aristotle of Portugal. His *Institutionum Dialecticarum* (Eight Books on Logic; Lisbon, 1564), was widely used as a textbook throughout Europe, and in 1625 it was in its thirty-fourth printing.

Basically an interpreter of the philosophy of Aristotle, Fonseca corrected the Aristotelian text then in use, using Greek manuscripts, and started the process of improving the Renaissance Latin versions. His logic is the traditional syllogistic which continued to be taught in Europe until J. S. Mill and the nineteenth-century mathematicians broadened the scope of the subject. As a student Fonseca had, of course, been taught a modified form of Thomism, but he showed a great deal of independence on specific questions. In theory of knowledge he maintained that a singular thing is directly known by the human intellect (contrary to Thomas Aquinas), and he seems to have felt (with the later Ockhamists) that the theory of intelligible species as intellectual determinants of the process of conceptualization is useless.

Fonseca placed great emphasis on the unity of the formal concept of being (influencing Francisco Suárez) and taught that this concept is univocal and not analogical in its reference to individual realities. However, he approximated the Thomistic real distinction of essence and existence by treating essence as an ultimate intrinsic mode of the nature of a thing and existence as a contingent addition to this nature. He is, then, partly responsible for the introduction of the terminology of modes into early modern metaphysics. Fonseca abandoned Thomism in denying that matter is pure potency and in rejecting quantified matter as the principle of individuation in bodies. He explained individuation as due to a positive

difference (*differentia*) added to the essence of a thing, a theory reminiscent of John Duns Scotus.

## FONTENELLE, BERNARD LE BOVIER DE (1657–1757)

Bernard Le Bovier de Fontenelle, the French author, forerunner of the Enlightenment, was born in Rouen and died in Paris, having lived one month short of a century. Schooled by the Jesuits, he also studied law, but soon abandoned the career of advocate to follow in the literary footsteps of his uncles, Pierre and Thomas Corneille. Neither then nor later was he to distinguish himself as a poet or dramatist but, in 1683, with the appearance of the *Dialogues des morts* (*Dialogues of the Dead*), he achieved immediate success as a man of letters. The witty paradoxes and sparkling conversations in these imaginary dialogues of illustrious and notorious figures of the past

confirmed the reputation of their twenty-six-year-old author as a seventeenth-century *belesprit*; more important, they revealed him as a singularly independent thinker, skeptical of traditional values and, as such, a potential enemy of seventeenth-century orthodoxy. Judging his literary fame firmly established, Fontenelle turned to the study of mathematics, physics, and astronomy and published *Entretiens sur la pluralité des mondes* (*Conversations on the Plurality of Worlds*, 1686), a brilliantly successful popularization of the Copernican system which, until that time, had achieved very limited acceptance.

The following year his *Histoire des Oracles*, ingeniously adapted from the ponderous Latin of A. van Dale, appeared anonymously. Ostensibly an exposure of imposture and charlatanism in religious practices of pagan antiquity, the work was soon recognized for what it really was: a bold attack on credulity and superstition in all ages. Equally daring was *De l'origine des fables* (*The Origin of Fables*), composed by Fontenelle before 1680, but fear of persecution invited prudence, and it was not published until 1724. One of the first modern studies in the field of comparative religion, it based early man's belief in the supernatural on his ignorance of natural phenomena. But it was obvious that the criticism was intended to apply equally as well to Christianity and other revealed religions.

The quarrel over the relative literary merits of the Ancients and Moderns had been raging for some years when, in 1688, Fontenelle entered the fray with his *Digression sur les Anciens et les Modernes*. His thesis was that since the question also included the problem of man's progress, the recent accumulation, organization, and dissemination of scientific knowledge proved the superiority of the Moderns. Because of his position in the dispute, entry into the French Academy was denied him on four occasions; and he was not elected a member until 1691.

In 1697 Fontenelle was elected to the Academy of Science, and two years later he became its secretary. His clarity and intelligence, the cool impartiality of his judgment, his wide range of scientific knowledge, and his gift for expression made Fontenelle ideally suited for the post, and he came to be considered as spokesman for his fellow academicians. He contributed a great deal to the widespread popularization of the scientific spirit at home and abroad with his remarkable series of *Éloges* for departed academy members, written over a period of forty years. These essays provided an impressive, constantly renewed picture of accomplishments in science on various fronts, written with the same lucidity and ease of expression that

marked all of Fontenelle's serious writing. They were admirably complemented by the *Histoire de l'Académie royale des sciences* that alone, with its masterful preface and original views, would have assured Fontenelle's reputation throughout eighteenth-century Europe as one of the great historians of the philosophy of science.

In the field of mathematics, Fontenelle was particularly interested in the differential calculus of Isaac Newton and Gottfried Wilhelm Leibniz and the analytical geometry of René Descartes. One of his own mathematical treatises is the *Préface des éléments de la géométrie de l'infini* (Elements of Infinitesimal Calculus; 1727). The last book he wrote was also scientific in nature. Titled *Théorie des tourbillons cartésiens* (The Theory of Cartesian Vortices; 1752), it showed him to be a disciple of Descartes in physics, if not in metaphysics.

Concerning Descartes, Fontenelle said that he should be held in esteem at all times but followed only now and then. Nevertheless, Fontenelle can be considered a Cartesian in two respects. First, his own skepticism was closely bound up with Descartes's principle of methodical doubt. Second, as a stout believer in the purely mechanical philosophy of nature, he found the Cartesian theory of vortices far closer to reality than Newton's laws of attraction, according to which it was necessary to hold that some invisible, seemingly supernatural force operated across vast stretches of space.

Among a number of audaciously conceived, anonymous works on religion and metaphysics ascribed to Fontenelle is the *Traité de la liberté*, which appeared in 1745 together with four other pamphlets under the title of *Nouvelles Libertés de penser*. The work, a few copies of which escaped police seizure, purports to reconcile divine foreknowledge with human free will, but, in fact, casts doubt on the existence of either.

Immediately following Fontenelle's death in January 1757, the general opinion of his accomplishments was summed up by Frédéric-Melchior Grimm: "The philosophic spirit, today so much in evidence, owes its beginnings to M. de Fontenelle" (*Correspondance littéraire*, February 1, 1757).

Although there were serious lapses in Fontenelle's knowledge and, hence, in his scientific judgment, his works nevertheless served as the single most important bond between the philosophico-scientific revolution in progress during his life and the *philosophe* movement just getting under way. He was one of the great forerunners of the French Enlightenment, and no small part of his success in this role lay in the fact that he exploited, as had

never been done before, a technique for the popularization of science that was still to have its effects some two centuries later.

## FOOT, PHILIPPA (1920–)

In the last half of the twentieth century, few philosophers figured as prominently and persistently in the central debates of English-speaking moral philosophy as Philippa Foot. Née Philippa Ruth Bosanquet, she was born in 1920 in Owston Ferry, Lincolnshire, in the United Kingdom. She studied for the PPE (philosophy, political science, and economics) at Somerville College, Oxford,

from 1939 to 1942. After receiving an MA in 1947, she became the Sommerville's first philosophy tutorial fellow in 1949 and vice principal in 1967. Moving to the United States, she held positions at Cornell University, the University of California at Berkeley, the Massachusetts Institute of Technology, Princeton University, New York University, and Stanford University. She settled at the University of California at Los Angeles in 1976 and became the first holder of the Gloria and Paul Griffin Chair in Philosophy in 1988, which she held until her retirement in 1991. A founder of Oxfam, she has been instrumental in bringing philosophy to bear on practical issues.

Although her work on such practical topics as abortion and euthanasia has been widely and justly influential, Foot's fundamental contributions are to the foundational questions of moral theory. Her publications in moral theory concentrate on three interlocking themes: the notion that virtue is central to morality, naturalism in ethics, and the place of practical reason in the moral life. These themes are pursued in a set of forcefully argued, original essays, most of which are collected in Foot 2002 and 2003. Foot's thoughts on these topics culminated in her book *Natural Goodness* (2001).

Although these themes are a constant preoccupation of her writings, Foot's positions evolve in significant and unexpected ways. This evolution can usefully be divided into an early, middle, and late period (for an excellent discussion of the first two periods, see Lawrence 1995). In several early papers (notably 1958–1959/2002 and 1961/2002), Foot set herself in opposition to a dominant trend in moral philosophy toward noncognitivism, as represented by the emotivism of Charles L. Stevenson (1947) and the prescriptivism of R. M. Hare (1952). According to these philosophers, evaluative language, and moral language in particular, has a distinctive function or meaning that sets it sharply apart from empirical or factual discourse. On this view, the primary function of a moral utterance is not to describe human actions and choices but rather to express the speaker's attitudes or stances (e.g., emotions or commitments) regarding them. Hence moral judgment is not objective, because it is not answerable to the nature or properties of its subject matter.

Foot strenuously opposed this trend, arguing that the concept of morality concerns what is necessary for human flourishing, and therefore that the truth of moral judgments is fixed by facts about the needs of human beings in relation to one another. This naturalism is intimately linked to Foot's view that "a sound moral philoso-

phy should start from a theory of the virtues and vices" (2002, p. xi). The ultimate standard of choosing and acting well is the natural needs of human beings. And the virtues are those traits that enable us to do so.

This virtue-centered naturalism, which Foot has never abandoned, reaches back to the ethics of Aristotle (1998), and sparked a resurgence of interest in virtue ethics in the last two decades of the twentieth century. Yet her naturalism was in tension with two further views to which she was drawn. If possessing and acting on the virtues is necessary for human flourishing, she thought, then having and acting on the virtues benefits their possessor. But common experience shows that in the case of at least some virtues, notably justice, acting virtuously might not benefit the agent, for justice restricts us from advancing our interests in certain ways. So either justice is not a virtue, or virtues are not necessarily good for us. In that case (as Thrasymachus was made to argue in Plato's *Republic*), we cannot honestly recommend justice as a virtue, and we have to concede that not everyone has reason to act justly.

Foot's initial response (1958–1959/2002) was to take Thrasymachus's challenge seriously, arguing, in effect, that the potential costs of committing injustice, and of being the kind of person who would commit injustice, are too steep to be worth it, that being unjust does not pay. But this response, Foot came to think, rested on a mistaken assumption. Justice is indeed a virtue because of its essential role in human happiness, but the mistake is to think (as Foot had tended to do) that the only way that virtues can serve well-being is by advancing the interests of those who possess them. Justice is concerned with the *common* good. Human life goes badly when individuals are prepared to cheat, lie, and steal. In this way, a deep connection between virtue and human well-being is retained, but it does not follow that every individual who acts contrary to justice disadvantages himself. This recantation (2002, pp. xii–xiii) marks Foot's transition to her middle period.

This reply to Thrasymachus prompted Foot to reconsider an orthodoxy to which she had previously been inclined to subscribe: that "moral judgments give reason for acting to each and every man" (1958–1959/2002, n. 6). One has reason to do something, Foot had argued, only if doing so contributes to one's ends or good. Since acting as justice or loyalty or charity does not necessarily promote my interests or ends, I do not necessarily have a reason to act in these ways. Foot concludes that the allegiance to morality derives not from the authority of practical reason (as followers of

Immanuel Kant (1998) argue) but from contingent attachments and devotions, such as love of the common good and hatred of cruelty. In this sense, Foot argues in a famous essay (1972/2002), moral reasons are “hypothetical,” not categorical.

Although this provocative thesis deeply shaped the ensuing philosophical literature on the connection between morality and practical reason, Foot eventually rejected it. This rejection signaled the third period of her work, in which she sets forth an entirely novel conception of practical reason. A vice like injustice is a kind of natural defect, she comes to argue, analogous to the defect in a lioness who neglects her cubs. What makes it a moral defect is that it concerns the will, in a broad sense: the ways in which the individual recognizes and responds to reasons. The virtues are a form of goodness in choosing, that is, in taking certain considerations as reasons for acting and desiring.

This way of linking the concept of the virtues to that of practical reason stands the traditional account on its head. Traditionally, it was supposed that we could develop a robust theory of practical reason independent of an account of virtue, and then we could see how morality measures up by that standard of rationality. This is an error, Foot argues in *Natural Goodness* (2001), for practical rationality is reasoning well in matters of action, and that cannot be specified without a general conception of what it is to function well as a human being. The theory of practical reason thus depends on a naturalistic understanding of virtue and vice.

Whether this understanding can be developed without relying on an unconvincing Aristotelian conception of human function is a disputed question. One major challenge is to spell out the sense in which goodness is natural. Foot recognizes that assertions about what is and is not rational cannot be settled by the methods of the natural sciences. (For reflections on this challenge, see Thompson 1995.) A related challenge is to understand the role that culture plays in morality. Culture is, of course, natural to human beings, but particular cultures obviously shape the content and understanding of morality by their members. It remains to be seen how these points can be accommodated within a contemporary Aristotelian theory.

Gary Watson (2005)

## FORCE

In the most general sense, force denotes the faculty of action or the power to overcome a resistance. In the physical sciences it is that entity that changes, or tends to change, the state of rest or of motion of a body. Consequently, it may also be defined as the cause of motion, or more precisely—assuming the validity of the principle of inertia, according to which unaccelerated motion and rest are dynamically and causally equivalent and correspond merely to different choices of the reference systems—as the cause of acceleration.

The metric unit of force in science is the *dyne*, which is the force necessary in order to give a mass of one gram an acceleration (increase of velocity) of one centimeter per second in each second. The British unit of force is the *poundal*, which is the force necessary to give a mass of one pound an acceleration of one foot per second each second. The practical unit is the *gram force*, that is, the force Earth exerts on one gram of mass at sea level and 45° latitude; it equals 980.616 dynes. Another common unit is the *newton*, which is the force necessary in order to give a mass of one kilogram an acceleration of one meter per second each second, and is therefore equivalent to 10<sup>5</sup> dynes.

Apart from being used in a figurative sense, such as “force of habit,” “police force,” or “economic forces,” the word *force*, especially in the natural philosophy of the eighteenth and nineteenth centuries and in the early writings on the principle of conservation of energy (R. Mayer, H. von Helmholtz) signified action and energy. This homonymic use caused considerable confusion at the time.

Originally taken as an analogy to human will power, muscular effort, and spiritual influence, the concept early became projected into inanimate objects and played an important role in ancient thaumaturgy, occultism, and medieval sorcery.

### CONCEPT OF FORCE IN ANCIENT PHILOSOPHY

The early Greek hylozoism of the Milesian school (Thales, Anaximander, Anaximenes) conceived nature as a living, animated, and self-moving being, and consequently did not see a problem in the origin of motion. The concept of force gained prominence only with Heraclitus’s doctrine of opposing tensions, according to which force is a primary constituent of physical reality and a regulative element in the universe. In Empedocles’s philosophy of love (*philia*) and strife (*neikos*), forces,

although still conceived in analogy to human affections, became efficient causes of change and motion. In spite of the fact that Plato’s natural philosophy relegates the principle of motion ultimately to the existence of a world soul and corresponds in this respect to early hylozoism rather than to the dynamistic teachings of Empedocles and Anaxagoras, the term *dynamis*, signifying not only transitive activity but also passive susceptibility or receptibility, plays an important role in his doctrine. Although Aristotle, in his conception of nature as “*physis*,” still recognized the Platonic notion of force as something inherent in matter, in *De Caelo* he also approached the formulation of a more mechanical conception of force as a physical emanation from one substance to another: through push and pull, bodies affect each other and generate motion in extraneous objects. This Aristotelian notion of emanating kinematic effects, although restricted to contiguous modes of action, is the first instance of the modern dynamical conception of force. In his *Physics* Aristotle subjected this cause of compulsory motion to a quantitative investigation: A force *A* that moves a mobile *B* through a distance *D* during the time *T* could move half the mobile ( $\frac{1}{2}B$ ) through twice the distance ( $2D$ ) during the same time (*T*), or could move half the mobile ( $\frac{1}{2}B$ ) through the distance *D* during half the time ( $\frac{1}{2}T$ ), and so forth. In modern terminology Aristotle’s dynamical law of motion may be stated as follows: The velocity of a mobile is proportional to the ratio of the motive force and the resistance of the medium. Nowhere did Aristotle employ units in which these quantities were to be measured. Although it is fairly obvious that forces were practically measured in terms of weight (the early use of the balance is an evidence of this), Aristotle’s conception of weight as a manifestation of natural motion and not as a cause of compulsory motion precluded, on theoretical grounds, the possibility of using the units of weight as units of force. Since, according to Aristotle, contiguity between the motor and the mobile was an indispensable prerequisite for the occurrence of dynamical action, force as an action at a distance had no place in his conceptual scheme. Hence, an explanation of planetary motion required the assumption of an external agent or astral intelligence as a “motor” attached to the star, unless the star was thought to be endowed with a life of its own.

With Posidonius’s investigations at Gades of the connection between the tides and the movements of the sun and the moon and his doctrine of a universal tension, the concept of force was generalized as something able to pervade all space. Stoic philosophy thus abandoned the Aristotelian restriction of an immediate linkage between the mover and the moved, and conceived force as a

mutual correspondence of action between objects, even when the objects were separated in space. In fact, the Stoics were probably the first to formulate the idea of a field of forces and to regard the universe as a vast system ruled by the interaction of forces.

### MEDIEVAL PHILOSOPHY

Arabian and Christian medieval philosophy, in general, adhered to the Aristotelian conception of force. The exceptions were mostly inspired by Neoplatonic ideas. Thus, in Abū-Yūsuf Ya‘qūb ibn Ishāq al-Kindī’s treatise *On the Tides (Fi-l-madd wal-jazr)*, his notion of force is wholly Aristotelian except that he holds that force can be propagated by means of optical rays, a theory conducive to astrological exploitation. Roger Bacon’s conception of forces as “species”—isolated entities, detached from their subject and spreading through space in accordance with specific laws of propagation—showed similar features.

The Aristotelian law of motion, already criticized by John Philoponus in the sixth century CE and by Avempace in the twelfth century, was shown by Thomas Bradwardine in the middle of the fourteenth century to contradict experience in the case of equality between the motive force and the resistance, so that the ratio is one but the velocity zero. Bradwardine consequently modified the law, claiming that the velocity, in modern terms, depends on the logarithm of the ratio between motive force and resistance.

In the fourteenth century the Stoic conception of a field of forces was also revived, probably independently of the ancient school. In his *Quaestiones Super Libris Quatuor de Caelo et Mundo* (Questions on the four books of the heaven and the Earth) John Buridan postulates a celestial force that permeates all space and exerts its influence on physical bodies, in contrast to the Peripatetic dictum, *Causa agens est simul cum suo effectu proximo et immediato*. However, the revolutions of celestial bodies, according to Buridan, are not the result of a constant activity of special intelligences, but rather of an original rotational impetus communicated to these bodies by the Creator at the beginning of time.

### KEPLER

A decisive stage in the development of the concept of force was reached in Johannes Kepler’s search for a quantitative determination of dynamic activity. In his early writings, such as the *Mysterium Cosmographicum* (1596), Kepler still refers to force as a soul animating the celestial bodies. His correspondence, however, and particularly his letters addressed to David Fabricius, show clearly that his

use of the term *anima* (“soul”) in his writings was merely a metaphor to express the immateriality of the principle that governs the mutual movements of celestial bodies. In 1605 Kepler was already convinced that the force of attraction could be subjected to a mathematical formalism. In the third part of his *Astronomia Nova* (1609), Kepler discusses the causes of planetary motion and insists for the first time on a mathematical definition of force, even if it is not a push or pull. “For we see that these motions take place in space and time and this virtue emanates and diffuses through the space of the universe, which are all mathematical conceptions. From this it follows that this virtue is subject also to other mathematical necessities.” Having discovered that the planets move in their orbits with velocities that vary with the distance from the sun, Kepler inquired into the physical cause of this mathematical relation and was thus led to assume the existence of a regulative force whose magnitude decreases with the distance. However, attraction was not yet seen as a radial force, but rather as a tangential drag, and Kepler, under the influence of William Gilbert’s *De Magnete* (1600), suggested an analogy with magnetism. But in spite of this, Kepler’s conception of a gravitational force of attraction is a typical example of the fact that the existence of forces is, and has to be, inferred from the phenomenological aspects of regularities in the variations of motion. It also exemplifies the fact that the postulation of forces as causes of motions and their kinematic variations is a methodological process that finds its philosophical justification in the reduction of numerous cases of functional dependence to one single agency. Kepler’s procedure thus became the prototype for the introduction of forces in the various branches of physics: gravitational, elastic, electromagnetic, nuclear forces, and so forth.

### NEWTON

Isaac Newton’s conception of force can be traced to two originally disparate classes of mechanical or dynamical phenomena which, however, finally found their logical unification in his *Principia* (1687), through its very definitions of force and mass. Documentary evidence seems to show that his earliest conception of force originated from the study of impact phenomena. Thus Newton’s “Waste Book 1664” (Ms. Add. 4004, Portsmouth Collection, University Library, Cambridge, U.K.) starts with a definition of the quantity of motion of a body as the product of its “quantity” (mass) and its velocity, and continues: “Hence it appears how & why amongst bodys moved some require a more potent or efficacious cause others a lesse to hinder or helpe their velocity. And ye

power of this cause is usually called force. And as this cause useth or applyeth its power or force to hinder or change ye perseverance of bodys in their state, it is said to Endeavour to change their perseverance." In another document (Ms. Add. 3965, Portsmouth Collection), force is implicitly defined by the statement: "The alteration of motion is ever proportional to ye force by wch it is altered." Considering the exact text of Newton's second law of motion in the *Principia*, "The change of motion is proportional to the motive force impressed," one is led to the conclusion that "force" in these statements denotes more or less what we mean today by "impulse" (which, in fact, is equal to the change of momentum). Newton's original conception of force was consequently that of a thrust, a kick, or a push, as exhibited in collision phenomena, which at that time were the subject of extensive studies by Galileo Galilei, Marcus Marci, John Wallis, and Christian Huygens. On the other hand, in his search for a derivation of the phenomenological aspects of planetary motions from the hypothesis of an inverse-square law, Newton needed the time rate of change of momentum as the primitive notion, and thus identified the change of momentum with its rate of change for astronomical applications. Later commentators, therefore, interpreted Newton as stating that force is measured by the product of mass and acceleration, a product that for constant mass equals the time rate of change of momentum. Thus, although not rigorously impeccable, Newton's definition of force led to a unified treatment of terrestrial and celestial mechanics, and the notion of force became a fundamental concept of physics. Whereas Newton's first law of motion or law of inertia, according to which every body, unaffected by a force, persists in a state of rest or of uniform motion, may be regarded as a qualitative definition of force (namely, as change of state of motion), the second law quantified the concept and provided a meaning for the notion of mass. The Newtonian characterization of force is completed with the third law, which states, in essence, that every force manifests itself invariably in a dual aspect: It has a mirror-image twin. For it claims that if *A* acts on *B*, then *B* acts on *A* with equal magnitude in the opposite direction; or in other words, to every action there is always opposed an equal reaction. Forces, consequently, arise only as the result of a combined interaction of at least two entities. In a universe composed of only one body, no forces are conceivable.

Having thus explored the quantitative aspects of force, and of gravitational force in particular, Newton does not specify the metaphysical nature of force; as far as physical science is concerned, force is an ultimately irreducible notion. Newton's contribution may thus be

regarded as the culmination of a conceptual development in a search for a quantitative determination of an otherwise obscure and indiscernible, yet necessary, notion—a development whose philosophical necessity had already been stressed by Bacon, Thomas Hobbes, and even René Descartes.

The scientific legitimacy of a force such as gravitation, which could act at a distance without the intermediacy of an intervening medium, was early called into question. Newton himself, particularly in his *Opticks* (1704), referred to certain speculations, primarily to the notion of an ether, in order to reduce such actions at a distance to contiguous effects compatible with the corpuscular-kinetic theory prevalent at that and later times. Yet, in spite of early opposition (as voiced particularly by Gottfried Wilhelm Leibniz, who rejected action at a distance as a scholastic obscure quality), the notion of force as conceived by Newton became the basic concept of classical theoretical mechanics. Pierre de Laplace, in his *Mécanique céleste* (1799–1805), considered the reduction of all mechanical phenomena to forces acting at a distance as the ultimate objective of the physical sciences, and Joseph Louis Lagrange's *Mécanique analytique* (1788), the highlight of classical mechanics, was written in the same spirit. The mechanics of action at a distance gained further support through its successful applications by Laplace, Siméon Denis Poisson, and Wilhelm Weber in the classical theories of electricity and magnetism. Even capillary phenomena—contact phenomena par excellence—were treated by Laplace and Karl Gauss as subject to actions at a distance.

#### CRITICISM OF ACTION AT A DISTANCE

The great mathematical success of these theories of force as an action at a distance did not suppress doubts as to the philosophical legitimacy of such conceptions, and alternative mechanistic or kinetic-corpuscular theories, especially for gravitation, were proposed in great number. One of the earliest attempts in this direction, George Louis Lesage's theory of "ultramundane particles" (1747), was typical of similar hypotheses that gained great popularity in the nineteenth century. Particles were assumed to move in all directions through space and to be rebounded by macroscopic bodies; the resulting screening effects were supposed to produce the mutual "attractions" of "gravitating" bodies. The main criticism of the Newtonian conception of force from the philosophical point of view, however, was directed against the hypostatization of force as a metaphysical entity of an autonomous ontolog-

ical status. George Berkeley, in his *De Motu* (On motion; 1721) opposed this approach and viewed the notion of force as a convenient auxiliary fiction with which to work; for the notion had the same status in science as the concept of epicycle has in astronomy. Such terms as *force*, *gravity*, and *attraction*, he admitted, are convenient for purposes of reasoning or computation; for an understanding of the nature of motion itself, however, Berkeley regards them as wholly irrelevant. They should not lead us to the fallacy that they could throw any light on the real efficient causes of motion, for the only objective of physical science is the establishment of the regularities and uniformities of natural phenomena; to account for particular phenomena means “reducing them under, and shewing their conformity to, such general rules” (*Siris*, 1744). David Hume, Pierre de Maupertuis, and especially the early proponents of modern positivism (Gustav Kirchhoff, Heinrich Hertz, Ernst Mach) followed Berkeley in asserting that force is merely a construct in the conceptual scheme of physics and that it should not be confounded with metaphysical causality. Most radical in this respect was Mach’s antimetaphysical attitude, in accordance with which he tried to divest mechanics of all conceptions of cause and force and to adopt a purely functional point of view. Following Kirchhoff’s *Lectures on Mechanics* (*Vorlesungen über Meckanik*, 1874–1876), Mach, in his *Science of Mechanics* (*Die Mechanik in ihrer Entwicklung, historisch-kritisch dargestellt*, 1883), identified force with the product of mass and acceleration and thus reduced it to a purely mathematical expression relating certain measurements of space and time.

But even after this process of purification and divestment of all causal or teleological implications, the concept of force was not eliminated from the conceptual scheme of physics. Its methodological justification lies in the fact that it enables us to discuss the general laws of motion irrespective of the particular physical situation with which these motions are associated. In contemporary physics the concept plays somewhat the same role as does the middle term in the traditional syllogism; it is a methodological intermediate in terms of which we can study the kinematical behavior of a physical body independent of the particular configuration in which it is found.

## PSYCHOLOGICAL ORIGINS OF THE CONCEPT OF FORCE

The advancement of the critical attitude toward the concept of force, initiated by Berkeley and Hume and culminating in the logical and metaphysical point of view held

by Kirchhoff and Mach, brought in its wake a study of the psychological origin of the notion. The first to deal at length with this problem was Thomas Reid, Hume’s immediate successor and founder of the Scottish school. He derived the concept of force from the consciousness we have of the operations of our own mind, and especially from the consciousness of our voluntary exertions in producing effects. Reid concluded that if we were not conscious of such exertions, we would not have formed any conception of force and consequently would not have projected this notion into nature and the changes in it that we observe. Immanuel Kant’s younger contemporary, Maine de Biran, whose personalistic philosophy has many points in common with Reid’s empirical intuitionism, considered our own will as the source of the notion of force; in his view, the resistance to muscular effort felt in the case of voluntary activity makes us aware that certain actions are not involuntary acts, but the results of our ego as a source of force. From the twofold nature of the ego as an individual source of action and as inseparably united to a resisting organism, we acquire the universal and necessary notion of force. While the Berkeley-Hume criticism led almost to the exclusion of the concept of force from science and natural philosophy, at the same time it supplied to the more psychologically and physiologically oriented philosophy important arguments to oppose such elimination. For it was claimed that the concept of force stands in the same relation to the sensation of muscular effort as the concept of motion to visual perception, and science without the concept of motion is inconceivable. Moreover, if one kind of sensation is to be preferred to the others, it should certainly be muscular sensation, the nearest to the psychological experience of volition. Even William James, who, in “The Feeling of Effort,” in *Collected Essays and Reviews* (1920), rejected the so-called feeling of innervation and opposed the view that the resistance to our muscular effort is the only sense that brings us into close contact with reality, contended that reality reveals itself in the form of a force like the force of effort we exert ourselves. The concept of force, according to James, thus remains “one of those universal ideas which belong of necessity to the intellectual furniture of every human mind.”

## FORCE [ADDENDUM]

Forces, understood as pushes or pulls that are exerted (in the first instance) by particulars and that cause motions, have received little philosophical attention in recent decades, reflecting both that forces no longer play a role in fundamental physical theory and that even where they do play a role (e.g., in Newtonian mechanics), it has seemed advisable (following Jammer, above) to give them a purely instrumentalist interpretation. What attention has been paid however indicates that various aspects of the notion of force (or notions; see below) deserve further philosophical consideration.

One such aspect concerns the ontological status of forces. Jammer's deflationary account of force as a mere "methodological intermediate," enabling the kinematical behavior of particulars to be studied independent of the details of specific configurations, but not to be taken with ontological seriousness, was motivated by traditional empiricist concerns with forces as purely theoretical entities (of the sort that exercised Berkeley); such concerns

also figure in van Fraassen's instrumentalist agnosticism about forces. Another source of concern about forces lies in the redundancy argument (of which Mill was an early proponent), according to which forces are not needed to explain motions (the usual non-force causes and effects being sufficient unto the task) and hence should (by Ockham's razor) be eliminated.

There are however ways of resisting or responding to such concerns. Hesse rejects Jammer's instrumentalism as inappropriately eliminating "the metaphysical, a priori, intuitive and anthropomorphic elements" of the classical notion of force. More straightforwardly one can deny that forces are purely theoretical on grounds that these are experienced in the course of ordinary events (of, for instance, liftings, pushings), in which case instrumentalist concerns with force are misguided. And in response to the redundancy argument, Bigelow et al. note that the appropriate application of Ockham's razor involves a *ceteris paribus* clause: Other things being equal, forces should be eliminated. But, they argue, other things are not equal: In particular, physics without forces does not explanatorily unify phenomena (in particular, motions) as well as does physics with forces. Indeed, one might maintain that, even if other entities unify motions, so long as forces unify these in a distinctive fashion (as they appear to do) Ockham's razor can be resisted.

It remains the case that forces do not play the role in contemporary physics that they once were thought to do. Even within the domain of classical (slow-moving, non-quantum) entities, Newton's force-based formulation of mechanics has been superseded for most explanatory and practical purposes by energy-based (e.g., Lagrangian and Hamiltonian) formulations. And while forces and Newton's laws (the third law being understood as a statement of conservation of momentum) are recognizably present in the relativistic extension of Newtonian mechanics, quantum indeterminacy appears to prevent Newton's theory (which presupposes that bodies have a determinate position and momentum) from being extended to treat quantum phenomena. (This is so, assuming the incorrectness of Bohm's deterministic, force-based interpretation of quantum theory, developed in Bohm and Hiley 1993, on which indeterminacy is given an epistemological spin, as uncertainty.) By way of contrast the concepts and operative principles of energy-based theories (energy, Hamilton's principle of stationary action) straightforwardly extend to both quantum and relativistic contexts. Moreover, in the General Theory of Relativity (GTR), the concept of force disappears altogether:

geometry plus inertial motion, rather than forces, guide motions due to gravity.

Upon closer examination however the above considerations do not show that the concept of force is ontologically obsolete. Concerning the classical domain: Force-based and energy-based formulations of mechanics are not only compatible but are also interderivable (under assumptions generally in place); as Feynman notes, Newtonian and Lagrangian dynamics are “exactly equivalent.” This equivalence reflects, among other things, the fact that both potential and kinetic energies are initially defined in terms of the work done by a force; more generally, it appears that force-based and energy-based mechanics are, from a theoretical point of view, mutually supporting, compatible perspectives on the same phenomena. (Such a take is reflected in an intuitive ontological conception of the relation between forces and potentials or potential energies, according to which the latter are dispositions of which forces are the manifestations.) Moreover the restricted application of Newtonian mechanics needn’t imply that forces don’t exist—at least supposing that the similarly restricted application of special sciences such as chemistry and biology doesn’t impugn the existence of their subject matters.

The question remains whether the posit of force is compatible with more fundamental theories. As mentioned, quantum indeterminacy poses a barrier to taking forces, as traditionally conceived, to exist at the quantum level; but if forces are special science entities, this is no surprise (plants don’t exist at the quantum level, either). Compatibility might rather be indicated by noting that the deep connection between forces and energies persists in quantum theory, albeit at an analogical level; as Jammer says, “No one has ever directly demonstrated the force of attraction between, say, a proton and an electron. And yet, in writing Schrödinger’s equation for such a system, we use the term  $e^2/r$  [associated with inverse-square attraction] for the potential energy, carrying it over, so to say, from classical dynamics as a generalization ultimately based on the concept of force.” More to the ontological point, one might take the fact that quantum interactions involve exchanges of momentum to suggest that forces are constituted by quantum particle exchanges.

A greater difficulty from the perspective of common applications of force-based mechanics is GTR’s denial of gravitational forces. It appears that *if* GTR is the correct theory of gravity, then the posit of gravitational forces cannot be maintained. For GTR and Newtonian mechanics agree that inertial motion does not involve forces; hence there is no way of arguing that an object’s inertial

motion along a geodesic “constitutes” the occurrence of gravitational forces. It is presently unclear, however, whether GTR is the correct treatment of gravity. In response to well-known problems in incompatibility between GTR and quantum theories, various attempts are underway to quantize gravity, which if successful might allow for gravitational forces after all.

Philosophers who agree that forces exist may yet disagree over metaphysical details. It remains unclear for example whether forces are independent intermediaries between non-force causes and effects (as Bigelow et al. suggest), or are rather dependent aspects of the latter entities. What (considered) ontological category do forces fall under—are they properties, manifested dispositions, relations, causal relations, *sui generis*? Another question concerns the status of component vs. resultant forces. In cases in which phenomena involve more than one sort of force (e.g., both an electromagnetic and a gravitational force—supposing the latter exist), do the associated component forces (whose occurrence is expressed by Coulomb’s law and Newton’s law of gravitation, respectively) exist alongside the resultant force input into Newton’s second law? Cartwright maintains that only the resultant force exists, while the component forces are mere mathematical fictions; Creary argues that the need to explain by composition of causes (here, forces) indicates that it is better to keep component and reject resultant forces.

Besides what might be called “Newtonian forces,” a distinct but related scientific notion of force also deserves philosophical attention: that of a “fundamental force” or interaction. Paradigmatic fundamental forces/interactions (electromagnetic, gravitational, nuclear) come in many of the same varieties as paradigmatic Newtonian forces; and as already indicated, there are interesting open questions here concerning the relationship between (e.g., electromagnetic) Newtonian forces and the lower-level mechanisms operative in the field-theoretic treatments of the corresponding fundamental forces/interactions. Besides these general metaphysical concerns, fundamental forces/interactions may shed new light on old metaphysical debates. For example, an appeal to fundamental forces/interactions provides what is arguably the best way of formulating physicalism and emergentism as viably contrasting views: With this approach, physicalists maintain that all phenomena are grounded solely in fundamental physical forces/interactions, whereas emergentists maintain that, at certain complex levels of organization (notably, those involved in the having of mental states), a new fundamental force/interaction comes into play.

## FOREKNOWLEDGE

*See Precognition*

## FOREKNOWLEDGE AND FREEDOM, THEOLOGICAL PROBLEM OF

Divine foreknowledge, like the other classical theistic attributes, raises philosophical problems of at least three kinds. First, there are problems with understanding the attribute itself. How should it be construed (assuming that it is even coherent)? And how might God come by such knowledge? (Are future events all present in their causes? Does God arrive at foreknowledge by inference from "middle knowledge"? Does he *see* the future as through a "time telescope"? Or does he just know it?) Second, there are questions about how this attribute can be compatible with the other divine attributes. As the creator, sustainer, and providential overseer of the world, for

example, God is supposed to be the supreme agent—but how can God approach the future as an active agent if his foreknowledge presents to him everything, including his own decisions and engagements with the world, as a fait accompli?

Finally, there are problems reconciling God's possession of this attribute with other things that appear undeniable. Of these, the most important is surely human freedom. If God knows before a person is even born exactly what that person will do throughout life, how could this person nevertheless retain the power to do otherwise, as free agency apparently requires? This is the classic foreknowledge problem; efforts to solve it are often what drive proposed solutions to the other two problems.

### HISTORICAL BACKGROUND

In *De Interpretatione*, Aristotle worried that accepting the truth of future contingents would result in a necessitarianism incompatible with human freedom; for if it is true either that there will be a sea battle tomorrow or that there will not be a sea battle tomorrow, the admiral on whose decision this event depends either cannot issue the requisite order (if there will not be a sea battle) or cannot refrain from issuing the order (if there will be a sea battle). A similar worry was later elaborated into the influential "Master Argument" of Diodorus Cronus, discussed by the Stoics. Because this threat to human freedom rests solely on logical principles, like the Law of Excluded Middle, it is often called "logical fatalism" in contrast to the "theological fatalism" generated by divine foreknowledge.

The subtheistic nature of the ancient divinities and the pluralism of pagan theology made the problem of theological fatalism avoidable, but this was to change with the advent of Christianity. Augustine provides a classic early exposition of the problem in *On Free Choice of the Will* (III.3):

How is it that these two propositions are not contradictory and inconsistent: (1) God has foreknowledge of everything in the future; and (2) We sin by the will, not by necessity? For ... if God foreknows that someone is going to sin, then it is necessary that he sin. But if it is necessary, the will has no choice about whether to sin ... [So:] either we draw the heretical conclusion that God does not foreknow everything in the future; or ... we must admit that sin happens by necessity and not by will.

Augustine went on to offer his own solution to this problem; his medieval successors added further solutions and

contributed enormously to the understanding of the problem, especially its modal character. Recent interest in the problem, sparked by a 1965 article by Nelson Pike, is probably as strong as it has been since the problem's heyday in the Middle Ages.

### FORMULATING THE PROBLEM

As Augustine notes, the argument for theological fatalism is designed to show that a certain assumption about God is incompatible with a certain assumption about free will, so that one of them must be rejected.

**THE GOD ASSUMPTION.** The theological assumptions that play an actual role in the argument concern God's existence and cognitive excellence. It is assumed in the first place that God knows all truths, or

- (i) God is omniscient.

Moreover, God believes *only* truths; indeed, he not only *does* not but *could* not believe any falsehoods. So

- (ii) God is essentially inerrant, that is, infallible.

The final assumption about God is

- (iii) God exists "from eternity."

The phrase *from eternity* is purposely ambiguous, straddling the view of God as an everlasting temporal being existing at all points in time (sempiternity) and the view of God as an atemporal being whose existence transcends time altogether (eternity proper). If (iii) is read, "There is no time such that the proposition *God exists*, if asserted at that time, would be false," then both views are accommodated. This allows for disambiguation, if necessary, to occur in the argument itself.

**THE FREEDOM ASSUMPTION.** The assumption with which the God Assumption is supposed to be incompatible is simply this:

Someone sometime does something freely.

*Freely* should be understood here in whatever sense is required for morally responsible agency, but otherwise pretheoretically—that way the theory of freedom under which it is allegedly incompatible with the God Assumption can emerge as a premise in the argument, and rejection of that premise can count as a solution to the problem.

**THE ARGUMENT.** Suppose someone X performs an action A at a time T3. Let T2 be a time prior to X's birth and T1 any time prior to T2. Then

- (1) It is true at T1 that X will do A at T3.

The principle underwriting this claim, sometimes called the omnitemporality of truth, is that a statement true at any time is (suitably modified) true at every time. This does not imply, in the case of (1), that anyone can know at T1 what X will do at T3, let alone that there are conditions at T1 sufficient for X's future action; it only says that, since X's doing A at T3 is an assumption of the argument, it is, at T1, *true* that X will do A at T3.

According to clauses (i) and (iii) of the God Assumption, an omniscient God who exists "from eternity" must know at T1 whatever is true at T1. So

- (2) God knows at T1 that X will do A at T3.

And if (2) is true, then so is

- (3); God believes at T1 that X will do A at T3.

This follows from the standard analysis of knowledge, according to which knowledge entails belief.

Once God holds this belief, it becomes part of the fixed past that he held that belief. It is no longer possible for him not to have held this belief. This is an instance of the "necessity of the past," conveyed in such maxims as "what's done is done." This is not logical necessity, since there are logically possible worlds with a different past; but it is arguably stronger than natural or causal necessity. Aristotle notes that "this alone is lacking even to God, to make undone things that have once been done" (*Nicomachean Ethics* VI.2.1139b10–11), and Aquinas comments, "As such it is more impossible than the raising of the dead to life, which implies no contradiction, and is called impossible only according to natural power" (*Summa Theologiae* I.25.4). Because what is necessary when past might have been nonnecessary or accidental when future, it is often called accidental necessity. The next step in the argument can therefore be stated this way:

- (4) It is accidentally necessary at T2 that God believed at T1 that X will do A at T3.

Since T1 is past relative to T2, (4) is true, given (3).

Though accidental necessity was introduced as a modality characteristic of the past, it is more general in scope. For a proposition *p* to be accidentally necessary at a time T is for *p* to be true no matter how the world continues after T. The past is then accidentally necessary by default; but the future can also qualify as accidentally necessary if entailed by accidentally necessary facts about the past. One such fact is the following:

(5) It is accidentally necessary at T2 that X will do A at T3.

This follows from (4) combined with clause (ii) of the God Assumption, according to which God's believing that X will do A at T3 entails that X will do A at T3.

Since T2 is a time prior to X's birth, X comes into existence with it already being the case that he must do A at T3. It is therefore too late for X to bring it about that he fails to do A at T3—that is,

(6) X cannot refrain from doing A at T3.

But if X cannot refrain from doing A at T3, then

(7) X does not do A at T3 *freely*.

This last inference is sanctioned by a "freedom version" of the so-called Principle of Alternate Possibilities, according to which a person is morally responsible for performing an action only if the person could have refrained from performing it. If a person is not morally responsible, owing to an inability to refrain, this person is not free in the sense required for moral responsibility. This is precisely the sense of "free" that is relevant to the Freedom Assumption.

The foregoing argument does not turn on any peculiar features of X, A, or T3; the same argument can be given for any agent, action, and time. So no one ever does anything freely. If the God Assumption is true, the Freedom Assumption is false.

## SOME COMMENTS ON THE ARGUMENT

Before canvassing possible responses to this argument, some explanatory remarks are in order.

First, some versions of the argument bypass (4), inferring the necessity of X's future action from (3) and divine infallibility alone. Such versions might succeed if clause (ii) of the God Assumption could be parsed this way:

(iia) If God believes that p, then necessarily p.

Unfortunately, the correct analysis of divine infallibility is

(iib) Necessarily, if God believes that p, then p.

And all that follows from (iib), given simply that God believes that X will do A at T3, is that X will do A at T3 (and will do so in any world in which God holds this belief). For the action to be necessary, based on (iib), God's belief must be necessary. The illusion that (5) can be derived without reliance on (4) is produced by an

equivocation between (iia) and (iib). Boethius, who called the necessity in (iia) "simple necessity" and the necessity in (iib) "conditional necessity," and Aquinas, who termed these "the necessity of the consequent" and "the necessity of the consequence" respectively, diagnosed the problem accurately and rightly insisted on the ineliminability of (4).

Second, step (4) does not rest on the simplistic principle that all true statements indexed to the past through tense or temporal references like "at T1" are accidentally necessary. This principle is in fact false. Confident of victory in tomorrow's election, the candidate proclaims, "My campaign for President began two years before its successful completion." Having just been fooled, I vow, "That was the last time I'm falling for that trick!" Suppose these declarations are in fact true. Though both assert something about the past, neither one is accidentally necessary, since either could (though *ex hypothesi* it won't) turn out false: The candidate might lose, I might get fooled again. Statements like these, which are not *genuinely* and *strictly* about the past, are called "soft facts" about the past as opposed to the "hard facts" to which the necessity of the past is applicable. What justifies (4), then, is that (3) looks like a *hard* fact about the past. (Certainly there is little question about the human analogue: If Joe believed yesterday that he will shave tomorrow, it is a hard fact, and therefore accidentally necessary, today that he held this belief yesterday.) This also explains the apparently trivial move from (2) to (3). To say of God's cognition in (2) that it constitutes knowledge is to say, in part, that it is true; but its truth depends on how things go at T3. So (2) is not strictly about the past; unlike (3), it is not a hard fact relative to T2.

Third, some critics point out that the future-truth argument for logical fatalism also begins with (1), but then moves directly to (4') It is accidentally necessary at T2 that it was true at T1 that X will do A at T3, and thence to (5). Their claim is that the argument for theological fatalism is just a needlessly complicated version of this argument, and is equally fallacious. The problem with this critique is that (1) is a paradigmatic soft fact relative to T2, undermining the inference to (4'), whereas routing the argument through the theological premises (2) and (3) allows (4) to follow from a *prima facie* hard fact about the past. This gives the argument for theological fatalism a clear logical advantage.

## RESPONSES

If the argument succeeds, either the God Assumption or the Freedom Assumption must be rejected. Those who

deny the Freedom Assumption in response to the argument are “theological fatalists.” There appear to be very few theological fatalists in this sense. Calvinists would qualify if anyone would. But most Calvinists are compatibilists and would therefore affirm the Freedom Assumption, while those who do reject the Freedom Assumption tend to do so on grounds other than the argument for theological fatalism.

Denying the God Assumption does not entail atheism unless the falsity of just one of the three clauses constituting the God Assumption is sufficient for there being no God. Some theists, indeed, deny that clause (i) is essential to theism when omniscience includes future contingents. If the argument succeeds, such truths are logically unknowable and should be excluded from divine omniscience, just as the logically impossible is excluded from divine omnipotence. “Open Theists” sometimes take this position, maintaining that God willingly limits his foreknowledge to make space for human freedom. There are, however, a number of reasons for thinking that the argument does not succeed.

**THE ARISTOTELIAN SOLUTION.** Step (1) has been rejected on the grounds that a statement about the future is not (yet) either true or false; it acquires a truth value only when what is now future becomes present. This seems to have been the position Aristotle adopted in response to the “future truth” argument for logical fatalism. It is also the favored position of Open Theists who prefer not to deny the God Assumption: If future contingents lack truth value, a deity who fails to foreknow them will not thereby lack anything necessary to omniscience. Critics, however, have pointed to serious logical costs associated with this move.

**THE BOETHIAN SOLUTION.** Step (2) follows from (1) only if God exists at T1. But if God does not exist in time, a view famously associated with Boethius, (2) is false; what is true instead is:

(2\*) God (timelessly) knows that X will do A at T3.

Two questions may be raised here. The first is whether this view of God is coherent: Though it is the classical view, it has come in for increasing criticism in recent years. The second question is whether a timeless deity might succumb to a modified version of the argument. It has been claimed, for example, that (2) can be replaced by:

(2#) It is true at T1 that God (timelessly) knows that X does A at T3.

(3) and (4) can be similarly modified, and (5) will then follow as before. It has also been claimed that what is fixed in eternity may be no less accidentally necessary than what is fixed in the past, so that (2\*) leads to:

(4\*) It is accidentally necessary at T2 that God (timelessly) believes that X will do A at T3.

and thence again to (5). But intuitions are a fragile guide here, and the viability of the Boethian solution remains open.

**THE OCKHAMIST SOLUTION.** The most popular solution in the contemporary debate is the denial of (4). A radical critique might challenge the very idea of accidental necessity as a modality characteristic of the past; but this extreme position runs counter to deep intuitions about the necessity of the past. The principal assault has come from those who accept the necessity of the past but argue, following William Ockham, that (3) is really a soft fact about the past.

In his treatise *Predestination, God's Foreknowledge and Future Contingents*, Ockham distinguishes hard and soft facts this way: “Some propositions are about the [past] as regards both their wording and their subject matter. ... Other propositions are about the [past] as regards their wording only and are equivalently about the future, since their truth depends on the truth of propositions about the future.” Ockham’s modern followers have cited at least four grounds for placing (3) among the latter propositions.

First, God’s belief that X will do A at T3 is counterfactually dependent on X’s doing A at T3; if X were to do otherwise, God would have believed otherwise. Unfortunately, this counterfactual dependence can obtain even if X *cannot* do otherwise; hence it provides no reason to think that God can still believe otherwise.

Second, one might develop necessary and sufficient conditions for hard facthood and show that (3) does not qualify. If this is done in terms of an “entailment criterion,” it appears that (3) is a soft fact after all, since it entails the future fact that X will do A at T3. But analyses of the hard/soft distinction, most employing entailment criteria, have grown mind-numbingly complex in response to counterexamples, and none has won consensus. This strategy has fallen into disfavor.

Third, one might approach the question from the side of the divine beliefs. How should divine cognition be construed so that (3) can be a soft fact relative to T2? Perhaps the “narrow content” of God’s belief is a hard fact about the past, but its “wide content” is determined by the

way the future actually unfolds—that the belief counts as the belief *that p* might then be a soft fact about the past. Or perhaps God’s beliefs about future contingents are dispositional rather than occurrent in nature, and this makes a difference to their status as hard or soft; then God might be (dispositionally) omniscient at the same time as future contingents remain contingent. Or perhaps, as William Alston (1986) argues, God does not even have beliefs—a position which Linda Zagzebski (1991) terms Thomistic Ockhamism. Even if coherent, such proposals appear to make God’s foreknowledge unavailable to him for action-guidance.

Fourth, one might finesse the difficulties of the above approaches with a direct demonstration that (3) is a soft fact, as suggested by Alvin Plantinga (1986) and (in another form) Ted Warfield (1997). If God exists necessarily, then (3) is true in all and only the worlds in which (1) is true, making (3) logically equivalent to (1). Since (1) is a paradigmatic soft fact relative to T2, (3) must be a soft fact as well, and (4) no longer follows. Critics, however, have charged this argument with question-begging.

**THE SCOTIST SOLUTION.** The inference from (4) to (5) has this form:

- (4) It is accidentally necessary that M
- (iib) Necessarily, if M, then N

Therefore:

- (5) It is accidentally necessary that N

This is a so-called *transfer principle*, since it transfers necessity from one proposition to another. Whether the inference is valid depends on the logic of accidental necessity. The parallel inference for logical necessity is certainly valid; if accidental-necessity-at-T can be modeled as truth in all of some subset of logically possible worlds—for example, the set of all worlds that share the same past up to T—then the above inference should be valid as well. Nevertheless, some types of necessity appear not to work like this, and similar transfer principles, like Peter Van Inwagen’s (1983) “rule  $\beta$ ,” have been disputed.

**THE EDWARDSIAN SOLUTION.** A compatibilist about free will and causal determinism will not agree that (5) is a reason for endorsing (6). The case for (and against) compatibilism is too large a subject to be broached here and is best pursued in connection with the problem of freedom vs. determinism, where it has received its most sophisticated development. Among theists who come to compatibilism from theological rather than causal deter-

minism, Jonathan Edwards is notable for rejecting step (6).

**THE AUGUSTINIAN SOLUTION.** Augustine seems to have argued that the agent might remain free even if divine foreknowledge closes all alternatives, so long as the agent’s action is self-initiated and God’s foreknowledge does not cause, compel, or otherwise explain the action. (How this fits with what Augustine says about divine grace, sovereignty, and predestination is another question.) The moral Augustine draws from foreknowledge cases is arguably the same moral that Harry Frankfurt (1969) draws from cases in which a mechanism eliminates an agent’s alternatives without interfering with the agent’s actual course of action; indeed, when divine foreknowledge is the mechanism, the result appears to be a perfect “Frankfurt-type counterexample” to the Principle of Alternate Possibilities, on which step (7) rests. If, however, only a predetermined future can be foreknown, even by God, then this solution fails.

## THE NATURE OF THE PROBLEM

There are a number of philosophical problems in the neighborhood of this one that can be approached simply as thought experiments, without regard to whether the world is arranged as the problem presupposes. These include Newcomb’s puzzle, the paradoxes of time travel and retrocausation, and perhaps even causal determinism itself. The problem of theological fatalism might be one of these; if it is, certain solutions become irrelevant. If someone reflecting on Zeno’s paradoxes of motion is puzzled about how Achilles could fail to pass the tortoise, the puzzlement is not addressed by denying Achilles’ existence or by reconceiving his attributes (for example, by making him a cripple or supposing he is in a coma). Likewise, someone reflecting on the argument for theological fatalism might be puzzled about how a paradigmatic candidate for free agency might be rendered unfree simply by adding infallible foreknowledge to the situation. Reconceiving God or denying God’s existence outright simply removes God from complicity in this puzzle; it does not solve the puzzle. The purely theological solutions—the Boethian and the third and fourth of the Ockhamist responses—fail to address this deeper puzzle, assuming that it is genuine.

## FORGIVENESS

Through the mid-twentieth century, academic treatments of forgiveness were largely theologically based. The latter part of the century saw the start of a secular discussion of forgiveness within analytic philosophy. The topic provides rich ground for philosophical reflection.

Participants in the discussion often focus on three issues: what forgiveness is, how it is accomplished, and when it is justified. Regarding the first, many appropriate Bishop Butler's claim that forgiveness is the overcoming of resentment. It is widely thought to be accomplished through compassion, perhaps by an imaginative process. The question of justification raises interesting issues about whether forgiveness can be required or whether it is always supererogatory.

There is, however, a prior question of considerable philosophical interest: How is forgiveness, so understood, even possible? Most would agree that not just any elimination of resentment counts as forgiving. You could not forgive by simply taking a pill that rendered you incapable of resentment. Nor does simply forgetting count as forgiving. Forgiveness requires overcoming resentment in the right way. However, it is not merely hard to say what that way is; it is unclear whether there could be such a way.

To keep forgiveness distinct from other responses, such as excuse or contempt, the forgiver must not deny (a) the seriousness of the wrong, (b) the moral standing of the wrongdoer, or (c) his or her own moral standing. Overcoming resentment by denying either the seriousness of the wrong or one's own claim against being wronged is excusing. Overcoming resentment by denying the standing of the wrongdoer is showing contempt for the wrongdoer, excluding him or her from the class of persons whose actions matter. To forgive, one must affirm the seriousness of the wrong and the importance of both oneself and the wrongdoer. Forgiveness must be uncompromising. The difficulty is that the three claims that forgiveness must not deny seem sufficient to ground the resentment that forgiveness must overcome. How, then, is forgiveness possible?

If resentment were necessarily vengeful or malicious, one could overcome it without compromise by achieving compassion. But resentment—that anger over a wrong that is incompatible with forgiveness—is not necessarily vengeful or malicious. One can empathize with the plight of the wrongdoer, have no desire to see him or her harmed, and still resent the wrong. Thus, in contrast with

a widely held view, compassion will not secure forgiveness.

If the three most obvious ways to overcome resentment—to discount the wrong, the wrongdoer, or oneself—were the only ways to overcome it, then forgiveness would be impossible. In order to understand an overcoming of resentment as a case of forgiveness, it needs to be distinguished from compromise. Here, then, lies a task for philosophy: to provide an articulate account of the way in which the overcoming of resentment can count as forgiveness. With that task completed, discussion can turn to how forgiveness is accomplished and when it is justified.

## FOUCAULT, MICHEL

(1926–1984)

Michel Foucault, though trained in philosophy, never considered himself a professional philosopher. Still, his research into the historical formation of truth, power relations, and modes of recognition regarded as self-evident in various disciplines—most notoriously the figure of man—is an important contribution to philosophy and is itself strikingly original philosophical thought. Born in Poitiers, France, Foucault studied at the École Normale Supérieure under Maurice Merleau-Ponty, Jean Beaufret (1907–1982)—Martin Heidegger's major interpreter in France—and Louis Althusser (1918–1990). Foucault earned his License de philosophie in 1948 and Diplôme de psycho-pathologie in 1952. He taught in Sweden, Poland, and Germany before his appointment as the head of the philosophy department at the University of Clermont-Ferrand. After two years in Tangiers following the publication of *Les mots et les choses* (*The Order of Things*) in 1966, Foucault returned to France and the university at Vincennes, France, just after the anti-authoritarian protests of May 1968. Foucault was elected to the Collège de France in the fall of 1970. Though he grew more engaged in political struggles in the late 1960s and early 1970s, his resistance to humanism made him an uneasy participant in organized movements. Still, his activism and writing earned him attention in the United States, where he became a popular lecturer. Foucault contracted AIDS at the outset of the epidemic and died of complications from the disease in June 1984.

Foucault's work is often divided into three periods, the earliest marked by his archaeological approach, the middle by a genealogy of the modern subject and the relation between power and knowledge, and the late identified with his turn to ethics and the "care of the self." This chronology is controversial: though it orients much of the secondary literature about Foucault, its value lies in its convenience more than in its philosophical or conceptual importance. Taken together, Foucault's works pursue critical inquiry into formative, elementary dimensions of knowledge, autonomy, and experience and are an important contribution to a process of critical engagement with the emergence and limitations of dominant forms of power and knowledge. His goal was to analyze the conditions under which forms of self-relation are created or modified so far as these relations constitute possible knowledge of oneself when such knowledge is referred to something other than an essential identity. Through a historical or genealogical approach to these conditions, Foucault challenges the traditional philosophical model

of the subject as having a nature or essence associated with ahistorical capabilities.

## ARCHAEOLOGY

*Folie et déraison* (*Madness and Civilization*; 1965) is the first of Foucault's archaeological works. At the time it was published, Foucault's thinking ranged from psychology and the human sciences (in relation to Ludwig Binswanger, Gaston Bachelard, and Georges Canguilhem [1904–1995]) to Friedrich Nietzsche and avant-garde literature. The book is therefore a powerful introduction to the challenge posed to traditional philosophical practice (and the dominance of phenomenology and existentialism in France) by the growing interest in structuralism, psychoanalysis, and postmodernism. Combining a materialist historical approach associated with the Annales group (Ernst Bloch, Henri Lefebvre [1901–1991], and Fernand Braudel [1902–1985]) and an ontology of the subject derived from his engagement with literature and his critical approach to psychoanalysis, *Madness and Civilization* established Foucault as an important philosopher and social critic in France.

## THE ASYLUM AND THE CLINIC

*Madness and Civilization* traces the emergence of a form of reason in reason's encounter with indications of its limits in unreason (in the Renaissance) and later in madness (in the classical age—the mid-seventeenth century to the beginning of the nineteenth century). Reason encountered its limits in the course of a transformation—at once administrative, moral, and epistemological—in which the exclusion of madness at the margins of community gave way to its confinement in hospitals and then in asylums. This confinement produced new objects of study—excluded populations marked by an inability to work, moral weakness, and disorder—displayed and subjected to emerging forms of knowledge and techniques for the disciplining of disorder and the cure of insanity. On the basis of these practices scientific psychology established the limits of the “normal,” themselves a product of a moral, medical, and juridical synthesis made possible by an ascendant administrative capacity to confine populations marked by unreason.

*Madness and Civilization* comprises an examination of the historical a priori conditions of the emergence of classical reason and an imaginative account of the formation of an experience of reason that defines not only the classical age (particularly René Descartes) but also contemporary thought. Its archaeological approach supposes that discursive formations—statements that delimit and

condition what can sensibly be said of madness—are governed by rules that are not reducible to subjective intentions or consciousness and that also govern what can be said or known. *Madness and Civilization* can also be understood as a preface to an analysis of discursive practices that produce relations of knowledge and power. It thus introduces readers to themes that traverse Foucault's work: the exclusion of difference in institutional contexts, the formation of knowledge of subjects on the basis of that exclusion, the relationship between knowledge and power, and the possibility of achieving distance from one's judgments, commitments, and philosophical prejudices through critique. Thus, these works are critical in the Kantian sense as Foucault understood it: they allow one to examine and transform the conditions through which the subject becomes an object of possible knowledge.

Foucault pursues a similar archaeological project in *Naissance de la clinique* (*The Birth of the Clinic*; 1963), an account of the formation of a mode of perception that makes possible medical knowledge of the body. Foucault shows that modern knowledge of disease is dependent on changing structures of perception and language that are sustained by practices and powers that inhabit the space of the clinic. Where standard histories of medicine portray medical knowledge as derived from an unstructured gaze and converging on objectivity, Foucault shows that accepted medical practices have their origins in something other than necessities of medical reason (e.g., the practice of the “round”) or inference and pure observation in the context of steadily improving methods. The philosophical importance of the book is its analysis of the merging of clinical language and ways of seeing—a contingent form of a gaze and its links to institutional powers that sustain it—with the language of rationality.

## WORDS AND THINGS

The most significant work of Foucault's archaeological period is *Order of Things*, in which Foucault again unearths and articulates the historical conditions for the possibility of knowledge in the human sciences in a given period: those knowledges associated with labor, life, and language. At the same time, *Order of Things* is a genealogy in an important sense: it traces the emergence of Foucault's own commitments and of the privileges and imperatives that accompany his own discourse. Thus, some critics accuse Foucault of engaging in criticism that leaves him with no standpoint from which to judge structures of power and knowledge that are evidently in question in his work, undermining his own ground and

promulgating relativism. Foucault called this charge “intellectual blackmail.”

*Order of Things* is a genealogy of the Same, of the rules and conditions that make possible the perception and knowledge of order. It proceeds by way of an account of two profound breaks in the coherence of knowledge about man and of the way those breaks affect modern knowledge and give it resources with which to freely think new possibilities. The first break occurred between the Renaissance and the classical epistemes. Foucault uses the word *episteme* to designate the regularities that account for the coherence of knowledge in a given period. The Renaissance episteme was coherent—one could speak truly about nature and link one’s speech to the world—because of its dependence on resemblance and similitude for the organization of what counted as knowledge and true perception. But this understanding of the relationship between language and the world, between the signifier and the signified, is ultimately broken—similitude becomes deceptive. The subsequent Renaissance episteme is oriented around the primacy of representation: the capacity of language to mirror the world and to correspond to it in a truthful way by virtue of its capacity to organize the multiplicity of identities and differences in a table or grid, making possible a new recognition of sameness. This is the first of two breaks.

Foucault’s primary concern, though, is to document the second break, the “profound upheaval” that led to the disintegration of representation at the end of the eighteenth century. This disintegration was prompted in various domains by a growing recognition of the limits of representation, particularly of its ability to account for the act of representing itself and to adequately represent the being who represents. As a result of this disintegration, knowledge in the human sciences becomes an “Analytic of Finitude.” Man appears for the first time as both the object of knowledge and the one who knows, an “empirico-transcendental doublet” understood in terms of his labor that can be alienated, his organism that is part of an evolutionary history, or his speaking a language that is no longer controlled by a representing subject but that has its own historicity, rules, and organic structures, while being utterly internal. Knowledge of man as this doublet is thus dependent on being able to account for man’s being in those places or regions in which man is absent. One of the consequences of this analysis is that the centrality of the figure man is itself subject to questioning and overcoming, which Foucault hoped his work would both reflect and generate. This project is to a large extent shared by Nietzsche, Heidegger, and Sigmund Freud.

*L’archéologie du savoir* (*The Archaeology of Knowledge*; 1969) attempts to give a systematic account of his methodological assumptions and procedures in his archaeological works, formulating the rules that operate within a discourse “at a superficial level” and that constitute a discourse’s coherence as a “game of truth.” Foucault’s work after *Archaeology of Knowledge* is usually understood as genealogical in scope and approach.

## GENEALOGY

The word *genealogy* is associated with Nietzsche and is understood as a patient tracing of the descent of authoritative discursive practices that structure the application of power to bodies and subjects (e.g., in the school, the hospital, and the prison). Foucault studies *dispositifs*, practices that exclude and construct forms of experience as abnormal in various ways (e.g., criminality, madness, and sexual deviancy) and that construct forms of subjectivity on the basis of knowledge of normalcy (e.g., the soldier, the student, the guard, or the attendant). He examines practices and texts that are no longer part of received knowledge but that nevertheless were important in the formation of a practice or the exclusion of a form of experience, where genealogy is an attempt to remember those lost experiences and complicated formations. The genealogy of various formations of subjectivation led Foucault to the identification and articulation of forms of power, most importantly the power of surveillance—a “microphysics of power”—in *Surveiller et punir* (*Discipline and Punish*; 1975).

*Discipline and Punish* concerns the emergence of the modern power to punish in the prison and of the way in which the prison, through observation, examination, and normalizing judgment, produces the conditions for the recognition of delinquency. Thus, it is a genealogy of the way in which power divides the “normal” from the “incarcerated” and of the formation of self-relation around the axes of normalcy, lawfulness, and the careful monitoring of one’s own excesses. Modern power encourages one to correct one’s own deviance. The notion of power at work in *Discipline and Punish* applies to the practices and techniques that operate inside and outside of the prison that discipline subjects who show signs of disorder (e.g., children, soldiers, students, crowds, criminals, and workers). Those techniques aim to produce a moral subject capable of self-discipline and of being aware of the virtues of obedience.

On this conception of power there are no agents in whom power is concentrated, but only techniques, regimens, regulations, and measures that divide the normal

or average from the pathological or criminal. This power is not in the service or control of a dominant interest, class, or group, but dispersed throughout the social body and concentrated in various institutions that are simultaneously carceral and clinical. This dispersion makes resistance to power difficult, but Foucault thought resistance was possible by intensifying one's recognition of the intolerability of specific forms of power by attention to voices or discourses that cannot be adequately heard from within dominant regimes. He conceived of his work as tools for use in the strategic interruption of dominant discourses and practices.

## ETHICS

While working on his genealogies and occasional politically incendiary essays in the 1970s (including lecture courses on the contemporaneous emergence of psychiatry and racism in *Abnormal* [2003a] and on discourse of and as war in *Society Must Be Defended* [2003b]), Foucault assembled his three-part *Histoire de la sexualité* (*History of Sexuality*). *La volonté de savoir* (*An Introduction*; 1976), the first volume, was an analysis of the “repressive hypothesis,” the idea that sexual expression went through a period of repression in the Victorian era and subsequently was liberated by an increasing awareness of the naturalness of sex. Foucault argues instead that sex was an important and much discussed issue for the Victorians and that discourses of sexuality and techniques of sexual control and expression are important avenues through which power operates on the body (by encouraging subjects to work on themselves) and are not reducible to a single repressive power. To examine what he called subjectivizing practices at work on the formation of sexuality, he constructs a genealogy of the experience of sexuality. On Foucault's terms sexuality is not a constant, natural feature of human beings, but takes historically singular forms, the emergence of which can be traced through a genealogical account.

*L'usage des plaisirs* (*The Use of Pleasure*; 1984) and *Le souci de soi* (*Care of the Self*; 1984), the second and third volumes of the *History of Sexuality*, respectively, were published eight years after the first volume and after considerable revision of his overall project. Foucault turns his attention from relatively recent formations of sexuality in the eighteenth and nineteenth centuries to the problem of desire and the desiring subject in ancient Greek and Hellenic thought, though always in relation to the present. He conducts a genealogy of the problematizations—the ways in which certain practices and forms of knowledge become a matter of concern—and practices surrounding

the formation of the subjects who can recognize and understand themselves in terms of the techniques, ethical concerns, and political relations that form around men who desire. *Use of Pleasure* focuses on the ways in which pleasure was a matter of concern for the Greeks and how it played a crucial role in the command that one “know thyself.” Foucault then traces a change from a focus on pleasure and its use to a focus on desire and how to protect oneself from its dangers before the emergence of the Christian problematic of pleasure, desire, and ethics. The third volume is a genealogy of the emergence of the modern subject in Hellenic and Roman practices of self-control and asceticism.

Foucault made important contributions to discreet areas of philosophical research, including feminist philosophy and gender theory, social, political and legal philosophy, the philosophy of science, aesthetics, theories of knowledge, and especially ethics, which is a constant concern throughout Foucault's works. While Foucault resisted moral theory and insisted on its danger, and while he resisted the articulation of a solid moral stance on which one could found commitment or advocacy, he nevertheless insisted on the ethical value of his genealogical work. Through the investigation of the conditions under which subjects are formed and modes of recognition are validated or legitimated, Foucault intensified awareness of the subjugating powers that invest the practices and discourses that structure one's understanding of oneself and others and turned that awareness back on itself to promote the exploration of new and singular modes of self-relation.

## FOUCHER, SIMON

(1644–1696)

Simon Foucher was one of the foremost critics of Cartesian philosophy. He was born in Dijon, France, where, after taking orders, he was made honorary canon of the Sainte Chapelle. He took a bachelor's degree in theology at the Sorbonne and spent his adult life as a chaplain in Paris, where he died. His first published work is a long didactic poem commemorating the death of Anne of Austria (1601–1666). In another long poem he defends the compatibility of Greek and Christian moral principles. In Paris he attended the lectures on Cartesian physics given by Jacques Rohault, which inspired him to make original experiments in the science of hygrometry (humidity of the atmosphere) on which he published two pioneering works in 1672 and 1686. He also produced three major dissertations concerning the value of Academic skepticism in the search for truth. He was the first to publish criticisms of both Nicolas Malebranche's occasionalism and Gottfried Wilhelm Leibniz's monadism, and it is for these critiques that he is best known.

## ACADEMIC METHOD

Foucher considered himself to be the reviver of Academic philosophy, by which he means Socratic ignorance combined with the reasonable doubt of Philo of Larissa and Antiochus of Ascalon, who say that they know some things and are ignorant of others; he argues that this is the middle way between dogmatism and Pyrrhonism. The primary maxim of his Academic philosophy is to recognize only *vérité évident* as a rule of truth. The Academic laws are:

- (1) To proceed only by demonstrations in philosophy
- (2) To avoid unanswerable questions
- (3) To admit when one does not know
- (4) To distinguish what one knows from what one does not know
- (5) Always to seek after knowledge

There are three important axioms:

- (1) True knowledge cannot come from sense experience
- (2) Opinion is not knowledge
- (3) Words must presuppose concepts

Foucher argues that the goal of philosophy is to find a criterion of truth with which to avoid error in judgment. The criterion can be used to obtain knowledge of the essence of things and to put this knowledge into a necessary order. But no criterion of truth can be adequate for attaining the absolute certainty that René Descartes seeks. Truth is basically human and fallible.

Foucher builds no system of his own; his talents are primarily critical. His method is that of the traditional skeptic: he assumes the suppositions of the system under analysis and then reasons by *reductio ad absurdum* to contradictory conclusions. But unlike the Pyrrhonian skeptics who wish to confute all knowledge claims, Foucher's Academic skepticism is meant to advance probable science and knowledge.

### CRITICISMS OF MALEBRANCHE AND CARTESIANISM

Foucher claims that Descartes, to his credit, takes his rules of method from the Academics but that it is a major mistake on Descartes's part to assert that clear and distinct ideas can be certain and that they represent things external to one. Foucher follows Aristotle in professing that he cannot understand how one can have knowledge of the external world if no such knowledge comes through the senses. He further insists that both Descartes's claim that the knowledge of the essence of matter is innate and that knowledge of the properties of extension comes only through the reason, and not the senses, are unintelligible. Beyond this, Foucher makes four basic criticisms of Cartesianism.

First, Foucher argues that if mind and matter differ in essence, this allows no possibility of essential likeness between the two substances, which is necessary for causal interaction. Therefore, Cartesian mind and matter cannot interact.

Second, interaction between mind and matter obviously takes place, yet this interaction cannot be accounted for by Cartesian principles. Consequently, the Cartesians cannot know the true essences of mind and matter. The principle that likeness is necessary between cause and effect is self-evident, Foucher says, so mind and matter cannot be essentially different.

The third criticism concerns the ontological similarity between sensations and conceptual ideas, both of which are said by the Cartesians to be modifications of the mind. Both also are caused by the interaction of the mind with material things. However, ideas are said to represent objects external to the mind, whereas sensations do

not. Foucher argues that if ideas are mental modifications representative of the material things that cause them, then why cannot sensations, which are also modifications of the mind, represent the material things that cause them? Or conversely, if sensations cannot represent material things, then how can ideas do so? This objection of Foucher's seems to be based on the Cartesian dictum that the cause of an idea must have at least as much formal or eminent reality as the idea has objective reality. Foucher argues that this means that it is necessary for there to be a likeness between the formal or eminent reality of the material thing and the objective reality of its idea. Because of this likeness, the material thing can cause the idea to resemble it and, hence, to represent it. Since sensations are caused by the same objects that cause ideas, why would sensations not also be like their causes, and hence representative of them? In this criticism Foucher basically ignores the Cartesian implication that conceptual ideas represent through description, not through resemblance, as sensations are ordinarily thought to do (although not by Descartes).

Fourth, if mind and matter are substances that differ in essence, then there can be no similarity or resemblance between them or their respective modifications. And, Foucher claims, it is obvious that if there is no resemblance, there can be no representation. Unextended ideas cannot represent extended material things or material modifications because ideas are mental modifications that can in no way resemble material things or material modifications. Hence, Cartesian ontology precludes an intelligible epistemology.

Such Cartesians as Rohault, Pierre-Sylvain Régis, Robert Desgabets, Louis de La Forge (1632–1666), and Antoine Le Grand (1629–1699) deny that ontological likeness or resemblance is necessary for an idea to represent its object. Foucher persists in asking for an explication of this nonresembling representation that is as intelligible as the notion that representation depends on resemblance, but he receives little more in reply than that God assures it. Foucher is himself a faithful Christian, but he insists against the Cartesians and Malebranche that declarations of faith in God's power and wisdom cannot be used as principles in philosophy.

Foucher takes Malebranche, as well as Descartes, to be saying that both sensations and ideas are modifications of the soul, which is a substance differing in essence from body. Malebranche denies that his ideas are mental modifications, but holds rather that they are beings in the mind of God. Foucher argues that Malebranchian ideas external to the mind, even if they are in the mind of God,

would be as difficult to know as are material objects external to the mind. Despite Malebranche's derision and that Foucher never takes him to be anything but a Cartesian, Foucher's criticisms bear on a vital point in Malebranche's system as well as in the systems of nonoccasionalist Cartesians. The epistemological failure of Cartesianism stems from the inability of Cartesians to give an explication of how ideas represent material things that is compatible with their dualist ontology.

### CORRESPONDENCE WITH LEIBNIZ

In a correspondence noteworthy for the clearness with which each philosopher states his views, Leibniz agrees with Foucher that Academic principles are useful and that once in a lifetime a philosopher should follow his suppositions to their foundations. But Foucher insists that philosophy is primarily the examination and establishment of first principles, whereas Leibniz contends that very few philosophers are needed for this task; the important work is to follow out consequences in the development of knowledge. Foucher agrees that mathematics and hypothetical systems based on propositions of identity allow the deduction of truths internal to coherent systems, but he is concerned with the correspondence relation of these conceptual systems to the external world. Before a deductive natural philosophy is possible, it must be determined that the physical world is truly represented by one's concepts, axioms, and systems.

Extracts from the correspondence appear in the *Journal des Sçavans* from 1692 to 1696. In these Leibniz first places his new system before the public and Foucher gives it its first published critique. Foucher sees Leibniz's new system as little more than preestablished Malebranchian occasionalism, and he asks why God should go to such trouble to make it appear that mind and body interact if they really do not. Leibniz objects to occasionalism on the grounds that God should not continually be involved in making adjustments; Foucher argues that preestablished harmony, with all adjustments made at once, is no better. He says that Leibniz, like Malebranche, retains matter that is useless in his system because everyone experiences the interaction between mind and body. The task is to explain how interaction does take place, not merely how it seems to take place and how one can talk as though it does. For this, a monistic ontology in which mind and matter are metaphysically similar is required.

Foucher thus approves of Leibniz's denial of the Cartesian contention that extension is the essence of matter and his development of a monism of monads. The closest Foucher himself comes to outlining a monistic

ontology is his suggestion to Leibniz that he should develop his ontology of monads to this end. Leibniz does not do this.

Foucher is not assured that any first principles apply to the world, and he criticizes Leibniz for building a system on uncertain foundations. Foucher reiterates that Descartes's criterion of certainty, clarity, and distinctness is useless and that the infallible mark of truth has not yet been discovered.

Foucher is important in the history of modern philosophy as a skeptic who originated epistemological criticisms that are fatal to the Cartesian way of ideas. Foucher's arguments against the distinction between ideas and sensations—that both are modifications of mind—were utilized by Pierre Bayle (*Dictionnaire historique et critique*, 5th ed. 1740, "Pyrrhon," Remark B), George Berkeley (*A Treatise concerning the Principles of Human Knowledge* 1710, 8–15; *Three Dialogues Between Hylas and Philonous* 1710, I), and David Hume (*A Treatise of Human Nature* 1739, I, IV, iv) to destroy the distinction between the primary qualities of size, shape, and position that John Locke says actually modify material bodies and the secondary qualities of sensible visual imagery, touch, taste, sound, and smell that Locke says do not modify bodies but are merely caused by them. The argument is that all these qualities are equally sensible.

## FOUILLÉE, ALFRED (1838–1912)

Alfred Fouillée, the French philosopher and sociologist, was a prolific writer, especially on political, social, and historical subjects. He was a lecturer in lycées at Douai and Montpellier, at the University of Bordeaux, and finally, from 1872 to 1875, at the École Normale in Paris. When he had to retire because of ill health, he devoted his time to his writings. Through most of his varied output there ran a common thread. This was a concern to reconcile the values of traditionally metaphysical or spiritualistic philosophy—above all, liberty and free will—with the deterministic and antimetaphysical findings of contemporary work in the natural sciences: a concern, that is, to reconcile philosophical idealism with scientific naturalism. Fouillée, who was not closely identified with any formal school of thought, thus represented a further step in the direction indicated before him by some of the later disciples of the spiritualistic school of Victor Cousin, such as Paul Janet and Étienne Vacherot, who aimed at absorbing or coming to terms with, rather than combating, the rising power of natural science and scientific philosophy.

Fouillée’s outstanding and most original contribution to this enterprise was the idea that thought could lead to action, which he embodied in his concept of *idée-force*, or “thought force.” This concept contains in itself

the essence of Fouillée’s consciously eclectic, conciliatory method and aim, for it borrows the notion of “force” from contemporary physical science and applies it to mental states, to consciousness. Force, defined as a tendency to action, becomes a universal fact of consciousness; conversely, every idea is a force that has a potential for realizing itself in action. Thus ideas, whether or not they are themselves caused, are causes; and since ideas are mental phenomena, mind is an efficient cause of physical action. The *idées-forces* are intermediaries between the private existence of consciousness and the objective existence of things. They enabled Fouillée to preserve spiritual values within the conditions imposed by natural science by developing what has been called a “positive metaphysics,” that is, a metaphysics within the limits of the physically conceivable. Thus he undertook to refute the central tenet of materialism that mind or consciousness is merely an epiphenomenon. Specifically taking up the crucial concept of liberty, Fouillée argued that the consciousness of liberty amounts to the existence of liberty, since it gives rise to ideas formulated in terms of freedom of choice and since these ideas can in fact exert an effect on the outside world.

Fouillée’s system is based primarily on psychological analysis, resembling, again, the spiritualism of the school of Cousin. This orientation was indicated by Fouillée himself when in his last work he labeled his philosophy “voluntaristic idealism.” The will is the most immediate reality of consciousness, although not sharply separated from the intelligence or reason; ideas in Fouillée seem scarcely distinguishable from intentions. Yet, since he was attempting a comprehensive philosophical synthesis, Fouillée also constructed ontological categories on his psychological foundations. Causation, for instance, was established as an objective reality because it is one of the conditions necessary for the exercise of will, for the efficacy of the *idées-forces*. In like manner he developed an ethics with a strong social orientation. Consciousness, he taught, is aware not only of its own existence but of the consciousness of others (in this connection he suggested the emendation of René Descartes’s famous dictum to read *Cogito ergo sumus*). Altruism is a necessity, since isolation is impossible; moral choice is explained in terms of the attractive or repulsive power of *idées-forces* in the form of ideals; and ethical conduct is defined in terms of social beneficence.

It is doubtful whether a system like Fouillée’s, developed from a defensive posture, could ever prove generally acceptable. The concept of *idées-forces* is suggestive and useful as a tool of psychological analysis, but dubious if

elevated to the status of ontological reality. It is ultimately a merely verbal concept or device, seeking to bridge the gap between internal or mental processes and physical actions by, as it were, inserting a hyphen between them. But it will not bear the weight it is meant to carry, and as a result, the system as a whole remains merely suspended between idealism and naturalism. Though he struck a responsive chord and was widely read in his day, Fouillée had, in the end, few if any important followers.

## FOURIER, FRANÇOIS MARIE CHARLES

(1772–1837)

François Marie Charles Fourier, the French social critic, utopian socialist, and eccentric, was born into a merchant family in Besançon. Except during the French Revolution, Charles Fourier led a quiet and isolated life as a minor business employee and bachelor in Paris, Lyons, Rouen,

and elsewhere in France, with occasional trips abroad. Shortly after the turn of the nineteenth century, Fourier began to develop his doctrine, publishing his first major work, *Théorie des quatre mouvements et des destinées générales*, in 1808. He continued throughout his life to elaborate and propagate his views with a single-minded devotion, acquired some followers, and was able to dedicate his last years entirely to his self-appointed task.

After a superficial classical secondary education in a Jesuit school in Besançon, Fourier was entirely self-taught. His reading was confined largely to contemporary periodicals and often apparently to bits of articles or merely to headlines. His views reflect many ideas of the Enlightenment and of the early nineteenth century, with strong Rousseauistic and physiocratic strains.

Fourier believed that, because the world had been created by a benevolent deity and yet wallowed in misery, men had obviously failed to carry out the divine plan. The plan was discovered by Fourier, and it had to be translated into practice. Happiness would then replace misery, unity would replace division, Harmony would replace Civilization. The transformation would occur through the release of man's thirteen passions, instilled by God but repressed in Civilization: the five senses; the four "group," or social, passions of ambition, friendship, love, and family feeling; the three "series," or distributive, passions, that is, the "cabalist," or passion for intrigue, the *papillone* (butterfly), or passion for diversification, and the "composite," or passion for combining pleasures; and, finally, the passion for harmony, which synthesizes all the others. With the passions released, existence would become intense joy, and a lifetime would seem but a moment.

To accomplish the release of the passions, humanity would have to be organized into phalanxes of about eighteen hundred men, women, and children. In each phalanx different characters and inclinations would be scientifically combined in a complex and finely graded system of groups and series so that each person could give full expression, in his work and in his other activities, to all his passions, tastes, and capacities, and avoid everything that did not suit him. The economies accomplished by communal work and living and by finding the right place for every talent, and the enormous enthusiasms and energies mobilized by the new order, would make phalanxes extremely successful economically as well as in terms of human happiness. Indeed, a single trial phalanx would prove its absolute superiority within a few weeks or, at the most, months and, through imitation, abolish Civilization in a year or two. Moreover, the savages and

barbarians who had stubbornly resisted Civilization would eagerly join Harmony. The result would be one world of happy phalanxes, linked vaguely by a hierarchy of monarchs and more effectively by temporary industrial armies for special tasks and similar touring bands of poets, actors, and musicians. Fourier's life became a constant search for the means to establish a trial phalanx, and his political, social, and other preferences were all subordinated to this one great purpose. Fourier believed his main enemies to be the *philosophes* of all sorts, with their "400,000 false volumes."

Fourier's ideas for transforming society were linked to peculiar views on man's past and to strange cosmological beliefs and "analogical" methods (Fourier argued "by analogy" in dealing with all elements of the cosmos). Because the world was one, the coming of Harmony would lead to new, beneficial creations on earth and would result in the appearance of new satellites, in the regaining of health by our planet, and in more distant desirable cosmic repercussions. At the moment, however, earth remained deplorably behind other planets, and Fourier hoped that sufficiently powerful telescopes would enable men to observe the system of Harmony as practiced by the Solarians or the inhabitants of Jupiter. Fantastic details of many kinds abound in Fourier's writings, and the very form of the writings is frequently bizarre.

In addition to giving rise to Fourierist communal experiments and anticipating cooperatives, Fourier has exercised a broad general influence as social critic, early socialist, and man of many insights, especially psychological ones. Fourier's criticism, appreciated by Karl Marx and Friedrich Engels among others, is notable for its fundamental character, its incisiveness, its richness, and its lack of compromise or nuance. It ranges from magnificent denunciations of exploitation and sham in family, society, church, and state, through striking discussions of fraudulent business practices (in particular of fraud in commerce, Fourier's *bête noire*), and of the appalling conditions of the masses, to a listing of dozens of different kinds of cuckoldry. Fourier was a moralist and believed that Harmony would establish truth as well as happiness among men, for truth rather than deception and hypocrisy would then become the profitable and accepted way of life.

Fourier's socialism is *sui generis*; he would have retained some private property, and he regarded inequality and discord as necessary for the construction of graded series and groups and the exercise of all passions. He stressed gastrosophy (the science of cuisine), opera, and horticulture rather than large-scale agriculture or

industry. Far from desiring to mold man to a social purpose, he essayed to create a society where every individual whim would be satisfied. But Fourier did define man in social terms (the natural unit for lions, he said, is the couple, and for man, a phalanx, for only in a phalanx could man truly be man); and he charted an extremely complicated and interdependent socialist society, in which men own property, work, and live in common, in their specially built phalansteries, one for each phalanx.

This vision, together with his criticism of the existing system and many of his specific doctrines, places Fourier as one of the most inspired preachers and prophets of modern socialism. Fourier's remarkable psychological insights, such as his championing of brief sessions and variety in work, his quickness to see oppression no matter how veiled, and his at times penetrating concern with different character formations and problems, link him, for instance, to modern pedagogy, the emancipation of women, and personnel management. Fourier can also be described as a brilliant exponent of the idea of alienation or as a premature theoretician of the affluent society. Especially notable are his emphasis on the repression of passions as the source of all evil, as well as the foundation of Civilization, and his vision of that insane world of repressed passions.

## FRAME PROBLEM

A conundrum known as the frame problem within artificial intelligence concerns the application of knowledge about the past to draw inferences about the future. It requires distinguishing those properties that change across time against a background of those properties that do not, which thus constitute a frame (Charniak and McDermott 1985). From the point of view of philosophy it appears to be a special case of the problem of induction, which requests justification for drawing inferences about the future based on knowledge of the past. David Hume, in particular, suggested that one's expectations about the future are no more than habits of the mind and doubted that knowledge relating the future to the past was possible.

Bertrand Russell, a twentieth-century student of Hume's eighteenth-century problem, observed that this problem cannot be resolved merely by stipulation or by postulating that the future will be like the past. That the future will be like the past in every respect may be significant but it is also false. That the future will be like the past in some respect may be true but it is also trivial. The problem is to discover those specific respects in which the future will be like the past that provide justification for inferences to some outcomes rather than others, under the same initial conditions. That in turn suggests that the frame problem, like the problem of induction, depends for its solution on a defensible theory of natural laws that supplies a basis for linking the future to the past.

### BACKGROUND

The first mention of a problem by this name was by John McCarthy and Patrick J. Hayes, who advanced a solution—the situational calculus—that depends on making assumptions about “the complete state of the universe at

an instant of time,” where “the laws of motion determine, given a situation, all future situations” (1969, p. 477). The reference to time raises concerns with relativity but, more important, not every feature of the universe makes a difference to every other feature at a later time. If one draws a distinction between global and local situations, where *global* concerns the complete state of the universe at a time and *local* only specific parts thereof, then local situations may prove tractable even if global situations should prove to be intractable.

Other characterizations of the problem include keeping track of the consequences of an action, including changes that they entail for representations of the world (Hayes 1973), and as a process of updating databases in response to changes that occur in the world (Barr and Feigenbaum 1981). Some claim it is not the problem of justifying inferences but of finding appropriate ways to express them (Hayes 1991), while others discuss the importance of the problem in relation to robots (Dennett 1984). As Robert Hadley notices, researchers in artificial intelligence tend to adopt narrower definitions of the problem, while philosophers tend to take the frame problem “to include any problem whose solution is *presupposed* by a solution to the narrow problem” (1988, p. 34). Some authors characterize the problem as less about knowledge than about knowledge representation.

### WORLDS OF ROBOTS

The connection between actions, representations, and the problem of change arises in part from the desire to provide artificial human beings (or robots) with the directional capabilities to navigate their way around the world. If those robots act on the basis of maps—where the term is being used as a generic characterization for internal representations—then it becomes important to distinguish between permanent and transient features of those maps, which makes database updating important. And because robots may bring about changes in their environment through interaction, it becomes important to revise those maps to reflect those changes, to maintain the current relevance of those internal representations, where these concerns converge.

The same connections, however, also obtain for human beings as other things that act on the basis of beliefs as their internal representations of the world. When those beliefs are sufficiently accurate and complete, actions taken based on them may be expected to be more appropriate and less likely to fail than would otherwise be the case. Insofar as the frame problem revolves around knowledge of when things are going to change and when

they are not going to change, it possesses general significance for natural humans and for artificial humans alike. Beliefs are true when they correspond to reality (as the way things are or as everything that is the case), and when they correspond to reality they provide an appropriate foundation for human action as well as for robotic behavior.

The suggestion has been made that the frame problem concerns common sense as a product of everyday experience in interacting with the world, based on the fact that often the course of events conforms to one's expectations (Hayes 1991, p. 72). The existence of habits of the mind, however, does not resolve the problem with respect to justifying those habits on the basis of experience in the past nor explain how one's beliefs about the future ought to be represented. Presumably, the problem of knowledge must be resolved to have knowledge to represent. The kind of knowledge that holds promise for solving these problems derives from studying those features of the world that remain constant across time as the objects of scientific inquiries rather than as the products of common sense. These properties are known as the laws of nature.

### LAWS OF NATURE

Laws of nature, unlike laws of society, cannot be violated or changed and require no enforcement. They must be distinguished from what are called accidental generalizations, which may be true as correlations that describe the history of the world but which could be violated and changed. If every Ferrari during the world's history happened to be red, then the generalization "all Ferraris are red" would be true, but it would not be a law, since there are processes and procedures, such as repainting a Ferrari, that would render it false. For a generalization to be law-like, its falsity must be logically possible but not physically possible, precisely because there are no processes or procedures that could separate an attribute from its reference property, even though the possession of that attribute is not true merely as a matter of definition.

There appear to be several species of natural laws, including simple laws of nomic form and causal laws of different kinds (Fetzer 1981, 1990). That gold is malleable and that matches are ignitable are examples of simple laws, provided that those attributes are permanent. The selling price of gold, by comparison, at \$500 an ounce, for example, is a transient attribute. These laws characterize properties that are possessed at one and the same time and do not explicitly imply changes across time. If the property of being malleable is a permanent property of

gold, however, then gold has the causal properties that define *malleability*, including assuming different shapes at subsequent times as an effect of different forces at prior times. Thus, simple laws entail causal counterparts.

### CAUSAL KINDS

The conception advanced by McCarthy and Hayes (1969), according to which complete states of the universe determine subsequent complete states according to laws of motion, presumes that those laws are exclusively deterministic, where given a complete state of the universe  $S_1$  at time  $t_1$ , one and only one complete successor state  $S_2$  is physically possible at  $t_2$ . Gottfried Wilhelm Leibniz and Pierre Simon de Laplace advanced similar conceptions. However, if any of the parts of the world are governed by causal processes that are indeterministic (or probabilistic), more than one successor state,  $S_2, S_3, \dots, S_n$  may be physically possible at time  $t_2$ . Simple examples may include flips of coins, tosses of dice, and draws of cards from decks, but that depends on the specificity of the conditions attending those events.

Draws of cards from decks, for example, are ontically deterministic in the sense that, given specific arrangements of the cards in the deck, one and only one specific card can be drawn. These draws are epistemically indeterministic in the sense that, as long as one adheres to the rules of the game, one does not know the specific arrangements and is consequently unable to predict the outcome. The situation is different with the laws of radioactive decay, however. For example, an atom of polonium-218 has a half-life of 3.05 minutes, which means that, during any specific 3.05 minute interval, it has a probability of decay of one-half. This implies that, for collections of polonium atoms, one can expect that, during any 3.05-minute interval, about half will decay without knowing which ones.

### TYPES OF SYSTEMS

Atoms of polonium-218 are closed systems for which there are no other properties that make any difference to their probability of decay than the length of temporal interval. Neither the weather, the day of the week, the presence or absence of observers—none of these factors affect the strength of this probability. In the case of flips of coins, tosses of dice, and draws of cards from decks there are other properties, such as the precise angular momentum imparted to a coin when flipped, which make it predictable with greater and greater precision, where condition  $F$  is relevant to outcome  $O$  under conditions  $C$  when it makes a difference to the probability out-

come O, given C. Increasingly precise specifications of the relevant conditions that affect outcomes thus allow instances of epistemic indeterminism to be established as ontically deterministic.

The probabilities of outcome depend on and vary with the complete sets of factors that are present on any specific occasion. When coins are bent, dice are loaded, or decks are stacked, the probabilities of various outcomes are no longer what they would have been under normal conditions. It follows that the truth of a lawlike sentence depends on taking into account the presence or absence of every property whose presence or absence makes a difference to the outcome on any specific occasion, which has been called the requirement of maximal specificity (Fetzer 1981, 1990). Closed systems are systems that satisfy this requirement, which is why their behavior across time can be systematically anticipated on the basis of corresponding maximally specific causal laws.

## PREDICTION

For closed systems, it is therefore possible to predict—either invariably or probabilistically—precisely how that system will behave over an interval of time  $t$  to  $t^*$  (when those properties are instantiated at time  $t$  and the outcome occurs at  $t^*$ ), so long as the laws of systems of that kind are known. When either (1) the laws of systems of that kind are not known or (2) the description available for that system is not closed, however, then precisely how that system would behave over a corresponding interval of time  $t$  to  $t^*$  cannot be predicted with—invariable or probabilistic—confidence, because essential information remains unknown. In those cases the frame problem cannot be solved; but, even given knowledge of those kinds, the representation problem remains.

Indeed, there are at least two dimensions to the problem, where the first concerns whether the system under consideration qualifies as an open or as a closed system in relation to the outcome of interest. In either case, one needs to have predicates in one's language to describe each of its relevant properties. The second concerns whether or not the system under consideration, even if it happens to be a closed system, requires a finite or an infinite set of predicates for its complete description. When the complete description of states of the universe requires infinitely many predicates, for example, because infinitely many properties need to be described relative to successive states of the universe, there are no solutions to frame problems for global situations. Those are restricted to closed systems appropriately describable by finite sets of predicates.

## SEMANTIC ISSUES

McCarthy and Hayes (1969) consider hypothetical situations that concern what would happen if specific events were to occur (such as the situation that would arise if Mr. Smith sold his car to Mrs. Jones, who has offered \$250 for it). These situations are properly represented by subjunctive conditionals (concerning what would be the case, if something were the case) and counterfactuals (as subjunctive conditionals with false antecedents). However, this implies that, even envisioned primarily as a problem of representation, the solution to the frame problem entails solving some of thorniest issues in philosophical logic concerning intensional conditionals and possible-world semantics. A plausible solution involves distinguishing ordinary-language subjunctives from scientific conditionals elaborated in recent research (Nute 1975; Fetzer and Nute 1979, 1980).

The semantics that appears most appropriate for scientific conditionals and lawlike sentences is a form of maximal-change semantics rather than one of the varieties of minimal-change semantics proposed by Robert Stalnaker (1968) and by David Lewis (1979). Thus, while their semantics depend on assuming that possible worlds that differ from the actual world are as similar to the actual world as they could be, apart from the specific features being varied, the semantics assumed here—for the sake of exploring representational aspects of the frame problem—permits possible worlds to differ from the actual world in all respects except those specified by their maximally specific reference-property descriptions and the permanent properties that attend them. Subjunctives are true provided that, in every world in which their antecedents are true, their consequents are also true or would be true with constant probabilities.

## LOGICAL FORM

An intensional calculus for the representation of lawlike sentences and causal conditionals of deterministic and probabilistic strength affords a possible framework for resolving the problem of representation (Fetzer and Nute 1979, 1980). Suppose that matches of kinds defined by chemical composition  $M$  are such that, when they are dry  $D$ , struck in fashion  $S$ , in the presence of oxygen  $O$ , then they light  $L$ . That could justify the lawlike claim, for every match  $x$  of kind  $M$  that is  $D$  and  $O$ ,  $S$ -ing  $x$  at  $t_1$  would invariably bring about its  $L$ -ing at  $t_2$ . That maximally specific antecedent could equally well be represented by various alternative formulations that included the same complete sets of relevant conditions, since adding oxygen when the other properties were present, for example,

would bring about the outcome just as the striking of the match, when those other properties were present, would bring it about.

Employing the double arrow,  $\_ \Rightarrow \dots$ , as the subjunctive conditional sign and the causal double arrow,  $\_ n \Rightarrow \dots$ , as the (probabilistic) causal conditional sign—where values of  $n$  range over  $u$  for deterministic cases and  $p$  (from zero to one) for probabilistic cases—then these lawlike relations could be formalized by means of a generalized conditional,  $(x)(t)[(Mxt \ \& \ Dxt \ \& \ Oxt) \Rightarrow (Sxt \ u \Rightarrow Lxt^*)]$ , which would be read, “For all  $x$  and all  $t$ , if  $x$  were  $M$  and  $D$  and  $O$  at  $t$ , then  $S$ -ing  $x$  at  $t$  would bring about (invariably)  $L$ -ing  $x$  at  $t^*$ ” (where  $t^*$  is a specific interval after  $t$ ). An instance of this generalization for a specific object  $c$  at a specific time  $t_1$  would have the following logical form,  $(Mct_1 \ \& \ Dct_1 \ \& \ Oct_1) \Rightarrow (Sct_1 \ u \Rightarrow Lct_2)$ , which would have logically equivalent variations, such as  $(Mct_1 \ \& \ Dct_1 \ \& \ Sct_1) \Rightarrow (Oct_1 \ u \Rightarrow Lct_2)$ , and so on.

## SCOREKEEPING

The conception of conversational scorekeeping was introduced by Lewis (1973) as a helpful technique for keeping track of assumptions that have been made within the context of an ordinary conversation. Donald Nute (1980), for example, discusses its application relative to conditionals that occur during ordinary language conversations. Suppose, for example, that, at one point in their conversation, Bill and Hillary agree that either she will run for the Senate (again) or she will run for president. If they later conclude that she is not going to run for the presidency, they are entitled to infer that she is going to run for the Senate, even if that conversation occurs weeks later, assuming the premise has not been withdrawn.

Analogously, for a computerized system with the capacity for the representation of conditionals, such as LISP or Prolog, for example, developing programs that reflect the laws of systems that interest project managers should be relatively straightforward. No matter when specific data enters the program and regardless of the specific order in which it is received, once the antecedent of the conditional has been satisfied, the program draws the inference with deterministic certainty or probabilistic confidence that an outcome of kind  $O$  either has occurred or may be expected to occur, given the temporal parameters that apply. The function **cond** in LISP, for example, appears to be appropriately adaptable for this purpose (Wilensky 1984, Fetzer 1991). Hayes (1991) raises the objection that **cond** supports inferences of the form

*modus ponens* but not of the form *modus tollens*, but that is sufficient for deriving predictions.

## IMPLEMENTATION

It appears to be the case that the frame problem can be solved, at least in principle, for closed systems involving only finite sets of relevant properties. Whether or not it can be solved in practice, of course, depends on the state of science and one’s knowledge of systems and laws of the kind under consideration. The solution that has been presented here, of course, presupposes an account of the nature of laws of which Hume would not have approved. Hume adopted an epistemic principle that precluded inference to the existence of properties and relations, including lawful and causal connections, that are not directly accessible to experience. His narrow form of inductivism cannot justify inferences to the existence of laws by contrast with mere correlations. Fortunately, a more robust epistemology based on inference to the best explanation accommodates the discovery of natural laws, where hypotheses are empirically testable by means of severe attempts to refute them (Fetzer 1981, 1990).

In spite of his emphasis on the representational aspect of the frame problem, even Hayes (1991) acknowledges that a theory of causation is a necessary condition for its solution. During the course of their review of a recent collection of studies of the frame problem, Selmer Bringsjord and Chris Welty (1994) suggest that the frame problem presupposes a solution to the problem of induction, which agrees with the position presented here. Whether or not the frame problem can be solved depends on whether or not the problem of induction can be solved, which in turn depends on deep issues in ontology and epistemology. If the considerations outlined earlier are well founded, however, then the problem of induction and the frame problem are both capable of successful resolution, even including its representational dimensions.

## FRANCK, SEBASTIAN (1499–1542)

Sebastian Franck, also known as Franck von Word, was an outstanding figure among the spiritualists of the Reformation. His basic spiritualist concept of the conflict in each human being and in the world between the Inner Word (Son of God; eternal, invisible Christ), which is

ultimate reality, and the outer word (law, flesh, selfishness), which is only appearance, shadow or phantom, was developed in all his philosophical, theological, historical, and cosmographical works. Franck was born in Donauwörth, Germany, and died in Basel. After studying at the University of Ingolstadt, Franck entered the Dominican Bethlehem College in Heidelberg in 1518. As a priest he officiated in the diocese of Augsburg. He turned to the Lutheran faith about 1526 and became Lutheran pastor in Buchenbach near Ansbach and then in Gustenfelden near Nürnberg. Franck resigned his pastorate in 1528 or early 1529 to become an independent writer and lived in Nürnberg until 1529 or early 1530.

Nürnberg, a cultural center, offered ample literary resources and personal contacts, especially with Theophrastus Paracelsus and the many followers of Hans Denck. Among Denck's followers were Albrecht Dürer's famous pupils the brothers Hans Sebald and Barthel Beham, whose sister Otilie became Franck's wife. When Franck left Nürnberg, three of his controversial books were already written. Two of them were free translations from Latin into German (with many of his own unorthodox ideas injected) of Andreas Althamer's *Diallage* (1528), a Lutheran attack against Anabaptism, and of an unknown author's *Chronica und beschreibung der Turkey mit yhrem begriff* (Nürnberg, 1530), in which his ideas on the invisible church were already outlined. The first book wholly his own, *Von dem gewlichen laster der trunckenhoyt* (1528), is a notable contribution to the literature on alcoholism.

From Nürnberg he moved to Strassburg, where he had occasion to meet Johann Buenderlin, Caspar Schwenckfeld, Melchior Hofmann, Jacob Ziegler, Michael Servetus, Johann Campanus, and, again, Paracelsus. There he wrote a universal history, extending from the creation of the world to the reign of Emperor Charles V and of Pope Clement VII, titled *Chronica, Zeytbuch und geschycht bibel* (Strassburg, 1531), famous for its numerous penetrating spiritualistic comments on many ecclesiastical and secular personalities and events. Its chronicle of heretics included Erasmus of Rotterdam as a Roman heretic. Because of this and his adverse remarks about Charles V, Franck was arrested and banned from Strassburg in 1531.

After living in Esslingen, Franck settled in Ulm as a printer and wrote most of his books there. His spiritualistic interpretation of the Scriptures can be found in his *Paradoxa ducenta octoginta ...* (Ulm, 1534), *Die guldin Arch ...* (Augsburg, 1538), and *Das verbütschiert mit sieben Siegeln verschlossen Buch* (Basel, 1539). *Die vier*

*Kronbüchlein* (Ulm, 1534) contains Erasmus's *Das thèur und kunstlich Buochlein Morie Encomion, das ist, ein Lob der Thorhait* and Cornelius Agrippa's *Von der Heylosigkeit Eitelkeit und ungewisheit aller Menschlichen Kunst und Weissheit* (both of which he freely translated from the original Latin texts), *Vom Baum des Wissens Guts and Böss ...*, in which he tries to prove that awareness of good and evil can impair one's goodness, and *Encomion, ein Lob des Thorechten Gottlichen Worts ...* His *Weltbuch, Spiegel un bildniss des gantzen Erdbodens ...* (Tübingen, 1534), a cosmography with one of the first German descriptions of America and with one chapter dealing with the different religious movements of his time, which initiated systematic comparison of religion on Reformation soil, became one of his most popular books. His *Germaniae Chronicon* (Augsburg, 1538) has been used as an important source for historical research. In his *Das Krieg büchlein des Friedens ...* (1539) Franck tried to prove that war not only contradicts Christ's teaching but is also "a devilish, inhuman thing, an abhorrent plague ... an open door for all vices and sins and destruction of land, soul, body and honor." Most of these works made Franck the defendant in a trial before the city council that was instigated by Martin Frecht, main preacher in the cathedral of Ulm, Philipp Melanchthon, Martin Butzer, and Landgrave Philip of Hesse. It resulted in his expulsion from Ulm.

Franck, his wife, and their six children went to Basel in July 1539. There, after the death of his wife, he married Barbara Beck of Strassburg. His famous collection, with his interpretation, of *Sprichwörter ...* (Frankfurt, 1541) was partially republished by G. E. Lessing. The last years of his life were devoted mostly to his Latin paraphrase of the *Deutsche Theologie*, which was never published, and to several posthumously published tractates (*Van het Ryke Christi*, Gouda, 1611; *Een Stichtelijck Tractaet van de Werelt des Duyvels Rijck*, Gouda, 1618; and *Sanctorum Communio*, Gouda, 1618), all of which survive only in the Dutch translations. They prove that dualism of God and world fully dominated his thoughts before his death.

Franck's worldview is primarily panentheistic, with heterogeneous elements drawn from Lutheranism, medieval mysticism, Neoplatonism, Renaissance speculation, humanism, Anabaptism, and rationalism, with ample citation of the Church Fathers and non-Christian philosophers. This comprehensive syncretism makes Franck an almost unique figure in the Reformation era and therefore a major figure in the history of ideas. As a religious philosopher he will be remembered for his radical spiritualistic tendency to replace exterior authority with inner illumination by God's spirit. The deep spiri-

tual meaning of the Bible (outer word)—which is allegorical, not historical but typological, full of contradictions and merely testimonial to the eternal truth—can be comprehended only by those who have already accepted the Inner Word: "Unless we listen to the word of God within ourselves, we can make nothing of Scripture ... for everything can be decked and defended with texts" (*Das verbütschiert mit sieben Siegeln verschlossen Buch*). In the light of his spiritualism none of the churches and sects, with their outgrown external disciplines, dogmas, sacraments, ceremonies, and festivals can be the true church. The true church is his *ecclesia spiritualis*, where only inward enlightenment is sufficient; it is the universal invisible church of the spirit, to which even those non-Christians who without knowledge of the incarnate Word have accepted the Inner Word can belong: "I love any man whom I can help and I call him brother, whether he be Jew or Samaritan ... I cannot belong to any separate sect" (*ibid.*).

As a historian Franck placed the Reformation in the stream of historical development and thus relativized it. He is credited with recognizing the historic force that externalizes the spiritual ("The world must have a papacy even if it has to steal it."). He also observed the typical recurrent rise and fall of kingdoms and peoples, and by recognizing this change of fortune as God's punishment for disobedience of his Inner Word, saw history as interaction between God and the world, as the struggle between the spirit and the forces which resist it.

As one of the most ardent advocates of religious liberty in the sixteenth century, Franck insisted on toleration not only among the individual members of the different churches and sects in Christendom but also toward Jews, Muslims, heathens, and even heretics, since all men, created by God, descended from Adam, and accessible to the Holy Spirit, are equal.

Martin Luther, Philipp Melanchthon, and Martin Butzer were especially aware of the danger of Franck's unorthodox thoughts to the new Protestant position. Luther called him "the devil's most cherished slanderous mouth." The convention of Protestant theologians at Schmalkalden in 1540 issued a resolution of condemnation of both Franck and Schwenckfeld, which the latter called a (Protestant) papal bull.

Franck's extraordinarily well written books had a great influence on German prose style. They were widely read in German, Dutch, Swiss, and even English editions until the end of the seventeenth century. There exist at least ten editions of his *Chronica* and as many of his

*Sprichwörter*. His *Weltbuch* went through at least six editions, as did his *Vier Kronbüchlein* or parts of it.

While Franck's specific traceable influence was restricted in Germany to Valentin Weigel and Gottfried Arnold, and in Basel to Sebastian Castellio, his spirit and ideas found ardent followers in Holland (Dirk Volkerts Coonhert, Menno Simons, David Joris, and the Franckists or Sebastianists). Although he had strong roots in the late Middle Ages, much of Franck's thought carried the seed of what was to become important in modern thinking. Wilhelm Dilthey rightly testifies that "the ideas of Franck flow toward modern times in a hundred streamlets."

## FRANK, ERICH

(1883–1949)

Erich Frank studied philology and classics at the universities of Vienna, Freiburg, and Berlin. In 1907 he turned to philosophy, which he studied in Heidelberg under Heinrich Rickert and Wilhelm Windelband. His philosophical career in Germany was brief but distinguished. In 1923 he became professor at Heidelberg, and five years later he was appointed Martin Heidegger's successor in Marburg. Three years after his dismissal from Marburg in 1936, he came to Harvard on a research fellowship and made America his second home. Almost all of Frank's works reflect his double interest in philosophy and history and his efforts to combine historical knowledge and philosophical thought: *Plato und die sogenannten Pythagoreer* (Halle, 1923); *Wissen, Wollen, Glauben* (Knowledge, will, belief), a collection of English and German historical and speculative essays, edited with an appreciation by Ludwig Edelstein (Zürich, 1955), of which the title essay represents Frank's most original contribution to philosophy; *Philosophical Understanding and Religious Truth* (New York, 1945).

As a student, Frank felt dissatisfied with current attempts to model philosophy on science and to eliminate the traditional questions of metaphysics, ontology, and religion. Nor was he long satisfied with the post-Kantian idealism that was offered as an alternative and which for a time attracted him. When in 1914 he discovered Søren Kierkegaard, at that time almost unknown in philosophical circles, he thought he had found the beginning of a new and fruitful approach to the problem of the subject-object dialectic. He shared his discovery with Karl Jaspers, and five years later, with the publication of Frank's essay *Wissen, Wollen, Glauben* and Jaspers's *Psychologie der Weltanschauungen* the foundations of German existentialism were laid. The major theme of Frank's essay is that the unity of the subject in self-consciousness is achieved not in the act of knowing or in the act of willing, but only in the act of faith. This knowledge of the self is logically unprovable but is also incontrovertible. The act of faith is neither blind belief nor a "will to believe," but arises out of the immediate awareness both of oneself as free and of a transcendence of oneself. Faith is thus both the condition and the result of the subject's freedom, and all theoretical and practical activity has its source in this freedom. Frank believed he had found in the act of faith the unity of the subject that Immanuel Kant sought but could not find in the act of judging.

Later Frank came to question the subjective direction in which existentialist philosophy was developing. In his review of Jaspers's *Philosophie* (1933) he not only criticized what he called the "atheistischer Nihilismus" (atheistic nihilism) of Heidegger, but also pointed out the insufficiency of Jaspers's existential ontology (the *Chiffre*), which, he claimed, bears no analogical relation to Being. Existentialism, he argued, has not succeeded in combining existential concerns with metaphysical objectivity. The freedom of the subject is not threatened by his encounter with the objective. Indeed, that freedom which does not express, historically and analogically, a truth concerning objective Being, is an empty, irrational freedom.

In *Philosophical Understanding and Religious Truth*, which grew out of the Flexner Lectures he gave at Bryn Mawr in 1943, Frank considered the question of analogical terms through which alone, in his view, philosophy could adequately express the subjective, existential experience of objective reality. All philosophical truth, he argued, is analogical in that it recounts, in and for each historical period, the relation of man to Being. Philosophical analogy is possible only because there is an objective reality to which our thinking bears a relation. Just as in *Knowledge, Will, Belief* Frank argued that the freedom of the subject always presupposes a transcendence of it, so he now maintained that philosophical thought presupposes an object beyond itself that is its content and its substance. Thus, philosophy shares with religion the belief that there is an objective reality to be known; the task of philosophy is, in part, the rational elucidation of religious truths. However, philosophy must not take the place of the revealed mystery of religion. In every historical period philosophical truths have a different starting point and find a different expression, but their content—Being—is eternal. Philosophical analogy is possible only because there is Being; and Being becomes part of our thinking only in analogy. The purpose of philosophy is to present in rational terms the existential dialectic of the subjective and the objective, the temporal and the eternal.

## FRANK, SEMĚN LIUDVIGOVICH (1877–1950)

SemĚn Liudvigovich Frank, the Russian philosopher and religious thinker, was trained in law at Moscow University (1894–1898) and in economics and philosophy at the universities of Berlin and Munich (1899–1902). As a student in Moscow he was a member of a Marxist group headed by P. B. Struve; his first published work was a critique of Karl Marx’s theory of value (1900). Between 1902 and 1905 (during which years he moved back and forth between Moscow and Germany) he was a principal contributor to Struve’s journal *Osvobozhdenie* (Liberation), published in Stuttgart.

Frank joined a number of other young ex-Marxist intellectuals—among them Struve, Nikolai Berdiaev, and Sergei Bulgakov—in publishing three important symposium volumes: *Problemy idealizma* (Problems of Idealism; Moscow, 1903); *Vekhi* (Signposts; Moscow, 1909); and *Iz glubiny* (De profundis; Moscow, 1918). This last work was printed but because of Soviet censorship was never released.

In 1906 Frank settled in St. Petersburg; in 1912 he joined the Russian Orthodox Church and began to teach philosophy at St. Petersburg University. In 1915 (at St. Petersburg) he published, and in 1916 defended, his master’s thesis, *Predmet znaniia* (The object of knowledge); in 1917 he published his doctoral dissertation, *Dusha cheloveka: Opyt vvedeniia v filosofskuyu psikhologiyu* (Man’s soul: An introductory essay in philosophical psychology; Moscow), but was unable to defend it because of political events. From 1917 to 1921 Frank was professor of philosophy and dean of the newly organized faculty of history and philosophy at Saratov University. In 1921 he was named professor of philosophy at Moscow University. He was among the group of non-Marxist intellectuals expelled from the Soviet Union in the summer of 1922.

He settled in Berlin, where he gave university lectures (in German) on Russian literature and culture. In 1937, forced to leave Germany, he moved to France. In 1945 he moved to London, where he died.

From Vladimir Solov’ev—and ultimately from Plotinus—Frank took his central doctrine of positive “total-unity” (*vseedinstvo*). His epistemological intuitivism was close to that of his older colleague Nikolai Losskii. His characteristic emphasis on the “metalogical unity” of the real, and its transcendence of the Aristotelian laws of thought, was drawn mainly from Nicholas of Cusa. Frank always identified himself as a Platonist.

Although Frank’s thought exhibits many Hegelian strands, and although he regularly used terms like *moment* (*das Moment*) in G. W. F. Hegel’s special sense (as “dialectical phase” or “component of a totality”), he employed one crucial pair of terms in a very un-Hegelian way. To the absoluteness of *real’nost’* (reality) he opposed the relativity of *deistvitel’nost’*, not “actuality” in the sense of Hegel’s *Wirklichkeit* (the common meaning of *deistvitel’nost’* in Russian philosophy) but the merely empirical or factual. Frank distinguished between conceptualizable and objectifiable “factuality” and the non-conceptualizable, metalogical “dual-unity” (*dvuedinstvo*) of “reality.” The real is fully related and concrete; the factual is isolated and abstract: “Being is a total-unity, in which everything particular exists and is conceivable only in its relation to something else” (*Nepostizhimoe* [The unknowable], p. 51). We apprehend reality as a “monodual” coincidence of opposites, as both “distinct from all particular determinate contents” of knowledge and as “containing and permeating” every such content (*Real’nost’ i chelovek* [Reality and man], pp. 93–94). The real is both “transdefinite” and “transfinite”; and in both respects it eludes conceptualization. “Everything finite,” Frank declared, “is given against a background of infinity. ... The knowable world is surrounded on all sides by the dark abyss of the unfathomable” (*Nepostizhimoe*, pp. 29, 35).

Frank agreed with René Descartes that, although the term *finite* is prior and positive in meaning, and the term *infinite* is derived from it by negation, “it is precisely the infinite as the ‘fullness of all’ that is given as primary and positive, while the concept of finitude is formed by negation of that fullness” (*Real’nost’ i chelovek*, p. 57).

Forms, or “ideal elements,” are determinate aspects of factuality. The totality of such determinations is grounded in what Frank, following Solov’ev, called the primordial unity or total-unity of the real. Although reality is unfathomable, it is not hidden; rather, it is “entirely

evident, being mysterious only in the sense that it is inexplicable, irreducible to anything else, and inaccessible to logically analytic thought. It is what Johann Wolfgang von Goethe called *ein offenes Geheimnis* (*Real'nost' i chelovek*, p. 78). "Objective factuality" is something alienated and abstract, a "rationalized, i.e., logically crystallized, part of reality." Like a nut's shell, it forms a "hard and relatively distinct outer layer, produced by the inner saps and energies of a living organism" (pp. 106ff.).

Reality in its wholeness is graspable only in the integral intuition of "living knowledge" (*zhivoe znanie*), of which conceptual knowledge is only a derivative product or superstructure: "All particular knowledge is partial knowledge of a whole."

The "I" of the Cartesian *cogito* is a "reality in which subject and object coincide—a "self-revealing" and "self-transparent being-for-itself," accessible to "living knowledge." Sounding rather like Martin Heidegger, whose general position he repudiated, Frank wrote, "We are conscious of ourselves only as a self-revelation of [being] in us" (*Nepostizhimoe*, p. 93). He also offered a more emphatic version of Heidegger's doctrine of *Mitsein*: "No finished 'I' exists prior to the encounter with the 'thou.' ... It is in this encounter ... that the 'I' in a genuine sense first comes into being" (pp. 148, 154). Frank also suggested Heidegger's category of impersonal "itness" (*das Man*): "The 'we' appears in the form of an 'it' ... which constitutes the basis and first source of objective being" (p. 177). Although there can be no "I" apart from its relation to a "thou," "every 'I' has a special root of its own, lying in secret depths inaccessible to others" and "the most essential part of me remains solitary and inexpressible." The more one is aware of oneself as a person, the more one withdraws into "metaphysical solitude," for "we are wholly open only to ourselves and to God" (*Real'nost' i chelovek*, pp. 127, 129).

In religious—and especially mystical—experience, "I encounter God as a 'thou' for me, only in ... that ultimate and essentially solitary stratum of my 'I' in which I am ... inaccessible to everyone except myself—and God (as Kierkegaard rightly insisted). I encounter God in the utter solitude in which I encounter death" (pp. 215f.).

Like Solov'ev, Frank generalized the notion of "Godmanhood" (Solov'ev's term was *Bogochelovechestvo*; Frank's somewhat more abstract term, *Bogochelovechnost'*) beyond its Christian context. Its primary reference is not to the Incarnation, but to the basic ontological category of "divine-human reality." In Frank's words, "The dual-unity of Godmanhood is logically prior to the conceptions of both God and man" (p. 249).

## FRANKFURT, HARRY (1929–)

Harry Frankfurt grew up in Brooklyn, New York, and Baltimore, Maryland. He received his PhD in philosophy from Johns Hopkins University in 1954, and he taught in the philosophy departments at Ohio State University; State University of New York, Binghamton; Rockefeller University; Yale University; and Princeton University.

Frankfurt has made original and important contributions to various fields in philosophy, including history of modern philosophy (primarily René Descartes), philosophical psychology, and moral philosophy. He has explored such issues as the relationship between moral responsibility and free will, the nature of the self, the role of necessitation or inevitability in both constraining and constituting persons, and central phenomena such as care, love, and truth. His work has exerted a significant influence on philosophers working in these areas, and some of his writings (especially on the role of love and truth in our lives) have been read by a wide audience. It is perhaps not surprising that Frankfurt's work has been appreciated beyond the walls of academia, as it is both penetrating and elegant.

In one of his most influential papers, "Alternate Possibilities and Moral Responsibility," Frankfurt argued that moral responsibility does not require the sort of free will that entails *alternative possibilities* or genuine freedom to do otherwise. He offered a template for a kind of example that calls into question the *Principle of Alternative Possibilities*, (PAP), according to which moral responsibility requires alternative possibilities. The *Frankfurt-Style Counterexamples* (to PAP) have a distinctive structure that involves *preemptive overdetermination*, that is, the existence of a fail-safe device that plays no role in the causal sequence that issues in the relevant behavior, but which renders that behavior inevitable.

The examples can be seen to be extensions of an example presented by John Locke. Locke discussed a man who is transported into a room while asleep. When he awakens, the man considers whether to leave the room, but stays for his own reasons. Unbeknownst to him, the door was locked and thus he could not have successfully left the room. According to Locke, the man stayed in the

room voluntarily although he could not have left the room.

Now it might be pointed out that although the man in Locke's example lacked a certain alternative possibility (the power to leave the room), he nevertheless had various important options available, including choosing to leave, trying to leave, turning the knob, and so forth. Frankfurt's distinctive contribution is the addition of a component to this sort of example which, as it were, *brings the locked door into the agent's brain*. That is, Frankfurt asks us to imagine someone who can secretly monitor an agent, even his brain activities; as things happen, no intervention by this kind of shadowy *counterfactual intervener* occurs. But if the agent were about to choose to do otherwise, this would trigger some process by which the intervener—say, a *nefarious neurosurgeon*—could ensure that the agent choose and behave as he actually does. Thus, Frankfurt has provided a more sophisticated version of Locke's example, one in which it is at least plausible to suppose that the agent in question chooses and acts freely and could legitimately be held morally responsible even though the agent literally could not have chosen otherwise and could not have done otherwise.

Frankfurt thus denied PAP. One who agrees with Frankfurt can thus contend that one of the main objections to compatibilism about causal determinism and moral responsibility can be blocked. That is, it is traditionally supposed that causal determinism threatens moral responsibility because it rules out the sort of free will that involves alternative possibilities; but if this sort of free will is not required for moral responsibility, then at least this sort of objection to compatibilism is rendered irrelevant. Of course, there may be other reasons to reject compatibilism. Frankfurt himself is officially agnostic about compatibilism, saying that we cannot be confident that causal determinism is compatible with being *active*, and thus we cannot be confident in the truth of the compatibility of causal determinism and moral responsibility.

In another seminal paper, "Freedom of the Will and the Concept of a Person," Frankfurt suggested that the distinctive feature of persons is a certain characteristic structure in their motivational states. We share preferences, beliefs, and so forth with mere animals. But we are unique in that we can step back from our preferences and form *second-order* preferences—preferences about our first-order preferences. Some of these second-order preferences are what Frankfurt called *second-order volitions*—the preference that a certain first-order preference lead one to act. According to Frankfurt it is not crucial what the basis for the second-order reflection is; it need not be

moral deliberation, for example. On his view, persons are distinctive in that they have the capacity to form second-order volitions; thus, they are the sort of entities for which freedom of the will can be a problem.

For Frankfurt, it is important to distinguish such notions of freedom to choose otherwise and freedom to do otherwise, on the one hand, from notions such as choosing freely and acting freely, on the other. The former involve alternative possibilities whereas the latter do not. In “Freedom of the Will and the Concept of a Person,” Frankfurt gives an account of acting freely in terms of the hierarchical account of the structure of human motivation. When one acts freely, one acts on the preference one really wants to have as one’s *will* (roughly, the actually motivating preference). In Frankfurt’s terminology when one acts freely, one *identifies* with one’s will, that is, one identifies with the first-order desire that actually motivates one to act. In contrast, one does not act freely when one does not identify with one’s will—one acts (say, smokes another cigarette or eats another piece of chocolate cake) despite identifying with other first-order desires). Frankfurt suggests, additionally, that identification consists in forming the relevant second-order volition; he suggests that one identifies with a first-order desire insofar as one forms a second-order preference to be motivated by that first-order desire. So, acting freely consists in a kind of *mesh* or harmony in the hierarchical structure of one’s mental economy. Of course, the existence of this synchronization of levels is entirely compatible with the agent’s lacking alternative possibilities.

In further work Frankfurt has refined the analysis of the crucial notion of identification in light of various problems. Additionally, whereas the early papers were primarily addressed to issues pertaining to freedom, determinism, and moral responsibility, the later papers exhibit an evolution toward questions about the *true self*. In “Identification and Wholeheartedness,” Frankfurt concedes that mere formation of the relevant second-order volition is not sufficient for identification, and he provides a more refined analysis, including the important notion of *decisive commitment* or *decision*. In a later paper, “The Faintest Passion,” Frankfurt adds the component of *satisfaction* to the analysis of identification. The notion of identification is important both to the account of acting freely and the true self, and it is interesting to ask whether the same notion can play the required roles in both accounts.

Not only is a certain sort of inevitability (lack of alternative possibilities) compatible with moral responsibility, Frankfurt contends that certain *volitional necessi-*

*ties*—things we simply cannot bring ourselves to will—help to constitute the boundaries of our true selves. In a series of papers Frankfurt explores the way in which our selves are formed through the process of caring, identification, and volitional constraints. In “The Importance of What We Care About,” Frankfurt identifies *caring* as a distinctive kind of motivation importantly different from morality. He denies that all-things-considered rationality needs to coincide with the deliverances of morality. In later work Frankfurt has built on his work on caring to give a nuanced account of the nature of love. For Frankfurt, love is central to the foundations of morality as well as to the formation of our selves.

Central themes in Frankfurt’s work are as follows: the compatibility of moral responsibility, caring, and love with certain sorts of necessity or inevitability and the contention that morality, normativity, or rationality should not be *built into* our analyses of human motivation at the very foundational level. For Frankfurt, caring and love are more central or, perhaps, more fundamental notions than rationality and morality.

## FRANKLIN, BENJAMIN

(1706–1790)

Benjamin Franklin, the U.S. statesman, scientist, and author, was born in Boston, where he attended school for less than a year. He learned the printer's trade, and at seventeen he ran away to Philadelphia. After two years in England (1724–1726) he returned to Pennsylvania, where, prospering in his trade, he began publishing the *Pennsylvania Gazette* in 1729 and *Poor Richard's Almanack* in 1732. He had already formed a tradesman's self-improvement club, the Junto, and soon began civic and educational promotions, including the founding of the American Philosophical Society.

Franklin retired from business in 1748, turned to science, and in 1751 published *Experiments and Observations on Electricity*. The same year he entered the Pennsylvania Assembly, where he was a leader in opposing the influence of Proprietor Thomas Penn and in advocating colonial union. In 1757, as agent for the assembly, he went to England, where, except for eighteen months, he lived until 1775, enjoying English society and the friendship of David Hume, Henry Home (Lord Kames), Richard Price, and other British philosophers. At first he worked loyally for the expansion of the British Empire and sought to exchange proprietary for royal government in Pennsylvania, but after 1765 he became the leading colonial spokesman in resisting British measures in North America. Although he opposed every act of oppression, he sought until the very end to reconcile differences; but in 1775 he returned home, signed the Declaration of Independence, and worked for a united war effort. In 1776 he went to France, where he signed the French Alliance (1778), secured loans and supplies for the Revolutionary War, and helped negotiate the Treaty of Paris (1783).

He was lionized by Voltaire, Madame Helvétius, Marquis de Condorcet, La Rochefoucauld d'Enville, and other *philosophes*, and returned home in 1785. He served for three years as president of the Pennsylvania Executive Council, attended the Constitutional Convention of 1787, sought the abolition of slavery, and worked on his *Autobiography* in the five years preceding his death.

Franklin's greatest popular fame is as a moralist. The aphorisms of Poor Richard and the example of his *Autobiography* have served as a philosophy of life for millions. In these two works Franklin sought deliberately to set down the rules of conduct that would enable anyone, however humbly born, to prosper and live more meaningfully. The emphasis was unashamedly on the mundane

virtues: thrift, hard work, diligence, prudence, moderation, honesty, and shrewdness. For this, Franklin has been denounced by D. H. Lawrence and others as a "snuff-colored man" who impoverished life by "fencing it in" with a stifling, despiritualizing morality. In fact, Franklin knew the precepts of Poor Richard were but a partial philosophy; in his own career and in his other writings he showed abundantly how full and imaginative human life can be.

Like many deists of his day, Franklin believed "in one God, Creator of the Universe, that he governs it by his Providence ... [and] that the soul of Man is immortal" (letter to Ezra Stiles, March 9, 1790).

As a scientist, Franklin formulated important and influential laws concerning the nature of electricity. By proving that lightning is an electrical discharge, he placed electricity beside heat, light, and gravity as one of the primordial forces in the universe and hypothesized a new dimension or quality possessed in some measure by all matter. Characteristically, Franklin turned readily from electrical theory to a useful invention, the lightning rod. His scientific attitude is summarized in the statement "Let the experiment be made," and in the observation that electrical experiments would "help to make a vain man humble."

As a public philosopher, Franklin assumed that the traditional personal values have political relevance. He shared the Aristotelian belief that government exists for the sake of the good life and that its powers can be used to that end. A good citizen, guided by the virtues Franklin encouraged in *Poor Richard's Almanack* and in his *Autobiography*, would undertake civic improvement and participate disinterestedly in government. In an expanding country filled with opportunity, Franklin saw individual initiative as the essential engine of progress, but he did not hesitate to seek whatever seemed required for the public good through government. His confidence in the virtue of the citizens of the United States caused him to favor government by consent, but he was not a simple democrat who believed majority will should be omnipotent. He accepted democracy because he thought it would yield good government; if it did not, he readily rejected it.

Franklin thought freedom's dynamism would cause its spread around the world, and therefore that the United States, as a leading free nation, would be influential without being predatory. At the same time he understood the anarchic character of international relations and counseled the nation to maintain its strength, protect its national interest, and act to maintain a balance between France and Great Britain. His essential faith was that,

from tradesmen's juntos to the court of Versailles, good men working together could improve the condition of humankind.

## FREEDOM

In the history of philosophical and social thought “freedom” has a specific use as a moral and a social concept—to refer either to circumstances that arise in the relations of man to man or to specific conditions of social life. Even when so restricted, important differences of usage are possible, and most of the political or philosophical argument about the meaning or the nature of freedom is con-

cerned with the legitimacy or convenience of particular applications of the term.

### ABSENCE OF CONSTRAINT OR COERCION

It is best to start from a conception of freedom that has been central in the tradition of European individualism and liberalism. According to this conception, freedom refers primarily to a condition characterized by the absence of coercion or constraint imposed by another person; a man is said to be free to the extent that he can choose his own goals or course of conduct, can choose between alternatives available to him, and is not compelled to act as he would not himself choose to act, or prevented from acting as he would otherwise choose to act, by the will of another man, of the state, or of any other authority. Freedom in the sense of not being coerced or constrained by another is sometimes called negative freedom (or “freedom from”); it refers to an area of conduct within which each man chooses his own course and is protected from compulsion or restraint. J. S. Mill's essay *On Liberty* is perhaps the best-known expression in English of this individualistic and liberal conception of freedom.

Some writers take the view that the absence of coercion is the sufficient and necessary condition for defining freedom; so long as a man acts of his own volition and is not coerced in what he does, he is free. Other writers wish to widen the concept in one or both of two ways. They argue that natural conditions, and not only the will or the power of other men, impose obstructions and restraints on our capacity to choose between alternatives and that therefore the growth of knowledge or anything else that increases our capacity to employ natural conditions for the achievement of our purposes ipso facto enlarges our freedom. They also sometimes argue that whether or not it is the will of other men or natural obstacles that are considered as limiting or constraining our actions, we cannot truly be said to be free to choose some preferred alternative unless we have the means or the power to achieve it, and thus the absence of means or power to do *X* is equivalent to absence of freedom to do it. For those who take this view the necessary conditions for the existence of freedom would be (a) the absence of human coercion or restraint preventing one from choosing alternatives he would wish to choose; (b) the absence of natural conditions preventing one from achieving a chosen objective; (c) the possession of the means or the power to achieve the objective one chooses of one's own volition. Many of the assertions frequently made about liberty in

recent political thought assume that possession of the means or power to realize preferred objectives is part of what it means to be free. For example, the contention that men who suffer from poverty or have a low level of education cannot really be free, or that they cannot be as free as the well-to-do and the well educated, relies on the assumption that “to be free to do *X*” includes within its meaning “to be able,” “to have the means,” and “to have the power” to do *X*.

What are the objections to thus connecting “being free to” with “having the capacity or the power to”? It can be said that, at least in many cases, equating freedom with possession of power will involve a distortion of ordinary language. If I ask, “Am I free to walk into the Pentagon?” the question will be clearly understood; but if I ask, “Am I free to walk across the Atlantic Ocean?” the appropriate answer will be “You are free to, if you can.” This suggests the main argument: The linking of “being free to” with “having the capacity or power” deprives the word *free* of its essential and unequivocal function, which is to refer to a situation or state of affairs in which a man’s choice of how he acts is not deliberately forced or restrained by another man. As Bertrand de Jouvenel points out, if we say that to be free to achieve chosen ends requires the possession of the power and the social means necessary for their achievement, then the problem of freedom coincides with (or becomes confused with) the quite different problem of how satisfactions are to be maximized. It may be true to say that the poor man is as free to spend his holidays in Monte Carlo as the rich man is, and true also to say that he cannot afford to do so. These two statements, it is argued, refer to two distinct states of affairs, and nothing is gained by amalgamating them.

### MEANING OF “COERCION”

Even if we confine ourselves to saying that a man is free insofar as his action is not coerced by another, it is evident that the concept of coercion itself requires some consideration. An important point may be made by examining Bertrand Russell’s often-quoted sentence: “Freedom in general may be defined as the absence of obstacles to the realization of desires.” This hardly goes far enough. Let us imagine an authoritarian society in which rulers have for years been so successful in controlling and manipulating what members of the community read and what views they encounter, and in which the educators have been able so subtly and skillfully to mold the minds and dispositions of the very young, that almost all citizens naturally desire what their rulers desire them to desire, without its ever occurring to them that there are alternatives to what

they are accustomed to or that their freedom to choose has been in any way circumscribed. They are not conscious of any obstructions to the satisfaction of desire and, indeed, no obstructions may exist to the satisfaction of any desires they experience. This is a limiting case, but it points to conditions that exist more or less in all societies. We would scarcely concede that the members of such a society enjoyed any or much freedom. The society described may be one in which coercion in the usual sense does not occur and has in fact become unnecessary.

Two important points follow from this. First, if absence of coercion is a necessary condition of being free, coercion must be understood as including not only the direct forms—commands or prohibitions backed by sanctions or superior power—but also the many indirect forms—molding and manipulation or, more generally, forms of control that are indirect because they involve control by certain persons of the conditions that determine or affect the alternatives available to others. This is an important extension of the notion of coercion. Second, if liberty means the right of individual choice between alternatives, then this right in turn implies that the alternatives can be known by those who are to choose; that individuals have the opportunity to understand the character of available alternatives and can make a deliberate or informed choice. The freedom that members of a society enjoy will be connected, therefore, with the extent to which competing opinions, objectives, modes of behavior, ways of living, and so on are, so to speak, on display; on how freely they can be recommended, criticized and examined; and thus on the ease with which men can make a deliberate choice between them.

For this reason, since literacy or education enlarges the capacity or faculty of choice and decision, it is an important precondition of the existence of freedom: knowledge extends the capacity for acting freely. Similarly, not only suppression but also distortion and misrepresentation, any kind of dishonest propaganda that gains its effect from privileged control over sources of publicity, may restrict the freedom of others; insofar as it succeeds in concealing or misrepresenting the character of certain of the available alternatives, it will tend to restrict or manipulate the range of choice no less effectively than direct coercion or constraint may; and thus it will also tend to limit the exercise of freedom in a particular society. It is not sufficient to consider only the presence or absence of coercion in the more literal and direct sense. Freedom in its positive aspect is the activity or process of choosing for oneself and acting on one’s own

initiative, and choice can be manipulated as readily as it can be coerced.

Does it follow from this that the extent of freedom is related to the number of available alternatives, in that the more alternatives there are for choice, the freer a man is? Clearly there can be no simple or direct relationship between the range of available alternatives and the extent of freedom. However numerous the alternatives between which a man may choose, he will not admit himself to be free if the one alternative that he would most prefer is the one that is excluded. In a society that forbids the preaching of Catholic doctrine and the practice of Catholic forms of worship, Catholics will not concede that they are free just because they are still free to be either Anglicans, Methodists, or Buddhists. In certain circumstances the extent of the range of available alternatives may be relevant to a judgment of the extent of freedom; but in general we can talk profitably about both the existence and the extent of freedom in a particular society only by taking into account the individual and social interests, the capacities, the modes of behavior, and the ways of living on behalf of which freedom is claimed.

### KINDS OF FREEDOM

When men speak of their being free or claim freedom for themselves, they are referring not only to the absence of coercion and restraint imposed by others (*freedom from*) but also to that on behalf of which freedom is being claimed (what they are claiming freedom *for*). This is another sense in which we can speak about a positive aspect of freedom. In political and social discussion a claim to freedom is almost invariably (albeit usually implicitly) a claim to a particular liberty, a claim to freedom for or in the exercise of some particular interest or form of activity. Although Russell says that freedom is the absence of obstacles to the satisfaction of desire, probably no serious philosophical or social thinker has defended freedom in the sense of absence of obstacles to the satisfaction of *any* desire; what has been defended, and what freedom has been identified with, is the absence of obstacles to the exercise and satisfaction of specific interests and forms of activity that are accepted as possessing special moral and social significance.

Thus, freedom in the abstract is a class comprising many species—freedom of thought and speech, freedom of association, freedom of assembly, freedom of worship, freedom of movement, freedom in the use or disposal of one's property, freedom in the choice of one's employer or occupation, and so on. In every case there is, of course, a reference to the absence of coercion or interference and

to an area within which one can choose or act on one's own initiative; not to an abstract or indeterminate possibility of choosing but instead to a specific sphere of individual or social activity within which the right to make one's own choices and decisions, to follow one's own course, is regarded as being of particular importance in the moral life of the individual. This seems to be one way in which positive notions of freedom (as contrasted with the more abstract idea of bare immunity from coercion or interference by others) have emerged, namely, in the attempt to identify (and thus to identify with freedom) those specific spheres of human activity within which what Mill calls individuality, the right and capacity for individual choice and initiative, really matter.

Some of the particular freedoms that have been much emphasized in recent times (freedom from want and freedom from fear are important examples) seem at first sight to refer neither to the absence of coercion nor to any specific interest or form of activity for which freedom is being claimed. It might appear that what *is* being claimed is, rather, the institution of political and economic arrangements by means of which men may be made immune from feelings and circumstances that they find to be evil. If this is all that is meant, then this is to employ freedom in a sense different from the one we have been discussing; this is shown by the fact that freedom from want and fear could conceivably be attained by the setting up of political and social arrangements under which the amplitude of choice within important spheres of activity would be drastically restricted and under which there might be a considerable measure of coercion and constraint; in other words, freedom from want and freedom from fear might well be compatible with a very authoritarian regime, just as in contemporary China freedom from flies is said to have been achieved by very authoritarian methods. Thus, if "freedom from want" and "freedom from fear" are taken simply in that way, the freedom involved is logically and socially distinct from that which has so far been taken as being central and fundamental in the tradition of liberal thinking. However, this may be to interpret these two freedoms superficially. For a more sympathetic interpretation we must return to what has been said about manipulation.

### FREEDOM AND POWER

In modern societies manipulation in various forms is at least as important as the processes we normally identify as coercive. It is well known that, within a society, a group of men may enjoy such control over property or the means of production, or over an educational system or

the media of communication, that they are able to determine within a fairly narrow range the alternatives between which their fellow citizens can choose. It is not only true that less privileged men often lack the means or the power to attain their preferred alternative but also that others can exploit their lack of power in order to prevent them from attaining what they would wish to attain; sometimes the less powerful can even be prevented from knowing what alternatives there are and from knowing that some of them might be capable or worthy of being pursued. It is this argument that can justify notions like “freedom from want” or “freedom from economic insecurity” and that links them with what has been taken to be the central sense of freedom, the absence of constraint. Even though we refuse to conclude that the mere absence of the means or the power to attain a preferred alternative goal is equivalent to not being *free* to pursue it, it is a different situation when means and power are controlled and manipulated by others in order to secure compliance with their demands. Thus, if “want” and “insecurity” describe a condition in which there is unequal control over the means and conditions of choice and action, in consequence of which some men can manipulate the range of choice available to others, then freedom from want and insecurity belongs with freedom from coercion; in that case, freedom from want and insecurity is the condition of the ability to act on one’s own initiative, which is the positive side of liberty.

There is, then, this connection between freedom and power: When there is conflict between individuals and groups for possession or control of scarce means and conditions of action, control over means is a condition of the availability of alternatives, and hence of choice and freedom. It follows, therefore, that when men have unequal power, this will often mean that they will also be unequal with respect to the freedom they enjoy—not merely in the sense that the man who is better off has the means to choose more widely and live more abundantly than his poorer brother (although this is also true) but in the more relevant sense that the more powerful man can restrict the range of choice and the freedom of the less powerful in order to satisfy his own interests more fully. Obviously this relation between inequality of power and inequality of freedom provides one of the connections that exist between liberty and democracy. If we define democracy as being a form of political organization in which all adult members of the community share in making decisions about the common arrangements of the society (including those decisions about the use and distribution of the resources that affect the choices of acting available to men), then the right to participate in the

making of these decisions is a liberty that will affect (or at least may very substantially affect) the range and character of the alternatives that are available in very important areas of social and private life.

**POLITICAL PARTICIPATION.** Thus, we may say that political participation, or sharing in the process of government, will enter into the meaning of “liberty” in society in at least two different ways. First, political activity and participation in government is an interest and mode of activity to which many men attach great importance, and thus the existence of the right and opportunity to engage in this form of activity is one of the liberties that some men cherish highly. Second, it is in addition a liberty that forms part of a wider structure of liberties because the extent to which this liberty is accorded and exercised will usually also affect the extent to which liberty is available in other areas of social life. This is not to say, of course, that the more democratic a society is (the less men are restrained or restricted in their participation in the activity of government), the more freedom there will be in other areas of social life; it is possible for democracies to be exceptionally coercive, restrictive, or intolerant in certain areas of living and, apart from this, it is also true that expansion of particular liberties (or of liberty in particular areas) often entails the curtailment of others. The point is, rather, that political liberty in the sense specified forms part of a more complex system of liberties in any developed society; both logically and causally, political liberty is connected with the liberties that are established in other spheres of individual activity.

## FREEDOM AND CHOICE

We have seen that liberty has its negative and its positive sides—“negative” referring to the absence of obstructions, interference, coercion, or indirect control; “positive,” to the processes of choosing and acting on one’s own initiative, and more concretely and less formally to the general types of human interests or forms of activity for the expression and exercise of which liberty is claimed. Some writers, concentrating particularly on the positive aspect, have been inclined to assert that a man is being free only when he is actually choosing, exercising initiative, and acting deliberately or responsibly. Mill, in what he says in *On Liberty* about “individuality,” “individual spontaneity,” the “despotism of custom,” and related matters, comes very close to asserting this, although he never quite does so. The same kind of view is hinted at in Graham Wallas’s “Freedom is the capacity for continuous initiative,” but it would be difficult to accept

this as a general position. For the devotee of a religious faith, the religious freedom he claims and believes himself to enjoy may be no more than the freedom to practice unmolested a form of worship he has inherited and which he has never felt the faintest temptation to question; in such a case it is a fiction to speak of a process of choice. The same can be said of the man who is content to follow narrowly, uncritically, and unadventurously the established customs and conventions of his society. Even though there may be a sense in which we can intelligibly talk of such men as being slaves to customs, habits, or orthodoxies, it would still be straining the point to maintain that they are not free.

On the other hand, the man who has been so molded and manipulated that he always wants what his ruler or superior wants him to want is scarcely free. This case suggests that freedom will exist only where there exists the *possibility* of choice, and the possibility of choice in turn implies not only the absence of direct coercion and compulsion but also that the availability and the characteristics of alternatives must be capable of being known. Thus, whatever the situation of any particular individual may be, it is most likely that there will be a large measure of individual freedom within a society when there exists what Mill calls a variety of conditions—where a wide variety of beliefs are in fact expressed and where there is a considerable diversity of tastes and pursuits, customs and codes of conduct, ways and styles of living. And, because of the connection between inequality of power and inequality with respect to the enjoyment of freedom, a society in which power is widely distributed is also likely to be the one characterized by the existence of wide possibilities for choice and individual initiative.

## FREGE, GOTTLOB

(1848–1925)

### LIFE

After studying mathematics, physics, chemistry, and philosophy at the universities of Jena and Göttingen, the German mathematician, logician, and philosopher Gottlob Frege obtained his mathematical doctorate in Göttingen (1873) and his mathematical *habilitation* in Jena (1874). From 1874 to 1879 he taught mathematics at the University of Jena as a lecturer; in 1879 he was promoted to adjunct professor, and in 1896 to associate professor. Frege never obtained a full professorship. He retired from teaching in 1917 because of illness, becoming emeritus in 1918.

While he received little professional recognition during his lifetime, Frege is widely regarded in the early twenty-first century as the greatest logician since Aristotle, one of the most profound philosophers of mathematics of all times, and a principal progenitor of analytic philosophy. His writing exhibits a level of rigor and precision that was not reached by other logicians until well after Frege's death.

### MAIN WORKS

In the monograph *Begriffsschrift* (1879) Frege introduces his most powerful technical invention, nowadays known as predicate logic. In his second book, *Die Grundlagen der Arithmetik* (1884), he discusses the philosophical foundations of the notion of number and provides an informal

argument to the effect that arithmetic is a part of logic (a thesis later known under the epithet *logicism*). The pamphlet *Funktion und Begriff* (1891) is an elucidation of Frege's fundamental ontological distinction between functions (with concepts as a special case) and objects; certain difficulties with the views expressed therein are discussed in the essay "Über Begriff und Gegenstand" (1892). Frege's most celebrated achievement in the philosophy of language, the distinction between the sense and the reference of an expression, is expounded in his landmark essay "Über Sinn und Bedeutung" (1892). *Grundgesetze der Arithmetik* (volume 1, 1893; volume 2, 1903), his magnum opus, constitutes his abortive (because of Bertrand Arthur William Russell's antinomy) attempt at rigorously proving the logicist thesis. The essay "Der Gedanke: Eine logische Untersuchung" (1918) is a conceptual investigation of truth and that with respect to which the question of truth arises (called thoughts by Frege).

## FREGE'S LOGIC

By replacing the traditional subject-predicate analysis of judgments with the function-argument paradigm of mathematics and inventing the powerful quantifier-variable mechanism, Frege was able to overcome the limitations of Aristotelian syllogistics and created the first system of (higher-order) predicate logic. He thereby devised a formal logical language adequate for the formalization of mathematical propositions, especially through the possibility of expressing multiply general statements such as "for every prime number, there is a greater one."

The first presentation of his *begriffsschrift* (concept script—Frege's logical formula language) is contained in the 1879 monograph by the same name. At this time, the linguistic and philosophical underpinnings of *begriffsschrift*, as well as the description of the language itself, are still somewhat imprecise. There are, for instance, no formation rules given for the formulas of the language; functions seem to be identified with functional expressions; the meanings of the propositional connectives are specified in terms of assertion and denial rather than truth and falsity; and although Frege officially countenances only one inference rule, namely, *modus ponens*, he tacitly uses an instantiation rule for the universal quantifier as well. The first volume of *Grundgesetze*, however, presents a mature and amazingly rigorous version of the system, taking into account the various insights Frege had developed since the publication of *Begriffsschrift*. Unless otherwise noted, the following discussion pertains to this later

system; for the time being, one should ignore the course-of-values operator, which is discussed later on in connection with Russell's antinomy.

The primitive symbols of Frege's *begriffsschrift* are then those for equality, negation, the material conditional, and the first- and higher-order universal quantifiers. In addition, there are gothic letters serving as bound variables (of first and higher orders), as well as Latin letters, whose role one would today characterize as that of free variables (again, of various orders). Disjunction, conjunction, and the existential quantifier are neither primitive, nor are they introduced as abbreviations, as would be customary today; rather, Frege notes that they can be simulated by means of the existing primitives.

Frege carefully distinguishes between basic laws (axioms) on the one hand, and inference rules on the other hand. With respect to a specified set of basic laws and rules of inference, he comes close to a rigorous definition of derivations in the predicate calculus.

The logical connectives, as well as the quantifiers, are taken to be denoting expressions, having as references the requisite truth functions and higher-order functions, respectively. Equality undergoes a radical change in interpretation between the time of *Begriffsschrift* and that of *Grundgesetze*. In the earlier system, assuming that the expression *A* refers to the object *a*, and the expression *B* to object *b*, Frege construes identities of the form  $A = B$  metalinguistically, taking them to mean that the expressions *A* and *B* are coreferential, rather than that *a* and *b* are the same object. In *Grundgesetze*, however, identity is conceived of as a binary relation between objects, much as is standard today (this change in interpretation is, incidentally, accompanied by a switch in notation from the triple bar  $\equiv$  to the now customary double bar  $=$ ). Arguably, there is an analogous shift in the understanding of the universal quantifier; the formulations in *Begriffsschrift* suggest that it is to be interpreted substitutionally, whereas it is fairly clear in *Grundgesetze* that an objectual interpretation is intended. But the issue is difficult to judge, not only because the language of the earlier work is rather imprecise but also because it is not clear whether Frege was aware of the significance of the distinction between objectual and substitutional quantification.

Frege's perhaps most impressive achievement in pure logic is his celebrated definition (with the proof of its adequacy) of the ancestral (or transitive closure)  $R^*$  of a binary relation *R* with the help of second-order quantification, already contained in *Begriffsschrift* and central to the logicist enterprise. Informally, an object *a* bears the ancestral  $R^*$  of a relation *R* to an object *b* if *b* can be

reached from  $a$  in a finite (nonzero) number of  $R$ -steps. That is, whenever there are objects  $a_1, a_2, \dots, a_n$  ( $n > 1$ ) such that  $a_1Ra_2, a_2Ra_3, \dots, a_{n-1}Ra_n$ , then  $a_1$  bears  $R^*$  to  $a_n$ . For example, if  $R$  is the parenting relation (so that  $xRy$  holds if and only if  $x$  is a parent of  $y$ ), then  $R^*$  is the ancestor relation (i.e.,  $xR^*y$  holds if and only if  $x$  is an ancestor of  $y$ ), because  $x$  is an ancestor of  $y$  if  $y$  is a child of  $x$ , or a child of a child of  $x$ , or a child of a child of a child of  $x$ , and so on. Frege's idea is to define  $R^*$  from  $R$  as follows:  $a$  stands in the relation  $R^*$  to  $b$  if and only if  $b$  has every property  $F$  such that (1) all objects to which  $a$  bears  $R$  have  $F$ , and (2)  $F$  is hereditary with respect to the relation  $R$  (meaning that, whenever something  $x$  has the property  $F$ , and  $x$  bears  $R$  to some  $y$ , then  $y$  also has  $F$ ). Note that this definition employs second-order quantification (over all  $R$ -hereditary properties  $F$ ).

It is clear that, if  $b$  can be reached from  $a$  in a finite nonzero number of  $R$ -steps, then Frege's definition correctly implies that  $aR^*b$ , for if  $F$  is any property and  $b$  can be reached from  $a$  in one step, then by clause (1) of the definition  $b$  must have  $F$ , and if  $b$  can be reached from  $a$  by some number of  $R$ -steps greater than 1, one must have passed through an object to which  $a$  bears  $R$ , and which thus has  $F$  by clause (1), and every further object through which one has passed, including the last object  $b$ , must have  $F$  by clause (2). On the contrary, if  $b$  cannot be reached from  $a$  in a finite nonzero number of  $R$ -steps, then  $b$  lacks just that property of being reachable from  $a$  in a finite number of  $R$ -steps (a property that fulfills conditions [1] and [2]). In modern notation Frege's formal definition is as follows:

$$aR^*b : \leftrightarrow \forall F((\forall x(aRx \rightarrow Fx) \ \& \ \forall x\forall y(Fx \ \& \ xRy \rightarrow Fy) \rightarrow Fb).$$

It should be noted, finally, that Frege did not regard the sentences of his *Begriffsschrift* as mere forms, open to arbitrary interpretation. Rather, he took them to express definite thoughts (i.e., propositions). This is manifest in the presence of a special symbol, the vertical judgment stroke, whose occurrence before a *Begriffsschrift* formula indicates that the formula's content is actually asserted (and not talked about or simply entertained without judgment as to truth and falsity). While Frege did discuss the formal character of logic in terms of preservation of consequence on substituting nonlogical expressions for others (witness his correspondence with David Hilbert and the 1906 essay series "Über die Grundlagen der Geometrie"), he showed little inclination to pursue such investigations himself. Frege also has little to say about the characterization of propositions as logical truths; there is no indication that he had anything like Alfred

Tarski's model-theoretic criterion in mind. He occasionally remarks that logical axioms are required to be "obvious," but generally takes it for granted that the specific basic laws he lays down are in fact logical truths.

## FREGE'S ONTOLOGY AND PHILOSOPHY OF LANGUAGE

Frege's mature ontology is characterized by the fundamental dichotomy between saturated entities or objects (*Gegenstände*) on the one hand, and unsaturated entities or functions on the other hand. Functions are unsaturated or incomplete in the sense that they carry argument places that need to be filled; an object is anything that is not a function. Concepts are special functions, namely, functions whose values are always one of the two truth-values: the True and the False (which Frege takes to be objects, as will be explained). The realm of functions is stratified: Unary functions mapping objects to objects are first level, unary functions mapping first-level functions to objects are second level (an instance being the concept denoted by the first-level existential quantifier, which maps every first-level concept under which some object falls to the True, and all other first-level concepts to the False), and so on. The stratification becomes more complicated with functions of more than one argument, since there exist, for instance, functions of two arguments with one argument place for unary first-level functions and one argument place for objects (an instance being the application function, which maps a unary first-level function  $f$  and an object  $a$  to the result  $f(a)$  of applying  $f$  to  $a$ ), and so on.

The saturated-unsaturated dichotomy has, for Frege, a parallel in the linguistic realm. Singular terms, such as proper names and definite descriptions, are (linguistically) saturated (or complete) and refer to objects; predicate and functional expressions are incomplete and refer to functions. In determining the ontological status of certain entities Frege often proceeds by analyzing the expressions used to refer to them and takes the saturated or unsaturated nature of the expressions as a reliable guide to their ontological saturation status.

Now since the expression "the concept *horse*" is grammatically a singular term, Frege takes it to refer to an object, which commits him to the paradoxical claim that the concept *horse* is not a concept (compare to "Über Begriff und Gegenstand"). In an attempt to resolve this predicament Frege proposes that with every concept  $F$  is associated a certain (proxy) object that serves as the referent of "the concept  $F$ " (some commentators believe that Frege intended the extension of  $F$  to be this proxy object,

but the interpretive issue remains contentious). There remains a fundamental problem, however, for on the one hand, objects and concepts belong to distinct ontological categories, so that no predicate can be meaningfully applied to both a concept and an object; but on the other hand, Frege's explanation of this categorial distinction requires him to use the predicates "is an object" and "is a concept" in just this way—as contrasting (nonempty) predicates that can be applied to the same items. This creates some famous difficulties, some of which are discussed in the essay "Über Begriff und Gegenstand," because singular terms such as "the concept *horse*" cannot, according to Frege, refer to concepts, but refer to certain (proxy) objects instead.

Frege's most famous invention is perhaps his distinction between the sense (*Sinn*) and the reference (*Bedeutung*) of a linguistic expression, first introduced in his short 1891 booklet *Funktion und Begriff*, and expounded in detail in the 1892 essay "Über Sinn und Bedeutung." In the case of a singular term its reference is the object denoted by the term, whereas its sense is determined by the way that object is presented through the expression (its mode of presentation). Frege conceives of complete (declarative) sentences, perhaps infelicitously, as peculiar singular terms, so that their references, the special logical objects the True and the False, respectively, are objects. The thought expressed by a sentence is then defined by Frege to be the sentence's sense. The sense of a sentence is thus the mode of presentation of its truth-value; that is, on a natural reading, the sentence's truth-conditions. In the case of incomplete expressions, such as predicates and functional expressions, the references are of course the corresponding unsaturated concepts and functions.

While not explicitly discussed in "Über Sinn und Bedeutung," it becomes clear from the Frege-Husserl correspondence that Frege intended the notion of sense to apply to predicates as well. Scholarly discussion continues whether Frege considered the senses of unsaturated expressions to be functions, or whether he regarded all senses as objects (a stance suggested by the fact that every sense can be referred to by means of a singular nominal phrase of the form "the sense of the expression X"). In the essay "Der Gedanke" Frege expounds a Platonistic view of senses as inhabitants of a "third realm" of nonperceptible, objective entities, as opposed to the (perceptible) objects of the external world and the subjective contents (ideas) of humans' minds.

Frege was motivated to introduce the sense-reference distinction to solve certain puzzles, chief among them (1) the apparent impossibility of informative identity state-

ments and (2) the apparent failure of substitutivity in contexts of propositional attitudes. As for (1), Frege argued that the statements "the morning star is the evening star" and "the morning star is the morning star" obviously differ in cognitive value (*Erkenntniswert*), which would be impossible if the object designated constituted the only meaning of a singular term. The sense-reference distinction allows one to attribute different cognitive values to these identity statements if the senses of the terms flanking the identity sign differ, while still allowing the objects denoted to be one and the same.

Regarding (2), Frege noticed that the sentences "John believes that the morning star is a body illuminated by the sun" and "John believes that the evening star is a body illuminated by the sun" may have different truth-values, although the one is obtained from the other by substitution of a coreferential term. He argued that, in contexts of propositional attitudes, expressions do not have their usual reference, but refer to their ordinary senses (which thus become their indirect references); then since "the morning star" and "the evening star" differ in ordinary sense, they are not, in the context at hand, coreferential, having distinct indirect references. Debate continues as to Frege's intentions concerning indirect senses of expressions, in particular whether iterated propositional attitude contexts give rise to an infinite hierarchy of indirect senses.

In the introduction to *Grundlagen* Frege enunciates "three fundamental principles" for his investigations. The first of these is an admonition to separate the logical from the psychological (a motif that runs through all of Frege's works); the third demands observance of the concept-object distinction. But it is the second of these principles that has drawn most attention and interpretation: "never to ask for the meaning of a word in isolation, but only in the context of a proposition." Other (not obviously equivalent) formulations of the principle occur in sections 60, 62, and 106 of *Grundlagen*; some authors take Frege to express a precursor of this principle in section 9 of *Begriffsschrift*, and some see an echo of it in *Grundgesetze*, volume 1, section 29.

The proper interpretation of the context principle continues to be contentious. While some philosophers regard it as being of the utmost importance to an understanding of Frege's philosophy, others view it as a rather ill-conceived and incoherent doctrine that he appears to have given up in later works. Those who take the context principle seriously mostly take it to claim some sort of epistemological priority of sentences (or perhaps the thoughts expressed by such) over subsentential linguistic

items (or perhaps their senses). It is easy to see why one might have misgivings about such an interpretation; after all, it at least appears to conflict with another Fregean principle, namely, that of compositionality (according to which the sense/reference of a compound expression is determined by the senses/references of its constituent expressions), which he held in high regard throughout his life.

## FREGE'S PHILOSOPHY OF MATHEMATICS

Frege was, first and foremost, a philosopher of mathematics. While he followed Immanuel Kant in taking the truths of (Euclidean) geometry to be synthetic and knowable *a priori* (forcefully defending this view against Hilbert's axiomatic method in geometry), he vigorously argued, against Kant, for the logicist thesis, that is, the claim that the arithmetic truths, presumably including real and complex analysis, are analytic. In comparing Frege's views with Kant's it is however important to keep in mind that Frege was operating with his own technical definitions of analyticity and syntheticity, which are not obviously equivalent to Kant's: According to Frege (*Grundlagen* §3), a mathematical truth is analytic if it is derivable by means of logical inference rules from the general logical laws (and definitions) alone, whereas it is synthetic if it cannot be proved without recourse to truths belonging to a particular area of knowledge. Thus, analyticity and syntheticity are, for Frege, logico-epistemic notions, while Kant took them to be part semantic (analytic judgments are those whose predicate is contained in the subject, they are true by virtue of the meanings of their terms) and part epistemic (synthetic judgments extend one's knowledge, analytic ones do not).

In the preface to *Begriffsschrift* Frege makes it clear that it was the question of the epistemic status of arithmetic truths that prompted him to develop his new logic. At this time, Frege still avoids outright endorsement of the logicist thesis, stating only that he intends to investigate how far one may get in arithmetic with logical inferences alone. But there can be little doubt that he already envisages a definite path along which the ultimate proof of logicism is to proceed. Thus, he notes in part 3 of this work that mathematical induction rests on the *Begriffsschrift* theorem that, if an object  $x$  bears the transitive closure  $R^*$  of a binary relation  $R$  to an object  $y$ , and if  $x$  has a property  $F$  that is inherited along  $R$ , then  $y$  has  $F$  as well. It therefore seems clear that Frege already understood the possibility of logically proving the mathematical induction principle once the number 0 and the successor rela-

tion among natural numbers had been suitably defined, for the natural numbers could then be given as just those objects following 0 in the transitive closure of the successor relation.

By the time of *Grundlagen* the doctrine of logicism is firmly in place. Having vigorously criticized a selection of philosophical views about the notion of number (notably John Stuart Mill's empiricist and Kant's transcendentalist views), Frege, in the second part of that work, provides an informal, yet rigorous outline of how the reduction of arithmetic to logic may actually be carried out. He begins this endeavor by insisting that (1) ascriptions of number involve assertions about concepts and (2) the numbers themselves must be construed as objects. Frege argues for (1) by noting first that certain statements, like universal categoricals such as "all whales are mammals" and existential statements such as "there are books on the shelf," predicate something of concepts (rather than individuals). The first example statement is clearly not about any individual whale, but says of the concept *whale* that it is subsumed under the concept *mammal*; the second example predicates nonemptiness of the concept *book on the shelf*. The point is even clearer with respect to negated existential statements; "there are no Venus moons" is obviously not about any moon of Venus (if the statement is true, there are none), but denies that something falls under the concept *Venus moon*. Indeed, Frege notes, saying that there are no Venus moons amounts to the same thing as ascribing the number zero to the concept *Venus moon*. And just as in these examples, the numerical statement "there are four books on the shelf" clearly does not predicate anything of any particular book; instead, it, too, is a statement about the concept *book on the shelf*.

The thesis that ascriptions of number are best understood, in analogy with these examples, as assertions about concepts, is further bolstered by the observation that everyday numerical statements invariably involve common nouns or predicates, which, according to Frege, refer to concepts. Moreover, faced with the fact that one may with equal justice say "there is one deck of cards on the table," "there are fifty-two cards on the table," and "there are four suits of cards on the table," one is led to the recognition that there are different standards of unit involved in these assertions, and it seems perfectly natural to identify the respective concepts as these standards of unit. Thesis (2) is a consequence of Frege's view that the ontological category of an entity may be read off reliably from the linguistic category of expression that denotes the entity: According to Frege number terms typically appear as singular terms in natural languages, for

example, as “the number of cards on the table” or “the number four.” Furthermore, pure arithmetic number terms typically flank the equality symbol, positions that, in Frege’s view, are reserved for singular terms. Hence, Frege concludes, numbers must be objects.

Thus on the one hand, numbers, qua properties of concepts, would seem to be (higher-order) concepts; yet on the other hand, they must be construed as objects. Frege solves this apparent difficulty by suggesting that attributive uses of number words, as in “Jupiter has four moons,” can always be paraphrased away, as in “the number of moons of Jupiter is four” (or, even more explicitly, “the number belonging to the concept *moon of Jupiter* is four”). In the latter statement, Frege claims, the *is* must denote identity and cannot function merely as a copula, since *four* is a singular term, and singular terms cannot follow the *is* of predication. The paradigmatic ascription of number then has the form “the number belonging to  $F = x$ ,” where  $F$  represents a predicate and  $x$  a singular term. Thus, the number term only forms part of the (higher-order) property ascribed to the concept, so that the objectual nature of number and the attributive character of ascriptions of number are compatible after all.

Frege next identifies a constraint that his reconstruction of arithmetic will have to abide by. Of fundamental importance for arithmetic are judgments of recognition, that is, identities, and so the definitions of the number-theoretic notions required for a proof of the logicist thesis must ensure that, in particular, identities of the form “the number belonging to  $F =$  the number belonging to  $G$ ” receive the proper truth conditions. For this special type of identity statement, the truth conditions can readily be formulated in (dyadic second-order) logical terms, namely, the number belonging to  $F$  is the same as the number belonging to  $G$  if and only if there exists a binary relation  $R$  that correlates the objects that are  $F$  one-one and onto with the objects that are  $G$ . Since Frege quotes a somewhat obscure passage from David Hume at this point in *Grundlagen*, the principle has, perhaps infelicitously, come to be known as Hume’s principle (HP).

Frege rejects HP as a definition of “the number belonging to  $F$ ” on the grounds that it fails to specify truth conditions for contexts of the form “the number belonging to  $F = x$ ,” where  $x$  is a term that does not have the form “the number belonging to  $G$ ,” for example, when  $x$  is an individual variable. (This objection is now usually referred to as the Caesar problem—somewhat inaccurately, as Frege uses Julius Caesar as an example in arguing against a slightly different proposal for a definition). Some commentators maintain that Frege’s only point in

bringing up this objection is to show how HP is inadequate as a definition of *number* as described earlier. Other commentators see Frege as struggling here to arrive at adequacy conditions for the introduction of new sortal concepts into a language. On such a reading, however, it is difficult to see why Frege was not troubled by the obvious analogous problem arising for extensions of concepts in the *Grundgesetze*.

In any case Frege proposes an explicit definition of “the number belonging to  $F$ ” that in effect amounts to taking this number to be the equivalence class of  $F$  under the equivalence relation of equinumerosity (which is explained in terms of the existence of a one-one and onto correlation): the number belonging to  $F$ , Frege stipulates, is the extension of the concept “concept equinumerous with  $F$ .” Frege relies on a naive understanding of the notion of extension (later, in *Grundgesetze*, extensions themselves would be governed by an axiom that was to prove fatal for Frege’s project). Frege then defines an object  $a$  to be a (cardinal) number if there exists a concept  $F$  such that  $a$  is the number belonging to  $F$ .

From the explicit definition of the number belonging to a concept, Frege proceeds to show that HP becomes derivable by means of pure logic and defines 0 as the number belonging to the concept “is an object not identical with itself” and 1 as the number belonging to the concept “is an object identical with 0.” The successor relation among cardinal numbers is defined as follows:  $n$  succeeds  $m$  if  $n$  is the number belonging to some concept  $F$  under which some object  $a$  falls, and  $m$  is the number belonging to the concept “is an object falling under  $F$ , but not identical to  $a$ .” Without proof Frege mentions the theorems that every number has at most one successor and one predecessor, and that every number except 0 succeeds some number. Making use of his definition of the ancestral (transitive closure) of a binary relation (as developed in *Begriffsschrift*), he defines the finite or natural numbers as those objects standing to 0 in the transitive reflexive closure of the successor relation, that is, informally, as those numbers than can be reached from 0 by taking successors finitely many times. Frege observes that this definition allows for a rather straightforward proof of the mathematical induction principle for natural numbers.

At this point, he has effectively recovered all the axioms of (second-order) Peano arithmetic from his definitions, except the one requiring every natural number to have a successor. Frege sketches a proof for this remaining axiom, which ultimately consists in showing by means of induction that, for any natural number  $n$ , the number belonging to the concept “object to which  $n$  bears

the transitive reflexive closure of the successor relation” (i.e., informally, “natural number being less than or equal to  $n$ ”) succeeds  $n$  (a fully detailed proof is carried out in *Grundgesetze*, although it is not entirely clear whether this is the same proof Frege intended in *Grundlagen*).

While the exposition of *Grundlagen* is entirely informal, *Grundgesetze*, which Frege hoped to be the final word on the logical nature of arithmetic, carries out the earlier sketch with full rigor, containing pages and pages of formal deductions in begriffsschrift notation. The crucial element added in *Grundgesetze* is the rigorous treatment of extensions of concepts (more precisely, of courses-of-values of functions, of which concept extensions are a special case). These are governed by Frege’s basic law V, whose special case for concepts says that the extensions of concepts F and G coincide if and only if the same objects fall under F as fall under G. The use of extensions allows for the technique of type-lowering: First-level concepts can be simulated by their extensions, second-level concepts H can be simulated by the first-level concepts under which fall precisely the extensions of concepts falling under H, and so on. Frege makes extensive use of this technique; in particular, instead of defining the number belonging to F as the extension of the second-level concept “concept equinumerous with F” he is now able to take numbers to be extensions of first-level concepts. Otherwise, he follows the sketch of *Grundlagen* closely.

As Russell pointed out in a letter to Frege in 1902, the theory expounded in *Grundgesetze* is inconsistent, since it allows for the derivation of Russell’s antinomy: Letting R be the first-level concept “ $x$  is the extension of some concept under which  $x$  does not fall,” and  $r$  its extension, it follows easily from Frege’s rules of inference, together with basic law V, that  $r$  both does and does not fall under R. Frege immediately realized that the antinomy threatened to undermine his life’s work. While the second volume of *Grundgesetze* was in press, he hastily devised a quick fix that has come to be known as Frege’s way out and added an appendix to the book, expressing both confidence that the revised system would prove capable of reconstructing arithmetic and worries about the philosophical underpinning of his revised basic law V. Frege’s way out proved not to be a way out, since it was inconsistent with the existence of more than one object. The genesis of the antinomy in Frege’s system is by now well understood; it arises through interplay of two principles that are individually consistent, namely, basic law V as mentioned earlier and *impredicative* second-order comprehension (roughly, statements to the effect that there

exists a concept with a certain property, where that property is itself specified with the help of quantification over concepts); Frege’s system with basic law V but only predicative instances of comprehension is now known to be consistent, but too weak to allow for a reconstruction of substantial mathematics.

Frege’s work on the logical foundation of real analysis remained fragmentary; the second volume of *Grundgesetze* contains only preliminary definitions and theorems. Presumably he had planned a third volume, which, however, never appeared. Toward the end of his life, Frege seems to have abandoned logicism altogether, suggesting that arithmetic was instead based entirely on geometry, and hence synthetic, as Kant had held. His ideas on how such a claim might be proved were, however, never worked out.

### NEO-FREGEANISM

Frege himself, and generations of philosophers and logicians after him, considered the mathematical content of *Grundlagen* and *Grundgesetze* largely obsolete because of the inconsistency of Frege’s theory of extensions of concepts. In the 1980s, however, it began to be recognized that Frege had indeed hit on an exciting fact: If one takes the framework of Frege’s theory to be essentially second-order predicate logic and adopts HP (with a primitive operator “the number belonging to,” attaching to concept expressions) as an axiom, all of second-order Peano arithmetic becomes derivable, using the exact definitions and proofs employed by Frege (who used the explicit definition of “the number of F” only to prove HP from it, obtaining all further results directly from HP). This fact has become known as Frege’s theorem. Importantly, it was soon observed that Frege arithmetic (i.e., full axiomatic second-order logic plus HP) is consistent, in contradistinction to the system of *Grundgesetze* (indeed, consistent relative to second-order Peano arithmetic).

It is still being debated whether, and to what extent, these discoveries have any bearing on the validity of the logicist thesis (restricted to arithmetic proper). While no one has seriously suggested that HP could be regarded as a principle of logic, some argue that it nevertheless enjoys some privileged epistemological status akin to analyticity, the principle being, in some sense, “analytic of” number. There are, however, serious difficulties in defending Frege arithmetic as being analytic. To start with, there is the familiar problem about the status of second-order logic itself, quite independently of HP. But even granting that second-order logic may count as logic in the requisite sense, further objections apply to HP. First, the principle

is not ontologically innocent, since it requires the first-order domain to be infinite, which is usually taken to be incompatible with analyticity. Second, any attempt to ground a privileged logical status of HP on its logical form (of an abstraction principle) runs afoul of the “bad company objection”: There are abstraction principles of the same general logical form as HP that are inconsistent (such as Frege’s basic law V). What is more, there are abstraction principles (like Boolos’s parity principle) that hold only in finite domains, which makes them incompatible with HP, and hence it cannot be the logical form of an abstraction principle alone that could make HP analytic. Research on abstraction principles has increased significantly as a consequence of this discussion, as has work on the general logical and mathematical features of Frege’s systems.

### FREGE’S INFLUENCE

Through his publications, as well as through personal correspondence, Frege exerted a profound influence on Russell, who appears to have been the first major thinker to appreciate Frege’s achievements in logic. Russell took over the logicist torch from Frege, and although Alfred North Whitehead and Russell’s *Principia Mathematica* differs in many ways from Frege’s work (it is much wider in scope, considerably less rigorous, and, in view of Russell’s antinomy, takes a different approach to classes), it is clearly also heavily influenced by Frege (e.g., in imposing a structure of levels, or types, on the underlying ontology, and in the definition of number, nowadays often referred to as the Frege-Russell definition of cardinal number). It is known that Russell had read “Über Sinn und Bedeutung” and at least parts of *Grundgesetze* when he developed his celebrated theory of descriptions; and while there is no direct evidence for such a claim, it seems plausible to assume that Frege’s discussion of definite descriptions in these works (especially the fully worked out formal theory of *Grundgesetze*) provided a helpful foil for Russell’s own theory.

The degree to which Frege influenced Edmund Husserl is a more contentious matter. It is known that Husserl read all of Frege’s major works and that the two corresponded extensively (except in the aftermath of Frege’s rather hostile review [1894] of Husserl’s *Philosophie der Arithmetik* [1891]). It seems fair to say that Frege (in particular, through the aforementioned review, as well as the preface to the first volume of *Grundgesetze*) is at least partly responsible for Husserl’s antipsychologistic turn.

While Frege met neither Russell nor Husserl in person, he did have personal interactions with both Rudolf Carnap and Ludwig Josef Johann Wittgenstein. As a student, Carnap enrolled in various classes on *begriffsschrift* taught by Frege in Jena between 1910 and 1914; surely it was Frege who instilled in Carnap the idea that mathematics was reducible to logic, a view that was to become central to the Vienna Circle’s philosophy. More generally, Frege shaped Carnap’s whole attitude toward philosophy. After his immigration to the United States, Carnap, with Alonzo Church, was instrumental in keeping Fregean ideas in logic alive in the United States (where they came to flourish, for instance, in the work in semantics of David Kaplan and Richard Montague). Wittgenstein first visited Frege in Jena in 1911, and then at least two more times, in 1912 and 1913, while he was Russell’s student in Cambridge. In addition, the two corresponded rather extensively from 1911 to 1920; it is clear from this correspondence that Frege and Wittgenstein thought highly of each other (the end of the correspondence is marked by an exchange of rather critical remarks by Frege on the *Tractatus* and by Wittgenstein on “Der Gedanke”). Fregean themes pervade the work of both the early and the late Wittgenstein, and it appears that Wittgenstein’s intellectual respect for Frege never subsided.

In spite of this illustrious group of correspondents, Frege was for many years regarded as a somewhat obscure and ultimately failed predecessor of Russell’s, possibly because few philosophers fully acknowledged Frege’s influence on them (of course, the extent of this influence may not have been clear to them at the time). In the 1930s Heinrich Scholz and his school in Münster, Germany, rediscovered Frege and began work on an edition of his works, but that never materialized. The situation changed somewhat in the wake of John Langshaw Austin’s English translation of the *Grundlagen*, which appeared in 1950; Frege was read, at that time, mainly as a philosopher of language, and as such influenced, among others, the British philosopher Peter Geach. The originality and independence of Frege’s work (especially from Russell’s), as well as his important role as a progenitor of analytic philosophy, was brought to prominence through the writings of Michael Dummett in the 1970s, who was himself heavily influenced by Frege’s methodology and interests. In the United States, besides those mentioned earlier, Donald Davidson’s work also revived discussion of Fregean themes. Crispin Wright’s neologicism, especially as subsequently articulated and criticized by George S. Boolos and others, caused a veritable renaissance of interest in Frege’s logical and mathematical work, beginning in the 1980s and continuing to this day.

### WORKS BY FREGE

*Ueber eine geometrische Darstellung der imaginären Gebilde in der Ebene. Inaugural-Dissertation der philosophischen Facultät zu Göttingen zur Erlangung der Doctorwürde vorgelegt von G. Frege aus Wismar*. Jena: A. Neuenhahn, 1873. Reprinted in *KS*, tr. as "On a Geometrical Representation of Imaginary Forms in the Plane," in *CP*, pp. 1–55.

*Rechnungsmethoden, die sich auf eine Erweiterung des Größenbegriffes gründen. Dissertation zur Erlangung der Venia Docendi bei der Philosophischen Facultät in Jena von Dr. Gottlob Frege* (1874). Reprinted in *KS*, tr. as "Methods of Calculation based on an Extension of the Concept of Quantity [Magnitude]," in *CP*, pp. 56–92.

Review of H. Seeger, *Die Elemente der Arithmetik, für den Schulunterricht bearbeitet*. *Jenaer Literaturzeitung* 1 (46) (1874): 722. Reprinted in *KS*, tr. as "Review of H. Seeger, *Die Elemente der Arithmetik*," in *CP*, pp. 93–94.

Review of A. v. Gall and Ed. Winter, *die analytische Geometrie des Punktes und der Geraden und ihre Anwendung auf Aufgaben*. *Jenaer Literaturzeitung* 4 (9) (1877): 133–134. Reprinted in *KS*, tr. as "Review of A. von Gall and E. Winter, *Die analytische Geometrie des Punktes und der Geraden und ihre Anwendung auf Aufgaben*," in *CP*, pp. 95–97.

Review of J. Thomae, *Sammlung von Formeln welche bei Anwendung der elliptischen und Rosenhain'schen Funktionen gebraucht werden*. *Jenaer Literaturzeitung* 4 (30) (1877): 472. Reprinted in *KS*, tr. as "Review of J. Thomae, *Sammlung von Formeln, welche bei Anwendung der elliptischen und Rosenhainschen Funktionen gebraucht werden*," in *CP*, p. 98.

"Über eine Weise, die Gestalt eines Dreiecks als complexe Größe aufzufassen," *Jenaische Zeitschrift für Naturwissenschaft* 12 (1878) Supplement, p. XVIII. Reprinted in *KS*, tr. as "Lecture on a Way of Conceiving the Shape of a Triangle as a Complex Quantity," in *CP*, pp. 99–100.

*Begriffsschrift, eine der arithmetischen nachgebildete Formelsprache des reinen Denkens*. Halle: L. Nebert, 1879. Reprinted in *Conceptual Notation and Related Articles*, tr. and ed. by T. W. Bynum (OUP, 1972), pp. 101–203. Also in *From Frege to Gödel: A Source Book in Mathematical Logic, 1879–1931* ed. J. van Heijenoort, tr. S. Bauer-Mengelberg (Harvard University Press, 1967), pp. 5–82. §1–12 in *TPW*, pp. 1–20, and in *FR*, pp. 47–78.

"Anwendungen der Begriffsschrift," *Jenaische Zeitschrift für Naturwissenschaft* 13 (1879) Supplement II, pp. 29–33. Reproduced in *Begriffsschrift und andere Aufsätze*, ed. I. Angelelli (Hildesheim: Georg Olms, 1964), tr. as "Applications of the 'Conceptual Notation,'" (1879), in *Conceptual Notation and Related Articles*, tr. and ed. by T. W. Bynum (OUP, 1972), pp. 204–208.

Review of Hoppe, *Lehrbuch der analytischen Geometrie, Deutsche Literaturzeitung* 1 (6) (1880). Reprinted in *KS*, tr. as "Review of Hoppe, *Lehrbuch der analytischen Geometrie I*," in *CP*, pp. 101–102.

"Ueber die wissenschaftliche Berechtigung einer Begriffsschrift," *Zeitschrift für Philosophie und philosophische Kritik* 81 (1882), pp. 48–56. Reprinted in *KS*, tr. as "On the Scientific Justification of a Conceptual Notation," in *Conceptual Notation and Related Articles*, tr. and ed. by T. W. Bynum (OUP, 1972), pp. 83–89, and tr. by J. M. Bartlett as "On the Scientific Justification of a Conceptual Notation," *Mind* 73 (1964), pp. 155–160.

"Über den Zweck der Begriffsschrift," *Jenaische Zeitschrift für Naturwissenschaft* 16 (1883) Supplement, pp. 1–10. Reprinted in *Begriffsschrift und andere Aufsätze*, ed. I. Angelelli (Hildesheim: Georg Olms, 1964), tr. as "On the Aim of the 'Conceptual Notation,'" in *Conceptual Notation and Related Articles*, tr. and ed. by T. W. Bynum (OUP, 1972), pp. 90–100. Also tr. by V. Dudman as "On the Purpose of the Begriffsschrift," *The Australasian Journal of Philosophy* 46 (1968), pp. 89–97.

"Geometrie der Punktpaare in der Ebene," *Jenaische Zeitschrift für Naturwissenschaft* 17 (1884) Supplement, pp. 98–102.

## FREUD, SIGMUND (1856–1939)

Sigmund Freud was the father of psychoanalysis, but—contrary to much apocryphal lore that dies hard—certainly not the originator of the hypothesis that unconscious ideation is essential to explain much of human overt behavior.

The generic doctrine of an unconscious domain of the mind has a venerable, long pre-Freudian history. Indeed, many of the most important doctrines commonly credited to Freud as his creations were tenets of his intellectual patrimony. Thus, as we recall from Plato's dialogue *The Meno*, Plato was concerned to understand how an ignorant slave boy could have arrived at geometric truths under mere questioning by an interlocutor with

reference to a diagram. Plato argued that the slave boy had not acquired such geometric knowledge during his life. Instead, he explained, the boy was tapping prenatal but unconsciously stored knowledge, and restoring it to his conscious memory.

At the turn of the eighteenth century, Gottfried W. Leibniz gave psychological arguments for the occurrence of subthreshold sensory perceptions and for the existence of unconscious mental contents or motives that manifest themselves in our behavior (Ellenberger 1970). Moreover, in his *New Essays on Human Understanding* (1981), Leibniz pointed out that when the contents of some forgotten experiences subsequently emerge in our consciousness, we may misidentify them as new experiences, rather than recognize them as having been unconsciously stored in our memory.

Historically, it is more significant that Freud also had other precursors who anticipated some of his key ideas with impressive specificity. As he himself acknowledged ([the abbreviation "S.E." will be used to refer to the Standard Edition of Freud's complete psychological works in English] S.E., 1914, 14:15–16), Arthur Schopenhauer and Friedrich Nietzsche had speculatively propounded major psychoanalytic doctrines that he himself reportedly developed independently from his clinical observations only thereafter. Indeed, in a 1995 German book, *Die Flucht ins Vergessen: Die Anfänge der Psychoanalyse Freuds bei Schopenhauer*, the Swiss psychologist Marcel Zentner traces the foundations of psychoanalysis to the philosophy of Schopenhauer.

But, as Freud then pointed out illuminatingly, it is one of the greatest threats to human self-esteem to face that "*the [human conscious] ego is not master in its own house*" (S.E., 1917, 17:143; emphasis in original). On the other hand, it is evasive to dismiss substantive criticisms of Freudian theory as being due to fears induced by psychoanalytic accounts of presumed unconscious motivations. Such a dismissal does not address the merits of the strictures directed against psychoanalysis.

Freud was born in Freiberg, Moravia, then part of the Austro-Hungarian Empire, in 1856. But when he was three years old, his family moved to Vienna, where he entered the University of Vienna in 1873 to study medicine. He lived there until he was expelled by the Nazis, when he moved to London, where he died in 1939.

It is important to distinguish between the validity of Freud's work qua psychoanalytic theoretician, and the merits of his earlier work. The zealous Freudian partisan

Mark Solms has edited and translated a presumably forthcoming four-volume series, *The Complete Neuroscientific Works of Sigmund Freud*. One focus of these writings is the neurological representation of mental functioning; another is Freud's supposed discovery of the essential morphological and physiological unity of the nerve cell and fiber.

They also contain contributions to the histology of the nerve cell, neuronal function, and neurophysiology. As a clinical neurologist, Freud wrote a monograph on aphasia (Solms and Saling, 1990). As Solms claims furthermore in his preview *An Introduction to the Neuro-Scientific Works of Sigmund Freud* (unpublished), Freud wrote major papers on cerebral palsy that earned him the status of a world authority. And he was a distinguished pediatric neurologist in the field of the movement disorders of childhood. Besides, Freud did scientific work on the properties of cocaine that benefited perhaps from his own use of that drug. Alas, that elating intake may well also account for some of the abandon featured by the more bizarre and grandiose of his psychoanalytic forays.

In 1880, he published a (free) translation of some of John Stuart Mill's philosophical writings. Yet, as Paul-Laurent Assoun notes in his 1995 *Freud, La Philosophie, et les Philosophes*, Freud was often disdainful of philosophy, despite clearly being indebted to the Viennese philosopher Franz Brentano, from whom he had taken several courses. The marks of Brentano's quondam representationalist and intentionalist account of the mental in the 1995 edition of his *Psychology from an Empirical Standpoint* are clearly discernible in Freud's conception of ideation. And the arguments for the existence of God championed by the quondam Roman Catholic priest Brentano further solidified the thoroughgoing atheism of Freud, who has been called a "godless Jew" (Gay, 1987, pp. 3–4; Grünbaum, 1993, ch. 7).

## PSYCHOANALYSIS

The most basic ideas of psychoanalytic theory were initially enunciated in Josef Breuer and Sigmund Freud's *Preliminary Communication* of 1893, which introduced their *Studies on Hysteria*. But the first published use of the word *psychoanalysis* occurred in Freud's 1896 French paper on *Heredity and the Aetiology of the Neuroses* (S.E., 1896, 3:151). Therein Freud designated Breuer's method of clinical investigation as "a new method of psychoanalysis." Astonishingly, the coauthored 1893 prolegomenon, which lays bare the logical foundation of the cornerstone theory of repression, has been overlooked

and untutoredly neglected in the literature, both psychoanalytic and philosophical. Breuer used hypnosis to revive and articulate a patient's unhappy memory of a supposedly repressed traumatic experience. The repression of that painful experience had occasioned the first appearance of a particular hysterical symptom, such as a phobic aversion to drinking water. Thus, Freud's mentor also induced the release of the suppressed emotional distress originally felt from the trauma. Thereby Breuer's method provided a catharsis for the patient.

The cathartic lifting of the repression yielded relief from the particular hysterical symptom. Breuer and Freud (1893) believed that they could therefore hypothesize that the repression, coupled with affective suppression, was the crucial cause for the development of the patient's psychoneurosis (S.E., 1893, 2:6–7; 3:29–31).

Having reasoned in this way, they concluded, in Freud's later words: "Thus one and the same procedure served simultaneously the purposes of [causally] investigating and of getting rid of the ailment; and this unusual conjunction was later retained in psycho-analysis" (S.E., 1924, 19:194).

In his 1924 historical retrospect, Freud acknowledged the pioneering role of Breuer's cathartic method: "The cathartic method was the immediate precursor of psychoanalysis; and, in spite of every extension of experience and of every modification of theory, is still contained within it as its nucleus" (S.E., 1924, 19:194).

Yet Freud was careful to highlight the contribution he made himself after the termination of his collaboration with Breuer. Referring to himself in the third person, he tells us: "Freud devoted himself to the further perfection of the instrument left over to him by his elder collaborator. The technical novelties which he introduced and the discoveries he made changed the cathartic method into psycho-analysis" (S.E. 1924, 19:195). Later on, Freud regarded repressed wishes rather than forgotten traumata as the principal pathogens of neuroses. These extensive elaborations have earned him the mantle of being the father of psychoanalysis.

It is important to recognize that there are major differences between the unconscious processes hypothesized by current cognitive psychology, on the one hand, and the unconscious contents of the mind claimed by psychoanalytic psychology, on the other (Eagle, 1987). These divergences are such that the existence of the cognitive unconscious clearly fails to support, if not impugns, the existence of Freud's "dynamic" unconscious.

His so-called dynamic unconscious is the supposed repository of repressed forbidden wishes of a sexual or aggressive nature, whose reentry or initial entry into consciousness is prevented by the defensive operations of the ego-agency of the mind. Though socially unacceptable, these instinctual desires are so imperious and peremptory that they recklessly seek immediate gratification, independently of the constraints of external reality.

But, in the cognitive unconscious, there is great rationality in the ubiquitous computational and associative problem-solving processes required by memory, perception, judgment, and attention. By contrast, as Freud emphasized, the wish-content of the dynamic unconscious makes it operate in a highly illogical way.

Having populated the dynamic unconscious with repressions, Freud reasoned that the use of his new technique of free association could lift these repressions of instinctual wishes, and could thereby bring the banished ideas back to consciousness unchanged. But in the case of the cognitive unconscious, we typically cannot bring to phenomenal consciousness the intellectual processes that are presumed to occur in it, although we can describe them theoretically. For example, even if his/her life depended on it, a student of czarist history simply could not bring into his/her phenomenal conscious experience the elaborate scanning or search process by which he/she rapidly comes up with the name of the Russian czarina's confidant G.Y. Rasputin, when asked for it. In sum, the presumed psychoanalytic unconscious as such cannot derive any credibility from the hypothesized cognitive unconscious.

## PSYCHOANALYSIS AND WESTERN CULTURE

The poet W.H. Auden claimed that psychoanalysis is a whole climate of opinion. And indeed, it has been argued dubiously that the supposed pervasive influence of Freudian ideas in our culture vouches for the validity of the psychoanalytic enterprise. But even the premise that Freudian theory has become part of the intellectual ethos and folklore of Western culture cannot be taken at face value. As the distinguished Swiss scholar Henri Ellenberger stressed in his major historical work of 1970 *The Discovery of the Unconscious*, the prevalence of vulgarized pseudo-Freudian concepts makes it very difficult to determine reliably the extent to which genuine psychoanalytic hypotheses have actually become influential in our culture at large.

For example, any slip of the tongue or other bungled action (parapraxis) is typically yet incorrectly

called a *Freudian slip*. But, as Freud himself pointed out, what is required for a slip or so-called parapraxis to qualify technically as Freudian is that it be motivationally opaque rather than transparent, precisely because its psychological motive is repressed (S.E., 1916–1917, 15: 41). Once it is clear what is meant by a bona fide Freudian slip, we need to ask whether there actually exist any such slips at all, that is, slips that appear to be psychologically unmotivated but are actually caused by repressed, unpleasant ideas. It is very important to appreciate how difficult it is to provide cogent evidence for such causation, as shown by strenuous attempts to furnish it experimentally.

Thus, as long as good empirical support for the Freudian scenario is unavailable, we actually do not know whether any bona fide Freudian slips exist at all. Just this lack of evidence serves to undermine the thesis that cultural influence is a criterion of validity. After all, if we have no cogent evidence for the existence of genuinely Freudian slips, then Freud's theory of bungled actions (parapraxes) might well be false. And if so, it would not contribute one iota to its validity even if our entire culture unanimously believed in it and made extensive explanatory use of it: When an ill-supported theory is used to provide explanations, they run the grave risk of being bogus, and its purported insights may well be pseudo-insights.

## THE CORNERSTONE OF PSYCHOANALYSIS

In his 1914 *On the History of the Psychoanalytic Movement*, Freud wrote: "The theory of repression is the cornerstone on which the whole structure of psychoanalysis rests. It is the most essential part of it" (S.E., 1914, 14:16). The pillars of the avowed cornerstone of Freud's theoretical edifice comprise several major theses: (1) Distressing mental states induce the operation of a psychic mechanism of repression, which consists in the banishment from consciousness of unpleasurable psychic states (S.E., 1915, 14:147); (2) once repression is operative (more or less fully), it not only banishes such negatively charged ideas from consciousness, but plays a further crucial multiple causal role: It is causally necessary for the pathogenesis of neuroses, the production of our dreams, and the generation of our various sorts of slips (bungled actions); and (3) the method of free association can identify and lift (undo) the patient's repressions; by doing so, it can identify the pathogens of the neuroses, and the generators of our dreams, as well as the causes of our motivationally opaque slips; moreover, by lifting the pathogenic repres-

sions, free association also functions therapeutically, rather than only investigatively.

Freud provided two sorts of arguments for his cardinal etiologic doctrine that repressions are the pathogens of the neuroses: His earlier one, which goes back to his original collaboration with Josef Breuer, relies on purported therapeutic successes from lifting repressions; the later one, designed to show that the pathogenic repressions are sexual, is drawn from presumed reenactments (transferences) of infantile episodes in the adult patient's interactions with the analyst during psychoanalytic treatment. The process of repression, which consists in the banishment of ideas from consciousness or in denying them entry into it, is itself presumed to be unconscious (S.E., 1915, 14:147). In Freud's view, our neurotic symptoms, the manifest contents of our dreams, and the slips we commit are each constructed as "compromises between the demands of a repressed impulse and the resistances of a censoring force in the ego" (S.E., 1925, 20:45; and 1916–1917, 16:301).

By being only such compromises, rather than fulfillments of the instinctual impulses, these products of the unconscious afford only substitutive gratifications or outlets. For brevity, one can say, therefore, that Freud has offered a unifying compromise model of neuroses, dreams, and parapraxes. Since the repressed impulse made a compromise with the repressing ego, compromise-formations are products of *unsuccessful* repressions!

But what, in the first place, is the motive or cause that initiates and sustains the operation of the unconscious mechanism of repression before it produces its own later effects? Apparently, Freud assumes axiomatically that distressing mental states, such as forbidden wishes, traumata, disgust, anxiety, anger, shame, hate, guilt, and sadness—all of which are unpleasurable—almost always actuate, and then fuel, forgetting to the point of repression. Thus, repression regulates pleasure and so called "unpleasure" or displeasure by defending our consciousness against various sorts of negative affect. Indeed, Freud claimed perennially that repression is the paragon among our defense mechanisms. As he put it dogmatically: "The tendency to forget what is disagreeable seems to me to be a quite universal one" (S.E., 1901, 6:144), and "The recollection of distressing impressions and the occurrence of distressing thoughts are opposed by a resistance" (S.E., 1901, 6:146).

Freud tries to disarm an important objection to his thesis that "distressing memories succumb especially easily to motivated forgetting". He says:

The assumption that a defensive trend of this kind exists cannot be objected to on the ground that one often enough finds it impossible, on the contrary, to get rid of distressing memories that pursue one, and to banish distressing affective impulses like remorse and the pangs of conscience. For we are not asserting that this defensive trend is able to put itself into effect *in every case*.

(S.E., 1901, 6:147, ITALICS ADDED).

He acknowledges as "also a true fact" that "distressing things are particularly hard to forget" (S.E., 1916–1917, 15:76–77).

Indeed, Freud himself told us as an adult that he "can remember very clearly," from age seven or eight, how his father rebuked him for having relieved himself in the presence of his parents in their bedroom. In a frightful blow to the boy's ego, his father said: "The boy will come to nothing" (S.E., 1900, 4:216).

But Freud's attempt here to uphold his thesis of motivated forgetting is evasive and unavailing: Since some painful mental states are vividly remembered, while others are forgotten or even repressed, it appears that factors different from their painfulness determine whether they are remembered or forgotten. For example, personality dispositions or situational variables may in fact be causally relevant. To the great detriment of his theory, Freud never came to grips with the unfavorable bearing of this key fact about the mnemonic effects of painfulness on the tenability of the following pillar of his theory of repression: When painful or forbidden experiences are forgotten, the forgetting is tantamount to their repression due to their negative affect, and thereby produces neurotic symptoms or other compromise formations.

The numerous and familiar occurrences of vivid and even obsessive recall of negative experiences pose a fundamental statistical and explanatory challenge to Freud that neither he nor his followers have ever met. Astonishingly, Freud thinks he can parry this basic statistical and explanatory challenge by an evasive dictum, as follows: "Mental life is the arena and battle-ground for mutually opposing purposes [of forgetting and remembering] (S.E. 1916–1917, 15:76) ...; there is room for both. It is only a question ... of what effects are produced by the one and the other" (S.E., 1916–1917, 15: 77). Indeed, just that question cries out for an answer from Freud if he is to make his case. Instead, he cavalierly left it to dangle epistemologically in limbo.

Freud's argument here is an evasive attempt to neutralize the ubiquitous refuting instances undermining his aforesaid claim (S.E., 1901, 6:144) that "The tendency to forget what is disagreeable seems to me to be a quite universal one." And he tries to do so by peremptorily inventing ad hoc an opposing tendency to remember negatively charged experiences. But since this gambit clearly fails, he has forfeited his basis for his pivotal etiologic scenario that forbidden or aversive states of mind are usually repressed and thereby cause compromise formations, such as neurotic symptoms.

### UNSUCCESSFUL REPRESSIONS AS PATHOGENS OF THE PSYCHONEUROSES

Let us articulate and scrutinize Breuer and Freud's 1893 argument, in their foundational *Preliminary Communication*, for the pathogenicity of unsuccessful repressions. There they wrote:

For we found, to our great surprise at first, that each individual hysterical symptom immediately and permanently disappeared when we had succeeded in bringing clearly to light the memory of the event by which it was provoked and in arousing its accompanying affect, and when the patient had described that event in the greatest possible detail and had put the affect into words. Recollection without affect almost invariably produces no result. The psychical process which originally took place must be repeated as vividly as possible; it must be brought back to its status nascendi and then given verbal utterance.

(S.E., 1893, 2:6–7).

Breuer and Freud make an important comment on their construal of this therapeutic finding:

It is plausible to suppose that it is a question here of unconscious suggestion: the patient expects to be relieved of his sufferings by this procedure, and it is this expectation, and not the verbal utterance, which is the operative factor. This, however, is not so. (S.E., 1893, 2:7)

And their avowed reason is that, in 1881, that is, in the "pre-suggestion" era, the cathartic method was used to remove separately distinct symptoms, "which sprang from separate causes" such that any one symptom disappeared only after the cathartic (abreactive) lifting of a particular repression. But Breuer and Freud do not tell us why the likelihood of a placebo effect should be deemed

to be lower when several symptoms are wiped out serially, than in the case of getting rid of only one symptom. Thus, as is pointed out in Grünbaum (1993), to discredit the hypothesis of placebo effect, it would have been essential to have comparisons with treatment outcome from a suitable control group whose repressions are not lifted. If that control group were to fare equally well, treatment gains from psychoanalysis would then be placebo effects after all.

In sum, Breuer and Freud inferred that the therapeutic removal of neurotic symptoms was produced by the cathartic lifting of the patient's previously ongoing repression of the pertinent traumatic memory, not by the therapist's suggestion or some other placebo factor (see Grünbaum 1993). This claim can be codified as follows:

*T. Therapeutic Hypothesis:* Lifting repressions of traumatic memories cathartically is causally relevant to the disappearance of neuroses.

As we saw, Breuer and Freud (S.E., 1893, 2:6) reported the immediate and permanent disappearance of each hysterical symptom after they cathartically lifted the repression of the memory of the trauma that occasioned the given symptom. They adduce this "evidence" to draw an epoch-making inductive etiologic inference, which postulates "a causal relation between the determining [repression of the memory of the] psychical trauma and the hysterical phenomenon" (S.E., 1893, 2:6). Citing the old scholastic dictum *Cessante causa cessat effectus* (When the cause ceases, its effect ceases), they invoke its contrapositive (S.E., 1893, 2:7), which states that as long as the effect (symptom) persists, so does its cause (the repressed memory of the psychical trauma). And they declare just that to be the pattern of the pathogenic action of the repressed psychical trauma. This trauma, we learn, is not a mere precipitating cause. Such a mere "agent provocateur" just releases the symptom, "which thereafter leads an independent existence." Instead, "the [repressed] memory of the trauma ... acts like a foreign body which long after its entry must continue to be regarded as an agent that is still at work" (S.E., 1893, 2:6).

The upshot of their account is that their observations of positive therapeutic outcome from the abreactive lifting of repressions, which they interpret in the sense of their therapeutic hypothesis, spelled a paramount etiologic moral as follows:

*E. Etiologic Hypothesis:* An ongoing repression accompanied by affective suppression is causally necessary for the initial pathogenesis and persistence of a neurosis.

Clearly, this etiologic hypothesis *E* permits the valid deduction of the therapeutic finding reported by Breuer and Freud as codified in their therapeutic hypothesis *T*: The cathartic lifting of the repressions of traumatic memories of events that occasion symptoms engendered the disappearance of the symptoms. And, as they told us explicitly (S.E., 1893, 2:6), this therapeutic finding is their evidence for their cardinal etiologic hypothesis *E*.

But this inductive argument is vitiated by what might be called the fallacy of crude hypothetico-deductive (H-D) pseudo-confirmation. Thus, note that the remedial action of aspirin consumption for tension headaches does not lend H-D support to the outlandish etiologic hypothesis that a hemolytic aspirin deficiency is a causal *sine qua non* for having tension headaches, although such remedial action is validly deducible from that bizarre hypothesis.

Wesley Salmon called attention to the fallacy of inductive causal inference from mere valid H-D deducibility by giving an example in which a deductively valid pseudo-explanation of a man's avoiding pregnancy can readily give rise to an H-D pseudo-confirmation of the addle-brained attribution of his nonpregnancy to his consumption of birth control pills. Salmon, in his coauthored 1971 book *Statistical Explanation and Statistical Relevance*, states the fatuous pseudo-explanation:

John Jones avoided becoming pregnant during the past year, for he had taken his wife's birth control pills regularly, and every man who regularly takes birth control pills avoids pregnancy. (p. 34)

Plainly, this deducibility of John Jones's recent failure to become pregnant from the stated premises does not lend any credence at all to the zany hypothesis that this absence of pregnancy is causally attributable to his consumption of birth control pills. Yet it is even true that any men who consume such pills in fact never do become pregnant. Patently, as Salmon notes, the fly in the ointment is that men just do not become pregnant, whether they take birth control pills or not.

His example shows that neither the empirical truth of the deductively inferred conclusion and of the pertinent initial condition concerning Jones nor the deductive validity of the inference can provide *bona fide* confirmation of the causal hypothesis that male consumption of birth control pills prevents male pregnancy: That hypothesis would first have to meet other epistemic requirements, which it manifestly cannot do.

Crude H-D confirmationism is a paradise of spurious causal inferences, as illustrated by Breuer and Freud's unsound etiologic inference. Thus, psychoanalytic narratives are replete with the belief that a hypothesized etiologic scenario embedded in a psychoanalytic narrative of an analysand's affliction is made credible merely because the postulated etiology then permits the logical deduction or probabilistic inference of the neurotic symptoms to be explained.

### THE PSYCHOANALYTIC METHOD OF CLINICAL INVESTIGATION BY FREE ASSOCIATION: IS IT BOTH INVESTIGATIVE AND THERAPEUTIC?

This method, the so-called "Fundamental Rule" of clinical investigation in the setting of psychoanalytic treatment, is the supposed microscope, and even X-ray tomograph, as it were, of the human mind. Freud devised it, when he became dissatisfied with the use of hypnosis, which Breuer and he had employed theretofore as their probe.

The rule of free association directs the patient to tell the analyst without reservation whatever comes to mind. Thus, it serves as the fundamental method of clinical investigation. We are told that by using this technique to unlock the floodgates of the unconscious, Freud was able to show that neuroses, dreams, and slips are caused by repressed motives. Just as in Breuer's cathartic use of hypnosis, it is a cardinal thesis of Freud's entire psychoanalytic enterprise that his method of free association has a twofold major capability, which is both investigative and therapeutic: (1) It can identify the unconscious causes of human thoughts and behavior, both abnormal and normal; and (2) by overcoming resistances and lifting repressions, it can remove the unconscious pathogens of neuroses and thus provide therapy for an important class of mental disorders.

But on what grounds did Freud assert that free association has the stunning investigative capability to be causally probative for etiologic research in psychopathology? Is it not too good to be true that one can put a psychologically disturbed person on the couch and fathom the etiology of her or his affliction by free association? As compared to fathoming the causation of major somatic diseases, that seems almost miraculous, if true at all. Freud tells us very clearly (S.E., 1900, 5:528) that his argument for his investigative tribute to free association as a means of uncovering the causation of neuroses is, at bottom, a therapeutic one going back to the cathartic method of treating hysteria.

In a nutshell, his argument for claiming that free associations are causally probative for etiologic research in psychopathology, as well as vehicles of therapy, is as follows: (1) As he and Breuer had contended, unsuccessful repressions are the pathogens of the psychoneuroses; (2) The supposedly free associations departing from the patient's neurotic symptoms uncover the pertinent repressions; (3) Hence the method of free associations can identify the pathogenic repressions, and in so doing, it lifts them and thereby provides therapy for the neurosis and its symptoms. But it behooves us to expand this argument with a view to then seeing why it fails in several respects, no matter how revealing the associative contents may otherwise be in regard to the patient's psychological preoccupations and personality dispositions.

Drawing on his joint work with Breuer, Freud first inferred that the therapeutic disappearance of the neurotic symptoms is causally attributable to the cathartic lifting of repressions by means of the method of free association. Relying on this key therapeutic hypothesis, he then drew two further major theoretical inferences: (1) The seeming removal of the neurosis by means of cathartically lifting repressions is good inductive evidence for postulating that repressions accompanied by affective suppression are themselves causally necessary for the very existence of a neurosis (S.E., 1893, 2:6–7), and (2) granted that such repressions are thus the essential causes of neurosis, and that the method of free association is uniquely capable of uncovering these repressions, this method is uniquely competent to identify the causes or pathogens of the neuroses.

But the argument fails for the following several reasons. In the first place, the durable therapeutic success on which it was predicated did not materialize, as Freud was driven to admit both relatively early and very late in his career (S.E., 1925, 20:27; 1937, 23:216–253). And indeed, over a century later, three currently practicing English psychoanalysts, (Fonagy et al., 2005, p. 367) conceded ruefully: "Notwithstanding a history of over 100 years, psychoanalytically informed psychological therapies have a poor evidence base." But even insofar as Freud achieved transitory therapeutic gain, it will be recalled that he had failed to rule out a rival hypothesis which undermines his attribution of such gain to the lifting of repressions by free association: the ominous rival hypothesis of placebo effect, which asserts that treatment ingredients other than insight into the patient's repressions—such as the mobilization of the patient's hope by the therapist—are responsible for any resulting improvement. (For a detailed account of the placebo concept in both psychia-

try and medicine, see Grünbaum, 1993, chap. 3). Nor have other analysts ruled out the placebo hypothesis during the past century.

Last, but not least, the repression etiology is inductively ill-founded, as will be recalled, and will now be seen further. It is unavailing to the purported etiologic probativeness of free associations that they may lift repressions, because Freud failed to show that the latter are pathogenic. In sum, Freud's argument has forfeited its premises.

Long after the *Preliminary Communication* of 1893, Freud (S.E., 1914, 14:12) offered an argument in his theory of "Transference" for the pathogenic role of repressions, hailing that argument as the most unshakable proof for his sexual etiology of the neuroses. It is a commonplace that many, if not all, adults carry over (transfer) to their adult interactions with other people attitudes and notions that they had acquired in (early) childhood. In this vein, Freud elaborates on this phenomenon in the context of the interpersonal transactions between the psychoanalyst and the patient. Thus, we learn, the patient transfers onto his or her psychoanalyst feelings and thoughts that originally pertained to important figures in his or her earlier life. In this important sense, the fantasies woven around the psychoanalyst by the analysand, and quite generally the latter's conduct toward his or her doctor, are hypothesized to be thematically recapitulatory of childhood episodes. And by thus being recapitulatory, the patient's behavior during treatment can be said to exhibit a thematic kinship to such very early episodes. Therefore, when the analyst interprets these supposed reenactments, the ensuing interpretations are called transference interpretations.

Freud and his followers have traditionally drawn the following highly questionable causal inference: Precisely in virtue of being thematically recapitulated in the patient-doctor interaction, the hypothesized earlier scenario in the patient's life can cogently be held to have originally been a pathogenic factor in the patient's affliction. For example, in his 1909 case history of the "Rat-Man," Freud infers that a certain emotional conflict had originally been the precipitating cause of the patient's inability to work, merely because this conflict had been thematically reenacted in a fantasy the "Rat-Man" had woven around Freud during treatment.

Thus, in the context of Freud's transference interpretations, the thematic reenactment is claimed to show that the early scenario had originally been pathogenic. According to this major etiologic conclusion, the patient's thematic reenactment in the treatment setting is also

asserted to be pathogenically recapitulatory by being pathogenic in the adult patient's here and now, rather than only thematically recapitulatory. Freud extols this dubious etiologic transference argument in his *On the History of the Psycho-Analytic Movement* (S.E., 1914, 14:12).

On the contrary, the patient's thematically recapitulatory behavior toward his or her doctor does not show that it is also pathogenically recapitulatory. The etiologic belief that it does so commits the "thematic affinity fallacy" (Grünbaum, 1993, p. 129; 2002, p. 134). How, for example, does the reenactment, during treatment, of a patient's early conflict show at all that the original conflict had been pathogenic in the first place? Indeed, it is epistemologically circular to infer the occurrence of infantile episodes from the adult patient's reports, and then to claim that these early episodes are thematically recapitulated in the adult analysand's conduct toward the analyst. Quite generally, how do transference phenomena focusing on the analyst show that a presumed current replica of a past event is pathogenic in the here and now?

Freud went on to build on the quicksand of his etiologic transference argument. It inspired two of his further fundamental tenets: first, the investigative thesis that the psychoanalytic dissection of the patient's behavior toward the analyst can reliably identify the original pathogens of his or her long-term neurosis; second, the cardinal therapeutic doctrine that the working through of the analysand's so-called transference neurosis is the key to overcoming his or her perennial problems.

## THE PSYCHOANALYTIC THEORY OF DREAMING

As we learn from Freud's opening pages on his method of dream interpretation, he extrapolated the presumed causally probative role of free associations from being only a method of etiologic inquiry aimed at therapy, to serving likewise as an avenue for finding the purported unconscious causes of dreams (S.E., 1900, 4:100–101; 5:528). And in the same breath, he reports that when patients told him about their dreams while associating freely to their symptoms, he extrapolated his compromise model from neurotic symptoms to manifest dream contents. A year later, he carried out the same twofold extrapolation to include slips or bungled actions.

But what do free associations tell us about our dreams? Whatever the manifest content of dreams, they are purportedly wish-fulfilling in at least two logically distinct ways: For every dream *D*, there exists at least one normally unconscious infantile wish *W* such that: (1) *W*

is the motivational cause of *D*; and (2) the manifest content of *D* graphically displays, more or less disguisedly, the state of affairs desired by *W*. As Freud opined: "When the latent dream-thoughts that are revealed by the analysis [via free association] of a dream are examined, one of them is found to stand out from among the rest ... the isolated thought is found to be a wishful impulse" (S.E., 1925, 20:44). But as Clark Glymour (1983) has emphasized, Freud manipulated and doctored the free associations to yield a distinguished wish motive. Thus, Freud had declared with categorical universality (S.E. 1900, 4:134) "there cannot be any dreams but wishful [i. e., wish-generated] dreams"

Quite independently of Freud's abortive therapeutic argument for the causal probativeness of free association, he offered his analysis of his 1895 *Specimen Irma Dream* as a nontherapeutic argument for the method of free association as a cogent means of identifying hypothesized hidden, forbidden wishes to be motives of our dreams. But, in a detailed critique of that unjustly celebrated *Irma Dream*, it has been shown that Freud's account there is, alas, no more than a piece of false advertising for the following reasons:

- It does not deliver at all the promised vindication of the probativeness of free association.
- It does nothing toward warranting his foolhardy dogma that all dreams are wish-fulfilling in his stated sense.
- It does not even pretend that his alleged "Specimen Dream" is evidence for his compromise model of manifest-dream content.
- The inveterate and continuing celebration of Freud's analysis of his "Irma Dream" in the psychoanalytic literature as the paragon of dream interpretation is completely unwarranted, because it is mere salesmanship (Grünbaum 1984, pp. 216–239).

Moreover, careful studies have shown that the so-called free associations are not free but are strongly influenced by the psychoanalyst's subtle promptings to the patient (Grünbaum 1984). And recent memory research has shown further how patients and others can be induced to generate pseudo-memories, which are false but deemed veridical by the patients themselves (Goleman 1994). As a corollary of the latter epistemological defects of the method of free association, it appears that such associations cannot reliably vouch for the contents of presumed past repressions that are lifted by them.

Once Freud had clearly chained himself gratuitously to the universal wish monopoly of dream generation, his interpretations of dreams were constrained to reconcile wish-contravening dreams with the decreed universality of wish fulfillment. Such reconciliation demanded imperiously that all other parts and details of his dream theory be obligingly tailored to the governing wish dogma so as to sustain it. Yet Freud artfully obscured this dynamic of theorizing, while begging the methodological question (S.E., 1900, 4:135). Wish-contravening dreams include anxiety dreams, nightmares, and the so-called counter-wish dreams (S.E., 1900, 4:157). As an example of the latter, Freud reports a trial attorney's dream that he had lost all of his court cases (S.E., 1900, 4:152).

His initial 1900 statement of his dual wish fulfillment in a dream had been: "Thus, its content was the fulfillment of a wish and its motive was a wish" (S.E., 1900, 4:119). But the sense in which dreams are wish fulfilling overall is purportedly threefold rather than only twofold: One supposed motivating cause is the universal preconscious wish to sleep, which allegedly provides a generic causal explanation of dreaming as such and, in turn, makes dreaming the guardian of sleep (S.E., 1900, 4:234; 5:680); another is the individualized repressed infantile wish, which is activated by the day's residue and explains the particular manifest content of a given dream; furthermore, as already noted, that manifest content of the dream graphically displays, more or less disguisedly, the state of affairs desired by the unconscious wish. The disguise is supposedly effected by the defensive operation of the dream distortion of the content of forbidden unconscious wishes.

But this theorized distortion of the hypothesized latent content must not be identified with the very familiar phenomenological bizarreness of the manifest dream content! By achieving a compromise with the repressed wishes, the postulated distortion makes "plausible that even dreams with a distressing content are to be construed as wish fulfillments" (S.E., 1900, 4:159). Accordingly, Freud concedes: "The fact that dreams really have a secret meaning which represents the fulfillment of a wish must be proved afresh in each particular case by analysis" (S.E., 1900, 4:146).

### THE HERMENEUTIC RECONSTRUCTION OF PSYCHOANALYSIS

In concert with the so-called hermeneutic German philosophers Karl Jaspers and Jürgen Habermas, the French philosopher Paul Ricoeur believed that victory can be

snatched from the jaws of the scientific failings of Freud's theory by abjuring his scientific aspirations as misguided. Claiming pejoratively that Freud himself had "scientifically" misunderstood his own theoretical achievement, some hermeneuts misconstrue it as a semantic accomplishment by trading on the multiply ambiguous word *meaning* (Grünbaum 1999, 2002).

In Freud's theory, an overt symptom manifests one or more underlying unconscious causes and gives evidence for its cause(s), so that the sense or meaning of the symptom is constituted by its latent motivational cause(s). But this notion of meaning is different from the one appropriate to the context of communication, in which linguistic symbols acquire semantic meaning by being used deliberately to designate their referents. Clearly, the relation of being a manifestation, which the symptom bears to its cause, differs from the semantic relation of designation, which a linguistic symbol bears to its object.

The hermeneutic reconstruction of psychoanalysis slides illicitly from one of two familiar senses of the term "meaning" encountered in ordinary discourse to another. When a pediatrician says that a child's spots on the skin mean measles, the meaning of the symptom is constituted by one of its causes, much as in the Freudian case. Yet, when speaking of Freud's making sense of a patient's symptoms, the analyst Anthony Storr (1986) conflates the fathoming of the etiologic sense or meaning of a symptom with the activity of making semantic sense of a text, preposterously transmogrifying Freud into a semanticist: "Freud was a man of genius whose expertise lay in semantics" (p. 260). And Ricoeur even wrongly credits Freud's theory of repression with having provided, *malgré lui*, a veritable semantics of desire.

Relatedly, John R. Searle has noted illuminatingly in his 1990 book *Intentionality* that, unlike many mental states, language is not intrinsically intentional in Brentano's directed sense; instead, the intentionality (aboutness) of language is extrinsically imposed on it by deliberately decreeing it to function referentially. Searle points out that the mental states of some animals and of pre-linguistic very young children do have intrinsic intentionality but no linguistic referentiality.

Thus, it is a fundamental hermeneuticist error to slide illicitly from the intrinsic, non-semantic intentionality of (many, but not all) mental states to the imposed, semantic sort possessed by language. Moreover, some of the neurotic symptoms of concern to psychoanalysts, such as diffuse depression and manic, undirected elation even lack Brentano intentionality.

Yet some version of a hermeneutic reconstruction of the psychoanalytic enterprise has been embraced with alacrity by a considerable number of analysts no less than by professors in humanities departments of universities. Its psychoanalytic adherents see it as buying absolution for their theory and therapy from the criteria of validation mandatory for causal hypotheses in the empirical sciences, although psychoanalysis is replete with just such hypotheses. This form of escape from accountability also augurs ill for the future of psychoanalysis, because the methods of the champions of the hermeneutic reconstruction of psychoanalysis have not spawned a single new important hypothesis. Instead, their reconstruction is a negativistic ideological battle cry whose disavowal of Freud's scientific aspirations presages the death of his legacy from sheer sterility, at least among those who demand the validation of theories by cogent evidence.

### FREUD ON THEISTIC RELIGION

In his 1933 essay *The Question of a Weltanschauung*, Freud appraised theism under the label of *religion* and wrote:

Religion is an attempt to master the sensory world in which we are situated by means of the wished world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery.

(S.E., 1933, 22:168).

And in his 1927 critique of theism entitled *The Future of an Illusion*, he stresses the logical priority of his atheism vis-à-vis his psychology of theism:

Nothing that I have said here against the truth-value of religions needed the support of psychoanalysis; it had been said by others long before analysis came into existence. If the application of the psycho-analytic method makes it possible to find a new argument against the truths of religion, tant pis [so much the worse] for religion; but defenders of religion will by the same right make use of psycho-analysis in order to give full value to the affective significance of religious doctrines.

(S.E., 1927, 21:37).

This avowed entitlement of religious partisans is presumably an allusion to Freud's friend Oskar Pfister, a Lutheran clergyman and avid champion of the use of

psychoanalysis in pastoral work. Relatedly, though, like Freud, also a committed atheist, Karl Marx had expressed sympathy for the quest for solace in the face of the trials and tribulations of life. Marx wrote:

“Religion ... is ... the protest against real distress. Religion is the sigh of the oppressed creature, the heart of a heartless world, just as it is the spirit of an unspiritual situation. It is the opium of the people.”

(FEUER 1959, p. 523).

Marx's use of the term *opium* here to characterize the consoling function of religion is descriptive rather than pejorative: In his time, opium was a commonly used anodyne, available without prescription.

Freud maintained that religious beliefs are engendered by the synergism of three significantly different sorts of powerful, relentless wishes. And for each of this trio of wishes, he conjectures a distinct scenario that specifies their content and mode of operation.

As he points out, the first set of these psychogenetic assumptions features wish motives that are largely conscious or manifest, instead of being the repressed wishes postulated by psychoanalytic theory. Accordingly, this component of Freud's triadic psychology of religion does not rely on any of his technical psychoanalytic teachings. But what are the relevant archaic conscious wishes? He explains eloquently in his 1927 book *The Future of an Illusion*:

... the terrifying impression of helplessness in childhood aroused the need for protection—for protection through love—which is provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfillment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfillments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system

(S.E., 1927, 21:30).

Understandably, therefore, the protector, creator, and lawgiver are all rolled into one. No wonder, says Freud

(S.E., 1933, 22:163–164), that in one and the same breath, Immanuel Kant coupled the starry heavens above, and the moral law within as both being awe-inspiring. After all, Freud asks rhetorically, “what have the heavenly bodies to do with the question of whether one human creature loves another or kills him?” And he answers: “The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone” (S.E., 1933, 22:164).

Insofar as Freud’s psychogenetic portrayal of religion depicts it as the product of conscious wishes, his account draws, not only on Ludwig A. Feuerbach, but also on commonsense psychology. After all, at least *prima facie*, it is rather a commonplace that people seek to avoid anxiety, and that they therefore tend to welcome the replacement of threatening beliefs by reassuring ones. Hence, for brevity, this component of Freud’s triadic psychology of religion can be designated as the “*commonsense hypothesis*,” which is not to say, however, that it is obviously true. Each of the other two components of this trinity is a set of psychoanalytic claims, asserting the operation of repressed motives. And yet they differ from each other, because one of them relies on Freud’s theory of the psychosexual development of the human individual, while the other consists of ethnopsychological and psychohistorical averrals pertaining to the evolution of our species as a whole. Accordingly, the former psychoanalytic assumptions can be dubbed *ontogenetic*, while the latter can be labeled *phylogenetic*.

The legitimacy of any psychogenetic portrait of religious creeds depends on the evidential merit of the explanatory psychological hypotheses adduced by it. Even the commonsense component of Freud’s triad is subject to this caveat. Invoking the criticisms of his great predecessors, he took it for granted that there is no cogency in any of the arguments for the existence of God offered by believers. But he coupled this philosophical judgment with the daring motivational claim that the faithful who nonetheless adduce such proofs had not, in fact, themselves been decisively moved by them, when giving assent to theism. Instead, he maintained, psychologically this assent is emotional or affective in origin.

Thus he is telling us that motivationally, the dialectical excogitations offered as existence proofs are *post hoc* rationalizations in which an elaborate intellectual façade takes the place of the deep-seated wishes that actually persuaded the theologians. Speaking epigrammatically in another context, Freud quotes Shakespeare’s Falstaff as

saying that reasons are “as plenty as blackberries” (S.E., 1914, 14:24).

It would seem to be basically a matter of empirical psychological fact whether the commonsense constituent of Freud’s psychogenetic portrait of religion is sound. Yet, it is not clear how to design a cogent test even of this hypothesis. For note that the required design needs to have two epistemic capabilities as follows: (1) It needs to yield evidence bearing on the validity of the functional explanation of religious belief as being anxiety-reducing; presumably this explanation postulates some kind of stabilizing psychic servomechanism that reacts homeostatically to psychological threat; and, furthermore, (2) the required test needs to be at least able to rank-order the intensity of the wish to escape from anxiety, as compared to the motivational persuasiveness of the theological existence proofs. Perhaps oscillating anxieties of believers who went through cycles of doubt and belief have already gone some way toward meeting the first condition by Mill’s method of concomitant variations. In any case, it would seem that an explicitly fideist belief in the existence of God—which avowedly is not based on any arguments—calls for psychological explanation in terms of wish motives!

The second requirement, however, seems to be a tall order indeed, although it does not warrant putting a cap on the ingenuity of potential empirical investigators. It, too, must be met, because of Freud’s bold claim that even the best of the arguments for the existence of God would not have convinced the great minds who advanced them, unless stronger tacit wishes had carried the day, or had prompted these intellects to prevaricate. But note that, so far, Freud’s portrayal of the motives for religious belief has studiously refrained from claiming that this belief is false, although he does avow its falsity later, after arguing that it is delusional. Hence whatever the empirical difficulties of validating his psychogenetic portrait, they are hardly tantamount to his commission of the hackneyed genetic fallacy, a mode of inference that he had explicitly rejected by means of disclaimers and qualifications.

In accord with his diagnosis of religion as an unwholesome childish fixation, Freud did advocate—as an experiment worth making—that children be given an irreligious education. But he took pains to say at once: “Should the experiment prove unsatisfactory I am ready to give up the reform and to return to my earlier, purely descriptive judgment that man is a creature of weak intelligence who is ruled by his instinctual wishes” (S.E., 1927, 21:48–49).

The two psychoanalytic components of Freud's triadic psychology of theism—its ontogeny and phylogeny—even more than its pre-psychoanalytic commonsense constituent, exigently require evidence for the existence of the two different sorts of wishes postulated by them. Insofar as even the very existence of these hidden desires is questionable, one remains less than convinced, when told that they contributed significantly to the initial genesis and later persistence of religious creeds. It is a corollary of the evidential scrutiny of the pertinent hypotheses that the psychoanalytic ontogeny of theism still lacks cogent evidential warrant (Grunbaum 1984, 1993).

But Freud was not content to confine himself to explanatory reliance on the conscious quest for anxiety reduction, and on his ontogeny of theism. Rather, he went on to develop a psychoanalytic phylogeny of theism (S.E., 1913, 13:100). In his view, this historical ethnopsychology is a valid extension of psychoanalysis.

As he sees it, by combining ethnography with psychoanalysis, he has discerned a third set of strong wishes that unite synergistically with the other two classes of this triad, and make the psychogenesis of belief in God the Father the more imperative. Therefore he proclaimed: "We now observe that the store of religious ideas includes not only wish-fulfillments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power" (S.E., 1927, 21:42).

Daring and ingenious though it is, Freud's psychoanalytic phylogeny of theism is dubious, if only because it assumes a Lamarckian inheritance of repressed racial memories. Furthermore, contrary to the uniform evolution of religions required by his account, more recent historical scholarship seems to call for developmental pluriformity, as pointed out by Hans Küng in his 1979 book *Freud and the Problem of God* (p. 67).

Professor Edward Erwin's essay *Psychoanalysis: Theory, Therapy, and Method of Inquiry Created by Sigmund Freud (1856–1939)* herein covers the post Freudians.

## Bibliography

### PRIMARY WORKS BY FREUD

- Breuer, Josef, and Sigmund Freud. "On the Psychological Mechanism of Hysterical Phenomena: Preliminary Communication" (1893). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 2, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "On the Psychological Mechanism of Hysterical Phenomena: A Lecture" (1893). In J. Strachey, *The Standard Edition of the Works of Sigmund Freud*, Vol. 3, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "Heredity and the Aetiology of the Neuroses" (1896). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 3, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "The Interpretation of Dreams" (1900). In *The Standard Edition of the Works of Sigmund Freud*, Vols. 4 (Part I) and 5 (Part II), edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "The Psychopathology of Everyday Life" (1901). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 6, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "The Claims of Psycho-Analysis to Scientific Interest" (1913). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 13, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "The Return of Totemism in Childhood" (1913). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 13, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "On the History of the Psycho-Analytic Movement" (1914). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 14, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "Repression" (1915). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 14, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "Introductory Lectures on Psycho-Analysis" (1915–1917). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 15 (Parts I and II) and Vol. 16 (Part III), edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "A Difficulty in the Path of Psycho-Analysis" (1917). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 17, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "A Short Account of Psychoanalysis" (1924). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 19, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "An Autobiographical Study" (1925). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 20, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.
- "The Future of an Illusion" (1927). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 21, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.

“New Introductory Lectures on Psychoanalysis” (1933). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 22, edited and translated by J. Strachey. London: Hogarth Press, 1933.

“Analysis Terminable and Interminable” (1937). In *The Standard Edition of the Works of Sigmund Freud*, Vol. 23, edited and translated by J. Strachey. London: Hogarth Press, 1953–1974.

## FRIENDSHIP

### FRIENDSHIP AND ITS PLACE IN THE MORAL DEBATE

Friendship is a central theme in ancient ethics, most notably in Aristotelian ethics, with two of the ten books of Aristotle’s *Nicomachean Ethics* (Books VIII and IX) (1985) devoted to the subject. But modern moral philosophy (from the mid-eighteenth century to the later part of the twentieth century) largely overlooked the role of friendship in moral life, in part because of the dominance of the impartialist stance of utilitarian and Kantian moral theory. Those theories also influenced the study of Aristotelian ethics. In the late 1970s and early 1980s, this trend shifted, in part due to a confluence of causes—renewed interest in Aristotelian ethics for its own sake, the development of modern *virtue ethics*, and the rise of feminist ethical theory. A seminal article by John Cooper on Aristotelian friendship (1977) helped to make Aristotle’s account accessible, and especially emphasized the role of friendship in a morally reflective life. Aristotle’s account remains the *locus classicus* for understanding the nature of friendship and its place in the moral life; however, before turning to that account, some background is important for understanding its resuscitation in the contemporary moral debate.

### THE NEGLECT OF FRIENDSHIP IN MODERN MORAL PHILOSOPHY

From a classical utilitarian view, in the broad tradition of Jeremy Bentham (1748–1832), an agent is obligated to do that which promotes maximally desired outcomes for the greatest number of people, irrespective of standing commitments to friends and family or other personal projects and pursuits. One is to view oneself as a causal lever, Bernard Williams (1963) charged, of optimal outcomes. Thus, if one can save one’s spouse or the next inventor of a cure for AIDS, one may be obligated, on a strict utility theory, to save the latter over the former. Rule utilitarians try to counter the unwelcome result, arguing that a general *rule* or *practice* of taking care of kith and kin is an

overall best way of promoting general welfare. But a strict act utilitarian (that is, one committed to assessing the overall good consequences produced by discrete acts) cannot consistently make this response.

From a Kantian view, drawn primarily from Immanuel Kant's early work *The Groundwork from the Metaphysic of Morals* (1785), motives of friendship may be acted upon in morally permissible ways when properly constrained by the impartial point of view of the Categorical Imperative. But even then, such motives, like those of sympathy or other inclinations, lack intrinsic moral worth of their own. So, to adapt a well-known example from Michael Stocker (1976) on a Kantian view, one acts in a morally worthy way when one visits a hospitalized friend not out of friendship, but out of duty. In later writings, Kant seems to soften his view, arguing that acting from friendship may be an important way of realizing the more general, obligatory end of beneficence. Still, Kant is ever wary that intimacy can undermine mutual respect; thus, friendship, is a constant teeter-totter between getting close and keeping at bay: "For we can regard love as attraction and respect as repulsion, and if the principle of love commands friends to come together, the principle of respect requires them to keep each other at a proper distance" (1976, p. 470).

The difficulty of fitting friendship squarely into modern moral theory led many to return to Aristotle's account. This renewal of interest coincides with a feminist push to take seriously the role of interpersonal relationships and caring in a moral point of view. In particular, the influential work by psychologist Carol Gilligan (1982) galvanized philosophers of various stripes to begin to look at friendship and attachment relations as important arenas of moral agency and moral development. Thus, in a sense, the renewed interest in friendship brought with it a rediscovery of the kind of moral psychology that is an integral part of ancient ethics.

## FRIENDSHIP IN ARISTOTELIAN ETHICS

The framing question of Aristotelian ethics, like that of most ancient ethics, is what constitutes flourishing or happiness (*eudaimonia*) for human beings? Aristotle's answer is that happiness is a composite of virtuous activity and external goods; chief among those external goods is the relational good of friendship, or *philia*. Humans are by nature "social creatures," Aristotle says, and self-sufficiency is always relational. Even if it turned out that the kind of virtuous or excellent activity most fitting for humans was contemplative and not civic or practical,

people would still contemplate best in the company of others (*NE* 1177a33).

According to Aristotle's definition, *philia* is a mutually acknowledged reciprocation of affection and good will on the basis of some ongoing specific interest, such as pleasure, utility, or virtue. Chosen friendship grounded in virtue or good character is the paradigmatic and most stable form of friendship. It is a friendship dedicated to the whole person and committed to the joint project of good living. The best sort of friends "live together" and "spend their days together," not as cattle grazing the same pasture, but "by sharing in argument and thought" (*NE* 1170b11–12). Given the intensity of these ideal friendships, one can reasonably expect to cultivate only a few at a given time. There is much good sense in these views: People are attracted to others on the basis of common pursuits and affinities and show mutual practical concern and good will within the context of the friendship. Were the friendship to dissolve, so, too, would the degree and nature of practical concern for the other.

Aristotle has sometimes been criticized for viewing friendship as a kind of mutual admiration society, and this, in part, because of his remark that a friend is "another self" or a "second self" (*NE* 1170b7). But in the context of his larger discussion, his claim is that people can rely on the best sort of friends to critically see themselves. Friends, he insists, are essential for the process of self-knowledge and for sustaining activities with a kind of zest and zeal that would be hard to muster individually (*NE* 1170a4–6). The best kind of friendship, he insists, is a sphere for moral growth and learning throughout life. And it is so, he concedes, even if friendship, as a kind of external good, exposes the individual to risk of loss and vulnerability. Kant's later worry that intimacy might erode self-sufficiency or autonomy is not Aristotle's concern. People's lives would lack luster without friends and loved ones. One misunderstands the nature of human happiness if one arms against the losses that attachments bring.

## EMPATHY AND FRIENDSHIP

However, there is an aspect of friendship that Aristotle never fully articulates, though it is central to a viable conception of friendship. And this is the notion of empathy, or better, mutual empathy. Part of the craving of friendship is to be in synchrony with another. People want their closest friends to track their hearts and minds. They want to know that another can feel their joy or anguish and share concerns and wishes in a way that is psychologically deeper than just formally sharing ends or activities. They

want to know that without too much struggle, a friend can be on the same page and convey that fact in a way that makes it clear that they are understood.

Empathy is an early-twentieth-century psychology word, a Greco translation (from *empathia*) of the German *Einfühlung*, to feel one's way into another. A century and a half earlier, the Scottish moral sentiment theorists David Hume and Adam Smith used the term sympathy to mean something similar. For Hume sympathy is a kind of vicarious arousal, a congruent feeling that allows access into others' minds. His model is mechanical: One is connected as if by a cord. A tug at one end causes a reverberation at the other. In this way, one "catches" another's feelings, as if by contagion. Adam Smith proposed a more cognitive account: Feeling another's pain or anguish through an act of imagination; to trade "places in fancy" (1968, p. 4). And this requires some analogical reasoning. As he puts it, one brings another's experiences "home" to oneself; bring the case back to one's own "breast" (1968, p. 4-5). More precisely, one conjures up in one's own mind, through associations and memories, what it would be like to stand in the other's shoes. The process, while cognitive, is not emotionally flat. One must feel something of what the other is feeling, "beat time" with the other, as Smith says (1968, p. 140,146,167). Moreover, to really understand the other's mind, it is not enough for imagination to transport *oneself* into *the other's* shoes. One may have to become *the other* in *the other's* shoes. As Smith puts it in one point, one has to "become in some measure same person with him" (1968, p. 4).

Whether one thinks of empathy as congruent feeling or imaginative transport, one expects close friendship to have some degree of attunement of this sort. The demand is not for a friend to be a mind reader of one's most concealed thoughts; that would be both psychologically implausible and, moreover, an invasion of privacy and autonomy. The point is that one wants some sense of being in sync, of being understood by another in a way that truly makes a life shared. Granted, this can become narcissistic—reminiscent of what an infant demands of a parent and what a parent offers an infant as part of the basic formation of the parent-child bond. Thus, shared eye gaze and reciprocal smiling are part of the early moments of learning mutuality. But a touch of this is what most people still wish for into their adult years. The craving seems a reasonable part of close friendship.

## FRIES, JAKOB FRIEDRICH (1773–1843)

Jakob Friedrich Fries, the German critical philosopher, was born in Barby, Saxony. An avowed follower and elaborator of Immanuel Kant’s philosophy, Fries emphasized the analytical, descriptive, and methodological aspects of the critical philosophy as against the constructive and speculative idealism of such contemporaries as K. L. Reinhold, Johann Gottlieb Fichte, Friedrich Schelling, and G. W. F. Hegel. He received his secondary and college education at the Moravian Academy in Niesky. From his Pietistic Moravian background Fries preserved a conviction of the importance of “pure feeling” as a manifestation of “the infinite in the finite.” At Niesky he was given a thorough grounding in mathematics and in the natural sciences. There he was also introduced to a version of Kant’s philosophy based on Reinhold’s, which he early sought to correct and supplement by secretly reading in Kant’s own writings. In 1795 he went to Leipzig, where he studied under the philosopher-physician Ernst Plattner.

The influence of Plattner and of F. H. Jacobi accounts for Fries’s emphasis on the concept of self-observation. From 1797 on, Fries continued his studies in mathematics and physics at Jena, where he also attended Fichte’s lectures. “I listened to Fichte, took notes, then rushed home and wrote rebuttals,” he later recalled. These critical notes were incorporated into his polemical writings. As early as 1798, in the article “Über das Verhältniss der empirischen Psychologie zur Metaphysik” (On the relation of empirical psychology to metaphysics; in *Erhard Schmid’s Psychologische Magazin*, Vol. 3), he argued that the task of philosophy is essentially descriptive rather than speculative.

Following his studies at Jena, Fries served as a private tutor in Switzerland, then returned to Jena as a docent in 1801, submitting a habilitation thesis on intellectual intuition. The polemical tract *Reinhold, Fichte und Schelling* (Leipzig, 1803) established his reputation as a critic of the romantic orthodoxy in German philosophy. From Jena he was called to a professorship in philosophy and mathematics at Heidelberg. That year he published *Wissen,*

*Glaube und Ahndung* (Knowing, faith and presage; Jena, 1805), a popular exposition of his doctrine of a threefold approach to reality. This was followed, during the years 1806–1807, by his chief work, the three-volume *Neue Kritik der Vernunft* (New critique of reason; Heidelberg, 1807; 2nd ed., *Neue oder anthropologische Kritik der Vernunft*, Heidelberg, 1828–1831), in which he attempted to correct and restate the Kantian critique of speculative and practical reason as a program of psychological self-observation or “anthropology.”

### PROGRESSIVE POLITICAL VIEWS

A decisive shift in Fries’s career occurred in 1816, when he returned to Jena to a professorship in theoretical philosophy. Under the tolerant and liberal regime of Duke Karl August, he published his *Ethik* (Heidelberg, 1818), a work in which he stressed the ideal of individual liberty and political equality as a consequence of the Kantian doctrine of the dignity proper to a human being. In pamphlets and lectures and at student gatherings during this period, Fries argued for constitutional and representative government, extolled the political wisdom of the “people,” opposed the conservatism of student secret societies, and advocated German unification. This activity, climaxed by his participation in the Wartburg Festival of October 18, 1817—a demonstration by student liberals that included a ceremonial burning of “reactionary” books—inevitably incurred the wrath of the Austrian and Prussian governments. It also elicited scornful comments from the politically more orthodox Hegel, who in his *Philosophy of Right* (translated by J. M. Knox, Oxford, 1942) downgraded Fries as “a ringleader of those hosts of superficiality, of these self-styled ‘philosophers,’” and attacked his Wartburg speech as “the quintessence of shallow thinking ... a broth of ‘heart, friendship, and inspiration.”” By 1819 the conservative opposition had prevailed upon Karl August, and Fries was suspended from his position at Jena. He had earlier lost hope that he would be offered the chair of philosophy at Berlin, which in 1818 went to Hegel.

Although Fries was eventually allowed to resume teaching at Jena (he taught science from 1824 and philosophy from 1825 on) and held this post until his death, the 1819 suspension was the final turn in his estrangement and isolation from the intellectual currents of the period. From then on, supported by a small following, he devoted his life to studies of mathematics, physics, and psychology, to systematization of his metaphysics and ethics, and to a rewriting of the history of philosophy on the theme of “progress in scientific development.” To this period

belong *Die mathematische Naturphilosophie* (Heidelberg, 1822); *System der Metaphysik* (Heidelberg, 1824); *Handbuch der psychischen Anthropologie* (2 vols., Jena, 1820 and 1821); and *Die Geschichte der Philosophie* (2 vols., Halle, 1837–1840).

### APPROACHES TO REALITY

Fries followed Immanuel Kant in the overall architectonic of his philosophy and in specific doctrines. Corresponding to Kant's three Critiques, he distinguished three approaches or attitudes toward reality—knowing, faith, and presage, or presentiment (*Ahndung*). We know things only as appearances to a peculiarly human sensibility and understanding. But we have faith in the reality of a world of real moral agents under eternal moral laws. Our understanding is aware of this world only negatively, as a limitation of the empirical world, through the Ideas of Reason. Finally, through presage or presentiment, a pure and disinterested feeling akin to the experience of the beautiful and the sublime, we are given the assurance that the world of appearances and the real world are not two worlds but one, and that the former is a manifestation of the latter—a finite projection of the infinite into the finite.

### TYPES OF KNOWLEDGE

Within the sphere of knowing, Fries distinguished two levels: original or immediate knowledge, and reflective or mediate knowledge. The types of mediate knowledge are given in the Kantian forms of judgment: analytic, synthetic a posteriori, and synthetic a priori. We must also distinguish three types of immediate knowledge. An empirical intuition is a direct awareness of the sensory given; a pure intuition is a direct awareness of space and time as empty containers of sensible entities; and an immediate metaphysical cognition is the direct but non-intuitive awareness of principles involving the categories of the understanding (for example, the principle of causality or the principle of the permanence of substance). No attempt to reduce cognitions of the second and third types to cognitions of the first type can ever succeed. Space and time are the forms of our empirical intuitions; the categories are the forms of human understanding. Fries thus shared with Kant the critical solution of the problem of a priori knowledge. He also shared with Kant the rejection of both the empiricist and the intellectual intuitionist solutions of the problem.

### METAPHYSICAL KNOWLEDGE

Fries departed from Kant, however, in his interpretation of the basis for the critical solution in the case of a priori metaphysical knowledge. Fries found inconsistency and circularity in Kant's attempt to validate categories and to "prove" the principles of the understanding by referring them to "the possibility of experience." If these are indeed principles, no proof could be required and none would be sufficient. Kant succumbed, in Fries's judgment, to the ancient rationalist prejudice that everything can be proved and that all truths can be reduced to a single principle—in Kant's case, the concept of possible experience. All that is possible, Fries objected, is to display the status of certain cognitions *as a priori* and necessary. "I do not prove," he explained, "that all substance is permanent; rather I point to the fact that the principle of the permanence of substance lies in every finite mind" (*Neue oder anthropologische Kritik der Vernunft*, 2nd ed., Vol. I). In Kant's language, only a "metaphysical deduction" (the answer to the question, "What is the case?") is possible.

### DISCOVERY OF METAPHYSICAL PRINCIPLES

The regression to metaphysical principles is not an easy task, for unlike empirical and pure intuitions, which are clear and readily available to consciousness, metaphysical principles lie "concealed and obscure" in the depths of human reason. Fries described this regression as a process of self-observation or "psychic anthropology," and likened it to experimental physics insofar as the latter aims to discover the general law involved in specific physical phenomena. Kant, accordingly, misunderstood the function of critical philosophy and the status of the judgments that constitute it, for whereas the truths that critical philosophy aims to uncover are nonempirical and necessary, the critique itself is empirical and fallible. Fries admired the long "subjective" deductions of the categories in the first edition of Kant's *Critique of Pure Reason* but was skeptical of the short "objective" deductions of the second edition.

### PROOF

A complete theory of proof must, therefore, distinguish three kinds: (1) demonstration, or the reduction of a "reflective" or "mediate" cognition to an intuition (pure or empirical); (2) proof, or the reduction of one mediate cognition to another; and (3) deduction, or a regressive analysis that traces a given cognition to its ground in immediate metaphysical knowledge. Just as in the case of demonstration, in which no question can arise concern-

ing the validity of the intuitions themselves, so too, in the case of deduction, no question can possibly arise as to the validity of our immediate metaphysical knowledge. A deduction is, of course, something fallible; closer scrutiny may later reveal a disparity between a given cognition and its supposed ground. But the same danger exists for demonstration—in this case minimally.

## TRUTH

Truth is a matter of correspondence between thought and object, but the object is not something transcendent; it is simply an immediate cognition. Truth is a relation between two levels of cognition. With regard to immediate knowledge itself we must accept the principle of “Reason’s self-reliance” (*Selbstvertrauen der Vernunft*), that is, that we possess such knowledge and that it is intrinsically valid.

## FRIES’S “PSYCHOLOGISM”

Fries’s restatement of the Kantian deduction has often been attacked as psychologism. If psychologism is understood as the attempt to find the validity of human beliefs in their psychological causes and in the laws of association, the charge is unfair. Fries was not a proponent of psychologism in that sense: For him, the validity of immediate knowledge lay in its logical character, universality, and necessity, not in its causal origins. Indeed, Fries wrote critically against such contemporary advocates of psychologism as Friedrich Eduard Beneke, with whom he was sometimes mistakenly compared. At the same time, he did seem to suggest that logical character can be gathered from mere psychological observation of our mental processes. And in this connection he has been justly criticized for confusing a mental act with its logical content. Certainly the process that Fries described as “anthropology” would be more accurately described today as “logical” or “phenomenological” analysis. Fries was perhaps misled by the analogy between a logical regress to presuppositions in philosophy and the heuristic regress (induction) to general hypotheses and theories in physics.

## SCIENCE AND MATHEMATICS

In the fields of mathematics, physics, and psychology, Fries’s thought was highly original and expertly worked out. He had a clear conception of a philosophy of mathematics and physics as an independent discipline, and anticipated the modern distinction between a theory and a metatheory. In his theory of nature he attacked Kant’s concessions to teleology and argued for a thoroughgoing

mechanism that would also encompass the biological sciences. His psychological investigations extended into the study of pathological phenomena. He took note of the distinction between inherited and acquired, as well as between continuous and periodic, mental disorders and argued for the physiological basis of mental illness—concepts that were by no means as current in Fries’s time as they are in ours and that were unfortunately ignored by the psychiatric practitioners of his day.

## FRIES’S INFLUENCE

Fries was succeeded at Jena by his pupil E. F. Apelt, who published a masterly textbook of Friesian metaphysics and in 1847 established the journal *Abhandlungen der Fries’schen Schule*, which served for two years as a forum for critical, scientifically oriented philosophy. There was a revival of interest in Fries and in his approach to Kant in the years preceding and immediately following World War I, centering about Leonard Nelson at Göttingen, who shared Fries’s scientific outlook and reacted to the idealist Neo-Kantian orthodoxy in the German universities of his time much as Fries had reacted to Fichte, Schelling, and Hegel. The theologian Rudolf Otto, an early associate of Nelson, developed Fries’s concept of “presage” in his influential book *Das Heilige* (*The Idea of the Holy*, Gotha, 1917). In 1904 Nelson established a new series of the *Abhandlungen der Fries’schen Schule* of which six volumes appeared before publication was discontinued in 1937. National Socialism proved itself as inimical to Nelson’s school as Klemens von Metternich’s political reaction had been to Fries’s. In 1958 Julius Kraft, a student of Nelson’s, founded the philosophical journal *Ratio* as a continuation of the *Abhandlungen*.

Although Fries’s influence was and remains limited, part of the interest that his philosophy holds for the modern reader lies in its analogues with, and anticipations of, positions and problems that were central in twentieth-century thought, especially in England and the United States. There is, first, an obvious but quite unexplored analogy between Fries’s psychological method and Edmund Husserl’s phenomenology. Moreover, the view that metaphysical principles can only be exhibited as such but not proved has been variously defended by R. G. Collingwood and by representatives of the Oxford school of linguistic analysis. There are also apparent counterparts of Fries’s “self-reliance of Reason” in G. E. Moore’s appeal to common sense, in the positivists’ appeal to a level of incorrigible knowledge, and in Ludwig Wittgenstein’s famous dictum that “the propositions of our ordinary language are in perfect order.” Indeed, the question

of the status of the propositions employed by the critical or analytical philosopher, which was first raised by Fries, has come under much discussion in recent years, under the heading “the problem of analysis.”

## Bibliography

### WORKS BY FRIES

- A list of all Fries's writings will be found in *Abhandlungen der Fries'schen Schule*, n.s., 6 (1937): 473–495.
- With G. König and Lutz Geldsetzer. *Sämtliche Schriften*. Aalen: Scientia Verlag, 1967.
- With D. Z. Phillips. *Dialogues on Morality and Religion*. Totowa, NJ: Barnes & Noble, 1982.
- With Frederick Gregory. *Knowledge, Belief, and Aesthetic Sense*. Köln: Jürgen Dinter, Verlag für Philosophie, 1989.
- On Fries's life and writings, the fundamental work remains E. L. T. Henke, *Jakob Friedrich Fries* (Leipzig, 1867). The last detailed study of Fries's theory of knowledge is in Alfred Kastil, *Fries' Lehre von der Unmittelbaren Erkenntnis*, a monograph that constitutes *Abhandlungen der Fries'schen Schule* 4 (1912). For a short critical assessment of the same subject, see Ernst Cassirer, *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit* (Berlin, 1923), Vol. III, Ch. 7. A stimulating but partisan account of Fries's philosophy will be found in Leonard Nelson, *Fortschritte und Rückschritte der Philosophie* (Frankfurt, 1962). In connection with Fries's theory of law and religion, especially interesting are Julius Kraft, *Die Methode der Rechtstheorie in der Schule von Kant und Fries* (Berlin, 1924) and Rudolf Otto, *Kantisch-Fries'sche Religionsphilosophie und ihre Anwendung auf die Theologie* (Tübingen: Mohr, 1909), translated by E. B. Dicker as *The Philosophy of Religion Based on Kant and Fries* (London: Williams and Norgate, 1931).

## FROEBEL, FRIEDRICH (1782–1852)

Friedrich Froebel, the German philosopher of education, was born at Oberweissbach in Thuringia. He studied forestry and related fields at the University of Jena, came in contact with Johann Heinrich Pestalozzi in 1808, and

participated as a volunteer in the war of liberation against Napoleon Bonaparte. In 1816 he established a school, which soon was moved from Griesheim to Keilhau, and in 1837 he founded his first kindergarten at Blankenburg in Thuringia, which became the model of many similar institutions. However, these institutions had to be closed in Prussia in 1851 because the government, as well as the clergy, suspected Froebel of liberal political and religious leanings. The prohibition lasted for ten years, but afterward the kindergarten movement spread rapidly throughout the European countries.

Froebel's whole educational theory and practice was determined by his conviction of the ultimate oneness of life, of nature and spirit. According to him it is the destiny of all things to unfold their divine essence and to reveal God in their transient being.

As Froebel's autobiography shows, he was, as a child, deeply troubled by the contrast between “spirit” and “the flesh” in the Christian supernaturalism and moralistic dualism of his father, a pastor, until he discovered the pervasive beauty of nature and the mystery of sex life in the whole creation. His conviction about the inner unity of the cosmos was confirmed by his scientific studies, his reading of the Zend-Avesta, and his acquaintance with Friedrich Schelling's philosophy of identity.

In conformity with his metaphysics, Froebel conceived of education as a continuation of the world's unceasing evolution on the level of consciousness, with the child's play being the first sign of life's urge toward purposeful activity. Thus, he wrote in *The Education of Man* (pp. 1ff.), “Education consists in leading man, as a thinking, intelligent being, growing into self-consciousness, to a pure, unsullied, conscious and free representation of the inner law of divine unity, and in teaching him means thereto.” Out of respect for the “inner law of unity” or for life as an “unbroken whole in all its operations and phenomena” (*The Education of Man*, p. 238), the educator should organize the instructional process in such a way that the order of the subjects to be taught supports the learner's inner development, while the whole program of studies should help the student to realize the reflection of the unity of life in the unity of knowledge.

Froebel's educational principles may be summarized as follows:

- (1) That the development of nature reveals itself in the development of the individual mind should be demonstrated in the teaching of science, the humanities, and religion.

- (2) Education should be structured to harmonize with the natural inner development of the pupil.
- (3) Education should unfold the whole man in each person. Religion should be taught in order to cultivate the emotions, nature should be studied because it is the self-revelation of God, and mathematics should be appreciated as the symbol of universal order. Language, too, connects man with the order and rhythm of things and should therefore take its part in education.
- (4) The arts should be taught, for art is a general human talent and conducive to the harmonious unfolding of a person's inner life.

The central theme in Froebel's educational work is most evident in *The Education of Man*, which presents a unique attempt to provide an ontological explanation of the process of human learning.

Historically, Froebel must be understood as being in the tradition of John Comenius, Jean-Jacques Rousseau, and Pestalozzi. His ideas have been criticized for many and sometimes contradictory reasons: for their pantheistic naturalism, their romanticism, their individualism and neglect of discipline, their sentimentality and their one-sided emphasis on early childhood. But there can be no doubt that the work with which his name is mainly connected, the kindergarten, has been an inestimable blessing to humankind, and many of his psychological insights, like those of Pestalozzi, have been increasingly confirmed by modern psychology.

## FRYE, MARILYN

(1941–)

Marilyn Frye, American feminist philosopher, was born in Tulsa, Oklahoma. She earned her bachelor's degree in philosophy from Stanford University in 1963, and her doctorate in philosophy at Cornell University in 1969, where she worked under the supervision of the analytic philosopher Max Black. She taught at the University of Pittsburgh, the University of Michigan, and the University of Washington before taking up a position at Michigan State University, where she was tenured in 1978, promoted to professor in 1983, and named University Distinguished Professor in 2003, the position she currently holds. Frye has held fellowships at the Center for the Study of Women in Society at the University of Oregon, the Center for Advanced Feminist Studies at the University of Minnesota, and the National Humanities Center in North Carolina. In 2001 she was awarded the Distinguished Woman Philosopher Award by the Society for Women in Philosophy.

Frye's writings reflect the analytic philosophical style of conceptual analysis and display clear, concise, jargon-free writing, though she applies this to subjects beyond the pale of the narrow world of analytic philosophy. Frye's dissertation, "Meaning and Illocutionary Force," and her first several articles in philosophy were on topics in philosophy of language. Subsequently she turned to topics in feminist philosophy, especially sexism, lesbianism, and racism, and it is in this field that she has made her most important contributions to philosophy. Frye expresses unusual commitment to bringing about social change through her writings. Moreover, she expresses herself with a pragmatic urgency frequently lacking in most professional philosophy, and she also makes exceptionally clear the time-bound and culture-bound nature of such change.

Frye's book *The Politics of Reality* (1983) begins with one of her most important and most often reprinted essays: "Oppression." In this essay she seeks to clarify the term "oppression" and how women can be said to be oppressed. Oppression, on her analysis, is a network of (often microscopic) forces that bind and confine certain social groups within a defined place so as to benefit a privileged social group. She analogizes oppression to a birdcage, which is macroscopic and visible, even though each of the wires of the cage is itself small and seemingly inconsequential in itself. Frye describes two characteristic features of women's oppression. First, women hold positions that simultaneously make them responsible yet

powerless to effect decisions to carry out their responsibilities successfully. Second, women internalize and self-police their limitations and restrictions. While men also face social restrictions (e.g., they cannot cry in front of other men), their restrictions are a part of a system that oppresses women and privileges men. In her essay “Sexism,” Frye defines “sexism” as an institutional term characterizing social structures that “create and enforce the elaborate and rigid patterns of sex-marking and sex-announcing which divide the species, along the line of sex, into dominators and subordinates” (1983, p. 38). She uses the term “male-chauvinism” to describe the personal relations that men engage in as dominators with women as subordinates. Most of the essays of the book are devoted to illuminating the social and personal relations that serve to oppress women.

In her writings, Frye illuminates the oppression of sexual minorities by heterosexuals and the oppression of minority races, and she connects these to the project of feminism. In two essays in her first book and in the majority of the essays of her book *Willful Virgin: Essays in Feminism* (1992), Frye takes up the theme of heterosexism as manifested in feminism and society at large. She carefully describes and analyzes the myriad ways in which heterosexuality is taken to be normative. In her essay “Willful Virgin, or Do You Have to Be a Lesbian to Be a Feminist,” Frye argues, “The central constitutive dynamic and key mechanism of the global phenomenon of male domination, oppression and exploitation of females is near-universal female heterosexuality” (1992, p. 129). By the term “female heterosexism” she refers not to a preference to engage in heterosexual sex, but rather to the worship of men and maleness that heterosexuality has traditionally required of women. That is, sexism exists because most women willingly tolerate being subordinate to and serving men. Furthermore, because women are subordinate to “their” men, they often comply with whatever other oppression their men perpetrate, such as racism, classism, and ethnic oppression. Thus, not participating in the patriarchal institution of female heterosexuality is an important kind of resistance to oppression generally.

Frye also devotes particular attention to the struggle against racism. She notes that acting White is a way of being privileged, yet for women, acting White consists largely of conformity to white men’s expectations of chastity, obedience, and decorum, does not offer any solace to white women, and serves only to separate them from other women. Thus for Frye, Whiteness, heterosex-

uality, and sexism are bound together in ways that institute and enforce patriarchy.

## FUNCTIONALISM

“Functionalism” is one of the major proposals that have been offered as solutions to the mind-body problem. Solutions to the mind-body problem usually try to answer questions such as: What is the ultimate nature of the mental? At the most general level, what makes a mental state mental? Or more specifically, what do thoughts have in common in virtue of which they are thoughts? That is, what makes a thought a thought? What makes a pain a pain? Cartesian dualism said the ultimate nature of the mental was to be found in a special mental substance. Behaviorism identified mental states with behavioral dispositions; physicalism, in its most influential version, identifies mental states with brain states. Functionalism says that mental states are constituted by their causal relations to one another and to sensory inputs and behavioral outputs. Functionalism is one of the major theoretical developments of twentieth-century analytic philosophy, and provides the conceptual underpinnings of much work in cognitive science.

Functionalism has three distinct sources. First, Hilary Putnam and Jerry Fodor saw mental states in terms of an empirical computational theory of the mind. Second, John Jamieson Carswell Smart’s “topic neutral” analyses led David M. Armstrong and David Lewis to a functionalist analysis of mental concepts. Third, Ludwig Wittgenstein’s idea of meaning as use led to a version of functionalism as a theory of meaning, further developed by Wilfrid Sellars and later Gilbert Harman.

One motivation behind functionalism can be appreciated by attention to artifact concepts such as *carburetor*, and biological concepts such as *kidney*. What it is for something to be a carburetor is for it to mix fuel and air in an internal combustion engine—*carburetor* is a functional concept. In the case of the kidney, the *scientific* concept is functional—defined in terms of a role in filtering the blood and maintaining certain chemical balances.

The kind of function relevant to the mind can be introduced via the parity-detecting automaton illustrated in the following figure, which tells us whether it has seen an odd or even number of “1”s. This automaton has two states,  $S_1$  and  $S_2$ ; one input, “1” (though its input can be nothing) and two outputs, it utters either the word “Odd” or “Even.” The table describes two functions, one from input and state to output, and another from input and state to next state. Each square encodes two conditionals specifying the output and next state given both the current state and input. The left box says that if the machine is in  $S_1$  and sees a “1,” it says “odd” (indicating that it has seen an odd number of “1”s) and goes to  $S_2$ . The right box says, similarly, that if the machine is in  $S_2$  and sees a “1,” it says “even” and goes back to  $S_1$ .

Now suppose we ask the question: “What is  $S_1$ ?” The answer is that the nature of  $S_1$  is entirely relational, and entirely captured by the table. We could give an explicit characterization of “ $S_1$ ” as follows:

Being in  $S_1$  = being in the first of two states that are related to one another and to inputs and outputs as follows: Being in one of the states and getting a “1” input results in going into the second state and emitting “Odd”; and being in the second of the two states and getting a “1” input results in going into the first and emitting “Even.”

Making the quantification over states more explicit:

Being in  $S_1$  = Being an  $x$  such that  $\exists P \exists Q$  [If  $x$  is in  $P$  and gets a “1” input, then it goes into  $Q$  and emits “Odd”; if  $x$  is in  $Q$  and gets a “1” input it gets into  $P$  and emits “Even” &  $x$  is in  $P$ ] (Note: Read “ $\exists P$ ” as “There is a property  $P$ .”)

This illustration can be used to make a number of points. (1) According to functionalism, the nature of a mental state is just like the nature of an automaton state: constituted by its relations to other states and to inputs and outputs. All there is to  $S_1$  is that being in it and getting a “1” input results in such and such, and so forth. According to functionalism, all there is to being in pain is that it disposes you to say “ouch,” wonder whether you are ill, it distracts you, and so forth. (2) Because mental states are like automaton states in this regard, the illustrated method for defining automaton states is supposed to work for mental states as well. Mental states can be totally characterized in terms that involve only logicomathematical language and terms for input signals and behavioral outputs. Thus functionalism satisfies one of the desiderata of behaviorism, characterizing the mental in entirely nonmental language.

(3)  $S_1$  is a second-order state in that it consists in having other properties, say mechanical or hydraulic or electronic properties, that have certain relations to one another. These other properties, the ones quantified over in the definitions just given, are said to be the realizations of the functional properties. So, although functionalism characterizes the mental in nonmental terms, it does so only by quantifying over realizations of mental states, which would not have delighted behaviorists. (4) One functional state can be realized in different ways. For example, an actual metal and plastic machine satisfying the machine table might be made of gears, wheels, pulleys and the like, in which case the realization of  $S_1$  would be a mechanical state; or the realization of  $S_1$  might be an electronic state, and so forth.

(5) Just as one functional state can be realized in different ways, one physical state can realize different functional states in different machines. This could happen, for example, if a single type of transistor were used to do different things in different machines. (6) Since  $S_1$  can be realized in many ways, a claim that  $S_1$  is a mechanical state would be false (at least arguably), as would a claim that  $S_1$  is an electronic state. For this reason, there is a strong case that functionalism shows physicalism is false: If a creature without a brain can think, thinking cannot be a brain state. (But see the section on functionalism and physicalism below.)

The notion of a realization deserves further discussion. In the early days of functionalism, a first-order property was often said to realize a functional property in virtue of a 1-1 correspondence between the two realms of properties. But such a definition of realization produces far too many realizations. Suppose, for example, that at  $t_1$

we shout “one” at a bucket of water, and then at  $t_2$  we shout “one” again. We can regard the bucket as a parity-detecting automaton by pairing the physical configuration of the bucket at  $t_1$  with  $S_1$  and the heat emitted or absorbed by the bucket at  $t_1$  with “odd”; by pairing the physical configuration of the bucket at  $t_2$  with  $S_2$  and the heat exchanged with the environment at  $t_2$  with “even”; and so on. What is left out by the post hoc correlation way of thinking of realization is that a true realization must satisfy the *counterfactuals* implicit in the table. To be a realization of  $S_1$ , it is not enough to lead to a certain output and state given that the input is a “1”; it is also required that had the input been a “0,” the  $S_1$  realization would have led to the other output and state. Satisfaction of the relevant counterfactuals is built into the notion of realization mentioned in (3) above.

Suppose we have a theory of mental states that specifies all the causal relations among the states, sensory inputs, and behavioral outputs. Focusing on pain as a sample mental state, it might say, among other things, that sitting on a tack causes pain, and that pain causes anxiety and saying “ouch.” Agreeing for the sake of the example to go along with this moronic theory, functionalism would then say that we could define “pain” as follows: being in pain = being in the first of two states, the first of which is caused by sitting on tacks, which in turn causes the other state and emitting “ouch.” More symbolically

Being in pain = Being an  $x$  such that  $\exists P \exists Q$  [sitting on a tack causes  $P$  &  $P$  causes both  $Q$  and emitting “ouch” &  $x$  is in  $P$ ]

More generally, if  $T$  is a psychological theory with  $n$  mental terms of which the 17th is “pain,” we can define “pain” relative to  $T$  as follows (the “ $F_1$ ” ... “ $F_n$ ” are variables that replace the  $n$  mental terms, and  $i_1$ , etc. And  $o_1$ , etc. indicates):

Being in pain = Being an  $x$  such that  $\exists F_1 \dots \exists F_n$   
[ $T(F_1 \dots F_n, i_1, \text{etc.}, o_1, \text{etc.})$  &  $x$  is in  $F_{17}$ ]

In this way, functionalism characterizes the mental in nonmental terms, in terms that involve quantification over realizations of mental states but no explicit mention of them; thus functionalism characterizes the mental in terms of structures that are tacked down to reality only at the inputs and outputs.

The psychological theory  $T$  just mentioned can be either an empirical psychological theory or else a commonsense “folk” theory, and the resulting functionalisms are very different. In the latter case, conceptual functionalism, the functional definitions are aimed at capturing

our ordinary mental concepts. In the former case, “psychofunctionalism,” the functional definitions are not supposed to capture ordinary concepts but are only supposed to fix the extensions of mental terms. The idea of psychofunctionalism is that the scientific nature of the mental consists not in anything biological, but in something “organizational,” analogous to computational structure. Conceptual functionalism, by contrast, can be thought of as a development of logical behaviorism. Logical behaviorists thought that pain was a disposition to pain behavior. But as Peter Geach and Roderick Chisholm pointed out, what counts as pain behavior depends on the agent’s beliefs and desires. Conceptual functionalists avoid this problem by defining each mental state in terms of its contribution to dispositions to behave—and have other mental states.

## FUNCTIONALISM AND PHYSICALISM

Theories of the mind prior to functionalism have been concerned both with (1) what there is, and (2) what gives each type of mental state its own identity, for example what pains have in common in virtue of which they are pains. Stretching these terms a bit, we might say that (1) is a matter of ontology and (2) of metaphysics. Here are the ontological claims: Dualism told us that there are both mental and physical substances, whereas behaviorism and physicalism are monistic, claiming that there are only physical substances. Here are the metaphysical claims: Behaviorism tells us that what pains (for example) have in common in virtue of which they are pains is something behavioral; dualism gave a nonphysical answer to this question, and physicalism gives a physical answer to this question.

Turning now to functionalism, it answers the metaphysical question without answering the ontological question. Functionalism tells us that what pains have in common—what makes them pains—is their function; but functionalism does not tell us whether the beings that have pains have any nonphysical parts. This point can be seen in terms of the automaton described above. In order to be an automaton of the type described, an actual concrete machine need only have states related to one another and to inputs and outputs in the way described. The machine description does not tell us how the machine works or what it is made of, and in particular it does not rule out a machine which is operated by an immaterial soul, so long as the soul is willing to operate in the deterministic manner specified in the table.

In thinking about the relation between functionalism and physicalism, it is useful to distinguish two cate-

gories of physicalist theses: One version of physicalism competes with functionalism, making a metaphysical claim about the physical nature of mental state properties or types (and is thus often called “type” physicalism). As mentioned above, on one point of view, functionalism shows that type of physicalism is false.

However, there are more modest physicalisms whose thrusts are ontological rather than metaphysical. Such physicalistic claims are not at all incompatible with functionalism. Consider, for example, a physicalism that says that every actual thing is made up entirely of particles of the sort that compose inorganic matter. In this sense of physicalism, most functionalists have been physicalists. Further, functionalism can be modified in a physicalistic direction, for example, by requiring that all properties quantified over in a functional definition by physical properties. Type physicalism is often contrasted with token physicalism. (The word *teeth* in this sentence has five letter tokens of three letter types.) Token physicalism says that each pain (for example) is a physical state, but token physicalism allows that there may be nothing physical that all pains share, nothing physical that makes a pain a pain.

It is a peculiarity of the literature on functionalism and physicalism that while some functionalists say functionalism shows physicalism is false, others say functionalism shows physicalism is true. In Lewis’s case, the issue is partly terminological. Lewis is a conceptual functionalist about “having pain.” Having pain on Lewis’s regimentation could be said to be a rigid designator of a functional property. (A rigid designator names the same thing in each possible world. “The color of the sky” is nonrigid, since it names red in worlds in which the sky is red. “Blue” is rigid, since it names blue even in worlds in which the sky is red.) “Pain,” by contrast, is a nonrigid designator conceptually equivalent to a definite description of the form “the state with such and such a causal role.” The referent of this phrase in us, Lewis holds, is a certain brain state, though the referent of this phrase in a robot might be a circuit state, and the referent in an angel would be a nonphysical state. Similarly, “the winning number” picks out “17” in one lottery and “596” in another. So Lewis is a functionalist (indeed a conceptual functionalist) about having pain.

In terms of the metaphysical issue described above—what do pains have in common in virtue of which they are pains—Lewis is a functionalist, not a physicalist. What a person’s pains and the robot’s pains share is a causal role, not anything physical. Just as there is no numerical similarity between 17 and 596 relevant to their

being winning numbers, there is no physical similarity between human and Martian pain that makes them pains. And there is no physical similarity of any kind between human pains and angel pains. However, on the issue of the scientific nature of pain, Lewis is a physicalist. What is in common to human and Martian pain in his view is something conceptual, not something scientific.

## FUNCTIONALISM AND PROPOSITIONAL ATTITUDES

The discussion of functional characterization given above assumes a psychological theory with a finite number of mental state terms. In the case of monadic states like pain, the sensation of red, and so forth, it does seem a theoretical option simply to list the states and their relations to other states, inputs and outputs. But for a number of reasons, this is not a sensible theoretical option for belief-states, desire-states, and other propositional attitude states. For one thing, the list would be too long to be represented without combinatorial methods. Indeed, there is arguably no upper bound on the number of propositions, any one of which could in principle be an object of thought. For another thing, there are systematic relations among beliefs: for example, the belief that John loves Mary and the belief that Mary loves John. These belief states represent the same objects as related to each other in converse ways. But a theory of the nature of beliefs can hardly just leave out such an important feature of them. We cannot treat “believes-that-grass-is-green,” “believes-that-grass-is-blue,” and so forth, as unrelated primitive predicates. So we will need a more sophisticated theory, one that involves some sort of combinatorial apparatus.

The most promising candidates are those that treat belief as a relation. But a relation to what? There are two distinct issues here. One issue is how to state the functional theory in a detailed way. A second issue is what types of states could possibly realize the relational propositional attitude states. Hartry Field and Fodor argue that to explain the productivity of propositional attitude states, there is no alternative to postulating a language of thought, a system of syntactically structured objects in the brain that express the propositions in propositional attitudes. In later work, Fodor has stressed the systematicity of propositional attitudes mentioned above. Fodor points out that the beliefs whose contents are systematically related exhibit the following sort of empirical relation: If one is capable of believing that Mary loves John, one is also capable of believing that John loves Mary. Fodor argues that only a language of thought in the brain could explain this fact.

## EXTERNALISM

The upshot of the famous “twin earth” arguments has been that meaning and content are in part in the world and in the language community. Functionalists have responded in a variety of ways. One reaction is to think of the inputs and outputs of a functional theory as long-arm as including the objects that one sees and manipulates. Another reaction is to stick with short-arm inputs and outputs that stop at the surfaces of the body, thinking of the intentional contents thereby characterized as narrow—supervening on the nonrelational physical properties of the body. There has been no widely recognized account of what narrow content is, nor is there any agreement as to whether there is any burden of proof on the advocates of narrow content to characterize it.

## MEANING

Functionalism says that understanding the meaning of the word *momentum* is a functional state. On one version of the view, the functional state can be seen in terms of the role of the word *momentum* itself in thinking, problem solving, planning, and so forth. But if understanding the meaning of *momentum* is this word’s having a certain function, then there is a very close relation between the meaning of a word and its function, and a natural proposal is to regard the close relation as simply identity, that is, the meaning of the word just *is* that function. Thus functionalism about content leads to functionalism about meaning, a theory that purports to tell us the metaphysical nature of meaning. This theory is popular in cognitive science, where in one version it is often known as procedural semantics, as well as in philosophy where it is often known as conceptual role semantics. The theory has been criticized (along with other versions of functionalism) by Putnam, Fodor, and E. LePore.

## HOLISM

Ned Block and Fodor noted the “damn/darn” problem. Functional theories must make reference to any difference in stimuli or responses that can be mentally significant. The difference between saying “damn” and “darn” when you stub your toe can, in some circumstances, be mentally significant. So the different functionalized theories appropriate to the two responses will affect the individuation of every state connected to those utterances, and for the same reason, every state connected to those states, and so on. His pains lead to “darn,” hers to “damn,” so their pains are functionally different, and likewise their desires to avoid pain, their beliefs that interact with those desires, and so on. Plausible assumptions lead to the con-

clusion that two individuals who differ in this way share almost nothing in the way of mental states. The upshot is that the functionalist needs a way of individuating mental states that is less fine-grained than appeal to the whole theory, a molecularist characterization. Even if one is optimistic about solving this problem in the case of pain by finding something functional in common to all pains, one cannot assume that success will transfer to beliefs or meanings, for success in the case of meaning and belief may involve an analytic/synthetic distinction.

## QUALIA

Recall the parity-detecting automaton described at the beginning of this entry. It could be instantiated by two people, each of whom is in charge of the function specified by a single box. Similarly, the much more complex functional organization of a human mind could “in principle” be instantiated by a vast army of people. We would have to think of the army as connected to a robot body, acting as the brain of that body, and the body would be like a person in its reactions to inputs. But would such an army really instantiate a mind? More pointedly, could such an army have pain, or the experience of red? If functionalism ascribes minds to things that do not have them, it is too liberal. W. G. Lycan suggests that we include much of human physiology in our theory to be functionalized to avoid liberalism; that is, the theory T in the definition described earlier would be a psychological theory plus a physiological theory. But that makes the opposite problem, chauvinism, worse. The resulting functional description will not apply to intelligent Martians whose physiologies are different from ours. Further, it seems easy to imagine a simple pain-feeling organism that shares little in the way of functional organization with us. The functionalized physiological theory of this organism will be hopelessly different from the corresponding theory of us. Indeed, even if one does not adopt Lycan’s tactic, it is not clear how pain could be characterized functionally so as to be common to us and the simple organism.

Much of the force of the problems just mentioned derives from attention to phenomenal states like the look of red. Phenomenal properties would seem to be intrinsic to (nonrelational properties of) the states that have them, and thus phenomenal properties seem independent of the relations among states, inputs and outputs that define functional states. Consider, for example, the fact that lobotomy patients often say that they continue to have pains that feel the same as before, but that the pains do not bother them. If the concept of pain is a functional

concept, what these patients say is contradictory or incoherent—but it seems to many of us that it is intelligible.

The chauvinism/liberalism problem affects the characterization of inputs and outputs. If we characterize inputs and outputs in a way appropriate to our bodies, we chauvinistically exclude creatures whose interface with the world is very different from ours—for example, creatures whose limbs end in wheels or, turning to a bigger difference, gaseous creatures who can manipulate and sense gases but for whom all solids and liquids are alike. The obvious alternative of characterizing inputs and outputs themselves functionally would appear to yield an abstract structure that might be satisfied by, for example, the economy of Bolivia under manipulation by a wealthy eccentric, and would thus fall to the opposite problem of liberalism.

It is tempting to respond to the chauvinism problem by supposing that the same functional theory that applies to a person also applies to the creatures with wheels. If they thought they had feet, they would try to act like us, and if we thought we had wheels, we would try to act like them. But notice that the functional definitions have to have some specifications of output organs in them. To be neutral among all the types of bodies that sentient beings could have would just be to adopt the liberal alternative of specifying the inputs and outputs themselves functionally.

## TELEOLOGY

Many philosophers propose that we avoid liberalism by characterizing functional roles teleologically. We exclude the armies and economies mentioned because their states are not for the right things. A major problem for this point of view is the lack of an acceptable teleological account. Accounts based on evolution smack up against the swamp-grandparents problem. Suppose you find out that your grandparents were formed from particles from the swamp that came together by chance. So, as it happens, you do not have any evolutionary history to speak of. If evolutionary accounts of the teleology underpinnings of content are right, your states do not have any content. A theory with such a consequence should be rejected.

## CAUSATION

Functionalism dictates that mental properties are second-order properties, properties that consist in having other properties that have certain relations to one another. But there is at least a *prima facie* problem about how such second-order properties could be causal and explanatory

in a way appropriate to the mental. Consider, for example, provocativeness, the second-order property that consists in having some first-order property (say redness) that causes bulls to be angry. The cape's redness provokes the bull, but does the cape's provocativeness provoke the bull? The cape's provocativeness might provoke an animal protection society, but is not the bull too stupid to be provoked by it?

Functionalism continues to be a lively and fluid point of view. Positive developments in recent years include enhanced prospects for conceptual functionalism and the articulation of the teleological point of view. Critical developments include problems with causality and holism, and continuing controversy over chauvinism and liberalism.

## FUNCTIONALISM IN SOCIOLOGY

In sociology and social anthropology the term “functional analysis” is used not only in the mathematical sense, where a function expresses a correspondence between two variables such that for every value of the one there are one or more determinate values of the other, and the second, or dependent, variable is, in a less technical use of the term, said to be a function of the first. Sociologists, of course, like all scientists, are interested in establishing such dependencies. The term “functional analysis” in their work also has a special connotation analogous to the use of the notion of “function” in describing biological systems or such artifacts as are self-organizing systems—for example, a heat engine with a thermostat. Such a system can be considered as a unitary whole; it is differentiated into elements, and the function of the elements can be said to be the part they play in maintaining the system in a persisting state or (in the case of artifacts) in maintaining the efficiency of the system for the purpose for which it has been set up. There are, however, differences between the use of the notion in sociology and the use as applied to biological and artificial systems, and these have become more apparent as sociologists have worked with and reflected on “functional methods.” The differences hinge on the questions of whether a society should be taken to be a single integrated system or whether it may be so diversified that what is “functional” for one part may not be so for others, and whether the only “end” to which an element of a social system should be shown to contribute is the maintenance of the system as a whole in its environment.

### FUNCTION AND CULTURAL FACTS

Functional notions were used by the pioneers of modern social anthropology and sociology, Émile Durkheim and W. Robertson Smith. The term *functionalism*, however, was first put forward as the name of a special method and approach by Bronislaw Malinowski in the article “Anthropology” in the *Encyclopaedia Britannica* (13th ed., supp. I). The article reads as something of a manifesto, in which functionalism is said to be “the right method” in social anthropology. Functional analysis is said to be “explanation of ... facts ... by the part they play within the integral system of culture, by the manner in which they are related to each other within the system, and by the manner in which this system is related to the physical surroundings. ... The functional view ... insists therefore upon the principle that in every type of civilisation, every

custom, material object, idea and belief fulfils some vital function, has some task to accomplish, represents an indispensable part within a working whole” (ibid., pp. 132–133). Thus, the function of magic is said to consist in its being “a remedy for specific maladjustments and mental conflicts, which culture creates in allowing man to transcend his biological equipment” (ibid., p. 136), and myth is said to perform an “indispensable function” in strengthening the traditions on which a cultural life depends.

These claims for the “functional method” were both vague and grandiose. Later exponents and critics of a functional method in the social sciences have been concerned to state more precisely what it does and what it does not claim to assert. (See especially Merton, 1957, and Nagel, 1956.) Malinowski’s account left the notion of the “needs” to which a function was said to be related insufficiently clear; his use of the word *indispensable* left it uncertain whether the “needs” themselves were indispensable to the society in question or whether the particular cultural item held to be the means of satisfying them was indispensable in the sense of not admitting of a substitute.

Malinowski’s statement of the method was also far more than a recommendation to anthropologists to look for functions; it was a dogmatic assertion that “an object ... appears as ‘inessential,’ ‘arbitrary,’ ‘devoid of function’ only as long as we do not understand the function of that detailed feature or object” (ibid., pp. 138–139). It also implied that every cultural item was necessary to the working of the social system as a whole. Of course, if the social system is defined as the total complex of all its cultural items, this becomes tautological. Malinowski avoided this by speaking of “vital needs” that the elements in the system are held to fulfill. But the notion of “needs,” interpreted biologically and psychologically, is so extremely general that it is not shown why they can be fulfilled only by particular cultural arrangements.

### FUNCTION AND SOCIAL STRUCTURE

The next leading anthropologist to use and also to write about “functional methods” was A. R. Radcliffe-Brown. (See especially his *Structure and Function in Primitive Society*.) Radcliffe-Brown worked with an even more “organic” notion of a society than did Malinowski, since the latter held that practices in a society should be seen as functional for the biological and psychological needs of its *members*, while Radcliffe-Brown was interested in seeing the function of a particular social usage as the contribution it makes to the *total social life*, which is unified as

a social system. Radcliffe-Brown regarded a social system as a set of interconnected features of social life, while he defined a social structure as “an arrangement of persons in institutionally controlled and defined relations.” This definition appears insufficiently abstract: “Social structure” surely should not be used to refer to persons in relationships, but to the distinguishable pattern of recurrent sets of relationships described by social roles. But Radcliffe-Brown’s account helped to link the notion of function with that of structure; that is, the uses studied were not those of separate cultural items, but of persistent forms of social relations, such as those shown in marriage arrangements.

The linking of function with structure helps to strengthen the biological, organic analogy behind this way of thinking. Thus, Radcliffe-Brown spoke of a social system as though it were a unitary whole in which every part is internally related to every other, and where it is possible to speak, by analogy with a biological organism, of the structure as serving a “total life.” Following this analogy, the use so served is seen as the survival of the total society as an ongoing concern. This way of looking on a society was no doubt made more plausible by the fact that the societies so studied were small-scale primitive ones, where the society might seem to be a whole of integrated parts that, it was thought, could be exhaustively enumerated. It becomes much less plausible when applied to larger, more flexible societies comprising a number of subgroups that often are hostile to one another. This may also explain why it appeared that the “function” served was the survival of the society in its traditional given form and why, therefore, functional theory has been held to support a conservative ideology.

### THE CONTEXT OF A FUNCTION

That functional theory need not be conservative was shown by Thomas Merton, who defined its central orientation as “the practice of interpreting data by establishing their consequences for larger structures in which they are implicated.” Merton pointed out that although the notion of function is related to that of some end or need served, this end may not be the perpetuation of the existing social system. Subgroups may have radical interests served by certain social practices that would thus be functional within the context of those interests. Hence, it is not meaningful to speak of a cultural element or institutional practice simply as “functional.” It must be shown to be functional in some specific context and in some specific respect; that is, it must have designated consequences for designated properties of designated units, but these

units need not be “the society as a whole.” However, the notion does presuppose some complex context in which it is possible to show how certain elements have certain consequences contributing to the complex being maintained in a certain state or to the furthering of some interest to which one “function” is related. That an element has such a function relative to such a context or interest can be stated as a matter of descriptive fact, and it need have no ethical implication to the effect that the interest itself (or the function) is thereby commended. Still less need it imply that persons or groups in a society are of consequence only because of such alleged functions.

### EXPLANATIONS AND DESCRIPTIONS

How far can the direction of attention to consequences be a form not only of description but also of explanation? Malinowski spoke of such functional analyses as “explanations,” though he also remarked that explanation, to the scientific thinker, is nothing but the most adequate description of a complex fact (*A Scientific Theory of Culture*, New York, 1944, p. 117). Whether or not this is a satisfactory view of scientific explanation, there remains the question of whether a functional analysis is the most adequate description of a complex fact *tout court*, or rather a description of the effects of certain elements in the complex on certain other elements; that is, a partial description from the point of view of a particular interest. Merton indeed used the word *interpretation*, which is presumably weaker than “explanation,” and he spoke throughout his work of “functional analyses.”

A functional analysis would be an explanation only if the answer to the question “What is the effect of  $x$  in context  $a, b, c$ ?” could also be seen as an answer to the question “Why does  $x$  occur?” or “Why does  $x$  have the character it has?” It could be so put if the effect of  $x$  is the intended effect of an intentional action (the effect of my turning the key is to unlock the door, and the reason I turn the key is to unlock the door); that is, if the explanation is explicitly teleological, so that it is said that  $x$  occurs in order to produce the effect  $y$ .

The interest of sociologists is, however, largely directed to detecting the unintended and unanticipated consequences of actions (what Merton called their “latent” as distinct from their “manifest” functions). In such cases, can an effect  $y$  be cited as an explanation, or partial explanation, answering the question “Why does  $x$  occur?” Can functional statements in contexts where conscious purpose is presumably absent be looked on as explanations? Jonathan Cohen has defined a functional explanation as one in which the fact to be explained, for

example, the beating of the heart, is a necessary condition for that which is cited as explaining it, for example, “to circulate the blood” (“Teleological Explanation,” *PAS* 51 [1950–1951]: 255–292; cf. D. M. Emmet, *Function, Purpose and Powers*, pp. 48ff.)

This definition describes the form of a functional statement, but does it show that it is a different kind of explanation from a causal one? Ernest Nagel claimed that the factual content of such functional statements can be exhaustively translated into causal terms (*Logic without Metaphysics*, pp. 250–251); for example, “the beating of the heart is a necessary condition for maintaining the circulation of the blood.” Similarly Kingsley Davis, in “The Myth of Functional Analysis as a Special Method in Sociology and Anthropology,” maintained that such statements simply assert that certain phenomena have certain consequences. To direct attention to consequences, especially unintended but interconnected consequences, is, he held, the distinctive approach of sociologists. “Functional” analysis is therefore not a special method in sociology, but just sociological method; and the name “functionalism,” as supposedly that of a special movement or school, had better be dropped.

From this it would appear that functional statements can be explanations where they can be interpreted teleologically in terms of purpose; that is, where to say an element in a system has a function is to say that it is as it is because it has been so designed with reference to a purpose for which the system has been set up. Where this reference to purpose cannot be made, functional statements would be a form of causal statement in which the interest is directed not to the cause of a phenomenon itself, but to its effects considered as causes within a wider context. However, the reference to a wider context and the need for this to be a context within which some systematic interconnections can be shown distinguish such statements from those presenting unilinear sequences of cause and effect.

### SELF-REGULATING SYSTEM

Functional statements are also particularly appropriate in those systematic contexts in which “return effects” on the cause itself can be shown; that is, where some of its consequences react back on it, so that the consequences can be invoked to explain, in part at any rate, why it is as it is. Thus, Nagel held that functional statements are most appropriately used in describing self-maintaining or self-regulating systems. His formulation for such systems can be briefly summarized as follows: Let *S* be a system and *E* its environment, and let *S* be functional, self-maintaining,

or directly organized with respect to a trait (property, state, process), *G*. Let *S* undergo a series of alterations terminating in *G*. Let there then be some fairly extensive class of changes either in *E* or in certain parts of *S*. Then, unless *S* contains some mechanism that produces effects compensating for these changes, *S* will cease to exhibit *G* or the tendency to acquire *G*.

The system *S* must be specified to show how its parts are causally relevant to the state *G*, and if the “function” of a part in maintaining *G* against changes is to be cited as a cause of the state of *S*, the return effects of this part on other parts of *S* must be specified. The instantaneous values of the state coordinates must be independent at any given time, although the values of one set at one time will not be independent of those of another set at another given time (that is, the values in one set will change according to previous changes in another set). Nagel held that the relations between the elements in a functional system need to be thus precisely specified, and that very few “functional analyses” in sociology satisfy these requirements.

### LATENT AND MANIFEST FUNCTIONS

Nevertheless, sociologists may be said to produce analyses in which they seek to approximate this model even if they do not entirely satisfy it. This is true particularly where the data studied are shown to have consequences in some larger context, and the consequences are return effects upon the data themselves, so that there is a mutual reinforcement. For instance, Malinowski claimed that the “function” of myths was to strengthen the traditions that help to maintain a social way of life. This may not have been the original reason for the creation of the myth (whatever this may have been, it was said by Malinowski to be sociologically unimportant). But it may be the case that the fact that the myth now performs this perhaps originally unintended function strengthens people’s interest in the myth and its hold upon them, and so serves to perpetuate it. Perhaps in some cases what was a “latent” function of some activity, such as recounting a myth, can thus be made the “manifest” function, the explicit purpose of the activity, without disturbing the disposition of its practitioners to go on doing it. But in some cases this may not be true. When, for instance, Malinowski said that “the function of religion is to relieve anxiety,” or others (such as Radcliffe-Brown) said that the function of religious ritual is to strengthen the will to maintain the common values on which the society depends, it is at least open to question whether the adherents of a religion would be able to go on practicing it if

they came to look on these functions as the “real reason” for doing so. Thus in some cases the change of a latent into a manifest function will be self-frustrating.

Certain conclusions can be drawn. First, it is misleading to speak of *the* function of a practice, belief, or institution *tout court*. It may have *a* function in relation to a certain interest in a certain context, and this itself may be a disfunction in relation to other interests. Thus, the fact that religion can sometimes relieve anxiety might be a disadvantage in contexts where interest lay in religion as a challenge to complacency.

Further, if such statements of “function” are to do more than merely describe consequences, it should be possible to show that the alleged function also reinforces the practice of the activity. But this must not be taken to imply that this is the sole or “real” reason for the practice. Thus, it may well be that, because of the complexity of human motivation, religious practices sometimes (not necessarily or always) relieve anxieties or promote loyalty to common values; if so, this can strengthen inducements to perform them.

The fact that activities performed with one interest in view can have unanticipated consequences in satisfying other interests can add to the survival value of these activities. Thus, Max Weber’s well-known view that there was a nexus between the Calvinistic ethic and the pursuit of capitalist enterprise should not be taken to imply that “the function” of Calvinistic religion was to promote moneymaking (or vice versa), still less that the pursuit of the former was a hypocritical cloak for the latter. Rather, Weber’s view implies that a particular kind of moral outlook, stressing diligence, thrift, and abstinence, was appropriate to the furtherance of capitalist enterprise, so that two independent and strong human interests, the religious and the economic, reinforced each other and thus helped to establish a way of life with considerable survival value. (It is worth noticing that this particular nexus could probably become established only under social and environmental conditions where there were opportunities for the entrepreneur who could save capital. But this is not to interpret these probably necessary conditions as sufficient conditions for explaining the Calvinistic way of life.)

A functional approach in sociology can therefore be taken not as the assumption that every cultural item has a function, but as a directive to watch for “functions,” particularly in the unintended consequences of a form of social action, above all for those functions that react back on the form of social action itself, so as to produce a mutually reinforcing nexus. But the analogy with biolog-

ical or with self-organizing systems must not be pressed too far, since behind forms of social activity are persons or groups capable of entertaining a variety of values and interests. Functional statements in sociology, even if they are not themselves teleological, carry an indirect teleological implication in that if something is said to have a function it has one in relation to some value, interest, or purpose held by some person or group within the society (though not necessarily by the sociologist himself, who may simply be reporting the fact that some form of activity promotes this value). Where no value is stated, the presumption tends to be that what is served is the preservation of the society as an ongoing concern. That it is desirable to preserve the society (though not necessarily just in its existing form) is taken for granted by almost everyone. Thus, when something is said to have a “function” in maintaining the society, although the point is not always recognized, one ingredient in the complex notion of function is a value judgment.

### **Bibliography**

There is an extensive literature discussing functional methods in sociology. Most of it is surveyed by Robert K. Merton, “Manifest and Latent Functions,” in his *Social Theory and Social Structure* (Glencoe, IL: Free Press, 1949; revised and enlarged, 1957), pp. 19–84.

Discussions of the use of functionalism in anthropology up to 1954 are considered by Raymond Firth, “Function,” in *Year Book of Anthropology* (Glencoe, IL, 1956).

See especially Bronislaw Malinowski, “Anthropology,” in *Encyclopaedia Britannica*, 13th ed., supplement I (Chicago, 1926); A. R. Radcliffe-Brown, *Structure and Function in Primitive Society* (London: Cohen and West, 1952), which contains some papers and addresses written some 20 years before publication; and Talcott Parsons, *Essays in Sociological Theory, Pure and Applied* (Glencoe, IL: Free Press, 1957).

Other discussions include Ernest Nagel, “Formalization of Functionalism,” in his *Logic without Metaphysics* (Glencoe, IL: Free Press, 1957), pp. 247–283, and *The Structure of Science* (New York: Harcourt Brace, 1961), pp. 520–535; D. M. Emmet, *Function, Purpose and Powers* (London, 1957); Kingsley Davis, “The Myth of Functional Analysis as a Special Method in Sociology and Anthropology,” in *American Sociological Review* 24 (1959): 757ff.; C. G. Hempel, “The Logic of Functional Analysis,” in *Symposium on Sociological Theory*, edited by Llewellyn Gross (Evanston, IL: Row, Peterson, 1959).

## FUZZY LOGIC

“Fuzzy logics” are multivalued logics intended to model human reasoning with certain types of imprecision. The field of fuzzy logic originated with a 1965 paper by Lotfi Zadeh, a professor of engineering at the University of California, Berkeley. It is significant that the inventor of fuzzy logic was neither a philosopher nor a linguist. Since 1965 research in fuzzy logic has always had an engineering and mathematical bent, while the philosophical foundations of fuzzy logic have always been under attack.

Many different formal systems have been proposed under the general name of fuzzy logic, but there is wide acceptance that the fundamental principles of fuzzy logic are

$$(1) \quad t(A \wedge B) = \min\{t(A), t(B)\}$$

$$(2) \quad t(A \vee B) = \max\{t(A), t(B)\}$$

$$(3) \quad t(\neg A) = 1 - t(A).$$

In these axioms  $A$  and  $B$  represent arbitrary propositions. The truth value of  $A$ , a real number between 0 and 1, is denoted  $t(A)$ . The first axiom above says that the truth value of  $A \wedge B$  is the lesser of the truth value of  $A$  and the truth value of  $B$ . The second and third axioms concerning disjunction and negation are to be understood similarly.

At the same time that Zadeh introduced fuzzy logic, he also introduced fuzzy set theory, a variant of naive set theory (i.e., everyday set theory as opposed to a foundational set theory such as the Zermelo-Fraenkel axioms) with the basic axioms

$$(1) \quad \mu(x \in P \cap Q) = \min\{\mu(x \in P), \mu(x \in Q)\}$$

$$(2) \quad \mu(x \in P \cup Q) = \max\{\mu(x \in P), \mu(x \in Q)\}$$

$$(3) \quad \mu(x \in P^c) = 1 - \mu(x \in P).$$

Here  $\mu(x \in P)$  denotes the degree to which  $x$  is a member of the set  $P$ . Since 1965 many branches of mathematics have been generalized along fuzzy set theory lines.

There are two fundamental differences between fuzzy logics and conventional logics such as classical predicate calculus or modal logics. Although these differences are technical, they are of considerable philosophical significance. First, conventional logics (except intuitionistic logics) require for every proposition that either it or its negation be true, that is, that  $t(A \vee \neg A) = 1$  in fuzzy logic notation. In fuzzy logics this “law of the excluded middle” does not hold. Second, there is no consensus about a

semantics for fuzzy logic that is well-defined independently of its proof theory, that is, the inferential axioms given above. In contrast, conventional logics have well-accepted semantics, for example Tarskian model theory for predicate calculus, and Kripkean possible worlds semantics for modal logics.

Fuzzy logics are claimed to be capable of representing the meanings of intrinsically imprecise natural language sentences, such as “Many Texans are rich,” for which the law of excluded middle fails. There is disagreement as to whether fuzzy methods successfully represent the complexities of concepts such as “many” and “rich.” What is clear is that the rules of fuzzy logic cannot be used for reasoning about frequentist or subjective types of uncertainty, whose properties are captured by standard probability theory. The central issue here is that the probability of a compound proposition such as  $A \wedge B$  is not a function just of the probabilities of the propositions  $A$  and  $B$ : The probability of  $A \wedge B$  also depends on the relationship between the propositions  $A$  and  $B$ , in particular on their independence or correlation.

The tolerance for ambiguity found in fuzzy logic, and specifically the rejection of the law of the excluded middle, is a revolutionary idea in mathematical logic. Some advocates of fuzzy logic claim that tolerance for ambiguity is also revolutionary philosophically, since Western philosophy, from Plato through René Descartes, has supposedly been an intrinsically dualistic tradition. According to this argument, fuzzy logic has been better received in Japan and other Asian countries than in the West because of the holistic, subtle nature of the Eastern intellectual tradition. Apart from the dualistic oversimplification of the distinction between “Western” and “Eastern” thought, this claim also ignores the continuous holistic tradition in European philosophical thought, from Zeno through Blaise Pascal to Martin Heidegger and Ludwig Wittgenstein.

There has been much artificial intelligence research on using fuzzy logic for representing real-world knowledge, and there has been some recent convergence between this work and parallel work by a distinct research community on knowledge representation using classical logics, nonmonotonic logics, and probability theory. So far this research has remained almost exclusively theoretical. In contrast, engineering work on using fuzzy logic for controlling complex machines heuristically has been highly successful in practice.

A fuzzy controller is a device, usually implemented as software for an embedded microprocessor, that continually monitors readings from sensors, and makes decisions

about actuator settings. For example, a controller for the automatic transmission of a car monitors road speed, the position of the accelerator pedal, and other factors, and decides whether to shift gears down or up, or not to shift. The knowledge possessed by a fuzzy controller is typically represented as rules such as

$$\mu(\text{speed}, \text{MODERATE}) \wedge \mu(\text{pedal}, \text{FULL-DOWN}) \rightarrow \mu(\text{shift}, \text{DOWN})$$

Here *speed* and *pedal* are sensory readings, *shift* is a possible actuator setting, and MODERATE, FULL-DOWN, and DOWN are fuzzy sets. Through inference rules for the fuzzy connectives  $\wedge$  and  $\rightarrow$ , the degree of membership of *speed* in MODERATE and of *pedal* in FULL-DOWN determines the desired degree of membership of *shift* in DOWN. Given a set of rules, a fuzzy controller continually computes the degree to which the antecedents of each rule are satisfied, and selects a conclusion that is the weighted average of the conclusion of each rule, where rules are weighted using these degrees.

Fuzzy controllers are widely used for two basic reasons. First, since the action chosen at each instant is typ-

ically the result of interpolating several rules, their behavior is smooth. Second, fuzzy controller rule sets are easy for humans to read and understand intuitively, hence easy to construct by trial and error.

## GADAMER, HANS-GEORG

(1900–2002)

Hans-Georg Gadamer, a Heidelberg philosopher and student of Martin Heidegger, is best known for his hermeneutic philosophy put forward in his *Wahrheit und Methode* (*Truth and Method*, 1960). Widely regarded as the most significant German philosopher after Heidegger, Gadamer wrote on Plato, Georg Wilhelm Friedrich Hegel, Heidegger, Aristotle's practical philosophy, reason in an age of science, aesthetics, poetics, Paul Celan, and other topics.

### BIOGRAPHY

Gadamer was born in Marburg and grew up in Breslau. His mother died when he was four. His father was a well-known university research scientist in pharmacological chemistry. In 1919 Gadamer's father was called from the University of Breslau to a research chair at the University of Marburg. Gadamer entered Marburg as a second-year student with interests in literature, art history, and classical philology. But he was soon drawn to the great neo-Kantian philosopher and Platonist, Paul Natorp, under whom he completed his doctoral dissertation in 1922 on pleasure in the Platonic dialogues. In 1923 Gadamer jour-

neyed for the summer semester to Freiburg to hear Heidegger, who was offering bold new interpretations of Aristotle and other philosophers. When Heidegger moved to Marburg in the fall of that year, Gadamer became his assistant and he remained so until 1928. During this time Gadamer also studied with Nicolai Hartmann, took seminars in classical philology under Paul Friedländer and others, and in 1927 was certified in classical philology. In 1928 he completed his habilitation under Heidegger on "Plato's dialectical ethics," based on the *Philebus*.

Gadamer remained another ten years in Marburg waiting for a call to a full-time teaching appointment. After 1933 his chances for a call were practically blotted out by his not being in good standing with the Nazis. But he remained active in the academic life at Marburg, which boasted some of Germany's leading intellectuals—Rudolf Bultmann in theology; Hartmann; Stefan George, the charismatic poet; Richard Hamann, the iconoclastic art historian; and finally, Friedländer and others, who represented the great philological tradition of Ulrich von Wilamowitz-Moellendorff.

In 1938 Gadamer was finally called to a chair in philosophy at Leipzig, where he was able to survive through the war years as a politically unthreatening classical

humanist. Because of his political integrity he was elected rector at Leipzig after the war. In 1947 he managed to escape the stultifying atmosphere of the new communist regime by being called to a position at Frankfurt University. He was at Frankfurt but two years when in 1949 he was called to fill Karl Jaspers's chair at the University of Heidelberg.

Gadamer remained in Heidelberg as chair in philosophy until his retirement in 1968. A gifted lecturer, he concentrated in the 1950s on topics that later became part of *Truth and Method*. At the same time, he worked to revive Hegel studies in Germany, and rebuilt a war-shattered department into one of the strongest in Germany. In 1952, along with Helmut Kuhn, he founded the *Philosophische Rundschau*, a journal dedicated to reviewing current books and discussing major issues in philosophy.

After 1968 Gadamer continued to lecture and offer seminars in Heidelberg as an honored emeritus professor, but now he allowed himself to accept invitations to speak in other countries and to serve as a guest professor at various universities, especially in the United States and Canada. This fed a growing interest in hermeneutics in the United States, an interest manifested in the number of dissertations and books being written on the subject. English translations of Gadamer's works began to appear: *Truth and Method* (1975), *Philosophical Hermeneutics* (1976), and *Hegel's Dialectic* (1976) being among the first.

## WORKS

In *Truth and Method* Gadamer's concepts can be logically divided into those within *Truth and Method* and those in the shorter writings after it. The latter category includes further writings defending and defining hermeneutics, writings in modern and ancient philosophy, and in aesthetics and poetics.

In *Truth and Method* Gadamer articulated the most detailed and nuanced account of the "event of understanding" in the history of philosophy. He based much of his thinking on Heidegger, Hegel, and Plato. From Heidegger's *Origin of a Work of Art* he drew strength for a powerful reassertion of the "truth" of art, and from Heidegger's *Being and Time* and later writings he drew concepts that called into question the goal of objectivity in interpretation. From Hegel and Plato he drew emphases on tradition, history, and dialogue. From Wilhelm Dilthey and Heidegger he drew an emphasis on the horizontal character of consciousness and the operativeness of history in all understanding. Understanding, he argues, takes place in a consciousness in which history—that is,

tradition—is always already at work, shaping, predisposing, predefining what the process of understanding involves. His term for this is *wirkungsgeschichtliches Bewußtsein*, "effective historical consciousness," and the encounter with the other, as person or as text, is a matter of *Horizontverschmelzung*.

In *Truth and Method* Gadamer shows the development after Kant of fateful conceptual turns in the course of eighteenth- and nineteenth-century philosophy, philology, and hermeneutics that have led to present presuppositions about understanding and the conditions for its possibility. He traces the dream of scientific objectivity in humanistic and social scientific knowledge in the nineteenth century, especially in Friedrich Daniel Ernst Schleiermacher and Dilthey, and the promising philosophical transformation of this "problematic" of understanding through Heidegger's phenomenological analysis of existential temporality and the historical situatedness of and the participation of history in understanding. He accepts Heidegger's description of the "forestructure" of understanding, adding to it his concept of an "anticipation of completeness" in all understanding. He argues that the process of understanding has the structure of a dialogue and can be likened to a game in that it follows rules and operates in a language that transcends it; thus, he emphasizes the "linguisticity" (*Sprachlichkeit*) of understanding and even ultimately its ontological character: "Being that can be understood is language," he asserted (*Truth and Method*, p. 432). Finally, one of the most distinctive and important of the contributions of *Truth and Method* is its insistence on a moment of "application" in all understanding.

The book's overarching goal, however, was to cause the artwork to be seen in a new way. While the title might lead one to expect it to be concerned with methods in the *Geisteswissenschaften*, Gadamer's professed aim is to defend the claim of artworks to be "true." In Gadamer's view the experience of encountering truth in great works of art demonstrates the limits of a science-oriented concept of understanding; the meaning and power of such artworks elude scientific modes of understanding. Gadamer wrote a good deal in explanation and defense of *Truth and Method*. These writings are now collected in volume two of his collected works.

Gadamer's writings on modern philosophy range through the Continental tradition since Kant and are influenced principally by Plato, who casts a shadow even over his modern writings; by Heidegger, about whom he wrote more than about any other modern philosopher; by Hegel, whose importance in modern philosophy

Gadamer repeatedly defended; and by Edmund Husserl whose phenomenology Gadamer used and treated as a major element in his thought. Most of his essays on ancient philosophy are directly or indirectly connected with Plato. From Plato he draws his model of dialogue, in which partners participate in quest of a truth that transcends the individual seeker. Gadamer's ethical thinking as well as his dialectical hermeneutics go back to Plato's "dialectical ethics" of respect for the other person, of openness, of seeking to strengthen the partner's case in order not merely to win a debate to one's own satisfaction but to move together toward truth, a result that benefits both sides and that both sides affirm.

Art and poetry were a major theme in Gadamer's writings throughout his career. In 1934 Gadamer wrote on "Plato and the Poets," and in the 1940s he was writing essays on Johann Christian Friedrich Hölderlin, Johann Wolfgang von Goethe, Karl Leberecht Immerman, and Rainer Maria Rilke. His articles after *Truth and Method* tend to select more sober and difficult poets such as Stefan George, Gottfried Benn, and Paul Celan. His essays on aesthetics and poetics continue to emphasize the truth of art, the need for dialogical openness, and the priority of the artwork's character of play. At the same time, another issue arises: What about basically nonrepresentational poetry? What about the "no longer beautiful" poetry of the modern (or postmodern) dark lyric? After a number of writings that struggle successfully with the dark lyric, such as *Wer bin ich und wer bist du?* (Who am I and who are you?; 1973), on poet Paul Celan, Gadamer poses the problem in somewhat different terms. For Gadamer it is a "task of philosophy" to develop a context within which one can still recognize and deal with—or "understand"—modern and postmodern art.

Gadamer's essay "The Relevance of the Beautiful" presents a twentieth-century defense of such art. In this essay experience becomes the reference point, even group experiences as one finds them in the historical record. Gadamer includes, not just experiences recorded in artworks or great poetry, which would create a circular argument, but in anthropological records of such things as (1) the role of play in human life, (2) the high experiences of festiveness in our own and other cultures, and (3) the power of participation in symbolic religious rites. In groping for an explanation of the power of art and a defense of its legitimacy, Gadamer offers an analysis of three categories—play, symbol, and festival.

In his essay "The Truth of the Artwork" (1960), Gadamer pointed to a threefold insufficiency of scientific thinking: (1) the insufficiency of scientific thinking, by

itself and without recourse to standards outside itself, to grapple with ethical problems such as human rights, abortion, ecology, or planning the future; (2) its incapacity to account for the experience of beauty in art and poetry or to lay down principles for its creation; and (3) its insufficiency to meet, or even account for, the spiritual needs of human beings. All these suggest that a recourse to the absolute priority of scientific presuppositions cannot serve us well in dealing with the encounter with ethical problems, artworks, or the divine. Art, like ethics and the divine, seems to move beyond the competence of the categories of scientific thinking. And they can claim to be "true." This is a major theme both in *Truth and Method* and in later writings.

In "Wort und Bild" (Word and image; 1992) Gadamer takes the final step and attempts to articulate aesthetic categories that apply both to plastic/pictorial arts and arts of the word. Among the several concepts to which he turns are the Greek concept of the fine (*kalon*) and to our experience of the rightness and absoluteness of art.

## GALEN

(129—c. 216 CE)

Galen (Aelius or Iulius Galenus of Pergamum), a doctor and philosopher, was the son of a rich architect. Born in modern-day Bergama in western Turkey, he was introduced as a student to all the main philosophical theories of classical antiquity. On his own admission, this led him only into a confusion from which he was rescued by con-

sidering mathematics, which henceforth provided him with a paradigm for understanding truth and falsehood. From 145, following the appearance of the healing god Asclepius to his father in a dream, he turned to medicine. He sat at the feet of medical teachers in Pergamum, Smyrna, and Alexandria, as part of what is the longest recorded medical education from the ancient world. In 157 he returned to Pergamum as doctor to the gladiators of the high priest, but in 162 he traveled to Rome, the imperial capital. There he quickly established a reputation as a doctor, anatomist, and philosopher, not always to the delight of his many competitors. In 166 he left Rome hurriedly but was recalled in 168 by Emperor Marcus Aurelius to join him and his brother on campaign in northern Italy. After his return to Rome in 169, he seems to have spent the rest of his life in Italy as a physician to the emperor's household although he made at least one visit to Pergamum. The traditional date for his death, c. 200, is based on an early misunderstanding of a comment, preserved by Arabic authors, that divided his life into seventeen years as a student and seventy as a doctor. A date of death around 216 fits better with the internal evidence from his many treatises and would allow him to continue writing major treatises on medicine and pharmacology well into the first decade of the third century, or even later.

Galen was an enormously prolific author, credited with more than 350 treatises on subjects ranging from attic comedy to vivisection, and from logic to pharmacology. Roughly half of these survive today, in whole or in part, mainly in his native Greek but also in Arabic, Hebrew, Persian, and medieval Latin versions. These translations are of great importance, particularly when the originals have been lost, for they frequently deal with philosophical issues that seem to have held little interest for the Byzantine. New discoveries of previously unknown treatises can be expected as major libraries in the Muslim world are opened to scholars and more works of medieval Arabic and Jewish philosophy are published. The recent recovery of new fragments in Arabic of the lost *On Scientific Discovery* suggests that a complete copy of the work Galen thought his greatest contribution to philosophy may eventually be found.

Galen's interest in philosophy can be followed throughout his life, from his very early *On Medical Experience* to his last work, *On My Own Opinions*. He regarded philosophy as essential to the proper practice of medicine: The best doctor was also a philosopher, whether or not he realized it. Conversely, a knowledge of medicine was valuable for philosophers, a conjunction Galen

traced back to Plato whose notions of the body in the *Timaeus* Galen derived from a (unhistorical) friendship with Hippocrates. In turn, Galen visualized Hippocrates as a Platonic philosopher, a claim that contributed to the growing dominance of Hippocrates as the symbol of the medical profession.

Fundamental to medicine was logic, both for structuring accurate diagnosis and for distinguishing between various degrees of certainty. Some suppositions could be proved to be true, others shown to be false, others were merely plausible and could be adopted only provisionally. Still others, such as the nature of god or the eternity of world, were incapable of proof or refutation and were best left to idle sophists. But Galen often muddled these important distinctions, either by treating the merely plausible as if it were true or by choosing as *obvious* and *universally agreed* bases for discussion facts or ideas that themselves were disputed by some of his opponents.

Galen's formal logic, on which he wrote several books, is impressive in its rigor and clarity. The Arabs' attribution to him of the discovery of the fourth syllogism may be right, or it may simply reflect Galen's extension of earlier debates about argument. Throughout his writings he stressed the importance of accuracy and clarity of expression, to avoid confusion, and to allow discussion with those offering different points of view. Ambiguity, on which he wrote an extant tract, was harmful to medicine as well as philosophy, and a sound training in logic he considered necessary for everyone. His demands for a mathematical precision in debate are not, however, fully borne out by his own practice, and his overwhelming powers of rhetoric often obscure his unscrupulous representation of the illogicality of his opponents.

His philosophy and his medicine reinforced each other. Where empirical observation was not enough by itself, logic and understanding of the theories of other philosophers could bridge the gap. Conversely, the facts of medical life exemplified and justified the cosmological and psychological doctrines of philosophers. His discussions of the value of empiricism in relation to understanding the causes of disease, one of the goals of the true doctor, show an awareness of the epistemological difficulties involved and an understanding that an experienced practitioner might reach the correct conclusion without having to go through the necessary chain of causation. He might also be a swifter and safer option than a callow youth, no matter how brilliant the youth's reasoning abilities. Galen's entire approach was eclectic, rejecting the

dogmatism of the philosophical schools of his own day in favor of the "twin legs" of reason and experience.

Galen's medicine was based on an Aristotelian physics combined with a Platonic psychology. His universe, made up of the four Aristotelian elements in various combinations or mixtures, had been overseen by a purposeful Creator, or Nature, and worked along the interconnected principles favored by the Aristotelians and Stoics. His explanations for the working of drugs, for instance, involved Aristotelian language and concepts. He was convinced that each part of the body had been designed teleologically, for a particular purpose, and any alteration or imbalance in its basic elements, qualities, or humors resulted in illness. Galen's defense of teleology, as evinced in the human hand and in the elephant's trunk, is arguably superior to that of Aristotle's, and his exposition of what he termed the "natural faculties" is far from the simplistic presentation familiar from later denunciations of Galenism.

Whereas he believed strongly in the existence of the soul, he refused to be drawn to any definitive statement about what the essence of the soul was. The Aristotelian and Stoic notions of an undivided controlling power within the body he vigorously rejected as being inconsistent with the facts of anatomy. His systematic dissections of a variety of animals convinced him that there were three almost independent systems within the body corresponding to the three parts of Plato's soul, as described in the *Republic* and *Timaeus*: the brain and nerves, concerned with thought and sensation; the heart and arteries, responsible for life and energy; and the veins and liver (a more precise rendering of Plato's *belly*), responsible for nutrition and growth. Galen never proclaimed a strict parallelism between the three systems, which was achieved only by later followers such as Avicenna and Averroes, and he devoted much more space to the first two than to the third. This lack of systematization was the result both of his enormous fecundity of ideas and his methods of composition, for most of his books were originally oral presentations, taken down by trained shorthand writers, and not carefully crafted treatises written at leisure. Not surprisingly, they are often repetitive and leave many knots untied.

The heart, for Galen, was the source of natural heat, and the place where a small amount of venous blood, mixed with air, was transformed into vigorous arterial blood. His repetition of the earlier experiments of Erasistratus (c. 304–250 BCE) proved convincingly that the arteries contained blood and not *pneuma* alone, as Erasistratus had argued. But his vitalist predilections con-

vinced him that the movement of arterial blood was not the result of any quasi-mechanical motion of the heart but brought about by the forcible contraction of the arteries controlled by natural powers within their thick coats. Just as most venous blood remained within the veins until it was absorbed as nutriment or excreted, so most arterial blood remained within the arteries. A tiny portion was transformed in the rete mirabile, a vascular plexus at the base of the skull (not found in humans but in some animals Galen dissected), to become psychic pneuma, which was refined still more in the networks of the brain to act as the means of transmission of sensation and the commands of the brain. Contrary to Aristotle and the Stoics, he could find no evidence for the heart as the seat of sensation and thought, especially since he could trace its nerves back to an origin in the innermost cavities of the brain. Galen's experimental dissections of the spinal cord in animals are among the most impressive ever performed, combining a precision of dissection with a careful planning and elucidation of what was to be achieved, and were not superseded until the mid-sixteenth century.

Galen's anatomical conclusions he believed far too important to be left entirely to doctors. In two of his longest treatises, *On the Usefulness of Parts* and *On the Opinions of Hippocrates and Plato*, he explained the consequences of his discoveries in Aristotelian and Platonic terms, respectively. Similarly, his comments on the *Timaeus* stressed the truth of many of Plato's observations and suggested that he must have gained his anatomical knowledge from the great Hippocrates himself. Plato was his favorite philosopher: Galen's writings are permeated with Platonic phraseology, and he wrote summaries of the *Timaeus* and other Platonic dialogues that are partially extant in Arabic.

A man of austere morality—Galen claimed to have read the *Golden Words* of Pythagoras nightly—he wrote extensively on ethics. He advocated a self-control brought about by an extensive philosophical training although he acknowledged that this might be doubly difficult for those who had been badly trained or whose psychic genetic makeup predisposed them to evil. He advocated a very strong interaction between body and soul, for just as overeating and drinking or pleasurable and painful sensations have an obvious effect on behavior, so, in turn, anger or grief can lead to physical illness and even death. Galen contrasts his own equanimity at the loss of most of his library in a fire with his mother's shocking irascibility and with the timorousness of a patient who worried himself to death after dreaming that he had replaced Atlas as

the upholder of the world. Doctor and philosopher should cooperate in the search for health and wholeness.

Anatomy also helped to resolve some philosophical disputes about intentionality. Some actions, Galen showed, were under the direct control of the brain via the nerves and muscles; others were "natural," the result of our genetic makeup, and beyond rational control; others were more complex, such as speech, which required both the will and the modification of "natural" patterns of breathing. Others, such as winking and blinking, appeared to indicate the coexistence of voluntary and involuntary activity in the same organ whereas others, such as a penile erection, he explained by other notions such as sympathy. Only laughter defeated his attempts at explanation. Throughout, Galen sought to use his medical experience to illuminate contemporary philosophical debate, just as he used philosophical debates on physics or causation to explain his decisions as a practitioner.

Contemporary reactions to his philosophy were mixed. A sect of Christians attempted to recast their Christianity to take account of his logical objections to miracles, but others were less polite. Skeptics objected to his reliance on sensory data, and the Aristotelian Alexander of Aphrodisias thought him a great doctor but a poor philosopher, whose profession in *On My Own Opinions* of agnosticism about many philosophical questions was a confession of failure. But his views on creation and some of his Platonic commentaries were cited with respect in the fifth century, and the Christian philosopher Nemesius of Emesa built his Christian anthropology largely on Galen's discoveries. Although much of his philosophy had disappeared in Greek by 1000, the Arabs drew heavily on his work. New fragments of his ethics recovered from Spanish Jewish writers of the twelfth and thirteenth centuries show how much they valued his approach to morality. Renaissance biographers were equally impressed, some even viewing his life as exemplifying the cardinal virtues—a perspective hardly shared by modern scholars. Others hotly debated whether he had become a Christian at the end of his life or not. But after the sixteenth century, Galenic philosophy, like his medicine, was abandoned, not to be studied again in considerable detail until the 1970s.

## GALEN [ADDENDUM]

Galen’s influence on medieval Islamic thought in general, and on Arabic philosophy in particular, can hardly be overestimated. Galen himself developed a system of philosophical and medical views that gained tremendous authority in Late Antiquity, notably in Alexandria and the Hellenized East. He emphasized the necessity that physicians be conversant in philosophy, and this idea was thoroughly enshrined, for instance, in the Late Antique medical curriculum in Alexandria. To give just one example, physiological and nosological processes were explained in terms of Aristotelian categories and the four causes. This medical tradition, aptly called “Galenism,” shaped the Islamic notion of sciences and medicine to a large extent; it is therefore not surprising that many of the most famous Arabic philosophers such as al-Kindī, al-Rāzī (Rhasis), Ibn Sīnā (Avicenna) and Ibn Rushd (Averroes) were also prominent physicians.

Virtually all the works of Galen’s medical and philosophical writings were translated into Arabic, and it is in this language that some of the most interesting philosophical works such as *On Medical Experience* survive. The idea of experience was hotly debated among medical authors in the medieval Islamic period, and treatises such as al-Rāzī’s *Doubts concerning Galen* show that Arabic authors engaged critically with him. However, many of Galen’s ideas, such as concepts about human physiology, which had already entered Late Antique Greek popular intellectual culture, became commonplace in the Islamic world.

## GALILEO GALILEI

(1564–1642)

Galileo Galilei, the Italian astronomer and physicist, was born at Pisa. Although he created no systematic philosophy, his influence on the trend of modern philosophical thought is very marked. To it may be traced the definitive separation of physical science from philosophy, the abandonment of authority as a criterion of scientific truth, the distinction between objective and subjective qualities in observable phenomena, and the introduction (or reintroduction) of empirical and skeptical elements into philosophical investigations. The seventeenth-century revival of atomism and the removal of occult qualities from the concept of causation owed much to Galileo. His writings marked the beginning of an antimetaphysical movement in philosophy, exemplified in later times by Positivism and operationalism, and they remained relatively free from such concealed ontological assumptions as are to be found in some ostensibly nonmetaphysical systems; for example, in philosophical empiricism, mechanism, and phenomenalism. The events of Galileo's personal life involved him in an active struggle for freedom of thought, and this in turn underlay those scientific and philosophical convictions for which he became a symbol to his contemporaries and followers.

After a meager, conventional preparatory education, Galileo was enrolled in the school of medicine at the University of Pisa in 1581. His interests turned to mathematics about 1583, and he left the university in 1585 without having received a degree. For a time he continued his studies alone, giving lessons at Siena and Florence, and in 1589 secured the chair of mathematics at Pisa. His early investigations in physics, particularly mechanics, set him in sharp opposition to the views prevailing among professors of philosophy, who, as followers of Aristotle, looked with disfavor upon the introduction of mathematics into physics. In 1591 Galileo left Pisa to become professor of mathematics at the University of Padua. Here he continued his mechanical researches, undertook the manufacture of mathematical instruments for sale, and

composed several useful treatises that were circulated in manuscript among his pupils and friends.

In 1604 he disclosed, in a letter to Fra Paolo Sarpi, the mathematical law of freely falling bodies. He had made substantial progress toward a rational mechanics when, in 1609, his attention was diverted from those studies by the invention of the telescope in Holland. Galileo promptly duplicated and improved the device, producing an instrument suitable for astronomical observation, and early in 1610 he published *Sidereus Nuncius* (The starry messenger), in which he described the mountainous character of the moon, the existence of countless previously unobserved stars, and the discovery of four satellites of Jupiter. These discoveries provoked widespread controversy among philosophers and astronomers. Shortly after *Sidereus Nuncius* was published, Galileo resigned his post and returned to Florence as chief mathematician and philosopher to Cosimo II de' Medici, grand duke of Tuscany. Late in 1610, he detected the curious appearance of Saturn (although he could not account for it) and the phases of Venus, and shortly thereafter he noted the phenomenon of sunspots.

Strong philosophical opposition was aroused by his publication in 1612 of *Discourse on Bodies in Water*, in which he ridiculed the Aristotelian theory of the elements, advocated observation and experiment as the chief criteria of physical truth, and gave some support to the views of Democritus. Publication in 1613 of his *Istoria e dimostrazioni intorno alle macchie solari* (Letters on sunspots) aroused theological opposition by its open support of the Copernican theory, which appeared to contradict the Bible by asserting the motion of Earth and the stability of the sun. Toward the end of that year certain philosophers and priests, in the presence of members of the ruling family, attacked Galileo and Copernicanism on religious grounds. Galileo replied in a long letter addressed to his former pupil Benedetto Castelli, who had defended him in his absence. In this letter Galileo contended that biblical passages had no authority in scientific controversies, and that the language of the Bible should instead be interpreted in the light of man's knowledge of natural phenomena, gained through reason and observation.

Early in 1615, Galileo was violently attacked from the pulpit in Florence, and a copy of his earlier letter, together with a denunciation of the Galileists, was sent to the Inquisition at Rome. Rumors spread that the Catholic Church would soon officially condemn the Copernican theory and silence Galileo. He countered by greatly expanding the arguments of his previous letter to Castelli,

and widely circulated the new version in manuscript copies ostensibly addressed to Grand Duchess Christina, the mother of Cosimo de' Medici. At the end of the same year Galileo went personally to Rome in an attempt to stem the anti-Copernican tide. In this he was unsuccessful, for the church officially moved to condemn the views of the motion of Earth and stability of the sun as contrary to the Scriptures. Galileo was instructed not to hold or defend these views, but no action was taken against his person or his previously published books.

After a period of silence, Galileo entered into a polemic with a Jesuit professor at Rome over the nature of comets, and in 1623 he published *The Assayer* (*Il saggia-tore*), ridiculing the Aristotelian philosophy and expounding his methodological ideas. This book was dedicated to the new pope, Urban VIII, who as cardinal had been very friendly toward Galileo. In 1624, Galileo visited Rome and obtained permission to write on the Copernican and Ptolemaic systems, provided that the treatment was impartial. The composition of his next book, *Dialogue concerning the Two Chief World Systems*, occupied Galileo intermittently for several years. After great difficulty in getting a license to publish it, he brought it out at Florence in 1632. Five months later the printer was ordered to issue no more copies, and Galileo was summoned to Rome to face the Inquisition. Despite remonstrances of the Tuscan ambassador and of Grand Duke Ferdinand II, he was eventually compelled to appear and stand trial. In June 1633 the book was condemned, and Galileo was sentenced to life imprisonment. He was, however, permitted to reside first at Siena with the archbishop, his friend and former pupil, and then under house arrest at his own villa near Florence. There he managed to compose and smuggle out his most mature work, a treatise on physics known as *Two New Sciences*, which was printed in Holland in 1638. Galileo died four years later.

### PHILOSOPHICAL ROOTS

The conditions of Galileo's education and career led to his intimate familiarity with the works of Aristotle. There is little evidence, however, that he ever preferred to read the works of any particular philosopher. His personal library was scanty, and his correspondence is devoid of philosophical references or discussions. In polemic works he refers often to Aristotle, usually with disfavor. His occasional references to Democritus, Socrates, Plato, and Seneca are more favorable but superficial, and appear to express general anti-Aristotelianism rather than allegiance to any other philosopher. Near contemporaries

such as Girolamo Cardano and Bernardino Telesio were dismissed by Galileo with the remark that he had read but little of their work. Although there is extant a Latin treatise in Galileo's handwriting that contains references to scores of ancient and medieval philosophers, this dates from his student days (1584) and is not demonstrably original or representative of his own views.

It is evident that during most of his life Galileo's favorite reading was literary rather than philosophical. He is said to have known Ludovico Ariosto by heart; he lectured on Dante Alighieri, annotated Torquato Tasso, delighted in the rustic dialect writings of Ruzzante (Angelo Beolco), and frequently cited Homer, Vergil, Pulci, and other poets in his works. Nowhere in his writings is there an overt expression of allegiance to any of his philosophical predecessors. However, the question of Galileo's true metaphysical position has been much debated in recent decades. His emphasis on the mathematical element in physics has induced many excellent scholars, led by Alexandre Koyré, to classify him unequivocally as a Platonist. On the other hand, Galileo's insistence on the power of observation to refute any reasoned conclusion has caused others, notably Ludovico Geymonat, to resist this conclusion and even to stress a strong Aristotelian element in Galileo's own work. In opposition to both these views, Edward Strong has questioned the propriety of reading any metaphysical position into Galileo's work and emphasizes his evident preoccupation with methodological considerations, to the exclusion of dogmatic philosophy. Finally, Alistair Crombie has aptly remarked that it is precisely the absence of systematic philosophy in Galileo that has made it possible for adherents of nearly every philosophical school to find some support for their views in his works.

Galileo's anti-Aristotelianism makes its first appearance in his early studies of motion. In order to defend a theory of motion (later abandoned) founded on Archimedean conceptions, he was obliged to demolish several prevailing Aristotelian assertions: that the speed of free fall is proportional to the weight of the falling body and inversely proportional to the density of the medium; that the motion of projectiles depends on some action of the medium; and that motion is impossible in the void. Galileo's attack on Aristotle widened with his adoption of the Copernican astronomy and his abandonment of the distinction between elemental and celestial matter, so essential to Aristotle's world view. In the end he questioned the reliability of Aristotelian logic and asserted that rigorous demonstration was to be found only in mathematics. Thus, it may be argued that Aristotle's physical errors led

Galileo to distrust logical deduction as a basis for physics, and his famous dictum that “the book of nature is written in mathematical characters, without a knowledge of which men cannot understand it” probably represents a methodological canon rather than a metaphysical position.

Galileo’s opposition to Aristotle was also to some degree a literary pose rather than a true philosophical position. In later years he often declared himself a better Aristotelian than his contemporary Peripatetic adversaries, and in the opening sections of the *Dialogue* he made extensive use of Aristotelian arguments to secure assent to essential points in the Copernican theory. Perhaps the chief significance of Galileo’s anti-Aristotelianism is its intimate relation to his consistent rejection of authority of any kind in matters of science. His unwillingness to accept any intermediary between himself and nature was the motivation of his bold warning to the church against the utilization of scriptural authority in scientific disputes. In short, Aristotle was not so much the philosophical opponent as the historical symbol in Galileo’s unremitting battle against authority as a criterion of truth.

**SEPARATION OF PHYSICS FROM PHILOSOPHY.** Until Galileo’s time, physical science (including theoretical astronomy) was regarded as a proper part of philosophy and was so taught in the universities. Aristotle’s principles of motion supplied the axioms, and the science was purely deductive. Several of Galileo’s predecessors had questioned those principles as being in apparent contradiction with experience; Galileo continued these attacks and undertook experimental investigations of the actual phenomena of motion. In this way he came upon some new results and sought principles from which both the old and new phenomena might be deductively established. If he was not entirely successful in this quest, that was not a matter of deep concern to him. René Descartes later criticized Galileo sharply for his investigation of physical effects without a prior knowledge of their causes, and Cartesian physics was made an integral part of Descartes’s systematic philosophy. In the end, however, the example of Galileo, and not that of Descartes, was followed by scientists. Physics became first a distinct branch (the “natural philosophy” of Isaac Newton) and ultimately a separate discipline from philosophy. The philosophical effects of this separation have been enormous. The emphasis on physics that prevailed in philosophy at Galileo’s time has vanished; in its place, the theory of knowledge has risen to preeminence in modern philosophy, where from time to time it has threatened to subordinate or even to expel metaphysics. It is very doubtful

that this would have come about without the separation of physical researches from philosophical investigations, in which separation Galileo was the pioneer.

Nor was Galileo content merely to remove terrestrial physical phenomena from the realm of speculative philosophy. Telescopic observation suggested to him a direct analogy between terrestrial and celestial matter, a conception that was antagonistic to Aristotle’s entire scheme. The mountainous character of the moon’s surface refuted the axiom of perfect sphericity of celestial bodies; the appearance and disappearance of sunspots destroyed the axiom of celestial immutability and perfection. Galileo did not hesitate to attribute terrestrial qualities to all celestial bodies, thus laying the basis for physical astronomy, even though this had grave religious implications and challenged the traditional cosmological and cosmogonical assumptions of the Peripatetics, who dominated the philosophical thought of the time.

#### ABANDONMENT OF AUTHORITY

The age into which Galileo was born was one in which the power of authority was uppermost in every sphere of activity—political, religious, and philosophical. It was therefore virtually impossible to attack that power in one sphere without disturbing it in others. To Galileo it was clear that in matters of scientific investigation, authority as such could not be allowed any weight; observation, experiment, and reason alone could establish physical truth. Accordingly, he disputed the right of philosophers and theologians to exercise control over scientific investigations or even scientific theories. Confronted with almost overwhelming opposition in this dispute, he was compelled to adopt, if not to formulate systematically, an alternative criterion of truth that might have some hope of acceptance. In so doing he avoided the error of such philosophers as Bernardino Telesio and Francis Bacon, who in effect had called for reliance solely upon sensory evidence, for Galileo was well aware of the possibility of illusion or of misinterpretation. It appeared to Galileo that mathematics alone had the kind of certainty that could be completely trusted, and he took the position that only to the extent to which men can detect mathematical regularities in phenomena can they be certain they have reached the truth in physical matters: “Without mathematics, one wanders about in a dark labyrinth.”

This dictum of Galileo’s is often taken today as the expression of a fundamentally Platonic viewpoint, but there is no evidence that Galileo believed in a world of Platonic forms as distinguished from that of events. He appears to have been concerned with relationships rather

than essences, and it is in this sense that his mathematical conception of the world is to be taken. He expressly stated that the failure of a physicist to describe the real world was not the fault either of that world or of mathematics, but was merely a result of the limited competence of the physicist, analogous to the shortcomings of a merchant or an accountant who had failed to take into account the weights of the containers in computing the value of his merchandise. Galileo held that although we must be satisfied with limited objectives, we may achieve complete certainty with regard to them.

Galileo's battle for free inquiry, independent of the interference of authority, was, in his own time, doomed to defeat. Nevertheless, the practicability of his alternative criterion of truth gained him a substantial number of followers whose intelligent application of his suggestions was eventually beneficial not only to physical science, but to philosophy as well. The systematic search for solutions to physical problems within preestablished limits of inquiry, under the rule that the demands of sense data, reason, and mathematical interpretation must be simultaneously satisfied, led to the development of a body of dependable knowledge of the physical world that philosophers could no longer ignore in their speculations about underlying reality. At the same time, this complex criterion of physical truth gave rise to a more serious examination of epistemological problems that had been relatively neglected in previous ages of untrammelled speculative philosophy. "We must deal with the real world, and not one on paper," Galileo proclaimed in his *Dialogue*.

It should be noted that Galileo did not extend his demands beyond the domain of physical science. In order to reconcile his scientific position with his acceptance of religious authority, he distinguished sharply between the two uses of language, or even the two languages, of faith and science. This position was expounded at length in his *Letter to Christina* (1615, published 1636). Wherever natural phenomena are involved, the language of the Bible is to be interpreted by the findings of science, while the exposition of supernatural texts is to be left to theologians. This concept of duality of language was given an interesting extension in his *Two New Sciences*; the purely mathematical sections are written in Latin, while the physical and more general sections are in Italian. It is reasonable to assume that Galileo's attitude toward the difficult question of why mathematical relations prevail in physics, and indeed toward metaphysical questions in general, was similar to his expressed opinion with regard to supernatural assertions of any kind: that they were outside the domain of science.

## OBJECTIVE AND SUBJECTIVE QUALITIES

It is well known that Galileo clearly set forth the distinction, later made into a fundamental principle by the philosophical empiricists, between primary and secondary qualities. In accordance with his conception that only mathematics afforded complete certainty, he believed that to the fundamental particles of matter one must attribute size, shape, number, and rate of motion; but that one is under no compulsion to invest them with color, sound, odor, and the like. This separation of subjective qualities from those capable of mathematical treatment was a decisive step in the removal of man from his traditionally central place in the entire scheme of things. It is also noteworthy that Galileo showed no interest whatever in pursuing an analysis of subjective (or secondary) qualities; he did not (as did Aristotle and Descartes) compose books on the mind, the spirit, or man in general. Thus, Galileo's treatment of this fundamental principle of empiricism is by no means indicative that he subscribed to an empiricist philosophy in the technical sense. His distinction of objective-subjective was simply an integral part of his separation of physics from philosophy; and if it had any metaphysical implications, they were lost to Galileo. The source of inspiration for this fundamental notion was certainly Greek atomism; but if any classifiable system of philosophy is to be found in Galileo's own writings, it is that of naive realism—a recurrent theme in physical science and the philosophy of science from Galileo's time through the nineteenth century.

Highly important philosophically in Galileo's physical investigations was his insistence on the doctrine of relativity of motion. On the one hand, this removed Earth from its privileged position in astronomy, and in this regard was little more than an extension of the Copernican revolution. On the other hand, it began a new revolutionary movement in which the investigation of natural laws as mathematical relationships was to replace traditional inquiries into the natures or essences of physical entities. Thus, the way was opened to a coherent science of dynamics, while the accepted world view based on the doctrine of "natural places" was rendered untenable.

## SKEPTICISM AND THE SCIENTIFIC METHOD

It is worth noting briefly that Galileo introduced (or rather reintroduced) into Western philosophy certain traditions of skepticism which had lapsed during the reign of authority. He often said that it was easier for him to determine that something was false than to discover the

truth of any matter, and he openly contended that it was less shameful to be ignorant than to argue on the wrong side. He was accustomed to advise his pupils freely and candidly to confess “I do not know” rather than to offer merely verbal explanations. Thus, among his followers it became once more respectable for a philosopher to acknowledge ignorance. The effects of this were very noticeable in the activities of his disciples and in the Galilean school they created. Establishment of the first great experimental scientific society, the Academy of the Cimento, with its motto of “Test and test again,” would scarcely have been possible before Galileo. It was his habit to stress the infinite amount that must remain unknown, no matter how deeply one might penetrate into any subject of inquiry.

**METHODOLOGICAL VIEWS.** Galileo’s philosophical importance is nowhere clearer than in his contributions to the method of scientific investigation. His suggestions and his example in this field laid the basis for procedures in physical science that have enriched epistemology as much as science itself. Yet Galileo’s conceptions of scientific method, like his other philosophic views, make their appearance in his books only implicitly and incidentally to other considerations. They are first apparent in his polemic work on floating bodies (1612), in which experiments are designed for and applied to the refutation of verbal explanations and arguments. This book marked a definite epoch in the philosophy of science, inasmuch as it is perhaps the first systematic exposition of physical experiments specifically designed to refute a philosophical position. In classical form, it presents the Peripatetic theory and Galileo’s countertheory, with a set of experimental tests to show the falsity of the former and the truth of the latter. Although methodological considerations are not discussed in the abstract, the work is a model of the “experimental philosophy” carried on by the school of Galileo.

The work on sunspots published in the following year is also rich in methodological material; here Galileo destroyed the arguments of his anonymous Jesuit adversary by establishing the analogy of terrestrial phenomena to solar phenomena and by applying mathematical reasoning to the problem of the location of the spots. In this instance the use of experiment was precluded by inaccessibility of the phenomena, but observational data were correctly applied in its stead. It thus constituted a methodological continuation of the book on floating bodies, although the points at issue were in this case strictly scientific and not philosophical, at least in modern terms. Particularly noteworthy are certain semantic

critiques directed against arguments based upon purely verbal deductions made by Galileo’s adversary in this controversy.

Because of the prohibition against discussion of Copernicanism, ten years elapsed before the publication of Galileo’s next acknowledged work, *The Assayer*, which differed markedly from his earlier works. Ostensibly a polemic over the nature of comets, it was in reality a detailed critique of the then prevailing treatment of astronomical phenomena. Instead of adopting a specific theory of comets, Galileo undertook to refute his opponent by showing that all his arguments depended upon assumptions that could not be demonstrated or upon confusions of a linguistic character. It is probable that he was motivated at least in part by a desire to place in the hands of his readers a method by which they might themselves arrive at conclusions that he had been forbidden to advocate. Among the principal themes of this work are the proper and improper use of observation and experiment, the distinction between primary and secondary qualities, the necessity for clarification of language in dealing with physical concepts, and the infinite scope of natural phenomena.

In his ill-fated *Dialogue* of 1632, Galileo developed the last-named theme at length. It was his view that physical truths are boundless in number but perfectly consistent; that human knowledge at any time can comprise but a finite part of this infinite whole; that sense experience, indispensable though it is to a knowledge of the world, can be deceptive or misleading in any given instance. Thus, the concept of physical science as essentially a process of successive approximations is already implicit in the teachings of Galileo. At each stage of inquiry, sense experience must be combined with reasoning and with mathematics to afford a sound basis of deduction. Galileo noted that the method used in proof is rarely the same as that used in making a discovery, and held that unless the proof is mathematical, it lacks absolute certainty.

The *Two New Sciences* of 1638, Galileo’s chief contribution to physics, was of less direct philosophical importance. Its indirect importance lies in the fact that it definitively established physics as a distinct discipline on the basis of its own methods of investigation, methods that have persisted virtually unchanged. Of particular importance to later philosophical developments were the introduction in this work of the concept of one-to-one correspondence in the analysis of the arithmetical infinite and Galileo’s suggestions relating to the roles of physical and mathematical indivisibles in the explanation of observable phenomena.

In conclusion, it should be observed that a profound difference existed between the methods by which Galileo and his contemporary, Johannes Kepler, applied mathematical reasoning to physical science, particularly to astronomy. Kepler's thought was pervaded by the conviction that numerical relationships determined the structure of the universe in the sense of Pythagorean mysticism. Accordingly he attempted, repeatedly, to deduce that structure from a priori numerical hypotheses. As a result, he was early led into fantastic speculations from which he was sometimes able to extricate himself only after years of labor. Galileo, on the other hand, regarded mathematics as an indispensable practical tool and as the definitive test in the quest for physical certainty; but he was not inclined to follow wherever mathematical deduction might lead. His errors, unlike Kepler's, are usually to be found in attempts to create mathematical proofs for physical laws of which he had previously made certain, in the desire to achieve the unique degree of certainty that he ascribed to mathematical demonstration.

## GALLUPPI, PASQUALE

(1770–1846)

Pasquale Galluppi, the Italian epistemologist and moral philosopher, was born in Tropea, Calabria. He began the study of law in Naples but soon switched to theology and philosophy. At first Galluppi was strongly influenced by Christian Wolff. In 1800 he began to read Étienne Bonnot de Condillac and John Locke, and his first published work, *Sull'analisi e sulla sintesi* (On analysis and synthesis; Naples, 1807), was an attack on sensationalism. From 1807 until 1815 Galluppi studied Immanuel Kant. Although he was strongly attracted by Kantianism, he finally rejected it as "skepticism," and, through an exami-

nation of René Descartes and Locke, he arrived at a position strongly resembling that of the Scottish common-sense school as it had been interpreted by the French eclectics.

The publication in 1819 of the first volume of his *Saggio filosofico sulla critica della conoscenza* (Philosophical essay on the critique of knowledge; 6 vols., Naples, 1819–1823) brought Galluppi widespread recognition. Between 1820 and 1827 he published his best-known works: the *Elementi di filosofia* (4 vols., Messina, 1820–1827), in which he expounded his theories, and the *Lettere filosofiche sulle vicende della filosofia relativamente ai principî delle conoscenze umane da Cartesio sino a Kant inclusivamente* (Philosophical letters on the events in philosophy concerning the principles of human knowledge from Descartes to Kant inclusive; Naples, 1838), a remarkable history of human thought. In October 1831 Galluppi was named professor of philosophy at the University of Naples. He corresponded with Victor Cousin, whose *Fragments philosophiques* he translated into Italian (2 vols., Naples, 1831–1832), and in 1838 he was named foreign correspondent of the Academie des Sciences Morales et Politiques.

Galluppi held that the only method of philosophy is analysis, a regressive movement in which reflective thought goes back over its own development. The starting point is consciousness: The existence of the conscious ego is “an original experimental truth” and an immediate intuition. The conscious ego consists in the immediate apprehension which the existing ego has of itself. This apprehension simultaneously produces apprehension of the object (which is sensation) and apprehension of the subject that perceives the object (which is feeling). Galluppi expressed this originating act in the formula “I feel (*sento*) a me which senses (*sente*) something” outside of me. Consciousness, in other words, is the awareness that the ego has of itself and of a separate, independently existing reality. On the basis of this indisputable testimony of consciousness Galluppi proclaimed the reality of both the ego and things, in opposition to George Berkeley’s idealism and David Hume’s analyses.

Using the same procedure, and by means of the evidence provided by internal consciousness, Galluppi found in the ego the universal ideas which had been denied by the empiricists: these ideas are proved by inner experience, which affirms the existence of God and, by revealing that the conscious ego can only be the effect of a divine intelligent cause, invariable and absolute, also attests the validity of causal relations. True knowledge, knowledge that is adequate to reality, consists in rear-

ranging, by a real synthesis, the objective unities of beings just as they are. The existence of God, proved in the same way that Descartes did, by means of consciousness (“I think, therefore I am; therefore God exists”), proves that the self-evident relationships are valid. (This last argument differs from the Cartesian principle of divine truth.)

Galluppi adhered to the same theory in moral philosophy. In moral philosophy also it is the testimony of consciousness that tells us we are free and that makes us feel the necessity of moral good and thus the presence of a natural moral law: Our duty is affirmed to us by our innermost sense.

## GAME THEORY

### GAMES OF COMPLETE INFORMATION

A game is an abstract, formal description of a strategic interaction. Any strategic interaction involves two or more decision makers (players), each with two or more

ways of acting (strategies), such that the outcome depends on the strategy choices of all the players. Each player has well-defined preferences among all the possible outcomes, enabling corresponding utilities (payoffs) to be assigned. A game makes explicit the rules governing players' interaction, the players' feasible strategies, and their preferences over outcomes. Game theory describes games by means of mathematical concepts (e.g., sets, functions, and relations).

**NORMAL FORM.** A possible representation of a game is in normal form. A normal form game is completely defined by three elements that constitute the structure of the game: a list of players  $i = 1, \dots, n$ ; for each player  $i$ ; a finite set of pure strategies  $S_i$ ; and a payoff function  $u_i$  that gives player  $i$ 's payoff  $u_i(s_i)$  for each  $n$ -tuple of strategies  $(s_1, \dots, s_n)$ , where  $u_i: \prod_{j=1}^n S_j \rightarrow \mathbb{R}$ . A player may choose to play a pure strategy or instead to randomize over his or her pure strategies; a probability distribution over pure strategies is called a mixed strategy and is denoted by  $\sigma_i$ . Each player's randomization is assumed to be statistically independent of that of his or her opponents, and the payoffs to a mixed strategy are the expected values of the corresponding pure strategy payoffs. A different interpretation of mixed strategies, based on the idea that players do not always randomize over their feasible actions, is that the probability distribution  $\sigma_i$  represents other players' uncertainty about what player will do. A mixed strategy is thus thought of as other players' conjecture about a player's plans of action. The conjectures depend on the player's private information, which is left unspecified in the model. A problem with this interpretation is that if there are reasons behind the choices a player makes, they should be included in the model, since they are likely to be payoff relevant.

The two-by-two matrix in Figure 1 depicts the two-player normal form representation of the famous Prisoner's dilemma game, where *C* stands for *cooperate* and *D* for *defect*. The numbers in the cell of the matrix denote players' payoffs: the first number is the payoff for the row player, the second for the column player. Each player picks a strategy independently, and the outcome, represented in terms of players' payoffs, is the joint product of these two strategies. Notice that in the game of Figure 1, each player is better off defecting no matter what the other player does. For example, if the column player cooperates, the row player gets a payoff of 3 by defecting and a payoff of 2 by cooperating, while if the column player defects, the row player gains a payoff of 1 by defecting and of 0 by cooperating. When, regardless of what other players do, a strategy yields a player a (strictly) infe-

rior payoff than some other strategy, it is called a *dominated strategy*. When a strategy yields the same payoff of another undominated strategy, but it has an inferior payoff against at least one opponent's strategy, it is called a *weakly dominated strategy*.

The game of Figure 1 is one of complete information, in that the players are assumed to know the rules of the game (which include players' strategies) and other players' payoffs. If players are allowed to enter into binding agreements before the game is played, one can say that the game is cooperative. Noncooperative games instead make no allowance for the existence of an enforcement mechanism that would make the terms of the agreement binding on the players. What strategies should rational players choose? What could be rightly called the central dogma of game theory states that rational players will always jointly maximize their expected utilities, or play a Nash equilibrium (compare Nash 1996). Informally, a Nash equilibrium specifies players' actions and beliefs such that (1) each player's action is optimal given his or her beliefs about other players' choices; (2) players' beliefs are correct. Thus, an outcome that is not a Nash equilibrium requires either that a player chooses a sub-optimal strategy or that some players misperceive the situation.

More formally, a Nash equilibrium is a vector of strategies  $(\sigma_1^*, \dots, \sigma_n^*)$ , one for each of the  $n$  players in the game, such that each  $\sigma_i^*$  is optimal given (or is a best reply to)  $\sigma_{-i}^*$ . That is

$$u_i(\sigma_i^*, \sigma_{-i}^*) \geq u_i(\sigma_i, \sigma_{-i}^*) \text{ for all mixed strategies of player } i \sigma_i$$

Note that optimality is only conditional on a fixed  $\sigma_{-i}$ , not on all possible  $\sigma_{-i}$ . A strategy that is a best reply to a

**FIGURE 2**

given combination of the opponents' strategies may fare poorly vis-à-vis another strategy combination.

In a game like the one depicted in Figure 2 the row player gains a payoff of 1 if the toss of two coins results in two heads or two tails and loses 1 otherwise, and vice versa for the column player.

This game has no Nash equilibrium in pure strategies. Nash proved that—provided certain restrictions are imposed on strategy sets and payoff functions—every game has at least one equilibrium in mixed strategies. In a mixed strategy equilibrium, the equilibrium strategy of each player makes the other indifferent between the strategies on which he or she is randomizing. In particular, the game in Figure 2 has a unique Nash equilibrium in which both players randomize between their strategies with probability  $\frac{1}{2}$ . Then, if the first player plays  $\sigma_1 = (\frac{1}{2} H, \frac{1}{2} T)$ , his or her expected payoff is  $\frac{1}{2} 1 + \frac{1}{2} - 1 = 0$  regardless of the strategy of the second player.

The players (and the game theorist) can predict that a specific equilibrium will be played just in case they have enough information to infer players' choices. The standard assumptions in game theory are:

CK1. The structure of the game is common knowledge

CK2. The players are rational (i.e., they are expected utility maximizers) and this is common knowledge

The concept of common knowledge was introduced by David K. Lewis (1969) in his study on convention, which is arguably the first major philosophical work in which game theory plays a central role as a modeling tool. Simply put, the idea of common knowledge is that a certain proposition  $p$  is common knowledge among two players if both of them know  $p$ , both of them know that they know  $p$ , and so on ad infinitum. The previous assumptions may allow the players to predict an opponent's strategy. For example, in the prisoner's dilemma

**FIGURE 3**

	c	d
a	2,4	0,1
b	0,1	0,1

game of Figure 1 rational players would never choose the strictly dominated strategy  $C$ . CK1 and CK2, then, allow the players to predict that the opponent will play  $D$ . However (compare Bicchieri 1993), the previous CK assumptions do not always guarantee that a prediction of play can be made. For one, even if the game has a unique equilibrium, the set of strategies that, under the assumptions CK1 and CK2, players may choose need not contain the equilibrium strategies only. Moreover, predictability is hampered by another common problem encountered in game theory: multiple Nash equilibria.

Suppose two players have to divide \$100 among them. They must restrict their proposals to integers, and each has to independently propose a way to split the sum. If the total proposed by both is equal or less than \$100, each gets what he or she proposed, otherwise they get nothing. This game has 101 Nash equilibria. Is there a way to predict which one will be chosen? In real life, many people would go for the fifty-fifty split. It is simple and it seems equitable. In Thomas C. Schelling's (1960) words, it is a focal point. Unfortunately, mere salience is not enough to provide a player with a reason for choice. In this example, only if it is common knowledge that the fifty-fifty split is the salient outcome does it become rational to propose \$50. Game theory, however, filters out any social or cultural information regarding strategies, leaving players with the task of coordinating their actions on the sole basis of common knowledge of rationality (and of the structure of the game).

A different approach to the problem of indeterminacy is to start by considering the set of Nash equilibria and ask whether some of them should be eliminated because they are in some sense unreasonable. This is the approach taken by the refinement program (Kohlberg 1990, van Damme 1987). Consider the game in Figure 3:

The game has two Nash equilibria in pure strategies:  $(a,c)$  and  $(b,d)$ . The equilibrium  $(a,c)$  is *Pareto dominant*,

since it gives both players a higher payoff than any other equilibrium in the game. However, common knowledge of rationality and of the structure of the game does not force the column player to expect the row player to eliminate the weakly dominated strategy  $b$ , nor is the row player forced to conclude that the column player will discard  $d$ . Prudence, however, may suggest that one should never be too sure of the opponents' choices. Even if the players have agreed to play a given equilibrium, some uncertainty remains. If so, one should try to model this uncertainty in the game. R. Selten's (1965) insight was to treat perfect rationality as a limit case. His "trembling hand" metaphor presupposes that deciding and acting are two separate processes, in that even if one decides to take a particular action, one may end up doing something else by mistake. An equilibrium strategy should be optimal not only against the opponents' strategies but also against some small probability  $\epsilon > 0$  that the opponents make mistakes. Such an equilibrium is *trembling-hand perfect*.

Is the equilibrium  $(b,d)$  perfect? If so,  $b$  must be optimal against  $c$  being played with probability  $\epsilon$  and  $d$  being played with probability  $1 - \epsilon$  for some small  $\epsilon > 0$ . But in this case the expected payoff to  $a$  is  $2\epsilon$  whereas the payoff to  $b$  is  $\epsilon$ . Hence for all  $\epsilon > 0$ ,  $a$  is a better strategy choice. The equilibrium  $(b,d)$  is not perfect, but  $(a,c)$  is. Therefore, a prudent player would discard  $(b,d)$ . In this simple game, checking perfection is easy, since only one mistake is possible. With many strategies, there usually are many more possible mistakes to take into account. Similarly, with many players one may need to worry about who is more likely to make a mistake.

**EXTENSIVE FORM.** A different representation of a game is the *extensive form*. It specifies the following information: a finite set of players  $i = 1, \dots, n$ ; the order of moves; the players' choices at each move; and what each player knows when he or she has to choose. The order of play is represented by a game tree  $T$ , which is a finite set of partially ordered nodes  $t \in T$  satisfying a precedence relation  $<$ . A *subgame* is a collection of branches of a game such that they start from the same node and the branches and the node together form a game tree by itself. A tree representation is sequential, because it shows the order in which actions are taken by the players. It is natural to think of sequential-move games as being ones in which players choose their strategies one after the other, and of simultaneous-move games as ones in which players choose their strategies at the same time. What is important, however, is not the temporal order of events per se, but whether players know about other players' actions when they have to choose their own. In the normal form

representation, players' information about other players' choices is not represented. This is the reason a normal form game could represent any one of several extensive form games. When the order of play is irrelevant to a game's outcome, then restricting oneself to the normal form is justifiable. When the order of play is relevant, however, the extensive form must be specified.

In an extensive form game the information a player has when he or she is choosing an action is explicitly represented using information sets, which partition the nodes of the tree. If an information set contains more than one node, the player who has to make a choice at that information set will be uncertain as to which node he or she is at. Not knowing at which node one is means that the player does not know which action was chosen by the preceding player. If a game contains information sets that are not singletons, the game is one of *imperfect information*.

A strategy for player  $i$  is a complete plan of action that specifies an action at every node at which it is  $i$ 's turn to move. Note that a strategy specifies actions even at nodes that will never be reached if that strategy is played. Consider the game in Figure 4. It is a finite game of perfect information in which player 1 moves first. If he chooses  $D$  at his first node, the game ends and player 1 nets a payoff of 1, whereas player 2 gets 0. But choosing  $D$  at the first node is only part of a strategy for player 1. For example, it can be part of a strategy that recommends "play  $D$  at your first node, and  $x$  at your last node." Another strategy may instead recommend playing  $D$  at his first node, and  $y$  at his last decision node. Though it may seem surprising that a strategy specifies actions even at nodes that will not be reached if that strategy is played, one must remember that a strategy is a full contingent plan of action. For example, the strategy  $Dx$  recommends playing  $D$  at the first node, thus effectively ending the game. It is important, however, to be able to have a plan of action in case  $D$  is not played. Player 1 may, after all, make a mistake and, because of player 2's response, find himself called to play at his last node. In that case, having a plan helps. Note that a strategy cannot be changed during the course of the game. Though a player may conjecture about several scenarios of moves and countermoves before playing the game, at the end of deliberation a strategy must be chosen and followed throughout the game.

The game of Figure 4 has two Nash equilibria in pure strategies:  $(Dx,d)$  and  $(Dy,d)$ . Is there a way to solve the indeterminacy?

Suppose player 1 were to reach his last node. Since he is by assumption rational, he will choose  $x$ , which guar-

**FIGURE 4**

antees him a payoff of 4. Knowing (by assumption) that player 1 is rational, player 2—if she were to reach her decision node—would play *d*, since by playing *a* she would net a lower payoff. Finally, since (by assumption) player 1 knows that player 2 is rational and that she knows that player 1 is rational, he will choose *D* at his first decision node. The equilibrium  $(Dy,d)$  should therefore be ruled out, since it recommends an irrational move at the last node. In the normal form, both equilibria survive. The reason is simple: Nash equilibrium does not constrain behavior out of equilibrium. In this example, if player 1 plans to choose *D* and player 2 plans to choose *d*, it does not matter what player 1 would do at his last node, since that node will never be reached.

The sequential procedure one has used to conclude that only  $(Dx,d)$  is a reasonable solution is known as backward induction. In finite games of perfect information with no ties in payoffs, backward induction always identifies a unique equilibrium. The premise of the backward induction argument is that mutual rationality and the structure of the game are common knowledge among the players. It has been argued by Ken Binmore (1987), Cristina Bicchieri (1989, 1993), and Philip J. Reny (1992) that under certain conditions common knowledge of rationality leads to inconsistencies. For example, if player 2 were to reach her decision node, would she keep thinking that player 1 is rational? How would she explain player 1's move? If player 1's move is inconsistent with common knowledge of rationality, player 2 will be unable to predict future play; as a corollary, what constitutes an optimal choice at her node remains undefined. As a consequence of the previous criticisms, the usual premises of backward induction arguments have come to be questioned (compare Pettit and Sugden 1989, Basu 1990, Bonanno 1991). There are a number of further equilibrium refinements for games in extensive form. Their multiplicity makes it impossible to delve into details here. The interested reader can consult Bicchieri (1993, chapter 3).

## GAMES OF INCOMPLETE INFORMATION

In games of incomplete information certain elements of the game are not common knowledge among the players. The knowledge and beliefs of the players have to be incorporated into the game-theoretic model, as one usually does in extensive form games, and an appropriate equilibrium concept has to be devised. The approach is based on the seminal work of John C. Harsanyi (1968). In the Bayesian approach adopted by Harsanyi, a player's uncertainty about variables that are relevant for his or her decision ought to be made explicit by means of probability distributions representing his or her beliefs. Moreover, second-order beliefs (beliefs about other players' beliefs) can be represented by further probability distributions, and third-order beliefs about second-order ones, and so on. The flexibility of Harsanyi's model allows one to incorporate all such infinite sequence of higher-order beliefs without an explicit representation of it.

The main idea is that the payoffs associated to each strategy profile depend on certain parameters  $\theta_1, \dots, \theta_n$ , one for each player  $1, \dots, n$ . Each parameter is drawn from a set  $\Theta_i = (a_i, b_i, \dots)$  associated with each player  $i$ . The composition of the sets  $\Theta_i$  is known, yet the true value of the parameter  $\theta_i$  is not (at least for one of the players). The parameter  $\theta_i$  is called *i*'s type and the set  $\Theta_i$  represents, intuitively, the other player's ignorance about *i*'s characteristics. A type amounts to a specification of certain variables: a player's strategy set, a player's preferences and payoff function, and so on, that make up the private information of a player. Although it is convenient to refer to "the type  $a_i$  of player *i*" as if it was a separate individual, one should keep in mind that types represent players' knowledge (and uncertainty about others) only. As mentioned earlier, in a Bayesian approach uncertainties are represented by probability distributions. Hence, each player has an initial probability distribution  $\mu_i = (\mu_i(a_i), \mu_i(b_i), \dots)$  over the types of any other player other than  $i$ . Since in a Bayesian game the choices of a player depend on his or her type, the concept of Nash equilibrium has to be generalized accordingly.

Note that all that a player knows, except from the game itself (and the priors), is his own type, and the fact that the other players do not know his own type as well. As their best responses depend on the players' actual types, a player must see himself through his opponents' eyes and plan a best reply against the possible strategies of his opponents for each potential type of his own. Thus, a strategy in a Bayesian game of incomplete information must map each possible type of each player into a plan of

actions. Then, since the other players' types are unknown, each player forms a best reply against the expected strategy of each opponent, where he averages over the (well-specified) reactions of all possible types of an opponent, using his prior probability measure on the type space. Such a profile of type-dependent strategies which are unilaterally unimprovable in expectations over the competing types' strategies forms a Bayesian Nash equilibrium. In other words, a Bayesian Nash equilibrium is a Nash equilibrium "at the interim stage" where each player selects a best response against the average best responses of the competing players.

In the framework provided by Harsanyi (1968) it is possible to reduce a game of incomplete information to one of imperfect information. "Nature" is called to make the first move of the game, as if it was an actual player. Nature's random moves determine the type of each player, with a fixed probability that represents the prior probability attached to the events that player  $i$  is of type  $\theta_i$ . Priors are assumed to be common knowledge, and players observe their own type only. Players then pick their strategies in this extended game, and it is possible to show that the equilibrium of such a game corresponds to the Bayesian Nash equilibrium of the game with incomplete information. In particular, the choice function  $s_i$  yields the action  $\sigma_i(\theta_i)$  if and only if (iff) that is the action that player  $i$  chooses in the game with Nature when she observes her type  $\theta_i$ .

## EPISTEMIC FOUNDATIONS OF GAME THEORY

An important development of game theory is the so-called epistemic approach. In the epistemic approach to game theory strategic reasoning is analyzed on the basis of hypothesis about what players know about the game, about other players' knowledge, and about other players' rationality. Since Robert J. Aumann's (1976) formalization, the idea of common knowledge, and the analysis of what players choose depending on what their beliefs about each other are, began to play an increasingly important role in game theory. In particular, one can evaluate solution concepts by examining the epistemic assumptions and hypotheses from which they can be derived (compare Battigalli and Bonanno 1999). Such epistemic hypotheses are treated formally using the tools provided by interactive epistemology (compare Aumann 1999).

To formalize players' knowledge states, one considers a space set  $\Omega$  whose elements are possible worlds. An event is then represented by a subset of  $\Omega$ . For example,

the proposition "it is sunny in Philadelphia" is represented by the set of all possible worlds in which it is sunny in Philadelphia. For each player, there exists an information function that partitions the space set. Intuitively, a player cannot distinguish among worlds belonging to the same cell of his or her information partition. Thus, in a possible world  $\omega$ , player  $i$  knows an event  $E$  iff the set  $E$  (of possible worlds in which  $E$  obtains) includes the cell of his or her information partition containing  $\omega$ . The intuition behind this is that if a player cannot distinguish among all the worlds in which  $E$  is true, then he or she knows that  $E$  is the case. It is possible to define a knowledge function  $K_i$  for each player  $i$  so that, when given  $E$  as an argument, it returns as a value the set of those worlds such that, for each one of them, the cell of  $i$ 's information partition that contains it is a subset of  $E$ . That is to say,  $K_i E$  is the event that  $i$  knows  $E$ .

By imposing certain conditions on the  $K_i$ 's, one can force the epistemic functions to possess certain properties. For example, by requiring that  $K_i E$  be a subset of  $E$ , one requires that what players know is true, since in every possible world in which  $K_i E$  obtains,  $E$  obtains as well; similarly, by requiring that  $K_i K_i E$  be a subset of  $K_i E$ , one establishes that players know what they know, and by requiring that  $K_i \neg K_i E$  be a subset of  $\neg K_i E$  that they know what they do not know (where  $\neg$  is the usual set-theoretical operation of complementation). The first condition is often referred to as the truth axiom, the second as the positive introspection axiom, and the third as the negative introspection axiom. Note that this setup has an equivalent formulation in terms of modal logics (compare Fagin et al. 1995, Meyer and van der Hoek 2004). To see the equivalence of the two approaches, consider that modal formulas express propositions whose semantic interpretation is given in terms of Kripke structures of possible worlds. It is then possible to establish a correspondence between formulas of the modal logic and events in the approach described earlier. In a Kripke model, then, an event corresponds to the set of those possible worlds that satisfy the formula expressing the proposition associated to that event.

Knowledge functions can be iterated, thus they can represent mutual and higher-order knowledge, and Aumann (1976) provides a mathematical definition of the idea of common knowledge in the setup sketched earlier. A proposition  $p$  is common knowledge between, say, two players  $i$  and  $j$  iff the set of worlds representing  $p$  includes the cells of  $i$ 's and  $j$ 's partitions meet that contain  $p$ , where the meet of two partitions is the finest common coarsening of them. An application of the definition is the

theorem proved in the same article, in which it is shown that if players have common priors, and their posteriors are common knowledge, then the posteriors are equal, even if the players derived them by conditioning on different information. Or, in other words, that one cannot “agree to disagree.” As mentioned earlier, Aumann formalized Lewis’s (1969) definition of common knowledge. However, it is currently debated whether Aumann’s seminal definition is a faithful rendition of Lewis’s informal characterization of common knowledge (compare Vanderschraaf 1998, Cubitt and Sugden 2003, Sillari 2005).

In such a framework it is possible to investigate which strategy profiles are compatible with certain epistemic assumptions about the players. For example, CK1 and CK2 imply that players would never choose strictly dominated strategies. The first contributions in this sense are David G. Pearce (1984) and B. Douglas Bernheim (1984), in which a procedure is devised to eliminate all the players’ strategies that are not rationalizable, that is, not supported by internally consistent beliefs about other players’ choices and beliefs. In general, it can be proved that certain epistemic conditions are only compatible with the strategy profiles yielded by a certain solution concept, hence providing an epistemic foundation for that solution concept. For example, Aumann and Adam Brandenburger (1995) proved that, for two-person games, mutual knowledge (i.e., first-order knowledge among all the players) of the structure of the game, of rationality, and of the players’ chosen strategies implies.

**CORRELATED EQUILIBRIUM.** So far it has been assumed that players’ strategies are independent, as though each player receives a private, independent signal and chooses a (mixed) strategy after having observed his or her own signal. However, signals need not be independent. For example, players can agree to play a certain strategy according to the outcome of some external jointly observed event, for example, a coin toss. If the agreement is self-fulfilling, in that players have no incentive to deviate from it, the resulting strategy profile is an equilibrium in correlated strategies or, in short, a correlated equilibrium (compare Aumann 1974, 1987). For any Nash equilibrium in mixed strategies, a correlation device can be set such that it generates a probability distribution over the possible outcomes of the game yielding such an equilibrium profile. Note, however, that the set of correlated equilibria of a game is much larger than the corresponding set of Nash equilibria. If the correlation signal is common knowledge among the players, one speaks of perfect correlation. However, players may correlate their strategies according to different signals (less

than perfect correlation). The idea is that players have information partitions whose cells include more than one possible outcome, since they ignore which signals are received by other players. To represent the fact that players receive different signals (i.e., they ignore which strategies will be chosen by other players), it is required that in every cell of the information partition of player *i* his or her strategy does not change. It is then possible to calculate the expected payoff of playing the strategy indicated by the correlation device versus the expected payoff obtained by playing a different strategy. If the players have no incentive to deviate from the indicated strategy, the profile yielded by the correlation device is an equilibrium. Correlation by means of private signals may generate outcomes more efficient than those obtained by playing a Nash equilibrium. An important philosophical application of correlated equilibrium is found by Peter Vanderschraaf (1998, 2001), in which conventions as defined by Lewis (1969) are shown to be correlated equilibria of coordination games.

## EVOLUTIONARY GAME THEORY

A Nash equilibrium need not be interpreted as a unique event. If one thinks of it as an observed regularity, one wants to know by what process such an equilibrium is reached and what accounts for its stability. When multiple equilibria are possible, one wants to know why players converged to one in particular and then stayed there. An alternative way of dealing with multiple equilibria is to suppose that the selection process is made by nature.

Evolutionary theories are inspired by population biology (e.g., see Maynard Smith 1982). These theories dispense with the notion of the decision maker, as well as with best responses/optimization, and use in their place a natural selection, a “survival of the fittest” process (with mutations) to model the frequencies with which various strategies are represented in the population over time. In a typical evolutionary model players are preprogrammed for certain strategies and are randomly matched with other players in pairwise repeated encounters. The relative frequency of a strategy in a population is simply the proportion of players in that population who adopt it. The theory focuses on how the strategy profiles of populations of such agents evolve over time, given that the outcomes of current games determine the frequency of different strategies in the future.

As an example, consider the game in Figure 5 and suppose that there are only two possible behavioral types: hawk and dove.

A hawk always fights and escalates contests until it wins or is badly hurt. A dove sticks to displays and retreats if the opponent escalates the conflict; if it fights with another dove, they will settle the contest after a long time. Payoffs are expected changes in fitness due to the outcome of the game. Fitness here means just reproductive success (e.g., the expected number of offspring per time unit).

Suppose injury has a payoff in terms of loss of fitness equal to  $C$ , and victory corresponds to a gain in fitness  $B$ . If hawk meets hawk, or dove meets dove, each has a 50 percent chance of victory. If a dove meets another dove, the winner gets  $B$  and the loser gets nothing, so the average increase in fitness for a dove meeting another dove is  $B/2$ . A dove meeting a hawk retreats, so his or her fitness is unchanged, whereas the hawk gets a gain in fitness  $B$ . If a hawk meets another hawk, they escalate until one wins. The winner has a fitness gain  $B$ , the loser a fitness loss  $C$ . So the average increase in fitness is  $(B - C)/2$ . The latter payoff is negative, since one assumes the cost of injury is greater than the gain in fitness obtained by winning the contest. One can also assume that players will be randomly paired in repeated encounters, and in each encounter they will play the stage game of Figure 5.

If the population were to consist predominantly of hawks, selection would favor the few doves, since hawks would meet mostly hawks and end up fighting with an average loss in fitness of  $(B - C)/2$ , and  $0 > (B - C)/2$ . In a population dominated by doves, hawks would spread, since every time they meet a dove (which would be most of the time) they would have a fitness gain of  $B$ , whereas doves on average would only get  $B/2$ . Evolutionary game theory wants to know how strategies do on average when games are played repeatedly between individuals who are randomly drawn from a large population. The average payoff to a strategy depends on the composition of the population, so a strategy may do well (in terms of fitness) in an environment and poorly in another. If the frequency of hawks in the population is  $q$  and that of doves correspondingly  $(1 - q)$ , the average increase in fitness for the hawks will be  $q(B - C)/2 + (1 - q)B$ , and  $(1 - q)B/2$  for the doves. The average payoff of a strategy in a given environment determines its future frequency in the population. In this example, the average increase in fitness for the hawks will be equal to that for the doves when the frequency of hawks in the population is  $q = B/C$ . At that frequency, the proportion of hawks and doves is stable. If the frequency of hawks is less than  $B/C$ , then they do better than doves and will consequently spread; if their fre-

**FIGURE 5**

dove/hawk	D	H
D	$B/2, B/2$	$0, B$
H	$B, 0$	$(B-C)/2, (B-C)/2$

quency is larger than  $B/C$ , they will do worse than doves and will shrink.

Note that if  $C > B$  then  $(B - C)/2 < 0$ , so the game in Figure 5 has two pure-strategy Nash equilibria:  $(H, D)$  and  $(D, H)$ . There is also a mixed strategy equilibrium in which hawk is played with probability  $q = B/C$  and dove is played with probability  $(1 - q) = C - B/C$ . If the game of Figure 5 were played by rational agents who choose which behavior to display, one would be at a loss in predicting their choices. From common knowledge of rationality and of the structure of the game, the players cannot infer that a particular equilibrium will be played. In the hawk-dove example, however, players are not rational and do not choose their strategies. So if an equilibrium is attained it must be the outcome of some process very different from rational deliberation. The process at work is natural selection: High-performing strategies increase in frequency whereas low-performing strategies' frequency diminishes and eventually goes to zero.

One has seen that in a population composed mostly of doves, hawks will thrive, and the opposite would occur in a population composed mainly of hawks. So for example, if hawks dominate the population, a mutant displaying dove behavior can invade the population, since individuals bearing the dove trait will do better than hawks. The main solution concept used in evolutionary game theory is the evolutionarily stable strategy (ESS) introduced by John Maynard Smith and George R. Price (1973). A strategy or behavioral trait is evolutionarily stable if, once it dominates in the population, it does strictly better than any mutant strategy, and hence it cannot be invaded. In the hawk-dove game, neither of the two pure behavioral types is evolutionarily stable, since each can be invaded by the other. One knows, however, that a population in which there is a proportion  $q = B/C$  of hawks and  $(1 - q) = C - B/C$  of doves is stable. This means that the type of behavior that consists in escalating fights with

probability  $q = B/C$  cannot be invaded by any other type, hence it is an ESS. An ESS is a strategy that, when it dominates the population, is a best reply against itself. Therefore, an evolutionarily stable strategy such as  $(B/C, C - B/C)$  is a Nash equilibrium. Though every ESS is a Nash equilibrium, the reverse does not hold; in our stage game, there are three Nash equilibria, but only the mixed strategy equilibrium  $(B/C, C - B/C)$  is an ESS.

Evolutionary games provide one with a way of explaining how agents that may or may not be rational and—if so—subject to severe information and calculation restrictions, achieve and sustain a Nash equilibrium. Philosophical implications and applications can be found in the works of Brian Skyrms (1990, 1996, 2004). When there exist evolutionarily stable strategies (or states), one knows which equilibrium will obtain, without the need to postulate refinements in the way players interpret off-equilibrium moves. Yet we need to know much more about processes of cultural transmission and to develop adequate ways to represent payoffs, so that the promise of evolutionary games is actually fulfilled.

GARRIGOU-LAGRANGE,  
RÉGINALD MARIE  
(1877–1964)

Réginald Marie Garrigou-Lagrange notably influenced the revival of Thomism in some European and American philosophical circles. He was born Gontran-Marie Garrigou-Lagrange at Auch, France. His first university studies were in the faculty of medicine at the University of Bordeaux. After two years, however, he chose to embrace the priesthood and on May 20, 1900, made his profession as a Dominican, receiving the name Réginald Marie.

In addition to the regular course of philosophy as a Dominican, he pursued graduate studies at the Sorbonne, where he had the opportunity to attend the lectures of Henri Bergson. In 1909 Garrigou-Lagrange entered into what proved to be a long career as professor at the international university of philosophical and theological studies in Rome, now called the Universitas Studiorum Pontificia S. Thomae Aquinatis in Urbe. He remained in this position until 1959. Although his courses were primarily in the theological faculty, it is significant that throughout his teaching life he lectured each week on the metaphysics of Thomas Aquinas. Garrigou-Lagrange was also a founding member of the Academia Pontificia Academia Romanae S. Thomae Aquinatis.

An accurate view of the philosophical thought of Garrigou-Lagrange must take into account the fact that he was not simply a philosopher; his professional labors as well as his writings are preponderantly theological. However, because his concern was with the teachings of Thomas Aquinas, his work has a philosophical import on two counts. First of all, the Thomistic theological synthesis is characterized by its employment of the speculative resources of human intelligence. In this concentration on theology, then, Garrigou-Lagrange necessarily devoted himself to the exposition of the basic Thomistic philosophical positions. Second, from the beginning of his career Garrigou-Lagrange was faced with a challenge to the relevance and the validity of Thomism, or indeed of any metempirical assertions of the human mind. It is to this challenge that his purely philosophical labors and writings are principally addressed.

His first book, *Le sens commun, la philosophie de l'être et les formules dogmatiques*, is a rejoinder to the position taken by Édouard Le Roy in a series of articles (*Revue de métaphysique et morale*, 1899–1901). Le Roy alleged all expressions of truth by the human mind to be totally relative, mutable, and conditioned. Human thought is simply the expression of de facto acceptations, significant

according to that natural and subjective orientation of the human mind which for Le Roy is the *sens commun*. Against this Bergsonian usage, Garrigou-Lagrange used the term *sens commun* to designate the commonly assumed character of the human mind, namely, its extramental orientation toward objectively existent and intelligible reality. He set himself the task of vindicating this realism, of defending the objective validity and transcendental range of human thought.

The basic themes of his position are readily discernible. The human intelligence has “being” as its conatural object. In its attainment of being the human mind surpasses sense knowledge, goes beyond mere phenomena. The first principles of human reason—identity, contradiction, causality, and finality—are not mere subjective thought patterns; they are grounded in being. The human evaluation of the data of experience in virtue of such principles, then, has an ontological validity; the human mind is capable of assertions concerning the real that are objectively true and absolute. Because in its attainment of being the mind goes beyond mere phenomena, the principles of philosophical inquiry have a transcendental validity. Man is able, consequently, to achieve true judgments, not only about the entitative structure of experienced reality, but also about the non-experienced but necessarily affirmed primary cause of the beings of experience. The connaturally realistic orientation of human intelligence, therefore, provides the capacity for objectively valid metaphysical evaluations of reality and even for a true natural theology.

Garrigou-Lagrange maintained that Thomas presented a philosophy of being that was an effectively enunciated and developed expression of the natural metaphysical orientation of human intelligence in which the *sens commun* has its scientifically articulated realization. Garrigou-Lagrange’s principal philosophical contribution, then, was a forceful and clear exposition of the basic Thomistic insights. In his writings there is a clear and honest confrontation of Thomistic realism with both nominalist empiricism and Kantian subjectivism.

An evaluation of the work of Garrigou-Lagrange must place it in relation to the so-called Neo-Scholastic movement. Since his career began well after the early attempts to reassert Thomism, his writings are free of the alien influences present in the work of the restoration’s pioneers. His chief concern, the basic critical problem of the validity of human intelligence, is a central issue in all Neo-Scholastic philosophy. In the light of subsequent developments among Neo-Scholastic philosophers, and even among Thomists, concerning the critical problem,

the approach of Garrigou-Lagrange may be designated as somewhat simplified. He strove to set forth directly the positive statements of a philosophy of being against a philosophy of becoming, to manifest the human mind as a faculty of truth, not an amasser or coordinator of data. Later Thomists have sought by more reflective methods to show how being manifests itself in the very process of cognition as the evidential justification of human knowledge. Their efforts are a refinement of the task to which the efforts of Garrigou-Lagrange were directed. His work, then, was a necessary stage in a vital development. Because of his dedication to the thought of Thomas, he directed that development to a more fruitful use of Thomas's understanding of the problems of being and intelligence.

## GARVE, CHRISTIAN

(1742–1798)

Christian Garve, the German “popular philosopher,” was born in Breslau. After studying at Frankfurt an der Oder, Halle, and Leipzig, he became extraordinary professor of philosophy at Leipzig in 1770, but in 1772 he resigned on account of ill health and moved to Breslau. In 1779 Frederick II called him to Charlottenburg, where he remained until his death.

Garve's interests were mainly in practical morality and empirical psychology. He sought useful knowledge and was averse to abstract speculation. He drew inspiration from Duc François de La Rochefoucauld and Claude-Adrien Helvétius, and especially from the British moralists. His translations of Adam Ferguson, Edmund Burke, Alexander Gerard, Adam Smith, and other British authors were important in popularizing British moral philosophy and aesthetics in Germany. He also translated and commented on the moral and political works of Aristotle and Cicero.

In his own writings Garve studied the individual characteristics and inclinations of different men, and their interrelation in society. He explained their differences by a difference in the degree of clarity and vividness of the ideas they possessed. Interest—the participation of an individual in the feelings, ideas, and actions of another—was a central notion in his psychology. It was derived from the “benevolence” and “sympathy” then current in British thought. In Garve's works psychology, sociology, and ethics were interwoven. His goal was that of a social psychologist, moralist, and educator. Immanuel Kant drew from Garve some elements of his moral and religious philosophy.

## GASSENDI, PIERRE

(1592–1655)

Pierre Gassendi, the leading French seventeenth-century skeptical and Epicurean philosopher and scientist, was born at Champtercier, a Provençal village in France. He studied at Digne and Aix-en-Provence and was appointed professor of rhetoric at Digne at the age of twenty-one. In 1614 he received his doctorate in theology at Avignon. He was ordained a priest in 1616 and was appointed professor of philosophy at Aix. From 1617 to 1623 he lectured on Aristotle's philosophy, developing a forceful critique of it. His first published work, *Exercitationes Paradoxicae Adversus Aristoteleos* (1624), was intended to be followed by six more parts, of which only the second part, published posthumously, was written. It contains both an attack on Aristotle's thought and portions of Gassendi's mitigated skepticism.

After a year in Digne, during which he performed various ecclesiastical duties, Gassendi visited Paris for a brief period in 1625 and became friendly with such avant-garde thinkers as Francois de La Mothe le Vayer and Marin Mersenne. He continued the astronomical researches that he had begun in Provence, and, with the mathematician Claude Mydorge (1585–1647), observed a lunar eclipse. Gassendi's careful astronomical records from 1618 to 1655 were published after his death. He also engaged in many scientific studies with his patron, Nicolas-Claude Fabri de Pieresc (1580–1637). His discovery of the perihelion of Mercury was an important support for the Copernican theory at the time.

Gassendi returned to Paris in 1628, remained there until August 1629, and then spent nine months in Flanders and Holland, where he met many leading scientists and scholars. He spent the next years partly in Paris and partly in Provence, publishing scientific works on astronomy and physics and presenting skeptical attacks on Herbert of Cherbury and the Rosicrucian Robert Fludd. He undertook an intensive study of Epicurean atomism, a subject in which he had been interested for some time. The results of this study were to form a basic part of his later writings.

In 1634 Gassendi was elected provost of the Cathedral of Digne. In 1641 he was sent to the assembly of the French clergy in Paris and during this visit taught philosophy to the young Molière (1622–1673). Gassendi was appointed to the chair of mathematics at the Royal College (now the Collège de France) in 1645, but because of ill health he was away from his post from 1648 to 1653. He fell ill in 1654 and died the following year.

Except for his early attacks on Aristotelianism, Fludd's Rosicrucianism, and Herbert of Cherbury, Gassendi's philosophical works date from the 1640s onward. In 1641, at the request of Mersenne, Gassendi wrote his objections to René Descartes's *Méditations* ("Fifth Set of Objections"). Descartes's testy answer led Gassendi to expand his criticism into the bulky *Disquisitio Metaphysica*, finished in 1642 and published in Amsterdam in 1644. He published three works on Epicurus and his philosophy between 1647 and 1649: *De Vita et Moribus Epicuri* (1647), *Animadversiones in Decimum Libri Diogenis Laertii, qui est de Vita, Moribus Plascitisque Epicuri* (1649), and *Syntagma Philosophiae Epicuri, cum Refutationibus Dogmatum, Quae Contra Fidem Christianum ab eo Asserta Sunt* (1649). His most important philosophical writings appeared only posthumously, in the 1658 edition of his complete works. His overall treatment of philosophical problems appears in *Syntagma Philosophicum* (*Opera*, volumes 1 and 2) and in the second part of his first work, the *Exercitationes*, which presents his constructive or mitigated skepticism.

## EXERCITATIONES

Gassendi's thought developed from a fairly thoroughgoing skepticism, strongly influenced by Sextus Empiricus, Michel Eyquem de Montaigne, Pierre Charron, and Francisco Sanches, to what he called a *via media* between skepticism and dogmatism. The *via media* involved both a fundamental epistemological skepticism and a hypothetical form of Epicurean atomism that was modified to eliminate those aspects of Epicurus's thought that conflicted with Christian doctrine. In the first part of the *Exercitationes* Gassendi, following in the tradition of Francesco Patrizi and Peter Ramus, tried to show all the erroneous or dubious aspects of Aristotelianism. The second part set forth an attack on all those who claimed to have discovered necessary and indubitable knowledge of the real nature of things. Our knowledge of the world, Gassendi insisted, comes only from sensory experience. We are unable to arrive at absolutely true first principles and real or essential definitions, since inductions from experience can never yield certain universal prepositions. No matter how much data are gathered, a negative instance may still turn up in the future. Even if we somehow managed to discover some genuine definitions and first principles, no further scientific knowledge about nature could be gained by employing syllogistic reasoning, since, as the Greek Pyrrhonists had shown, the truth of the premises of a syllogism depends on antecedent knowledge that the conclusion is true. Either the conclu-

sion is part of the evidence of the premises or the syllogism establishes nothing, since it is not known whether the premises are true.

In the concluding section Gassendi launched his strongest attack on the possibility of gaining necessary knowledge about the world. Using the arguments of the ancient skeptics, he tried to show that all that we can know is how things appear, not how they really are in themselves. We can know that honey seems sweet, but we cannot find out if it really is sweet. On the basis of appearances we cannot tell what the real nature of things must be that produces such effects on us. Sense experience varies too much to provide any means for determining what reality is like on the basis of what is perceived. We lack any means of reasoning from experience to what has caused it. We are not even able to establish any criterion of true knowledge. Hence, we can only conclude that nothing can be known about reality. However, in this early work Gassendi insisted that we can develop useful sciences about appearances. As long as we restrict our conclusions to the world of experience, we will neither come in conflict with divine truth, nor accept any dubious dogmatic theory about unperceived reality. Such theories, whether metaphysical or mathematical, are presumptuous conjectures that have no value whatsoever.

### OBJECTIONS TO DESCARTES

In his middle period Gassendi challenged those who claimed to have discovered some means of knowing the real nature of things. He employed various skeptical arguments against Renaissance naturalists and against such leading “new philosophers” as Herbert of Cherbury and Descartes. Gassendi’s two letters against Herbert’s *De Veritate* (in which the latter claimed to have refuted skepticism) used arguments about diversity of experience and disagreements among individuals to counter Herbert’s common notions and common consent theory. In the “Fifth Set of Objections” and the *Disquisitio Metaphysica*, Gassendi turned skeptical argumentation against Cartesianism. He tried to show that Descartes’s method of doubt illustrated what the skeptics had claimed for centuries. Then Gassendi challenged Descartes’s positive dogmatic conclusions. Gassendi contended that the vaunted Cartesian criterion of true knowledge (that of clarity and distinctness) was useless, since people often think that they clearly and distinctly perceive something and then turn out to be wrong. Hence, to employ this criterion, another criterion would be needed to determine when something really is clear and distinct and does not merely appear to be so. In addition, another criterion

would be necessary to employ this second criterion, and so forth.

The culmination of Gassendi’s attack, which Descartes called the objections of objections, was his posing the possibility that all knowledge, even if it were clear and distinct, might not be about anything outside of our minds. If this could be the case, then all the knowledge purported to be found by Descartes might be imaginary or fictitious. Descartes saw this suggestion as a fundamental challenge to his system and as a denial of the possibility of gaining knowledge about any reality other than our own thoughts. His reply consisted in refusing to take the objection seriously, since if one did, “it follows that there is nothing that we can in any way comprehend, conceive or imagine, that should be accepted as true, that is to say that we have to shut the door completely on reason, and be content to be monkeys, or parrots, and no longer men” (Descartes, *Oeuvres*, C. Adam and P. Tannery, eds. vol. IXA, 212).

### MITIGATED SKEPTICISM

In his later writings Gassendi attempted to develop a mitigated skepticism that would show how we could possess worthwhile knowledge about the world of appearances and how a science of this world could be developed, using Epicurean atomism as a hypothetical model.

Gassendi’s mature theory about our knowledge of the world appears in his *Syntagma Philosophicum*, published in 1658 after his death. The work is enormous, containing 1,600 folio pages, printed in double columns. It is divided into three general sections, the first dealing with logic and theory of knowledge, the second with the natural world, and the third with ethics. Because of his skepticism, Gassendi did not regard metaphysics as a serious subject and so he omitted it entirely from his book.

At the outset, Gassendi seeks to establish a way to knowledge that is between the doubts of the skeptics and the complete assurances of the dogmatists. Neither the view that we can know nothing nor the view that we can know everything is tenable. The skeptics admit that we can know how nature appears to us. But they deny that we can know more than this. On the contrary, the dogmatists claim that we can know the real nature of things, which are not apparent to us. This, Gassendi contends, is exaggerating the power of the human mind. However, between skepticism and dogmatism there is a third possibility, which has been called constructive or mitigated skepticism, an acceptance of the thesis that although in a fundamental sense we cannot gain certain knowledge of the nature of reality, we can nevertheless gain a type of

knowledge that we need have no reason to doubt and that will suffice to enable us to understand the world.

This limited knowledge is obtained first by accepting what is obvious to us, our sense experience, plus certain obvious conclusions from it, such as that things exist. Signs found in sense experience enable us to know about other matters not immediately obvious to the senses. The ancient Greek skeptics had admitted that, on the basis of the constant conjunctions found in experience, we could judge that certain things temporarily not apparent to us were the case, such as when we see smoke, we can judge that there is a fire. In addition, we are also able to judge, by means of our reasoning ability, that particular sense experiences indicate that the world has certain features, even though we are never able to perceive these features. Thus, we can judge from the appearance of sweat on the skin that it has pores.

Long before the invention of the telescope, Democritus was able to judge from the white color of the Milky Way that it is composed of an innumerable quantity of stars. This type of reasoning, which leads us to knowledge about the world, is based on a careful and cautious evaluation of our sense information by our reason, plus inferences, made from this information, based on careful reasoning and on certain general principles that we have learned from experience. The conclusions we reach in this way about the nature of the world are beyond doubt and are ultimately evaluated in terms of future information gained from experience (as in the case of the Milky Way) and from these conclusions in explaining the course of our experience. We do not discover the absolute truth in this way, but only a faint shadow of it. This faint shadow will turn out to be the most satisfactory scientific explanation that can be given of experience in terms of the hypothesis (confirmed by experience and reasoning) that the world is composed of atoms in motion.

In terms of this theory of knowledge Gassendi examines various logical systems, ancient and modern, to state the best method for attaining limited knowledge. Many of the classical devices, Gassendi finds, are practically useless. The philosophies of Francis Bacon and Descartes have serious defects, Gassendi claims. Our senses can err, and we cannot, no matter what we do, attain real knowledge of the inner nature of things. But a logical method that is based on sense information carefully analyzed on general, unquestionable principles gained from experience and careful reasoning, and constantly checked and verified, can serve as the instrument for attaining what truth is possible.

## ATOMISM

According to Gassendi what we can know about the world consists of a modified form of the atomism of Epicurus, modified in terms of the science of the time and the religious principles Gassendi maintained that he accepted. (Whether Gassendi was a sincere Christian has been, and still is, debated among scholars.) After surveying and criticizing the views of various philosophers about the nature of the world, Gassendi offers as the most probable theory (but not as the necessarily true one) the view that the actual components of the universe are indivisible atoms, moving in empty space. The supposed atoms are assumed to have been eternally created by God, to have different shapes, and to be moving at different rates of speed. Gassendi did not want mathematically describable atoms, since he feared this would lead to some sort of mathematical metaphysics. His atoms had features like those of ordinary experience. The atoms collided and presumably the result of all the collisions is the world that we perceive. A mechanical model related to our experience can then allow us to find empirical laws, make predictions, and explain relationships between different kinds of phenomena. In so relating the phenomenal world to the atomic world, there is no longer any need for Aristotelian purposes.

Appealing to the recent findings of scientists such as Evangelista Torricelli (1608–1647) and Blaise Pascal, Gassendi insists that the essential feature of atoms is solidity. In addition, they have the properties of extension, figure, and weight. They are conceived of as having the kinds of configurations found in ordinary experience, like those of wagon wheels and houses, rather than mathematically describable sizes and shapes. Gassendi had a distrust of those who maintained that nature was to be described in mathematical terms, since he felt that they were probably advocating some type of Platonic metaphysical theory about the nature of reality.

God has created the atoms and given them an impulse to move downward. They move at different rates of speed, and for this reason they collide with one another. The collisions change the courses of the atoms, causing still further collisions, and so on. The various changes that take place in the world, both on the apparent and on the nonapparent level, can be accounted for by the movements of the atoms, their collisions, and their combinations. Thus, the real world is conceived as a mechanism made up of small moving parts, the atoms. The qualities and movements of the atoms suffice to account for changes in the real world and the way in which the world appears to us. The qualities that we per-

ceive, the colors, sounds, tastes, smells, and so on (the so-called secondary qualities), are not actually properties of real objects. Instead, they are the ways we perceive various atomic movements when they affect our sense organs.

Gassendi begins to modify his Epicurean theory when he discusses the cause of the movement of the atoms. He accepts the Scholastic thesis that the primary cause of motion is God. The evidence that God exists is the almost universal natural belief in a deity and the conclusion drawn from observing the order in the universe, namely, that there must be an orderer or designer of the world. That there are some atheists is dismissed by Gassendi as similar to the existence of blind people. That a few people lack the normal, natural human faculties and beliefs is no reason to doubt the reliability of the faculties and beliefs of the rest of humankind. Both the senses and our reasoning ability give us an adequate basis for accepting the view that there is a God.

One's conception of God is that of an omniscient and omnipotent being who is all-wise and all-good. He is the author and providential guide and cause of everything that exists and everything that happens in the world. Gassendi specifically rejects Epicurus's view that everything can be explained and accounted for solely in terms of the atoms and their motions. Where, he asks, do the atoms come from, and what makes them move? Furthermore, if the world were produced only by "the fortuitous concourse of atoms," why is it that the atoms never, by themselves, make a house, or a temple, or a book? Each of these seems to require a designer to organize the atoms in a specific way, and so does the universe in general.

Turning from physical events to mental ones, Gassendi attempts to give an atomic explanation of the nature of the soul. First, he exhibits his vast erudition by examining the opinions of many different ancient philosophers on the subject. Then he offers the theory that seemed most probable to him; namely, that the animal soul is a material object. Though we cannot see the soul, reason convinces us that it must exist. The various processes that occur in living beings, such as nutrition, sensation, and movement, could not take place were there not a soul. But what is the soul like? It is a tenuous material substance existing in the body. It is like a subtle fire, giving life to corporeal things somewhat as fire warms objects.

The human soul, however, is more complex than the animal soul, being composed of two parts. The first is the irrational soul, which is material and is like the soul of any other living thing. It accounts for the vegetative and sensitive processes that exist in man. This part of the

human soul comes to us from our parents. Besides this, we possess another feature of our souls, the rational element that, Gassendi insists, contrary to Epicurus's view, is not corporeal and is not derived from other human beings, but only from God. The rational part of our souls, which is responsible for our higher intellectual activities, is also immortal. Epicurus had argued for the mortality of the soul, but Gassendi strongly insists that only the animal soul is mortal. As evidence for his belief in the immortality of the rational soul, Gassendi contends that the fact that it is immaterial suffices to show that it is immortal. Furthermore, the universal agreement of humankind on this point is offered as another proof, as well as the view that the divine and just government of the world would seem to require human immortality for a proper system of rewards and punishments to function.

Gassendi apparently believed that there was no conflict between his atomism and his views about man and God. Hence, Catholicism could be compatible with a strictly material account of the natural world. And although Gassendi was a heliocentrist he tried to present his astronomical views in such a way that they did not conflict with those of the church in its condemnation of Galileo Galilei.

Gassendi's atomism was as complete a scientific theory as any other offered in the first half of the seventeenth century. It rivaled Descartes's. However, as science developed later on, Gassendi's picture was replaced by that of Isaac Newton and others. No important discoveries are attributed to Gassendi's great scientific program.

## HUMAN PSYCHOLOGY

In his discussion of human psychology Gassendi presents a theory to explain how the various mental processes take place. This section culminates with an examination of the sources of all of our knowledge, which, to some extent, anticipates the views that appear in John Locke's *An Essay concerning Human Understanding* (1690).

The faculties of sensation and imagination are common to humans and animals. Gassendi even asserts that sensation occurs to some extent in plants and minerals. Sensation occurs by means of a physical process involving material particles affecting a sense organ and causing a sensation, which is a physical event in the brain. The faculty of the imagination, which includes the memory as well, operates on traces or remains of the physical sense impressions. These traces are conceived of as waves in the brain that are actuated by other motions in the body and then cause further movements in the brain, giving rise to sensations or feelings similar to the original sensation

that caused the wave. Much of the account offered by Gassendi is close to that presented by his contemporary, the materialistic philosopher Thomas Hobbes.

The imagination has three functions: apprehension, judgment, and reasoning. We can apprehend, as a result of the wave motions, the exact experiences and sensations that have occurred. Because of movements inside and outside us, the various waves can be agitated at later times, so that we can now be aware of what we experienced yesterday. Also, different features of different experiences can be apprehended at the same time, giving rise to apprehensions of objects that have never, as such, been experienced. Thus, for example, our apprehension of a centaur results from our previous sense experience of a horse and a man, plus the simultaneous activation of part of the remaining wave that came from each of them. Judging and reasoning, which Gassendi insists takes place in both humans and beasts, involves comparing apprehensions and associating them together according to their relations in actual experience. The faculties of judgment and reasoning put various apprehensions into an ordered sequence based on the experienced sequences of sensations, plus the natural instinct that makes us expect certain consequences to follow from what we have experienced.

Up to this point the detailed psychological theory that Gassendi presents is much like that later developed by the British empiricists from Locke to John Stuart Mill. But Gassendi also insists that there is another mental faculty that exists in humans, but not in other animals, that of intelligence or understanding, which belongs to our rational souls. By means of intelligence we are able to know things that cannot be experienced in sensation, such as God, space, and time. By this faculty we are also able to know the abstract essences of things, which transcend the powers of the imagination. Thus, for example, the imagination can know what “man” is, in terms of the sensations received. But, the essence of man, what it is that makes him what he is, can be known only by the intelligence. Lastly, this highest mental faculty is capable of self-consciousness. It can reflect on its operations and those of the imagination and make us aware that we see, we think, and so on.

In terms of this theory of the nature of the soul Gassendi next offers his opinion about the origin of our ideas. He repudiates completely the theory of Descartes and of Herbert of Cherbury that we possess innate ideas. Instead, Gassendi insists on the principle accepted by Aristotle and Epicurus, that there is nothing in the understanding that was not first in the senses. At the outset, the

mind is a *tabula rasa*, a blank tablet. All the particular ideas that the mind ever knows, such as that of the sun, either come directly from sense experience or result from combinations of elements furnished by the senses. General or abstract ideas are formed by the intelligence from the collection of sense materials. In this case the sense information is necessary, but not sufficient to account for general ideas, such as that of “man.” The intelligence goes beyond the actual sense-data in forming a unique idea from all the particular sensations. With regard to ideas of incorporeal things, which cannot be known by the senses, sense experience and the imagination furnish the occasion for the understanding to gain this knowledge. Because of certain experiences the understanding thinks, reflects, abstracts, and arrives at ideas, such as that of God. The senses provide some of the basic materials for these ideas and provide the context in which the understanding reasons to reach a conception of an incorporeal being.

Thus, all ideas either come from the senses or result from intellectual activities that are either caused or occasioned by sense information. However, in the cases of abstract ideas and ideas of incorporeal things, the actual content does not derive from any particular sense experiences. General principles, such as “The whole is greater than the part,” are formed by induction from various particular experiences. When all of our experiences exhibit the same characteristics, we reach a general conclusion, which then becomes the basis of all further reasoning.

## ETHICS AND RELIGION

The last part of *Syntagma* deals with ethics. Gassendi’s theory is only a slightly modified version of Epicurus’s hedonism. Gassendi holds that every pleasure, considered in itself, is a good and that all things that are considered good have value only in terms of the pleasure they produce. A completely pleasurable life is one without pains and troubles. Ultimately, for Gassendi, such a life can be achieved only by God. We can mitigate the pains in our lives as much as possible and thus attain a relatively good life.

A major problem in interpreting Gassendi’s contribution is that of assessing his intentions and actual beliefs. There has been great debate whether Gassendi was really a Christian. He has been seen both as the founder of modern materialism, a leading skeptic and libertine, and as a serious Christian trying to find a *via media* between his faith and the new science. There have been long debates, especially in French literature, about the so-called *Le cas Gassendi*. He was a close associate of

some of the leading French freethinkers and took part in retreats with them where they boasted of being able to speak freely on all subjects. Gassendi was also a close friend of some leading church figures such as Mersenne. Gassendi and Mersenne shared similar views about science and its foundations. They agreed that science could not refute skepticism and each offered a form of mitigated skepticism as a way of carrying on useful science without metaphysics. Nobody ever questioned Mersenne's religious sincerity, and he remained in closest touch with Gassendi. No charges were ever made at the time about any heretical opinion or activity on the part of Gassendi.

Arguments about how to evaluate Gassendi still go on. Researches into his few theological writings go one direction, his materialism points another way, and his associations with leading figures of the time, ranging from Hobbes to Pascal, allow for many interpretations. Gassendi was a priest all his life and he was friendly with the most orthodox and the most unorthodox figures of his time. His philosophical system represented a cautious and careful attempt to explain the world in keeping with both the results of the new science and the official views of the Catholic Church. He may have seen, as few others of his time did, the importance of the values of his religious tradition, of the classical heritage, and of the new science, and at the same time fully appreciated what the skeptics had shown about man's fallible nature. Unlike Montaigne, Charron, and La Mothe Le Vayer (all of whom he admired), he did not wish to destroy the fruits of human efforts along with man's presumptuous and dubious claims. More like Sanchez, he wanted to find a constructive resolution to the skeptical crisis of the Renaissance, but not in the form of the new dogmatisms of Herbert of Cherbury or Descartes. Living within a major religious tradition, he tried to show that by discarding Aristotelianism and by accepting the wisdom of the skeptics along with certain elements of Epicureanism, faith and the new scientific discoveries could coexist.

Gassendi adapted various features of the philosophy of Epicurus to the state of knowledge of his day, and he modified certain portions of Epicurus's theory that were not in keeping with the Christian religion. The result was a semiskeptical, semiempirical theory that portrayed the world in terms of an atomic structure. Gassendi's philosophy remained important throughout the seventeenth century and was the chief modern alternative to Descartes's. It began to lose its appeal and importance after the development of Newton's scientific theories. Many of the basic elements of later English philosophy

appear in Gassendi's views, and he probably had great influence on such thinkers as Hobbes and Locke.

## INFLUENCE AND SIGNIFICANCE

Gassendi was one of the foremost philosophers and scientists of the early seventeenth century. He was the most important rival and critic of Descartes, and he had a crucial role in the revival of the ideas of the ancient Greek skeptics and atomists. Gassendi began his intellectual career as a skeptic; a staunch follower of Sextus Empiricus and Montaigne. Gradually, he mitigated his skepticism in the face of the scientific revolution of the time, in which he played a major role, and he adopted more and more of a materialistic explanation of the world based on the ancient theory of Epicurus. Though a prominent Catholic priest of his day, Gassendi developed one of the first completely mechanistic and materialistic theories of modern times.

Gassendi's ideas had much influence in the seventeenth century. Although he published his work in huge Latin tomes, a French abridgement was made in the latter part of the century and many portions of his work appeared in English. His ideas were being taught in Jesuit schools in France, English universities, and even newly founded institutions in North America. Because of the close similarity between Gassendi's skeptical empiricism and some of the major portions of Locke's *Essay concerning Human Understanding*, there has been a good deal of discussion about whether Locke was influenced by Gassendi or used some of his works. It has been discovered that one of Gassendi's main works on Epicurus appeared in English in 1659 in Thomas Stanley's *History of Philosophy*, a work that Locke knew. Locke had also met a few of Gassendi's disciples in France, so it is possible that some influence occurred.

Gassendi's atomism never connected itself with basic scientific findings, so that modern atomism had to start elsewhere. There has been more interest in Gassendi in recent years. Many conferences were held for his 400th birthday in 1992, with explorations of many aspects of his thought and activities, and his scientific researches are proving important in the history of botany, geology, and other fields. There is growing interest in his critique of Cartesian philosophy and he is now being seen as a genuinely original thinker of the first rank.

## Bibliography

### WORKS BY GASSENDI

- Exercitationes Paradoxicae Adversus Aristoteleos* (1624). Amsterdam: Apud Ludovicum Elzevirium, 1649.
- Petri Gassendi Diniensis ecclesiae praepositi ... Opera Omnia*. 6 vols. Lyon, France: Sumptibus Laurentii Anisson, & Ioan. Bapt. Deuenet, 1658.
- Lettres familières à François Luillier pendant l'hiver, 1632–1633*, edited by Bernard Rochot. Paris: J. Vrin, 1944.
- Recherches métaphysiques*. Translated and edited by Bernard Rochot. Paris: J. Vrin, 1962. Originally published as *Disquisitio Metaphysica* in 1644.

### WORKS ABOUT GASSENDI

- Bernier, François. *Abrégé de la philosophie de Gassendi*. 7 vols. Paris: Fayard, 1992. French translation of some of Gassendi's major texts.
- Bloch, Olivier R. *La philosophie de Gassendi: Nominalisme, matérialisme, et métaphysique*. The Hague: Martinus Nijhoff, 1971. Careful study of Gassendi's philosophical development.
- Centre International de synthèse. *Pierre Gassendi, 1592–1655, sa vie et son oeuvre*. Paris: A. Michel, 1955. Lectures on Gassendi by Bernard Rochot, Alexandre Koyré, Georges Montgrédien, and Antoine Adam. Some excellent discussions of his philosophical and scientific views.
- Gregory, Tullio. *Scetticismo ed empirismo: Studio su Gassendi*. Bari, Italy: Laterza, 1961. Important study emphasizing Gassendi's materialism and skepticism.
- Hess, Gerhard. "Pierre Gassendi, Der Französische Späthumanismus und das Problem von Wissen und Glauben." *Berliner Beiträge zur Romanischen Philologie* 9 (1939): 1–99. Important study of Gassendi's views on faith and reason.
- Joy, Lynn Sumida. *Gassendi the Atomist: Advocate of History in an Age of Science*. New York: Cambridge University Press, 1987. Study of Gassendi's humanistic development of his scientific theories.
- Kroll, Richard W. F. *The Material Word: Literate Culture in the Restoration and Early Eighteenth Century*. Baltimore, MD: Johns Hopkins University Press, 1991. The impact of Gassendi's ideas in Restoration England.
- Murr, Sylvia, ed. *Gassendi et l'Europe*. Paris: J. Vrin, 1997. Essays by many scholars on the 400th anniversary of Gassendi's birth.
- Osler, Margaret. *Divine Will and the Mechanical Philosophy: Gassendi and Descartes on Contingency and Necessity in the Created World*. New York: Cambridge University Press, 1994. Contrasts Descartes's philosophical theology with that of Gassendi's.

Pintard, René. *Le libertinage érudit dans la première moitié du XVIIe siècle*. Geneva, Switzerland: Slatkine, 2000. New edition of Pintard's 1943 work. Gassendi is examined in relation to the *libertins*, and an irreligious interpretation of his views is offered.

Popkin, Richard H. *The History of Scepticism: From Savonarola to Bayle*. Rev. ed. New York: Oxford University Press, 2003.

This is a newly revised and enlarged edition of Popkin's 1979 work, *The History of Scepticism: From Erasmus to Spinoza*. Depicts Gassendi's place in the history of skepticism.

Rochot, Bernard. "Le cas Gassendi." *Revue d'histoire littéraire de la France* 47 (1947): 289–313. Defense of Gassendi's religious sincerity against the accusations of Pintard.

Rochot, Bernard. "Gassendi et le Syntagma Philosophicum." *Revue de synthèse* 47 (1950): 67–79. Study of Gassendi's philosophy of science and scientific method.

Rochot, Bernard. *Les travaux de Gassendi sur Epicure et sur l'atomisme, 1619–1658*. Paris: J. Vrin, 1944. Important study of Gassendi's development. Contains a critical bibliography.

Turner, Anthony, and Nadine Gomez. *Pierre Gassendi: Explorateur des sciences*. Catalogue from the exhibit on Gassendi at the Musée de Digne, Digne-les-Bains, France, May 19–October 18, 1992. Portrays the many scientific interests Gassendi had.

*Richard Popkin (1967, 2005)*

## GAUGE THEORY

Gauge theory is concerned with the problem of comparing physical states at different space-time locations. To get a feel for the problem, it is best to begin with a simple example. Quantum chromodynamics is the theory of the force that binds quarks together. An initial presentation of the theory might begin by stating that the *color force* (a fanciful name having nothing to do with visual colors) comes in three *color charges*—red, blue, and green, and their *anticharges*—anti-red, anti-blue, and anti-green. Every quark has one of these charges, and a stable collection of quarks must have no net color. Thus, a stable three-quark object, such as a proton, can be formed from a red, a blue, and a green quark (red + green + blue = white, which is colorless), or a stable two-quark object, such as a pion, can be formed from a red quark and an anti-red quark. This would explain why quarks are never seen in isolation. Just as electric charge comes in two forms, positive and negative, color charges come in six species. The interaction between any pair of quarks will depend on their charges.

Note an immediate consequence of the little story just told. It suggests that given any two arbitrarily specified quarks, no matter where they happen to be, there is a fact about what color charge they have, and, a fortiori, a

fact about whether their color charges are the same or different. Most metaphysical accounts of properties have the same consequence. If there is a universal corresponding to the color charge red, for example, then there is a fundamental fact about any pair of quarks whether they both instantiate this universal or not. Or if one prefers a theory of tropes, then there is still a fundamental metaphysical fact about whether the trope that is part of one quark is qualitatively identical to the trope that is part of the other. These metaphysical facts would obtain no matter where the two quarks were located even if they were located in different space-times.

Gauge theory rejects this metaphysics. It is correct, according to gauge theory, that there is a variety of color charges possible for each quark and that the structure of these physical possibilities is that of a genus with six species (speaking roughly). But there is no natural identification between the particular color states available to one quark and the particular color states available to a distantly located quark. Here an analogy will help.

Consider the surface of a sphere. At any point on the sphere, there is a set of directions one can move in. And the generic structure of that set at any one point is exactly the same as the structure of the set at any other point: Wherever you are, you have a full 360 degrees of different directions available. But there is no fact about whether a particular direction at one point on the sphere is *the same* or *different* from a particular direction at another point on the sphere. One could, for example, lay down a circle with degree markings from zero to 360 at the North Pole and lay down an identical circle somewhere on the equator. But there is no further sensible constraint that the two circles be *oriented the same way* or that the zero-degree direction at the North Pole *point the same way* as the zero-degree direction at the equator. One cannot sensibly ask of two arrows, one at the North Pole and the other at the equator, whether they point the same way or not.

Having placed the circle of degrees at the North Pole in one orientation, one is still free to place the circle at the equator at any orientation one likes. Such an arbitrary choice of orientation for the degree numbers is called *picking a gauge*, that is, fixing on a convention for assigning numbers to different directions at different points. Once one has picked a gauge, one can talk about an arrow at the North Pole and one at the equator pointing the same way (e.g., both pointing at thirty-seven degrees), but since the gauge itself was an arbitrary choice, the *sameness* carries no ontological weight.

When considering distant points on the sphere, it is obvious that there is no sameness or difference of direc-

tion: The set of directions one can go in at one point are, as it were, specifically different from the set of directions one can go at another. And one might then be tempted to simply index any direction by the point it is attached to: There are a set of North Pole directions and a set of Eiffel Tower directions, and so on, with none of these being intrinsically comparable to any other. But the situation is not so simple. Suppose a person is standing at the North Pole holding a rod out in a certain direction and is told to walk forward *keeping the rod pointed the same way*, that is, the person is to walk forward *without letting the rod twist*. This is a sensible demand, and a physically meaningful one: If the rod is allowed to twist as the person walks, the force will be felt in the hands. But *twisting* is just *changing direction*. So if there is a fact about whether the rod is twisting, there must be a fact about whether it is changing direction even though at every moment the person is located at a different point on the surface of the earth.

There is a nice mathematical object that handles this situation. The set of directions one can go in at any given point of the sphere is called its *tangent space*. The tangent spaces are all generically identical (360 degrees around) but specifically different: Each tangent space is *glued to* a point on the surface of the sphere. The mathematical object that will now be introduced is called a *connection* on the tangent spaces, and what it allows, intuitively, is for one to make comparisons between directions in the tangent space at one point with directions in tangents spaces at points infinitesimally nearby. So, as one moves continuously from one point to another on the sphere, the connection will determine whether the direction of the rod is changing or not. There are no absolute comparisons of *distant* directions, but there are comparisons of *nearby* ones mediated by the connection. More precisely, the connection provides a notion of *parallel transport*, that is, of *carrying* a direction from one tangent space to another without twisting *along a specified path*. It does not underwrite any absolute comparison of directions in different tangent spaces.

This is the sort of structure used in the gauge theories of physics. There are various charge states available to a quark at one location, and a similarly structured set of charge states available to a quark at another location, but no absolute comparison between the two: There is no fact about whether the states of the quarks are the same or different. How, then, can there be any *forces* associated with the color charges? In the case of the electric force, it is critical to know whether two particles have the same or different charge: Like charges repel and unlike charges attract. How can one say, as was said above, that a stable

collection of quarks must have no net color if there is no fact about exactly which color charge each quark has?

It is not enough to say that in a proton or a pion the quarks are nearby so there is a way of comparing their charges: Nearby is evidently not a mathematically precise term. The story is rather this. In modern particle theory, every force is mediated by a set of particles. The electromagnetic force is mediated by the photon, and the color force is mediated by particles called *gluons*. Furthermore, unlike the case of the photon, which carries no electric charge, the gluons themselves carry the color charge. And the very same remarks about the impossibility of absolute judgments about *which* charge a quark carries can be made about which charge a gluon carries. For heuristic purposes, it helps to think of gluons as carrying two charges: a color and an anticolor.

Now, suppose there is a bound state of two quarks, as in a pion. The quarks are only bound to each other through the mediating effect of a gluon. Originally, it was said that the pion as a whole must have no color, so the quarks can be, for example, one red and the other anti-red. But the gauge freedom, the freedom to identify different states at different points as the red state or the blue state means that there must be an equally valid description according to which the one quark is blue and the other anti-red. This seems to violate the demand that the pion have no net color.

Here, the gluon comes to the rescue. When gauge is changed, it must be done in a locally smooth way, and this means that not only do the color charges ascribed to the quarks change, but the color charges ascribed to the mediating gluon will change, too. So, while in one choice of gauge the pion will be described as a red quark bound to an anti-red quark by (say) a mediating blue/anti-blue gluon, in another choice of gauge, the very same pion will be described as a blue quark bound to an anti-red quark by a mediating red/anti-blue gluon. In each case there is no net color charge even though the particular charges ascribed to the constituents change. Evidently, while there is a *gauge freedom* involved in ascribing charges to particles—free enough so that any particle can be ascribed any charge—there are global constraints on the choice of gauge, and changing the gauge for one particle will have to have consequences for the charges ascribed to others. Because the gauge can be changed in different ways at different points, this is called a *local gauge freedom*.

The key point is this: The gauge freedom is wide enough that there is no objective, gauge-independent fact even about whether two particles have either same or different color charge. So no metaphysics that tries to asso-

ciate the color charges with universals or tropes in the usual way can succeed. This result is of particular significance for David Armstrong's project of justifying belief in universals by appeal to scientific accounts of the world. The fundamental structures employed by the best scientific theories simply do not correspond to the ontology of substance/universal that Armstrong proposes.

Gauge theories provide a novel approach to the fundamental ontological problem of sameness and difference. A metaphysics of universals or tropes entails that there be certain absolute facts about whether two individuals have similar or different qualities or properties, facts that obtain independently of where the individuals are located or even whether they are located in the same space-time at all. According to gauge theories, comparisons of *properties* are always mediated by a gauge connection. This means both that comparisons between individuals that inhabit disconnected space-time cannot be made at all and that even within a single space-time, ascription of charges to individuals always requires a somewhat arbitrary global choice of a gauge. The gauge connection itself is objective, but the particular charges assigned to individuals are not. This is an ontological structure that does not fit neatly in any traditional metaphysical category.

## GAUNILO

(fl. 11th century)

Soon after St. Anselm circulated his *Proslogion*, it was the target of a vigorous rejoinder by an otherwise unknown Benedictine monk named Gaunilo. Although Gaunilo's "Reply on Behalf of the Fool" raises a number of objections to the ontological argument, by far the best known is the Lost Island *reductio*, an argument intended to be exactly parallel to Anselm's that generates an obviously absurd conclusion. Gaunilo proposes that instead of "that than which nothing greater can be thought" we consider "that island than which no greater can be thought" (2001, p. 31). We understand what that expression means, so

(following Anselm's reasoning in the ontological argument) the greatest conceivable island exists in our understanding. But (again following Anselm's reasoning) that island must exist in reality as well; for if it did not, we could imagine a greater island—namely, one that existed in reality—and the greatest conceivable island would not be the greatest conceivable island after all. Surely, though, it is absurd to suppose that the greatest conceivable island actually exists in reality.

In order to defend himself against Gaunilo's criticism, Anselm would have to show why Gaunilo's argument about the island is not in fact analogous to his own argument about that than which nothing greater can be thought. Yet although his "reply to Gaunilo" asserts more than once that the island example fails, he does not explain why it fails. The usual reply given on Anselm's behalf (and indeed often attributed to Anselm himself) is that the notion of a greatest conceivable island is incoherent; however great an island might be, one could always conceive of a greater. (For a reading of the argument that endorses a response of this sort, see Klima 2000.)

Gaunilo's reply does have its defenders, however, most notably Nicholas Wolterstorff, who argues that Anselm "realized the 'tellingness' of [Gaunilo's] points. ... The sign of his realization, however, is not concession; Anselm does not concede. The sign is rather bluster" (Wolterstorff 1993, 87).

## GAY, JOHN (1699–1745)

John Gay, the English moral philosopher, was a fellow of Sidney Sussex College, Cambridge, and later vicar of

Wilshampstead, Bedfordshire. His short "Dissertation concerning the Fundamental Principle of Virtue or Morality" was first published as a preface to Edmund Law's translation of William King's Latin *Essay on the Origin of Evil* (1731). (Law was bishop of Carlisle and King was archbishop of Dublin.) The "Dissertation" is one of the seminal works in the history of English utilitarianism. In the eighteenth century its influence may be found in the works of the theological utilitarians, Abraham Tucker (*The Light of Nature Pursued*, 7 vols., 1768–1778) and William Paley (*Principles of Moral and Political Philosophy*, 1785). David Hartley said that Gay's assertion of the importance of psychological association in human nature was the origin of his *Observations on Man* (1749).

Gay hoped to eradicate confusion in moral philosophy and to harmonize the competing theories about the criterion of virtue. In his survey of candidates for the criterion of virtue, Gay noticed acting agreeably to nature; acting agreeably to reason; conformity to the fitness of things; conformity with truth; promoting the common good; and conformity to the will of God. In opposition to the claim that a criterion of virtue can be stated, Gay noticed the protagonists of the moral sense who claim that our judgments of virtue and vice are but the instinctive determinations of a moral sense. Gay set himself the task of showing that all of the above-mentioned criteria of virtue are compatible and not inconsistent with our having a moral sense.

Gay insisted upon the difference between a definition and a criterion, claiming that one must know what a thing is before one can measure it. Therefore, he first defined virtue as conformity to a rule of life. He expanded on the concept of "rule of life" by saying that it is a rule directing the actions of all rational creatures with respect to each other's happiness and that the rule must be understood to be obligatory for everyone in all cases.

Gay next turned to the question, What is it that can oblige everyone in all cases to follow a rule of life? He argued that a full and complete obligation can only arise from the authority of God, because only God can in all cases make a man happy or miserable. Gay then said that the criterion of virtue is the will of God. But what rule of life does God will that we follow? Attending to God's nature, we find him supremely happy. From God's goodness we infer that he has designed men to be happy and that he has willed the means to human happiness. Therefore, a person should always behave so as to be a means to the happiness of humankind. Arguing from the will of

God, Gay thus arrived at a criterion of virtue once removed.

The above account covers what might be called the first part of Gay's system. In it he found the clues for harmonizing the several criteria of virtue he had collected from earlier writers. He found conformity to the will of God to be the fundamental criterion of virtue, but the other criteria are necessary to explicate this one. Thus the criterion of the will of God with respect to virtue is whatever promotes the happiness of humankind or the common good. Gay defined things that are fitting and agreeable to nature as those things or actions which may be used to bring about the happiness of humankind. He complained about earlier writers who left the phrases "fitness of things" or "agreeableness to nature" empty of meaning by not seeing that they must be used in relation to some end, namely, the happiness of humankind.

To account for agreeableness to reason as a criterion of virtue, Gay included under his notion of reason not only reason—that is, the foreseeing of the inconveniences of certain things and actions by contemplating their natures—but also experience, or the perceiving of these inconveniences when they happen. Reason in this extended sense is the criterion of the fitness and unfitness of things and actions, as they contribute to human happiness. Gay added that when reason conforms to things as they really are, we say that we have the "reason" of things, or the "truth" of things. Thus, he fit in conformity with truth as yet another criterion of virtue. But while he succeeded in fitting all these criteria into an account of virtue, he also warned that some are more remote criteria than others.

Gay brought the moral sense into his account of virtue by denying that it is innate, or that it operates instinctively. Men must acquire the moral sense, notably by learning to be pleased by those actions which promote human happiness and to be displeased by those which do the contrary. Gay allowed that once it is learned, the operation of the moral sense may be habitual. He also allowed that much of humankind may learn what virtue is by example and observation, without being able to reason out their judgments.

Gay also explained why a person may be virtuous. Curiously enough, he made little of man's obligation to obey the will of God. Rather he appealed to the universality of man's inclination to seek pleasure and to avoid pain; and he equated a person's happiness with his being pleased. There are two motives, then, for virtuous behavior. First, when I see that my own happiness depends on the happiness of others, I will seek to promote their hap-

piness in the hope that they will in turn promote mine. Second, since esteem and merit are associated with virtue, I may behave virtuously in order to enjoy the pleasure of being esteemed. Similarly, I will esteem those who promote my happiness, in order to encourage them.

## GEHLEN, ARNOLD

(1904–1976)

The German social psychologist Arnold Gehlen was born in Leipzig. In 1934 he succeeded his teacher Hans Driesch as professor of philosophy at the University of Leipzig. He went to Königsberg in 1938 and from 1940 to 1944 was at the University of Vienna. In 1948 he became professor of sociology and psychology at the Hochschule für Verwaltungswissenschaften at Speyer. After 1962 he was at the Technische Hochschule in Aachen. He died in Hamburg.

Gehlen, a leading representative of the movement known as philosophical anthropology, sought to reinterpret the concepts of mind and intelligence in biological and sociological terms. His eclectic thought has partial affinities with the pragmatism of G. H. Mead and F. C. S. Schiller, with the integrationalism of Rudolf von Ihering, Maurice Hauriou, and Carl Schmitt, and with the cultural criticism of Oswald Spengler, Hans Freyer, and Martin Heidegger. At the same time, he rejects ontology and metaphysics. He rejects the traditional dualisms of soul and body, mind and matter, theory and practice. He emphasizes the predominant role of collective, or institutional, values as against those of individuals. He discards rationalism and regards present-day civilization as one of late-period decline.

### METHOD AND TASK OF PHILOSOPHY

Gehlen rejects the experimental methods of the natural sciences as leading to materialism and rejects the "understanding" approach of the advocates of the *Geisteswis-*

*senschaften*, because it employs contemporary intellectual standards in the analysis of heterogeneous situations. The method of philosophy, Gehlen claims, is the intuitive or phenomenological method that he himself uses to interpret the significance of sociocultural institutions. According to Gehlen the task of philosophy differs from that of science. Disregarding the factual inferences of the sciences as irrelevant, philosophers should “unravel” (*freilegen*) the realities that are their proper concern. These realities, or “categories,” are the basic qualities of man and of institutions that remain intact after the fullest cultural, social, and historical analyses. Gehlen conceives of such a study of reality as empirical and thus envisages no complete system of categories.

### MAN'S NATURE AND POWER

Gehlen defines man as an “acting, anticipatory, nondetermined, self-delimiting being—a product of culture.” Like other philosophical anthropologists, Gehlen views man, compared with other animals, as a vulnerable, deficient being, lacking the powerful instincts and natural weapons of survival of other animals. Man's fabled power of thought is an artificial substitute for his weak instincts. He is reduced to dependence on technical means for his survival. For survival and to liberate himself from anxiety he has had to develop tools and techniques including language, myth, and magic, and has had to create a common, habitual, and stable cultural environment.

This cultural environment is perpetuated in institutions, the historically evolved realities of state, family, law, economy, and so forth. To be “legitimate” an institution need not be useful but must be derived from man's nature as expressed in the cultic, nonutilitarian experiences of ecstasy, trance, and asceticism. Institutions are comprehensive and abstract structures that, through their principle of order, impart autonomy to the individuals participating in the collective *entente secrète*. The utility of social and cultural institutions is a secondary by-product of their development. Gehlen contrasts unreflective, spontaneous, self-sacrificing action, which he describes as noble (*vornehm und edel*), with self-interested and utilitarian action (including its sublimated forms in art, philosophy, and literature), which he designates as base (*gemein*).

### THEORY OF TRUTH

Like certain pragmatists, Gehlen stressed action as the determinant of valid thought. While defining truth in terms of inner coherence and correspondence with facts, Gehlen also distinguished another aspect of truth, which he calls “inner truth.” “Essentially irrational, non-scientific and not directly controllable experience has its truth: that is certainty. And it has its form of acting: non-experimental action based on tradition, instinct, habit and conviction” (*Der Mensch*, p. 330). These illogical, ethical certainties are valid without rational or experimental justification—as a matter of mere “appositeness” or inner sanity. Rational knowledge (*Wissenschaft*) cannot take over the function of the *idées directrices* of society that are the product of *Urphantasie*, the divinity and energy of the animal component of man.

PESSIMISM

Gehlen's analysis of his age was unrelievedly somber. His times, according to Gehlen, were marked both by the dissolution of institutions and a shift in individual and social consciousness from irrational certainty to an anarchic intellectualization. This change took place against a historical background in which organic agrarian society was giving way to organized industrial society. The cultural rupture transforms social organisms into “colonies of parasites” riddled with subjectivism, mechanization, a turn toward abstract and mathematical methods in art and science (desensualization), and experimental thinking.

### PESSIMISM

Rising living standards, far from representing progress, create new urges for limitless satisfactions. Such changes lead away from ethical obligation deriving from man's nature to goal-directed efficiency deriving from man's method. These changes entail making the spiritual sphere political and robbing the political sphere of its religious aura. Since science is esoteric, the mass of the people are condemned to be primitive. The eclipse of the nation-state and the trend toward supranational organization and peace will leave a legacy of unresolved conflicts that may lead to a complete loss of individual freedom. Only two very unlikely circumstances could reverse the trend: an unexpected return to legitimate, nonrational values that are not amenable to conscious volition or the rise of a creative personality to provide a new kind of institutional leadership.

According to Gehlen, the philosopher's task in such a world situation is to point to signs of decline and to emphasize the “legitimate” elements in national heritages as expressed in the institutions of state, church, and law. Although present-day society is increasingly alienated from these heritages, they alone represent society's legitimate “reality.” Reality has therefore to be sought in the archaic forms of the past.

## GEISTESWISSENSCHAFTEN

*Geisteswissenschaften*, a term commonly used in German to denote disciplines referred to as “the humanities” in English, emerged in the course of a nineteenth-century discussion about the proper designation for those disciplines whose topics and methodologies were different from those of the newly predominant natural sciences (*Naturwissenschaften*) such as physics, biology, and chemistry. A compound word, its second component—“the word *Wissenschaften*” or “sciences”—indicates that these disciplines are indeed legitimate sciences, but sciences of a different kind than the natural sciences. The assumption underlying the discussion out of which the term emerged is that there are valid scientific methods for studying topics such as literature, art, and history, but that the objects of these disciplines and their appropriate methods were significantly different from the objects and quantitative methods appropriate of modern natural science. Originally conceived as one side of a binary opposition between the realms of “nature” and those things that could not be subsumed under that heading, it uses the term “*Geist*” to provide a positive description of the general domain that is the proper field of study for those disciplines.

Many scholars have noted that the plural form of the term was used in 1849 in J. Schiel’s German translation of John Stuart Mill’s *Logic* as a translation for Mill’s phrase “the moral sciences” and count that as the origin of the term *Geisteswissenschaften*. However, earlier uses of similar terms have been documented (see, e.g., Diemer) and the term *Geist* as a central term for historical and cultural manifestations of human mentality had become common in German romantic philosophy (Herder and Hamann), and German Idealism (especially Hegel) well before 1850.

The clearest formulation of the notion of *Geisteswissenschaften* as a group of disciplines united by a common method was presented by Wilhelm Dilthey in his *Einführung in die Geisteswissenschaften* (1883). In this work, he identifies the common topic of these sciences as historical social reality that cannot be captured through the natural sciences. They find their ultimate basis in the structures of human experience, which is essentially historically and contextually situated. Hence the *Geisteswissenschaften* seek to do more than merely to explain, instead they seek to understand the expressions of human experience by situating them into broader personal, social, and historical contexts that provide insight into their “sense.” For Dilthey, then, the fundamental disci-

plines for all of these others were anthropology and psychology, with psychology understood as a descriptive science aimed at understanding the structures of human experience.

During the late nineteenth and the first half of the twentieth centuries these fields included not only what would traditionally fall under the concept of the humanities in English, such as philosophy, history, philology, and the histories of art and music, but also traditional faculties such as law and theology whose methodologies were not consistent with those of the natural sciences. It also came to include areas that were just beginning to emerge as special disciplines such as political science and sociology, which at the time were paradigms of the *Geisteswissenschaften*. Hence in the second half of the nineteenth century and the beginning of the twentieth century, the term *Geisteswissenschaften* was in competition with the term “*Kulturwissenschaften*” or “cultural sciences” as another way of capturing the difference between all of the fields that were distinct from natural sciences, a term that was championed above all by members of the Southwest German school of Neokantianism such as Wilhelm Windelband (1915) and Heinrich Rickert (1986) for all of the areas Dilthey called *Geisteswissenschaften*. They stressed the unique and specific nature of the objects that these (idiographic) sciences seek to understand as opposed to the general laws that were the object of the (nomothetic) natural sciences.

During the first half of the twentieth century, Dilthey’s preferred terminology predominated, but toward the end of the twentieth century, the social sciences have come to be generally grouped together under the heading of “*Sozialwissenschaften*” or “*Gesellschaftswissenschaften*,” two different German words for “social sciences,” as they have increasingly adopted the quantitative methodologies associated with the natural sciences. From the outset, questions about the status of psychology as a scientific discipline have played a pivotal role in the discussion of the nature and limits of the *Geisteswissenschaften*. At the end of the twentieth century, however, it too was increasingly grouped together with social sciences based on shared quantitative research methods; the notion of the *Geisteswissenschaften* became closer once again to what in English would be called the humanities. Law, economics, and the social sciences are becoming less commonly subsumed under the heading of the *Geisteswissenschaften* and an increasing number of departments concentrating on history, literature, art, and related fields often choose to refer to themselves as *Kulturwissenschaften* instead of as *Geisteswissenschaften* as

they combine methodologies from both the humanities and the social sciences into their studies.

## GENERAL WILL, THE

The idea of the general will (*volonté générale*) forms the core of Jean-Jacques Rousseau’s political philosophy. Others had introduced the term before him, and his use influenced many others, including Immanuel Kant and Georg Wilhelm Friedrich Hegel, but the general will is most closely associated with Rousseau’s *Social Contract* (1762/1997). In that work, Rousseau argued that “the general will alone can direct the forces of the State according to . . . the common good” (II.1.1, p. 57) and that political rule is only legitimate when based on a social contract that establishes the general will as sovereign. This led Rousseau to hold that laws must be authorized by the people as a whole, since “only the general will obligates particulars, and there can never be any assurance

that a particular will conforms to the general will until it has been submitted to the free suffrage of the people” (II.7.7, p. 70). The general will, as Rousseau understood it, is impartial in that it “must issue from all in order to apply to all” (II.4.5, p. 62).

Prior to Rousseau, the term “general will” was introduced into seventeenth-century theological disputes by Antoine Arnauld and then discussed by Blaise Pascal and Nicolas Malebranche, among others. The issue was whether God has a *general will* to grant all people salvation, and if so, how it is possible and just for particular individuals to be condemned to hell. In the early eighteenth century, authors such as Pierre Bayle and the Baron de Montesquieu began to use the term in a secular context. In defending the separation of governmental powers, Montesquieu associated the legislative function with the general will and judicial power with a particular will. When Denis Diderot published an entry on “natural law” in his *Encyclopédie* in 1755, the general will held a central place. He wrote that only humanity, and not any individual, can “determine the nature of justice and injustice. . . . Private wills are suspect; they may be either good or bad. But the general will is always good” (1755/1992, pp. 19–20). He continued, “The general will is in each person a pure expression of the understanding, which in the silence of the passions calculates what every individual may demand from his fellow-man, and what his fellow-man has a right to demand of him” (pp. 20–21).

While clearly influenced by Diderot, Rousseau rejected his colleague’s cosmopolitanism and focused instead on the general will of a society. Rousseau held that “each individual may, as a man, have a particular will contrary to or different from the general will he has as a Citizen” (I.7.7, p. 52). A person’s private will directs him toward his own particular interests, while the general will aims at the common good of society. In addition, Rousseau introduced the crucial contrast between the general will and the will of all: “From the preceding it follows that the general will is always upright and always tends to the public utility: but it does not follow from it that the people’s deliberations are always equally upright. . . . There is often a considerable difference between the will of all and the general will” (II.3.1–2, pp. 59–60). A simple aggregation of private wills may generate the will of all, but the general will requires a mutual adjustment of interests in light of what individuals can reasonably demand of one another.

There is no infallible procedure by which to determine the general will. Rousseau argued that the general will can only act when all the people are gathered together

in the “people’s assembly” to vote on whether a proposed law “does or does not conform to the general will, which is theirs” (IV.2.8, p. 124). However, when their private wills distort their assessment of the common good, individuals may be mistaken about the content of the general will. It is even possible for the majority to be mistaken, and Rousseau was especially concerned about two sources of corruption, not to the general will itself, but to a society’s ability to identify it. The first was the existence of factions, which Rousseau believed would lead individuals to elevate their shared private interests above the general will. The second was large inequalities in wealth, which could allow the wealthy to replace the judgment of the poor with their own: “No citizen [should] be so very rich that he can buy another, and none so poor that he is compelled to sell himself” (II.11.2, p. 78).

Rousseau held that outside of society, individuals have “natural freedom,” since they need not limit their ability to act on their private wills. However, because private wills may conflict, individuals may still be dependent on the private wills of others and therefore lack freedom. It is only when a society is guided by the general will that individuals are freed from their dependence on private wills and are able to achieve “civic freedom.” Their natural freedom is then limited, since they may no longer act on their private wills when these conflict with the general will. However, since others are similarly constrained, no one is dependent on anyone’s private will.

For example, it is only under the general will that mere possession is transformed into property, with the result that no one may take what is not theirs. Furthermore, in a passage that strongly prefigured the work of Kant, Rousseau wrote that being freed from the dictates of one’s own private will also represents a kind of moral freedom, “which alone makes man truly the master of himself; for the impulsion of mere appetite is slavery, and obedience to the law one has prescribed to oneself is freedom” (I.8.3, p. 54). Understanding that freedom involves independence from arbitrary private wills and that such dependency can only be avoided by the general will helps to explain Rousseau’s comment “Whoever refuses to obey the general will shall be constrained to do so by the entire body: which means nothing other than that he shall be forced to be free” (I.7.8, p. 53). For Rousseau, this merely meant that individuals should be constrained in their unconditional pursuit of self-interest by principles of justice, which make them independent of anyone’s private will.

Beginning with Hegel, but especially in the twentieth century, many critics saw in Rousseau the origins of the

Reign of Terror of the French Revolution or an endorsement of unconstrained majority rule. For example, in 1945 Bertrand Russell wrote that Rousseau was “the inventor of the political philosophy of pseudo-democratic dictatorships” and that “Hitler is an outcome of Rousseau” (pp. 684, 685). Such interpretations, because they neglect the contrast between the general will and the will of all, typically reveal more about the ideological fears and commitments of the commentators than about Rousseau. In contrast, the final decades of the twentieth century brought a revitalization of liberal political philosophy, much of it under the influence of John Rawls, and with it came a renewed interest in the general will. Rawls’s project can be understood as an attempt to reconcile the two elements that Rousseau identified as the central commitments of the general will: “If one inquires into precisely what the greatest good of all consists in, which ought to be the end of every system of legislation, one will find that it comes down to these two principal objects, *freedom and equality*” (II.11.1, p. 78).

## GENERICIS

Generics are noun phrases (NPs) and sentences of certain types; the phenomena exhibited by these NPs and sentences are known as “genericity.” Two rather different phenomena are embraced by this term, and they both are of interest to philosophers.

### THE FIRST PHENOMENON:

#### REFERENCE TO A GENUS (OR KIND)

An example of the first phenomenon, reference to a genus, is the sentence *The black-capped chickadee winters in central Alberta*, which refers to the genus, or kind, *The Black-Capped Chickadee*. The sentence may also do other things, such as make claims concerning individual black-capped chickadees and the things they do. But the way it accomplishes these other tasks is to employ its NP subject term to refer to the kind and then make a predication about this kind. There are various tests that one might employ to show that NPs like this really do refer to kinds. For instance, note that predicates like *is (not) extinct* are true only of kinds and not of individual instances of a kind. It makes no sense to assert that *Tweety is extinct* (as opposed to being dead). But it does make sense to say *The black-capped chickadee is not extinct*, thereby showing that in this sentence at least, *the black-capped chickadee* refers to a genus. Of course, not every occurrence of *the black-capped chickadee* refers to a kind. For example, it does not do so in *The black-capped chickadee in the far cage needs more seed*; here *the black-capped chickadee* refers to an individual instance.

A fundamental question concerning this type of genericity is the following: What types of expressions can refer to genera? As the previous example shows, definite NPs can do this in certain sentences. And since the sentence *Black-capped chickadees winter in central Alberta* has the same force as the previous example, most theorists take these “bare plural” NPs also to refer to kinds, at least in this sort of sentence. Another type of NP that is of the same nature contains mass terms (“bare singular” NPs they are sometimes called) such as *gold*, *furniture*, and *information*. The subjects of sentences like *Gold is a yellowish metal* refer to a kind. There is at least one case in English of a bare singular count NP that designates a kind: In *Man evolved from the great apes*, the NP *man* (as opposed to the common noun *man*, as it occurs in ... *is a man*) refers to a kind. And there are some proper names of kinds also, such as *Ursa arctos horribilis is common in the mountains of Alberta*. On the other hand, indefinite NPs do not refer to kinds (with an exception to be men-

tioned just below): *A grizzly bear is common in the mountains of Alberta* seems nonsensical; the indefinite NP in *A black-capped chickadee winters in central Alberta* refers to some individual instance of the kind. The same is true for quantified NPs: The subject NPs in *Every/Most/Some/All/Each/Few black-capped chickadee(s) winter(s) in central Alberta* quantify over individual instances of the kind, and do not designate the kind. (Actually, there can be reference to kinds using indefinite NPs and quantified NPs, but then these NPs are given a *taxonomic* interpretation. We can say *All dinosaurs are extinct*, meaning thereby that every species of dinosaur is extinct; similarly, we can say *A whale has been labeled as endangered*, meaning thereby that a species of whale, perhaps the Blue Whale, has been labeled as endangered.)

Another fundamental question concerning this type of genericity is the following: What are the truth makers for such sentences? Some of these predications seem clearly to predicate a property *directly* of a kind—in cases such as *The dodo is extinct*. But consider the (true) generic sentence *Man landed on the moon in 1969*. In such cases the truth maker would seem to be the initial person who satisfies the predicate; then this property is attributed or projected to the kind. But of course not every property that is true of an individual person becomes true of mankind. For this type of *indirect reference to a kind*, it seems that the property in question must be “important” enough: For sentences like *Man pole-vaulted 6 meters in 1985* do not seem true, even though Sergey Bubka of Ukraine did so in Paris in 1985 (and he was the first person to have done so).

We can also sometimes use an individual exemplar of a kind as the truth-maker for things we (or other agents) do, as in *We photographed the grizzly in Alberta last summer*, when in fact it was only a few of the instances of *Ursa arctos horribilis* that were photographed. These and other types of indirect reference to kinds are discussed by Krifka et al. (1995). The fact that predicates that are primarily true of ordinary individuals are somehow projected to be true of kinds raises questions of both a logical nature (about the resulting “type mismatch”) and a metaphysical nature (about the relation between kinds and their exemplars).

Yet a further fundamental question concerns what kinds there are. The examples thus far surveyed have been of “natural kinds,” but clearly there are kinds of artifacts: *Schockley invented the transistor in 1957* employs *the transistor* as designating a kind. And *The Coke bottle has a narrow neck* employs *The Coke bottle* in this way also; yet *The green bottle has a narrow neck* seems not so much false as

nonsensical, unless *the green bottle* is taken to designate a particular bottle. Intuitively, there just is no such kind as The Green Bottle. Of course, with sufficient background contextual buildup one can make *The green bottle* be, for instance, the salvation of all those stricken with some new disease. Considerations like these have suggested to some that the notion of kind that is relevant to genericity in this first sense is “conventional” or “social.”

## THE SECOND PHENOMENON: GENERIC CHARACTERIZATION

An example of the second phenomenon, generic characterization, is the sentence *Lions have manes*, which predicates the property of having a mane “generically” to lions. By this it is meant that it is *generally* true (plus some qualifications to be discussed below) that lions have manes. As we know, only male lions have manes, so this predication is not universally true of lions. This feature is usually described by saying that generic characterizations *allow for exceptions* while they nonetheless remain true. It is this feature of genericity that has aroused the interest of logically oriented philosophers of language; for, given this portrayal of generic characterization, some radically new logical techniques will be required in order to employ these sentences in arguments.

Note that this second notion of genericity is a feature of entire sentences, whereas the first notion was a feature of NPs. But to complicate matters, the two phenomena can occur together, as in *The rutabaga contains vitamins A and C*, where *The rutabaga* exemplifies genericity of the first sort and the sentence as a whole exemplifies genericity of the second sort. (There might be some rutabagas that are missing either vitamin A or C, yet the original sentence would be true.)

Generic characterizing sentences express regularities about specimens of a kind: some regularities concern properties that are exemplified by the typical member (such as in the rutabaga sentence), whereas others express regularities of action that an object engages in (such as in “habitual” sentences like *Mary plays tennis after lunch*, which again is true despite the existence of days where Mary must work after lunch). It is this ability to express regularities in the face of exceptions that explains why all languages allow the expression of generic characterization. People notice regularities in nature and form “folk laws” to codify these regularities and predict what the future might bring. Despite the existence of exceptions, they are intellectually satisfying and practically useful because the objects *typically* or *usually* or *normally* or

*nominally* perform those actions. And such regularities commonly have exceptions.

Most writers in the genericity literature have argued that it is wrong to view these characterizing generic sentences as “really false but acceptable despite the exceptions because they are close enough to being universally true.” For, they claim, most of our knowledge of the world is encoded in these generic sentences, so this is not a useful attitude. And if it were correct, then we would expect that sentences with fewer exceptions are more acceptable. But this is not borne out by examples, as we will see shortly.

These writers also have tended to shun the view that generics are *neither* true nor false but are instead directions or rules. For, this would make most of our knowledge become neither true nor false but instead directions to guide our belief formation ability. Further, since generics would not have a truth value, they could not be embedded inside propositional attitudes or joined into longer generic statements. But *John knows that rutabagas contain vitamin A* and *It is common that countries that do not honor women’s rights also do not honor general human rights* are in fact either true or false.

Consider this list of (true) characterizing generic sentences:

1. Snakes are reptiles.
2. Telephone books are thick books.
3. Guppies give live birth.
4. Italians are good skiers.
5. Crocodiles live to an old age.
6. Frenchmen eat horsemeat.
7. Unicorns have one horn.

Obviously these call for different proportions of the subject terms satisfying the predicate. In (1) it is all; in (2) most; in (3) some subset of the females; in (4) some small percentage, but a greater percentage than in other countries (or maybe the very best of the Italian skiers are often better than the very best from other countries); in (5) it is strikingly few, since of the hundreds born to one female at a time, most are eaten within a few weeks of birth; in (6) there need be only a very small percentage—somehow the culturally determined views of North America make it striking that it happens at all; and in (7) no unicorns have one horn. Such examples show that there is no univocal quantifier that will serve in all characterizing sentences.

Even attempts to employ vague, probabilistic quantifiers such as *most* or *generally* or *in a significant number of cases* are misguided. Consider such false characterizing sentences as the following:

8. Leukemia patients are children
9. Prime numbers are odd.

These false sentences would become true if prefixed by *In a significant number of cases*. Indeed, the actual number of cases has nothing to do with the truth of the characterizing generic sentence as opposed to what evidence we might have for the sentence’s truth. We might use the preponderance of thick telephone books in the world as our evidence for the truth of (2); but we will be prepared to retract it when we discover other relevant background facts, as perhaps happens with (9). This is often put as “characterizing sentences are inherently intensional.” A sentence like *Members of this club help one another in emergencies* can be true despite there never having been any emergency. What is required for its truth is intensional: the preparedness to act in certain ways in certain situations. This intensionality is often claimed to thwart any attempt to use an extensional quantifier in the analysis of characterizing generics.

## TWO RELATED AREAS

The feature of allowing for exceptions while nonetheless remaining true raises interesting issues in logic. This general topic is called *nonmonotonic reasoning* in the artificial-intelligence literature. Although these researchers do not explicitly aim to provide a semantics for characterizing generic sentences, nonetheless results of their research might be pressed into service for this purpose (Pelletier and Asher, 1997).

The issue of how children can learn that some occurrences of NPs are universal, others existential, and still others generic has been investigated both from the point of view of English-speaking children learning language (Hollinger et al. 2002) and comparatively between English-speaking children and Mandarin-speaking children (Gelman and Tardif 1998). It seems that children learn the difference by the age of four and that there is a difference in the frequency of generic vs. nongeneric NPs and sentences encountered by English and Mandarin children.

## PHILOSOPHICAL CONSIDERATIONS

Genericity has been seen by some as requiring an ontology of (abstract?) kinds, individuals, and (momentary) stages of individuals. Furthermore, it seems to some that the semantics of generics presumes that these kinds are

conventional in some way. And the issues surrounding natural laws that admit of exceptions has been seen by some as endorsing a kind of scientific antirealism. All of these considerations raise deep questions of the relation between semantic models of natural language and reality. Some have claimed that the relationship should be modest and that these ontological conclusions pertain only to the metaphysical presuppositions of natural language—a natural-language metaphysics, in the phrase of Bach (1986)—but not necessarily to reality. This is the deepest issue in philosophy of language.

## GENETICS AND REPRODUCTIVE TECHNOLOGIES

Modern genetics and technological aids to human reproduction, like other advances in science and technology, have created ethical problems heretofore unencountered. Biomedical developments have also posed new conceptual, epistemological, and metaphysical problems. This entry addresses these philosophical concerns as well as the more widely discussed ethical implications of contemporary genetics and reproductive technologies. One conceptual and ethical link between these two fields is the prospect of "designing our descendants." This prospect has been viewed by some as a boon to humankind (Fletcher 1974) and by others as a fearsome possibility to be avoided at all costs (Ramsey 1970).

The Human Genome Initiative, a "big science" project launched by the U.S. government to map and sequence the entire human genome, has heightened concerns about the privacy and confidentiality of genetic information, the uses to which such information might be put, and the possibility of stigmatizing individuals or groups because of their genetic constitution. The knowledge the Human Genome Project can yield is massive in contrast to previous efforts to acquire information about human genetics.

The contemporary science of genetics provides, not only an understanding of heritable traits, but also the capability to diagnose the probability or certainty of transmitting to offspring genetic conditions such as sickle-cell anemia, Tay-Sachs disease, or cystic fibrosis. The ability to identify and locate specific genes that render a person likely to manifest heritable conditions, such as Huntington's disease and certain forms of cancer, raises profound questions about the wisdom and desirability of learning about future contingencies when no cure exists and preventive measures are of uncertain efficacy.

A conceptual question is prompted by the rapid advances in genetics: What constitutes genetic disease? The traditional concept of disease relies on the ability of medical scientists to identify deviations from the normal physiological functioning of an organism. Asymptomatic diseases, such as hypertension, can be detected by diagnostic instruments even though the individual feels no symptoms of illness. With the discovery of genes that render an individual with a family history highly likely to develop a particular disease later in life, how should the

individual who carries the gene be characterized? Does the person in whom the gene is found have a genetic disease or not? The individual has no symptoms and the disease may never express itself. Yet merely being susceptible opens the possibility of harm to the interests of such individuals, making them vulnerable to actions by others such as insurance companies who seek to deny insurance on grounds of a preexisting condition or employers who refuse to hire workers with a known propensity for illness.

Beyond the problems posed by diagnosis and prediction in genetics are those of intervention: Is gene therapy intrinsically different from traditional medical therapy? Even if gene therapy by means of manipulating somatic cells poses no special problem, what about altering germline cells, a procedure that would affect future generations? If genetic manipulation to correct defects is ethically permissible, what, if anything, would be wrong with alterations intended to provide genetic enhancement? Are efforts to improve human intelligence, appearance, or other attributes by genetic means essentially different from the traditional methods of education, physical or mental training, or behavior modification (President's Commission for the Study of Ethical Problems 1982)?

Attempts to improve the quality of the human gene pool, or "positive eugenics," have generally been viewed with disfavor, especially after the policies in Nazi Germany promoting racial hygiene (Proctor 1988). Yet eugenic practices remain at the level of individual choice. The recipients of donated sperm are typically given information about physical and other personal characteristics of donors, allowing them to choose sperm from a donor whose traits they hope to replicate in the child. The prospect of genetic enhancement using the techniques of recombinant DNA manipulation can allow for more precision and wider applications than older approaches such as selective sperm banking.

Knowledge that one carries a gene for a heritable disease can pose a profound dilemma for the individual. An early form of this dilemma arose when carrier screening was the only way to determine whether a couple would pass on a genetic disease to their offspring. A couple then had to decide whether to take the chance that a child would be born with the heritable condition. With the advent of various forms of prenatal diagnosis (amniocentesis, chorionic villus sampling, blood tests), the presence of some genetic diseases in a fetus can be detected. The ethical question in such cases is whether to abort an afflicted fetus. In the case of both carrier screening and prenatal diagnosis, trained genetics counselors have uni-

formly taken a nondirective approach. The norm in genetics counseling has generally been to provide unbiased information to enable individuals or couples to make an informed decision whether to initiate a pregnancy or to abort a fetus found to have a genetic disease (Lappe 1971, President's Commission for the Study of Ethical Problems 1983).

As the science of genetics yields an increasing amount of information, individuals are faced with making decisions about prophylactic medical interventions. For example, a woman who learns that she carries a gene for an inherited form of breast cancer may contemplate bilateral mastectomy before any clinical signs appear. The epistemological problem posed by such scenarios is a familiar philosophical one: decision making under risk and uncertainty. If the woman decides to undergo a major, disfiguring operation, she does so with the knowledge that she might escape the disease entirely. But if she forgoes the preventive step, she runs the risk of developing a dread disease that may be curable if detected early but that also has a high mortality rate.

The knowledge by individuals or couples that they are at risk for transmitting a genetic disease to offspring is one indication for embarking on the use of reproductive technologies. The couple may elect to use donated sperm or ova. A far more common indication for the use of reproductive technologies, however, is infertility or subfertility on the part of one or both members of a couple. Methods include in vitro fertilization (IVF)—fertilizing a human ovum outside the womb—the use of sperm or ova contributed by third parties or the womb of a woman not intended to be the rearing parent (surrogacy); cryopreservation (freezing) of fertilized ova, which are termed *preembryos*; and embryo splitting.

Frequently discussed ethical issues include concerns about destruction of the traditional family when third parties are used as gamete donors or surrogates (Macklin 1991); worries about the effect on children who learn that they were born as a result of these techniques; and the opposite worry about harmful effects of struggling to maintain family secrets. Prior to the first IVF birth in 1978, fears were expressed that IVF would produce a higher than normal incidence of birth defects, but scientific evidence gathered over the years has shown this concern to be unwarranted. The objection that being created with the aid of gametes from a third party can harm the interests of children is countered by the metaphysical observation that these are children who would never have existed but for the use of these techniques.

Different religions are opposed to the use of some or all of these reproductive technologies. The Roman Catholic Church has urged prohibition of virtually all forms of assisted reproduction (Congregation for the Doctrine of the Faith 1987). The church's opposition is based on the fact that these techniques separate the procreative and unitive functions of marriage. Some authorities in Orthodox Judaism allow insemination from non-Jewish sperm donors but prohibit donation from Jews, in order to prevent consanguinity; others oppose all third-party donations out of fear of consanguinity and also by analogy with adultery. Islamic law prohibits the use of sperm or eggs from anyone other than the married couple on grounds that the results are similar to adultery (Serour 1992). Since the identity of gamete donors is normally kept confidential, a secular concern is that a brother and sister may unwittingly mate or marry, unaware that they have a genetic parent in common.

Possibly the most intriguing philosophical issues posed by reproductive technologies are those that arise from the newfound ability to separate the genetic from the gestational procreative functions. IVF permits an ovum from one woman to be fertilized and the resulting embryo implanted in a different woman. This creates the entirely novel situation of two different "mothers": the genetic mother, who supplies the egg; and the gestational mother, who undergoes pregnancy and childbirth. Apart from the emotional or other psychological consequences that may result from such arrangements, the separation of the woman's procreative role into two distinct biological functions requires a conceptual decision of whether the individual who performs each function properly deserves the appellation "mother" (Macklin 1991).

A variation on this conceptual theme stems from research that demonstrates the capability of transplanting ovaries from an aborted fetus into an adult woman who lacks ovaries of her own. The woman into whom the ovaries are transplanted is a mother in the traditional sense of one who is pregnant and gives birth to the child. Is it appropriate to construe the aborted fetus as the "genetic mother"? The conceptual oddity of this construal suggests that "mother" is a concept laden with connotations that do not permit its expansion to include aborted fetuses. Although the aborted fetus is without question the source of the genetic material from which the new life was created, it is semantically odd to conclude that the aborted fetus is the genetic mother.

A persistent quandary relates to the status of extra-corporeal embryos. The product of IVF is termed a *pre-embryo*, partly because of its early developmental stage

but also because it is unimplanted. The ability to freeze embryos indefinitely and thaw them for use later poses both conceptual and ethical questions. When disputes arise concerning the ownership of embryos, should the embryos be construed as "people" or as "property" (Annas 1989, Robertson 1990)? Should anyone other than the couple who contributed the gametes have the authority to destroy frozen embryos? If it is permissible to destroy embryos that are not intended for implantation, is it permissible to do experiments on the embryos? Controversy exists over the splitting of embryos, a technique sometimes called cloning (Robertson 1994). One objection holds that such deliberate duplication destroys genetic individuality and thus devalues the uniqueness of each individual.

Genetics and reproductive technologies pose new philosophical questions about the scope and limits of such familiar concepts as disease, individuality, parent, mother, and the family. The importance accorded to human reproduction and lineage throughout history is a reminder that such questions are not merely abstract concerns of philosophers but deeply rooted in the lives of individuals and communities.

## GENETICS AND REPRODUCTIVE TECHNOLOGIES [ADDENDUM]

Philosophical scholarship on genetics and reproductive technologies typically follows the development of these scientific fields closely, providing critical analysis of the major assumptions and implications of their emerging claims, often in advance of their realization. This addendum reviews three discussions that have become particularly prominent in the literature since Ruth Macklin's original entry appeared in 1996: debates over the design and interpretation of human genetic variation research, the prospect of human reproductive cloning, and the potential limits of human genetic modification.

### HUMAN GENETIC VARIATION RESEARCH

The principal outcome of the Human Genome Project was a set of research tools for human genetic variation research. With improved genomic maps and DNA sequencing technologies, geneticists have been able to launch a new generation of projects comparing human genomes to better understand our similarities, differences, and patterns of relationship at the molecular level. These comparisons are critical to the development of successful medical applications of genomic research, as well as to the interests of anthropologists and paleontologists interested in the evolution, differentiation, and global migrations of our species (Risch et. al. 2002). On the other hand, these comparisons also raise two sets of important philosophical issues:

First, how should scientists define and identify the relevant comparison groups within our species? The ini-

tial attempt to use genomic tools in a large scale study of human variation, the so-called Human Genome Diversity Project, followed the accepted practice of physical anthropologists and epidemiologists of describing its target groups in ethnic, linguistic, and geographical terms, and was called to task by both biologists and social scientists for using socially constructed categories that would obfuscate rather than illuminate underlying patterns of gene flow within our species (Gannet 2001, Reardon 2005). Rather than reifying various human political histories by looking for "ethnic-affiliation markers" in human DNA, some suggested a random global sampling strategy blinded to social identifiers (National Research Council 1998). The U.S. National Institutes of Health followed this approach in developing a major genetic variation research resource—a databank of known single nucleotide variants in human DNA—and was in turn called to task by public health and pharmacogenomic researchers for omitting "phenotypic data" about the distribution of the DNA variants across different populations (Altshuler and Clark 2005).

As a result, the subsequent international effort to a variation-measuring "haplotype map" of the human genome intentionally collected samples from groups defined by their "continents of origin" (International Hapmap Consortium 2003). Critics charge that this strategy returns population genomics to a set of outmoded racial categories that human scientists of all stripes have repudiated as biomedically meaningless and socially pernicious (Duster 2005). Claims that, nevertheless, research framed in this way has identified patterns of genetic variation that cluster along racial lines, and that these variations may be the key to "population specific" public health interventions or even "race-based medicine," have only lent fuel to this conceptual debate.

The second issue follows from the first. Assuming that, for the foreseeable future, the definition of comparison groups in population genomics will be informed by socially constructed criteria at some level of resolution (either familial, tribal, ethnic, racial, or regional), how should the interests of group members be protected? Outside of groups with clear political sovereignty, like Native American nations, most targets of genetic analysis have ambiguous moral standing. Is it ethically important for scientists to attempt to discuss their plans with groups at the collective level before recruiting individual group members into genetic variation studies? Some argue strongly that a principle of "respect for community" needs to supplement our traditionally individualistic principles of research ethics in these contexts, if only

because individuals gain so much of their identity through their community memberships and their genetic lineages (Weijer 1999). Others argue that, at least for genetic studies, extensive efforts at community engagement are disingenuous and guaranteed to fail, given the mismatch between genetic populations and the politically defined communities available for consultation (Juengst 1998).

### HUMAN REPRODUCTIVE CLONING

Philosophical questions about the nature of human identity have been raised from quite another angle, meanwhile, by the successful cloning of a sheep in 1997 (McGee 2000). In that case, the nucleus of a mammary gland cell from an adult ewe was transplanted into an enucleated egg, and, after 280 attempts, coaxed into developing into a genomic twin of the gland cell's donor. If the technique that produced Dolly, the ewe, could be used effectively with humans, it would open up the prospect of adding reproductive cloning to the repertoire of techniques available to those seeking to procreative assistance. This prospect has prompted questions about the personal identity and moral status of the resulting "delayed twin," but these seem easily answered by our experience with natural twins who also have identical genomes: Clearly, the cloned individual would be a distinct person with full moral standing, due full protection against exploitation or abuse by his or her progenitors.

However, anticipating parental expectations for cloned offspring raises more difficult questions. How similar might the cloned offspring be to the progenitor, and what impact should the foreknowledge (or assumption) of such similarities have on the rearing of the offspring? Should progenitors of clones assume special responsibilities to anticipate the health and behavioral challenges their delayed twins may face, or do they, instead, acquire unusual obligations to refrain as much as possible from prejudicing the life experience of their offspring? These questions are animating new work on the nature and ethics of parenting, procreative liberty, and the limits of genetic determinism. They have also given new energy to "natural law" arguments against reproductive technologies in general, by providing a case in which the slippery technological slope seems to lead us to a form of reproduction—*asexual reproduction*—that contradicts an element of human nature that has been fundamental to our species' identity to date (Lauritzen 2001).

Behind all of these concerns looms a follow-up question that links this discussion to back to the role of genetic lineage in human identity. Given the psychologi-

cal complexities of cloning and their potential impact on the offspring, is the value of sheer genetic continuity important enough to ever warrant the inclusion of this option on the menus of fertility medicine? Some argue that prospective parents who feel the need for genetic connections with their offspring simply mistakenly essentialistic, and should be re-educated accordingly (Post 1997). Others, however, suggest that the interest in extending the limits of procreative liberty to defend technologies like cloning reflects something important about the role of lineage in human identity which philosophy has yet to fully unravel (Roberts 1995).

### HUMAN GENETIC MODIFICATION

The philosophical status of intergenerational genetic connections also lies at the heart of a new generation of attempts to define the appropriate limits of human genetic modification. The provisional boundaries of such a practice were established in the 1980s to provide a window for human gene therapy research. On one axis, a line was drawn between using genetic interventions to treat disease, and using it to attempt to "enhance" human traits to achieve nonmedical goals. On the other genetic interventions that only affected somatic cells were distinguished from those that might lead to intergenerational transmission of modifications, through the "germ-line." Both distinctions have come under recent philosophical critique. The line between treatment and enhancement appears difficult to maintain as a conceptual matter and its moral implications diverge significantly between its personal, parental, professional and public policy applications (Parens 1998). Meanwhile, it begins to appear that the price to pay for successful somatic cell gene therapy will be the development of tools for safe and effective germ-line interventions, and in that light the arguments in favor of abandoning that boundary in the service of medicine are gaining strength (Chapman and Frankel 2003).

Animating these debates is another argument over the importance of our genetic inheritance. Those who strive to preserve the "common genetic heritage of humankind" and protect the rights of future generations to "inherit an untampered genome" argue that our genetic inheritance forms the limits of our "species integrity", the violation of which risks literally de-humanizing ourselves and our offspring (Annas, Andrews, Isasi 2002; Fukuyama 2002). On this view, the contours of human nature, and thus the foundations of human moral status, are defined by the pool of genes—and their variants—that humans have collected over the course of our

evolution, and any manipulation of that legacy risks distorting or corrupting the human identity of our offspring.

This view is difficult to reconcile with what population genetics, developmental biology and gene transfer research itself teach us about the fluidity of the human genome and its relatively remote role in the human traits we prize most (Robert and Baylis 2003, DeGrazia 2005). Like the interest in race-based genomic medicine and concerns about the moral status of clones, it accepts a level of genetic essentialism that seems more indebted to Aristotle than to James Watson and Francis Crick. Nevertheless, all these views enjoy wide acceptance in both academic and public circles, which is intriguing. Perhaps this convergence signals the next challenge that genetics offers philosophy: to help clarify the role of genetic histories—the genes we inherit, the lineages we belong to, the peoples we spring from—in our identities as human beings and our experience of the human condition. If philosophical anthropology examines what it means to be a human individual, what genetics seems to call for now is a *philosophical genealogy*: the study of what it means to be a human descendant (Juengst 2004).

### GENOVESI, ANTONIO (1713–1769)

The Italian philosopher and economist Antonio Genovesi (the name was originally Genovese), was born in Castiglione, Salerno. After studying literature and rhetoric and then philosophy, he attended the lectures of the aged Giambattista Vico. In 1741 he began to teach metaphysics at the University of Naples as extraordinary professor. In 1743 he published the first volume of his *Elementa Metaphysicae Mathematicum in Modum Adornata* (5 vols., Naples, 1743–1745), for which he was accused of rationalism and atheism. In 1745 he began to teach ethics. In that year he published his *Elementa Artis Logico-criticae* and an important historical introduction to the Neapolitan edition of Pieter van Musschenbroek's *Elementa Physicae*. In the same year his *Universae Christianae Theologiae Elementa* was accused of heterodoxy; it was not published until after his death (Venice, 1771). Discouraged, Genovesi turned to other, less philosophical studies. He was offered the new chair of civil economy

(economics), the first in Europe, by the University of Naples and began his lectures in 1754 (*Delle lezioni di commercio ossia di economia civile*, Naples, 1765–1767). The problems of practical philosophy which occupied his final years are discussed in *Diceosina o sia filosofia del giusto e dell'onesto* (2 vols., Naples, 1766–1777).

In Genovesi's judgment, modern philosophy began when Francis Bacon and Galileo Galilei freed Europe from abstract and sterile inquiry. "Dialectics and metaphysics," he proclaimed, "are the Don Quixote of the Republic of Letters." According to him, it is impossible to know true reality, substance, that which "underlies" the phenomena that we can observe. (He asked, "Who lifts the skirt of nature to see that which ὑπάρχει [underlies]?"") Although his thought had some similarities to George Berkeley's idealism and Gottfried Wilhelm Leibniz's monadism, as time went on his interest turned from logic and metaphysics and was oriented toward the moral disciplines, particularly toward economics, which he considered as affecting "our present comfort and tranquility." He sought to determine in a rational system "the primary, simple, and universal laws" of economics. He arranged in a similar framework the *Discorso sopra il vero fine delle lettere e delle scienze* (Naples, 1753), in which he argued against all inquiries "that remain exclusively in the shadow of the school, and never transgress into the acquisition of something useful for mankind."

### Bibliography

#### WORKS BY GENOVESI

*Opere scelte*. Milan, 1824.

*Illuministi italiani*. Vol. V: *Riformatori napoletani*, edited by Franco Venturi, 1–330. Naples and Milan, 1962. Contains an important introduction and bibliography on Genovesi's influence in Italy.

*Autobiografia, lettere e altri scritti*, edited by Gennaro Savarese. Milan: Feltrinelli, 1962.

#### WORKS ON GENOVESI

## GENTILE, GIOVANNI

(1875–1944)

Giovanni Gentile was one of the major figures in the resurgence of Hegelian idealism in Italy at the beginning of the twentieth century. His "actual idealism," or "actualism," represents the subjective extreme of the idealist tradition in that the present activity of reflective awareness (*l'atto del pensiero, pensiero pensante*) is regarded as the absolute foundation on which all else depends. The act of thinking is the "pure act" that creates the world of human experience.

### LIFE AND WORKS

Gentile was born on May 30, 1875, at Castelvetro in Sicily. He began his university education as a student of Italian literature under Alessandro d'Ancona at Pisa in 1893, but was quickly drawn into the study of philosophy by Donato Jaja, a pupil of the Neapolitan Hegelian, Bertrando Spaventa. Of the two main threads that run through all of Gentile's work, one—his concern with the theory and practice of education—is rooted directly in his own temperament and his strongly felt vocation as a teacher; but the other—his almost chauvinistic interest in the Italian philosophical tradition and its relation to the general European tradition—reflects the lifelong influence of Spaventa on his mind. His degree thesis, *Rosmini e Gioberti* (Pisa, 1898), in which he emphasized points of contact and agreement between the native Catholic thinkers and the German Idealists, was meant to illustrate Spaventa's thesis regarding "the circulation of European philosophy."

His second book was a critical examination of Karl Marx (*La filosofia di Marx*, Pisa, 1899) from an orthodox Hegelian standpoint. While writing it, Gentile became acquainted with Benedetto Croce, who was similarly occupied at the time. Thus began a friendly alliance that lasted more than twenty years. Gentile was the younger by nine years, but it seems clear that in these early formative years it was he who influenced the development of Croce's philosophy rather than vice versa, as most of their contemporaries assumed. Gentile was always more of a Hegelian than Croce ever became, and was more exclusively interested in the traditional problems of philosophy.

In 1900 Gentile wrote his important essay “The Concept of Education” (“Il concetto scientifico della pedagogia”) and began his long campaign for the reform of the Italian school system. He became *Privatdocent* at Naples in 1903 and professor of the history of philosophy at Palermo in 1906. But the “reform of the Hegelian dialectic” and the “method of immanence” that led to actual idealism (in a paper of 1912) were worked out amid controversies with Modernists and polemics for religious instruction in elementary schools; and Gentile’s philosophy was first fully expounded in the two-volume work *Sommario di pedagogia come scienza filosofica* (Summary of Educational Theory; 2 vols., Bari, 1913–1914).

In 1914 Gentile succeeded to Jaja’s chair at Pisa, where he wrote the one book through which he is internationally known, *Teoria generale della spirito come atto puro* (The General Theory of the Spirit as Pure Act; Pisa, 1916). In 1917 he moved to the University of Rome; and the first volume of his *Sistema di logica come teoria del conoscere* (System of Logic as Theory of Knowing; Pisa, 1917), the most systematic statement of his view, appeared. The second volume followed at Bari in 1923.

In 1922 Gentile became minister of education in Benito Mussolini’s first Cabinet, and in this capacity he reformed and reorganized the whole Italian school system. After his resignation in 1924 he became the first president of the National Fascist Institute of Culture; he remained for the rest of his life the most prominent publicist of the regime and the self-styled “philosopher of fascism.” Gentile continued until his death to lecture at Rome, but in the fascist period his only important philosophical work was the *Filosofia dell’arte* (Milan, 1931). He was directing editor of the *Enciclopedia italiana* from its inception in 1925 to its completion in 1937. After the fall of Mussolini in 1943, Gentile went into retirement and wrote a short but important book on the genesis and structure of society that was published only after his death (*Genesi e struttura della società*, Florence, 1946). Subsequently persuaded to return to public life as a supporter of the Fascist Social Republic set up by the Germans, Gentile was assassinated by Italian communist partisans at Florence on April 15, 1944.

### CONCEPTION OF PHILOSOPHY

Gentile justifies his “theory of the spirit as pure act” in two ways. First, he strives to show that it is the logical outcome of the whole movement of Western philosophical thought since René Descartes; and, second, that the “method of pure immanence,” when we arrive at it, pro-

vides an adequate and coherent way of explicating our actual experience. It is impossible to give more than the briefest indication of the line of his historical argument, although it bulks very large in most of his systematic works.

In any case, the significance of his theory emerges more clearly through an examination of his analysis of actual experience. The claim that actual idealism is the logical outcome of the main tradition of modern philosophy is interesting chiefly because it throws light on Gentile’s conception of the essential problem of philosophy and the conditions for its solution. Philosophy for him, as for Johann Gottlieb Fichte, was *Wissenschaftslehre*, the science of knowledge, the science that, without presupposing anything itself, provides an a priori ground for the presuppositions actually made in other sciences. Descartes’s method of universal doubt can quite naturally be viewed as the first approach to this problem, and George Berkeley’s doctrine that *esse est percipi* is a vital step toward its solution. However, the genesis of actual idealism begins with Immanuel Kant; and although Gentile arrived at his view through the progressive elaboration of a “reform of the Hegelian dialectic” that had been initiated by Spaventa, he remains fundamentally a Kantian in his determination to confine philosophical speculation to the task of exhibiting the logical structure of actual experience. He is at one with Kant and Fichte in his resolute rejection of any “dogmatic metaphysics” that posits or presupposes a reality transcending actual consciousness.

### THEORY OF SELF-CONSTITUTION

There is a temptation to say at once that it is a mistake to conceive of the task of philosophy in this way, as the exhibition of the logical structure of actual experience, and that the ideal of a “philosophy without presuppositions” is a chimera. The most primitive postulate of ordinary common sense is that a physical world exists prior to and independent of our consciousness of it. However, Gentile’s theory is not meant to be taken as a denial of this assumption, but as a thesis about logical priority. The temporal preexistence of the object of awareness is itself something that we take ourselves to be aware of, and in this sense the commonsense assumption is a product of our attempt to organize our experience in thought. Actual idealism must properly be judged as a theory about this process of rational organization or “concrete logic.”

The most primitive level of the process for which we have ordinary words is sensation. We normally distin-

guish the objective cause of a sensation from the subjective feeling (pleasant or unpleasant) that it arouses in us. According to Gentile, this is a mistake. The sensation as a whole is our act of self-awareness, and the pleasure or pain is an aspect of this whole, not a reaction of the self to an object. He agrees emphatically that there cannot be any actual consciousness without the distinction of the subject of the awareness from the object of which it is aware. But he holds that since what has to be understood is the integral unity of the self, it is a mistake to look for the cause of experience within the content of experience. At the ideal limit, pure sensation can be thought of as an encounter with something absolutely other than the self; but it can also be thought of as a spontaneous activity of self-affirmation. Gentile does in fact employ “sensation” in both ways. Spontaneous self-affirmation is in his view the ideal aim of the artist, and loss of self in the contemplation of an absolute object is the typical concern of religious experience. But actual experience is always a synthesis, so that pure art and pure religion are nowhere to be found; and the actual understanding of any type of artistic or religious experience will involve restoring the suppressed aspects of the synthesis, that is to say, discovering the philosophy behind it.

Actual sensation is a process of self-constitution (*autocitisi*) in which the subject preserves its own past and relates it to present sensation. Language is abstractly the instrument and concretely the form through which this is done. It is neither the clothing nor the vehicle, but the embodiment of our thought. But we are able to think of it abstractly, as an inheritance shared by all who are able to use it, because the thought embodied in it has universal import. Thus the self that comes to consciousness when we express our thoughts in language is a spiritual universe, a system of meanings in which all other thinking beings can share. This is the absolute subject of experience, the transcendental Ego whose being (like the God of Aristotle and St. Thomas Aquinas) is “pure act.” The abstract form that Kant called the “transcendental unity of apperception” is given concrete existence, or brought to life, so to speak, in Gentile’s conception of the “pure act” of “self-founding.” My reflective awareness is on the one hand exactly what is essential to my existence as an independent personality; but on the other hand, so far as I achieve reflective awareness, I enter the world of thought in which nothing belongs, or can belong, to me personally. When I claim to think something, I must be able to communicate my thought; I must be able to show others the path by which I arrived at it so that, insofar as they can follow in my footsteps, they can share it. Reflective awareness is already communication, for my own

thought is a dialogue within myself. The obvious fact that humans are social animals and that the peculiarly human institution of language is a collaborative production has its absolute or philosophical ground in the fact that the founding of the self is the founding of a transcendental society.

When we understand the fundamental concept of self-constitution in this way, Gentile’s thesis about the unity of thought and action, which was the chief bone of contention between him and Croce, falls naturally into place and is easily understood. There appears to be a contrast between thought and action because in cognitive thinking we presuppose the reality we are concerned about, whereas our action is directed toward the creation of some object. However, all thinking and acting is in reality part of the same activity of self-conquest in which nothing is absolutely presupposed theoretically, and some things must be accepted (or presupposed) practically, if there is to be a line between the self and the not-self, the conquering subject and the nature or world that is to be conquered: “the spiritual act is never a self-creation that must be contemplated and watched over afterward; it is always simultaneously a self-creation that is self-awareness and vice versa” (*Opere* I, 84). The establishment of truth is the self-establishment of the transcendental Ego; and the establishment of the Ego is the establishment of an ideal community that Gentile, like G. W. F. Hegel, calls “the State.”

The State is on the one side that complex of social institutions, cultural traditions, and ethical values that appears to the individual as the actual fabric of his own moral personality; on the other side it is all the ideals that have still to be striven for and achieved in the actual world in which he lives. Gentile often insists on this latter Mazzinian side of his doctrine, but in practice he tended to subordinate it to his conservative Hegelian faith in the rationality of the actual social structure. In his fascist apologias it often seems as if whatever is done in the name of the existing State must be patiently, even joyfully, accepted and endured as a condition for any further advance—an attitude that is more reminiscent of Thomas Hobbes than of Giuseppe Mazzini. There can be no question that this attitude is false to the spirit of his doctrine.

#### GENTILE’S LOGIC AND THE FORMS OF VALUE

The unity of theory and practice means that in Gentile’s work “logic”—the concrete logic of the self-concept—becomes inseparable if not indistinguishable from ethics,

and philosophy itself is seen as the critical self-awareness of actual political life. His major theoretical problem was to show how the nonpolitical values of human experience could be integrated into his view. This problem came to Gentile in the form that Hegel gave it when he made art and religion the moments of the final triad of the Absolute Idea, subordinate only to philosophy itself. Gentile solved it by regarding art and religion as the moments of his own Absolute, the act of thought. Thus art and religion, instead of being ultimate, become primitive; they are the essential moments of all experience. They have their joint origin, as has been shown, in the opposite aspects of the sensation or “self-feeling” in which consciousness originates. As distinct modes of experience they are attempts to achieve the impossible by aesthetically recapturing or mystically losing oneself in that ideal point of origin.

Thus the seeming independence of aesthetic and religious values arises from the one-sided consciousness of the artist or worshiper. In reality the self-willed artist is dedicated to the production of an object of universal value and significance; art is not just the release of feeling, but the disciplined expression of it. And the proclaiming of the glory of God or the doing of his will is the work of a human voice or the task of a human hand. The “private” world of the artist and the “other” world of the believer get their meaning and fulfill their function in the actual society of the transcendental Ego. When we view the artist’s work, we must strive to comprehend the ideal to which he has devoted his skill; and when we seek to interpret a religious doctrine, we must express its meaning for humanity and in terms of our own actual lives. It thus becomes the task of the critic to interpret the work of art or the religious doctrine philosophically. Gentile wrote a number of books and essays—mainly but not exclusively about literary artists—in which he endeavored to do just this; and on the religious side he maintained that his “humanistic conception of the world” was a philosophical expression of the Christian revelation.

In the concrete logic of the act of thought, the moment of spontaneous self-expression is prior to the consciousness of the object, which necessarily appears as a limit upon the self. Hence, in the progressive development of consciousness, which is the subject of Gentile’s philosophy of education, an aesthetic phase of free, spontaneous play is succeeded by a religious phase that it is the main task of the elementary school to establish and govern. On this basis a properly philosophical conception of the world, a sense of the autonomous moral responsibil-

ity of the self-conscious citizen, should then be built up in secondary education.

**ABSTRACT LOGIC.** It should by now be clear that actual idealism can be interpreted as primarily a theory about the logical structure of our experience of values. But this theory does contain within it a theory about the ordinary logic of factual propositions. Formal logic, whether mathematical or conceptual, is the logic of presupposition, the logic of “nature,” the abstract logic of any object that any actual concrete consciousness may assume as its content. Gentile thought of this *logo astratto* as being essentially static and unchanging. Benedict de Spinoza’s system was for him the perfect philosophical expression and *reductio ad absurdum* of it; and his own conception of natural science was strictly Kantian. “Nature” was for him an a priori concept with a fixed logical structure, not an idea that evolves in the dialectic of actual research. But this is only a reflection of his own personal background and interests. The “idea of nature” has a history, and a full development of the theory of mind as pure act would seem to require that the history of science be incorporated as an essential aspect or complement of the history of theoretical philosophy.

Gentile’s own use of the category of the *logo astratto* in the sphere of practical philosophy was quite fluid and dialectical. In ethics, for example, it appears as the nature that we must conquer and subdue, but it appears also as the abstract law to which we must submit. When we remember that the transcendental Ego itself, the *logo concreto*, is both the organic unity of all prior achievement and the ideal of a perfect harmony still to be achieved, this becomes quite easy to understand. The concrete self-concept has its abstract content under each aspect—there is sinful nature and there is the law in virtue of which we are aware of it as sinful; the act of self-constitution is the resolution of the conflict that produced the two opposed abstractions.

**NEGATIVE VALUES.** Finally, Gentile holds that error, pain, and sin are in some sense “unreal.” This doctrine follows logically from the fact that they belong to the category of the *logo astratto*. They are things that we are conscious of, and they have already been overcome or surpassed in the very consciousness of them. It is quite easy to exhibit, as a mere matter of logic, how “truth” is the concrete category of which “error” is only the abstract content. For to be actually aware that some proposition is or may be an error is to hold that a proposition about that proposition is true—namely, the proposition that it is or may be an error.

In the case of sin, something more than a logical relationship of propositions is involved. If I say, "I am a sinner," I am setting myself up as a supposedly just judge of my own conduct; but I do not thereby cease to be a sinner. Rather, the question is posed of how a single self is to be constituted out of this divided consciousness. This is the key to the only defensible interpretation of Gentile's doctrine, which then asserts that when I truly say, "I am a sinner," I must be on the road to redemption and that the test of whether I do actually think I am a sinner is my consciousness of repentance.

Gentile's view that "pleasure" is the concrete and "pain" or "grief" the abstract category is more difficult to interpret. If I am conscious of being in pain, I have certainly "overcome" the pain; that is, isolated it and objectified it as a fact. But to argue that because of this it is not really I who am in pain is sheer sophistry. It is certainly true that the consciousness of pain is a complex activity (including, for example, the active seeking of a remedy or a distraction), while the pain in itself is an abstract element. But pain is "unreal" only in the sense in which art and religion are unreal. That is to say, there cannot be a pure pain-consciousness, for this is just the point at which consciousness disappears.

### GENTILE'S INFLUENCE

Actual Idealism was the dominant philosophy in Italian state schools and universities throughout the last twenty years of Gentile's life. In this period his students, like Hegel's, split into two main parties. There was first the "right," led by Armando Carlini, who emphasized the Christian origin and Augustinian character of much of Gentile's thought, and identified the transcendental Ego with the God of Catholic theology. After Gentile's death this group joined with the religious existentialists to form the contemporary movement known as Christian Spiritualism.

On the other side, a group of younger disciples, led by Ugo Spirito, formed the Gentilian "left," which from the first devoted itself to social problems and provided much of the economic and political theory of the fascist corporate state. Since World War II this group has been aligned with the political left and has shown some affinities with orthodox Marxism. But in the current work of both groups it is the mystical spirit of Gentile's philosophy rather than the logical structure that has survived. Outside of Italy, Gentile's influence can be seen most notably in the work of R. G. Collingwood.

### Bibliography

The Gentile Foundation was established in Rome in 1947, with the *Giornale critico della filosofia italiana* (founded by Gentile in 1920) as its official organ. The foundation is issuing the definitive edition of Gentile's *Complete Works* in 55 volumes. Three of his books have been translated into English: *The Theory of Mind as Pure Act* (London: Macmillan, 1922); *The Reform of Education*, lectures to the schoolteachers of Trieste (New York: Harcourt Brace, 1922); and *Genesis and Structure of Society* (Urbana: University of Illinois Press, 1960). This last includes a complete bibliography and critical survey of everything by or about Gentile in English.

For critical studies of Gentile, see the following: H. S. Harris, *The Social Philosophy of Giovanni Gentile* (Urbana: University of Illinois Press, 1960) surveys the whole range of Gentile's practical philosophy, including his "philosophy of fascism," which has been largely ignored above. R. W. Holmes, *The Idealism of Giovanni Gentile* (New York: Macmillan, 1937) is a detailed and critical study of the *System of Logic* and a work of fundamental importance. P. Romanell, *The Philosophy of Giovanni Gentile* (New York: S.F. Vanni, 1938) provides a general survey.

H. S. Harris (1967)

## GEOMETRY

Until 1800, mathematics was divided into two great branches: *geometry* and *arithmetic*. Both were commonly regarded as the more obviously secure repositories of human knowledge. At this stage, geometry could be suitably defined as "the science which investigates the properties and relations of magnitudes in space, as lines, surfaces, and solids" (*Oxford English Dictionary*). However, with the enormous enrichment of mathematics in the nineteenth century, the scope of geometry was greatly expanded and diversified, its content disrupted, and its epistemic standing called into question.

The word "geometry" comes from a Greek word that literally means measurement of the earth and was originally applied to the art of land surveying. But around 500 BCE or even earlier, the spatial properties and relations

that had been codified by land surveyors in Mesopotamia and Egypt became in Greece the starting-point of inquiries of a more abstract sort that soon took leave of their down-to-earth origins. In this guise, geometry appeared to Plato as a testimony of the other-worldly origin of the human soul (*Meno*) and was included by him as a compulsory item in the curriculum for would-be philosopher-kings (*Republic*, VII, 526c–528d). For more than twenty centuries, philosophers regarded the geometry created by Greek mathematicians from Eudoxus, through Euclid, to Archimedes and Apollonius as the standard of indubitable truth and cogent reasoning. As a result of later developments, geometry, with the rest of mathematics, came to be seen as a capital example of the loss of certainty that currently pervades most areas of civilized life (Kline 1980). In more than one sense, this enhances, rather than diminishes its philosophical significance.

This entry is divided into three sections. The first section touches on some philosophically noteworthy aspects of ancient geometry. The second section deals briefly with geometry and philosophy from 1600 to 1800. And the third section describes those episodes in the history of geometry since 1800 that had the greatest impact on twentieth-century philosophy.

## TOPICS IN ANCIENT GEOMETRY

**GEOMETRY IN THE MIDDLE EAST.** According to Herodotus (2.109), the Greeks learned land surveying (*geōmētriē*) from the Egyptians, who used it to reassess taxes on properties partially washed away by the Nile. It appears that this art was first cultivated in the Middle East to cope with the consequences of floods in southern Mesopotamia. Archaeological evidence from both regions displays applications of the so-called theorem of Pythagoras, and a clay tablet now at Yale University (YBC 7289) gives the length of the diagonal of a unit square as 1.41421296, the same approximation to  $\sqrt{2}$  that Ptolemy used some 2,000 years later. The Old Babylonian scribe who calculated it probably knew that he could improve on this figure, but it is highly unlikely that he suspected that no algorithm could ever yield a perfectly accurate one. No extant document from ancient Egypt or Mesopotamia contains the general statement of a geometric theorem or anything that even remotely resembles a geometric proof.

**PYTHAGOREANS AND IRRATIONALS.** Thales of Miletus, “the first to philosophize,” supposedly was also the first to prove a geometric theorem (namely, that a trian-

gle with two equal sides also has two equal angles). The earliest proofs probably consisted of diagrams that plainly displayed the relations they were meant to prove (see Plato, *Meno*, 80d–86c). But Greek geometers soon produced purely discursive proofs (like the one given later in this paragraph). The Pythagoreans, intellectually and politically active in southern Italy throughout the fifth century BCE, worked intensely on mathematical problems, as they thought that numbers (i.e., the positive integers) are the principles of everything. This suggestive belief was supported by their discovery that musical chords are associated with simple numerical proportions. It broke down, however, when a member of the school, possibly Hippias of Metapontum, showed that there are geometric magnitudes of the same kind whose relative sizes cannot be conveyed by numbers. Presumably, this was first demonstrated for the diagonal and the side of the regular pentagon; but it is proved more easily for the diagonal and the side of a square by the following argument transmitted in an appendix to Euclid’s *Elements*.

Take the side of the square as the unit of length. Then, by Pythagoras’s theorem, the length of the diagonal equals  $\sqrt{2}$ . But there are no two integers  $a$  and  $b$  such that  $(a/b)^2 = 2$ . For suppose there are. Then, by simplification of the fraction  $a/b$  we should find two integers  $p$  and  $q$ , with no common divisor, such that  $(p/q)^2 = 2$ . Then  $p^2 = 2q^2$  and  $p$  is an even number, equal to  $2n$ , say. (For the square of an odd number, say  $2n + 1$ , is always odd, that is,  $4n^2 + 4n + 1$ ). But then  $2q^2 = p^2 = 4n^2$ , and  $q^2 = 2n^2$ , so that  $q$  is also even. But this is impossible, for we assumed that  $p$  and  $q$  do not have a common divisor. Therefore, one cannot find two integers  $a$  and  $b$ , no matter how large, such that the diagonal of a square exactly equals  $a \times 1/b$  of its side. Awareness of the existence of incommensurable lengths cut short dreams of grasping nature through numbers and opened a chasm between arithmetic and geometry.

**EUDOXUS’S THEORY OF PROPORTIONS.** Eudoxus of Cnidos (c. 390–c. 337 BCE) invented a method for representing the visible motion of each planet in the sky (including Sun and Moon) as the resultant of the combined uniform rotations of several geocentric spheres. Eudoxus’s planetary models are the earliest extant example of geometrical representation of natural processes for the sake of predicting their future evolution. Their moderate predictive success may have motivated Plato’s change of mind from his early view that real planetary motions are essentially irregular and unpredictable (*Republic* VII, 529d7–530b4) to his later commendation of mathematical astronomy as an efficient servant of

theology (*Laws* VII, 822a4–c5; X, 897c4–9; XII, 966d6–967d2) and his endorsement of Eudoxus’s program as the proper way of “saving the phenomena” of the sky (Simplicius, 7.492.30–35). Eudoxus also originated the method of exhaustion employed by Archimedes for calculating volumes enclosed by curved surfaces, which was the first step toward the creation of the integral calculus. But Eudoxus’s chief contribution to geometry was his theory of proportions, preserved in book 5 of Euclid’s *Elements*. With it, geometry recovered the computational powers it had lost when separated from arithmetic, and the road was opened for rigorously conceiving and handling physical quantities of all sorts.

Two magnitudes  $a$  and  $b$  are said to have a ratio  $a:b$  to one another if there are integers  $m$  and  $n$  such that  $m \times a > b$  and  $n \times b > a$ . (The assumption that any two lengths have a ratio to one another is known as the Archimedean postulate.) Eudoxus produced definitions by virtue of which ratios can be added and multiplied, yielding new ratios, and any two ratios  $a:b$  and  $c:d$  satisfy *trichotomy*, that is, either  $a:b = c:d$ , or  $a:b > c:d$ , or  $c:d > a:b$ . In this last case, there will always be an integer  $n$  such that  $n(a:b) > c:d$ . Thus, it is natural to regard all Eudoxean ratios as magnitudes that have ratios to one another. This paves the way for setting up equations that combine magnitudes of very different kinds, for example, masses, distances, and times, or volumes, temperatures, and pressures (as represented by their respective ratios with the appropriate units). However, it is not apparent that anyone saw this before the seventeenth century.

**EUCLID’S ELEMENTS.** In this, the most famous of mathematical textbooks, Euclid (c. 325–c. 265 BCE) organized the results and displayed the methods of fourth-century-BCE Greek geometry. It is usually taken for granted that the book is patterned after Aristotle’s conception of a true science (*epistēmē*). This must consist of a collection of universal statements (theorems) obtained by deductive inference from self-evident premises (axioms) and definitions using a few self-explanatory terms (primitives). However, Euclid’s book, though *prima facie* it may seem to prove every theorem from five postulates and a short list of so-called common notions, often resorts to unspoken assumptions. Moreover, Euclid’s deductions do not all fit into the narrow frame of Aristotle’s logic, and use forms of inference first codified by George Boole (1815–1864), Augustus De Morgan (1806–1871), and Charles Sanders Peirce (1839–1914). Also, his primary definitions (e.g., “A *straight* is a line which lies evenly with the points in itself”) would have to be further supplemented by axioms to be of use in deductions. It seems

more likely, therefore, that Aristotle based his idea of a true science on his own grasp of what contemporary geometers were doing (textbooks similar to Euclid’s had been around since Aristotle was a student in Plato’s Academy) but did not set a paradigm that they or their successors actually followed.

**EUCLID’S POSTULATES.** The first three postulates are not statements, but requests to allow certain constructions. The third—“to describe a circle with any center and any radius”—would require an infinite drawing board, which is not self-evidently available. The fifth is a conditional existential statement: “If a straight line falling on two straight lines makes the interior angles on the same side less than two right angles, the two straight lines, *if produced indefinitely*, intersect on that side on which are the angles less than the two right angles.” Obviously, the condition here printed in italics can only be met on an endless plane. So in the finite world of Aristotelian and medieval cosmology, this postulate is vacuously true, and its existential consequent may be false (there may well not be any such intersection). Still, if Euclid’s other postulates and the Archimedean postulate are true, denial of the consequent implies that a quadrangle with three right angles has an acute angle at the remaining corner, so there can be no rectangles. It also implies that polygons with the same shape also have the same size, in which case Aristotle’s suggestion (*Physics* 207b29–34) that all geometrical theorems can be demonstrated in his bounded cosmos by suitably scaling down the diagrams employed would simply be wrong.

These seemingly counterintuitive implications kept geometers throughout the centuries trying to prove the fifth postulate from other principles until, shortly after 1820, Nikolay Lobachevsky and Janos Bolyai dared to deny it and independently published essentially the same system of non-Euclidean geometry. It might be a sign of Euclid’s genius that he did not gloss over the fact that this assumption (without which the theorem of Pythagoras will not stand) is not self-evident.

## GEOMETRY AND PHILOSOPHY AT THE ONSET OF MODERNITY

**NATURE GEOMETRIZED.** Aristotle taught that natural science, to adequately grasp its proper subject, must employ terms that connote the peculiar matter of each thing, for example, “snub,” which only applies to fleshy noses, rather than “concave,” which connotes merely a geometric shape (*Metaphysics* E, 1, 1025b30–1026a7; *Physics* II, 2, 194a2–27). Still, he agreed (*Metaphysics* Λ, 8)

with the purely geometric description of astronomical phenomena proposed by Eudoxus, presumably because he believed that ether, the stuff that the heavens are made of, can change only by rotation about the center of the Earth, and this is properly described in geometric terms. Anyway, Aristotle's strictures on science did not deter Archimedes (c. 287–212 BCE) from dealing mathematically with the equilibrium and the flotation of bodies. In the meantime, astronomers from Apollonius (third cent. BCE) and Hipparchus (second cent. BCE), through Ptolemy (second cent. CE), to Copernicus (1473–1543) developed ever more complex geometric models of planetary motion, involving diverse circular motions about different centers (none of which coincides with that of the Earth).

After Galileo Galilei's telescope showed that there are mountains on the Moon and fleeting spots on the Sun, the distinction between celestial and terrestrial physics became pointless, and each took cues from the other. Thus Johannes Kepler (1571–1630) sought to explain the motion of planets (including the Earth) by *forces* exerted on them from the Sun, while Galileo (1564–1642) proposed a chronogeometrical model of free fall on the surface of the Earth, which he conceived as uniformly accelerated rectilinear motion. Lasting success was finally achieved by Isaac Newton (1642–1727), by dint of his mathematical genius and his consummate command of geometry. In the course of these efforts, Kepler (1609) had the words "God is always doing geometry" printed on the front page of his masterpiece, and Galileo wrote that the book of nature "is written in mathematical language, and its characters are triangles, circles and other geometrical figures, without which we cannot understand a word of it" (1623, sec. 6). René Descartes's contention that extension is the one and only clearly and distinctly conceivable attribute of bodies surely called for a comprehensive and thoroughgoing geometrization of physics and might have led to it had geometry been ripe enough to deal with its strenuous demands.

**DESCARTES'S REVOLUTION IN GEOMETRY.** Except for his first law of motion (the principle of inertia) and his work on the refraction of light, Descartes's direct contribution to physics, subjected to unsparing criticism by Christian Huygens, Gottfried Wilhelm Leibniz, and Isaac Newton, failed to gain admission into the classical canon. But modern mathematical physics would not have been possible without Descartes's *indirect* contribution to it, through his two great inventions in geometry: *coordinates* (independently introduced also by Pierre Fermat) and the *algebra of lengths*.

Coordinates are quantitative labels employed for identifying points in space. By means of them the relations among the points can be quantitatively represented and investigated. Nowadays geometric coordinates are drawn from the field of real numbers  $\mathbb{R}$ , which we regard as a natural extension of  $\mathbb{Q}$ , the field of rationals, which, in turn, is constructed from the familiar integers. But this understanding of these matters was still far off in Descartes's time (although his geometric algebra was a decisive step toward it). To avoid anachronism, one must regard Descartes's original coordinates as oriented lengths or, more exactly, as Eudoxean ratios between such lengths and a conventionally chosen unit length. To assign so-called Cartesian coordinates to a point  $P$  in space, one takes the three distances  $x$ ,  $y$ , and  $z$  from  $P$  to three mutually perpendicular planes (listed in a conventional order, the same for all points), and prefixes to each a plus sign or a minus sign, according to the side of the respective plane that faces  $P$  (again by convention). The Cartesian coordinates of  $P$  then form an ordered triple of oriented lengths, say  $\langle +x, -y, -z \rangle$ . (There are other ways of defining coordinates: Oblique coordinates depend on three planes not at right angles to each other. Polar coordinates label a point  $P$  by its absolute distance from a fixed point  $O$ , the angle made by  $OP$  with a fixed plane  $\Gamma$  through  $O$ , and the angle made by the perpendicular projection of  $OP$  on  $\Gamma$  with a fixed line through  $O$  on that same plane.)

In Euclid's *Elements* (1956), segments are added to segments in an obvious way to obtain new segments; multiplying a segment  $s$  by an integer  $n$  amounts to adding  $n$  copies of  $s$  end to end; a straight segment or a length is never multiplied by another one. Until not too long ago, it was usually understood that such multiplications do occur in Euclid's book, but then the product of such a multiplication had to be an *area*. Descartes followed Euclid on the addition of lengths and defined the multiplication of a length  $a$  by a length  $b$  so as to yield still another length  $ab$ . Here is how. Draw two straight lines from a point  $O$ . Mark points  $F$  and  $H$  on one line so that  $OF$  has unit length and  $OH$  has length  $a$ . Mark point  $G$  on the second line so that  $OG$  has length  $b$ . Draw the straight line segment  $FG$ . Let the parallel to  $FG$  through  $H$  cut the second line at  $K$ . Clearly, then,  $OH/OF = OK/OG$ . Therefore,  $OG \times OH = OK \times OF$ ; in other words,  $OK$  has length  $ab$  (Figure 1).

By this procedure, entirely based on elementary geometrical knowledge available to Euclid, Descartes and his successors were able to represent all geometrical relations by equations or inequalities between given and unknown

FIGURE 1

quantities, and to solve geometrical problems algebraically. In the algebra all such quantities were handled in the same way as the positive integers and they were therefore called *numbers*. Newton explains: “By a number we do not understand a multitude of units, but rather the abstract ratio of any quantity to another quantity of the same kind, which is taken as a unit. There are three varieties of number: integers, rationals and irrationals” (1707, p. 2). Eventually, they were called *real* numbers, to distinguish them from the imaginary ones, that is, the multiples of  $\sqrt{-1}$ , which also turned up as solutions of algebraic equations.

The method of coordinates soon suggested the idea of a space with  $n$  dimensions, whose points would be labeled by  $n$  quantities. In particular, if  $\langle x, y \rangle$  denotes an arbitrary point on a plane, a straight line on that plane can now be defined as the set of points satisfying the linear equation  $y = ax + b$ , and a circle with radius  $r$  and center at  $\langle 0, 0 \rangle$  as the set of points satisfying the quadratic equation  $x^2 + y^2 = r^2$ . These two equations take care of all points on the plane that can be constructed with a ruler and a compass, which were the only points contemplated by Euclid. But after Descartes, mathematicians felt free to consider any curve defined by an algebraic equation or indeed by a convergent series, such as  $y = \sin x$ , or  $y = e^x$  (where  $e$  is the base of the natural logarithms). Even though Euclid never countenanced the plethora of points obtainable in such ways and it does not follow from his postulates, what we normally call “Euclidean space” comprises them all.

**KANT’S PHILOSOPHY OF GEOMETRY.** The overwhelming success of geometry in physics and astronomy induced some seventeenth-century philosophers to fol-

low its example in ethics and metaphysics. The foremost instance of this is Benedict de Spinoza’s *Ethica ordine geometrico demonstrata* (Ethics demonstrated in geometric order; 1677), but John Locke too believed that “if men would in the same method, and with the same indifference, search after moral as they do mathematical truths,” then “a great part of morality might be made out with that clearness, that could leave, to a considering man, no more reason to doubt, than he could have to doubt of the truth of propositions in mathematics, which have been demonstrated to him” (1690, IV.iii.20, xii.8).

Immanuel Kant, however, thought otherwise. Invidiously comparing geometry, as a science that “excels all others in certainty and distinctness,” with metaphysics, which “has only just started out on the path to these goals” (1902–, 2: 168), he recommended, in 1763, that the latter stop imitating the former, in order to progress along that path. He soon went further. In his Latin dissertation of 1770, Kant taught that confusion and stagnation in metaphysics were due to the contamination of the human intellect with the sensuous notions of time and space. By thoroughly avoiding them, metaphysics will escape the temptations of materialism and determinism and become a secure science of God, freedom, and immortality. Yet in the *Critique of Pure Reason* (1781), Kant likened the purified understanding he advocated in 1770 to a bird that, tired by the resistance of the air, sets out to fly in a vacuum. In his mature view, the basic concepts of human thought—one and many, reality and negation, substance and cause—are not obtained from sensuous experience, but they can refer to objects only when applied to it, under the conditions of human sensibility, namely, space and time.

This decisive turnabout in the history of philosophy is closely related to Kant’s reflections on geometry and its use in physics. In 1746 Kant spoke of a general or “supreme” geometry, adapted to a space with any number of dimensions. That the space we live in has only three dimensions is due to the empirical fact that all material particles are linked by forces governed by Newton’s inverse-square law (1902–, 1: 34). But in 1768 he made a discovery that, he thought, put an end to all such explanations of space and spatial structure from the physical relations between bodies in space. No description of a shoe in terms of its different parts and the relations between them will allow us to tell a left shoe from the matching right shoe; the difference between the two shoes can be grasped only by considering their respective orientation in the space that embraces them. Kant understood this to imply that the bodily structure of bodies

depends on that of space as a whole, which therefore is presupposed by them, rather than being only an expression of their interactions.

Kant was then faced with the following dilemma: Either (a) space itself is a substance, of which bodies are modes (a position that, according to Kant, results in Spinoza's unchristian and immoral deification of space), or (b) space must be thought of as possessing a novel, hitherto unheard of manner of existence (which implies a corresponding adjustment of the ontological standing of bodies as such). About 1769 Kant lighted on alternative (b), which he described around 1791 as one of the two hinges on which metaphysics must turn (the other one being the reality of freedom). He claims that "*space is not something objective and real, neither a substance, nor an accident, nor a relation; it is rather a subjective and ideal scheme, so to speak—which issues from the nature of the mind according to a stable law—for coordinating everything that is sensed externally*" (1902–, 2: 403). Or, in mantra form, *space is one of the forms of human sensibility* (time is the other one). As a consequence of this, things are bodies only insofar as they are actual or potential objects of our sense perception, but not as they are in themselves. (Indeed, Kant figured out in the early 1770s that the standard assumption that things in themselves are spatial would make it impossible to solve the contradictions regarding the limit of the physical world and the divisibility of its content, which he later set forth in the first two items of the Antinomy of pure reason.)

Kant's conception of space is the key to his philosophy of geometry (and is in turn reinforced by it). The epistemological problem of geometry lies in explaining how it can furnish us with precise quantitative information about things we have never met in real life and which anyway we could not measure accurately, for example, the exact size of the angles of a trillion-sided regular polygon. Plato proposed that this knowledge is remembered from another life in which we had direct access to the intelligible "form" of things. The fact that geometry contains such knowledge nourished similar hopes for metaphysics and ethics, which, however, were crushed by Kant's approach. In his view, geometry rests on our natural awareness of the conditions under which alone the manifold appearances displayed through our external senses "can be ordered into certain relations" (1787, B 34) and thus shaped into corporeal phenomena. Such awareness is not intellectual but intuitive, as we may gather from the example of the pair of shoes, described above, and also from the fact that geometrical proofs proceed by the "construction of concepts." Kant explains this expression

somewhat intriguingly as follows: "To *construct* a concept means to exhibit a priori the intuition that corresponds to it: the construction of a concept therefore requires a *non-empirical* intuition which ... as intuition is a *particular* object, but nevertheless, as the construction of a concept (a general idea), must convey universal validity for all possible intuitions that belong under the same concept" (1781/1787, A 713/B 742).

Anyone not put off by these opaque notions could well regard them as a proper explanation of the amazing success of geometry in physics. For, if geometry spells out the ordering that is required for us to grasp external phenomena, then it is no wonder that all external phenomena comply in every detail with the teachings of geometry. Soon, however, innovations in geometry moved the ground from under Kant's position and made it untenable. Before we turn to them, it should be emphasized that among these innovations, the best known one—the derivation of a consistent geometry from the denial of Euclid's fifth postulate—does not challenge Kant's view but somehow corroborates it. For Kant, geometry provides information, conveyed by what he called *synthetic* propositions, and this implies that any of its unproven principles can be denied without self-contradiction.

## FROM GAUSS TO HILBERT AND BEYOND

**NON-EUCLIDEAN GEOMETRY.** The fact that Euclid's fifth postulate is not self-evident prompted several mathematicians to try to prove it. John Wallis (1616–1703) succeeded in inferring it from the assumption that for any given figure there is another one, similar to it, of any arbitrary size. This assumption is neither necessarily true nor empirically obvious, but it does provide a perspicuous characterization of Euclidean space.

Girolamo Saccheri (1733[1986]) sought to prove the postulate indirectly. He devised a quadrilateral thus constructed on a plane: Draw straight lines  $m$  and  $n$  through points  $P$  and  $Q$ , making right angles with the segment  $PQ$ . Mark points  $A$  and  $B$  on  $m$  so that  $AP = PB$ . Mark points  $C$  and  $D$  on  $n$  so that  $CA$  and  $DB$  are both perpendicular to  $m$  (See Figure 2).

If one assumes the Archimedean postulate (which Saccheri tacitly does), the fifth postulate will hold if and only if  $\angle ACQ$  and  $\angle BDQ$  are right angles. Saccheri assumed that these angles are obtuse and easily proved that, if so, two points can be joined by more than one line, which he considered absurd. He then assumed that both

FIGURE 2

angles are acute and derived from this hypothesis many surprising propositions that did not appear to be contradictory, until at last he reached one he pronounced “repugnant to the nature of the straight line.”

The consequences that Saccheri drew from the acute-angle hypothesis reappeared in the nineteenth century in the private papers of Carl F. Gauss (1777–1855) and in independent publications by Nikolay I. Lobachevsky (1793–1856) and Janos Bolyai (1802–1860). These authors treated these consequences as theorems of an alternative system of geometry, based on the straightforward denial of Euclid’s fifth postulate (with the others retained). This system has received various names, but by priority of publication, it should be called *Lobachevskian geometry*. In this geometry, the three interior angles of a triangle add up to less than two right angles, the difference being proportional to the area of the triangle. Therefore, similar triangles are congruent. Consider again the segment  $PQ$  perpendicular to straight line  $m$  at  $P$ . By the denial of the fifth postulate, there is a set  $S$  of straight lines through  $Q$  that form an acute angle with  $PQ$  on one or the other side of it and yet do not meet  $m$  on that side (let alone on the side where they form an obtuse angle with  $PQ$ ). Let  $\alpha$  be the smallest of these angles. By symmetry, there are two lines in  $S$  that form angle  $\alpha$  on either side of  $PQ$ . In Lobachevsky’s terminology (independently adopted also by both Gauss and Bolyai), these two lines are called the *parallels* of  $m$  through  $Q$ , and  $\alpha$  is the *angle of parallelism* for  $PQ$ . The size of  $\alpha$  decreases as  $PQ$  grows. On any Lobachevskian plane, there is a unique length  $h$  such that the angle of parallelism for any segment of length  $h$  equals  $45^\circ$ . The length  $h$  provides an absolute standard of length for that plane. Kant’s friend Johann Heinrich Lambert, who around 1766 worked on this sub-

ject along lines similar to Saccheri’s, said there was “something alluring about this consequence which readily arouses the desire that the [acute angle] hypothesis be true!” (1786/1895, p. 162). Note that if, in the case discussed,  $PQ = h$ , the two parallels to  $m$  through  $Q$  are mutually perpendicular. Lambert thought this was an intolerable paradox.

The absence of contradiction in a long series of theorems inferred from the denial of the fifth postulate does not, of course, imply that Lobachevskian geometry is consistent. Lobachevsky proposed an argument for proving that his geometry is at least as tenable as Euclidean geometry. He showed that there is a logically formal correspondence between the equations of Lobachevskian trigonometry and the familiar equations of spherical trigonometry. By virtue of it, any contradiction derived from the former will be matched by one flowing from the latter. Such a contradiction would entail that the said standard trigonometric equations are false, and this in turn would entail the falsehood of the Euclidean principles from which these equations follow.

Lobachevsky also tried to ascertain whether his own geometry or Euclid’s is true of physical space. He used astronomical data to calculate the sum of the internal angles of the triangle formed by three stars and concluded that the difference between the result obtained in a Lobachevskian space and the Euclidean value was well within the margin of observational error. Decades would pass before Hermann Lotze (1879, p. 774) pointed out that all such attempts are vain, for if astronomical measurements do not agree with Euclidean geometry, the disagreement can still be accounted for by a deviation of stellar light from its supposedly rectilinear trajectory.

**GROUPS AND INVARIANTS.** Shortly before Lobachevsky’s earliest publication on his geometry, Jean-Victor Poncelet’s *Treatise on the Projective Properties of Figures* (1822) started a way of doing geometry that seemed more intuitive and tame but which ultimately was much more radical and would have deeper consequences than the denial of Euclid’s fifth postulate. It is based on adding to each straight line  $m$  a “point at infinity” that  $m$  shares with every straight line parallel to it and treating all such “points” as belonging to a single “plane.” This assumption enormously simplified the statement and the proof of geometric theorems concerning relations of incidence, collinearity, and coplanarity among points, lines, and planes. Metric features like distance and metric relations like congruence were totally ignored. Natural (initially tacit) assumptions regarding the neighborhood relations

between the points at infinity and the standard points implied that ordinary space differed drastically from the new *projective space* in which it was now embedded. For example, a left shoe traveling indefinitely in a fixed direction would, after crossing the plane at infinity, return to its original location from the opposite side, in the guise of a right shoe. In this way, projective geometry disposed of Kant's claim about the irreducible difference between the two kinds of shoes, its ontological implications, and its intuitive roots.

Projective geometry grew in scope and sophistication at the hands of August Moebius (1790–1868), Julius Plücker (1801–1868), Karl Georg Christian von Staudt (1798–1867), Arthur Cayley (1821–1895), and others. Different sorts of numerical coordinates were introduced as sheer labeling devices, for in this metric-free context they plainly did not represent distances. The use of coordinates consisting of complex numbers made it possible to introduce more points, in addition to the familiar real points (those labeled by real numbers). These “complex points” are linked to real points and among themselves by relations of collinearity (if their coordinates satisfy the same linear equations) and vicinity (by dint of the neighborhood relations between real and nonreal numbers on the complex plane). The beautiful vistas opened by such developments inspired further flights of mathematical freedom leading to the creation of still other branches of geometry.

Moved by the confusing variety of geometrical methods and approaches, Felix Klein formulated his celebrated Erlangen Program, in which he seeks to unify all forms of geometry under a single overarching point of view. This is provided by the notion of *transformation group* and the related notion of *invariant*.

Let  $S$  be a set of points. A *transformation* (or *permutation*)  $T$  of  $S$  assigns to each point  $p$  of  $S$  one and only one point  $T(p)$  of  $S$ , in such a way that every point of  $S$  equals  $T(p)$  for some  $p$ . In other words, a transformation of  $S$  is a one-to-one mapping of  $S$  onto itself. We say that  $T(p)$  is the *value* of  $T$  at  $p$ .  $T$  is said to *send*  $p$  to  $T(p)$ . If  $M$  is a subset of  $S$ ,  $T$  is said to *send*  $M$  to the set  $T(M) = \{T(p) : p \in M\}$ . For every transformation  $T$ , there is an *inverse transformation*  $T^{-1}$  that, for each  $p$  in  $S$ , sends  $T(p)$  back to  $p$ . The identity transformation  $\text{Id}_S$  sends every  $p$  in  $S$  to itself. Given two transformations  $T_1$  and  $T_2$ , their *product*  $T_2T_1$  is the transformation that sends each  $p$  in  $S$  to the value of  $T_2$  at  $T_1(p)$ . The product of transformations is clearly *associative*, that is,  $(T_3T_2)T_1 = T_3(T_2T_1)$  for any three transformations  $T_1$ ,  $T_2$ , and  $T_3$ . A set  $G$  is a *group of transformations* of  $S$  if every element of  $G$  is a transfor-

mation of  $S$  and  $G$  contains (1) the product of any two of its elements, (2) the inverse of every one of its elements, and (3) the identity transformation  $\text{Id}_S$ . Any subset of  $G$  that meets conditions (1) through (3) is said to be a *subgroup* of  $G$ .

Given a group  $G$  of transformations of a set  $S$ , let  $R$  be an  $n$ -adic predicate ( $n \geq 1$ ) such that, for any points  $p_1, \dots, p_n$  in  $S$  and any transformation  $T$  in  $G$ ,  $R(p_1, \dots, p_n)$  implies that  $R(T(p_1), \dots, T(p_n))$ . We say then that  $R$  is an *invariant* of group  $G$  or that  $R$  is *G-invariant*. Likewise, a function  $f$  on  $S^n$  is said to be *G-invariant* if, for every  $n$ -tuple  $\langle p_1, \dots, p_n \rangle$  of elements of  $S$ ,  $f(p_1, \dots, p_n) = f(T(p_1), \dots, T(p_n))$ .  $G$  is said to *preserve* its invariants.

Klein's Erlangen Program for systematically ordering geometries is based on the following simple idea: Each geometry is the study of the invariants of a group, and the relations of inclusion between groups and their subgroups determine a hierarchy of geometries. Starting from the group of all possible transformations of an arbitrary set, whose sole invariant is the cardinality of the set, one descends, through multiple branches, right down to the trivial group, which is a subgroup of every group and preserves every property and relation, for it only comprises the identity transformation. In particular, projective geometry studies the invariants of the group of collineations, that is, the set of transformations that send straight lines to straight lines. This is a subgroup of the group of continuous transformations, whose invariants are the *topological* properties of projective space. Drawing on work by Arthur Cayley (1859), Klein (1871, 1873) found a way of defining different real-valued functions on point pairs that behaved, on well-defined regions of projective space, precisely like the distance functions of, respectively, Lobachevskian geometry (which he called *hyperbolic*), Euclidean geometry (which he called *parabolic*), and a third geometry (which he called *elliptic*). Each of these functions was an invariant of a certain subgroup of the said group, comprising the collineations that map a specific quadric surface onto itself.

Klein's result led Russell (1897) to assert that the general “form of externality” is disclosed to us a priori in projective geometry, but its metric structure—which Russell wrongheadedly claimed can *only* be Lobachevskian, Euclidean, or elliptic—must be determined a posteriori by experiment. Poincaré took another view of this matter: If geometry is nothing but the study of a group, “one may say that the truth of the geometry of Euclid is not incompatible with the truth of the geometry of Lobachevsky, for the existence of a group is not incompatible with that of another group” (1887, p. 290). Euclidean geometry has

seemed preferable only because the rotations and translations of the Euclidean group reflect, to a comfortable approximation, the motions of ordinary hard bodies in our environment.

**RIEMANNIAN MANIFOLDS.** In his lecture “On the Hypotheses Which Lie at the Foundation of Geometry” (1867), Bernhard Riemann took an approach to geometry that did not fit into Klein’s Erlangen Program. He noted that traditional geometry rested on assumptions summed up in Pythagoras’s theorem (by which the distance between a point with Cartesian coordinates  $\langle x, y, z \rangle$  and the origin  $\langle 0, 0, 0 \rangle$  equals the positive square root of  $x^2 + y^2 + z^2$ ). These assumptions had been corroborated by using light rays to line up things and rigid bodies to measure the length of lines, and therefore were bound to break down on very small scales, where such physical objects are not available, and perhaps also on very large scales, where the errors of observation generated by using such instruments might become intolerable.

Riemann therefore proposed to proceed from more general assumptions toward a more flexible geometry that physicists could later resort to when they needed it. He took his cue from Carl Friedrich Gauss’s work on the intrinsic geometry of surfaces (1828), which he extended to general spaces of  $n$ -dimensions (*n-manifolds*, for short). Though Riemann supposedly addressed his lecture to humanists (hence its meager use of mathematical symbolism), the meaning and reach of the lecture first became clear through its further elaboration by other outstanding mathematicians (e.g., Elwin Bruno Christoffel, Friedrich Schur, Wilhelm Killing, Élie Cartan, Hermann Weyl), and a whole century would pass before it was satisfactorily explained to undergraduate students (Spivak 1979). The following rough sketch of Riemann’s breakthrough owes much to the light shed on it by such later developments.

An  $n$ -manifold  $M$  is furnished with coordinate systems or *charts*, by which different regions or *patches* of  $M$  are mapped continuously and one-to-one onto subsets of  $\mathbb{R}^n$  (the set of all  $n$ -tuples of real numbers, endowed with the neighborhood relations it inherits from the real-number field  $\mathbb{R}$ ). Two charts defined on overlapping patches are said to be *compatible* if the coordinate transformation between them is a smooth function from one open subset of  $\mathbb{R}^n$  onto another (possibly the same) one. An *atlas* of  $M$  is a collection of compatible charts for  $M$  such that every point of  $M$  lies on the patch of at least one chart. Any atlas  $A$  of  $M$  determines a corresponding maximal atlas  $A_{\max}$  comprising every conceivable chart of  $M$

compatible with those in  $A$ . The way the charts of  $A_{\max}$  combine with each other in coordinate transformations reflects the overlapping and intertwining of the patches on which they are defined and thus specifies the global topology, the shape, of  $M$ . (In the realm of 2-manifolds, or surfaces, the atlas of a pretzel differs from that of a donut or a bun.) The lengths of curves drawn in  $M$  (which are best thought of as continuous mappings of an open interval of  $\mathbb{R}$  into  $M$ ) can then be defined in an endless variety of ways by rules that assign to each point  $p$  of  $M$  an appropriate function on the coordinate differentials at  $p$ , in a manner that varies smoothly from point to point.

Riemann was aware that this approach gave the mathematician enormous freedom, and he proposed restricting the admissible functions, for the time being, to quadratic functions on coordinate differentials, which, on a small neighborhood of each point of  $M$ , would yield a definition of length in optimal agreement with the  $n$ -dimensional version of the Pythagorean theorem. To conform to the standard concept of length, he also required his quadratic functions to be positive-definite, that is, to take their values only among the nonnegative real numbers. This requirement was subsequently relaxed in the spacetime geometries of the theory of relativity, which, for this reason, are often called *semi-Riemannian*.

From the standpoint of twentieth-century mathematics, the characterization of an  $n$ -manifold  $M$  by means of an atlas of the kind described makes it possible to assign an  $n$ -dimensional real vector space to each point  $p$  of  $M$ , the *tangent space* at  $p$  (thus called by analogy with the plane tangent to a smooth surface at any point of it). A Riemannian metric on  $M$  assigns to each  $p$  of  $M$  a tensor of rank 2, that is, a bilinear function on its tangent space, that varies smoothly from point to point. Riemann’s quadratic functions on the coordinate differentials at each point can be naturally obtained as appropriate representations, relative to one or another locally defined coordinate system, of such coordinate independent objects.

A given Riemannian metric  $\mu$  on  $M$  determines a smoothly varying assignment, to each  $p$  of  $M$ , of a tensor of rank 4, that is, a quadrilinear function on its tangent space. Such an assignment is in effect a *field of tensors* (one at each point), but, for short, this assignment is called the *Riemann tensor* of the Riemannian manifold  $\langle M, \mu \rangle$ . This is a natural generalization to  $n$ -manifolds of the analytically defined yet fairly intuitive concept of the Gaussian curvature of a surface (a real-valued function that is positive and constant on a sphere, variable but

always positive on an ovoid, alternatively positive and negative on the surface of a saddle, and equal to 0 on a plane or a cylinder), and is therefore also called the *curvature tensor*, a term that mathematicians wield nonchalantly but that among philosophers has been a source of endless worries.

On this same analogy,  $n$ -manifolds of constant 0 curvature are said to be *flat*. In particular, Euclidean space is a flat 3-manifold, while Lobachevskian space is a 3-manifold of constant negative curvature, and Klein's elliptic space is a 3-manifold of constant positive curvature. But a generic Riemannian manifold  $\langle M, \mu \rangle$  has variable curvature, and therefore the only group of transformations of  $M$  that will preserve the metric  $\mu$  is the trivial group consisting only of the identity transformation. Already for this reason, Riemannian geometry obviously cannot fall under the Erlangen Program. Another excluding reason is the fact that a geometric inquiry that considers general spaces of endlessly different shapes cannot be characterized by a group of transformations of one of these spaces onto itself. Still, there are Riemannian manifolds endowed with interesting symmetries, and group theory has been the tool of choice for studying them.

**HILBERT'S FOUNDATIONS.** Euclid's putative program for logically inferring the truths of geometry from a sufficient list of unproven premises was fondly imitated by scientists and philosophers in the seventeenth century, but it was first properly carried out by Moritz Pasch (1882). He gathered what he regarded as the empirical foundation of geometry into a few undefined concepts concerning the shape, size, and reciprocal position of bodies and a few axioms that linked these concepts among themselves and with other concepts defined in terms of them. Pasch's axioms "state what has been observed in certain very simple diagrams" (p. 43). All other geometric statements should be proved from the axioms by the strictest deductive methods.

Pasch dealt with projective geometry. The first rigorous axiomatization of Euclidean geometry was given in David Hilbert's *Foundations of Geometry* (1899), a book that had a major influence on twentieth-century mathematics and philosophy. Hilbert invited the reader to consider three arbitrary sets of objects, which he called points, straights, and planes; three undefined relations of *incidence* between a point and a straight line, between a straight line and a plane, and among three points; and two undefined relations of *congruence* between two pairs of points (*segments*), and between two equivalence classes of point triples (*angles*). Hilbert linked these objects and

relations through nineteen axioms, which—when supplemented with the "axiom of completeness" added in the second edition—are sufficient for characterizing the said objects and relations up to isomorphism. This means that if we have two threefold collections of points, straights, and planes having the prescribed relations of incidence and congruence in agreement with Hilbert's twenty axioms, there will always be a one-one mapping of the points, straights, and planes of one collection respectively onto the points, straights, and planes of the second that preserves all five sorts of relations. Such a structure-preserving mapping between structured sets is called an *isomorphism*. Evidently it can hold between two systems of intuitively very dissimilar objects.

Hilbert availed himself of this feature of axiomatic theories for studying the independence of some axioms from the rest. To prove such independence, he proposed actual instances (*models*) of the structure determined by all the axioms but one, plus the negation of the omitted one. Gottlob Frege complained that the geometric axioms retained in these exercises could be applied to Hilbert's far-fetched models only by tampering with the natural meaning of words. Hilbert replied, on December 29, 1899, "Every theory is only a scaffolding or schema of concepts together with their necessary mutual relations, and the basic elements can be conceived in any way you wish. If I take for my points any system of things, for example, the system *love, law, chimney-sweep, ...* and I just assume all my axioms as relations between these things, my theorems, for example, the theorem of Pythagoras, also hold of these things.... This feature of theories can never be a shortcoming and is in any case inevitable" (Frege 1967, p. 412). Hilbert's declaration of independence from sense experience and ordinary usage concisely expresses the modern view of mathematics as a universal "science of patterns" (Resnik 1997), in which geometry is barely distinguishable from its other branches, except on historical grounds.

**THE GEOMETRY OF THE UNIVERSE.** This approach to pure geometry and mathematics gives physicists enormous freedom to choose the abstract structures they judge most suitable for representing (modeling) the phenomena under inquiry. Yet, as Albert Einstein (1921) pointed out, so long as physics remains unable to provide, from microphysical principles, an exact theoretical construction of the instruments it uses for measuring distances and times, it will continue to need a practical geometry, which must be suggested and corroborated by experience.

According to Einstein, the stability of sharp spectral lines justifies the postulate that any two ideal clocks, once running beside each other at the same rate, will always do so, no matter where and when they are brought together again for comparison. Under this postulate, and for spatiotemporal regions sufficiently small that gravity is practically homogeneous in them, experience has amply vindicated the validity of the flat semi-Riemannian geometry that Hermann Minkowski (1909) initially proposed for the whole world. For broader regions, Einstein's theory of general relativity assumes a semi-Riemannian spacetime geometry whose variable curvature reflects the variations in gravity.

By solving Einstein's equations of the gravitational field under cosmologically plausible special symmetry requirements, Alexander Friedmann (1922, 1924) produced big-bang models of the universe. These big-bang models were ready at hand to explain the systematic recession of the galaxies away from us when discovered by Vesto Slipher and Edwin Hubble before 1930 and the current low temperature of the background thermal radiation when discovered by Arno Penzias and Robert Wilson in 1964. It is worth emphasizing that the explanation of these phenomena from the Einstein field equations is purely geometrical—a consequence of the shape of the universe under the postulated symmetry requirements. Purely geometric arguments also support the proof by Stephen Hawking and Roger Penrose (1970) that, under physically very plausible assumptions, a generic relativistic space-time most likely contains black holes.

## GERARD, ALEXANDER (1728–1795)

Alexander Gerard was professor of moral philosophy and divinity at the University of Aberdeen and a leading member of the Aberdeen Philosophical Club along with James Beattie and, most importantly, Thomas Reid. He is known primarily for his *Essay on Taste* (1759/1963), which was awarded a prize by the Edinburgh Society for the Encouragement of Arts, Sciences, Manufacture, and Agriculture. Gerard returned to the subject with *An Essay on Genius* (1774/1966). In addition to the primary influence of Reid, the work of David Hume is a principal influence, though, like Reid, Gerard disagrees fundamentally with what he takes to be Hume’s skepticism.

Although Gerard writes in the tradition of eighteenth-century theories of taste, it is questionable whether he should be regarded as a taste theorist in a

strict sense. Gerard is responding to the theories of criticism of Francis Hutcheson and Hume who set the context of discussion in terms of taste and sentiment, but Gerard follows Reid in taking a more realist position regarding the qualities that produce a perception of beauty and relies more directly on rules and principles that are derived by induction. Thus, Gerard defends a position that is moving rapidly away from an essential dependence on taste.

Gerard depends on two fundamental principles. The first is a faculty of imagination. Imagination combines reflective ideas supplied by fancy. Gerard's faculty psychology posits internal senses that are "reflexive," that is, they refer to the workings of the mind rather than to external objects. However, whereas for Hutcheson an internal, reflexive sense is a direct intuition of beauty and virtue, Gerard, following Reid, treats internal senses as active principles of perception. Internal senses correspond to the qualities that they respond to. For example, there are senses of novelty, sublimity, beauty, imitation, harmony, ridicule, and virtue. The second fundamental principle, following Joseph Addison's *Spectator* essays (particularly no. 418), identifies the pleasures of the imagination as depending on mental activity. The faculty of imagination exercises the mind; and, when that exercise falls within a moderate range, it is experienced as pleasurable. If it is either too languid and easy or too excited and difficult, discomfort (or simply indifference) results. These two principles combine to explain judgments of taste.

The subordination of taste to imagination seems clear; for example in *Essay on Taste*, Gerard writes "Taste, therefore, though itself a species of sensation, is in respect of its principles, justly reduced to imagination" (1759/1963, p. 144); and later, "Taste, in most of its forms at least, [is] a derivative and secondary power. We can trace it up to simpler principles, by pointing out the mental process that produces it, or enumerating the qualities by the combination of which it is formed. These are found, on inquiry, to be no other than certain exertions of *imagination*" (1759/1963, p. 151). Gerard goes on to explain each of the aesthetic predicates in terms of the kind of pleasurable mental activity that they produce: "The sources of all the sentiments of taste ly [sic] in the mind. The qualities of objects affect, in a certain manner, some principles of human nature, which by their operation, either singly or several in conjunction, produce gratification or disgust. ... Simplicity, for instance, occasions easiness of conception; novelty or variety, an effort to

conceive; amplitude, an expansion of soul" (1759/1963, p. 260).

Gerard holds that sentiment can be judged false because the qualities of taste can be figured out empirically. If I perceive something as grand that lacks the necessary qualities of extensiveness and amplitude, I am mistaken in my sentiment just as I would be if I experienced motion in violation of its actual occurrence. Therefore, for Gerard, there can be only a limited appeal to sentiment: "the qualities of an object, which gratify us, are more fixed and definite than the sensation which they excite" (1759/1963, p. 288). Gerard is clearly committed to what he understands as a "scientific"—that is, Newtonian—model, but at bottom he is siding with Reid against Hume by holding that aesthetic properties must be really in the object and that principles of common sense are sufficient to provide standards of judgment when disagreement arises.

For both Reid and Gerard, active judgment is logically prior to sensory experience in the aesthetic process. The function of sensory experience is to supply the material; the aesthetic operation comes about only when the mind is actively engaged. For example, Gerard writes, "For all the objects that affect taste, and excite its sentiments, are certain forms or pictures made by fancy, certain parts or qualities of things which it combines into complex modes" (1759/1963, p. 157). "In order, therefore, to form an able critic, taste must be attended with a philosophical genius, which may subject these materials to a regular induction, reduce them into classes, and determine the general rules which govern them" (1759/1963, p. 171). That engagement is critical and judgmental. Gerard's theory points toward Archibald Alison's *Essay on the Nature and Principles of Taste* (1790) in that Alison, too, reduces taste to a form of mental activity. But when Gerard says that "The sources of all the sentiments of taste lie in the mind" (1759/1963, p. 290), his purpose is to deny Hume's division between external sense and passions and to side with Reid's dualism between mind and body. Gerard's theory of taste marks the beginning, therefore, of a break with the theories of taste that run from The Third Earl of Shaftesbury (Anthony Ashley Cooper) through Addison and Hutcheson to Hume.

**GERBERT OF AURILLAC**

(c. 938–1003)

Gerbert of Aurillac, an educational reformer and pope (Silvester II) of the eleventh century, was born in Auvergne about 938, became a monk of St. Gérard d'Aurillac, and was educated there and in Catalonia. He later visited Rome, where Pope John XIII (965–972) introduced him to Emperor Otto I. Gerbert shortly left Otto's court to study at Rheims, where he later became master of the schools. His fame led Otto II to make him abbot of Bobbio about 980, but in 983 Gerbert returned to Rheims, where he engaged in political and antipapal controversies. In 991 he became archbishop, and after many vicissitudes he was transferred to Ravenna in 998. His old friend and patron Otto III secured his election as Pope Silvester II in 999; as pope he established the church in Hungary and strongly asserted papal claims. He died in 1003.

Despite the intrigues and restlessness of his later public life, Gerbert was—and was recognized as—the

most learned, versatile, and influential master of his age. Rheims during his first stay (c. 966–980) became a principal center of the educational revival that was beginning to inspire the cathedral schools of France and that from them passed to the universities. Fulbert, founder of the school of Chartres, was Gerbert's pupil.

Gerbert's greatest achievement was to give new life to the skeleton of the ancient *trivium* and *quadrivium*. In rhetoric he restored the careful study of Terence and Vergil, the satirists Horace and Persius, Lucan, and the critics Seneca and Quintilian; in dialectic, which he reestablished as the goal of a literary education, he developed what was to become the classical syllabus of the *Isagoge* of Porphyry, the *Categories* and *De Interpretatione* of Aristotle, the *Topics* of Cicero, and the whole dialectical corpus of Boethius. He rescued the *quadrivium* from its bookish decadence and injected a real, practical orientation. In mathematics, his forte, Gerbert revived the ancient Greek tradition and replaced clumsy Roman numerals with the Indian numerals 1 through 9; he produced a simplified abacus, with instructions for its use; and he wrote at length on methods of multiplication and division. In astronomy he taught by means of a sphere showing the movements of the planets.

It is uncertain how much these innovations were the result of his early experiences in Spain and his contacts there with Arabic science and thought. Save for a short disputation on human reason, in which he showed an attraction toward the Platonic Ideas, he wrote no philosophical work. His only authentic scientific writings are mathematical. His letters, some of which contain discussions of mathematics, illustrate his political activity and the events of his age. In his later life he had little influence on the intellectual and spiritual life of his age. His earlier work as a teacher, however, marked an epoch.

## GERSON, JEAN DE

(1363–1429)

Jean de Gerson was one of the most influential French intellectuals of the early fifteenth century. He studied under Pierre d'Ailly and received his doctorate in theology in 1392. He was elected the chancellor of the University of Paris in 1395. He used this key position for intense intellectual involvement in ecclesiastical politics. He was part of the University of Paris delegation to the Council of Constance and played an important role in the discussions there. After the council, he fell from political favor. Returning to France in 1419, he lived in Lyon for the rest of his life in relative obscurity. He was then engaged mainly in literary work, producing, for example, the well-known defense of Joan d'Arc.

During Gerson's lifetime, the emphasis in university work turned from research to teaching and social influence. The saying "everything necessary has already been written" was often used at the time, and accordingly university teaching was often directly based on canonical sources. Gerson was an active figure in developing the university away from "idle speculations" and toward applying learning for the larger world. His own philosophical work cannot be described as highly original. But he was very productive and very influential through his writings on popular topics.

In political philosophy, Gerson was close to his master Pierre d'Ailly. They worked in close cooperation on many issues. As *conciliarists*, they understood the church

as a political society. Thus, they thought that a general council of the church would have the power to solve the papal schism, like in any political society the ruler may rightly be deposed if he fails to promote the welfare of the society. Gerson cannot be said to have promoted individual rights because he did not understand the welfare of society in terms of the welfare of the individual.

Gerson has been called both an opponent and a proponent of the nominalist movement of his time. In many contexts, he relied on nominalist positions. He was, however, an opponent of the idea that natural reason could solve metaphysical problems. Also, he acted with the Renaissance humanists against the increasing role of logic and natural reason in the theological faculties. This was a time in which the English tradition in nominalist logico-semantic work was gaining ground in continental universities, especially among the Scotists and the Ockhamists. Later on, achievements in this field were to prove crucial in the formation of what is today known as modern science. Gerson's opposition to this increasing emphasis on logico-semantic analysis in the theological faculties was not so much due to a disagreement about philosophical issues so much as a preference for what he saw as more applicable and experientially grounded knowledge.

Instead of speculative theology, Gerson encouraged mystical theology, and indeed many of his best known writings are from this field. His approach is that it is the duty of every person to acquire experiential knowledge of God. This did not mean a rejection of philosophical learning. Rather, Gerson sought for mutual support between devotion and learning. In his anthropological writings, he presents a threefold division both of cognitive potencies—simple understanding, reason, and sensitivity (*intelligentia simplex*, *ratio*, and *sensualitas*)—and of affective potencies—conscience, rational desire, sensitive desire (*synderesis*, *appetitus rationalis*, and *appetitus sensualis*). These divisions accord with neoplatonic models, but Gerson's special emphasis is upon the reciprocal relations between the affective and the cognitive powers. They must work together so that knowledge and love both contribute to the approach to God. In this way, the *unio mystica* can be achieved. Gerson says very little about that experience itself, claiming that it is known only through experience and cannot be described.

Gerson was a typical fifteenth-century Renaissance intellectual. He was deeply religious and committed his efforts to public affairs, concentrating on the papal schism and his duties at the University of Paris. Apart from the writings on mysticism, his philosophical views

are best understood in terms of the ecclesiastical situation and his position in the university politics of the time.

## GERSONIDES

(1288–1344)

Gersonides, or Levi ben Gershon, also known by his acronym, “RaLBaG,” was a French Jewish philosopher, biblical exegete, mathematician, and astronomer. He was born at Bagnols and died at Perpignan. He was the inventor of two astronomical instruments, the Jacob’s staff (“baculus”) and an improved camera obscura. Gersonides’ literary contributions include biblical commentaries of a philosophical and moral tone, supercommentaries to Averroes’s treatises on Aristotle, and his philosophical masterwork, *Milhamot Adonai* (Wars of the lord). Because of his knowledge of Averroes, Gersonides was exposed to a more authentic version of Aristotle than was available to his predecessors and was thus motivated to reexamine certain problems that he felt had previously been treated inadequately or incorrectly. These problems, corresponding to the six sections of the “Wars,” are (1) the nature and immortality of the soul, (2) prophecy, (3) the nature of God’s knowledge, (4) divine providence, (5) miracles and the structure of the universe, and (6) the creation of the world. Methodologically, he recognized the authority of the four roots of knowledge (as first formulated by Saadya Gaon), namely, reason, sensory per-

ception, divine revelation, and rabbinic tradition, in that order of priority, although he seldom cited the last specifically.

The work begins with a detailed analysis of Aristotle’s doctrine of the soul according to the interpretations of Alexander of Aphrodisias, Themistius, and Averroes. In agreement with Alexander, Gersonides maintained that the material or hylic intellect is a capacity inherent in the sensitive soul. Under the agency of the Active Intellect, the last of the separate intelligences, the material intellect is transformed, through the acquisition of ideas, into an actual or acquired intellect. Opposing the nominalism of Alexander and Maimonides, Gersonides maintained the reality of the ideational content of the acquired intellect. It is this acquired intellect that survives independently after the death of the individual.

Gersonides’ account of the nature of God’s knowledge is related to his theory of divine attributes. Maimonides’ theory of homonymy, according to which attributes in general and the term *knowing* in particular refer to entirely different concepts when applied to God and man, allowed Maimonides to maintain both God’s absolute omniscience and human free will. Rejecting this as absurd, Gersonides reaffirmed, in agreement with the Muslim philosophers Avicenna and Averroes, that attributes are to be treated as ambiguous terms, applied in a primary sense to God but in a derivative sense to man. Furthermore, the attributes imply no plurality in God’s nature since they are subjects of discourse and not of essence, just as the terms *redness* and *color* imply no plurality in the concept “red.”

Since God’s knowledge is similar in nature to man’s, he cannot know the contingent and consequently knows the particulars only insofar as they are ordered. This amounts to a virtual restriction of divine knowledge to the universals. Since men are endowed with free will, this restriction normally precludes special providence for individuals. However, some individuals enjoy special providence; this consists in a knowledge, received from the Active Intellect, of stellar configurations that determine events on earth. Modern scholarship has not generally noted that this explanation of special providence for the intellectual elite was foreshadowed in one of the two discussions of the problem in Maimonides’ *Guide for the Perplexed* (III.51).

The communication of astrological information to the human intellect by the Active Intellect is known as prophecy. The prophet, to the extent of his ability, interprets the general information received, in the light of the particular circumstances with which he is concerned,

Gersonides' tendency to deny God's direct involvement in terrestrial affairs is further illustrated by his theory that the capacity for miracles was implanted in nature so that miracles do not represent any specific divine concern.

In his discussion of the origin of the world, Gersonides agreed with Maimonides that it was indeed created but, in opposition to him, maintained that *ex nihilo nihil fit*. Rather, he posited an absolutely formless matter (not eternal in time since time did not exist before the creation of the world) out of which the world was formed. Gersonides found this dualism useful in ascribing the origin of evil to matter.

### **Bibliography**

Gersonides' *Milhamot Adonai* (Wars of the lord) was first printed at Riva di Trenta (1560) and reprinted at Leipzig (1866). The editions omit the rather technical astronomical treatise in the fifth book which is extant in manuscript and which was translated into Latin by order of Clement VI. The partial German translation by Benzion Kellerman, *Die Kämpfe Gottes von Lewi ben Gerson* (Berlin, 1914), should be read in conjunction with Isaac Husik's review, "Studies in Gersonides," in *Jewish Quarterly Review*, n.s., 8 (1917–1918): 113ff. and 231ff. For a complete bibliography, see *Encyclopedia Judaica* (Berlin, 1929), Vol. IV, p. 656; Vol. VII, pp. 328ff. and 338, to which may be added H. Wolfson, "Maimonides and Gersonides on Divine Attributes as Ambiguous Terms," in *Mordecai Kaplan Jubilee Volume*, edited by M. Davis, 515–530. (New York: Jewish Theological Society, 1953).

## GERSONIDES [ADDENDUM]

The intensive and fruitful research conducted on Gersonides since the 1960s has increasingly led to a recognition of his exceptional stature as a philosopher-scientist. It is also appreciated now that the multifarious aspects of Gersonides' thought constitute a coherent unity that must be studied as such. Contrary to Maimonides, whom he venerated, Gersonides believed in the human power to discover God's blueprint for creation, namely through empirical study of nature and through the interpretation of God's revelation (the Scriptures). This belief triggered his various scientific activities, most of which have been the subject of recent research.

Following notably Charles Touati's French monograph on Gersonides' philosophy, many detailed studies have been devoted to specific issues. Several parts of the *Wars of the Lord* have been translated into English and French, followed by a full English translation by Seymour Feldman. The great significance and originality of the largely unpublished astronomical part of Gersonides' *Wars* (often referred to as his *Astronomy*) have been brought to light, notably by Bernard R. Goldstein. In addition, J. L. Mancha has shown that the Latin translation of the *Astronomy* had been realized with the collaboration of Gersonides himself at the papal court in Avignon, testifying to the importance ascribed to it there. (For these and all other bibliographical references see Kellner's "Bibliographia gersonideana.")

Scholars realize now that Gersonides' numerous super-commentaries on Averroes's commentaries on Aristotle's treatises are crucial for an adequate understanding of Gersonides' thought and its evolution. Recent scholarship (R. Glasner) established that Gersonides was the first to teach Averroes's commentaries—in their Hebrew versions—in the Jewish community of southern France. Recent editions of Gersonides' commentary of the Pentateuch unearthed new material, revealing that Gersonides was more interested in Jewish law than had previously been thought. More generally, the great importance of the biblical commentaries for the understanding of Gersonides' thought has become better appreciated.

Scholars—notably Ruth Glasner—point to the originality of Gersonides' thinking about natural philosophy and its central place in his work. The originality of Gersonides' work in logic has also been highlighted, notably by Charles Manekin. Other studies, especially by Sara Klein-Braslav, emphasize the importance of Gersonides' scientific methodology. Gersonides depended essentially on literature available in Hebrew; the question why his work bears next to no trace of a familiarity with Latin philosophy—even though Gersonides is known to have had contacts with Christians—has been much, albeit inconclusively, discussed in recent research.

## GESTALT THEORY

The Gestalt movement in psychology began early in the twentieth century; its founders were the German psychologists Max Wertheimer, Wolfgang Köhler, and Kurt Koffka. A Gestalt is essentially an organized whole whose parts belong together, as opposed to being simply juxtaposed or randomly distributed. As Wertheimer put it, “What happens to a part of the whole is determined by intrinsic laws inherent in this whole.” The Gestalt theorists believed this principle to be of wide application and to be relevant to the psychology of perception in particular.

#### HISTORY

As early as 1890 Christian von Ehrenfels had pointed out that to appreciate a melody we need to be aware not of single tones in isolation but of a succession of tones

**FIGURE 1**

which combine in a particular way. If notes of the same pitch as those of the original melody are presented in a different temporal order, there will be a completely different effect, whereas the same melody played in a different key is immediately recognizable, even though the notes are different in pitch from the original ones. The melody as a whole was said by von Ehrenfels to have a *Gestaltqualität* independent of the qualities of the separate notes. Wertheimer, Köhler, and Koffka were concerned to apply the concept of Gestalt over a wide area and thus give a new direction to psychological research.

A central feature in their view was the doctrine of isomorphism, which asserts that our experiences have the same structure as the brain processes which underlie them. Thus, if the stimulus is a nearly complete circle which the subject sees as a complete circle the doctrine of isomorphism would assert that there must be some pattern in the brain that is isomorphic with the complete circle, as opposed to the incomplete one. The detailed neurological hypotheses which they put forward are of questionable value, but the general principle is still of interest, as is Köhler’s demonstration that there are Gestalten in physical nature, for example, the soap bubble, whose spherical shape is the necessary result of the total forces in operation at any one time (see Koffka, *Principles of Gestalt Psychology*, p. 14).

The following are some typical examples of the Gestalt principle as applied to vision: Figure 1 appears as a cross; if, however, we consider the effect on the retina of

FIGURE 2A

the eye of each of the dots in isolation, there is nothing to account for the way in which they are organized. Implicit in traditional thinking, according to Köhler and Koffka, is the so-called constancy hypothesis—the hypothesis that stimulation of a particular point on the retina has a constant effect regardless of the total pattern of stimulation. Yet if the constancy hypothesis were true, it would be hard to explain the obvious recognizability of the “4” in Figure 2a and its camouflage in Figure 2b, since the same retinal points are being stimulated in both cases. Similarly one cannot explain how a person who moves from twenty yards away to ten yards away continues to look approximately the same size, since the retinal stimulation must by the laws of optics be quite different. Indeed there are many characteristics of the perceived world (what Koffka terms the “behavioral,” as opposed to the “geographical,” environment) which do not bear a one-one relationship to anything in the pattern of stimulation. Thus, in Figure 3 we see the lines as four pairs, but the “togetherness” of each pair has no direct counterpart in the system of stimuli; and in Edgar Rubin’s famous example (Figure 4), whether we see the white as “figure” and the black as “ground” or vice versa, there is no direct counterpart to the “thinglike” character of the figure and the absence of this character in the ground.

This thinglike character, the character of “productivity,” which occurs in some causal transactions, the character of “being mine,” which belongs to, say, my hand in contrast to an object on which my hand is resting, the character of anger present in someone’s face—these are some of the many features which are present in the behavioral environment, even though they are necessarily absent from the world of physics because there is nothing in the stimulus situation directly corresponding to them.

FIGURE 2B

On the Gestalt view what is all-important is the way in which the immediate, or “proximal,” stimuli (for example, light waves or sound waves) combine in space and time; when these combinations are of a certain kind, certain perceptual organizations will arise (for example, two parts of a diagram will be seen as belonging together), and laws can be framed in terms of which such organizations can be predicted. Details of these laws have been set out by David Katz; they include the law of proximity, which states that, other things being equal, in a total stimulus situation those elements which are closest to each other tend to form groups, and the law of closed forms, which states that, other things being equal, lines which enclose a surface tend to be seen as a unit.

A law of a more general kind is that of *Prägnanz*. As formulated by Koffka (*Principles of Gestalt Psychology*, p. 110), this law states: “Psychological organisation will always be as ‘good’ as the prevailing conditions allow. In this definition the term ‘good’ is undefined. It embraces such properties as regularity and symmetry, simplicity and others.” In other words, when the stimuli are of a certain kind, there are forces within the organism that operate in the direction of maximum simplicity; hence, we tend to see “good” figures—squares and circles, for example—rather than less regular ones. The word *Prägnanz* is of course ultimately connected with the Latin *impregnare*. The suggestion here, however, is not that of something being fertilized or made pregnant but rather of something being stamped or pressed into a particular shape (compare the word *prägen*, which is used primarily to refer to the minting of coins). Certain types of configurations, one might say, are particularly impressive; they carry a certain stamp or they strike us in particular ways.

Contrary to what has sometimes been said, the Gestalt psychologists did not dispute that past experience can influence perception; this is made plain by Katz in *Gestalt Psychology* (pp. 28–29). Their criticism was

FIGURE 3

directed against the view of perception that invoked past experience as a *deus ex machina* when observed results did not fit the constancy hypothesis. Thus a penny, unless its flat surface is directly in front of us, might be expected from the laws of optics to look elliptical. Since it does not, one can preserve the view that the “basic datum” is an ellipse by postulating a rapid process of inference based on past experience. On this view we *infer* that the penny is round because of our alleged previous experience of round pennies. According to the Gestalt psychologists, however, not only is there nothing in introspection to suggest such an inference; they would also have questioned whether in fact it is particularly common in ordinary life for pennies to have their flat surfaces directly in front of the observer—a condition that their opponents’ theory seems to require. In contrast, their view was that when the proximal stimuli combine in a certain way a particular perceptual organization is forced upon us; thus a circle is a “good” figure, and hence the “internal forces” will operate in the direction of a circle rather than an ellipse.

Interesting experimental studies include those of Wertheimer (“Experimentelle Studien über das Sehen von Bewegung,” in *Zeitschrift für Psychologie*) on the perception of movement, those of Köhler (*The Mentality of Apes*) on problem solving in apes, those of Wertheimer (*Productive Thinking*) and K. Duncker (“On Problem Solving”) on problem solving in humans, that of Katz (*The World of Colour*) on the perception of color, that of Rubin (*Synsoplevede Figurer*) on the figure-ground distinction, those of Kurt Lewin (*Principles of Topological Psychology*), who has attempted to apply Gestalt principles to the study of social situations, and those of Albert Michotte (*La perception de la causalité*)—although he was not a member of the original group—on the conditions in which we receive an impression of causality. A recent interesting development is the attempt to relate figural goodness to the amount of information (in the mathe-

FIGURE 4

matical sense) needed to specify a particular pattern or figure (see especially Fred Attneave, *Applications of Information Theory to Psychology*, p. 82). The problem of perceptual Gestalten has arisen in an acute form in the programming of computers to carry out pattern recognition (see, for instance, Kirsch, “Computer Interpretation of English Text and Picture Patterns”).

#### SCIENCE AND COMMON SENSE

The advance of science continually brings in its train a challenge to our commonsense beliefs about the world. At one time or another in the history of scientific thought it has been held, for example, that sense perception is unreliable, that the things around us are not really colored, that the floor on which we walk is not really solid, and that no two events are ever exactly simultaneous. In contrast with many other scientific systems, Gestalt theory involves the attempt to call us away from such paradoxes back to common sense; it invites us to consider the world as we in fact experience it, not as we might expect to experience it in the light of the latest scientific developments.

It does not, of course, follow, that philosophical paradoxes can be disposed of simply by pointing out that experience is in fact of such-and-such a kind. Thus, it is no argument against John Locke’s account of substance or David Hume’s account of causality to point out that

the behavioral environment is found by experience to consist of things in causal interaction, any more than it is an argument against the distinction between primary and secondary qualities to point out that we are aware of greenness as being in the grass and not in our heads. Similarly, a philosopher who wishes to defend the sense-datum terminology cannot be refuted simply by an appeal to Rubin's claim that what we perceive is organized into figure and ground and is not just "a mosaic of sense data." As a corrective against those who mistake the point of philosophical arguments, it may be helpful on occasions to make explicit exactly what we are aware of at the commonsense level, but this does not prove the philosophical arguments to be wrong.

Despite the emphasis on naive judgment, however, the Gestalt program does not involve an uncritical return to naive realism. Rather, its claim is that the gulf between what common sense tells us and what science tells us is not, after all, as great as might be supposed; the world of nature is *gestaltet* no less than are our experiences. Moreover, although in some of their discussions Köhler and Koffka speak in traditional terms about "the relation between mind and matter," their views do not fit easily into the traditional categories of interactionism, epiphenomenalism, and parallelism; indeed, like many modern philosophers, they are critical of a starting point which forces us to decide between theories couched in these terms.

#### POSITIVISM AND BEHAVIORISM

The prevailing scientific attitude of the time, which Koffka called "positivism," was mistaken, on the Gestalt view, because it allowed no place for the categories of meaning and value. The important fact for psychology is that the behavioral environment is organized—it is intelligible. Thus we are making *sense* out of a person's facial expression when we say that he is angry. Similarly, if a person listens to music, he is sometimes aware that a chord with the leading note (the seventh of the scale) at the top *requires* to be followed by the tonic chord of the original key; the cadence has its special meaning only if the second chord follows the first. This remains true even though such "requiredness," as Köhler terms it in *The Place of Value in a World of Facts*, can play no part in the world of physics. As physical science advances we are enabled to make continually more refined statements about the geographical environment; but in so doing, on the Gestalt view, we are in danger of losing sight of facts—those of the behavioral environment—which for the psychologist are of special interest. Koffka agreed that vitalism is "no

solution but a mere re-naming of the problem"; but by taking seriously the concept of Gestalt one can, he held, be antimechanistic without being obscurantist.

There is also an attack on the allegedly "scientific" creed of behaviorism, whose development was almost contemporary with that of Gestalt theory. The term *behaviorism*, as Köhler understands it, implies a denial that there can be "a science of direct experience," either because there is no such thing as direct experience or because if it exists, it is not accessible to public scrutiny. In reply Köhler points out that no scientist can even begin to experiment unless he starts from his own experienced world. He also points out that one has as little or as much justification to be skeptical about the world of experience as one has to be skeptical about the world of physics; there is no good reason why the behaviorist should choose to ignore the world of experience while taking the world of physics on trust.

#### ISOMORPHISM

It is far from clear whether the doctrine of isomorphism constitutes a radically new discovery, as the Gestalt theorists supposed, or whether it is a somewhat high-sounding way of asserting the obvious. Most modern psychologists, if asked, would doubtless express the hope that complete explanations of perception and learning will eventually be found in terms of brain processes. If, therefore, the contribution of Gestalt theory is to be distinctive, clearly some more far-reaching claim must be involved.

Koffka expressly pointed out that Gestalt theory does not stand or fall with the correctness of a particular theory about perceived movement. According to Koffka its more general objective is to contribute to "the integration of value, life, and mind. ... The Gestalt concept ... cuts across the division of realms of existence, being applicable in each of them." That is, there are Gestalten in nature (for example, the soap bubble); there are Gestalten in the living brain; and there are Gestalten in our conscious experience. In traditional discussions about the relation between mind and body, according to Köhler, it was "tacitly assumed that only *microscopic* events in the cortex can be the correlates of mental life." In contrast, the doctrine of isomorphism invites us, in Koffka's words, to "think of the physiological processes not as molecular but as molar phenomena. ... If they are molar, their molar properties will be the same as those of the conscious processes which they are supposed to underlie." As has already been pointed out, this is not just an answer within the context

of traditional mind-body dualism; it is an attempt to look at this whole family of problems afresh.

The distinction between the geographical and behavioral environments gives rise to difficulties of its own. One very reasonably asks, in the first place, what kind of duality is involved. Clearly, there are not two environments in the same sense that there are—or might be—two rooms in a country cottage. If a child specialist recommended a change of environment for a child, it would make no sense to reply “very well; we will change him from the geographical to the behavioral environment.” One is reminded in this connection of Arthur Eddington’s claim—which in fact involves the same kind of difficulty—that he is writing simultaneously at two tables. Second, if we take the idea of two environments at its face value, we are tempted to ascribe some kind of superior status or “reality” to one or the other. It is the geographical environment, according to Koffka, whose contents are “real”: “The pen with which I am writing is a unit in my behavioural environment and so is the *real* pen in the geographical” (italics added). What is “real,” however, does not apparently coincide with what is “given”; “every *datum* is a behavioural datum; physical reality is not a datum but a constructum.” The suggestion that each of us somehow “constructs” a physical world out of his immediate experiences implies a phenomenalist view which in the last resort leads inevitably to solipsism. Clearly this was not Koffka’s intention, but he gave no indication how such a conclusion can be avoided.

The important point, according to Köhler and Koffka, is that the concept of Gestalt cuts across these two different kinds of reality. In the words of Köhler, “Any actual consciousness is in every case not only blindly coupled to its corresponding psychophysical processes, but is akin to it in essential structural properties.” The difficulty here is that *anything* can be regarded as “structurally akin” to anything else, provided enough rules are given. Many maps are structurally akin to landscapes in that they involve the same geometrical shapes; but if one is allowed sufficient rules for specifying what represents what, a map of England (as we now call it) could function without any misrepresentation as a map of France. What Köhler needs to argue for is some relatively clear-cut and uncomplicated structural relationship. Thus, it may well be that the shape of the areas stimulated in the cortex has something in common with the shape which we observe in an object, although it is hard to see how there can be any close parallel in the case of color, since, when *X* is looking at a green object, *Y* does not find anything green in *X*’s cortex. One must suppose that the use of the term

*psychophysical* (instead of *physical*) to describe processes in the brain is intended to emphasize these relatively close structural similarities.

## KNOWLEDGE OF OTHER MINDS

In reply to the charge of solipsism, Köhler and Koffka could point out that they both discuss the problem of knowledge of other minds at some length. The main feature of philosophical interest in these discussions is that structural similarities are pointed out between behavior which is noticed by others and so-called inner states, which are discriminated only by the person himself. A person’s wincing may have precisely the same temporal properties as his twinges of pain, and the sound of his rising voice may have the same movement properties as his inner feelings of rising anger. Koffka pointed out that a character in a Mickey Mouse cartoon can quite well look exuberant or dejected; and if we can directly observe such exuberance or dejection in these cases, there seems to be no reason why we should not directly observe it in our friends. Similarly, Michotte has argued that visual experiences of live movement are structurally similar to kinaesthetic and other experiences that we have when we make an effort. These considerations are not, of course, sufficient to remove all possible skeptical doubts; but they at least make clear the conditions in which we can justifiably say of a person that, for example, he is angry, dejected, or making an effort.

## “SEEING” AND INFERENCE

Koffka suggested that the word *see* should be used in a “purely phenomenological” sense, that is, in such a way that the words which follow are a simple description of our experience. Thus, if we look at a table that is partly covered by a book, we are not aware of any gap or hole in the table in the area where the book is; and Koffka therefore wanted to say that what we *see* is a complete table. On his view it is necessary to describe our experience without being influenced by considerations of what we might expect to see on the basis of scientific knowledge—in this case, by our knowledge about the characteristics of the light waves striking the retina.

In ordinary usage, when we say that we or someone else saw something, this is normally not just the report of a visual experience; there is also an implicit claim to correctness. If the person is in fact deceived, then one is wrong to use the word *saw*, just as one would be wrong to say that a person has “proved” something if his argument contains a fallacy. One might therefore express Koffka’s difficulty by saying that, as our knowledge of physics

increases, claims to *correctness* will force us further and further away from naive description. “Why,” he asked rhetorically, “are we so hopelessly stupid as to call the colour of our table-cloth on the candle-lit dinner table white, when Helmholtz told us that it was yellow?” According to Koffka’s proposed usage we actually see a white tablecloth, the evidence of the physicists notwithstanding.

This “purely phenomenological” sense of “see,” however, is unnecessary. We already possess the expression “seeing-as” for situations where we do not wish to make claims to correctness. On this usage, we *see* the tablecloth as white even though we might have expected to see it as yellow. Similarly, a person who is exposed to an ambiguous diagram may *see* it as two-dimensional, even though on another occasion he sees it as three-dimensional. Unless one is an extreme skeptic and asserts that claims to correctness are never appropriate when visual perception is involved, it is surely useful to have a terminology which enables us to make such claims on some occasions and to withhold them on others.

Moreover, Koffka’s proposed usage, if adopted consistently, carries the paradoxical consequence that we can never be sure or unsure about what we see, nor can we be right or wrong. If we look more carefully at something, or if others give us a verbal description or point to a contour line, we may, of course, see something new; but we were still neither right nor wrong about what we saw before.

There is the further paradoxical consequence that no two people can ever see the same thing. Köhler is apparently prepared to accept this, since he expressly tells us that no two scientific investigators ever see the same galvanometer. Moreover, if everything that we see (in Koffka’s sense) is, by definition, part of the behavioral environment, this has the effect of turning the behavioral environment into a home for every erroneous perception which has been made. It is as bad as having to postulate false facts to ensure that false propositions refer to something. In general, the distinction between the geographical and behavioral environments involves many points of interest, but in philosophizing in this area, Koffka in particular was not successful in avoiding paradoxical consequences.

As far as psychology is concerned, the work of the Gestalt theorists has led to the discovery of a large number of new facts, particularly in the sphere of perception, and to a reinterpretation of facts which were already known. On the basis of the laws of structural organization, predictions can be made about what will be perceived when the proximal stimuli are of a particular kind,

and these predictions normally work. The neurological explanations are inadequate by present standards, but even in this area the Gestalt theorists have at least called attention to problems which require to be solved, and, in particular, they have taken seriously the challenge presented by our ability to perceive spatial and temporal relationships.

On the broader theoretical issues, traditionally the province of philosophy, their main contribution has been to indicate the need for a change of emphasis. In the light of advancing scientific knowledge, it appeared to be the case that what we thought we were perceiving was not what we were really perceiving at all (“the grass is not really green,” “the white tablecloth seen in candlelight is really yellow,” and so on). For the Gestalt theorists, however, as for some modern philosophers, such claims were paradoxical and confused. Whatever physics tells us, the starting point, on the Gestalt theorists’ view, must necessarily be the world as perceived by common sense; this is the world to which organisms respond, and it is therefore of special importance for the psychologist; moreover, if we ourselves did not perceive it in certain ways, physics could not even begin. This is to say, in effect, that language descriptive of ordinary experience can never be reduced to the language of physics—a thesis that has been held in many forms but which has seldom been defended in such a sustained and systematic way.

## GEULINCX, ARNOLD (1624–1669)

Arnold (or Aernout) Geulincx, the Flemish metaphysician and moralist, was born in Antwerp. He studied philosophy and theology at Louvain and in 1646 was made professor of philosophy, a position he held for twelve years. Although information about his life at Louvain is limited and his important works date from a later period, it appears that as a student he was influenced by the Cartesian Guillaume Philippi, that in his teaching, as later, he attacked scholastic physics from a Cartesian point of view, and that he was also attracted by the doctrines of Cornelis Jansen.

In 1658, on charges that were not made public but that may have been prompted by his criticisms of scholasticism and accepted religious practices, he was deprived of his professorship and left Louvain for Leiden. At the same time, he renounced Roman Catholicism and became a Calvinist. Arriving in Leiden in distressed circumstances, he was assisted by the Cartesian Abraham van der Heyden (Heidanus) and set to work on a study of fevers, which he presented for the doctorate in medicine. Despite his precarious situation at first, Geulincx succeeded in publishing treatises on logic and method (*Logica Fundamentis Suis ... Restituta*, Leiden, 1662, and *Methodus Inveniendi Argumenta*, Leiden, 1663) and the first part of his most accomplished work, the "Ethics" (*De Virtute et Primis Ejus Proprietatibus*, Leiden, 1665). He was appointed professor extraordinary of philosophy at

the university in 1665 and remained in Leiden until his untimely death, in 1669. Six years later the complete “Ethics” was published, under the title *Γνωθι σεαυτον, Sive ... Ethica* (Leiden, 1675). His “Physics,” taken from manuscripts used in his classes, appeared in 1688 (*Physica Vera*, Leiden); commentaries on René Descartes’s *Principles of Philosophy* in 1690 and 1691 (*Annotata Prae-currentia, Annotata Majora*, Dordrecht); and the very important “Metaphysics,” published apparently from a student’s copy, in 1691 (*Metaphysica Vera et ad Mentem Peripateticam*, Amsterdam).

## OCCASIONALISM

Geulincx is best known for his occasionalist theory of causation and his denial of the substantiality of particular created things. Following Descartes’s order of procedure in his “Metaphysics,” he considered at the outset the possibility and the limits of doubt and found that our first knowledge is of the self as a thinking thing. Consideration of the various states of the self or mind led him to formulate a principle, which he took to be self-evident though obscured by prejudices, that expresses a necessary condition implicit in our conception of an action: that something cannot be done unless there is knowledge of how it is done, or, as specifically related to activities of the self, that a person does not do what he does not know how to do (*impossibile est, ut is faciat, qui nescit quomodo fiat; quod nescis quomodo fiat, id non facis*).

The principle had far-reaching consequences in Geulincx’s moral philosophy as well as in his metaphysics. Concerning the self, he contended that actions involving movements of the body cannot in truth be attributed to the self and that the mind or soul is not, as it is often supposed to be, the true cause of movements of the body. Not only are we unaware of changes in the brain, nerves, and muscles requisite for, say, moving the arm, but even if we know of these changes from a study of physiology, our knowledge is based on *ex post facto* observation of sequences of volitions and physiological happenings, not on awareness of a supposed mental activity producing these movements. Though we have, Geulincx maintained, immediate knowledge and understanding of internal actions—that is, of acts not involving bodily movements and consisting solely of changes in a state of mind—we are not in like manner cognizant of how movements are initiated in the body or how external actions come about. Accordingly the influence of the human mind is limited to its own states, and the mind is not the master of—that is, the true cause of movements in—the body.

The principle was also invoked against the assumption that bodies, or corporeal things, are capable of acting, either on minds or on other corporeal things. It is assumed, for instance, that a fire acts on a man’s body and, affecting sense organs, nerves, and brain, produces sensations of light and heat in his mind. It is also assumed that in cases of impact one body striking another sets the second body in motion. But how, Geulincx asked, can a body produce these effects? To bring them about, according to his principle, it would have to know how. Yet admittedly a body is inanimate and, lacking consciousness, lacks the knowledge that on reflection we see is a necessary condition of acting. Bodies are *res brutae*. To suppose that they have the distinctively spiritual characteristic of acting is a signal instance of confusion involving the self-contradictory notion of corporeal action or causation. Arguing against the possibility of genuine corporeal causation as such, Geulincx, like the occasionalists Géraud de Cordemoy and Nicolas Malebranche, took it to be true *a fortiori* that bodies cannot act on minds. (There is no evidence that Geulincx was influenced by, or that he in turn influenced, the other occasionalists.)

Though the human mind does not act on the body and bodies do not act on the mind or on other bodies, changes obviously do take place, and in these changes we discern patterns or constant conjunctions of events. According to Geulincx, the agent responsible for these changes is God, and the patterns we observe are due to laws that God enacts and in accordance with which he operates. Explicating his theory of supernatural causation in the case of volitions and bodily movements, Geulincx iterated two analogies, the second of which was the subject of an important controversy among German historians in the nineteenth century. (1) When a child wants his cradle to move, it often happens that the cradle moves, not as a result of his willing it, but because the mother or nurse in attendance wills that it move. (2) Two clocks that are synchronized sound the hour in unison, not because one influences the other, but because they are fashioned in such a way that they keep the same time. The second illustration has been cited to show that Geulincx, like Gottfried Wilhelm Leibniz, conceived of a preestablished harmony between mind and body and that he was the unacknowledged source of Leibniz’s famous analogy of concurrent clocks and, by implication, of Leibniz’s view of the relation between mind and body.

Against this interpretation it can be argued convincingly (as was done by Eduard Zeller) that in Geulincx’s view, God’s actions, though in accordance with rules, are immediate or direct in the sense that there is nothing in

mind or body comparable to the internal natures which, according to Leibniz, account for their successive states and mediate the will of God and the course of events. It is not the case, however, that the actions of Geulincx's God are ad hoc or, as Leibniz accused the occasionalists, that Geulincx's God is a *deus ex machina*. The rules of his action are fixed, and he simply applies them, with no special volitions required, in particular circumstances.

## SUBSTANCE

Geulincx's views about substance were roughly midway between Descartes's and Benedict (Baruch) de Spinoza's. In the Synopsis of the *Meditations*, Descartes, drawing a distinction between body taken generally (*in genere sumptum*) and the human body, suggested that the former, like a person's mind, is a substance or pure substance (*puram ... substantiam*), whereas the latter, insofar as it is a particular body differing from other bodies, is not. Following Descartes's lead, Geulincx contrasted body in itself (*corpus ipsum, corpus simpliciter dictum*), which he identified with extension, and particular bodies, which he claimed are modes of body (*aliquid ipsius corporis simpliciter dicti, modi corporis*). Body in itself is simple, unique, individual, infinite, and indivisible. Particular bodies are limitations of, or abstractions from, body in itself. They are not, he explained, constituent parts, nor are they figments of the mind (*entia rationis*); rather, they are related to body in itself as the superficies, or surface, of a particular body is related to that particular body. In another analogy, as the country is not a collection of fields, orchards, and meadows but the land on which these divisions are imposed, so corporeal nature is not an aggregate of particular bodies but the matter or extension common to them all and specified in various ways. The analogy also explains Geulincx's conception of mind. Like Spinoza (though independently), he held that individual minds are themselves not substances but modes of mind (*modi mentis*) or of infinite thinking substance, which he identified with God. We are, he said, both from God and in God (*ex Deo et in Deo*). To the extent to which we can transcend the distorting forms of our limited understandings and see the eternal truths in ourselves as they are in the mind of God, we lose our status as limited beings and are one with God. Geulincx's reflections on problems about substance paralleled Spinoza's. However, he preserved the Cartesian distinction between thinking substance and extended substance, or matter.

## ETHICS

In the letter prefaced to the first part of his "Ethics," Geulincx implied that his moral philosophy rounds out the system conceived by Descartes, who, though he proposed a provisional code of morality in the *Discourse*, did not bring this branch of the tree of knowledge to fruition. In Geulincx's view the subject matter of ethics is virtue, and virtue is located not in deeds but in a determination of the will—that is, in love of right reason or, since reason as prescriptive comprises laws imposed by God, in devotion to divine law. Though virtue is one and simple, there are four aspects, and these cardinal virtues are distinguished from and contrasted with the traditional cardinal virtues, which refer to actions or accomplishments, not to the locus of morality—namely, the condition of the will. (1) *Diligence* is attention to the voice of reason. Its issue is wisdom and prudence in conduct. (2) *Obedience* involves compliance with the dictates of reason. Though we are free to will in conformity to divine law or not, in the end we cannot but do what God wills. By obeying his prescriptions we attain freedom in the highest degree: We will what we can do and do not will what we cannot do, and our volitions are effective. (3) *Justice*, also, is a determination of the will: to will no more and no less than reason dictates. (4) *Humility* consists in knowledge, and denial, of self (*contemptio sui*) in the love of reason and of God. Contrasted with the virtuous man is the egoist, whose end in life is happiness. He is the slave of his passions and the creature of circumstance, whereas the virtuous man, not seeking happiness and resigned to what happens to him, is in a position to attain it.

## GEULINCX, ARNOLD [ADDENDUM]

### LIFE AND WORKS

Arnold Geulincx was born in Antwerp, Belgium, in 1624. In 1641 he matriculated at University of Louvain, where he became a professor of philosophy in 1646. For reasons that never became clear but were probably of a religious nature (at Louvain there was much sensitivity over Jansenism), he was suspended from his duties and consequently dismissed in 1657/1658. He moved to Leiden, The Netherlands, and converted to Calvinism. After taking a degree in medicine he obtained permission to lecture on philosophy, but his position was regularized only in 1662, when he was appointed reader in logic. He became professor *extra ordinem* in 1665. In 1667 he died from the plague. Most of his works, dealing with logic, moral philosophy, physics, and metaphysics, were published posthumously.

### LOGIC

Although the main merits of Geulincx's works on logic seem to be their elegance and precision, Karl Dürr

(1939–1940, 1965) and Gabriël Nuchelmans (1983, 1984, 1986) show that he made some important steps toward a logic of propositions. According to him words like *est* and *non* are signs (*notæ*) by which to indicate the mental act performed with respect to a particular content. Every denial is the negation of an affirmative claim, and that means that an affirmation has been present to the mind (*affirmatio inclusa*). Accordingly, "Peter is not learned" must be interpreted as "It is not the case that Peter is learned" or also as "The sentence 'Peter is learned' is false."

Speaking of compound conditional sentences, Geulincx defines an antecedent as a statement that says that the whole of that which some other statement (the consequent) says to be the case, is indeed the case. Consequence is a form of containment (*continentia*): Between two statements A and B there obtains a relation of consequence if A says the dictum of B. Both the theory of containment and the theorem that every A implies the statement "A is true" are corollaries of Geulincx's idea that by making a statement one commits oneself to the truth of that statement and of everything entailed by that statement. For example, if one says "I am standing," this must be taken as an affirmation of whatever is entailed by that statement, such as, for example, "I am capable of standing." Accordingly, "I am standing" serves as the antecedent of any number of other statements to the truth of which one commits oneself.

### METAPHYSICS

According to Geulincx metaphysics is first philosophy or first science. It deals with the human subject, body, and God, each of which is the basis of a separate science: *autologia*, *somatologia* and *theologia*. The autologia basically consists in an exploration of the Cartesian *cogito*, which, however, Geulincx does not see as the basic principle of his philosophy but rather as a way to gain access to the realm of necessary truths. In fact, the more fundamental principle is the axiom that one can truly be said to make or do something only if one knows how it is made or done (*quod nescis quomodo fiat, id non facis*). This axiom allows Geulincx to claim that one is a passive spectator of the world, one's only activities being to will and think, albeit in a purely immanent way. Indeed, the world cannot be the cause of one's seeing and perceiving, given the fact that, since it can neither think nor know anything, it cannot be active. The only true cause is God and the only truly causal relation is that between God and the world. In fact, all philosophy should start with the concept of God, and the only reason why one has to start with the *cogito* is that the Fall has obscured one's faculties.

The result of Geulincx's analysis is that God is Being *simpliciter* as well as Mind *simpliciter*. This implies not only that all reality is ultimately mental but also that whatever is neither God nor part of God is nothing but an appearance. In fact, there are only two things that really exist, namely, Mind, which is the creator, and Body, which is the created. One's mind is part of the Divine mind (*mentis quid*). One's body is part of a phenomenal world. Particular three-dimensional bodies can be understood as limitations of the archetypal Extension that was produced in the act of creation. However, that there is a world, extended in three dimensions, can be known through the sensations God causes one to have. Finally, since contingent facts cannot be accounted for by principles of metaphysics (which explain only what is necessary), physics makes use of hypotheses, which must consist of clear and distinct ideas that together with the principles of metaphysics must be sufficient to explain all phenomena.

### MORAL PHILOSOPHY

Like his metaphysics, Geulincx's moral philosophy is based on a corollary of his fundamental axiom, namely, that where there is no possibility to act there can be no will either (*ubi nihil vales, ibi etiam nihil velis*). In whatever way one acts, it is God that makes one act in that particular way. Accordingly, virtue is not to act in a particular way but to internally yield to God's will. Morality lies in the intention, not in the act. As a result, the cardinal virtues are dispositions: diligence, obedience, justice, and above all humility. On the contrary, passions are like sense impressions. Although they belong to human nature, they are relevant only insofar as they prevent one from developing the right attitude toward God's will. The most dangerous passion in this respect is self-love. In any case, the reward of virtue is that, freed from self-love, one enjoys peace and tranquility in this life.

### RELATIONS TO OTHER THINKERS

Although much in Geulincx's philosophy goes back to René Descartes, it would probably be wrong to call him a Cartesian. For not only are the various parts of his philosophy differently connected (his metaphysics is crowned by his moral philosophy, not by his physics, which is comparatively independent), his metaphysics is, as has been shown by Brian Cooney (1972, 1978), basically an attempt to provide a metaphysical account of Divine Creation.

Accordingly, his philosophy has more affinity with Nicolas Malebranche's, with whom Geulincx shares a

basically occasionalist interpretation of causality. Also, there is some similarity (although no affinity at all) with Benedict (Baruch) de Spinoza's philosophy, except, of course, that Spinoza rejects the idea of creation. In fact, Geulincx's starting point is fundamentally different. Whereas Spinoza argues that on the basis of Cartesian metaphysics it is impossible to account for creation, Geulincx takes creation to be a fact and attempts to make sense of it in terms of Cartesian metaphysics. However, the only way to do this is, he believes, to assume that creation consists in producing a world of appearance.

Not only Geulincx's metaphysics but also his physics is different from Descartes's, not because it would involve different concepts but because the status of their concepts is interpreted in a different way: Geulincx's concepts are hypotheses that, even if they are clear and distinct, are not automatically and necessarily true. This doctrine, which involves an interplay of empirical and metaphysical principles, has often been associated with Immanuel Kant's theory of judgment (Cassirer 1971–1973), but this is a bit far fetched. The best characterization seems to be that he is a Christian philosopher trying to find his way in the world of post-Aristotelian philosophy and availing himself of the language and concepts of his contemporaries to provide an intelligible account of the mysteries of faith.

## GEWIRTH, ALAN

(1912–2004)

Alan Gewirth was a twentieth-century moral philosopher best known for his attempt to complete the Kantian project and show that rationality requires morality. Gewirth took his BA at Columbia University in 1934, studying with John Herman Randall and Richard McKeon. After two years of graduate study at Columbia, he spend the academic year 1936–1937 on a Sage Fellowship at Cornell University and then followed McKeon to the University of Chicago as his research and teaching assistant. In June 1942 Gewirth was drafted into the army, and, without seeing combat, moved up the ranks from private to captain in four years. After World War II, he returned to Columbia and received his PhD in philosophy in 1948. From 1947 on, he was a regular member of the faculty at the University of Chicago, eventually becoming the Edward Carson Waller Distinguished Service Professor in the Philosophy Department in a career that lasted more than sixty years. He also taught as visiting professor at Harvard University, the University of Michigan, John Hopkins University, and the University of Santa Barbara.

Early in his career Gewirth did important work on Descartes's theory of knowledge; later he did notable scholarly studies of the medieval political philosopher, Marsilius of Padua, published as his *Marsilius of Padua and Medieval Political Philosophy* (1951) and a published a translation from the Latin of Marsilius's *Defensor Pacis* (1956) with a lengthy introduction. Gewirth is best known, however, for his attempt to develop a stringently rational foundation for morality in his *Reason and Moral-*

*ity* (1978). The central argument of this book begins with a claim that every rational agent must accept, which is that he or she prudentially ought to have freedom and well-being. Gewirth argues that when the logical implications of this claim are fully worked out, particularly when the claim is universalized, it follows that every rational agent must also accept the claim that all prospective, purposive agents *morally* ought to have freedom and well-being, although, of course, purposive agents may not act on this claim—that is, they may not act morally.

Most of the critical reaction to Gewirth's work has focused on this particular argument. Two book of critical responses, along with replies from Gewirth, have been published. key issue concerns whether the universalization of a rationally inescapable claim that "I prudentially ought to have freedom and well-being" leads to the claim that "we all morally ought to have freedom and well-being" or to the claim of universal ethical egoism that "we all prudentially ought to have (or pursue) freedom and well-being." Gewirth claims the former; many of his critics claim the latter. Yet even some of those who reject Gewirth's argument for morality, for example, Christine Korsgaard and myself have been inspired by him to develop somewhat different arguments that attempt to establish just the same conclusion that Gewirth wanted to establish—that morality is rationally required.

In *The Community of Rights* (1996), Gewirth hoped to add to enhance his defense of morality by establishing against libertarians that rights—especially the human rights that equally belong to all humans as such—are positive as well as negative, and that they therefore warrant serious and active governmental concern for protecting and promoting the freedom and well-being of all humans, especially those who are most deprived. To this end, Gewirth employs two independent arguments. The first appeals to a definition of freedom, but, unfortunately, not to a definition of freedom that libertarians are required to endorse. The second is dialectical, but this argument parallels and depends crucially on Gewirth's earlier argument for morality.

In his last completed book, *Self-Fulfillment* (1998), Gewirth develops an interesting notion of self-fulfillment that is either compatible with or required by his conception of morality. A new book manuscript, *Human Rights and Global Justice*, which focused on questions of international justice, remained unfinished at his death.

## GEYSER, JOSEPH (1869–1948)

Joseph Geysler, the German critical realist philosopher, was born in Erkelenz, in the Rhineland. He received a doctorate in philosophy from the University of Bonn in 1898. He became an extraordinary professor at the University of Münster in 1904 and a full professor there in 1911. In 1917 Geysler was called to Freiburg, and in 1924 he succeeded Clemens Baeumker, the distinguished historian of ancient and medieval philosophy, at the University of Munich.

From his youth, Geysler opposed what he regarded as two basic tendencies in recent philosophy, an intellectualism strongly tinged with historical relativism and an overly abstract, idealistic Kantianism. He devoted himself to recalling philosophy to the asking of questions that are largely independent of any temporary situation and to the answering of these questions in an objective, critically realist manner. This attitude, but not Geysler's attachment to Thomistic tradition, was shared by the realist Oswald Külpe and the philosopher of nature Erich Becher. Above all, Geysler was totally devoted to the *philosophia perennis* (Gottfried Wilhelm Leibniz), and through it he related himself to the older European intellectual traditions. Phi-

losophy, he strongly believed, is not a constant new beginning. For Geysler, philosophy, in the words of the early Middle Ages, is like a dwarf perched on the shoulders of a great past in order to see farther. Classical philosophy, in the thought of Plato and Aristotle, was already approaching great truths, insights that have claims on the present as part of a constantly self-renewing stream of thought, a stream that has both enriched and been enriched by the Christian worldview.

Geysler held that answers to philosophical questions must be based on direct contact with a real actuality, understood in the Aristotelian sense, as an entity independent of consciousness, and not on the creative activity of an idealistic, theoretical thought. Only thus can we stand on firm ground. Philosophy is in this view a kind of middle position between the reality of experience and the ideality of a creative reconstruction of the forms of existence. Geysler sensitively expounded this basic attitude in his short but deeply probing book, *Eidologie oder Philosophie als Formerkenntnis* (Eidology, or philosophy as knowledge of form; Münster, 1921). In this programmatic work, whose basic ideas were to guide Geysler's thought from then on, philosophy is presented as a progressive penetration into the realm of possible essences of being insofar as they offer themselves to experience.

Geysler's inclusive *Lehrbuch der allgemeinen Psychologie* (Münster, 1908; 3rd ed., 2 vols., Münster, 1920) had already been written from this point of view, which also formed the basis of Geysler's acute critique of Neo-Kantianism and Edmund Husserl's phenomenology in *Grundlegung der Logik und Erkenntnistheorie* (Foundations of logic and epistemology; Münster, 1919) and *Auf dem Kampffeld der Logik* (On the battlefield of logic; Freiburg, 1926), as well as of his later exposition of ontology and metaphysics. In all of these works we see Geysler as a relentless logician who was honest and strict with himself and an epistemologist capable of critical observations.

We can now examine how Geysler deals with modern problems. Geysler's *Psychologie* combined philosophical and modern empirical psychology, for he found it impossible to separate philosophy from psychology without damage to both disciplines. This open attitude permitted him to develop a method for recording mental life in all its unconscious, organic, and even ontological aspects. Nevertheless, Geysler fought against and tried to refute psychologism, the claim that even logical phenomena depend on psychological structures of experience. He developed an unambiguous distinction between actual psychological events and the logical, objective analysis of

meaning (in the manner of Heinrich Rickert). With equal intellectual vigor he gave a firm basis to his logical objectivism bound to being and distinguished it from both epistemological idealism and the phenomenological theory of constitution.

Objectivism meant for Geysler that logical laws are not only inner relations of thought but that they also have a real ontological character and that they stand the test of analysis. According to Geysler, philosophy should therefore explain how man is capable of grasping the ideal logical order in reality itself. Here we come face to face with ultimate realities, which reveal themselves to the human intellect only after suitable deductive rational preparation. Nevertheless, Geysler attains a knowledge of essence akin to that of phenomenology. But one could say that his phenomenology is Aristotelian and realistic, and Geysler can be credited with showing a connection, through Bernhard Bolzano, between the thought of Husserl and that of Aristotle. Geysler's epistemology is logically rational and tied to reality, and it stresses discursive, genetic methods. Only as a last resort could Geysler justify to his intellectual conscience an encounter with pure immediate insights.

The same rational and empirically bound method is evident in Geysler's views on causation, which provoked a many-sided controversy. These views are of particular relevance to contemporary discussions of the bases of natural science. The principle of universal causation, further seen as the law of causation, has always been considered to be the solid foundation of any given truth that can be discovered by analysis. In this sense it was one of the most essential supports of one of the traditional proofs of the existence of God. It was assumed to be evident and analytically a priori provable that the contingent world must have a supercontingent cause in God. Geysler investigated the distinctions between the ground of knowledge, the principle of contradiction, and the principle of sufficient reason. In *Philosophia Perennis, Festgabe Joseph Geysler*, Kurt Huber gives an exact summary of Geysler's critical investigations. In the same book Aloys Wenzel points out that Geysler was the first philosopher to further develop Arthur Schopenhauer's investigation of the principle of sufficient reason. Geysler showed further, in *Das Prinzip vom zureichenden Grunde* (The principle of sufficient reason; Ratisbon, 1929) and *Das Gesetz der Ursache* (The law of cause; Freiburg, 1933), that only through experience can we discover the meaning of causality. Everything has its sufficient reason, including being: "Everything that comes into being does so through a cause." Such a notion is originally given to us in the mental experience of cau-

sation in willing. The notion contains a synthetic feature, but it nevertheless remains completely unconditional although it is not given to intuition as an analytic law of thought. The questions of whether the principle of causation is a priori, and of how it is related to matters of experience, is significant for any possible further epistemological and metaphysical construction that is in accord with experience. Controversy with Thomistic philosophers resulted from this statement.

Geysler's position was also clearly expressed in his metaphysics. He was committed to an inductive metaphysics, not to a purely speculative metaphysics derived from intellectual immediacy. He thus distinguished his own thought from metaphysics as practiced by such Neo-Thomists as Gallus M. Manser and Antonin-Dalmace Sertillanges.

Similarly, when Geysler, like Francisco Suárez, ascribed a concrete, individual spiritual essence to human existence, he did not do so primarily in the Thomistic sense of a universal spiritual essence which achieves individuality by being united with matter. In the foreground of Geysler's thought is the empirically unique real event. It is thus not surprising to learn that Geysler, although he recognized a rational metaphysical knowledge of God by analogy, critically denied any intuitive insight into God's existence. (Here he differentiated his thought from Max Scheler's philosophy of religion, which he criticized in *Max Schelers Phänomenologie der Religion*, Freiburg, 1929). It also shows why Geysler rejected any ontological proof of God, that is, any knowledge of God reached by even the concept of the most perfect being discovered by an a priori encounter with essence. Rather, he felt that the existence of God is to be discovered a posteriori by an interpretation of the "united facts of experience." Geysler's thought found its completion in a rationally founded metaphysical knowledge of God.

Geysler was one of the most inclusive systematic thinkers of modern times. Nicolai Hartmann, another great systematizer, once said that he had learned more from Geysler's criticisms of his ontology than from those of any other contemporary. Few recent philosophers can call such a consistently thought-out and complete worldview their own. Geysler's worldview was developed within and into an inner unity with his Christian conviction; this firmness of attitude toward the world was also expressed in his whole steady personality, which endured the unhappy experience of his homeland during the last years of his life under the perspective of hope.

## GIBBON, EDWARD (1737–1794)

Edward Gibbon, the English historian and man of letters, was born at Putney, Surrey, of a well-to-do family. Frail and constantly ill, the child owed the preservation of his life to an aunt, Miss Catherine Porten, who also acted as his teacher. After instruction by a series of tutors and much reading on his own, he entered Magdalen College, Oxford, at the age of fifteen, with, as he later confessed, "a

stock of erudition which might have puzzled a doctor, and a degree of ignorance of which a schoolboy would have been ashamed." Fourteen months at college, "the most idle and unprofitable of my whole life," ended with self-conversion to Roman Catholicism. His irate father immediately packed him off to Lausanne, Switzerland, under the care of Daniel Pavillard, a Calvinist minister who soon led him back to Protestantism. Thereafter, he developed a decidedly skeptical bent. During his five years' stay in Switzerland, Gibbon learned French, Italian, and Greek, and read all the Latin classics. He also fell in love with Suzanne Curchod. When his father refused consent to their marriage, "I sighed as a lover, I obeyed as a son." Mlle. Curchod later married Jacques Necker, distinguished French financier and statesman, and became famous as a *salonnière*. Gibbon never married.

Gibbon's first publication was *Essai sur l'étude de la littérature* (1761). A later manuscript fragment of a "History of the Swiss Revolution," also in French, was shown to David Hume, who approved of the project but chided the author: "Why do you compose in French, and carry faggots into the wood?" Thereafter, Gibbon composed all his major works in English. For more than two years (1759–1762), Gibbon was a captain in the Hampshire militia, and a surprisingly good one. In 1763, with the end of the Seven Years' War, he returned to the Continent, visiting Paris, Lausanne, and finally Rome. He records that it was on October 15, 1764, while musing amid the ruins of the Capitol, that the idea of writing about the decline and fall of the city—later extended to the empire—first occurred to him.

Returning to England in 1765, he became a man of letters and man about town. In 1774 he was elected to Dr. Johnson's Literary Club, where he became the intimate friend of Adam Smith. In the same year he obtained a seat in parliament, where he earned the distinction of never making a speech. He was, however, hard at work on his great history, the first quarto volume of *The History of the Decline and Fall of the Roman Empire*, which appeared in 1776. A letter of congratulation from the dying Hume "overpaid the labour of ten years," but warned that a clamor would arise. It did, and Gibbon responded three years later with a *Vindication*. The sixth and last volume of the history was published in 1788. At least fifty British replies and refutations were published before Gibbon's death, and literally hundreds have been published in many languages since. At his death, Gibbon left behind six drafts of an autobiography, which were pieced together and published in his *Miscellaneous Works* in two volumes by Lord Sheffield (London, 1796).

## THE HISTORY OF THE “DECLINE AND FALL OF THE ROMAN EMPIRE”

Received as a masterpiece on first publication, Gibbon's history is still regarded as such, and has never been superseded. Certain misinterpretations of facts, to be sure, have been detected and many additional facts have come to light; some prejudices have been revealed and some misjudgments have become apparent, “but in the main things he is still our master, above and beyond ‘date’”—so acknowledged J. B. Bury in the modern standard edition of the work.

It is the famous fifteenth and sixteenth chapters of the first volume, however, that entitle Gibbon to an honored place in the history of philosophy. These are the two chapters that stirred up violent controversy in 1776, and they are still controversial. The problem that Gibbon set himself was to explain the progress of primitive Christianity and its influence upon the ultimate fall of the Roman Empire. Writing *en philosophe*, Gibbon comes to the conclusion that the fall of Rome represents “the triumph of barbarism and religion.” He ironically dismisses the most commonly accepted causes of the triumph of Christianity, namely, the convincing historical evidence of the doctrine itself and the ruling providence of its great Author. He notes that through the course of time prejudice and passion have distorted and rendered ambiguous the meaning of the doctrine, while the providence of Deity remains inscrutable to man. The former cause, therefore, is unhistorical, while the latter is unphilosophical. Ruling out supernaturalism as a cause, Gibbon consequently confines himself in the fifteenth chapter to an analysis and discussion of the secondary causes of the rapid growth of the Christian church—causes that can be tested both by historical fact and by philosophical and psychological analysis.

With cool detachment of philosophical and historical inquiry, he examines the early history of the church in the same spirit that he would examine any period of secular history in which no assertions of supernaturalism had been made. He discusses five secondary causes of the rise of Christianity: (1) The inflexible zeal of the Christians was inherited in part from the Jews, who alone had broken the religious harmony of the ancient world, which was based upon mutual toleration of all creeds, and had insisted that theirs was the one and only true religion. The Christians turned this defensive zeal into both the proselytizing of all ranks of people and the persecution of all varieties of idolatry.

(2) Belief in immortality, uncertain and disputed among the ancient philosophers and not to be found in

the law of Moses, gradually began to be accepted by the Jews after their servitude to Egyptians and Babylonians. Early Christians, contemptuous of their present existence and convinced of their immortality, believed in the near approach of the end of the world, which was to be preceded by the Second Coming of Christ. At this time, believers and unbelievers alike would receive judgment—the former, eternal bliss; the latter, eternal damnation. As for the tortures which awaited sinners and deluded philosophers, Gibbon finds it proper “to draw a veil over the rest of this infernal description.”

(3) The early history of the church is replete with claims to miraculous powers and to divine inspiration. Such forms of superstition and “enthusiasm” made constant progress, until they became part of church tradition. But it remains the scholarly duty of the historian to examine such claims and to reject all pretensions to inspiration that are unacceptable in the light of reason. If the age of miracles once existed, all reasonable men, in contrast to the credulous and the fanatical, agree that at some time it either suddenly or gradually terminated.

(4) The pure and austere morals of the early Christians were enhanced by two laudable human motives: repentance for past sins and the desire for perfection. Converted sinners became saints, disdainfully rejecting the natural human propensities for pleasure and action in favor of the monkish virtues of humility, meekness, and patience. A state of celibacy came to be exalted as the nearest approach to divine perfection, and sensual pleasure was inexorably replaced by spiritual pride. Passive obedience to civil authority led to a refusal to partake in any form of civil administration or military defense of the empire, even when it became evident that such disregard of the public welfare guaranteed the triumph of barbarism. In sum, the morals, and the errors, of the primitive Christians were in reality the excess of their virtues.

(5) Though immune to both the business and the pleasure of the world, the primitive Christians took keen interest in the government of the church, an enthusiasm that gave rise to much religious contention. At first, the bishops were regarded as the equals of the people, but gradually took upon themselves arbitrary power, ultimately proclaiming themselves vice-regents of Christ. Thence arose the rigid distinction between clergy and laity. The early communion of goods among the Christians was soon relaxed, and the clergy adopted the tithe from the original Jewish code. Further clerical controls included excommunication, which involved not only spiritual but also temporal punishment. As to the actual numbers of Christians, nothing definite can be con-

cluded, the figures of the Fathers being at complete variance with those of the pagan historians, and neither providing accuracy. Seneca, the two Plinys, Tacitus, Plutarch, Galen, Epictetus, Marcus Antonius, great sages all, have little or nothing to say about the “perfection” of Christianity. Alleged miracles for the benefit of the church passed unnoticed.

In the sixteenth chapter, Gibbon examines the question of the persecutions of the primitive Christians by some of the Roman emperors. The blame, he indicates, rests chiefly upon the intolerant zeal of the Christians themselves, which drove the emperors reluctantly toward persecution. Even so, there were frequent peaceful intervals, and the detailed accounts of the sufferings of the “martyrs” were largely the inventions of later ecclesiastical writers. Gibbon estimates that no more than two thousand Christians were executed during the period of the most vigorous persecution, and suggests a comparison with the hundreds of thousands of Protestants executed during the relatively brief period of the Reformation, the latter figure far exceeding all martyrdoms over the course of many centuries of early Christian persecution.

#### GIBBON'S SOURCES

Among the many influences upon Gibbon's method and philosophy, the following should be mentioned: first, John Locke's commonsense approach to philosophy and religion; second, the rationalism of the deists; third, the philosophy of history presented in Baron de Montesquieu's treatise *Considérations sur les causes de la grandeur et de la décadence des Romains* (1734); fourth, the philosophical skepticism of Hume. From Hume he also learned the necessity of investigating the causes of historical events, and from Hume and Voltaire, the importance of cultural, social, and political history. The *Decline and Fall* has gone through multitudinous complete editions and condensations, both in English and in translation, and will continue to be read, not only as a great history, but also as a great piece of literature.

## GIBBS, JOSIAH (1839–1903)

Josiah Gibbs, a theoretical physicist, was born and died in New Haven, Connecticut, and, aside from a few years studying physics in Europe, spent his academic career at Yale. He is one of the few distinguished American theoretical physicists prior to the twentieth century. Gibbs made advances in vector analysis, and he made major contributions to thermodynamics including an insightful diagrammatic method, work on equilibrium and stability, the definition of free energy, and his famous phase rule regarding coexistent phases of a substance. In a vital contribution to thermodynamics Gibbs extended this theory to deal with the rules that describe how chemical interactions are to be integrated with the other thermodynamic processes. He is the inventor of the notion of chemical potential, the key concept of chemical thermodynamics.

For philosophers it is Gibbs's work in statistical mechanics that is of great interest. This work is contained in his elegant *Elementary Principles in Statistical Mechanics* (1902). James Clerk Maxwell and Ludwig Boltzmann had previously developed a method for calculating equilibrium values by taking them to be averages over functions of the microscopic phase of the system using a time invariant probability distribution over a constant energy subspace of the phase space of the system. This technique reappears in Gibbs in the form of his “microcanonical ensembles.”

But Gibbs introduced other ensembles as well. Most important of these is the canonical ensemble that intro-

duces a time invariant probability distribution over the phase space that allows for different energies. For systems with a large number of degrees of freedom (a large number of molecules in a gas, for example), this probability distribution is highly concentrated about one specific energy. In these cases, averages calculated using the canonical distribution and those calculated using the microcanonical distribution will converge in the limit of an infinite number of degrees of freedom. Because calculations done using the canonical ensemble are much easier than those using the microcanonical, most practical statistical mechanics is done in the framework of Gibbs's canonical ensembles. Gibbs also developed the grand canonical ensemble whose use becomes necessary when chemical changes are part of the thermodynamic processes.

By showing how these ensembles and the features of them vary as constraints on the system are varied, Gibbs was able to show "analogies" between features of the ensembles and averages of features calculated with their probability distributions and standard thermodynamic quantities such as temperature and entropy. He is cautious in making any explicit "identification" of the latter with the former, possibly in part because of the known difficulties faced by standard statistical-kinetic reasoning at that time in correctly predicting such quantities as specific heats.

With the association of thermodynamic and statistical mechanical quantities, it is easy to understand the microcanonical ensemble as appropriate for a system energetically isolated from the rest of the world, and the canonical as appropriate for a system in perfect thermal contact with an infinite heat bath of constant temperature.

Gibbs's treatment of nonequilibrium is the source of one standard approach to that problem, but remains controversial to this day. Gibbs's ensembles can be thought of as a vast collection of systems identically prepared at the macroscopic level. Find the ensemble for such a collection of systems; now, change a constraint on the system (say by removing a partition in a box of gas): How will the ensemble, appropriate for equilibrium before the change of constraint, evolve? Will it evolve to the ensemble appropriate for equilibrium in the new constraint condition? This is what is most desirable because people want to show that, in some appropriate sense, the systems in the ensemble at a later time will be found, in general, to be ever closer to the equilibrium condition. But provably the Gibbs's ensemble cannot so evolve (Liouville's Theorem).

But, Gibbs argues, the ensemble may evolve in such a way as to approach the new equilibrium ensemble in a "coarse grained" sense. He uses the analogy of a glass mostly filled with water but partly filled with insoluble black ink. Stir the fluid. If one looks closely enough, the fluid always consists of pure water or pure ink, because the ink is insoluble. But looked at "coarsely," the fluid approaches a uniformly gray color. Gibbs was not able to show that such "mixing" would actually occur, but modern extensions of ergodic theory have been able to prove mixing theorems that hold under certain physical conditions. And idealized systems (such as molecules as "hard sphere in a box") have been shown to be mixing. It remains controversial, however, as to whether this model of an ensemble evolving in a coarse-grained sense is the appropriate one for characterizing the actual approach to equilibrium of nonequilibrium systems.

Gibbs is aware that "mixing" ought to be a time symmetric feature of his ensembles, given that it is driven by a time symmetric underlying dynamics of the molecules. But applying mixing in the past time direction would lead, incorrectly, to predict antithermodynamic behavior for systems. His solution is to argue that one ought to apply statistical inferences only into the unknown future, and that applying them to infer the a past that is already known is illegitimate. Paul and Tatiana Ehrenfest, in their important 1910 survey of statistical mechanics, called Gibbs's argument "incomprehensible." But it was later taken up and developed by Satoru Watanabe and Erwin Schrödinger. It also remains a subject of contemporary controversy in discussions of the relationship between the intuitive asymmetry of time and entropic features of the world.

## GILBERT OF POITIERS

(c. 1076–1154)

Gilbert of Poitiers (Gilbertus Porreta, Gilbert de la Porée), the twelfth-century theologian and metaphysician, was born at Poitiers about 1076 and received his first schooling there. Next he went to study under Bernard of Chartres, and later (but before 1117) he devoted himself to theology under Anselm at Laon. He seems to have succeeded Bernard as chancellor at Chartres between 1126 and 1137 and, after a short period as a master in Paris, was elevated in 1142 to the bishopric of Poitiers. He died greatly esteemed in 1154, although in the 1140s he had been made to feel the hostility of other theologians, principally Bernard of Clairvaux, who brought him to trial to account for his opinions at Paris in 1147 and at Rheims in 1148.

Gilbert wrote much and acquired great fame for his scriptural and Boethian commentaries. The former were the fruit of his years at Laon and included major expositions of the Psalms and of the Epistles of St. Paul, as well as other biblical commentaries that have, with greater or lesser certainty, been ascribed to him. But the commentaries upon Boethius's four *opuscula sacra* (and especially that upon the *De Trinitate*) proved controversial. Although Gilbert was never officially condemned for theological error, after his trial in 1148 he appended a new preface to these commentaries professing his orthodoxy. In addition, the treatise *De Discretione Animae, Spiritus et Mentis* is now confidently ascribed to Gilbert. Highly uncertain, however, is Gilbert's authorship of the *Liber Sex Principiorum*. The six *principia* are the last six Aristotelian categories (place, time, situation, habit, action, and passion), which the writer of this treatise considered to be accessory forms (*formae assistentes*) or extrinsic circumstances of a substance. The first four categories, on the other hand, are either substance itself or necessarily inherent forms of a substance. This work enjoyed great authority in the Middle Ages as a completion of Aristotle's own *Categoriae*.

An understanding of Gilbert's authentic philosophical teaching must be based principally upon his Boethian commentaries and upon the literature inspired by his trial. Gilbert's doctrine of being and of the process of knowledge departs from a key distinction between substance and subsistence. A substance is an actually existing individual being that supports (*substat*) a number of accidents. Some beings, however—genera and species, for example—have no need of accidents and are more accurately described as subsistences than as substances. Forms

or Ideas in themselves are subsistences and do not come into contact with matter. Only copies (*exempla*) descend into matter. The human mind arrives at the knowledge of the eternal Ideas by first "collecting" from concrete, individual things their substantial similarity, that is, their created or "native" forms (*formae nativae*), to which Gilbert attributed universality. By perceiving the similarity of forms within a group, the mind arrives at the concept of species and then, by the same process, it arrives at the concept of genus. Finally, transcending all created forms, it attains the primary forms, which are in God. Thus, Gilbert inquired why concrete forms agree with one another, and he focused his attention upon the *intellectus* of the universal which is abstracted from singulars. He based his theory of knowledge upon the Platonic doctrine of Ideas but also employed the Boethian-Aristotelian doctrine of abstraction.

The divine work of creation involved the production of forms, which are images of the divine Ideas, and the uniting of these forms to matter. Gilbert described the created being as a compound of the *id quod est* ("what it is") and the *id quo est* ("that by which it is"). Socrates is a man (*id quod est*), but he is what he is by virtue of his humanity and corporeity (*id quo est*). The origin of this distinction is the grammatical rule that, *in naturalibus*, every name signifies both a substance and a quality. But whereas all created being is compound, the divine being is absolutely simple. In God, essence (*id quod est*) and divinity (*id quo est*) coincide. Nonetheless, Gilbert applied the distinction to God, describing divinity as the form in God by which he is God. Gilbert's opponents, such as Bernard of Clairvaux, would not accept this separation of God and his divinity; they maintained that divinity is God, and not that by which he is. Gilbert's position was a difficult one to maintain, but he had no desire to compromise the divine simplicity or unity, and his writings support his claim that he had not established a real distinction between God and his divinity.

In a similar manner, Gilbert's application of logical and grammatical principles to the problem of the Incarnation of Christ aroused suspicions. Gilbert was reluctant to say that the divine nature became flesh, preferring to say that a person, Christ, took a human nature. Other logicians of the day were similarly concerned to test various traditional formulations of the divine Incarnation in the light of Boethian concepts. If Gilbert slipped in his analysis of the person and natures of Christ, he did not intend to deny Christ's divinity or his humanity.

Gilbert's school of disciples survived as a strong force in the twelfth century and included John of Salisbury,

Otto of Freising, Alan of Lille, Nicholas of Amiens, Radulphus Ardens, and John Beleth. It blended at times with the dialectical tradition stemming from Abelard, and, by its investigation of the character of essences, the school of Gilbert perhaps helped to prepare the way for the influx of Avicennian philosophy.

## Bibliography

### WORKS BY GILBERT

*Liber de Sex Principiis Gilberto Porretano Ascriptus* has appeared in two modern editions: that by A. Heysse (Münster-in-Westfalen: Aschendorf, 1929) and that by D. van den Eynde (Münster-in-Westfalen, 1953). Commentaries on Boethius may be found in *Patrologia Latina*, edited by J. P. Migne, Vol. 64 (Paris, 1847), cols. 1255–1412. N. M. Häring has edited new editions of the commentaries on the *De Trinitate* and on the *De Praedicatione*, which are in *Nine Mediaeval Thinkers*, edited by J. R. O'Donnell (Toronto, 1955); on the *De Hebdomadibus*, which is in *Traditio* 9 (1953): 177–211; and on the *Contra Eutychem et Nestorium*, which is in *Archives d'histoire doctrinale et littéraire du moyen âge* 21 (1954): 241–357. Häring has also edited the *De Discretionem Animae, Mentis et Spiritus*, which is in *Mediaeval Studies* 22 (1960): 148–191, and “A Christmas Sermon by Gilbert of Poitiers,” in *Mediaeval Studies* 23 (1961): 126–135. Gilbert's biblical commentaries are unprinted save for the prologue and commentary on Psalms 1 and 2, edited by M. Fontana, in *Logos* 13 (1930): 283–301.

See also *Commentarius Porretanus Anonymus in Primam Epistolam ad Corinthios*, edited by A. M. Landgraf, in Vol. 117 of the series *Studi e testi* (Vatican City: Biblioteca Apostolica Vaticana, 1945), and E. Rathbone, *Notae Super Iohannem Secundum Magistrum Gil[bertum]*, in Vol. 18 of the series *Recherches de théologie ancienne et médiévale* (Louvain: Abbaye du Mont César, 1951), pp. 205–210.

### WORKS ON GILBERT

The following works contain information on Gilbert: Étienne Gilson, *History of Christian Philosophy in the Middle Ages* (London: Sheed and Ward, 1955), pp. 140–144; A. M. Landgraf, “Untersuchungen zu den Eigenlehre Gilberts,” in *Zeitschrift für katholische Theologie* 54 (1930): 180–213; A. Forest, “Le Réalisme de Gilbert de la Porrée dans le commentaire du *De Hebdomadibus*,” in *Revue néo-scholastique de philosophie* 36 (1934): 101–110; A. Hayen, “Le Concile de Reims et l'erreur théologique de Gilbert,” in *Archives d'histoire doctrinale et littéraire du moyen âge* 10–11 (1935–1936): 29–102; M. H. Vicaire, “Les Porrétains et l'avicennisme avant 1215,” in *Revue des sciences philosophiques et théologiques* 26 (1937): 449–482; M. E. Williams, *The Teaching of Gilbert Porreta on the Trinity*, Vol. 56 in the series *Analecta Gregoriana* (Rome, 1951); M. A. Schmidt, *Gottheit und Trinität nach dem Kommentar des Gilbert Porreta zu Boethius, De Trinitate* (Basel, 1956); S.

Gammersbach, *Gilbert von Poitiers und seine Prozesse im Urteil der Zeitgenossen* (Cologne: Böhlau, 1959); and N. M. Häring, “The Case of Gilbert,” in *Mediaeval Studies* 13 (1951): 1–40; “A Latin Dialogue on the Doctrine of Gilbert,” in *Mediaeval Studies* 15 (1953): 243–289; and “Sprachlogische und philosophische Voraussetzungen zum Verständnis der Christologie Gilberts,” in *Scholastik* 32 (1957): 373–398.

## GILES OF ROME

(c. 1247–1316)

Giles of Rome, the scholastic philosopher whose real name was Aegidius Colonna Romanus, was born in Rome. Giles entered the Augustinian order of hermits in 1265 and subsequently studied at the University of Paris, where from 1268 to 1272 he was probably the pupil of Thomas Aquinas, who was then lecturing at the university as Dominican regent master. In 1277 the bishop of Paris made his far-reaching condemnation of 219 theses, mainly of Aristotelian origin but also including a number of Thomist propositions. Among these were Thomas's doctrine that each being contains only one substantial form, as opposed to the traditional Augustinian belief in a plurality of forms. Giles, a young scholar, joined in the ensuing controversy with the publication of a sharply worded defense of the Thomist view, the *Liber Contra Gradus et Pluralitatem Formarum*. He attacked the Augustinian doctrine as being contrary to both reason and faith. Upon his refusal of Bishop Tempier's demand for a retraction, Giles left Paris, perhaps for a cooling-off period, but returned in 1285 to take the first Augustinian chair in theology and to receive his license to teach. He remained a professor until 1292, when he was appointed prior general of his order. In 1295 Pope Boniface VIII appointed him archbishop of Bourges, in which office he remained until his death. In 1287 his teachings had become the official doctrine of the Augustinian order, although neither of the other great Augustinian thinkers of the fourteenth century, Thomas of Strasbourg and Gregory of Rimini (each a general of the order) followed his teachings.

## METAPHYSICS

Giles's philosophical position still remains something of an enigma. The older view that he was strictly a disciple of Thomas has gradually been modified. While it is true that he reached substantially the same conclusions as Thomas on two of the burning issues of the day, the unity

of the substantial form and the distinction between essence and existence, neither of these seems to have been from Thomist premises and, in the case of the second issue, the conclusion did not even lead to the same doctrine. In particular, Giles seems to have been influenced to a far greater degree than Thomas by Neoplatonism, and especially Proclus, on whose *Liber de Causis* he commented in 1280. This affinity would explain his own treatment of the relation of essence to existence. Thomas had never made a real distinction between the two but had regarded them rather as a composition in which *esse* is the actuality of *essentia*, which is itself the source of a being's actuality; or put another way, a being is what it is in virtue of the actuality (*esse*) that derives from its form (*essentia*). For Giles, on the other hand, *esse* and *essentia* were distinct things (*res*) from the outset. He therefore treated as real what for Thomas were abstractions, an attitude confirmed in his Commentary on the *Liber de Causis*, where he thought in terms of a universe of intelligible beings. To attain intelligible knowledge, it suffices for the image of an object to act directly upon the possible intellect, which under the influence of the active intellect is able to conceive it as an intelligible species. This led Giles to the characteristically Platonic conclusion "that the same quiddity considered in things is particular, considered in the mind is universal."

### SCIENTIFIC CONTRIBUTIONS

Although knowledge of Giles's scientific outlook is even less comprehensive than that of his philosophical system, his treatment, often Neoplatonic, of time, movement, gravity, quantity, the intensification and remission of forms, and matter is known to us. Giles made his most original and important contribution to later scholastic scientific discussion concerning the nature of quantity. He posited a twofold quantity (*duplex quantitas*) that corresponds to the modern distinction between mass and volume. On the one hand, a body contains a constant quantity of matter, which limits its possibilities of development; for instance, a barleycorn cannot become a mountain. On the other hand, the same quantity of matter can undergo various changes in dimension, and according to its volume it will be denser or rarer in structure—as with, say, water or air. Giles took this distinction to infer that mass and volume were thus two independent quantities.

Giles also distinguished sharply between form and matter in the structure of a material substance—the so-called problem of the *mixtum*. This raised the question of what happened to the forms of the four material ele-

ments—fire, earth, air, and water—which composed any material substance when they were combined with form of that substance, for example, wood. Did they continue to exist separately, or were they absorbed into the substantial form? This was one of the earliest scientific problems to exercise the Scholastics, and while Giles based himself upon what Thomas had already said, he also went further. He accepted Thomas's solution that the forms of the material elements, once included in a material substance, no longer remained formally and actually in being but, rather, virtually as part of the qualities of the substance. To this, however, he added the distinction between the material and formal qualities. The former (*ex parte materiae*) remained the same through all changes in the substance; the forms, on the other hand, could not remain numerically the same. Another aspect of Giles's *mixtum* theory was of a hierarchy (*ordo realis*) among substantial forms, in which each higher form virtually contained the lower forms, the higher form being able to do more perfectly whatever the lower form could do.

Giles was also the first among the high Scholastics to state explicitly the problem of the increased speed of a falling body, namely, that this was not caused by the approach of its destination but rather by the growing distance from its starting point. Again, concerning a falling body in a vacuum, a problem which was to exercise successive generations of fourteenth-century thinkers, Giles was the first to pose it directly, taking a standpoint different from that of Thomas. In his Commentary on Aristotle's *Physics*, Giles posed other original questions about movement: Whether the sole cause of why movement took place in time, and not instantaneously, was resistance to the mover from the medium in which it moved, and whether in a vacuum movement itself would be composed of a succession of instants which in themselves did not constitute time. To both Giles answered in the affirmative. Thus the difference between movement in a medium and movement in a vacuum was that in the first case it was successive as opposed to instantaneous, owing to the resistance encountered; in a vacuum, on the other hand, it was *motus discretus in tempore discreto*. There can be little doubt from what is already known of his scientific speculation that Giles was the forerunner of the scientific inquiry so characteristic of the fourteenth century.

### POLITICAL PHILOSOPHY

Giles had been tutor to the future Philip IV (the Fair) of France, to whom he dedicated his *De Regimine Principium*. This work, stressing the Aristotelian view of a ruler, was based upon the *Ethics* and *Politics*. But with the out-

break of the struggle between Philip IV and Pope Boniface VIII in 1296, Giles took the pope's side. His *De Potestate Ecclesiastica* (probably written c. 1302) stated, in the most extreme form yet, the Augustinian view of society, in which the spiritual power is superior to the temporal and only the faithful can possess the just and righteous lordship derived from the universal lordship of the church. Lordship is a gift from God, and justice is submission to God through the church; hence, sin deprives the sinner of all right of lordship. Giles here sowed the seeds of the doctrine of dominion and grace that was to be developed by Richard FitzRalph and then turned against the church by John Wyclif.

## GILSON, ÉTIENNE HENRY

(1884–1978)

Étienne Henry Gilson, the French neo-Thomist philosopher, was born in Paris. His higher education was acquired at the University of Paris. In 1907 he received his agrégé and in 1913, after several years of teaching, his doctorate, publishing both his minor and major theses, *Index scolastico-cartésien* and *La liberté chez Descartes et la théologie*. The years 1914–1916 saw Gilson serving France as an officer on the battlefield. Captured at Verdun, he was a prisoner of war from 1916 to 1918. He spent two years as professor of philosophy at the University of Strasbourg and in 1921 became professor of the history of medieval philosophy at the Sorbonne, in which position he served until 1932, when he accepted the chair of the history of medieval philosophy at the Collège de France, where he taught until 1951. Gilson cooperated with members of the Congregation of Priests of St. Basil of Toronto, at their invitation, to found, in 1929, the Institute of Medieval Studies, in association with Saint Michael's College in the University of Toronto. He was a professor and director of studies at the institute from its foundation until 1956.

Numerous leading universities conferred honorary degrees on Gilson, and many invited him to deliver prominent lectureships, among them the Gifford Lectures at the University of Aberdeen (1930–1931), published as *The Spirit of Medieval Philosophy*; the William James Lectures at Harvard (1936–1937), published as *The Unity of Philosophical Experience*; the Richard Lectures at the University of Virginia (1937), published as *Reason and Revelation in the Middle Ages*; the Mahlon Powell Lectures at the University of Indiana (1940), published as *God and Philosophy*; and the A. W. Mellon Lectures in the fine arts (1955), published as *Painting and Reality*. Gilson founded and directed the famous *Études de philosophie médiévale* and the *Archives d'histoire doctrinale et littéraire du moyen âge* and was a director of *Medieval Studies*, the annual publication of the Pontifical Institute of Medieval Studies. Among the many academies and societies of which he was a member was the select French Academy, to which he was elected in 1947.

### PHILOSOPHICAL POSITION

Gilson's main thoughts may best be appreciated in company with two parts of his own intellectual history. (1) The great Jewish scholar Lucien Lévy-Bruhl advised Gilson to study the relation between René Descartes and Scholasticism. From this research Gilson learned to read St. Thomas Aquinas and to recognize that the metaphysical conclusions of Descartes made sense only in the context of Thomas's metaphysics. (2) Further study of Thomas and other medieval thinkers from St. Augustine through William of Ockham proved for Gilson that there was no common philosophy employed within the theologies but, rather, there were different authentic philosophies.

To do the choosing, demonstrating, and judging that he considered one of the proper tasks of philosophy, Gilson gradually developed his personal philosophical position. The only philosopher, Gilson maintained, who made him clearly realize the full metaphysical implications of the major problems was Thomas, a fact that in no way lessened Gilson's intellectual freedom, for he always wanted to be free to agree with somebody when he thought that what was said was right. For him what characterized Thomism is the decision to locate the act of existence in the heart of the real as an act that can be grasped only by or in the essence whose act it is, as an act, therefore, that has primacy not over and above being but within being. Thus, Thomism as an authentic existentialism is opposed equally to the "Thomistic" essentialists, who deposit a dead essence in the mind as a quiddity

without preserving its contact with the act of being, and to such existentialisms as those of Søren Kierkegaard, Martin Heidegger, Karl Jaspers, and Jean-Paul Sartre, which, although divergent from one another, commonly deal with existence only as an object of a possible phenomenology of human existence and are phenomenologies still in search of ontologies.

Gilson's personal commitment to the existentialism of Thomism was related to one of his most central philosophical doctrines—namely, the reality and philosophical validity of what he terms *Christian philosophy*. In *The Spirit of Medieval Philosophy* and in many other books and articles Gilson demonstrated that the Christian religion and its theologies have had the capacity to produce metaphysical conclusions and to transform philosophy itself. Several of its philosophical ideas the Greek philosophers never knew—for example, the existence of a unique God, the infinite, simple, supremely free Creator of the universe, as an all-powerful efficient cause, as well as the existence of man as a substantial composite of soul and body, free, made in God's image. Regarding the philosophical problem of how a speculation can be rational and philosophical if it is connected with religious beliefs, history as such is incompetent to answer, but philosophy provides the answer. History shows that the alliance of the two distinct orders of thought has produced positive philosophical results. Although Gilson recognizes, with Thomas and other medieval theologians, the distinction of philosophy and theology, he opposes their separation as practiced by Descartes and by numerous neo-Scholastics from the sixteenth century to the present day, for whom philosophy became no more than temporary and successively different alliances with any sort of currently fashionable philosophical position that could be reconciled with revelation.

As Gilson saw it, in the medieval theologians what could be philosophically demonstrated received in theological works the full benefit of rational demonstration. Such philosophical demonstrations were part of sacred doctrine and were also philosophy because they were reached by the human intellect through its own light. In the case of Thomas, who represents for Gilson the best in Christian philosophy, the philosophy is that of a theologian with the order of development required for theological ends; hence, one cannot release Thomistic philosophy from its theological moorings without running the risk of not knowing its origin and end, of altering its nature, and even of not grasping its meaning. Apart from the historical fact of the nonseparation of philosophy and theology, Gilson was convinced that the very nature of philosophy

does not demand that the philosophy of Thomas be extracted from the world of faith and the influence of revelation. Philosophy has been and can be authentically philosophy and Christian at one and the same time, for the orientation of Christian philosophy—to knowledge about God and man—entails no a priori exclusion of any area of philosophical research because nothing in the universe is irrelevant to knowledge about God and man.

This central theme in Gilson's philosophy—the nature and validity of Christian philosophy—has exasperated so-called Thomists seeking to develop a Thomism separate from theology; to rationalists it has seemed not to be philosophy at all. Gilson tirelessly represented the historical evidence and philosophical reasons to identify and justify Christian philosophy as the use that the Christian makes of philosophical reason when he associates religious faith and philosophical reflection. Rhetorically, Gilson asked why those who profess the Christian faith and its doctrines should see themselves excluded from philosophy simply because they prefer to philosophize about what they believe.

Other influential aspects of Gilson's philosophical doctrines concern education, social and political philosophy, the philosophy of art, and the history of modern and contemporary philosophy. In *Painting and Reality*, Gilson interprets the evolution of the art of painting, especially its most recent phases, in the light of his existential metaphysics. Because artistic beauty is made, not found, Gilson opposes mere imitation as artistic beauty; the function of any work of art *qua* art is solely to cause in us the contemplative pleasure of enjoying it. In a masterful defense Gilson analyzes the history of art from Leonardo da Vinci to the mid-twentieth century, demonstrates that representation is not of the essence of art, and argues for the legitimacy of abstraction and the necessity to sacrifice all elements of reality that do not contribute to the plastic structure of a work.

## GIOBERTI, VINCENZO (1801–1852)

Vincenzo Gioberti, the Italian philosopher, ecclesiastical polemicist, and statesman, was born in Turin. As a statesman he upheld federalism as the goal of the movement for Italian unity. Gioberti's *Del primato morale e civile degli Italiani* (Brussels, 1843) is one of the great documents of the Risorgimento. His most famous polemical work is *Il gesuita moderno* (5 vols., Lausanne, 1846–1847), attacking the allegedly reactionary influence of the Jesuits on church policy. Throughout his intensely active career, philosophy remained his dominant interest. A long political exile (1833–1845) provided the occasion for the composition of his most important philosophical works: *Teorica del sovranaturale* (Brussels, 1838), *Introduzione allo studio della filosofia* (Brussels, 1840), and *Degli errori filosofici di Antonio Rosmini* (Brussels, 1841; 2nd enl. ed., 3 vols., 1843–1844).

### “PROTOLOGIA”

In 1841 and 1842 Gioberti gave a course of lectures (published as *Cours de philosophie*, Milan, 1947). The second part of these lectures, “Protologie ou science première,” was the first sketch of a subject of which many of Gioberti's works can be considered fragmentary studies.

The term *protologia* may derive from the title of a work by Ermenegildo Pini (1739–1825) that was published in 1803. Gioberti envisaged *protologia* as “the science of the creative act and of the ideal formula which expresses it completely.” Its complement is *deuterologia*, the theory of the sciences constructed by reflection on the basis of being as it is intuited. *Protologia* has three divisions: theology, logic, and cosmology, which includes psychology. The division arises out of the three elements of the ideal formula, “Being creates the existent.” *Protologia* escapes the subject-object dichotomy; it studies neither the subject nor the object but the intelligible principle that relates the two.

### ONTOLOGISM

Because of his constant affirmation that being-in-itself is constitutively present to the human intellect, Gioberti’s philosophical position is generally described as ontologism. Being is present to the intellect as thought, not as a sensible property of mind itself; that is, the being which is present to the mind is not merely the being of the mind but being itself. Gioberti rejected what he called sensism, by which he meant the view that the being present to the human mind is simply its own being apprehended by the senses. Gioberti asserted that the activity of the human mind “concreates” its object in conjunction with the presence of being. The being constitutively present to the human mind is not merely possible being but real being, and indeed the most real being. This being is indeterminate, not in the sense that it lacks all distinction but in the sense that all distinctions are so related and fused that the human mind does not immediately succeed in discerning them. For this reason the original intuition of being can make known the existent only in conjunction with sensible experience. Sensible experience makes the existent present, but the existent is known by virtue of being. The existent is not, however, a part, determination, or moment of being but a creation of being. Existents are present in being as elements of its creative possibility, not as its modes or qualities (on this point Gioberti thought that he was in disagreement with Benedict Spinoza). The act of thought renders the existent present, and since this act is being and is act only insofar as it is being, it concretes the existent. The act of judgment, which is the pure form of knowledge, has a particular form for thus establishing any particular existent. Its ideal form, or “ideal formula,” informs every judgment independently of its particular concern. This ideal formula, “Being creates the existent,” is the presence of the pure form of the judgment in its pure possibility.

### LANGUAGE

Ontologism shows that thought is a creative act. The object of thought comes into being through the operation of thought in the word. In this view Gioberti was strongly influenced by Giambattista Vico, and like Vico he studied the problem of language as the general theory of the word. Language is the specific manner in which the concreative operation of thought and being is effected in the human matrix. The concreative act, to be actual and effective, must reflect the human condition—it must be psychologized, but not in the manner which Gioberti opposed as “sensism.” Gioberti advocated a transcendent psychologism in which the transcendental operation is the transaction of a concrete existent subject. Language is transcendental in that it reflects the constitutive presence of being in accordance with the structure of the human mind while enabling the mind to transcend its own existential limits and achieve universal significance. In this process of transcendence the ideal formula is specified according to the form not only of the object but also of the subject. Language places knowledge beyond the subject-object split. It reduces the being mentioned in the ideal formula to the effective principle of concrete science.

The transcendental operation of language seems to be widely distributed throughout the numerical range of human subjectivity. Gioberti suggested that it is a transaction of particular groups and ultimately of the nation. This view was important in *Del primato morale e civile degli Italiani* and was given an aristocratic cast in the claim that within the nation the transcendental operation is the work only of an elite.

### “PALINGENESIS”

Language constitutes the first movement of the life of the spirit, a movement implicit in the ideal formula, “Being creates existence.” It is thus at the focus of the genesis of existence and the real as object. The pure form of human thought moves from the immediate givenness of the existent to its ideal ground. In experience we encounter the end product of the movement expressed in the ideal formula. Thought must return the existent thus encountered to its ground in being. Its movement is therefore a *palingenesis*—a return of existence to being.

*Mimesis* is the mode of existence of that which is encountered in experience. It is a state, but not a radical or irremediable one, of alienation. *Methexis* is the state of the thinking subject, the intelligence whose constitutive principle is the intelligible, that is being. *Methexis* is the

link that ends the alienation between being and existence in *palingenesis*.

Gioberti did not mean by *palingenesis* a dissolution of the distinctions of existence into the indeterminacy of ideal being. Rather, through *palingenesis* the being of the existent qua existent (that is, in its distinctness) is ideally grounded in being. Thus, being itself needs the movement of *mimesis* down into the world in order that it may come into its own actuality, or distinctness, through *methexis*. Hence, being is not absolutely transcendent. It reaches its actuality in the word and thus belongs inalienably to the region of culture and history. Gioberti's theory of language thus contains in germ a theory of culture and history. Culture and cultures are the historical forms of *palingenesis*.

### THEOLOGY, POLITICS, AND ETHICS

The *palingenesis* of being is the central operation of the spirit and determines the actual form of the world. The fact that this one process can be studied from two points of view provided Gioberti with a basis for a correlative distinction and unity of theology and philosophy. Theology possesses a certain superiority deriving chiefly from its object, God. Supernatural theology does not, however, take possession of the internal, or constitutive, word of God; it must make use of analogies drawn from philosophy. Supernatural revelation makes use of the "natural revelation" of the word. Philosophy is therefore superior to theology in that it provides the interpretative categories of theology.

*Palingenesis* takes on deontological status as the supreme norm of action. In this aspect it is the axiological principle of both the moral and the political orders. In both morals and politics, in conscience and in law, the essential process is the return of existence to being. Similarly, Gioberti held that the church is the historical and institutional form of the *palingenesis* of being under the dispensation of revelation.

Gioberti's thought is still influential in two of the leading strands of contemporary Italian thought, Gentilean actual idealism and Christian spiritualism.

## GLANVILL, JOSEPH

(1636–1680)

Joseph Glanvill was a skeptic, a prominent defender of the experimental research of the early Royal Society, a liberal rationalistic Anglican theologian and preacher, and a staunch and influential believer in witchcraft. He studied at Cambridge, where he came under the influence of Henry More. On first learning of René Descartes's work Glanvill became an advocate of Cartesianism but was quickly led to cast doubt on it as a metaphysical theory because of More's objections. He then treated Cartesianism as a working hypothesis and began analyzing how much certitude anyone could have about what is going on in the world. He came into contact with John Wilkins, the bishop of Chester, and began developing his case in terms of the categories employed by him.

Glanvill's first work, *The Vanity of Dogmatizing* (1661), was soon revised into the larger *Scepsis Scientifica* (1665), and began with a most laudatory "Address to the Royal Society," which led to Glanvill being elected as a fellow.

## GLANVILL AND SKEPTICISM

Glanvill saw the skeptical problem as one that could not be so easily set aside. He saw the reliability of one's faculties as central for avoiding any ultimate and overwhelming skepticism. But Glanvill saw that the kind of certainty one would need to be absolutely sure of one's faculties ("infallible certainty," in which one is assured, "'tis impossible things should be otherwise than we conceive them or affirm them") is unattainable—"for it may not be absolutely impossible, but that our Faculties may be so construed, as always to deceive us in the things we judge most certain and assured."

One may not be able to attain infallible certitude, but one can attain indubitable certitude that one's faculties are true. This is indubitable in two senses: first, that one finds that one has to believe them, and, second, that one has no reason or cause for doubting them. One has to believe one's faculties are reliable if one is to have any rational life at all, even though one has no evidence that one's faculties are, in fact, reliable.

Glanvill carried this on to base acceptance of historical data (and especially that of scripture) on the indubitable principle that "Mankind cannot be supposed to combine to deceive, in things wherein they can have no design or interest to do it." So, skepticism can be set aside in mathematics, science, history, and theology, because one has no actual reason to doubt the results in these areas. One has to believe various findings and act with confidence. But, having said this, Glanvill immediately made clear that he had not offered or provided any way of eliminating ultimate skepticism.

For Glanvill, reasons for doubting had to be reasonable. Descartes's reasons for doubting he dismissed as hyperbolic or metaphysical. No reasonable person would entertain them. On the contrary, there can be reasonable doubts about many things, but this does not prevent one from having a degree of certitude about other matters. Glanvill insisted that human beings are basically in a state of ignorance due to the original Fall. They cannot know the springs and principles by which the world is operating. They can only hypothesize about this and recognize that any hypothesis could be false. There is a reasonable basis for doubting in that one never has sufficient evidence or knowledge and one cannot be sure that things cannot be otherwise than one conceives them.

Glanvill introduced what was to be an important point in later scientific thought, namely, that one can never find necessary connections between events. Any causal hypothesis that one works out is always open to

question and doubt, since one does not understand the inner workings of Nature. One can find concomitances of events (what David Hume later called constant conjunctions) but not necessary connections. Because of this analysis of one's causal reason, Glanvill has often been considered a precursor of Hume, although there is no evidence that Hume ever read any of his work.

## REASON AND RELIGION

Glanvill's discussion of the relation of reason and religion is perhaps his most original contribution—that of offering a rational-skeptical fideism as a way of living with irremediable skepticism. Glanvill made the acceptance of the reliability of one's faculties a genuine act of faith. "The belief of our Reason is an Exercise of Faith, and Faith is an Act of Reason." He had preceded this by stating that "Reason is certain and infallible," which turns out to be based on one's knowledge "that first Principles are certain, and that our Senses do not deceive us, because God that bestowed them upon us, is True and Good."

Glanvill was not emulating Descartes in making true knowledge depend on the proof that God is not a deceiver. Rather, Glanvill was offering a kind of rational fideism. Faith, and faith alone, is the basis for one's belief in reason. One believes in reason because one believes in God's veracity. One does not try to prove that God is truthful; one believes this. Thus, faith in God gives one faith in reason, which in turn "justifies" one's belief that God is no deceiver.

Glanvill saw that the ultimate guarantee of one's certitude depends not on what one can prove, but on what one can believe. One can believe that God is truthful, and hence believe in the reliability of one's faculties. The first belief is reasonable, since one has no reason to doubt of it. This, then, enables one to avoid ultimate skepticism, by avoiding the fundamental skeptical problem of proving one's first principles.

Glanvill's rational fideism grows out of seeing the conditions requisite for certain and unquestionable reasoning (namely, that God is reliable), and is in sharp contrast to the irrational fideism being offered in the late seventeenth century by Pierre Bayle and Pierre Jurieu. Glanvill posed the possibility that rationality could be based on faith, and in terms of what human beings consider reasonable, accepting such faith is an exercise of reason. Using this rational fideism, Glanvill tried to show the reasonableness of religious belief and of Latitudinarian Christianity.

Glanvill provided an epistemology for a “mitigated” skepticism, which could delineate the kind of certitude that the new scientists could find. Instead of basing the “new science” on dogmatic metaphysical principles, he offered an undogmatic semiskepticism sufficient to encourage the nondogmatic inquiries of the scientists of the Royal Society, while opposing the dogmatism of Descartes, Thomas Hobbes, and Benedict (Baruch) de Spinoza.

Glanvill’s belief in witches comes from his critique of the materialism of Hobbes and others. The question of whether evil spirits exist, Glanvill pointed out, is a factual question, not a metaphysical one and has to be answered by examining the empirical evidence. Glanvill compiled ample testimonials to convince any “reasonable” person that (1) it is possible that evil spirits or witches exist, (2) it is probable that they do, and (3) that the acknowledgment of their existence allows for the best explanation of various observed phenomena. Glanvill pointed out that various societies have laws against practicing witchcraft, so it seems likely that there is something of this sort that could be practiced. The possible existence of witches is also part of a larger and more significant question—that of the existence of spirits. If demonic or evil spirits cannot exist, then how can one be sure that good spirits—angels or God—can exist? To deny the possibility of the existence of witches is to deny the possibility of any sort of spiritual or divine world.

#### GLANVILL’S CARTESIANISM

Glanvill offered a nondogmatic, or deontologized, Cartesianism as the best scientific model of explanation for natural phenomena. In his continuation of Francis Bacon’s *New Atlantis* Glanvill had his sage present Cartesianism as “the neatest Mechanical System of things that had appear’d in the world,” though it was not certain or all encompassing. The sages could also accept the preexistence of the soul and the existence of spiritual agents, whose manner of operating may not be known or even knowable to one.

Glanvill was an eclectic philosopher, taking his views in part from More, Descartes, Bacon, Anne Conway, and the members of the Royal Society. Glanvill’s world of natural science, spirits, and Christianity, based on the “plausible” testimony of historical documents, is one way these kinds of knowledge could be brought into harmony. Glanvill paid the price of having this all rest on a basically ineliminable skepticism. If one could find solace and comfort in a faith in a nondeceiving Deity, then a nice,

harmonious world of science and religion could be accepted.

## GNOSTICISM

“Gnosticism” (from the Greek *gnosis*, “knowledge”) designates a broad variety of religious teachings that were rife in the Hellenized Near East of the first centuries CE and purported to offer knowledge of the otherwise hidden truth of total reality as the indispensable key to man’s salvation. Most of the schools or sects in question were ostensibly Christian by the time our earliest witnesses, the Church Fathers, were familiar with them, and in consequence the whole movement was long regarded as essentially an aberration from Christian doctrine. However, although Gnosticism provided the first chapter in the history of Christian heresies, the Christian veneer of the systems playing that role is often thin to the point of transparency; and clearly non-Christian writings have come to light that by all criteria of content must be classed as Gnostic as well. The details of the literary evidence point to highly syncretistic origins, in which Jew-

ish, Iranian, Babylonian, Egyptian, and other Oriental traditions were blended with one another and with Greek concepts in an extremely free manner. The results were as readily made to represent an alleged esoteric truth of the Christian message as to constitute a superior (Mani) or even hostile (Mandaeans) alternative to it.

This syncretism, pertaining mainly to the outer shell, does not preclude—in fact it tends to mask—a highly original inner unity of thought distinct from all the disparate historical elements employed in its representation. Massively mythological though this representation usually is, the substance thus expressed has philosophical significance as embodying a fundamental choice—the radical antithesis to the classical Greek choice—in the realms of universal theory and human practice at once. The powerful Gnostic impulse to elaborate its basic vision into grandly constructed, quasi-rational systems of thought where everything proceeds from an absolute beginning makes Gnosticism a landmark in the history of the speculative system as such; and it is the identity of that basic vision that defines what is Gnostic and alone justifies the classing of systems of such considerable diversity under one heading.

#### GNOSTIC TEACHERS AND SCHOOLS

A number of gnostic teachers and writers are known by name (mainly those listed as heresiarchs in the patristic refutations), but much of the surviving literature is anonymous or pseudepigraphic, in keeping with the revelatory style in which it is cast. Historical individuals whose thought is documented by either critical accounts or direct fragments of their works include the Samaritan Simon Magus and his spiritual descendants Menander, Saturninus, Cerinthus, and Cerdon (first and second centuries); the Alexandrians Carpocrates, Basilides and his son Isidore, and, foremost, Valentinus with his illustrious disciples Ptolemaeus, Heracleon, Theodotus, and Marcus (second century); the Pontian Marcion and the Syrian Bardesanes (second century); and the Persian-Babylonian Mani (third century). Major sects whose doctrines are well documented but not identified by individual authors or founders are, in the Christian camp, the Barbeliotes, Sethites, and Ophites (the last actually a cluster of sects); in the Hellenistic-pagan camp, the Hermetic religion (perhaps merely a literature and not an actual sect); in the Semitic East, the anti-Christian Mandaeans. Towering over the known thinkers are Valentinus, Marcion, and Mani; and Valentinianism and Manichaeism respectively represent the culminations of the two main alternative types of Gnostic speculation. The last two are here con-

sidered merely for their part in and exemplification of the wider context.

#### SOURCES

With the exception of that of the Mandaeans, Gnostic literature was denied direct tradition under the dominion of Christianity and Islam after the eclipse of the Gnostic communities themselves. Thus, until fairly recently, information was supplied almost solely by the abundant indirect sources. These were, in the main, the antihetical works of the Church Fathers (Greek, Latin, and Syriac, from Irenaeus in the second century to Theodore bar Konai in the eighth century) with their diligent reports, summaries, and excerpts, and still later Islamic histories and compendia. However, for some time an impressive series of manuscript discoveries has been adding vastly to our store of original texts: Coptic-Gnostic papyrus codices from Egypt, belonging to the Christian branch of Gnosticism—the find in 1945 of a whole library at Nag Hammadi is revolutionizing the state of documentation in the area hitherto principally covered by the patristic testimony—Manichaean fragments in Persian, Turkish, and Chinese from Turfan in central Asia and in Coptic from Egypt, and the sacred writings of the Mandaeans of Iraq.

The Mandaeans are the one case of a Gnostic community surviving to the present with an unbroken written tradition of their voluminous Aramaic literature; it came to the attention of Western scholars in the nineteenth century, after it had escaped that of the Church Fathers in antiquity (probably because of the Fathers' predominantly Greek orientation). In all the other cases, the new original sources generally bear out, while greatly enriching, the testimony of the older indirect evidence. The following account, based on the entire, extremely varied material, is synoptic and selective, placing its emphases according to a conception of the whole as a system.

#### GNOSTIC DUALISM

A radically dualistic mood dominates the Gnostic attitude and unites its widely diversified expressions, whether doctrinal, poetical, or ethical. The dualism is between man and world, and between the world and God. In either case, it is a dualism of antithetical, not complementary, terms; and it is basically one: that of man and world mirrors on the plane of experience the primordial one of God and world and is, in Gnostic theory, deduced from it. The interpreter may hold conversely that the transcendent doctrine of a world-God opposition

sprang from the immanent experience of a disunion of man and world, that is, it reflects a human condition of alienation. In the three-term configuration, man and God belong in essence together against the world but are in fact separated by the world, which in the Gnostic view is the alienating, divisive agency.

The object of Gnostic speculation is to derive these basic polarities—the existing state of things—by way of genetic myths from the first things and through such genealogy to point the way to their eventual resolution. The myth, a conscious symbolical construction, is thus predictive by being genetic, eschatological by being explanatory. Accordingly, the typical Gnostic system starts with a doctrine of divine transcendence in its original purity; traces the genesis of the world from some primordial disruption of this blessed state, a loss of divine integrity that leads to the emergence of lower powers who become the makers and rulers of this world; then, as a crucial episode in the drama, it recounts the creation and early fate of man, in whom the further conflict becomes centered; the final theme—in fact, the implied theme throughout—is man’s salvation, which is more than man’s, since it involves the overcoming and eventual dissolving of the cosmic system and is thus the instrument of reintegration for the impaired godhead itself, the self-saving of God.

**GOD AND THE DIVINE REALM.** The transcendence of the supreme deity is stressed to the utmost degree in all Gnostic theology. Topologically, he is transmundane, dwelling in his own realm entirely outside the physical universe, at immeasurable distance from man’s terrestrial abode; ontologically, he is acosmic, even anticosmic: To this world and whatever belongs to it he is the essentially “other” and “alien” (Marcion), the “alien Life” (Mandaeans), the “depth” or “abyss” (Valentinians), even “the not-being” (Basilides); epistemologically, because of the transcendence and otherness of his being, and because nature neither reveals nor even indicates him, he is naturally unknown, ineffable, defying predication, surpassing comprehension, and strictly unknowable. Some positive attributes and metaphors do apply to him: Light, Life, Spirit, Father, the Good—but not Creator, Ruler, Judge. Significantly, in some systems one of his secret names is Man. Mainly, the discourse about him must move in negations, and historically Gnosticism is one of the fountainheads of negative theology.

However, the Absolute is not alone but is surrounded by an aura of eternal, graded expressions of his infinitude, partial aspects of his perfection, hypostatized into

quasi-personal beings (aeons) with highly abstract names (mostly of mental properties) and together forming the hierarchy of the divine realm, the pleroma (Plenitude). The emanation of this inner manifold from the primal ground, a kind of self-differentiation of the Absolute, is sometimes described in terms of subtle spiritual dialectics, more often in rather naturalistic (for instance, sexual), terms. Among the tenuously mythological entities that thus arise (such as Mind, Grace, Word, Knowledge, Life) are two more concrete ones with definite roles in the further evolution of the transcendental drama: Man as an eternal, divine, precosmic principle (sometimes even identified with the First Being himself) and Wisdom (Sophia), usually the last and youngest of the aeons. Extensive speculation about the diversity within the pleroma is the mark of advanced systems, but some degree of manifold on the upper reaches of being is requisite for all Gnostic metaphysics because it provides the condition for divine fallibility on which the movement into creation and alienation depends.
