In the theology of Thomas Aquinas, and in conciliar definitions, philosophy is instrumental. The content and authority of dogma are derived wholly from revelation, although some theologians have attempted to place dogmas in the context of a speculative system that is alien to the basic principles of Christian theism. Inevitably, the dogmas then lose their original, distinctive, and (above all) supernatural significance. Thus G. W. F. Hegel and his disciples held that Christ merely exhibits in a supreme mode the natural coinherence of the finite and the infinite.

At the other extreme, some post-Kantian thinkers, while remaining in the church, have denied that dogmas state objective truths concerning God. But we are to act “as if” they were true, and in so acting we shall find that the moral life is given both a meaning and a power that it cannot otherwise possess. This reduction of dogmas to the status of pragmatic postulates is the twenty-sixth proposition condemned by the decree *Lamentabili* (1907).

## DONG ZHONGSHU

(c. 179–c. 104 BCE)

Dong Zhongshu, probably the most influential Confucian scholar of the Han dynasty (206 BCE–220 CE), laid an institutional basis for the Confucian orthodoxy and for the recruitment of able scholars as government officials through the examination system. He was an expert in the Gongyang commentary of the Confucian classic *Spring and Autumn*, and he gave the classic a new interpretation that combines the ethical and political teachings of Confucius with the supernatural view of the metaphysicians.

After having received the degree of eruditus (*boshi*) in the Confucian classics, Dong Zhongshu became a public instructor during the reign (156–140 BCE) of Emperor Jing. It has been recorded that he lectured from behind a curtain, and although he had many students, few were admitted to his presence. He was also said to have been so engrossed in his scholarly pursuits that for three years he did not even once visit his garden. As a result of his responses to the written inquiries addressed to the scholars of the realm by Emperor Wu (reigned 140–87 BCE), Dong Zhongshu attracted imperial notice and was appointed minister successively to two royal princes. However, he was not successful in his political career and spent the remaining years of his life in teaching and writing. In addition to his several memorials to the throne, he is known for his work on the *Spring and Autumn*, titled *Chunqiu Fanlu* (Copious Dew in Spring and Autumn), a curious admixture of moral and metaphysical essays in seventeen chapters. He had numerous followers and his influence lasted well beyond his lifetime.

Dong Zhongshu's main contribution as a Confucian philosopher lies in his study of the *Spring and Autumn*, which, according to him, teaches "compliance with Heaven's will and imitation of the ancients." To do so is "for the people to follow the sovereign, and for the sovereign to follow Heaven." Thus, the basic principle in gov-

ernment is to subject the people to the sovereign's domination, and the sovereign to Heaven's will. In Dong's concept, Heaven (*Tian*) is not the all-mighty anthropomorphic god of the ancient Chinese but the physical universe itself. Somewhat akin to the Western concept of nature, it is nevertheless endowed with intellect and purpose. The ruler, as Heaven's representative on earth, should administer his kingdom in accordance with Heaven's will. As Heaven is inherently good and benevolent, so should the sovereign be. His virtuous rule will be marked by order and harmony in the universe. On the other hand, any evil act of his will cause catastrophes (such as floods and fires, earthquakes and mountain slides) and anomalies (such as comets, eclipses, and the growing of beards on women) sent by Heaven as a warning to men. "The origin of catastrophes and anomalies," he wrote in "Copious Dew," "is traceable to misrule in the state. First, Heaven sends catastrophes to admonish the people. When this goes unheeded and no changes are made, Heaven would then frighten the people with prodigies. If men are still unawed, ruin and destruction will finally befall the empire."

Although he was an avowed monarchist, Dong Zhongshu's strange science of the catastrophes and anomalies had the effect of curbing misgovernment on the part of the ruler. The idea has so embedded itself in the minds of the Chinese people that even in more enlightened and rational times, Confucian scholar-officials found Dong's concept useful as a means of remonstrance against the ruler's misuse of despotic power. But Dong Zhongshu is remembered today chiefly for his historical role in exalting Confucianism as China's official state doctrine, which was to mold the nation for more than two thousand years from the Han dynasty to the present age.

## DOSTOEVSKY, FYODOR MIKHAILOVICH (1821–1881)

Fyodor Mikhailovich Dostoevsky was a famed Russian writer whose works reflect an intense interest in philosophical questions about the human condition. With some justification, Dostoevsky's thought has been linked with existentialism—it is unsystematic and sometimes paradoxical, and his fiction in particular is marked by a concern with the irrational in human behavior and with the burdens and blessings of free choice. In the full sweep of his writings, however—which included essays, notebooks, diaries, and letters in addition to fiction—Dostoevsky gave expression to a comprehensive Christian philosophy that cannot be classed as either existentialism or irrationalism, despite his influence on thinkers of both of those schools—the European (Friedrich Nietzsche, Albert Camus), as well as the Russian (Nikolai Berdyaev, Lev Shestov).

### METAPHYSICS AND EPISTEMOLOGY

Dostoevsky's conception of the human situation is rooted most fundamentally in a traditional Christian dualism: Reality is divided into material and spiritual realms, at the intersection of which stands humanity. Matter and spirit are binary opposites for Dostoevsky, mutually exclusive in essence and attributes. And yet humans partake of both—a situation that generates metaphysical and epistemological puzzles.

As physical inhabitants of the material world, human beings are perishable entities, subject to laws of causal determination of the kind discovered by natural scientists. But as spiritual persons they are eternal and not fully determinable by natural causes. Dostoevsky's sympathies lay on the spiritual side, and accordingly the major part of his philosophizing was devoted to defending such idealist theses as the immortality of the soul (which he considered the basic tenet of Christian belief) and the doctrine of free will (the philosophical thesis with which he is most closely identified). At least six separate arguments for life after death can be found in his writings, beginning in 1864 in a lengthy diary entry on the death of his first wife—a passage of utmost importance for his philosophical outlook (Scanlan 2002, pp. 19–37). The significance of free will as a defining trait of humanity is memorably portrayed in his most pointedly philosophical work—*Notes from Underground* (1864)—in which he attacks the determinism of Nikolai Chernyshevsky and other Russian materialists, contending that human choices are radi-

cally unpredictable because people are capable of deliberately falsifying any prediction made. As Gary Saul Morson (1998) points out, the notion of an indeterminate future is central to Dostoevsky's narrative style as well as to his philosophical outlook.

The epistemological puzzle created by humanity's hybrid nature is how a spiritual soul mired in a material world, dependent on a physical brain and sensory apparatus, can fully understand either realm. At times Dostoevsky despaired of the mind's ability to comprehend reality at all, but more typically he stressed the partiality and tentativeness of human knowledge and the inability of science to fathom the human essence. He regarded reason as a limited capacity, denying that it could present conclusive proofs of such beliefs as personal immortality and the existence of God; at the same time, he accepted reason as consistent with and providing some support for those beliefs, as his own discursive arguments for them attest. In the voice of Father Zosima in *The Brothers Karamazov* (1879–1880) he also accepted mystical experience as a limited source of knowledge of reality: “Much on earth is concealed from us, but in place of it we have been granted a secret, mysterious sense of our living bond with the other world” (p. 320). Even this mysterious sense, however, tells us nothing more than that there is a “full synthesis of all being,” which in the 1864 diary entry he identified with God (Proffer, vol. 1, 1973, p. 40). He did not reject the theistic notion of God as a person who created and rules the world, but he based that notion not on reason or mystical experience but solely on faith grounded in love.

### ETHICS

Dostoevsky's ethical thinking was dominated by his opposition to egoism and defense of altruism as expressed in Christ's commandment to “love thy neighbor as thyself.” His first major attack on egoism came in *Notes from Underground*, in the form of a devastating critique of the ethical theory (a form of enlightened egoism) espoused by Chernyshevsky and his followers. In the diary entry on the death of his first wife, Dostoevsky formulated the opposition between the Christian law of love and the egoistic force in human nature that opposed it, which he dubbed the law of personality. The struggle between these two laws, both rooted in the complex material-spiritual nature of humanity, remained central to Dostoevsky's writings—fiction and nonfiction alike—throughout his career. Despite his emphasis on free choice he did not regard freedom as the highest human

value; freedom is limited morally by the Christian law of love.

As the philosophical foundation for the law of love, Dostoevsky long relied on the idea that an inborn human conscience tells people authoritatively whether an action is right or wrong. Shortly before his death, however, he reluctantly admitted that conscience does not always speak univocally and that it may itself be evil; he concluded that morality has as its ultimate ground the religious faith that accepts the law of love as Christ proclaimed and lived it. Dostoevsky interpreted the law deontologically, as commanding or prohibiting actions as good or bad in themselves regardless of their results, thus rejecting utilitarianism. He vigorously opposed the idea, powerfully dramatized in both *Crime and Punishment* (1866) and *Demons* (1871–72) that an action abhorrent in itself may be justified by supposed future good consequences.

Two other recurring ethical themes in Dostoevsky's novels, particularly *Crime and Punishment* and *The Brothers Karamazov*, are also directly related to his devotion to the Christian moral ideal. These are the notions of universal moral responsibility ("I am responsible not only for my actions but for those of everyone") and the moral value of suffering. If essentially the ethical ideal is to be Christlike, it means freely accepting responsibility for others and suffering for their good, as Christ in the atonement took upon himself the sins of all humanity.

## AESTHETICS

Dostoevsky's philosophy of art was laid out most fully in a polemical essay entitled "Mr. —bov and the Question of Art" (1861), directed against the so-called civic school of Russian criticism then represented most prominently by Nikolai Dobrolyubov. Just as Dostoevsky rejected utilitarian ethics, he had no sympathy for the view that art should be judged on the basis of its usefulness in promoting the satisfaction of basic human needs, such as the needs for food, shelter, and clothing.

Dostoevsky's argument against these critics was twofold. First, they failed to understand that human beings have aesthetic as well as material needs—specifically, a need for beauty, defined broadly in classical terms as "harmony and tranquility" (Magarshack 1997, p. 125), and a need to engage in creative activity—a notion reminiscent of the play theory of art advanced by Konrad Lange and Karl Groos. Second, Dostoevsky contended that utilitarian reasoning is a poor tool for determining the value of art, regardless of what needs it serves, for

such reasoning rests on predicting the future impact of a work—something people cannot do with any confidence.

Dostoevsky did not deny that aesthetic values may have social and moral significance; beauty is not a narrowly aesthetic category for him. In *The Idiot* (1868) he describes Prince Myshkin as insisting that "beauty will save the world," presumably having in mind Beauty as producing harmony and tranquility in society (p. 382). But he vigorously denied that artists have a duty to engage in useful activity. Art, he argued, should be judged on the basis of its artistry, not its moral or social impact, and he defended the right of the artist to free scope for creativity.

## SOCIAL PHILOSOPHY

A critic of Russian serfdom, Dostoevsky was drawn to European Enlightenment thinking in his youth and became active in clandestine revolutionary circles; in 1849 he was arrested and sentenced to nine years of imprisonment and exile in Siberia. He was never opposed in principle to the Russian imperial system of government, however, and upon his return to European Russia and the subsequent emancipation of the serfs in 1861 he became a champion of Russian autocracy and a severe critic of violent revolution, which he attacked most powerfully in the novel *Demons*. Through many journalistic articles, especially a long series entitled *A Writer's Diary* (1873, 1876–1881), he was an influential commentator on political, economic, and other social issues, writing from a Slavophile, nationalist perspective.

Dostoevsky's defense of autocracy was based on his conviction that the citizens of Russia willingly accepted a patriarchal hierarchy of social strata based on inequalities in talents and abilities. Such inequalities are not evils in Russia, he argued, because they are mutually acknowledged in an atmosphere of respect dictated by the Christian law of love. European political institutions designed to limit authority, he contended, were outgrowths of the history of the European states, which had their origin in the conquest of one people by another (such as the Gauls by the Franks) and were still characterized by hostility between rulers and ruled, unlike the harmony between the Tsar-father and his children that always existed in Russia. In Dostoevsky's idealized conception, an autocracy can be the freest state in the world, for its rulers need not fear their subjects.

Dostoevsky's aversion to the Russian revolutionaries extended to their economic program—socialism—because he considered it one of the great European evils threatening Russia's unique civilization. He called it, par-

adoxically, the height of egoism, because its appeal was to personal greed and the advancement of one's own rights against those of others. Above all, he saw socialism as destructive of human freedom: The revolutionary socialist, Dostoevsky argued, seeks the compulsory union of humanity by forcing economic change in the supposed interest of all. *Notes from Underground*, *Demons*, and *The Brothers Karamazov* all offer vivid treatments of this theme; the tale of the Grand Inquisitor in the latter novel is universally acclaimed as one of the most brilliant dramatic embodiments of philosophical ideas in world literature. Dostoevsky's remarkably prescient anticipation, in these and other works, of the aims and even the tactics of the twentieth-century Russian Bolsheviks has contributed to his reputation as a prophet.

### PHILOSOPHY OF HISTORY

Scattered throughout Dostoevsky's published and unpublished writings are fragments of a nationalistic theory of world history that, although generally consonant with his ethical and religious views, has provoked much controversy because of the messianic mission it ascribed to Russia (particularly in later writings such as *A Writer's Diary*) and its seeming inconsistency with his conception of the future as radically undetermined and hence unpredictable.

In an early (1864–1865) notebook, Dostoevsky sketched three stages in the evolution of human society: (1) Primitive patriarchalism, in which humans live in unreflective community, lacking a concept of self; (2) Civilization, in which personal consciousness and egoism arise; community disintegrates and previously accepted patriarchal laws are questioned. This is a diseased condition, for it undermines faith in God and destroys the spontaneity of life; and (3) Christianity, in which there is a return to God, community, and spontaneity but on a conscious level: individuals voluntarily give themselves to others by accepting the law of love.

Dostoevsky's many discussions of national differences among peoples drew on this conception of levels of evolutionary progress. He believed that the Western European peoples, and even more the Jewish people wherever they resided, represented the diseased condition of egoism characteristic of the second stage of history. Russians, by contrast, as true Christians, are altruistic; furthermore they possess a unique trait he calls *universal responsiveness*, by virtue of which they comprehend and sympathize with the problems of all peoples of the world. The Russians, then, are the only nation firmly situated in the third stage of history—Shatov in *Demons* calls them

“the only ‘god-bearing’ nation” (p. 247)—and it is their mission to raise others to that level by uniting them in a single loving community. As early as 1856 Dostoevsky had coined the expression *the Russian idea* for his nation's special role in world history. More than a century later, following the collapse of the Soviet Union, the term gained new life as the rallying cry of Russian nationalists.

## DOUBLE TRUTH, DOCTRINE OF

See *Averroism*

## DOUBT

To be in doubt about a proposition is to withhold assent both from it and from its contradictory. Although people sometimes withhold assent with no reason for doing so and persist in this even after conceding that they have no reason, doubt is rational only when one has a reason for it and reasonable only when the reason is a good one. Doubt may be accompanied by various feelings, but it seems unlikely that there are specific feelings uniquely associated with it; in general, the feelings associated with doubt are anxiety or hesitation, which are identified as feelings of doubt when they arise in contexts involving questions of belief. In any case, philosophers are not ordinarily concerned with psychological characterizations of a doubter's state of mind. Their attention is primarily devoted to understanding the conditions under which doubt is reasonable and to defining the limits of reasonable doubt.

### EVIDENCE AND REASONABLE DOUBT

Whether it is reasonable for a person to doubt a proposition cannot always be decided solely by considering the evidence that the person possesses relevant to the proposition or, in a situation in which there is purportedly non-inferential knowledge, by considering his ground for assent. Doubts that are unreasonable or absurd in one situation may be quite reasonable in another, although the available evidence or ground is the same in both cases. For example, special caution is appropriate when the penalties for error are particularly great; hence, an ordinarily acceptable basis for assent may be inadequate if much depends upon avoiding error, although the gravity of the risk does not in itself constitute evidence. Moreover, a basis for assent that would be entirely compelling in normal circumstances may be insufficient if otherwise remote possibilities of error must be taken seriously because of threats posed by a resourceful deceiver.

From the fact that someone has no reason to doubt a given proposition, therefore, it does not follow that the evidence he possesses is sufficient to render unreasonable *all* doubts concerning the proposition. It would seem quite worthwhile to explore the ways in which the reasonableness of doubt is affected by considerations other than the available evidence or ground for assent. Philosophers, however, on the whole, are interested only in very general principles that are not affected by contingencies of any sort. For this reason, perhaps, philosophical studies of doubt have usually been concerned with limiting cases in which the reasonableness of doubt depends only on the available evidence or ground for assent. In other words, they have dealt mainly with what is *indubitable*—with what it is never reasonable to doubt regardless of contextual variables of the sort described above. Accordingly, a philosopher's designation of certain propositions as *dubitable* is not generally to be understood as a denial that there are circumstances in which doubting these propositions would be absurd. The designation means only that given the evidence or ground for the propositions, there are conceivable circumstances in which doubt would be reasonable.

### CONDITIONS OF INDUBITABILITY

Toward the end of the First Meditation, René Descartes invokes the distinction between what is indubitable and what, in normal circumstances, is open to no reasonable doubt. In defense of his decision to regard as dubitable many propositions which, in practice, it is unreasonable to doubt, he declares, "I cannot at present yield too much to distrust, since it is not now a question of action but only of meditation and of knowledge." In their usual concerns, individuals are not often required to decide whether a proposition is indubitable, as distinct from deciding whether there is any reason to doubt it. Questions of indubitability are theoretical: they concern only the relation between a proposition and the evidence or ground for it, and take no account of the other concrete circumstances in which a proposition is evaluated.

**LIMITS OF RELEVANT EVIDENCE.** When is one entitled to regard a proposition as indubitable? It might be maintained that one is not entitled to do so as long as anything which can serve as evidence relevant to the proposition remains unexamined, on the ground that when this evidence comes to be examined, it may turn out to require an alteration of belief. But by virtue of the empirical and logical connections among facts, the truth-value of any proposition affects the truth-values of an unlimited number of others: Hence, the truth-values of an unlimited

number of propositions are relevant to that of any proposition and may serve as evidence concerning it. Since it is impossible to examine each of these other propositions, no proposition could ever be regarded as indubitable if it were first necessary to examine everything that may serve as evidence relevant to its truth-value. On the other hand, it seems that this impasse can be avoided only if it is possible to settle in advance the import of matters that have not been examined.

**IMMEDIATE EXPERIENCE.** That it is in fact possible to settle the import of matters that have not been examined may be brought out as follows. The impossibility of checking all the consequences of an empirical proposition is often cited to support the view that empirical propositions must always remain dubitable. Nonetheless, many philosophers who employ this argument concede the indubitability of so-called “basic propositions,” or a person’s current reports of the immediate contents of his consciousness (for example, pains, sense data, thoughts). But however fragmented and ephemeral immediate experiences may be, they are not without innumerable conditions and consequences. Like those of empirical propositions (statements of fact about the world outside immediate consciousness), the truth-values of basic propositions are connected with those of an unlimited number of other propositions which may be construed as evidence relevant to them. Hence, if a person’s current reports of the immediate data of his own consciousness are indubitable, it is not because he has surveyed everything that may serve as evidence relevant to them: rather, it is because his ground for making the report is such that he cannot reasonably acknowledge that any evidence could supersede it. Indeed, it is reasonable for him to require that all evidence be interpreted so as to be consistent with his report.

**INCORRIGIBILITY.** When one proposition serves as evidence relevant to a second, it does so by virtue of certain other empirical or logical propositions (laws or rules) by which the two are connected. The connection may be broken or its nature altered, however, if the intermediary propositions upon which it depends are rejected or revised. Thus, the possibility of coming upon contrary evidence can be excluded by requiring that this alternative be adopted whenever necessary.

But under what conditions is it reasonable to make such a requirement of incorrigibility—to arrange that nothing count as evidence against a certain proposition? In some cases (for instance, when a mathematical proposition is supported by a well-understood proof, or when a

basic proposition is grounded in immediate experience) it may seem fairly clear that the conditions are satisfied. However, philosophers have failed to provide a general account of these conditions; instead, they have usually limited themselves to identifying particular instances of their satisfaction. Some philosophers have claimed with considerable plausibility that certain elementary mathematical propositions (such as that  $2 + 2 = 4$ ) may be regarded as indubitable without proof, but they have done little to explain systematically why this should be so. With regard to empirical propositions, neglect of the problem of clarifying the conditions in which they may be accepted as indubitable has resulted in part from widespread controversy over whether the problem properly arises at all. That there are no such conditions is frequently maintained by philosophers (for example, Bertrand Russell, A. J. Ayer, C. S. Peirce, C. I. Lewis) who subscribe to certain popular epistemological doctrines—in particular, the doctrines that every empirical proposition is to be construed on the model of a scientific hypothesis, or that it is to be interpreted phenomenologically as equivalent to an unlimited number of predictions.

#### LOGICAL CONTINGENCY AND NECESSITY

A more general obstacle to a sound understanding of the basis of indubitability lies in a tendency to look for it in the wrong place. A proposition is indubitable when there could be no reason to doubt it, but this impossibility is not in general inherent in the logical character of the proposition itself. Indubitability is an epistemic property that depends on the relation between a proposition and the evidence or ground for assent with which it is considered. In particular, dubitability and indubitability must not be confused with logical contingency and logical necessity. The logical contingency of a proposition does not as such entail that no one has conclusive evidence or ground for it, and a logically necessary proposition may reasonably be doubted by someone who is not in a position to appreciate its necessity and who therefore must concede the possibility that further inquiry will uncover evidence against it.

Moreover, it is a mistake to suppose that evidence for a proposition is not conclusive unless its conjunction with the denial of the proposition is self-contradictory. To be sure, a proposition is indubitable if and only if no basis for assenting to its alternative is conceivable, but something may be inconceivable even though it contradicts neither itself nor what has already been established.

## CONDITIONS OF RATIONAL INQUIRY

The claim that a basis for doubt is inconceivable is justified whenever a denial of the claim would violate the conditions or presuppositions of rational inquiry. Avoidance of self-contradiction is perhaps the most familiar of these conditions, but it is not the only one. For instance, since inquiry is fundamentally an attempt to discriminate between what is to be accepted and what is to be rejected, nothing can rationally be conceived which involves denying the necessity for making these discriminations or undermining the possibility of making them.

A systematic explanation of dubitability and indubitability awaits, therefore, a general theory of the nature of rationality which illuminates the presuppositions and conditions that rationality requires. Furthermore, it awaits an account, developed from this theory, of the particular conditions in which propositions of various sorts must be regarded as indubitable if the possibility of rationality is to be preserved. Even if this were done, however, a further problem would remain. While an adequate theory of rationality would give a clear account of the conditions in which a proposition may reasonably be regarded as indubitable, it cannot of course guarantee that these conditions are correctly identified in any given case. To support the claim that a certain proposition is indubitable, it is not sufficient to understand the conditions in which such claims are justified; it is also necessary to know that the conditions are fulfilled in the particular case in question.

## THE INDUBITABILITY REGRESS

A disturbing pattern of argument seems to develop, however, in considering the proposition that a given proposition is indubitable. The proposition that the conditions for the indubitability of a certain proposition have been satisfied cannot itself be regarded as beyond doubt unless the conditions for *its* indubitability have been satisfied; but the satisfaction of *these* conditions is dubitable unless ..., and so on.

But acknowledging this regress does not require one to concede that it is never reasonable to regard a proposition as indubitable. Rather, the view to which the regress leads appears to be that while there are occasions on which it is reasonable to regard a proposition as indubitable, it is never altogether indubitable just which occasions these are. There is an air of paradox here, perhaps, but there is no logical difficulty. The regress does not interfere with the possibility of there being satisfactory logical relations between indubitability claims and judgments establishing that these claims are reasonable. It

only interferes with our confidence in ourselves, suggesting that there is always room for doubt as to whether we are being reasonable. Or, to put the matter a bit differently, the regress supports no more than the mordant comment that it is never reasonable to insist that the question of whether one is being reasonable is entirely closed.

## DREAMS

Almost all of us have had dreams, yet few could say with confidence what they are, beyond agreeing that they occur during sleep and have some likeness to waking experience. Yet most people would in all probability accept the kind of definition given by philosophers, for example Plato's "visions within us, . . . which are remembered by us when we are awake and in the external world" (*Timaeus*, 46A) or Aristotle's "the dream is a kind of imagination, and, more particularly, one which occurs in sleep" (*De Somniis*, 462a). Indeed, such notions seem to be summarized in the *Oxford Dictionary's* definition: "A train of thoughts, images, or fancies passing through the mind during sleep; a vision during sleep." Dreams are striking phenomena, and the more superstitious see in them signs and portents of what is to happen; even today divination by dreams has not lost its popularity. A more sophisticated way of looking at dreams is to regard them as revealing something about the sleeper, either about his physical condition or about his mental state. An example of the former can be seen in the diagnostic technique used in the temple of Aesculapius; patients seeking a cure had to sleep all night in the temple precincts and would experience a "vision" that would indicate the disease or its cure. Many writers had suggested that mental states were revealed by dreams, but there was little serious study of the idea until the work of Sigmund Freud and his followers. Freud's doctrine of the unconscious, and the way in which it is revealed in dreams and other less rational activities, is important for psychiatry; but he had little to say about the nature of dreams that is of interest to the philosopher, though the fact that they had been found worthy of study may have resulted in an increase in philosophical concern about the problems they raise.

While we are having them, dreams often appear to be as real as waking experience; children have to be told that the object of their terror "was only a dream," hence not part of the world. William James expressed this well in his *Principles of Psychology*: "The world of dreams is our real world whilst we are sleeping, because our attention then lapses from the sensible world. Conversely, when we wake the attention usually lapses from the dream-world and that becomes unreal." This similarity has led philosophers to pose the question, "How can you prove whether at this moment we are sleeping, and all our thoughts are a

dream; or whether we are awake, and talking to one another in the waking state?" (Plato, *Theaetetus*, 158). In perhaps the most famous example of the difficulty of distinguishing dreams from reality, René Descartes introduced his method of universal doubt. He concluded, "I see so manifestly that there are no certain indications by which we may clearly distinguish wakefulness from sleep that I am lost in astonishment" (*First Meditation*). Descartes finally resolved his doubts in this respect by appealing to a criterion of consistency: "For at present I find a very notable difference between the two, inasmuch as our memory can never connect our dreams with one another, or with the whole course of our lives, as it unites events which happen to us while we are awake" (*Sixth Meditation*). Such a consistency criterion has been adopted by several more recent writers on the topic. Unfortunately, this will not do the task required, for consistency can only be used as a test of a particular experience by waiting to see what happens in the future. It would enable me to tell that I had been dreaming, not that I am now dreaming; for however confident I am of the reality of my surroundings, something may happen in the future that will reveal them to be part of a dream. Further, the problem remains whether any consistency discovered is a real or a dreamed one.

The failure of consistency to provide a test need not be worrying, for the times in which genuine doubt arises are normally those involving memory—I am not sure if this event actually happened or whether I dreamed it. In such a case I would normally try to remember some part of the event that would have left a mark in the physical world, and then see if there is such a trace of the event; if there is nothing, I conclude that I had dreamed the occurrence. In spite of Descartes's remark, it is rare that we are in doubt about whether we *are* dreaming. The expression "I must be dreaming" is normally used in circumstances when I am quite sure that I am not dreaming, to express surprise at some pleasant occurrence, for example the arrival of a friend whom I thought to be somewhere distant. There are times when we are aware that we are dreaming, though normally a dream presents itself as real and no questions about its genuineness arise. It seems that the conviction that one is dreaming does not come from a previous doubt within the dream about the status of the experience; it just occurs, though sometimes accompanied with a feeling of relief. But in most cases the dream convinces us that it is reality, in that no doubt or questioning arises during its course. The difference between dreams and hallucinations lies in the fact that there is nothing external to dreams with which they can be compared, no tests that can be applied. For if we did

apply a test in a dream, the result would be to confirm its reality. Philosophers have sought for some mark or test that would solve this problem, but there is none available. Any suggested sign of reality could be duplicated in the dream, and if all dreams bore marks of unreality, then there could not even be confusion over the remembering of them.

It has been generally agreed that dreams are due to the workings of the imagination no longer under the control of the intellect or the senses, as can be seen from the quotations at the beginning of this article; but it would seem that in such contexts the meaning of the word "imagination" had been left vague, serving rather as an indication of puzzlement than as a solution to a problem. Some recent work by physiologists has led to the suggestion (by W. Dement and N. Kleitman) that dreaming is correlated with rapid eye movements during sleep. Such a suggestion would seem to confirm Aristotle's remark that "dreaming is an activity of the sensitive faculty, but of it as being imaginative" (459a). The use of a physiological criterion for dreams has been challenged by Norman Malcolm in his book *Dreaming* (1959), which is clearly the most important contemporary discussion of the whole topic. In the course of it he challenges virtually all the assumptions made by previous philosophers. In criticism of the physiological work, he asserts that waking testimony is the sole criterion of dreaming (p. 81). The obvious difficulties that arise from the common belief that external stimuli can cause or influence the course of a dream, or that observers can sometimes tell from bodily movements that a sleeper is having a violent dream, he dismisses by means of a definition that dreams can take place only when the subject is sound asleep and that a person who is sleeping cannot respond to external stimuli (pp. 25–26). It might be thought that Malcolm was here doing the same thing for which he criticizes the physiologists, namely introducing a new concept of dreaming, for surely the ordinary unsophisticated notion includes the possibility of our recognizing that someone asleep is having a dream, in some cases at least, as well as the possibility of the dreamer being aware that he is dreaming. If both of these beliefs are ruled out by a philosophical argument, then it would appear that the concept of dreaming held by most people has been changed in important ways. Most of the points made in the earlier part of this article would be understood by those with an unsophisticated notion of dreaming.

Malcolm's arguments are, however, powerful and subtle, and his critics, of whom A. J. Ayer is perhaps the most eminent, have found it not at all easy to refute them.

Malcolm bases his reasoning on Ludwig Wittgenstein's *Philosophical Investigations*, in particular on the dictum that "an 'inner process' stands in need of outward criteria" (I. § 580). Malcolm argues that we can come by the concept of dreaming only by learning it from descriptions of dreams, "from the familiar phenomenon that we call 'telling a dream'" (II, p. 55). To talk of "remembering a dream" is to use the word *remember* in a sense different from the normal, for there is no external criterion by which we can check our memory, as there is in the paradigm cases of remembering, that of remembering an event in the public world, which can be checked by ourselves and others. What is told sincerely on waking is the dream, because there is no other way of finding out what, if anything, occurred while the teller slept. (This can be compared with Freud's reliance on the narration of the dream, but this was essential for its use in diagnosis. Nevertheless, Freud was willing to evaluate critically the veracity of actual dream accounts on the basis of his theory or as a result of previous analysis of its dreamer. For most purposes, it made no difference whether the dream account or the dream itself was being considered; Freud's concern was with different problems.)

Yet Malcolm rejects Ayer's suggestion that this theory amounts to saying that "we do not dream, but only wake with delusive memories of experiences we have never had." Malcolm is clearly correct in stressing the importance of the report of a dream and its difference from reports of public events; what the dreamer says on waking is final. Though we must learn the use of the word *dream* in the way Malcolm indicates, this does not rule out the possibility of its use being extended by further experience, for instance, correlating dream reports with observations of the dreamer, as Dement and Kleitman have done. The trouble is Malcolm's use of the term *criterion*, which is never clearly explained, and which seems to lead him into a crude verificationism; he even talks of "the senselessness, in the sense of the impossibility of verification, of the notion of a dream as an occurrence" (p. 83). A further consequence of Malcolm's use of the dream report as a criterion for dreaming is that it becomes impossible to talk of children having dreams before they have learned to speak (p. 59). If, as Malcolm apparently wishes to maintain, words can be used only if their application can be strictly verified, then many ordinary uses will be cut out. That we now have a particular concept of some mental activity does not make it impossible that further experience will lead us to introduce a modification of it, in which case the way in which we first learned it may have no bearing on the criterion of its use. For example, many words used in the sciences are first

learned in an approximate way and their criteria of application refined in the course of education. Malcolm claims that his argument applies only to words that refer to “inner” processes. What he seems to do, however, is extend Wittgenstein’s argument, valid in the area Wittgenstein intended it for, beyond its legitimate sphere. The primary use of the word *dreaming* depends upon the notion of telling a dream, but this does not prevent an extended use. Peter Geach remarks that Wittgenstein mentioned in a lecture Lytton Strachey’s description of Queen Victoria’s dying thoughts: “He expressly repudiated the view that such a description is meaningless because ‘unverifiable’; it has meaning, he said, but only through its connexion with a wider, public, ‘language-game’ of describing people’s thoughts” (*Mental Acts*, p. 3). In fact it is only because we know what it is to dream that we can understand the difficulties raised by talk of “verifying” reports of dreams.

Ayer also criticizes Malcolm’s denial that one can make assertions while asleep, but in this case with less effect. It does seem clear that the words “I am asleep” cannot be used to make a genuine assertion, because such an utterance would contradict what was asserted, just as the only possible truthful reply to the question, “Are you asleep?” is “No.” An absence of reply is what would lead the questioner to assert that the man was really asleep.

In spite of Malcolm’s statement (p. 66) that there is no place for an implication or assumption that a man is aware of anything at all while asleep, many would claim, and understand others’ claims, that they had become aware that they were dreaming. This also implies that they were aware that they were asleep. As part of a dream narrative, such awareness could be reported by the words, “I suddenly realized that it was all a dream.” Clearly, such an assertion could not be taught by ostensive means. However, there seems no reason why, having learned how to use the ordinary concept of dreaming and expressions such as “I suddenly realized that,” we should not combine the two into an assertion that would be commonly understood to apply to a possible experience. Malcolm’s claim that a person must be partially awake to be aware that he is dreaming (pp. 38–44) seems, as suggested above, a redefinition of the term for which no adequate reason is advanced.

Malcolm wishes to say that the problem of what dreams are is a pseudo problem; he refuses to allow that they can be called experiences, illusions, workings of the imagination, or anything else they have been thought to be by previous philosophers. Ayer concludes his criticism of *Dreaming* by maintaining that dreams are experiences

and mostly illusions, and “are found to be so by the same criteria that apply to illusions in general.” This remark is difficult to understand; here Malcolm’s stress on the report of the dream comes into its own; in recounting it I am not claiming that these things happened. Because while dreaming there is no possibility of making assertions about my experiences to other people, to describe dreams as illusions makes no sense. Malcolm has clearly made out his case in this respect. On the other hand, it seems difficult to deny that dreams are experiences, if only because the description is sufficiently vague to cover almost any “mental” phenomena. The same may be said of talking of dreams as being composed of images; here dreaming is being used as one of the examples of mental imagery, a vague concept. In spite of Malcolm’s work, the problem of the nature of dreaming is still open for philosophical discussion, but any future examination of the problem will have to take his book fully into account. Many philosophers would still wish to assert that dreams occur, that they take place during sleep, while admitting that the meaning and justification of such claims is by no means clear.

## DRETSKE, FRED

(1932–)

Born in 1932, Fred Dretske received his PhD from the University of Minnesota. He is emeritus professor of philosophy at Stanford University and professor of philosophy at Duke University. Since the early 1970s Dretske's work has been at the center of a number of key disputes in epistemology and the philosophies of perception, mind, and consciousness. Despite their range, two basic motivations unify Dretske's writings: the need to understand the mind in relation to its environment and a steadfast naturalistic outlook on the mind and its operations.

In *Seeing and Knowing* (1969), Dretske emphasized a form of perception that he labeled "nonepistemic seeing." This is an direct relation between perceiver and object not involving any particular conceptualization of the perceived object nor requiring any particular beliefs about it. Dretske argued that the concept of nonepistemic seeing is fundamental to understanding perception and the place of the mind within the world. Without it we have no way of understanding how we can all experience the same world despite having widely divergent concepts and beliefs. Via the notion of nonepistemic seeing, we can strip away our cognitive interpretive faculties and be left with the content of perception: the *objects* of the world we perceive.

Attention to nonepistemic seeing also undercuts the old idea that seeing involves "direct acquaintance" with

some mysterious mental object, from whose incorrigibly known features we can only *infer* the existence of the external world.

We might naturally ask, What is the basic enabling feature of nonepistemic seeing? The answer is that there is an internal state of the perceiver that "carries the information" about the seen object. In *Knowledge and the Flow of Information* (1981), Dretske developed a sophisticated, elaborate, and technical account of information and its role in knowledge, thought, and perception. Building on his earlier epistemological work, Dretske analyzed knowledge in terms of *informationally caused* beliefs. To take one of Dretske's famous examples (from 1970), someone at a zoo *knows* that there is a zebra in front of him if that very information is causing his belief. Whether the appropriate information is available depends on the context of its occurrence, since information is a function of the *relevant* alternative messages that a signal could deliver. If there are lots of cleverly disguised mules about, his belief may not be caused by the information that there is a zebra in front of him (since the presence of that information may depend upon how much the perceiver knows about how zebras look), and thus he may not know that there is a zebra in front of him.

Dretske's account has an infamous consequence: the denial of inferential knowledge via known entailments. If our subject knows that these (the creatures in front of him) are zebras and that it follows from *x*'s being a zebra that *x* is *not* a disguised mule, then it would seem he could infer that these are not mules and hence *know* this. But how could he know this when he is utterly unable to distinguish a painted mule from a zebra? Dretske asserted that someone could know that something is a zebra without knowing that it is not a painted mule. While the mechanics of information allow this "paradox," the general issue remains highly contentious.

How can information or content play a causal role in the world? This is a key issue for Dretske's project of naturalizing the mind, or as Dretske puts it, baking "a mental cake with physical yeast and flour." Crudely put, the problem is that all behavior appears to have purely physical explanations that need appeal not to any information but only to local causes. We know how charge, momentum, and gravity cause events; informational causation seems to be something else altogether and quite mysterious.

In *Explaining Behavior* (1988), Dretske addressed this problem via a distinction between "triggering" and "structuring" causes. If *C* is an efficient or local cause of *M*, it is a triggering cause. The structuring cause of *M* is

“the processes which explain why *C* causes *M*” (p. 91). In particular, the structuring causes of behavior are the historical processes that institute the triggering causal links between information-carrying mental states and behavior. Two aspects of this sort of explanation must be distinguished. The first comprises the historical processes—evolution, learning, or design—by which some internal state comes to have an “indicator function.” The second is the deployment of the indicator to modify behavior *because* of what is indicated. Dretske maintains that, while a great many states serve to carry information of one sort or another and while these states certainly do enter into causal relations, only *learning* can bring about systems in which the carried information causally explains why these states cause the behavior they do. Only in learning do “we see meanings ... doing some real work in shaping behavior” (“Dretske’s Replies,” p. 201).

The emphasis on learning leads to obvious difficulties. It seems to imply that innate mental states cannot explain behavior (perhaps cannot even *cause* behavior and maybe cannot even exist). In *Naturalizing the Mind* (1995), Dretske, elaborating his view, allowed that evolutionary processes can produce representational mental states that do not depend on learning for their efficacy. There he distinguished *systemic* and *acquired* representational states. The former are the experiential qualities of experience. Their content is nonconceptual and fixed by biology. Systemic representation underpins nonepistemic perception. And it enables acquired representations, a form of which constitute beliefs and the other propositional attitudes. This distinction allows for a more nuanced theory of mind and forms the basis for an ambitious representational theory of consciousness. In *Naturalizing the Mind*, Dretske also develops an intriguing theory of introspection in which our self-knowledge involves a special application of mentalistic concepts to our own experience.

Dretske continues to claim that representation is essentially linked to the external environment. In his theory of consciousness, the experiential nature of mental states depends on their representational properties (and all conscious states, including such “pure” sensations as pain or tickles, are conceived of as representational). While promising a complete naturalization of the most troublesome feature of the mind, representational properties have a downside. Since representational properties are determined and constituted by relations with the environment, Dretske’s views have the consequence that a newly created *duplicate* of a person would utterly lack consciousness. Many find this less than plausible.

Be that as it may, Dretske presents an elegantly unified and comprehensive theory of mind that makes our mental lives fully causal in an entirely naturalistic way. His views, in their clarity, argumentative care, and intellectual honesty, exemplify the best features of modern analytic philosophy.

## DRIESCH, HANS ADOLF EDUARD (1867–1941)

Hans Adolf Eduard Driesch, perhaps the outstanding representative of neovitalism, was born at Bad Kreuznach, Germany. His father, Paul Driesch, was a merchant in Hamburg. From 1877 Hans Driesch attended the Johanneum (a humanist gymnasium) in his native city, graduating with honors in 1886. He then studied zoology, first under A. Weismann at Freiburg, then at Munich, and finally under Ernst Haeckel at Jena, receiving his Ph.D. in 1889; his dissertation was titled “Tektonische Studien an Hydroidpolyphen” (Tectonic studies of hydroid polyphen).

## DEVELOPMENT OF DRIESCH'S THOUGHT

Reacting to arguments advanced by G. Wolff, W. His, and A. Goette, Driesch early became skeptical of Haeckel's mechanistic interpretation of the organism. The work of Wilhelm Roux, in particular, induced him to explore the whole vitalism-mechanism issue. Driesch's first publication, *Die mathematisch-mechanische Behandlung morphologischer Probleme der Biologie* (Mathematico-mechanical treatment of morphological problems of biology; Jena, 1890), led to a break with Haeckel. Then, following Roux's example, Driesch put the embryogenetic theory of His and Weismann to an experimental test. His and Weismann had held that morphogenetic development of the living organism could be explained by assuming that a specifically organized yet invisible structure of great complexity is contained in the nucleus of the germ cell and that the gradual unfolding of this structure, through nuclear division, determines the course of every ontogeny. Roux's experiments, in 1888, had seemed to confirm this theory of "tectonic preformation." When he destroyed one of the blastomeres at the two-cell stage, the remaining one would develop into a half embryo—either the left half or the right half, depending on which blastomere had been destroyed. Driesch merely intended to provide further confirmation of these facts. But where Roux had experimented with the egg of a frog, Driesch used eggs of the sea urchin. Against all expectations he found that each blastomere of the two-cell stage of a sea urchin egg developed into a whole embryo half the normal size. This was the opposite of Roux's results and was irreconcilable with the His-Weismann theory.

While at the Marine Biological Station in Naples, from 1891 to 1900, Driesch continued his experimental investigations, confirming and reconfirming in startling ways his earlier findings, and began to formulate his own theory. Relevant to the development of his ideas was a study of Otto Liebmann's book *Analysis der Wirklichkeit* (Analysis of reality) and of the writings of Immanuel Kant, Arthur Schopenhauer, René Descartes, John Locke, and David Hume. Alois Riehl's *Kritizismus* (Criticism) provided the springboard for Driesch's own theoretical efforts. The first results were published in 1893 under the title *Die Biologie als selbständige Grundwissenschaft* (Biology as an independent basic science; Leipzig). This book was followed by *Analytische Theorie der organischen Entwicklung* (Analytic theory of organic development; Leipzig, 1894), which contains the first formulation of Driesch's own teleologically oriented embryological the-

ory. But as yet this was a theory of "preformed teleology," not a vitalistic interpretation of embryological development. Only in 1895 did it dawn on Driesch that mechanistic principles could not account for his experimental findings.

Up to this time Driesch had accepted a "machine" theory of organismic development. Now he realized that such a theory would not do. In an essay titled "Die Maschinentheorie des Lebens" (The machine theory of life; in *Biologisches Zentralblatt* 16 [1896]: 353–368) he formulated as precisely as possible the view he had held so far, a view that he did not yet regard as vitalism. His first formulation of a dynamically teleological, and therefore genuinely vitalistic, theory was published under the title *Die Lokalisation morphogenetischer Vorgänge, ein Beweis vitalistischen Geschehens* (The localization of morphogenetic processes, a proof of vitalistic developments; Leipzig, 1899). In this book Driesch introduced the concept of the "harmonious equipotential system" and the proof that such a system cannot be accounted for in terms of mechanistic principles. The publication of 1899 thus marked the end of one period in Driesch's intellectual development and the beginning of another.

Gradually his interest in experimental work ceased. He now searched the literature in the field of physiology for possible proof that a "machine" theory could provide an adequate explanation of the phenomena of life. He found none, as his two books *Die organischen Regulationen* (Organic regulations; Leipzig, 1901) and *Die "Seele" als elementarer Naturfaktor* (The "soul" as elementary factor of nature; Leipzig, 1903) show. However, the conception of the "autonomy" of life had now to be justified within the broader framework of natural science. Driesch provided this justification in a book titled *Naturbegriffe und Natururteile* (Concepts of nature and judgments of nature; Leipzig, 1904). In 1905 he published *Der Vitalismus als Geschichte und als Lehre* (*The History and Theory of Vitalism*), in which he summed up his position against a historical background. That same year he "resolved to become a philosopher." His Gifford Lectures at the University of Aberdeen in 1907–1908, published in 1908 as *The Science and Philosophy of the Organism*, provided a splendid opportunity to present his position in systematic form.

From 1908 on, Driesch was concerned exclusively with philosophical problems. In 1909 he became a *Privatdozent* at Heidelberg and in 1912 a member of the university's philosophical faculty. In 1912, also, he published his basic philosophical work, *Ordnungslehre* (Theory of order). This was followed by *Die Logik als Aufgabe* (Logic

as a task; Tübingen, 1913) and, in 1917, by *Wirklichkeitslehre* (Theory of reality). These three books together—ranging as they do over the fields of epistemology, logic, and metaphysics—embody the whole of Driesch's philosophical system, but they do not mark the end of his intellectual development. In *Leib und Seele* (Body and soul; 1916) Driesch set forth his definitive arguments against every “psycho-mechanical parallelism,” and in *Wissen und Denken* (Knowing and thinking; Leipzig, 1919) he clarified and expanded his epistemological position.

In 1919 Driesch accepted a chair of systematic philosophy at the University of Cologne and in 1921 assumed a similar post at the University of Leipzig. During 1922–1923 he was a visiting professor in China. In 1926–1927 he lectured in the United States and in Buenos Aires. Being out of sympathy with the Nazi regime, ideologically and politically, he was retired in 1933. Adolf Hitler could not tolerate a thinker who fervently believed that nationalism was but “an obstacle to the realization of the *one* State of God.” During the time of changing appointments, Driesch became interested more and more in problems of psychology and parapsychology. Books published in 1932 and 1938 reflect this development.

### DRIESCH'S PHILOSOPHY

Although known primarily as one of the leading neovitalists, Driesch was also a critical realist and an “inductive” metaphysician. His system as a whole is developed most fully and most systematically in his *Ordnungslehre* and his *Wirklichkeitslehre*.

In his Gifford Lectures Driesch had evolved the argument that the phenomena of ontogenetic development, as revealed in his own experimental work, can be explained only when we assume the existence and the efficacy of some nonmechanistic and “whole-making” factor in nature, which Driesch called *entelechy*. This *entelechy*, “lacking all the characteristics of quantity,” is not some special kind of energy, not a “constant” or a “force.” It is not in space or in time but acts into space and into time. *Entelechy*, Driesch confessed, is “entelechy, an elementary factor *sui generis*” that “acts teleologically.” But even Driesch could not blind himself to the fact that such a definition of his key concept is essentially meaningless because it is defined only negatively. He therefore tried, in his *Ordnungslehre*, to show that the conception of *entelechy* is logically legitimate after all.

Starting with the “irreducible and inexplicable primordial fact” that “knowing about my knowledge, I know something,” Driesch found in his experience “primordial

concepts of order the meaning of which I, as the experiencing subject, grasp only ‘intuitively’” (*Bedeutungsschau*), and that the experience as a whole presses on toward our “seeing everything in order.” The method through which this “order” is revealed is that of “positing” or “discriminating” “objects of experience.” It is necessary, however, to distinguish between “positing” (*setzen*) and “implicitly positing” (*mitsetzen*). What is “posited” may, in turn, “implicitly posit” something else. The whole procedure implies that the “object” is always “my” object (since I “posit” it), not some “thing-in-itself.” To postulate an “objectivity” as a reality independent of, and separated from, “my” experience would involve a fallacy. Still, we must somehow transcend this “methodological subjectivism” by attempting to obtain a complete view of the totality of experience, actual and possible. In constructing this “whole” we are to be guided by the principle of economy: Only necessary steps should be taken, for “order” is perfect only when it includes everything necessary but nothing more. Now, upon inspection, I find that the experience I have is such that I can always select some specific part of it and identify it as “this,” or as *A*. But as soon as I have posited a “this,” all the rest of my experience has become a “nonthis,” and the basic principle of noncontradiction—“this is not nonthis”—emerges. Moreover, when I posit a “this” and define it as *A*, I have before me (1) the *concept A* and (2) the *judgment* “*A* is there” or “*A* exists” (at least as an object for me). But let us now assume that some particular object *A* has the discernible attributes *abcd*, whereas some other object *A'* has the attributes *acd*. The objects are clearly different, but *A* includes *A'*, or “*A* implicitly posits *A'*.” Thus, the posit “wolf” implicitly posits “beast of prey,” and any existing wolf implicitly posits an existing beast of prey. By extension, we obtain “*A* posits *A'*, and *A'* posits *a*; therefore, *A* posits *a*.” The principles of logic, thus, have their basis in our intuitive experience of order. The same is true, of course, of arithmetic and geometry. In fact, it is the aim of Driesch's general theory of order to disclose all the primordial elements of order first given in basic intuition.

Among “my” experiences there are some that I “have had before”; I “remember” them. This fact opens up an entirely new dimension of experience. But given this new dimension, I can now establish a remarkable order in my experience if I regard some of the objects of my immediate experience as an indication of the “being” or the “becoming” of an *X* that behaves as if it were independent of my experience of it; that is, it behaves as if it were a self-sufficient “realm of nature” in which the bipolar “cause-effect” relationship prevails. However, since, on

the one hand, the effect cannot be richer in content than is its cause but, on the other hand, the living individual is a “whole” that is more than the sum of its parts, a close scrutiny of experience led Driesch to distinguish between a “merely mechanical causality” (*Einzelheitskausalität*) and a “whole-making causality” (*Ganzheitskausalität*) that involves more than merely additive changes. In ontogenetic development, for example, a mere sum of “equipotentialities” is thus transformed into the “wholeness” of the mature organism. “Restitution” and “adaptations,” experimentally demonstrable, are manifestations of this “whole-making” causality. The living organism itself, in its indisputable wholeness, is the most obvious result of *Ganzheitskausalität*. Thus, vitalism finds its justification within Driesch’s epistemology.

At the psychological and cultural levels, “whole-making causality” predominates, and Driesch posited “my soul” as “the unconscious foundation” of my conscious experience. The “soul,” therefore, is also “posited in the service of order.” “My primordial knowing of the meaning of order and my primordial willing of order ... indicate ... a certain primordial state and dynamics of my soul.” “The *working* of ‘my soul’ [which guides my ‘actions’] and certain *states* [of my soul] are ‘parallel’ to ‘my conscious havings.’” “This sounds very artificial,” Driesch admitted, “but logic is a very artificial instrument.” When Driesch took up this theme again, in his *Wirklichkeitslehre*, he argued that “metaphysically,” “my soul and my entelechy are One in the sphere of the Absolute.” And it is at the level of the Absolute only that we can speak of “psycho-physical interaction.” But the Absolute, so understood, transcends all possibilities of our knowing, and it is “an error to take, as did G. W. F. Hegel, the sum of its traces for the Whole.”

All considerations of normal mental life lead us only to the threshold of the unconscious; it is in dreamlike and certain abnormal cases of mental life that we encounter “the depths of our soul.” And in parapsychological phenomena—especially in telepathy, mind reading, clairvoyance, telekinesis, and materialization (all of which Driesch accepted as proved facts)—we find traces of a supra-individual wholeness. More important, however, our sense of duty also points toward a supra-personal whole, which, in the course of history, is continuously evolving. “In my experience of duty I am participating in the supra-personal whole of which I am an empirical embodiment, and it is *as if* I had some knowledge about the final outcome of the development of that whole.” That is to say, my sense of duty indicates the general direction of the supra-personal development. The ulti-

mate goal, however, remains unknown. From this point of view, history took on its particular meaning for Driesch.

Throughout his work Driesch’s orientation is intended to be essentially empirical. Any argument concerning the nature of the ultimately Real will therefore have to be hypothetical only. It starts with the affirmation of the “given” as consequent of a conjectural “ground.” His guiding principle in the realm of metaphysics amounts to this: The Real that I posit must be so constituted that it implicitly posits all our experience. If we can conceive and posit such a Real, then all laws of nature, and all true principles and formulas of the sciences, will merge into it, and our experiences will all be “explained” by it. And since our experience is a mixture of wholeness (the organic and the mental realms) and nonwholeness (the material world), Reality itself must be such that I can posit a dualistic foundation of the totality of my experience. In fact, there is nothing—not even within the ultimately Real—to bridge the gap between wholeness and nonwholeness. And this means, for Driesch, that ultimately there is either God and “non-God,” or a dualism within God himself. To put it differently, either the theism of the Judeo-Christian tradition or a pantheism of a God continually “making himself” and transcending his own earlier stages is ultimately reconcilable with the facts of experience. Driesch himself found it impossible to decide between these alternatives. He was sure, however, that a materialistic-mechanistic monism would not do.

## DUALISM IN THE PHILOSOPHY OF MIND

Mind-body dualism is the doctrine that human persons are not made out of ordinary matter, at least not entirely. Every person has—or, on many versions of the view, simply is identical to—a soul. A soul is said to have little in common with human bodies and other material objects but is in one way or another responsible for a person’s mental life.

Mind-body dualism is sometimes called “substance dualism,” to distinguish the view from “property dualism”—the thesis that mental properties (such as being in pain, thinking of Vienna) are in some way significantly different from or independent of physical properties (such as having neurons firing in one’s brain in a certain pattern). Property dualism is meant to allow for what is often called “dual-aspect theory”: persons are material objects with a nonphysical, mental “aspect” but no nonphysical *parts*—that is, no immaterial soul.

The entry begins with a brief discussion of property dualism, only to set it to one side in order to examine substance dualism in detail: its varieties, the traditional objections to the view, and the most popular arguments in its favor.

### PROPERTY DUALISM

Before considering ways in which mental and physical properties might be distinct or independent, one needs to know what is meant by the terms *mental* and *physical*. (The expressions *property* and *state* shall be used interchangeably; being in pain is a mental property or mental state, weighing 150 pounds is a physical property or physical state. Many different things can be in pain or have the same weight; so properties and states are, in some sense, universals.)

Phenomenal states, such as experiencing a reddish afterimage or feeling a sharp pain, are surely mental states, as are “intentional attitudes” such as believing, doubting, loving, and hating. There may be puzzles about how to classify the unconscious desires and fears probed by psychoanalysts; but otherwise, the boundaries of the mental seem fairly clear. The range of things one might mean by *physical property* is, however, broader and more problematic. A narrow reading of *physical* might include only properties that come in for explicit mention in current fundamental physics—or in an imagined “final, true physics.” A more generous approach would include any property expressible given just the resources of physics, mathematics, and logic. Sufficient generosity along these lines would allow for physical properties corresponding even to infinite disjunctions of arbitrarily chosen, maximally precise microphysical descriptions (that is, “consisting of such-and-such fundamental particles arranged in precisely this way, or that way, or ...”).

If property dualism were simply the thesis that mental properties are not identical to physical properties, narrowly construed, the doctrine would be of little interest. Synthesizing bile is a state of the liver; reaching gale force is a state of the winds in a hurricane; and neither “synthesizing bile” nor “reaching gale force” is a term likely to appear in any fundamental physics, contemporary or idealized. If “pain” fails to show up in physics for similar reasons, the mental state it names may be no less physical than the synthesis of bile or the force of a hurricane.

Given the more generous understanding of “physical,” synthesizing bile or reaching gale force might well be identical to, or at least necessarily coextensive with, a physical property—a property equivalent to all the possible ways to synthesize bile or reach gale force, described in extreme microphysical detail. Imagine a god surveying all the possible worlds it could create, with their many varieties of particles and fields and laws. Such a being could disjoin all the microphysical descriptions of livers synthesizing bile or hurricanes achieving gale-force winds and thereby define physical properties necessarily coextensive with the target biological and meteorological properties. The existence of such definitions would show that the functioning of a liver or the strength of a hurricane could not possibly come apart from the behavior of the matter constituting the liver or the air and water through which the hurricane moves. If the god could do the same for mental states, that would show that they, too, are firmly grounded in microphysical facts.

To arrive at a truly interesting version of property dualism, one might suppose that even godlike powers to

exhaustively describe every possible microphysical system would fail to produce a physical property necessarily coextensive with each mental property. Many who use the term follow David Chalmers (1996) in identifying it with the following sort of thesis: For at least some mental states, it is not possible to define, in terms of microphysical properties alone, a physical property common to all individuals in that mental state, and only to them—even given the resources of arbitrarily complex definitions and infinite disjunction, and even when restricting the search to a property that is merely coextensive in worlds with the same fundamental physical properties.

Property dualism, so understood, is equivalent to the failure of a variety of supervenience—a notion first used in philosophy of mind by Donald Davidson (1970) and brought into focus by Jaegwon Kim (1990). In the technical sense of *supervene* that is relevant here, the mental properties of a thing supervene upon its microphysical properties if and only if, among all the possible individuals in all the possible worlds, there is no pair with all the same microphysical properties but different mental properties. Kim showed that if supervenience held, one could define a physical property coextensive with any mental property simply by disjoining all the sufficiently precise microphysical descriptions of possible individuals having that property.

Defining property dualism as a failure of the mental to supervene upon the microphysical seems to presuppose that the fundamental properties of anything worthy of the name “physics” will not include mental states. But, as Robert Adams (1987) and Richard Swinburne (1997) point out, if mental states really are fundamental, one might expect that experiencing particular kinds of pains or smells will have to figure in some of the most basic laws. Still, so long as the nonmental physical properties of matter could be the same while the envisaged brutally mental ones could have been different (had there been different natural laws relating the two kinds of property), there would be a failure of supervenience: The mental properties would fail to supervene upon the purely physical properties.

Unlike substance dualism, property dualism remains a respectable position within philosophy of mind, defended by Chalmers (1996) and others. It seems easy to imagine physically indiscernible zombies (animate human bodies with no consciousness) or people whose spectrum of color experiences is the reverse of one’s own. If genuinely possible, these scenarios show that the mental does not supervene upon the physical.

Substance dualism is also inconsistent with supervenience. If souls lack the properties mentioned in physics, they cannot very well differ physically; but, because different people are obviously thinking different things, the dualist's souls must differ mentally.

Until the latter half of the twentieth century, a dualism of mental and physical properties was largely taken for granted, even among philosophers who called themselves materialists. The term “dualism” almost always meant a dualism of distinct substances—a practice to be followed in the remainder of this entry.

### PURE DUALISM AND COMPOSITE DUALISM

Many dualists, like Plato, teach that persons are entirely immaterial; they are identical with souls and are related to their physical bodies as pilot to ship. Others—perhaps René Descartes (1984), certainly St. Thomas Aquinas (cf. Stump 2003) and Richard Swinburne (1997)—identify a person with a composite of soul and body. Among composite dualists, further differences emerge: most composite dualists ascribe one's mental properties to the soul and one's physical properties to the body. On this version of composite dualism, a person is identical with a psychophysical whole that includes the thinking soul as a part. Eric Olson (2001) has drawn attention to some of the drawbacks of this view. It suggests that the soul is the real thinker, and that a person only has mental states by courtesy. But how could something—the soul—think and not be a person? How could it think for someone else? If the composite dualist insists that the person and the soul are both thinkers and that neither is the subject of mental states in a more fundamental way than the other, then each person includes two thinkers, neither of which can distinguish itself from the other.

St. Thomas Aquinas advocated a very different sort of composite dualism (for exposition, cf. Stump 2003, Leftow 2001). Within Aquinas's Aristotelian metaphysics, “accidental forms” explain a thing's accidental properties, and a “substantial form” explains its being, or essence. Following Aristotle, Aquinas calls the substantial forms of living things “souls”; the soul of a human being is responsible for its entire complex physical and mental nature. But it is not the soul that thinks or acts, it is the whole human being—a composite of matter and the soul or form that gives the matter its distinctively human structure. Aquinas departed from Aristotle in supposing that the human soul is a “subsistent form,” something that continues to exist after death while not “informing” any matter. It even manages to think in that truncated state.

The Thomistic doctrine of the soul is a borderline case of mind-body dualism—although, with Eleonore Stump (2003) and Brian Leftow (2001), one may well regard its intermediate status as a promising sign. Although body and soul are united, says Aquinas, the soul has no mental properties; it is not itself a mind. Nor is it responsible for a person's mental powers alone; it includes the physical nature of a human being as well. For present purposes, dualism will be restricted to theories like Plato's pure dualism or Swinburne's composite dualism: theories positing souls with mental states of their own, in this life.

### THE SPECTRUM OF DUALISMS

One point of agreement among dualists of all stripes is that there are a great many things in the world that lack mentality of any sort; and that, associated with each human person, there is a thinking thing, a soul, not composed of the same kinds of stuff as these nonmental things. The animist and spiritualist may think of the soul as extended or composite (ghostlike, perhaps composed of “ectoplasm”); but they deny, at any rate, that it is made of stuff that can be found in objects completely devoid of mentality. To be a substance dualist, then, one must at least accept a doctrine one might call *compositional dualism*: There exist things that can think alongside things that cannot think; and the thinking things either have no parts at all, or else parts of a special kind, unique to thinking things.

One could be a compositional dualist but still be a materialist. Roderick Chisholm (1978) took seriously the hypothesis that a person might be a tiny physical particle lodged somewhere in the brain. Suppose someone claimed, in a similar spirit, that the soul is a point-sized thinking substance that has the same mass as a proton and the same charge as an electron; and that every substance with a similar mass and charge is capable of thought. This rather bizarre theory qualifies as compositional dualism—yet it seems also to be a kind of materialism. Since dualism has always been thought of as an alternative to materialism, there must be more to it than compositional dualism. The missing component is clear: The thinking thing cannot simply be a special kind of physical object, such as a new species of fundamental particle; but what is it to be “nonphysical”?

Daniel Dennett sees a fundamental incoherence in the very idea of a nonphysical soul: “A ghost in the machine is of no help in our theories unless it is a ghost that can move things around ... but anything that can move a physical thing is itself a physical thing (although

perhaps a strange and heretofore unstudied kind of physical thing)” (Dennett 1991, p. 35). If one were to define *physical* as “able to produce effects in space,” then of course a nonphysical soul could not interact with a body. When dualists have denied that the soul is physical, they have meant many things—but none has been so foolish as to mean that.

Every plausible version of compositional dualism implies that substances capable of thought (and their parts, if any) have some important properties in common with substances utterly incapable of thought. To call a thinking thing “nonphysical” is not to say it has absolutely nothing in common with the matter of nonsentient things; it is rather to deny that they have as much in common as one might have thought. But dualists disagree about which attributes of ordinary matter are not found in thinking substances—that is, they mean different things by “nonphysical.” The result is a spectrum of dualisms.

The maximal difference a dualist might posit between soul and body would be to identify souls with necessarily existing abstract objects, outside of space and time, like numbers or Plato’s Forms. Some have said that persons are to their bodies as programs are to the computers that run the programs. And, if programs are understood in a way that makes them quite independent of the particular computers running them, they become abstract objects, mathematical entities. But it is hard to take this analogy very seriously. Almost all dualists will agree that souls have this much in common with ordinary material things: They are concrete entities, existing in time, and capable of change.

René Descartes allowed at least that much similarity between souls and ordinary matter, but little more. Cartesian souls are not dependent upon the behavior of matter for their continued existence or ability to think. They have no position in space. Descartes also claimed that souls are “simple,” or without parts. Since he believed that everything in space was infinitely divisible, this was another way in which souls were unlike anything made of ordinary matter (Descartes, 1984).

Few dualists are so far out along the spectrum of dualisms as Descartes, however. It has become harder to deny that the ability to think depends upon a properly functioning brain. William Hasker (1999), Charles Taliaferro (1994), and other contemporary dualists go further, denying the existential independence of souls: When an organism has a sufficiently complex nervous system, it then automatically also generates a nonphysical substance to be the subject of that consciousness—an “emer-

gent substance” that remains radically but not completely dependent upon the brain for most of its operations and even for its continued existence. Hasker, W. D. Hart (1988), and—long before them—Samuel Clarke (1738) and Hermann Lotze (1885) have insisted that souls are located in space. Hart argues that mind-body interaction could even involve the transfer of a conserved quantity between soul and body. The “psychic energy” he describes makes souls even more like paradigmatic physical things. Still, Hart’s souls lack charge, mass, spin, and all other interesting intrinsic properties characterizing physical particles. Furthermore, Hart defines measurable degrees of psychic energy in terms of the propensity to sustain beliefs, not in terms of physical effects; so even this quasi-physical quantity seems grounded in the mental nature of Hart’s souls rather than in any features they share with ordinary matter.

Hart’s view should surely qualify as a kind of dualism—his souls are immaterial enough—and the Chisholm-inspired particle materialism should not. If, as seems likely, there is no sharp line on the spectrum of compositional dualisms between the two, then the term “dualism” is vague. As with most vague yet useful terms, the region of indeterminacy is largely unoccupied.

The less extreme dualisms are of greater philosophical interest than Cartesianism. They make souls a part of the natural order, generated by any brain sufficiently complex to subserve conscious experience. One of the worst problems of interaction (the “pairing problem,” discussed in the next section) is easily solved if souls are in space. Furthermore, few, if any, of the principal arguments for dualism (including the ones surveyed below) require Cartesian souls. Less radical dualisms are safer, positing no more differences between souls and material objects than are implied by the reasons for rejecting materialism.

## PROBLEMS OF INTERACTION

Most objections to dualism fall under one of three heads: problems of interaction, epistemological worries, and application of Ockham’s Razor. The most commonly cited “knockdown” objection to dualism is the impossibility of causal interaction between things as dissimilar as a physical body and an immaterial soul. The obvious rejoinder is that very dissimilar things do interact. For example, particles are certainly quite unlike the fields that push them around and that are, in turn, altered when particles are introduced into them. Attempts to make the objection more persuasive come in two versions.

The “pairing objection” begins with Ernest Sosa’s observation: “What pairs physical objects as proper mates for causal interaction is in general their places in the all-encompassing spatial framework of physical reality” (1984, p. 275). Consider a series of duplicate guns, each of which hits a different target. Guns and targets are exactly alike; only differences in spatial relations explain why each gun hits a different target—the target at which it is aimed. Compare guns and targets to the bodies and souls of identical twins Joe and Moe. However similar they are, only Joe’s body causes experiences in Joe’s soul; only decisions taken by Joe lead directly to motions of Joe’s body. According to the Cartesian, there can be no differences in the spatial relations between Joe’s soul and the bodies of Joe and Moe; being outside of space, the soul cannot be closer to one body than to the other. But in what other respects could Joe’s soul be “closer” to Joe’s body than to Moe’s body, and Moe’s soul closer to Moe’s body than to Joe’s? Descartes’s souls are all equally cut off from the physical world, so no answer comes readily to mind.

The pairing objection tacitly assumes that causal laws, and the dispositions and powers of objects described by such laws, are always general—an assumption some dualists reject. John Foster (1991) and Peter Unger (2006) think that souls and bodies could have not only dispositions to react to certain types of objects and situations but also dispositions to interact in special ways with particular individuals—individuals that need not differ in any qualitative or relational way.

Dualists like Clarke (1738), Lotze (1885), Hart (1988), and Hasker (1999) are in an even stronger position, since they assume that souls fall within the same spatial coordinate system as bodies. They make the natural assumption that, if souls are to be found in space at all, they must be located within the brains with which they interact. But one still wants to know exactly what sort of region a soul is supposed to occupy. Many dualists believe souls are simple, or partless. Must a simple thing occupy a geometrical point, on pain of being divisible into at least two parts, a left and right half? Some philosophers say no. Clarke (1738) and Lotze (1885) claim that the soul is spatially extended but simple. Lotze locates the soul within the brain wherever interaction takes place—which could be many different places at once, and different places at different times. Leibniz considers a mode of spatial occupancy the Scholastics called “definitive ubeity”: there is a precise region in which the soul is located, but it is not true of any subregions that it is located precisely there (Leibniz, 1981, p. 221). Although these are difficult notions, they may represent ways (or perhaps two

descriptions of the same way) for a soul to occupy more than a mere point while remaining a partless unity.

A second objection to interaction alleges that the mental states attributed to souls are of the wrong sort to enter into laws governing physical phenomena. If the “qualia” of phenomenal experiences (for example, the felt redishness of a red after-image, the sharp flavor of an acrid smell) could somehow be reduced to physical states of brains or analyzed in terms of functional roles that physical states could play, then they would pose little threat to a materialistic picture within which all causation is underwritten by laws of the sort one finds in physics. If they characterize the states of a nonphysical soul, however, they will have to be taken seriously as extra, fundamental features of the world, requiring causal explanation. Causation requires laws; but in order for the astonishing variety of phenomenal states, falling under several sense modalities, to enter into the kinds of laws familiar from the sciences, they must be susceptible of precise mathematical comparison. However, as Robert Adams points out, “[t]here is no plausible, non-adhoc way of associating phenomenal qualia in general ... with a range of mathematical values....” (Adams 1987, p. 256). Laws linking the phenomenal experiences of a soul to the physical states of a body are bound to be relatively unsystematic and staggeringly complex. Far better to suppose that phenomenal properties are merely complex physical states of the brain; and that, as such, they obey laws that can be derived from those of biology, chemistry, and, ultimately, fundamental physics.

This second interaction objection, however powerful it might be, applies not only to substance dualists but also to anyone who is a property dualist about phenomenal states. Many philosophers who are happy to suppose that persons are identical with physical objects (such as living, human bodies or brains) nevertheless heartily endorse property dualism with respect to the qualia of phenomenal states. Like substance dualists, these property dualists must admit that there are additional laws governing the production of phenomenal qualia—laws that are quite complicated and, to some extent, piecemeal. (David Chalmers, Gregg Rosenberg, and others have floated theories about the form such laws might take [Chalmers, 1996; Rosenberg, 2004].)

Property dualism remains a respectable position within contemporary philosophy of mind, with powerful arguments in its favor. In the circumstances, then, this second problem of interaction can hardly be the final nail in the coffin of substance dualism.

## EPISTEMOLOGICAL WORRIES

After interaction objections, the most commonly voiced complaints about substance dualism are epistemological in flavor: Suppose persons are souls that merely happen to be associated with bodies. One cannot keep track of another's soul by keeping an eye on it, or holding it fast. How, then, does one know that souls are not constantly coming and going "behind the scenes"?

Immanuel Kant's analogy illustrates the problem: "An elastic ball which impinges upon another similar ball in a straight line communicates to the latter its whole motion, and therefore its whole state (that is, if we take account only of the positions in space)." A series of mental substances passing on "representations together with the consciousness of them" would end with one that is "conscious of all the states of the previously changed substance, as being its own states, because they would have been transferred to it together with the consciousness of them." But if we identify persons with individual mental substances, "it would not have been one and the same person in all these states" (1965 p. 342). Kant's scenario is often turned into an argument against dualism: If it were reasonable to suppose that each person is identical with a soul, then it would be reasonable to be skeptical about whether we are dealing with the same person from one minute to the next. Since this is not reasonable, neither is the supposition that a person is a soul.

The argument fails if one endorses John Locke's view (in the chapter "Of Identity and Diversity" in his *Enquiry* [1975]) that a person is not identical with a particular soul but is instead constituted by a soul, and possibly by different souls at different times. So long as the succession of souls pass on the right sorts of mental states (Locke emphasizes memories), the person survives, constituted by one soul and then another. To give this reply would require that one say, with Locke, that a person and the person's soul are distinct things, although the soul thinks whenever the person does. In that case, if a person always remains responsible for the things she has done, then one soul could justly be punished for the deeds of another soul. (Locke himself seems to have thought that, although such punishment would not be unjust, it would not be very nice, and so God can be counted on not to allow soul-switching.)

Locke's approach is surely not the only way to dispel the Kant-inspired epistemological worry. Another is simply: *to quo que*. If our knowledge of the persistence of physical objects—including human bodies—is just as vulnerable to similar skeptical doubts, then materialism has no advantage over dualism. But what sort of evidence

supports the belief that a physical object observed at one time is the same as an object observed at another time—and not, say, an exact duplicate that has swapped places with the original due to random quantum-mechanical fluctuations or the whimsy of a powerful demon? Just as one can imagine one soul being replaced by a near duplicate without anyone's being the wiser, so one can imagine a physical object being replaced by a near duplicate with no readily detectable evidence that a switch was made. Does the ability to imagine such things require that one produce nonquestion-begging arguments against them if one is ever to claim knowledge of identity over time? Surely not. Is there some special problem with souls? If so, it needs more spelling out than it usually receives.

## OCKHAM'S RAZOR

Some of the most frequently voiced objections to dualism—the ones based on problems of interaction and epistemological worries—may become less impressive upon examination. At least one formidable objection remains, however: that there is simply no need to believe in souls in addition to bodies; so the soul falls victim to Ockham's razor, the injunction to postulate no more entities than necessary. One has the evidence of one's own senses for a world of physical bodies. But even if property dualists are right and some psychological phenomena cannot be reduced to or exhaustively explained in terms of properties similar to those now ascribed to physical bodies and their parts, nothing would be gained by supposing that these irreducible mental properties belong to some new entity. And adding the extra entities requires many further ad hoc epicycles that undermine any explanatory value their addition might have had. For instance, one must now explain why the exercise of the soul's mental powers depends so heavily upon a properly functioning brain. Perhaps hard evidence of spirit possession, reincarnation, veridical out-of-body experiences, and the like would change the situation. But, in its absence, respect for parsimony in theory construction provides a powerful reason to reject souls.

## MODAL ARGUMENTS

The two most famous styles of argument for dualism may be found, unsurprisingly, in Descartes. One is a modal argument (that is, an argument built around what is possible or necessary) from the possibility of disembodiment to the conclusion that every person actually has, or is, a soul. The other is an argument from the "unity of consciousness" to the conclusion that the subject of consciousness is a partless (and so, by Descartes's lights,

nonphysical) substance. Each sort of argument has been subjected to withering criticism, however; and, despite repeated attempts to revive them, the prognosis is not good.

Some of a thing's properties appear clearly to be contingent, while others seem essential. It is possible to lose a contingent property, but not an essential one—it characterizes the thing necessarily. It is possible for me to survive the loss of my leg; so having two legs is one of my contingent properties. If it were possible for me to survive the destruction of my entire body, without acquiring new bodily parts, I would be contingently embodied. If it were not possible, then having a body would be part of my essence.

Descartes develops a modal argument in his sixth meditation: “[T]he fact that I can clearly and distinctly understand one thing apart from another is enough to make me certain that the two things are distinct. . . . Thus, simply by knowing that I exist and seeing at the same time that absolutely nothing else belongs to my nature or essence except that I am a thinking thing, I can infer correctly that my essence consists solely in the fact that I am a thinking thing” (1984, p. 54).

Swinburne (1997) defends a roughly similar argument. He points out that it is easy to imagine scenarios in which one survives the utter destruction of all the material parts of one's body at once, or the swapping of one body for another. There is nothing straightforwardly inconsistent in such stories, and Swinburne takes this to be strong evidence that the stories represent genuine possibilities. He also assumes, not unreasonably, that no mere material object could survive such adventures. On these assumptions, one should reason as follows: “I could survive the destruction, all at once, of all the matter in my body; my body could not survive this; so I am not identical with my body.”

In the absence of a reduction of possibility to logical consistency, it is unclear where evidence for possibility could come from if not from the seeming coherence of various imagined states of affairs. So it is not unreasonable to grant that, if one can conceive of being unextended or of surviving the destruction of one's body, then this fact provides at least *prima facie* evidence for the possibility of these things. But *prima facie* evidence may be undermined, and in the arguments of Descartes and Swinburne, it is counterbalanced by the conceivability of states of affairs that are inconsistent with the possibility of the separation of person and body. Many find that they are able to imagine themselves as having nothing but extended or material parts just as easily and clearly as they

can imagine persisting without parts or without a body. One can conceive of oneself as a mere organism, a brain, or even a rock. But if such things cannot possibly be unextended, or continue to exist after annihilation of their physical parts—an assumption required by the modal arguments for dualism—then one has *prima facie* evidence for the possibility of being identical with a thing that could not possibly survive in an unextended or disembodied state. But if some envisaged situation is possibly not possible, then it is simply not possible. So it is simply not possible that I be unextended or disembodied.

The plausibility of this widely accepted principle of modal reasoning (that what is possibly not possible is not really possible at all) may be more apparent when stated in the jargon of “possible worlds”: If there is a world that is possible from our perspective (that is, from the point of view of the actual world, this other world represents a way things could have been); and if, from the perspective of that other world, some imagined state of affairs or circumstance is not possible; then that imagined state of affairs is not possible from the point of view of the actual world either—that is, it is simply not possible. Applied to the case in hand, this modal principle becomes: If, according to some possible world, I do not exist without a body in any possible world, then this remains true in the actual world—I do not exist without a body in any possible world.

If I find it just as conceivable to suppose that I am entirely physical as to suppose that I become disembodied, then I have the same sort of evidence for the possibility of each supposition. But they cannot both be possible. So the evidence from conceivability cuts both ways and cancels itself out.

There is more to be said on behalf of modal arguments for dualism, of course. Perhaps the way in which one can conceive of one's disembodiment is qualitatively better—more luminous or complete—than the way in which one can conceive of one's being a mere brain or organism. And perhaps the higher quality of the act of conception brings with it an “epistemic boost” for the possibility of the scenario thus conceived. But making a case for such a difference would require wading far into the murky waters of modal epistemology.

## ARGUMENTS FROM THE UNITY OF CONSCIOUSNESS

Many dualists (such as Joseph Butler [1736], Samuel Clarke [1738], Lotze [1894], and, Hasker [1999]) would agree with Descartes about the importance of what came to be called “the unity of consciousness”: an argument

based on the unity of consciousness alone is “enough to show me that the mind is completely different from the body, even if I did not already know as much from other considerations” (1984, p. 59).

The unity of consciousness may be illustrated by a person who sees a book fall, hears the sound of its impact, and feels a pain in her right toe where it struck. She can immediately infer that there is something that sees the fall, hears the impact, and feels a pain. The facts of experience do not simply imply the occurrence of three events, a “seeing of a book’s fall,” a “hearing of an impact,” and a “feeling of a pain.” Events of these types could occur to three different thinking things, no one of which is able to compare the sound with the sight and the pain. What must be added to capture the additional information is that the three events all occur to one and the same individual.

Thus the unity of consciousness supports the view that whatever is the bearer of psychological properties must be a single substance capable of exemplifying a plurality of properties. Its unitary nature consists in the impossibility of its having a “division of psychological labor” among parts. If a single thinker can recognize the difference between sounds and colors, this thinker does not enjoy the ability to compare the two simply by having one part that does its seeing and another that does its hearing, even if these parts are tightly bound together. As Franz Brentano remarks, this “would be like saying that, of course, neither a blind man nor a deaf man could compare colors with sounds, but if one sees and the other hears, the two together can recognize the relationship” (1995 p. 159).

Many dualists have claimed that the unity of consciousness requires that whatever is conscious must be a unity having no parts at all. Although Brentano believed the soul to be simple, he did not think the simplicity of the soul follows immediately from the unity of consciousness alone, and he was surely right. As Brentano points out, what is not ruled out as a subject of consciousness is an extended substance that exemplifies all of its psychological properties as a whole (1987). To use Brentano’s metaphor, the psychological properties could be “spread equally” over all of the parts of this extended thinking thing. None of the many arguments that have been given to rule out this possibility has met with widespread acceptance, even among dualists.

## ARGUMENTS FROM THE VAGUENESS OF MATERIAL OBJECTS

Arguments for dualism often take the form of objections to any normal sort of materialism. A materialism that identified a person with a single cell or proton would be at least as incredible as dualism (absent some sort of revolution in neurophysiology). What materialists want is a view according to which a human person may be identified with a reasonably normal physical object, one that already has a place in our commonsense conception of the world—an object with natural boundaries, such as those of an organism, a brain, or perhaps even a single hemisphere of a brain. But animals and their organs belong on a spectrum that includes bushes, branches, clouds, mountains, rivers, tidal waves, and all manner of ill-behaved entities. Familiar material objects such as these exhibit vagueness or indeterminacy in their spatial and temporal boundaries. And the strategies typically implemented to resolve puzzles posed by vague objects do not seem so satisfactory when applied to oneself.

Human bodies and brains appear surprisingly like clouds upon close inspection—blurry around the edges. Many particles are in the process of being assimilated or cast off; they are neither clearly “in” nor clearly “out.” The temporal boundaries of living things—their coming into existence and passing away—also display a disturbing fuzziness. No one doubts that meteorologists have considerable freedom in deciding where exactly to draw the line between a hurricane and a mere tropical storm. But organisms and brains are not unlike storms in this respect; pressure to find the first and final moments in the life of a human body or brain can only force a decision like the one made by the meteorologists.

Sharper lines will not be found by those who, with Locke, dismiss biological boundaries for persons in favor of psychological ones. Neo-Lockeans must admit that psychological continuity, like biological life, is a matter of more and less; that personalities emerge, and frequently deteriorate, only gradually.

The materialist must, therefore, allow that the spatial and temporal indeterminacies of large-scale material objects infect human persons; and that the standard strategies for coping with fuzzy objects apply to persons as well. But application of these strategies to oneself can produce a disturbing sense of vertigo. The feeling is especially intense in the temporal case.

One group of botanists could establish the convention that no acorn is an oak tree, and another that oak trees are grown-up acorns; one meteorological society

could lay it down that hurricanes only begin when a tropical storm attains wind-speeds exceeding 74 miles per hour, another could choose 73. Similarly, one linguistic community could insist that persons exist at conception (twinning, they might say, is the generation of two “new” persons and the end of the first); while another community might talk as though persons come into existence as soon as twinning is impossible or differentiation of organs begins or rudimentary psychological states are detectable or the first breath is taken. Similar ranges of options lie open at the other end of life. If human persons are as much like trees and hurricanes as human bodies appear to be, such differences in usage would affect the extension of “person” and, with it, the reference of “I” in the mouths of speakers from different communities. The physical facts leave room for more than one perfectly acceptable refinement of the concept “tree” or “hurricane”; if human persons are entirely physical, the same must be true of human person.

If these refinements in the extension of “person” are to be genuine possibilities, there must already exist different physical objects corresponding to the different decisions that could be made about origins and deaths; and each of these preexisting objects must have what it takes, intrinsically, to be a conscious person. Speaking and thinking differently cannot make new physical objects spring into existence, nor can it turn objects with no phenomenal states into objects with the rich phenomenology of a human person. But then there must already be quite a few humanlike creatures located wherever a human person is located, each exactly like a person in every intrinsic respect. Although some philosophers (notably, the friends of temporal parts) have learned to live with this result, it raises dizzying possibilities. If the extension of a term like *person* is determined by present and past usage and the rule for determining the referent of *I* is something like “it refers to the person speaking,” then a shift from one of the acceptable refinements of “human person” to another could render a conscious, self-referring creature no longer able to think for itself. If, instead, *I* is not tied to the actual meaning of “person” but rather refers ambiguously to each of the humanlike creatures associated with a given person, then there are many thinkers with slightly different pasts and futures, and none can tell which one he or she is (a result emphasized in Olson 1997).

The possibility of fission and fusion is a further source of indeterminacy and conventionality in spatiotemporal boundaries, one that Chisholm (1976) and Swinburne (1997) have exploited in arguments for dual-

ism. When half of a bush is destroyed, one is tempted to say it survives; when it is merely split in two, and the halves successfully transplanted, one is tempted to say one of two things: either that there are two new bushes or that the bush survives as a scattered object, part in one place, part in another. If persons are thought to be middle-sized material objects with biological or psychological persistence conditions, similar circumstances of fission and fusion are conceivable and perhaps even physically possible. (Because a great deal of basic psychological continuity is preserved through the loss of either hemisphere, fission is probably a physical possibility on neo-Lockean accounts of personal identity.) If one takes the first approach to bushes, regarding fission as the end of the original plant, one should say the same thing about a purely physical human being.

There has been little need for precision about the fate of a divided bush. But a community of language users that felt the need could surely introduce a term for things exactly like bushes while decreeing that no such thing can survive loss of half its mass at once; another community could choose 49 percent; but neither group need fear making a mistake. Comparable freedom with respect to persons would require one to say things like, “If my linguistic community were to change its mind, either this would alter my persistence conditions—a strange power to change the nature of a physical object by talking differently—or else it would shift the referent of *I* in my mouth, rendering me no longer able to refer to myself in the first person.” Neither alternative is attractive. The analogue to treating the divided bush as a scattered object would be to say that a person could be in two places at once, undergoing radically different experiences, thinking incompatible thoughts, and so on.

#### TENDER-MINDEDNESS AND ONTIC IGNORANCE

It is hard to apply to oneself the same strategies one would unhesitatingly use to deal with indeterminacy in the identity conditions and borders of ordinary physical objects. Chisholm and Swinburne take this discomfort as evidence that human beings are not ordinary physical objects. Stipulations about whether a person survives a certain borderline adventure are bootless if the person is in fact an immaterial substance whose identity over time is an all-or-nothing affair.

Resisting materialism because it is hard to accept that human beings are as fuzzy and conventional as ordinary physical objects will no doubt strike many philosophers as mere tender-mindedness. After all, they will insist, it

should be possible for philosophy to reveal something new about persons; and surely it is more certain that human beings are material objects than that they have perfectly adequate self-conceptions. (Derek Parfit [1984] takes this approach, emphasizing the radical morals to be drawn from the vagueness of human persons.)

On the other hand, it would be high-handed to dismiss as tender-minded anyone who allows the argument from vagueness to count against materialism. If the consequences of supposing that persons are vague material objects seem incredible, this might quite properly increase the weight that can be given to other considerations in favor of dualism: arguments from theological premises, for example, or more esoteric philosophical arguments (such as those of Peter Unger, J. R. Smythies, or John Foster) that would carry greater conviction if materialism were not thought to be utterly obvious and unproblematic. All by themselves, however, the foregoing arguments from vagueness ought probably be taken to support nothing stronger than (what George Graham [1999] calls) “ontic ignorance”: “I know not what manner of thing I am.”

## DUBOS, ABBE JEAN BAPTISTE (1670–1742)

With his *Réflexions critiques sur la poésie et sur la peinture*, Abbe Jean Baptiste DuBos—diplomat, man of letters, member of the *Académie française*—had an essential influence on the aesthetic thought of the Enlightenment.

*Réflexions critiques*, published for the first time in 1719 and re-edited several times, is one of the founding texts of the new “aesthetics” that came into its own in the eighteenth century. DuBos defends a sense-based theory of aesthetic feeling that is set in motion by poetry, painting, and music. In his *Réflexions*, DuBos’s successors saw, on the one hand, an aesthetic that stressed the effects of artworks on spectators and that favored the highly emotional or moving dimension of the aesthetic response to art, and, on the other hand, an attempt to base aesthetic judgment on nonrational bases—what DuBos called the “sixth sense” feeling, or the “heart.” His strictly emotionalist interpretation of the “paradox” of negative feelings—which has it that the more we are afflicted by the artistic representation the more pleasure we derive from it—captured the attention of all eighteenth-century theorists of tragic emotion.

The method of the *Réflexions* aims for the “experimental,” that is, it is founded on the observation of psychological, social, environmental (*climatiques*), and historical causes. In this respect, his empiricism is tinged with eclecticism, while with regard to the analysis of the mind and emotions, he belongs more strictly to the philosophical vein stemming from John Locke. In view of its subject, this work can be interpreted in somewhat anachronistic terms as a *metacriticism*; as a philosophical endeavor aimed at revealing the general principles of literary and artistic criticism. A certain theoretical distance from DuBos’s aesthetic thought (the coherence of which is not always obvious at first glance) helps us to see that it tries to articulate three specific issues: the analysis of the emotional response to an artwork, the theory of aesthetic judgment, and the causes of the historical variations of genius.

1) The only aim of poetry and painting is to please and to arouse feeling by the imitation of subjects that are themselves moving. Art fills a specific need: that of the mind to be kept occupied in order to avoid tedium. The “artificial” passions art stirs have thus the emotional power of ordinary passions, without having their grievous consequences. DuBos proposes that the pleasure we derive from passions (even negative ones) comes

uniquely from the emotional energy and intensity inherent in them, not from the reflective consciousness that we ourselves are not at risk or from the mere enjoyment of artistic imitation. After analyzing the nature and causes of viewers’ aesthetic pleasures, DuBos explores the various means of producing these pleasures by examining the powers of artistic imitation and by comparing the relative force of different artistic forms and, within these forms, the different artistic genres. Thus, tragedy is superior to comedy, for example, just as painting (which uses “natural signs”) touches us more directly than poetry (which uses the “artificial signs” of language). However, at the end of the day, absolute aesthetic primacy goes to staged tragedy, which articulates a succession of “paintings” or scenes in time and takes gradual control of our emotions.

2) Aesthetic sentiment also possesses an *evaluative* dimension; it functions as a principle of *judgment* concerning artistic and literary works; DuBos demonstrates, against the pretensions of a normative and professional criticism, that only the *sentiments* of the *public*, which become more and more assured as time goes by, can reliably decide the real merit of artworks.

3) All this analysis of emotional and evaluative modalities of the artistic experience are part of what could be called a “scientific” criticism that aims to reflect on the diverse historical “causes” (both physical and moral) that explain the *variations* in the production and reception of artistic and literary works; DuBos develops a theory of genius, the manifestations of which are essentially submitted to so-called “climatic” (including physical and environmental) conditions, while simultaneously founding a vein of historical criticism supported by a cyclical conception of history. Together these three elements sketch out an aesthetic theory that is clearly anti-rationalist, for which neither individual aesthetic responses, nor the evaluation and acknowledgment of a work’s merit, nor the mechanisms of artistic and literary production, are subjected to the constraints of rules and normative prescriptions. DuBos thus holds an original place in the *Querelle des Anciens et des Modernes*: he refutes the rationalist pretensions of the “*Modernes*” while shifting the debate to the analysis of the feelings.

## DUCASSE, CURT JOHN

(1881–1969)

Curt John Ducasse, philosopher and educator, was born in Angoulême, France. After attending schools in France and England, he came to the United States in 1900. He received his B.A. and M.A. degrees from the University of Washington and, in 1912, his Ph.D. from Harvard University, where he had served as an assistant to Josiah Royce. He taught philosophy at the University of Washington from 1912 until 1926, at Brown University from 1926 until his retirement in 1958, and elsewhere as visiting professor. He served as president of the Association for Symbolic Logic (1936–1938), which he had helped to found, and of other learned societies. He published extensively in all fields of philosophy.

## PHILOSOPHICAL METHOD

Ducasse's views on method are worked out in detail in *Philosophy as a Science: Its Matter and Method* (New York, 1941), in his Carus lectures, published as *Nature, Mind, and Death* (La Salle, IL, 1951), and elsewhere.

He held that philosophy is a science and that it differs from other sciences not in the generic features of its method but by virtue of its subject matter, which consists of "spontaneous particular appraisals" (1941) or "standard evaluative statements" (1951) made by some person or group. The primitive problems of philosophy are to define the value predicates "good," "valid," "real," and so on, and their opposites, as used by the person or persons whose standard evaluative statements are taken as data. In the definitions will appear such terms as *necessary*, *fact*, and *possibility*, which are also in need of analysis, giving rise to derivative problems. Both sorts of problems are essentially semantical. Ducasse is thus squarely in the analytical tradition. However, he argued more explicitly

than other contemporary analysts that a proposed analysis of a term as used in paradigm statements has the status of a hypothesis, and that it can be confirmed or disconfirmed by observing whether it is substitutable for the analysans in the paradigm statements without altering any of their standard implications.

## CAUSATION

Ducasse had adumbrated the above views and had applied his method to the concept of causality in *Causation and the Types of Necessity* (Seattle, 1924). Ducasse had always regarded causality as a "fundamental category," and in subsequent works he continued to refine his original analysis.

According to Ducasse, causality is a relation between events, is essentially triadic, and is correctly defined in terms of J. S. Mill's method of difference. That "method" is not in fact a method for discovering causal connections but a description of the causal relation itself. If, in a state of affairs *S*, only two changes occur, one the change *C* at time  $T_1$  and the other the change *E* at time  $T_2$ , *C* is the cause of *E*. Ducasse asserted that despite David Hume's definition of causation as regularity of sequence, Hume actually thought of it in terms of the advent of a single difference in a given state of affairs, as is proved by the way he formulated his rules for ascertaining causal connections by a *single* experiment.

Given the above definition, the supposition that some events have no cause implies a contradiction. Hence, indeterminism, the view that some events are matters of objective change, is self-contradictory, although people are "free" in the sense that, and to the extent that, they can do what they will to do.

## MIND AND NATURE

In *Nature, Mind, and Death*, Ducasse went on to assert that nature is the material world, comprising all the things, events, and relations which are publicly perceptible. The mental, which is directly observable only through introspection, is not part of nature. Substances are analyzed as systems of properties and their relations. A property is a causal capacity. Thus,

to say of carborundum that it is *abrasive* means that, under certain conditions, friction of it against certain other solids causes them to wear away. ... More generally, to say that a substance *S* has a property or capacity *P* means that *S* is such that, in circumstances of kind *K*, an event of kind *C*, occurring in *S* or about *S*, regularly

causes an event of kind *E* to occur in or about *S*.  
(*Nature, Mind, and Death*, p. 165)

Since *C* and *E* may stand for either a physical or a mental event, there are four kinds of properties: psychophysical, if *C* and *E* are both physical events; psychophysical, if *C* is physical and *E* psychological; psychophysical; and psychophysical.

The relation of a mind, a mental substance, to "its body," a material substance, is that of causal interaction. This is an analytic truth, for by "its body" can only be meant "the body with which that mind directly interacts." Many of the usual objections to interactionism presuppose a mistaken conception of causality.

In the case of psychophysical properties ("bitter," "blue") it is important to distinguish between the sense quality in terms of which the property is defined and the property itself. "Bitter," for example, is equivocal. As applied to quinine, it is a disposition term designating the capacity of quinine to cause a certain taste experience when one places it on one's tongue. As applied to the experience itself, it is the name of a quality. With respect to the properties of material things, Ducasse is a realist. Quinine is bitter and roses are red, in the dispositional sense, even if the properties are not being exercised. Of properties, it is false that *esse* is *percipi*. But in the case of sense qualities, it is true that *esse* is *percipi*.

Now G. E. Moore, in his "Refutation of Idealism," had argued that since we can distinguish the sensum blue that is the object of a sensation from the sensing itself, *sensa* might exist without consciousness of them, and they might therefore be nonmental. Against Moore, Ducasse argues in *Nature, Mind, and Death* that a sensum is not an "object" of sensation but the "content" of it. When one sees some lapis lazuli, the lapis lazuli is the object seen. But the relation of the lapis lazuli to the seeing of it when "I see some lapis lazuli" is true is not the same as the relation of blue to the seeing of it when "I see blue" is true. (Compare "I taste quinine" with "I taste bitter," or "I am jumping a ditch" with "I am jumping gracefully.") After a meticulous examination of various hypotheses on what the relation of *sensa* to sensing might be, Ducasse concludes that *sensa* are species of experience. "I sense blue" means "I sense blue-ly," or, alternatively, "I sense in the manner blue," just as "I am dancing a waltz" means "I am dancing waltz-ily (in the manner of dancing called 'dancing a waltz')." Just as a waltz could not conceivably exist apart from the dancing of it, a sensum could not exist apart from the sensing of it.

On the basis of this analysis, Ducasse submits that the basic criterion of the mental may be expressed by saying that "if something being experienced is connate with the experiencing of it, then it is a mental primitive."

## AESTHETICS

In *The Philosophy of Art* (New York, 1929), *Art, the Critics, and You* (New York, 1944), and many articles, Ducasse formulates and defends an emotionalist theory of art and aesthetic experience. His principal contentions are that art in the broadest sense is skilled activity; that fine or aesthetic art consists in the skilled objectification of feeling; that the fine artist judges the adequacy of the work he creates not by the degree to which it approximates to beauty but by the faithfulness with which it reflects back to him the feeling to which he attempted to give objective expression; that in the aesthetic attitude one "throws oneself open" to the advent of feelings; and that judgments of aesthetic value are relative to the taste of the critic.

## PHILOSOPHY OF RELIGION

In *A Philosophical Scrutiny of Religion* (New York, 1953), Ducasse defines religion as essentially any set of articles of faith, with the observances, feelings, and so on, tied thereto, that has the social function of motivating altruism in individuals and the personal function of giving the believer inner peace and assurance. According to this definition, belief in a God or gods is not essential to religion. Ducasse himself is not a theist. He holds that orthodox theism is contradicted by the existence of evil, and that polytheism is more plausible than monotheism conceived in the orthodox manner.

## PARANORMAL PHENOMENA

Throughout his career, Ducasse was interested in and wrote about the "wild facts" of mental telepathy, clairvoyance, precognition, and so on. His interest in them was manifold. If paranormal phenomena do occur, received theories about the mental and the physical must be revised to account for them. It is a gratuitous assumption that any theory capable of taming the wild facts would have to postulate supernatural entities or "spooks." It could well be as scientific as are current theories about hypnotism, which have more or less tamed the wild facts of mesmerism. One of the troubles of psychical research is the lack of a fruitful theory.

If paranormal phenomena do occur, there would be important implications for philosophy. How would

philosophers have to conceive of time, causality, perception if there were such a thing as precognition?

It is a logical possibility that a mind survives the death of its body (or, to allow for reincarnation, bodies), even when due account has been taken of current science. But is there any evidence that it does? If there is, it is likely to be found by objective sifting of the reports concerning paranormal phenomena. In *A Critical Examination of the Belief in a Life after Death* (Springfield, IL, 1961), Ducasse states that the conclusion about survival seemingly warranted at present is that “the balance of the evidence so far obtained is on the side of the reality of survival,” but that the evidence is not conclusive.

## DUHEM, PIERRE MAURICE MARIE (1861–1916)

Pierre Maurice Marie Duhem was noted for his original work in theoretical physics, especially thermodynamics, and in the history and philosophy of science. He was born and studied in Paris, and at the age of twenty-five published an important book on thermodynamics. In 1887

he went to the faculty of sciences at Lille University, where he taught hydrodynamics, elasticity, and acoustics. He married but his wife soon died, leaving him with a daughter. In 1893 he moved to Rennes and in 1895 to a chair at Bordeaux University, which he held until his death. Throughout his life he was a Catholic and a conservative.

His approach to physics was systematic and mathematical, and his interest in axiomatic methods undoubtedly determined to some extent the nature of his philosophical account of scientific theories, contained mainly in his book *La théorie physique: son objet, sa structure* (*The Aim and Structure of Physical Theory*), first published in 1906. He wrote a great deal on the history of science, especially in the fields of mechanics, astronomy, and physics, largely because he believed that a knowledge of the history of a concept and of the problems it was designed to meet was essential for a proper understanding of that concept. For the scientist, the history of his subject should be not a mere hobby but an essential part of his scientific work. Duhem’s most important works in this field are *Les origines de la statique*, published in 1905–1906, and *Le système du monde*, an account of various systems of astronomy, in eight volumes, published between 1913 and 1958.

### SCIENCE AND METAPHYSICS

Duhem’s account of physical theory is positivistic and pragmatic, having clear connections with those of Ernst Mach and Henri Poincaré. It begins with, and takes its character largely from, his views on explanation. Indeed, one might say that it begins with a dogmatic and unsupported presupposition about the nature of explanation. He says that to explain is “to strip reality of the appearances covering it like a veil, in order to see the bare reality itself.”

But the sciences depend upon observation, and observation shows us no more than the appearances: it cannot penetrate to the reality beneath. This reality is the province of metaphysics; only metaphysics can explain. Science merely deals with the relations between, primarily, our sensations (or the appearance of the world to us) and, ultimately, our abstract ideas of these appearances. A physical theory is somehow an abstract representation of the relations between appearances and not a picture of the reality lurking behind them.

Thus, as far as science alone is concerned, Duhem is as antimetaphysical as Mach and more so than Heinrich Hertz. But, in general, he is not antimetaphysical at all. In a sense, metaphysics is the most important of all studies

because it penetrates to the reality of things and explains the appearances; but when we are doing science, we must never import into it metaphysical aims or ideas. Science and metaphysics are both highly respectable, but they are utterly distinct and must be kept so on pain of confusion.

We may, Duhem thinks, penetrate to reality, not by the methods of science, but by pure reason. He attaches great importance to the doctrine that man is free, a statement that cannot conflict with any of the conclusions of science. His metaphysical views, which he did not work out in detail, are Aristotelian; properly understood—that is, stripped of its outmoded science—the Aristotelian physics contains an accurate picture of the cosmological order, whose appearance to human beings is studied by the sciences.

Scientists, according to Duhem, have seldom made the distinction between science and metaphysics, with the result that many theories have been seen as attempted explanations and so have been garnished with strictly superfluous “pictorial” and explanatory elements. These theories can be divided into two parts, called by Duhem “representative” and “explanatory.” What is valuable in such theories, and hence what survives and what may be common to apparently different theories, is the representative part.

### THE USES OF THEORIES

This conception of the representative nature of theories is linked with the various ways in which theories are useful to us. First, they promote economy by connecting large numbers of experimental laws deductively under a few hypotheses or principles; we need remember only these principles instead of a large number of laws. Second, by classifying laws systematically they enable us to select the laws we need on a particular occasion for a particular purpose. Third, they enable us to predict, that is, to anticipate the results of experiments. These are functions that can be performed by the representative parts of theories, which merely link general statements derived from observation and experiment in a practically convenient way, rather than in a way that corresponds to the underlying reality of things.

### THE CONSTRUCTION OF THEORIES

Duhem’s account of the way in which theories are constructed exhibits his conception of the nature of physical theories. There are four fundamental operations in their construction.

- (1) Among the observable, measurable properties that we wish our theory to represent, we look for a few that can be regarded as simple and as combining to form the rest. Because they are measurable, we can represent them by mathematical symbols. These symbols have no intrinsic connection with the properties they represent: they are conventional signs for these properties. For example, temperature measured in degrees centigrade is a conventional and quantitative representation of the felt warmth and cold of sense experience.
- (2) We construct a small number of principles, or “hypotheses,” which are propositions arbitrarily connecting our symbols in a manner controlled only by the requirements of convenience and logical consistency. We may give as an example the definition of “momentum” as the product of mass and velocity.
- (3) We combine these hypotheses according to the rules of mathematical analysis; again there is no question of representing the real relations between properties, and convenience and consistency are still our guides.
- (4) Certain of the consequences drawn out by our third operation are “translated” back into physical terms. That is, we arrive at new statements about the measurable properties of bodies, our methods of defining and measuring these properties serving as a kind of “dictionary” to assist us in the translation. These new statements can now be compared with the results of experiments; the theory is a good one if they fit, a bad one if they do not.

### THE NATURE OF LAWS AND THEORIES

Thus, a physical theory, for Duhem, is always mathematical and is a conventional system of linkages between propositions “representing” general statements or laws arrived at by experiment or observation. It is a device for calculating, and nothing matters except that the results of the calculations square with our observations. We might illustrate this in the following way. There are various routes by plane from city *A* (the known laws) to city *B* (the new laws), and it does not matter which route we take as long as we arrive at *B*: We are flying blind; the plane has no windows, and we cannot see the landscape, the sun, or even the clouds during the journey; we must not suppose that the interior of the plane resembles *A* or *B* or the country in between.

The idea that physical characteristics are analyzable into basic elements that are simple and ultimate has figured largely in empiricist and positivist accounts of the sciences. This idea involves numerous difficulties, not the least among them being that of giving any precise meaning to simplicity. Duhem avoids some of the difficulties. Because physical theories do not explain, his simple elements need not be ultimate in nature; they need not be *incapable* of further analysis. They may merely be properties that we *take to be* fundamental and that we have not succeeded in analyzing.

Duhem distinguishes between “practical facts” and “theoretical facts.” A description of a phenomenon in ordinary (“observational”) language states a practical fact, and its translation into the symbols of the theory states a theoretical fact. But the theoretical fact, as should now be obvious, is a “fact” only in a very odd sense; it has some kind of formal correspondence with the practical fact, but it is always an approximation or an idealization and always has many alternatives.

There is a similar relation between empirical or “commonsense” laws and scientific laws. Scientific laws state the relations between symbols that derive their meanings from the theories of which they are a part. These laws are approximations and idealizations and do not state the relations between actual physical properties. As an example, Duhem cites Boyle’s law. This states the relations, not between pressures that may be felt and volumes that may be seen, but between their ideal representatives in a complex theory of gases. The same word, *pressure*, may stand for different concepts in different theories, and in its commonsense, everyday use it stands for a concept or concepts different again from all these.

A commonsense law, such as “Paper is inflammable,” is correctly said to be either true or false. No scientific law, however, can be said to be true or false because every accepted scientific law has equally acceptable alternatives. None of these alternatives is any more correct than any of the others. There are two points here. To call the law we actually accept “true” is to suggest that the acceptable alternatives are false, which is misleading. Moreover, all the possible alternatives are idealizations: there is nothing of which they can be said to be strictly true. The symbols used in scientific laws are always too simple to represent completely the phenomena and their connections; hence, the laws must always be provisional.

Duhem distinguishes between observation and interpretation in a way that would now be questioned by certain philosophers. An observer looking at a spot of light on a scale *may* be merely observing this spot, or he

may be doing this *and* interpreting it as the final step in measuring the resistance of a coil. Here, observing needs only attentiveness and reliable eyesight, but interpreting requires a knowledge of electrical theory as well. A boy who knew nothing whatever about electrical theory could be given the task of recording the movements of the spot on the scale; a physicist who had not seen these movements but who knew the theory and was prepared to rely on the boy could interpret the records appropriately.

It follows from Duhem’s account that scientific laws and theories are not arrived at by induction. No experiment in physics involves mere generalizing from observations because the description of the experiment and its result, in the appropriate terms, involves the use of our physical symbols and, therefore, an interpretation of the phenomena depending upon the acceptance of a particular theory.

Duhem has important things to say about the testing of scientific hypotheses and theories. An empirical generalization of the form “All *A*’s are *B*” can never be conclusively established, because we can never be sure that we have examined all the *A*’s, but it may be conclusively falsified by finding one *A* that is not *B*. Thus, if we take such a generalization to be the pattern of scientific hypotheses, we must say that these hypotheses are open to conclusive refutation. But this is too simple, for a scientific hypothesis can never be tested independently of other hypotheses. This is a point that probably has to be made for any adequate account of scientific theorizing, but it is clearly an essential part of Duhem’s account. For him, a hypothesis is always part of a theory, and it is used to make predictions only along with other parts of the theory and perhaps other theories. The failure of a prediction, then, indicates some inadequacy in the hypothesis in question *or* in some other hypothesis of the theory *or* in another theory that has been assumed in making the prediction, but it does no more than this to locate the inadequacy. It shows conclusively that something is wrong, but it tells us neither where to look for that something nor what we must reject or modify.

Thus, there can be no crucial experiments in physics. The pattern of a crucial experiment is this: we have two conflicting hypotheses about a given phenomenon and we design an experiment that will give one specifiable result if one hypothesis is acceptable and the other not, and another specifiable result if the other is acceptable and the first not. But hypotheses are not, as this suggests, independent and isolable. In fact, we must always confront a whole theory, of which one hypothesis is a part, with another whole theory, of which the other hypothesis

is a part. It is much more difficult to devise an experiment to choose between theories, and even if we could, it might be that a theory that conflicts with the experiment could be squared with it by making minor modifications whereby it would become as acceptable as the other theory under test.

This view may be criticized on the grounds that it is logically possible to find a crucial experiment that would enable us to choose between two theories. Of course, a theory that conflicts with experimental results may be capable of modification so that it does not conflict, but if it then gives exactly the same deductions as its rival, it is doubtful that they can be regarded as different theories, in Duhem's view. On the other hand, if they give different deductions covering the same field, it remains logically possible to devise a conclusive experiment to choose between these two theories. Karl Popper objects to Duhem's view on the grounds that the only reason Duhem thought crucial experiments impossible was because he stressed verification rather than falsification. It is not clear that Popper's objection is valid, for Duhem seems to have noticed the obvious fact that the aim of a crucial experiment is to eliminate one of the theories.

Although there is much in common between Duhem's and Poincaré's accounts of scientific theories, Duhem uses this last point about theory modification in criticism of part of Poincaré's view. According to Poincaré and others, certain important hypotheses of physical theory cannot be refuted by experiment because they are *definitions*. For example, the statement that the acceleration of a freely falling body is constant really defines "freely falling"; if an experiment appears to conflict with this, the most we can say is that the body was not falling freely. Nothing we observe can compel us to reject the original statement because it is not an empirical statement. Duhem, in reply, gives a different reason why we sometimes treat scientific statements in this way. It is not that the hypotheses we treat in this way are definitions but that they cannot be tested in isolation; thus, we are usually free, in the face of an unfulfilled prediction, to keep any given hypothesis and reject some other. This does not mean that we shall never be forced to reject that given hypothesis in consequence of some other modification we make to the theory, but only that the odds are against this happening on any given occasion.

## DÜHRING, EUGEN KARL (1833–1921)

Eugen Karl Dühring, the German philosopher and political economist, was born in Berlin and died in Nowawes, near Potsdam. Dühring practiced law in Berlin from 1856 to 1859, but an eye ailment, eventually leading to total blindness, forced him to abandon this career. In 1861 he took his doctorate in philosophy at the University of Berlin, with a dissertation titled *De Tempore, Spatio, Causalitate Atque de Analysis Infinitesimalis Logica*. He became university lecturer in 1863, but his feuding with colleagues and his attacks on the university led to his dismissal in 1877. From then until his death he lived the life of a private scholar. In his later years, Dühring's attacks on religion (*Asiatismus*), militarism, Marxism, the Bismarck state, the universities, and Judaism became more and more virulent. Nevertheless, he retained a small group of loyal followers who founded a journal primarily devoted to his essays, the *Personalist und Emanzipator* (1899). Three years after Dühring's death, E. Döll founded the Dühring-Bund.

Dühring's early views, expressed in his *Natürliche Dialektik*, were Kantian. Eventually, however, he came to reject Immanuel Kant's phenomena-noumena distinction, with its corollary that we do not apprehend reality as it is in itself. Dühring maintained that the mind does grasp reality directly, and that the laws of thought are in some sense also laws of being.

### KNOWLEDGE AND REALITY

While denouncing metaphysics and every sort of supernaturalism, Dühring formulated a theory of reality that is no less metaphysical than that of the philosophers whom he attacked. Philosophy, according to Dühring, should aim at a comprehensive account of reality, an account that will be consonant with the natural sciences. A complete knowledge of reality is possible if we restrict ourselves to what is given, using the "rational imagination" that is the organ for philosophizing. (This constructive imagination is used also in mathematics, Dühring held.) The outcome of this activity, an activity of passion guided by the understanding, will be a coherent and comprehensive world picture. Dühring praised Arthur Schopenhauer, Ludwig Feuerbach, and Auguste Comte for their efforts in this direction.

The fundamental law that we are to use in apprehending reality is the Law of Determinate Number. This law provides an easy solution to the antinomies in which reason finds itself when seeking knowledge beyond the

realm of possible experience. It states that all thinkable numbers are complete or determined, and that the notion of an infinite or undetermined number is therefore impossible. Dühring suggested that the conception of an infinity of events or of units is somehow logically contradictory, as if one were to speak of a countless number that had been counted. For the theory of reality, the consequences of Dühring's law are that the number of events in time that preceded the present moment must be finite, and so too must be the number of objects in space. The history of the universe must have had an absolute beginning, and every object that exists or has existed must be divisible into a finite number of parts. It is nevertheless possible, Dühring maintained, that time and space extend infinitely from here and now.

A "primordial being" lies beyond the first event in time, though this being can be defined only by negating the properties of objects and events in time. Still, we can say of it that it contains the "roots" of every event and object, though it does not consist of events and is not an object. History develops out of this primordial being by an evolutionary process, from the more homogeneous to the more diversified.

What is actual must be here and now. The past is no longer real. The primordial condition of being no longer exists, though its traces are still evident. The laws of the physical universe, the atoms that make up matter—these are the unchanging aspects of the world, the persistent traces of the primordial being.

### CHANGE AND EVOLUTION

The evolution of the universe involves the coming into being of genuinely new forms, and there exists the possibility that further novelty will emerge with the passage of time. The coming into being of motion, and of living creatures and conscious agents, are examples of new phenomena in the transition from the original condition of the world to its present state. Productive, creative activity is an essential fact about the universe, yielding new existences, new phenomena. The laws that describe such changes are nevertheless constant. We do not clearly understand how such genuine novelty occurs, and we ought not to construct speculative hypotheses. An honest philosopher will simply confess his ignorance.

How the world may evolve in the future is also beyond our knowledge. Either natural processes will continue mechanically without ever coming to an end or, what is more probable, there will emerge something radically different. Dühring accepted the latter alternative for the reason that he believed differentiation is a basic law of

nature. However, since the number of possible changes is finite, there must be either an eternal recurrence of the world process, as Friedrich Nietzsche suggested, or an end.

### MIND AND CONSCIOUSNESS

Dürring's philosophy of mind is at first glance dualistic. Conscious activity is totally different from inanimate processes. The former is, however, an outcome of the clash of mechanical processes or forces. The sensation of resistance is the most basic sort of consciousness, and it reveals very clearly that its origin is the antagonism of physical forces.

While Dürring's position is positivistic in its emphasis on the limitation of human knowledge to the world described by natural science, and in its rejection of any independent philosophical knowledge of reality, he differs from some nineteenth-century positivists, such as Ernst Mach, in rejecting phenomenalism as the only valid basis for knowledge. Dürring maintained that although no disembodied spirits or souls exist, the world that is given to consciousness is one that contains not only matter and physical forces but also life and activity. Furthermore, he did not repudiate the concepts of cause and force or approve of a reductionism that would restrict intelligible discourse to phenomena, a restriction that he called "a morbid and skeptical aberration."

### RELIGION

In his passionate opposition to religion and to every form of mysticism, Dürring is reminiscent of Lucretius. Religion is "a cradle of delusions," he maintained, and it is only by becoming free from its superstitions that man can become truly noble. The idea of an "other world" is a stumbling block to the proper appreciation of the real world that we encounter directly. We must find our values in this world.

Dürring's teleological optimism led him to reject Charles Darwin's theory that a struggle for existence is necessitated by the insufficiency of means to satisfy natural needs. The conditions for happiness are not impossible, he said. Even pain exists as an enhancement of our appreciation of pleasure. Only manmade institutions stand in the way of human happiness; religion is one of these institutions. Science, as carried on in the nineteenth century, is equally pernicious, since it involves "a hodgepodge of superstition, skepticism and apathy."

### ETHICS AND ECONOMICS

Dürring held that the feeling of sympathy is the foundation of morality. In applying this theory to the field of economics, Dürring came to a conclusion that Friedrich Engels and other Marxists have found highly objectionable. The interests of capitalist and worker, Dürring maintained, are not really opposed. By means of free competition there could be an ultimate harmony and compatibility between the two classes. Dürring's economic doctrines also supported the idea of a "national" political economy. He advocated tariff protection of national industries as a means of promoting the culture and morality of all citizens in the state. This goal could be realized most effectively when the economy of a nation was self-sufficient.

### NATIONALISM AND RACISM

Dürring was an ardent German patriot, and some of the enormous popularity that his writings enjoyed in the latter part of the nineteenth century can be traced to this. He worshiped Frederick the Great. Along with his nationalistic zeal, however, Dürring betrayed a generous amount of prejudice, denouncing Jews, Greeks, and even Johann Wolfgang von Goethe, who was too cosmopolitan for Dürring's taste. Some conjecture that Nietzsche was influenced by Dürring's *Wert des Lebens*. But the joyous affirmation of life that Dürring shared with Nietzsche stands in sharp contrast to the vicious, embittered tone of many of Dürring's writings, and Nietzsche's rejection of pessimism stands on quite other grounds than that of Dürring.

## DUMMETT, MICHAEL ANTHONY EARDLEY (1925–)

Michael Anthony Eardley Dummett is perhaps the most important philosopher of logic of the second half of the twentieth century. Born on June 27, 1925, in London, England, Dummett completed his formal education at Christ Church, Oxford, and served for many years on the faculty of that university. A fellow of All Souls' College from 1979 to 1992, Dummett was the Wykeham Professor of Logic. His influential work has made commonplace (though not uncontroversial) the claim that philosophical matters concerning logic and truth are central to metaphysics, understood in roughly the traditional sense. Dummett has profoundly and permanently shifted the ground of debates concerning metaphysical realism.

Much of Dummett's work has taken place in the context of his commentaries on Gottlob Frege, at whose hands, Dummett claims, epistemology was supplanted by the philosophy of language as the fundamental field of philosophical investigation. Frege's reorientation of philosophy, comparable to the Cartesian installation of epistemology as the foundation of philosophical thinking,

finally directed philosophers' attention to the proper focus: the relation of language to reality. Dummett is thus a leading advocate of the "linguistic turn." He is heavily influenced by Ludwig Wittgenstein's later work and by intuitionism in the philosophy of mathematics.

Dummett claims to have articulated a common structure embodied in a number of disputes pitting realists against their opponents. For example, the medieval debate over universals consisted of realists, who argued for the existence of mind-independent, objective properties, against various denials of realism (conceptualism, nominalism). Realism's claim about material objects contrasts with varieties of idealism, all of which share the general view that material objects do not exist objectively and independently of the mind. Positions that are antagonistic toward the positing of an objective, mind-independent realm are antirealist positions. Dummett holds that the proper way to approach the dispute is to investigate what logical principles that are valid on the realistic view must be abandoned by antirealism. In particular Dummett claims that the law of bivalence, according to which every meaningful statement is determinately either true or false, is the mark of realism.

According to Dummett, the route to antirealism must be a meaning-theoretical one and thus focus on the role of the notion of truth in explicating meaning. His position on the theory of meaning has been called verificationism but, more properly, should be called neoverificationism to distinguish him from logical positivism. Dummett argues that truth, if conceived realistically, cannot be the fundamental notion of a theory of meaning—that is, if truth is conceived as satisfying the principle of bivalence. He recommends abandoning this classical notion of truth. His positive proposal can be put either of two ways: he sometimes suggests that the classical notion of truth must be replaced by a different concept of truth, one that does not include the bivalence principle; at other times he suggests that truth be replaced by verification as the central meaning-theoretical notion.

The theory of meaning is concerned with the relationships of truth, meaning, and use. Holding to a sophisticated reading of the "meaning is use" idea, Dummett argues that a theory of meaning based on the classical notion of truth cannot successfully analyze the ability of speakers to use their language. That is, the meaning of a sentence cannot be identified with—or, more weakly, connected with sufficient intimacy to—the sentence's truth conditions if truth is conceived classically, because the resultant theory of meaning attributes to a speaker a grasp of meaning that cannot be explained in terms of

her possession of recognitional skills pertaining to truth, i.e., her possession of certain epistemic capacities.

Dummett's key arguments concerning this conclusion have been called the acquisition and manifestation arguments. Because some of the sentences of the language in question are undecidable (their truth or falsity cannot be recognized by means of "decision procedures"), it is inexplicable how a speaker is able to learn their truth-conditional meanings through training. Grasping the truth conditions of these sentences is beyond the ken of finite beings. Similarly, since a grasp of a sentence's meaning must be conclusively demonstrable in one's actions, it is inconceivable that a speaker could display competence in the language if this means demonstrating his or her grasp of a sentence's recognition-transcendent truth conditions. Because of this sensitivity of the theory of meaning to such epistemological concerns, Dummett concludes that the central explanatory notion of a theory of meaning cannot be epistemically unconstrained. Thus, a notion of truth requires sensitivity to the epistemic limitations of language users.

This requirement leads to an intuitionistic concept of truth, whereby bivalence fails and not all sentences can be said to possess a truth value despite being meaningful. Failure of bivalence may concern past-tense and future-tense sentences, attributions of dispositional properties to no-longer-existent objects that never displayed possession or lack of the dispositions in question, and, crucially, sentences involving unrestricted quantification over infinite domains. Further pursuit of this line leads Dummett into consideration and rejection of meaning-theoretical holism and to an emphasis on the role of logical inference in verification.

Dummett presents a compelling case for the interrelatedness of metaphysical questions and meaning-theoretical ones; in particular, he argues that notion of truth—and, concomitantly, the logic that correctly formalizes the corresponding notion of valid or truth-preserving inference—depends on a prior investigation in the theory of meaning.

Dummett's importance to philosophy lies in his demonstration of the ways in which metaphysics relates to the philosophy of logic and how those two fields in turn relate to the philosophy of language.

## DUNS SCOTUS, JOHN (c. 1266–1308)

As with many of the medieval Schoolmen, little is known of the early life of John Duns, the Scot (or Scotus), a theologian and philosopher. From the record of his ordination to the priesthood by Bishop Oliver Sutton at Northampton on March 17, 1291, it is inferred that he was born early in 1266. Rival traditions, neither of which can be traced to medieval sources, link him with each of the two main branches of the Duns family in Scotland. According to one account, he was the son of Ninian Duns, a landowner who lived near Maxton in Roxburghshire, received his early schooling at Haddington, and in 1277 entered the Franciscan convent at Dumfries, where his uncle was guardian. Another popular tradition, however, states that his father was the younger son of the Duns of Grueldykes, whose estate was near the present village of Duns in Berwickshire. As a bachelor of theology, Scotus lectured on the *Sentences* of Peter Lombard at Cambridge (date unknown), at Oxford about 1300, and at Paris from 1302 to 1303, when he and others were banished for not taking the side of King Philip the Fair against Pope Boniface VIII in a quarrel over the taxation of church property for the wars with England. The exile

was short, however, for Scotus was back in Paris by 1304 and became regent master of theology in 1305. In 1307 he was transferred to the Franciscan study house at Cologne, where he died the following year.

## WORKS

Scotus's early death interrupted the final editing of his most important work, the monumental commentary on the *Sentences* known as the *Ordinatio* (or in earlier editions as the *Commentaria Oxoniensia* or simply the *Opus Oxoniense*). An outgrowth of earlier lectures begun at Oxford and continued on the Continent, this final version was dictated to scribes, with instruction to implement it with materials from his Paris and Cambridge lectures. A modern critical edition of the *Ordinatio*, begun by the Typis Polyglottis Vaticanis (Vatican Press) in 1950, is still in progress. Though less extensive in scope, Scotus's *Quaestiones Quodlibetales* are almost as important; they express his most mature thinking as regent master at Paris. Also authentic are the *Quaestiones Subtilissimae in Metaphysicam* on Aristotle's *Metaphysics*; some forty-six shorter disputations held in Oxford and Paris and known as *Collationes*; and a series of logical writings in the form of questions on Porphyry's *Isagoge* and on Aristotle's *Categories*, *De Interpretatione* and *De Sophisticis Elenchis*. The *Tractatus de Primo Principio* is a short but important compendium of natural theology; drawing heavily upon the *Ordinatio*, it seems to be one of Scotus's latest works. Like the *Theoremata*, a work whose authenticity has been seriously questioned, the *Tractatus* was apparently dictated only in an incomplete form and left to some amanuensis to finish.

## THEOLOGY AND PHILOSOPHY

Like the majority of the great thinkers of the late thirteenth and early fourteenth centuries, Scotus was a professional theologian rather than a philosopher. One of the privileges accorded mendicant friars like the Franciscans and Dominicans was that of beginning their studies for a mastership in theology without having first become a Master of Arts. The philosophical courses they took in preparation were pursued in study houses of their own order and were, as a rule, less extensive than those required of the candidate for an M.A. As a consequence of this educational program their commentaries on the philosophical works of Aristotle were usually written later than those on biblical works or on the *Sentences* of Peter Lombard; also, the most important features of their philosophy are frequently found in the context of a theological question. This does not mean that they confused

theology with philosophy in principle, but only that in practice they used philosophy almost exclusively for systematic defense or explication of the data of revelation. But in so doing, these theologians assumed that philosophy as a work of reason unaided by faith played an autonomous role and had a competence of its own, limited though it might be where questions of man's nature and destiny were at issue.

This critical attitude concerning the respective spheres of philosophy and theology became more pronounced around the turn of the fourteenth century. Thus, we often find Scotus not only distinguishing in reply to a particular question the answers given by the theologians from those of the "philosophers" (Aristotle and his Arabic commentators) but also pointing out what the philosophers could have proved had they been better at their profession. On the other hand, the genuine interest in the logical structure of "science" (*episteme*), as Aristotle understood the term, led to an inevitable comparison of systematic theology with the requirements of a science such as Euclid's geometry.

Paradoxically, it is in the attempt of the Scholastics to show to what extent theology is or is not a science that we find the most important expressions of their ideas of a deductive system. This is particularly true of the lengthy discussions on the nature of theology in the prologue of Scotus's *Ordinatio*. Similarly, if we look for the origin of some important and influential philosophical concepts that lie at the heart of Galileo Galilei's mechanics, we find them in the medieval discussions of "the intension and remission of forms" (that is, how qualities like hot and white increase in intensity). It was in his analysis of how a man might grow in supernatural charity, for instance, that Scotus introduced his theory of how variations in the intensity of a quality might be treated quantitatively. This key notion, developed by the Merton Schoolmen and extended to the problem of motion, made possible Galileo's description of the free fall of bodies.

Scotus was most concerned with what philosophy has to say about God and the human spirit. Though his ethical views and philosophy of nature are not without interest, Scotus was primarily a metaphysician.

## METAPHYSICS

Scotus was thoroughly familiar with the writings of Avicenna, whose concept of metaphysics Scotus brought to the service of theology. Avicenna agreed with Averroes that Aristotle's metaphysics was meant to be more than a collection of opinions (*doxa*) and had the character of a science (*episteme*) or body of demonstrated truths, where

“demonstration” is understood in the sense of the *Posterior Analytics*. They also agreed that this science was in great part concerned with God and the Intelligences responsible for the movement of the planetary spheres. But Averroes believed that the existence of God is proved by physics or natural science (by Aristotle’s argument for a prime mover), whereas Avicenna developed a causal proof within the framework of metaphysics itself. Scotus argued that the Averroistic view subordinates Aristotle’s “first philosophy” to physics when it should be autonomous. Moreover—and more important—one needs a metaphysician to prove that the “prime mover” is the First Being, and metaphysics provides more and better arguments for God’s existence than this particular physical proof. Part of the difficulty with the physical proof stems from Aristotle’s axiom that “whatever is moved is moved by another.” Scotus did not regard this as intuitively evident or deducible from any other such principles. Furthermore, he saw numerous counterinstances in experience, such as man’s free will or a body’s continued motion after external force is removed.

**THE TRANSCENDENTALS.** Scotus saw metaphysics as an autonomous science concerned with the transcendentals, those realities or aspects of reality that transcend the physical. Its subject matter, as Avicenna rightly maintained, is being as being and its transcendental attributes. In contrast with St. Thomas Aquinas, who restricted transcendental to such notions as have the same extension as “being,” Scotus treated any notion applicable to reality but not included in one of Aristotle’s ten categories as transcendental. At least four classes of such can be enumerated. Being (*ens*) is the first of the transcendental notions. It is an irreducibly simple notion of widest extension that is used to designate any subject whose existence implies no contradiction. “Existence” refers to the real or extramental world. Next come the three attributes coextensive with being—“one,” “true,” and “good”—for to be capable of existing in the extramental world, the subject must have a certain unity and be capable of being known and being desired or willed. Third, there are an unlimited number of attributes such as “infinite-or-finite,” “necessary-or-contingent,” “cause-or-caused,” and so on, that are coextensive with being only in disjunction. Finally, there are many other predicates whose formal notion or definition contains no hint of imperfection or limitation. These are known as pure or unqualified perfections. In addition to being (*ens*), its coextensive attributes, and the more perfect member of each disjunction, this class of transcendentals includes any attribute that can be ascribed to God, whether it pertain to him alone

(such as omnipotence or omniscience) or whether it also is characteristic of certain creatures (such as wisdom, knowledge, free will).

**Disjunctive attributes.** Like Avicenna, Scotus regarded the disjunctive transcendentals as the most important for metaphysics, but being Christian, he conceived these supercategories of being somewhat differently. Avicenna held that creation proceeded from God by a necessary and inevitable process of emanation, whereas for Scotus creation was contingent and dependent on God’s free election. Therefore, for Scotus the less perfect member of each disjunction represents only a possible type of real being, whereas for Avicenna these possible types must all eventually be actualized, and therefore the complete disjunction is a necessary consequence of “being.” Scotus expressed this difference in what might be called his “law of disjunction”:

In the disjunctive attributes, while the entire disjunction cannot be demonstrated from “being,” nevertheless as a universal rule by positing the less perfect extreme of some being, we can conclude that the more perfect extreme is realized in some other being. Thus it follows that if some being is finite, then some being is infinite, and if some being is contingent, then some being is necessary. For in such cases it is not possible for the more imperfect extreme of the disjunction to be existentially predicated of “being” particularly taken, unless the more perfect extreme be existentially verified of some other being upon which it depends. (*Ordinatio* I, 39)

The task of the metaphysician, then, is to work out the ways in which the various transcendental concepts entail one another. One of the more important conclusions that will emerge from such an analysis is that there is one, and only one, being in which all pure perfection coexists. Such an infinite being we call God.

**PROOF FOR GOD’S EXISTENCE.** Scotus suggested that the metaphysician might use any pair of disjunctives to prove God exists (and here he seems to be in the tradition of William of Auvergne and the “second way” of St. Bonaventure). However, the one metaphysical proof he chose to work out in any detail seems to be a synthesis of what he considered the best elements of all the proofs of his predecessors. Henry of Ghent, whose writings so often served as the springboard for Scotus’s own discussion of any problem, had tried to bring some order into the many proofs advanced during the Middle Ages by grouping them under two general headings, the way of causality

and the way of eminence. The first drew its inspiration from Aristotelian principles, whereas the second was Augustinian in tone and stemmed from the School of St. Victor and the *Monologion* of St. Anselm. The way of causality was further divided by Henry accordingly as God is treated as the efficient, the final, or the exemplar cause of creatures.

Scotus simplified the causal approach by eliminating the exemplar cause as a distinct category. He treated it as merely a subdivision of efficiency and implied that the cause in question is intelligent and does not act by a blind impulse of nature. As for the way of eminence, it was treated not simply in terms of its Platonic or Augustinian origins but as having a foundation in Aristotelian principles as well. The proof was developed in two principal parts, one dealing with the relative attributes of the infinite being—efficiency, finality, and eminent perfection—and the second with the absolute property of his infinity. Given the infinity of God, Scotus essayed to show there can be but one such being. Each section is a concatenation of closely reasoned conclusions, some thirty-odd in all.

The argument was perhaps one of the most elaborate and detailed proofs for God's existence constructed during the Middle Ages, and apart from any intrinsic merit as a whole it is of considerable historical interest. From the time Scotus first formulated it, he subjected the proof to several revisions, mainly in the direction of greater conceptual economy and logical rigor. In what seems to be the final version (in the *Tractatus de Primo Principio*), the proof is prefaced by two chapters that represent an attempt to formalize what a Schoolman at the turn of the fourteenth century must have regarded as the basic axioms and theses of the science of metaphysics. Other interesting aspects of the argument appear in answer to possible objections to the proof. One anticipates Immanuel Kant's causal antinomy. Aristotle and his Arabic commentators maintained that the world with its cyclic growth and decay had no beginning. How, then, can one argue to the existence of an uncaused efficient cause? Scotus's solution reveals the influence of Avicenna. On the ground that whatever does not exist of itself has only the possibility of existence as something essential to itself, Avicenna argued that this holds not only of the moment a thing begins to be but of every subsequent moment as well. The true cause of any effect, then, must coexist with and conserve the effect and therefore must be distinguished from the ancillary chain of partial causes that succeed one another in time.

Scotus developed this distinction in terms of what he called an essential versus an accidental concatenation of causes. A series of generative causes such as grandparent, parent, and child, or any sequence of events such as those later analyzed by David Hume, would be causes only accidentally ordered to one another in the production of their final effect. Where an essential ordering or concatenation exists, all the causal factors must coexist both to produce and to conserve their effect. This is true whether they be of different types (such as material, formal, efficient, and final) or whether they be a chain of efficient or final causes, such as Avicenna postulated for the hierarchy of Intelligences between God and the material world. While infinite regress in accidentally ordered causes may be possible, Scotus said, the chain as a whole must be essentially ordered to some coexisting cause that guarantees the perpetuity of what is constant or cyclic about such repetitive productivity. But no philosopher postulates an infinite regress where the concatenation of causes is essential and all must coexist. One does not explain how any possible effect is actually conserved, for instance, by assuming an infinity of links upon which it depends.

*Technical demonstration.* How is any proof that begins with factual propositions demonstrative or scientific in Aristotle's sense of demonstrative? Are not all such premises contingent? With Avicenna obviously in mind, Scotus explained that pagan philosophers could admit that every factual proposition is necessarily true because of the deterministic chain of causes that links it to the first creative cause, God. According to pagan philosophers, this is true not only of eternal entities like primary matter or the inferior or secondary Intelligences but also of all temporal events brought about by the clockwork motions of the heavenly bodies that these Intelligences cause. Empirical explanations of temporal events are required only because the human mind is unable to trace all the intricate links of causal efficacy that make any given event a necessary and inevitable consequence of God's essential nature.

If such a theory were true, Scotus argued, it would eliminate all genuine contingency from the world and thus conflict with one of the most manifest truths of human experience, namely, that we are free to act otherwise than we do. Should one deny such an obvious fact, it is not argument he needs but punishment or perception. "If, as Avicenna says, those who deny a first principle should be beaten or exposed to fire until they concede that to burn or not to burn are not identical, so too ought those who deny that some being is contingent be exposed to torments until they concede that it is possible for them

not to be tormented” (*Ordinatio* I, 39). If true contingency exists, however, it can only be because the first cause does not create the world by any necessity of nature. But if the whole of creation depends upon God’s free will, then every factual or existential statement about it will be radically contingent. How, then, can any proof from effect to cause satisfy Aristotle’s demand that demonstration begin with necessary premises? One could argue legitimately, but not demonstratively, from such an obvious fact as contingency. Yet, Scotus maintained, it is possible to convert the argument into a technical demonstration by shifting to what is necessary and essential about any contingent fact, namely, its possibility. For while one cannot always infer actuality from possibility, the converse inference is universally valid. What is more, Scotus added, statements about such possibilities are necessary; hence, he preferred to construct the proof from efficiency in the mode of possibility thus: Something can be produced, therefore something can be productive; since an infinite regress or circularity in essentially concatenated causes is impossible, some uncaused agent must be possible and hence actual, since it cannot be both possible and incapable of being caused if it is not actually existing.

One can argue similarly of the possibility of a final cause or of a most perfect nature. (Scotus’s argument in this connection bears a curious parallel to Ludwig Wittgenstein’s about simple objects in the *Tractatus Logico-Philosophicus*.) Scotus saw God as the necessary or a priori condition required to make any contingent truth about the world possible; these possibilities must be a part of God’s nature, “written into him from the beginning”; as source of all possibility, he himself cannot be “merely possible.” It is in God’s knowledge of, and power over, these limitless possibilities that we discover what is fixed, essential, and noncontingent about not only the actual world but about all possible worlds as well. Since God is the fixed locus in which all possibilities coexist, he must be infinite in knowledge, in power, and therefore in his essence or nature. Since contradictions arise if one assumes that more than one such infinite mind, power, or being exists, there can be but one God.

## THEORY OF KNOWLEDGE

After establishing the existence of an infinite being to his own satisfaction, Scotus undertook an analysis of the concepts that enter into statements about God, and in so doing he threw considerable light upon his own theory of knowledge, particularly upon how he considered notions

that transcend the level of sensible phenomena to be possible.

**UNIVOCITY AND THE TRANSCENDENTALS.** Some of the earlier Schoolmen like Alexander of Hales, St. Bonaventure, and Henry of Ghent fell back upon various theories of innatism or illuminationism (in which elements from St. Augustine and Avicenna were grafted upon the Aristotelian theory of knowledge) to account for such knowledge as seems to have no foundation in the data of the senses. These hybrid interpretations of Aristotle had this in common: His theory was used to explain only how general or universal concepts applicable to the visible world are abstracted from sense images. But where any notion applicable to God was involved, some illumination from a transcendent mind was thought to be required. Not only did this hold for notions obviously proper to God—such as “necessary being” and “omnipotence”—but also for such seemingly common transcendentals as “being,” “true,” and “good.” Although the latter terms were predicated of creatures as well as of God, their meaning was not univocal. Associated with each term were two similar, and hence often indistinguishable, meanings, both simple and irreducible to any common denominator. One was believed to be proper to creatures and to be abstracted from sensible things by the aid of an agent intellect; the other was proper to God, and since it transcended in perfection anything to be found in creatures, it must be given from above. It was maintained that these innate ideas, impressed upon the soul at birth, lie dormant in the storehouse of the mind, to be recalled like forgotten memories when man encounters something analogous in sensible experience. The discovery of God in created things, then, was explained much like Plato’s account of how man recalls the transcendent world of ideas.

As Aristotle’s own writings became better known, however, the popularity of such theories diminished. More and more Scholastics followed Thomas Aquinas in rejecting any special illumination theory to explain man’s knowledge of God, but like Thomas they failed to see that this required any modification of the traditional doctrine of the analogy of being and other transcendental terms. Scotus seems to have been the first to see the discrepancy between the two positions. He pointed out that if all of our general notions (including those of being and its transcendental attributes) are formed by reflecting upon sensible things, as Aristotle explained, then some notions such as being must be univocally predicable of God and creatures, or all knowledge of God becomes impossible. Arguing specifically against Henry of Ghent, who claimed

we have either a concept of being proper to God or one common to finite creatures, Scotus insisted on the need of a third or neutral notion of being as a common element in both the other concepts. This is evident, he said, because we can be certain that God is a being while remaining in doubt as to whether he is an infinite or a finite being. When we prove him to be infinite, this does not destroy but adds to our previous incomplete and imperfect notion of him. The same could be said of other transcendental notions, such as wisdom or goodness. Indeed, every irreducibly simple notion predicable of God must be univocally predicable of the finite and created thing from which it was abstracted. Any perfection of God is analogous to its created similitude, but we conceive such a perfection as something exclusive or proper to God through composite concepts constructed by affirming, denying, and interrelating conceptual elements that are simple and univocally predicable of creatures. For even though every such element is itself general, certain combinations thereof may serve to characterize one, and only one, thing. Although such concepts are proper to God, they retain their general character and do not express positively the unique individuality of the divine nature. Hence the need for proving that only one God exists.

Scotus also held that the transcendental notion of being (*ens*) is univocal to substance and accidents as well as to God and creatures. We have no more sensible experience of substance than we do of God; its very notion is a conceptual construct, and we would be unable to infer its existence if substance did not have something positive in common with our experiential data.

**THE FORMAL DISTINCTION.** The concept of the formal distinction, like univocity of being, is another characteristic metaphysical thesis connected with Scotus's theory of knowledge. Though usually associated with his name, the distinction did not originate with him. It represents a development of what is sometimes called the "virtual distinction" or "conceptual distinction with a foundation in the thing." The latter is an intermediate between the real distinction and that which is merely conceptual. The difference between the morning star and evening star, for example, is purely conceptual. Here one and the same thing, the planet Venus, is conceived and named in two different ways because of the different ways or contexts in which it appears to us. The real distinction, on the contrary, concerns two or more individual items, such as Plato and Socrates, body and soul, or substance and its accidents. Though two such things may coexist or even form a substantial unity or accidental aggregate, it is

logically possible that one be separated from the other or even exist apart from the other. The Scholastics generally recognized the need of some intermediary distinction if the objectivity of our knowledge of things is to be safeguarded. How is it possible, they asked, to speak of a plurality of attributes or perfections in God when the divine nature is devoid of any real distinction? How is it possible for a creature to resemble God according to one such attribute and not another? Similarly, if the human soul is really simple, as many of the later Scholastics taught, how can it lack all objective distinction and still be like an angel by virtue of its rational powers and unlike the angel by reason of its sentient nature? All agree that it is possible for the human mind to conceive one of these intelligible aspects of a thing apart from another and that both concepts give a partial insight into what is objectively present to the thing known.

To put it another way, there is a certain isomorphism between concept and reality, in virtue of which concept may be said to be a likeness (*species*) or picture of reality. This "likeness" should not be construed in terms of the relatively simply way a snapshot depicts a scene, but perhaps something more akin to Wittgenstein's "logical picture," being based upon what shows itself in both the world of facts and our thoughts about the world. In virtue of this intelligibility of form, we can speak of *ratio* (the Latin equivalent of the Greek *logos* or the Avicennist *intentio*) either as in things or as in the mind. To the extent that this *ratio* or intelligible feature is a property or characteristic of a thing, we are justified in saying that the individual possessing it is a so-and-so. Though such *rationes* can be conceived one without the other because their definitions differ and what is implied by one is not necessarily implied by the other, nevertheless, as characteristic of a specific individual, they constitute one thing. They are not separable from that individual in the way the soul can be separated from the body, or a husband from his family. Not even the divine power can separate a soul from its powers or the common features of the individual from what is unique (his *haecceity*).

Thomas spoke of this nonidentity as conceptual, with the qualification that it does not arise merely in virtue of thinking mind but "by reason of a property of the thing itself." Henry of Ghent called it an intentional distinction, but he added that the distinction is only potential prior to our thinking about it. Scotus, however, argued that if something has the native ability to produce different concepts of itself in the mind, each concept reflecting a partial but incomplete insight into the thing's nature, then the distinction must be in some sense actual.

Put in another way, there must be several “formalities” in the thing (where “form” is understood as the objective basis for a concept and “little form” or formality as an intelligible aspect or feature of a thing that is less than the total intelligible content of a thing). Here again Scotus argued (on a line later followed by Wittgenstein) that a thing’s possibilities, unlike their actualization, are not accidental but are essential to it and must have some actual basis. If a thing is virtually two things inasmuch as it is able to be grasped in two mutually exclusive ways, this nonidentity of intelligible content must be prior to our actually thinking about the thing, and to that extent it exists as a reality (*realitas*) or in other words, objectively. This nonidentity of realities, or formalities, is greatest in the case of the Trinity, where the peculiar properties of the three divine persons must be really identical with, but formally distinct from, the divine nature they have in common. This formal nonidentity holds also for the divine attributes, such as wisdom, knowledge, and love, which although really one are virtually many.

The formal distinction was also used by Scotus to explain the validity of our universal conceptions of individuals, a Scotistic thesis that influenced C. S. Peirce. Unlike the “nominalists,” Scotus did not believe that the common features of things can be accounted for fully in terms of their being represented by a common term or class concept. Some objective basis for this inclusion is required, and this similarity or aspect in which one individual resembles another he called its common nature (*natura communis*). This common nature is indifferent to being either individualized (as it invariably is in the extramental world) or being recognized as a universal feature of several individuals (as it is when we relate the concept of this “nature,” such as “man,” to Peter or Paul). The common nature is individualized concretely by what Scotus called its thisness (*haecceity*), which is a formality other than the nature, a unique property that can characterize one, and only one, subject.

Scotus consequently rejected the Aristotelian-Thomistic thesis that the principle of individuation is identified somehow with matter by reason of matter’s quantitative aspect. This thesis would seem to make individuality something extrinsic to the thing itself, or at least the effect of something really other than the thing itself, since matter or matter signed with quantity is really distinct from the form. The requirement of haecceity is a logical one, according to Scotus, for in practice we do not differentiate individual persons or objects because we know their respective haecceity (that is, their Petrinity, Paulinity, their “thisness,” or “thatness”), but because of

such accidental differences as being in different places at the same time, or having different colored hair or eyes. However, this individuating difference, he insisted, is known to God and can be known by man in a future life, where his intellect is not so dependent upon sense perception.

**KNOWING AS AN ACTIVITY.** Though Scotus rejected illumination in favor of what is basically an Aristotelian theory of knowledge, his teaching on the subject shows the influence of some other of Augustine’s ideas, notably the active role of the intellect in cognition. Scotus’s position is midway between the Aristotelian passivism (the “possible intellect” as a purely “passive potency” receives impressions from without) and Augustine’s activism (the intellect as spiritual can act on matter, but matter cannot act upon the spirit or mind). Scotus believed that the so-called possible intellect actively cooperates in concept formation and other intellectual operations. This activity is something over and above that which is usually ascribed to the “agent intellect.” Intellect and object (or something that is proxy for the object, such as the intelligible *species* where abstract knowledge is involved) interact as two mutually complementary principles (like man and woman in generation) to produce concepts. Since these concepts reflect only common or universal characteristics of individuals rather than what is uniquely singular about them, it cannot be the singular object itself that directly interacts with the mind, but an intelligible likeness (*species*) that carries information only about the “common nature” of the object and not its haecceity. The formation of such a likeness or species is the joint effect of the agent intellect and sense image working together as essentially ordered efficient causes. It is in this way that Scotus interpreted the Aristotelian distinction of agent and possible intellect.

**INTUITIVE VERSUS ABSTRACTIVE COGNITION.** Although the above description accounts for man’s abstract intellectual knowledge, Scotus believed that the human mind is capable of intuitive knowledge as well. By this he understood a simple (nonjudgmental) awareness of an object as existing. Where abstract cognition leaves us unable to assert whether a thing exists or not, one can assert that it exists from intuitive cognition of anything. In such a case no intelligible species of the object need intervene, for the mind is in direct contact with the thing known. While most Scholastics limited intuitive knowledge to the sense level, Scotus argued that if the human intellect is capable only of abstract cognition—what can be abstracted from sense encounters in the way described

by Aristotle—then the face-to-face vision of God promised to us in the afterlife becomes impossible. Consequently, our ideas of the proper object of the human intellect must be expanded to account for this.

Scotus thought that rational considerations also require us to admit some degree of intuitive power in man even if the full ambit of this power cannot be established by a philosopher. There are many primary contingent propositions of which we are absolutely certain (such as “I doubt such and such” or “I am thinking of such and such”). Since this certitude cannot be accounted for by any amount of conceptual analysis of the propositional terms, we must admit some prior simple awareness of the existential situation that verifies the proposition. This cannot be mere sensory knowledge, since the existential judgment often involves conceptual or nonsensory meanings, as in the examples given above. It is not clear that Scotus wished to assert that in this life we have intuitive knowledge of anything more than our interior acts of mind, will, and so on. This would seem to limit intellectual intuition to reflective awareness and would be consistent with his statements that we have no direct or immediate knowledge of the haecceity of any extramental object. However, he believed that in the afterlife man by his native powers will be able to intuit any created thing, be it material or spiritual, and to that extent man’s mind is not essentially inferior to that of the angel. On the other hand, it is not merely because of man’s lapsed state that his mind is at present limited to knowing the intelligible features of sense data but also because of the natural harmony of body and mind that would obtain even in a purely natural state.

**CERTITUDE.** The human capacity for certitude was also discussed, with Henry of Ghent as the chief opponent. Henry, Scotus explained, appealed to illumination, not for the acquisition of our everyday concepts about the world, since these are obtained by abstraction, but for certitude of judgment. Although the “mechanics” of the process are not fully clear, two “mental images” or species are involved, one derived from creatures, the other imparted by divine illumination from above. Since both the human mind and the sensible object are subject to change, no species or likeness taken from the sensible object and impressed upon the mind will yield invariant truth. Something must needs be added from above. Scotus made short shrift of this theory. If the conclusion of a syllogism is no stronger than its weakest premises, neither does a blending of an immutable and a mutable species make for immutability. Furthermore, if the object is so radically mutable that nothing is invariant under change,

then to know it as immutable is itself an error. By way of contrast, Scotus set out to show that certitude is possible without any special illumination. This is certainly the case with first principles and the conclusions necessarily entailed by them. Such necessary truths assert a connection or disconnection between concepts that is independent of the source of the concepts. It is not, for example, because we are actually in sense contact with a finite composite that we can assert that a “whole” of this kind is greater than a part thereof. Even if we erroneously perceive white as black and vice versa, a judgment like “white is not black” precludes any possible error because it depends only on a knowledge of the terms and not on how we arrived at that knowledge.

A second type of certitude concerns internal states of mind or actions. That we are feeling, willing, doubting are experiential facts that can be known with a degree of certitude equal to that of first principles or the conclusions they entail.

A third category concerns many propositions of natural science where a combination of experience and conceptual analysis gives us certitude. Reposing in our soul is the self-evident proposition: “Whatever occurs in a great many instances by a cause that is not free is the natural effect of that cause.” Even if the terms are derived from erring senses, we know this to be true, for the very meaning of nature or natural cause is one that is neither free nor acts haphazardly. If experience reveals recurrent behavior patterns where no free intelligent agent is involved, then we are evidently dealing with a natural cause. If the same situation recurs, we can be certain at least of what *should* result therefrom. That the effect expected actually does occur depends upon two further conditions: that the natural course of events is not interrupted by some unforeseen causal factor and that God does not miraculously intervene. Even sensory perception can be analyzed critically to exclude any reasonable doubt. Conflicting sense reports produce such illusions as the stick immersed in water that feels straight yet appears to be bent. Yet there is always some self-evident principle possessed by our mind that enables us to decide which sense perceptual information is correct. Here it is the proposition “Any harder object is not broken by something soft that gives way before it.” There are many areas of knowledge, then, where humans are perfectly well equipped to arrive at certitude without any special divine enlightenment.

## THE DOMAIN OF CREATURES

**EXEMPLAR IDEAS.** Scholastics generally accepted Augustine's theory that before creatures are produced, they pre-exist in God's mind as archetypal ideas. Scotus differed from Bonaventure and Thomas, however, by denying that God knows creatures through such ideas. Every creature is limited and finite as to intelligible content. To make God's knowledge of a creature dependent upon this limited intelligibility of any given idea denigrates the perfection of his intellect; if there is any dependence of idea and intellect, it must be the other way round. Only the infinitely perfect essence can be regarded as logically, though not temporally, antecedent to God's knowledge of both himself and possible creatures. Since possible creatures are written into the divine nature itself, in knowing his nature God knows each possible creature, and in knowing the creature he gives it intelligibility and existence as an object of thought. Like the creative painter or sculptor who produces an idea of his masterpiece in his mind before embodying it in canvas or stone, God, if he is not to act blindly but intelligently, must have a guiding idea or "divine blueprint" of the creature that is logically prior to his decision to create it. Creatures, then, are dually dependent upon God; they depend upon his infinitely fertile knowledge for their conception as exemplar ideas, and they depend upon the divine election of his omnipotent will for their actual existence. This tendency to distinguish various "logical moments" in God, and in terms of their nonmutual entailment to set up some kind of order or "priority of nature" among them, is characteristic of much of Scotus's theological speculation and became a prime target for William of Ockham's subsequent criticism.

**THEORY OF MATTER AND FORM.** The hylomorphic interpretation formerly attributed to Scotus was based on the *De Rerum Principio*, now ascribed to Cardinal Vital du Four. Scotus, unlike most of his Franciscan predecessors, did not accept the view of Solomon ben Judah ibn Gabirol (Avicebron) that all creatures are composed of matter and form. He considered both angels and human souls as simple substances, devoid of any real parts, though they differ in the formal perfections they possess.

Since Scotus did not equate matter with potency (as did St. Bonaventure), nor did he consider it in any way a principle of individuation (as did St. Thomas), there was no reason to postulate it in spiritual creatures either to explain why they are not pure act like God or to account for the possibility of a plurality of individuals in the same species. Hence, against Thomas, Scotus argued that even

though angels lack matter, more than one individual of the same species may exist. More important, Scotus, like John Peckham and Richard of Middleton before him, insisted that matter must be a positive entity. Peckham's view grew out of his Augustinian theory of matter as the seat of the "seminal reasons," but Scotus rejected this germinal interpretation of inchoate forms and argued that if matter is what Aristotle thought it to be, it must have some minimal entity or actuality apart from form. It is true that primary matter is said to be pure potency, but there are two types of such passive potency; one is called objective and refers to something that is simply nonexistent but that can be the object of some productive creation. Matter as the correlative of form, however, is a "subjective" potency or capacity; it is a neutral subject able to exist under different forms and hence is not really identical with any one of them. Absolutely speaking, God could give matter existence apart from all form, either accidental or substantial. In such a case, matter would exist much like a pure spirit or the human soul.

William of Ockham followed Scotus on this point, as well as in his view that the primary matter of the sun and planetary spheres is not any different from that found in terrestrial bodies, though the substantial form in question may be superior to that of terrestrial elements and compounds.

**THE HUMAN SOUL AS FORM.** From man's ability to think or reason, Scotus argued that the intellective soul is the substantial form that makes man precisely human. But to the extent that reason can prove the soul to be the form of the body, it becomes correspondingly more difficult to demonstrate that the soul will survive the death of the body. While the traditional arguments for immortality have probabilistic value, only faith can make one certain of this truth. On the other hand, if the soul must be a spiritual substance to account for the higher life of reason, at least one other perishable "form of corporeity" must be postulated to give primary matter the form of a human body. Though to this extent Scotus agreed with the pluriformists against St. Thomas, it is not so clear that he would postulate additional subsidiary forms. A virtual presence of the lower forms (elements and chemical compounds) in the form of corporeity would seem to suffice. The form of corporeity has dimensive quantity, that is, it is not the same in each and every part of the body, as is the human soul. The same may be said of the "souls" of plants and animals. Though the human soul has the formal perfections of both the vegetative and the animal souls, these components are not really distinct parts. A

formal distinction between the soul's faculties or powers suffices to account for this.

**FREE WILL.** Particularly in his conception of free will, Scotus departed in many respects from contemporary positions. The will is not simply an intellectual appetite, a motor power or drive guided by intelligence rather than mere sense perception. Freedom of will, in other words, is not a simple logical consequence of intelligence but is unique among the agencies found in nature. All other active powers or potentialities (*potentiae activae*) are determined by their nature not only to act but to act in a specific way unless impeded by internal or external causes. But even when all the intrinsic or extrinsic conditions necessary for its operation are present, the free will need not act. Not only may it refrain from acting at all but it may act now one way, now another. The will has a twofold positive response toward a concrete thing or situation. It can love or seek what is good, or it can hate or shun what is evil. Moreover, it has an inborn inclination to do so. But unlike the sense appetites, the will need not follow its inclination. Scotus rejected Thomas's theory that man is free only if he sees some measure of imperfection or evil in a good object and that the will is necessitated by its end (the good as such), though it is free to choose between several means of attaining it.

But Scotus saw a still more basic freedom in the will, one that Aristotle and Plato failed to recognize. Their theory of human appetites and loves can be called physical in the original sense of that term. All striving, all activity stems from an imperfection in the agent, whose actions all tend to perfect or complete its nature. *Physis* or "nature" means literally what a thing is "born to be" or become. Since what perfects a thing is its good, and since striving for what is good is a form of love, we could say that all activity is sparked by love. The peculiarity of such "love," however, is that it can never be truly altruistic or even objective. It is radically self-centered in the sense that nature seeks primarily and above all else its own welfare. If at times we find what appears to be altruistic behavior, it is always a case where the "nature" or "species" is favored at the cost of the individual. But nature, either in its individual concretization or as a self-perpetuating species, must of necessity and in all that it does seek its own perfection. This is its supreme value, and the ultimate goal of its loves. Such a theory presents a dual difficulty for a Christian. How can one maintain that "God is love" (I John 4.16) and how can man love God above all things if self-perfection is his supreme value? Thomas tried to solve the problem within the general framework of the Aristotelian system by making God

the perfection of man. In loving God as his supreme value, man is really loving himself. Love of friendship becomes possible to the extent that he loves another as an "other self." This solution had its drawbacks, for certain aspects of Christian mysticism must then be dealt with in a Procrustean way. It leaves unexplained certain facets of man's complex love life. Finally, the theory commits Thomas, as it did Aristotle, to maintain that the intellect, rather than free will, is the highest and most divine of man's powers—a view at odds with the whole Christian tradition and particularly with Augustine.

Scotus tried another tack, developing an idea suggested by St. Anselm of Canterbury. The will has a twofold inclination or attraction toward the good. One inclination is the affection for what is to our advantage (*affectio commodi*), which corresponds to the drive for the welfare of the self described above. It inclines man to seek his perfection and happiness in all that he does. If this tendency alone were operative, we would love God only because he is our greatest good, and man's perfected self (albeit perfected by union with God in knowledge and love) would be the supreme object of man's affection; it would be that which is loved for its own sake and for the sake of which all else is loved.

But there is a second and more noble tendency in the will, an inclination or affection for justice (*affectio iustitiae*), so called because it inclines one to do justice to the objective goodness, the intrinsic value of a thing regardless of whether it happens to be a good for oneself or not. There are several distinguishing features of this "affection for justice." It inclines one to love a thing primarily for its own sake (its absolute worth) rather than for what it does or can do for one (its relative value). Hence, it leads one to love God in himself as the most perfect and adorable of objects, irrespective of the fact that he happens to love us in return or that such a love for God produces supreme delight or happiness in man as its concomitant effect. Third, it enables one to love his neighbor literally as himself (where each individual is of equal objective value). Finally, this love is not jealous of the beloved but seeks to make the beloved loved and appreciated by others. "Whoever loves perfectly, desires co-lovers for the beloved" (*Opus Oxoniense* III, 37). Recall the tendency to make others admire the beautiful or the sorrow felt when something perfectly lovely is unloved, desecrated, or destroyed. If the *affectio commodi* tends to utter selfishness as a limiting case, the first checkrein on its headlong self-seeking is the *affectio iustitiae*. Scotus wrote:

This affection for what is just is the first tempering influence on the affection for what is to our

advantage. And inasmuch as our will need not actually seek that towards which the latter affection inclines us, nor need we seek it above all else, this affection for what is just, I say, is that liberty which is native or innate in the will, since it provides the first tempering influence on our affection for what is to our own advantage. (Ibid., II, 6, 2)

The will's basic liberty, in short, is that which frees it from the necessity of nature described by Aristotle, the need to seek its own perfection and fulfillment above all else. Here is the factor needed to account for the generous and genuinely altruistic features of human love inexplicable in terms of the physicalist theory.

Scotus therefore distinguished between the will with respect to its natural inclinations and the will as free. The former is the will considered as the seat of the affection for the advantageous. It views everything as something delightful, useful, or a good for oneself and leads to the love of desire (*velle concupiscentiae*). As free or rational (in accord with right reason), the will is the seat of the affection for justice that inclines us to love each thing "honestly" or as a *bonum honestum*, that is, for what it is in itself and hence for its own sake. Since only such love recognizes the supreme value and dignity of a person and finds its highest and most characteristic expression when directed toward another, it is usually called the love of friendship (*velle amicitiae*) or of wishing one well (*amor benevolentiae*).

## ETHICAL AND POLITICAL PHILOSOPHY

Although not primarily an ethicist, Scotus did solve enough specific moral problems from the standpoint of his general system of ethics to make it clear that his ethical system falls well within the accepted code of Christian morality of the day. Yet it does have some distinctive features, most of them growing out of the theory of the will's native liberty. Without some such theory, Scotus did not believe a genuine ethics is possible. If man had only a "natural will" (a rational or intellectual appetite dominated by the inclination for self-fulfillment), he would be incapable of sin but subject to errors of judgment. On the other hand, if the will's freedom is taken to mean nothing more than simple liberation from this inclination of nature, its actions would become irrational and governed by chance or caprice. What is needed is some counterinclination that frees man from this need to follow his natural inclination yet is in accord with right reason. This is

precisely the function of man's native freedom. Man's reason, when unimpeded by emotional considerations, is capable of arriving at a fairly objective estimate of the most important human actions in terms of the intrinsic worth of the goal attained, the effort expended, the consequences, and so on. By reason of its "affection for justice" the will is inclined to accept and to seek such intrinsic values, even when this runs counter to other natural inclinations of self-indulgence. But being free to disregard the inclination for self-indulgence and to follow the higher dictates of justice, man becomes responsible for the good or evil he foresees will result from either course of action. It is the exercise of this freedom that is a necessary, though not a sufficient, condition for any action to have a moral value.

The other requisite conditions become apparent if we consider the nature of moral goodness. An action may be called good on several counts. There is that transcendental goodness coextensive with being which means simply that, having some positive entity, a thing can be wanted or desired. But over and above this is that natural goodness which may or may not be present. Like bodily beauty, this accidental quality is a harmonious blend of all that becomes the thing in question. Actions also can have such a natural goodness. Walking, running, and the like may be done awkwardly or with a certain grace or beauty. More generally, an activity or operation of mind or will can be "in harmony with its efficient cause, its object, its purpose and its form and is naturally good when it has all that becomes it in this way" (*Opus Oxoniense* II, 40). But moral goodness goes beyond this natural goodness. "Even as beauty of body is a harmonious blend of all that becomes a body so far as size, color, figure and so on are concerned," Scotus wrote, "so the goodness of a moral act is a combination of all that is becoming to it according to right reason" (II, 40). One must consider not only the nature of the action itself but also all the circumstances, including the purpose of its performance. An otherwise naturally good action may be vitiated morally if circumstances forbid it or if it is done for an evil end.

Right reason tells us there is one action that can never be inordinate or unbecoming under any set of circumstances: the love of God for his own sake. "God is to be loved" is the first moral principle or ethical norm. This and its converse, "God must never be hated or dishonored," are two obligations from which God himself can never grant dispensation. He is the one absolute intrinsic value, which cannot be loved to excess; but "anything

other than God is good because God wills it and not vice versa" (III, 19).

Scotus argued here as in the case of the divine intellect. The intelligibility of a creature depends upon God's knowing it, and not the other way around. So too its actual value or goodness depends upon God's loving it with a creative love and not vice versa. This obviously applies to transcendental goodness, which is coextensive with a thing's being, but it also holds for natural and moral goodness as well. If the infinite perfection of God's will prevents it from being dependent or necessitated by any finite good, it also ensures that creation as a whole will be good. God is like a master craftsman. For all his artistic liberty, he cannot turn out a product that is badly done. Yet no particular creation is so perfect, beautiful, or good that God might not have produced another that is also good; neither must all evil or ugliness be absent, particularly where this stems from a creature's misuse of his freedom. Nevertheless, there are limits to which God's providence can allow evil to enter into the world picture. He may permit suffering and injustice so that humankind may learn the consequences of its misbehavior and through a collective sense of responsibility may right its social wrongs.

While certain actions may be naturally good or bad, they are not by that very fact invested with a moral value; they may still be morally indifferent even when all circumstances are taken into consideration. Only hatred and the "friendship-love" of God are invested with moral value of themselves, and as the motivation for otherwise naturally good or indifferent actions they may make the actions morally wrong or good. Otherwise, the action must be forbidden by God to be morally wrong or commanded by him to be morally good. To that extent, moral goodness too depends upon the will of God. However, it is important to know that some actions are good or bad only because God commands or forbids them, whereas he enjoins or prohibits other actions because they are naturally good or bad, that is, they are consonant or in conflict with man's nature in the sense that they tend to perfect it or do violence to it. Such are the precepts of the natural law embodied in the Decalogue and "written into man's heart."

But note that what makes obedience to this instinctual law of moral value is that it be recognized and intended as something willed by God; otherwise, good as it may be naturally, the action is morally indifferent. This too is a consequence of man's native liberty, which can be bound only by an absolute value or the will of its author. To the extent that the first two commandments are

expressions of the first moral principle and its converse, God can never make their violation morally right or a matter of indifference; the same does not hold of the last seven, which regulate man's behavior to his fellow man. God granted genuine dispensations from natural law, permitting polygamy to the patriarchs so that the children of God might be multiplied when believers were few. This might be permitted again if plague or war so decimated the male population that race survival was threatened. In such a case, God would reveal this dispensation to man, probably through his church.

**HUMAN SOCIETY.** Although Scotus wrote little on the origin of civil power, his ideas of its origin resemble John Locke's. Society is naturally organized into families; but when they band into communities they find some higher authority necessary and agree to vest it in an individual or a group, and decide how it is to be perpetuated—for example, by election or hereditary succession. All political authority is derived from the consent of the governed, and no legislator may pass laws for private advantage or that conflict with the natural or divine positive law. Private property is a product of positive rather than natural law and may not be administered to the detriment of the common good. More striking, perhaps, than Scotus's social philosophy was his theological theory (which influenced Francisco Suárez and, more recently, Pierre Teilhard de Chardin) that the second person of the Trinity would have become incarnate even if man had not sinned. Intended as God's "firstborn of creatures," Christ represents the alpha and omega not only of human society but of all creation.

Known to posterity as the "subtle doctor," Scotus is admittedly a difficult thinker. Almost invariably his thought develops through an involved dialogue with unnamed contemporaries. Although this undoubtedly delighted his students and still interests the historian, it tries the patience of most readers. His style has neither the simplicity of St. Thomas's nor the beauty of Bonaventure's, yet as late as the seventeenth century he attracted more followers than they. Like students who unconsciously mimic the worst mannerisms of their mentor, many of Scotus's disciples seemed bent more on outdoing him in subtlety than in clarifying and developing his insights, so that for both the humanist and reformer "dunce" (a Duns-man) became a word of obloquy. Yet there have always been a hardy few who find the effort of exploring his mind rewarding. Even a poet like Gerard Manley Hopkins regarded his insights as unrivaled "be rival Italy or Greece," and the philosopher C. S. Peirce considered Scotus the greatest speculative mind of the

Middle Ages as well as one of the “profoundest metaphysicians that ever lived.” Even existentialists, who deplore the efforts to cast his philosophy in Aristotle’s mold of science, find his views on intuition, contingency, and freedom refreshing. Scotus’s doctrine of haecceity, applied to the human person, invests each individual with a unique value as one wanted and loved by God, quite apart from any trait he shares with others or any contribution he might make to society.

Despite his genius for speculation, Scotus considered speculation merely a means to an end: “Thinking of God matters little, if he be not loved in contemplation.” Against Aristotle, he appealed to “our philosopher, Paul,” who recognized the supreme value of friendship and love, which, directed to God, make men truly wise.

## Bibliography

### EDITIONS AND TRANSLATIONS

*Opera Omnia*, edited by L. Wadding, 12 vols. (Lyons, 1639), reprinted with L. Vivès, ed., 26 vols. (Paris, 1891–1895), contains most authentic and some spurious works, with commentaries by seventeenth-century Scotists. The seven volumes of the critical Vatican edition, edited by C. Balić and others (Vatican City, 1950–), contain only the first book of the *Ordinatio* and seven distinctions of the Oxford lectures. The edition may run to thirty or forty volumes.

For *Tractatus de Primo Principio*, see M. Mueller’s edition (Freiburg im Bresgau, 1941) and new editions with English translations by Evan Roche (St. Bonaventure, NY, 1949) and Allan Wolter (Chicago, 1965); the latter is titled *Duns Scotus: A Treatise on God as the First Principle*.

Wolter’s book contains translations of two questions from the first Oxford lectures; his *Duns Scotus: Philosophical Writings* (Edinburgh and London, 1962) is in Latin and English, and the paperback reprint (Indianapolis, 1964) appears without Latin. The question translated in *Free Will*, edited by S. Morgenbesser and J. Walsh (Englewood Cliffs, NJ: Prentice-Hall, 1962), is Scotus’s earlier view, which he modified slightly; cf. C. Balić, “Une Question inédite de J. D. Scot sur la volonté,” in *Recherches de théologie ancienne et médiévale* 3 (1931): 191–208. A translation of a question on the need for theology appears in *Medieval Philosophy*, edited by Herman

Shapiro (New York: Modern Library, 1964), and in Nathaniel Micklem, *Reason and Revelation* (Edinburgh, 1953); on Christ as alpha and omega of creation in C. Balić, *Theologiae Marianae Elementa* (Sibenik, Yugoslavia, 1933), a Latin edition, and Allan Wolter, “D. Scotus on the Predestination of Christ,” in *The Cord* (St. Bonaventure, NY), 5 (December 1955): 366–372, an English translation.

### STUDIES AND BIBLIOGRAPHIES

The best introduction to the vast literature of the nineteenth and twentieth centuries is O. Schäfer, *Bibliographia de Vita, Operibus et Doctrina I. D. Scoti Saecula XIX–XX* (Rome, 1955); also see A. B. Emden, *A Biographical Register of the University of Oxford to A.D. 1500*, Vol. I (Oxford, 1957), pp. 607–610, and the annual *Bibliographia Franciscana* (Rome), especially Vol. XI (1962) on.

Most general histories and studies as late as C. R. S. Harris, *Duns Scotus* (Oxford, 1927), use the inauthentic *De Rerum Principio* or other spurious works. Recommended are the following more recent histories of medieval philosophy: P. Böhner and Étienne Gilson, *Christliche Philosophie von ihren Anfängen bis Nikolaus von Cues*, 3rd ed. (Paderborn, 1954); Frederick Copleston, *A History of Philosophy*, Vol. II, Part II (Westminster, MD, 1950); Armand Maurer, *Medieval Philosophy* (New York: Random House, 1962); and Julius Weinberg, *A Short History of Medieval Philosophy* (Princeton: Princeton University Press, 1964).

## DUNS SCOTUS, JOHN [ADDENDUM]

Perhaps the most important recent area of research in Scotus’s philosophy has been in modal theory. There are two fundamental questions: To what extent does Scotus develop an understanding of modalities that is fundamentally *logical*, independent of states of affairs in the actual world? And to what extent are modal concepts dependent on divine causal activity? The two questions are distinct, in the sense that the first is about the *defini-*

tion of the various modal terms, whereas the second is about the explanation for the *fact* that there are modalities at all. If God were to cause modalities, then he would also cause the property of conceivability that is the mark of logical possibility. The first question, in particular, has important ramifications for Scotus's theory of the freedom of the will.

As always with Scotus, these questions do not admit of straightforward answers. On the first question, Scotus's modal thought has, as one modern commentator puts it, a "Janus-faced character." On the one hand, Scotus often formulates modal notions as though consistency (*repugnantia*, in Scotus's Latin) is the relevant root concept: A proposition is possible if it is consistent, impossible if it is inconsistent, contingent if its contradictory is consistent, necessary if its contradictory is inconsistent. On the other hand, however, Scotus frequently talks as though consistency requires the existence of real powers and capacities, such that, for example, "possibly *p*" is true only if there is an agent with the power to bring it about that *p*. The second of these accounts clearly owes a great deal to the Aristotelian modal notions of Scotus's predecessors, according to which, for example, something is possible if and only if it is at some time actual. Scotus's proof of God's existence exploits this second account. The real possibility of there being causes in the world (entailed by the fact that there are causes in the world) requires, given the impossibility of an infinite regress of causes, the real possibility of the existence of a first cause. But such a real possibility requires that the causal conditions for the existence of such a first cause be satisfied. Now, a first cause is, according to Scotus, one whose causal explanation is somehow internal to itself. So such a being must exist, or else the conditions for its possible existence are not satisfied.

The argument clearly reveals the problems associated with the second of Scotus's modal theories. Of far more interest in the history of philosophy is Scotus's development of the notion of what he labels "logical possibility," understood as pure consistency or conceivability. Thus, he sometimes defines *possible* as "that which does not include a contradiction," and in line with this defines *contingent* as follows: "I do not call contingent everything that is neither necessary nor everlasting, but that whose opposite could have happened when this did" (Scotus 1982, p. 85). So the contingent is that whose nonexistence does not entail a contradiction. The significance of the simultaneity claim is that contingency—and modality in general—is on this account to be thought of not temporally or diachronically but synchronically, in terms of

conceivable states of affairs considered as alternatives at the same time.

Scotus uses this account to undergird his radically libertarian account of human freedom. The human will is such that it can, in exactly the same set of circumstances, determine itself to act or not to act, or to do *a* or to do not-*a*. But this account requires the notion of alternative possibilities at one and the same time. Given the other aspect of Scotus's "Janus-like character" on this issue, however, an acceptance of the synchronic notion of contingency also entails the notion of libertarian freedom. For *real* contingency—contingency in the real world, as Scotus believes to be observable—requires a real free power. Scotus uses this insight as part of his argument for the claim that the first cause (God) must be a free agent. This does not mean, of course, that every logical possibility has to correspond to some real power in the world. So the new modal theory could coherently be developed without any of the residual Aristotelian apparatus—something that occurs in the generation after Scotus, and then most notably in the work of Leibniz, on which Scotus and his followers were tremendously influential.

Modern discussions of the second modal question consciously or unconsciously reflect discussions among seventeenth-century followers of Scotus. On one rather Platonist reading of Scotus, modalities are wholly independent of God; they are preconditions that govern even divine thought and action. On another reading of Scotus, God alone determines the reality, though not the content, of modalities. If there were no God, then there would be no modalities, even though the content of the modalities is not something over which God has any control. A middle position holds that, according to Scotus, modalities cannot obtain in the absence of any other reality whatever, but that Scotus does not hold God to be necessarily the required cause of modalities. In the absence of God (a counterpossible claim canvassed by Scotus for the sake of argument), there would be modal facts if and only if there were some nonmodal facts to be the bearers of the modal facts.

Scotus is well aware of the objection that a counterpossible premise entails any conclusion. But he holds that there are, as it were, degrees of conceivability about counterpossibles. The nonexistence of God seems coherently conceivable—its self-contradictoriness is not immediately evident—and in this respect is unlike the concept of a married bachelor, or, in Scotus's essentialist example, an irrational man. Scotus holds that, on this basis, principled conclusions can be drawn from such "moderate" counterpossible premises.

## THE COMMON NATURE AND UNIVERSALS

Scotus is one of the most important writers on the question of universals. D. M. Armstrong explicitly notes Scotus as taking a position on universals different from that of modern writers such as Armstrong himself. For in modern theories of universals, a universal is *numerically one* in all of its exemplifications. The ancient and medieval tradition, springing in various ways from Aristotle, Alexander of Aphrodisias, and the Neoplatonists, denies this claim about universals, and Scotus provides the fullest development and explication of the ancient tradition on this question.

The Islamic philosopher Avicenna provided the clearest distillation of the ancient tradition available to the medieval West. Avicenna, echoing a common earlier distinction, distinguished a kind-nature as such from the nature existing as a concept in the mind and the same nature existing in particulars. The kind-nature as such is the *content* of the concept. According to Avicenna, the notions of numerical unity and/or multiplicity cannot be built into the kind nature—it is neither one nor many—because the nature (humanity, for example) must be able to exist both in one thing (Socrates) and in many (all human beings). On this view, the kind-nature as such is nothing more than a theoretical construct unifying the concept, on the one hand, with the particulars on the other.

Scotus accepts the threefold understanding of nature but holds that the kind-nature as such must be more than a merely theoretical construct. The kind-nature, in the account of Avicenna, is supposed to be the *subject* of both individuality (as existent in particular substances) and of universality (as existent in the mind). Scotus reasons that something that is supposed to be the subject of individuality and universality must have some real being or entity of its own. And this means that the nature as such must have such entity. The nature as such also has a certain identity or unity—Scotus calls it a “less-than-numerical” unity, compatible with divisibility into different particulars. The nature is thus identical in all its instances, but in a nonnumerical way. And this marks the way in which the developed ancient and medieval accounts are distinct from the modern accounts of, say, Armstrong who, as he puts it, “cannot understand what this second, lesser, sort of identity is” (Armstrong 1978, p. 112), (Scotus rejects views such as Armstrong’s because he does not see how a numerically singular item could be the subject of different and incompatible properties in different particulars.) In line with this argument, Scotus holds that individua-

tion is fundamentally a matter of explaining indivisibility: An individual is not divisible in the way that a nature is; this explanation must in turn be something that is intrinsically indivisible—namely, a haecceity or thisness.

## DURANDUS OF SAINT-POURÇAIN

(c. 1275–1334)

Durandus of Saint-Pourçain, the scholastic philosopher and theologian, bishop, and author (*Doctor Modernus*, *Doctor Fundatus*), was born in Saint-Pourçain-sur-Sioule in Auvergne, France. He entered the Dominican order at Clermont at the age of eighteen, and his philosophical studies were probably completed in his own priory of Clermont. By 1303 he was assigned to St. Jacques, Paris, to study theology at the university. There, according to some historians, he was influenced by his confrere James of Metz. The first version of Durandus's commentary on the *Sentences* of Peter Lombard represents his lectures as bachelor (1307–1308). In these lectures he strongly opposed certain views of Thomas Aquinas, whom the Dominican order had in 1286 commanded its members to study, promote, and defend. At Paris the nominalistic views of Durandus were immediately attacked by Hervé Nédellec and Peter of La Palu. Consequently, between 1310 and 1313 Durandus prepared a revision of his commentary, in which he mitigated many of his previous statements and omitted the more offensive passages. However, this was neither satisfactory to the order nor in accord with his own convictions. Nevertheless, he was granted a license by the university to incept in theology, succeeding Yves of Caen. Before completing his first year as master (1312–1313), he was called to Avignon by Pope Clement V to lecture in the papal *Curia*, replacing Peter Godin. Toward the end of that year the master general of the Dominicans, Berengar of Landorra, appointed a commission of nine theologians, headed by Hervé Nédellec, to examine the writings of Durandus. The commission singled out ninety-three propositions that were contrary to Thomistic teaching. Between 1314 and 1317, Durandus was continuously attacked in Paris by Hervé Nédellec, Peter of La Palu, John of Naples, James of Lausanne, Guido Terreni, and Gerard of Bologna. He replied to these in his *Excusationes* and in his Advent disputations *de quolibet* at Avignon (1314–1316). In the first *Quodlibet* he inveighed against “certain idiots” who charged him with Pelagianism or semi-Pelagianism.

Consecrated bishop in 1317, Durandus prepared a third and final version of his commentary on the *Sentences*, now free from all control by his order. He expressed regret that the first version had been circulated outside the order against his wishes, “before it had been sufficiently corrected” by him, insisting that only this new version was to be recognized as definitive. However, while some views are closer to the “common teaching” of the schools, the final version contains much that was taken verbatim from the first draft and from the first Avignon *Quodlibet*. It is, perhaps, not surprising that the final version, completed in 1327, abounds in compromises and contradictions.

In the jurisdictional dispute between Pope John XXII and Philip VI of France, Durandus sided with the pope in the treatise *On the Source of Authority* (1328), a work that later was published by Peter Bertrandi as his own composition. However, Durandus's reply to the pope's theological opinion concerning the beatific vision (1333) was promptly submitted to a commission of theologians, who found eleven objectionable statements. The reply of “the blessed master Durandus” was later vindicated by Benedict XII. But Durandus did not live to see himself vindicated, for he died at Meaux in 1334.

In philosophical matters Durandus manifested an independence of spirit more influenced by Augustine and Bonaventure than by Aristotle and Thomas. He has often been called a precursor of William of Ockham, but the similarities are only incidental; and it is most unlikely that either philosopher influenced the other. Besides denying the Thomistic distinction between essence and existence in creatures (as did Hervé Nédellec), he rejected the reality of mental species and the distinction between agent and possible intellect. For him, only individuals exist, receiving their individuality not from matter but from their efficient cause. Thus, in the act of knowing, the possible intellect is sufficiently active of itself to grasp individual existents directly and to create universal concepts by eliminating individual differences from consideration. In theology he manifested certain nominalist and Pelagian tendencies typical of the *moderni* of his day, tendencies that were to assume a more radical form in the teaching of Ockham.

In the later Middle Ages the prestige of Durandus was considerable. In the sixteenth century his final *Commentary on the Sentences* enjoyed an extraordinarily high reputation, particularly after its first printing (Paris, 1508). At Salamanca it was one of the alternative texts in the faculty of theology, the others being the *Summa* of Thomas and the *Sentences* of Peter Lombard, and the

chair of Durandus rivaled those of Thomas and John Duns Scotus.

Later writers have sometimes confused this Durandus with William Durand, Durandus Petit, or Durandus Ferrandi.

## DURKHEIM, ÉMILE

(1858–1917)

The French sociologist and philosopher Émile Durkheim was born in Épinal (Vosges). At an early age Durkheim decided not to follow the rabbinical tradition of his family. On leaving the Collège d'Épinal Durkheim went to Paris, first to the Lycée Louis-le-Grand, and then, in 1879, to the École Normale Supérieure. He was dissatisfied with what he saw as a too literary, unscientific style of education, connected with a superficial dilettantism in contemporary philosophy. On graduating in 1882, he decided to devote his career to sociology with the aim of establishing an intellectually respectable, positive science of society to replace, or at least supplement, speculative philosophy and provide an intellectual foundation for the institutions of the Third Republic. At an early stage, then, Durkheim developed a preoccupation which was to dominate his whole intellectual life—to establish a genuine science of social life, which would include a science of ethics and thus provide a reliable guide to social policy.

### INFLUENCES AND INTELLECTUAL DEVELOPMENT

From 1882 to 1887 he was professor of philosophy at lycées in Sens, Saint-Quentin, and Troyes, during which time various intellectual influences helped him to fill out his conception of a social science. His study of Herbert Spencer instilled in him a predilection for biological models, which was most pronounced in his early work. His reading of Alfred Espinas, and later personal contact with him, led him to his central conception of the "collective consciousness" of a society and the related conviction that the laws of social life are sui generis and not reducible, for instance, to laws of individual psychology.

In “Individual and Collective Representations” (1898) he argued that we should not attempt to infer social laws from biological laws, but that the findings of biology should be compared subsequently with independently established social laws on the assumption that “all organisms must have certain characteristics in common which are worth while studying.” His conception of a positive science of ethics received a powerful new impetus from a visit to Wilhelm Wundt’s psychophysical laboratory in Leipzig while on a leave of absence during the school term of 1885–1886. In 1887 he was appointed *chargé de cours* at the University of Bordeaux, becoming the first to teach social science at a French university; he also taught pedagogy and thus began to develop an enduring interest in the relevance of sociology to educational questions.

In 1896 Durkheim was promoted to professor of social science at Bordeaux. In 1898 he founded and became editor of *L’année sociologique*, a journal designed to unify the social sciences and encourage specific research projects. He moved to the University of Paris as *chargé de cours* in 1902, becoming professor of education in 1906 and professor of education and sociology in 1913. The outbreak of war in 1914 moved Durkheim to write a number of pamphlets with a strongly nationalistic tone, not always easy to reconcile with the views developed in his earlier, more scholarly works.

### THE COLLECTIVE CONSCIENCE

Durkheim’s determination to establish an autonomous, specialized science of sociology led him to investigate the possibility of viewing human societies as irreducible, sui generis, entities. From there he was led to the central conception in his work, that of “collective representations,” whose system in a given society constitutes its “collective conscience.” Collective representations have both an intellectual and an emotional aspect. As examples Durkheim offered a language, a currency, a set of professional practices, and the “material culture” of a society; but he also included the phenomenon of group emotions, such as may be generated, for example, at a lynching, and which cannot be accounted for as a mere summation of the individual emotions of the several participants.

Durkheim said that collective representations are “collective” rather than “universal”; they “exist outside the individual consciousness,” on which they operate “coercively.” It is possible to determine collective representations directly—not merely via the thoughts and emotions of individuals—by examining their permanent expressions in, for instance, systems of written law, works of art, and literature, and by working with statistical averages.

Thus, in *Suicide* Durkheim said that the “social fact” was the statistical suicide rate, not the circumstances attending individual suicides. His treatment of the relations between collective and individual representations, however, was often obscure, and he would pass from statements about the social determinants of the suicide rate to statements like this: “Human deliberations ... are often only purely formal, with no object but confirmation of a resolve previously formed for reasons unknown to consciousness.” His important conception of social forces thus took on a questionable, metaphysical complexion.

### NORMAL AND PATHOLOGICAL SOCIAL TYPES

The conception of “social solidarity” went with that of collective representations and provided Durkheim with a means of distinguishing social types. The simplest form of social group is the “horde,” which exhibits a “mechanical” solidarity in which individuals are attached directly to the group by adherence to a common set of powerful collective sentiments. The “clan” is the horde considered as an element in a more extensive group, and the most primitive form of durable social group is the segmental society organized in clans. More complex societies exhibit “organic” solidarity with extensive division of labor: the collective conscience is weak and individuals are attached to functional groups, while the society’s cohesion is to be seen in the complex interdependence of these groups.

The distinction between social types led to a conception of “normal” and “pathological” forms, which provided a basis for Durkheim’s account of the practical, ethical relevance of sociology. The normal is so only relative to a given social type at a particular stage of development. It may thus be difficult to determine, particularly during transitional phases. But once we have determined it in a particular case, the normal will merge with the average, though the sociologist must also attempt to show how the normal condition of a species follows logically from its nature. Durkheim believed that we can thus distinguish between social “health” and “disease” by means of “an objective criterion, inherent in the facts themselves”; for, he argued, on Darwinian lines, the dissemination of a characteristic throughout a species would be inexplicable if we did not suppose it to be on the whole advantageous. The sociologist, like the physician, should try “to maintain the normal state.”

Durkheim applied this precept in the practical conclusions he drew from his study of suicide. It is important to maintain collective sentiment against suicide, at least those types of suicide most characteristic of organic soli-

darity, since the general ideal of humanity is the sole remaining strong collective sentiment, and the practice of suicide offends this sentiment. He advocated making use of the special nature of societies with organic solidarity in order to counteract suicide, by strengthening occupational groups and allowing them to take a firmer grip on the lives of individuals.

Durkheim's most influential discussion of a pathological social situation concerned "anomie." Anomie is characteristic of advanced organic societies and comes about when diverse social functions are in too tenuous or too intermittent mutual contact. Anomic division of labor exhibits itself in commercial crises, conflicts between capital and labor, and the disintegration of intellectual work through specialization. In relation to individuals the result of anomie is that "society's influence is lacking in the basically individual passions, thus leaving them without a check-rein." Durkheim used this concept to explain such phenomena as the high correlation between suicide and widowhood and between the suicide rate and the divorce rate.

### FUNCTION AND CAUSE

Closely connected with his position on suicide and collective sentiments is Durkheim's concept of "function" as a mode of sociological explanation. He defined "function" as a relation between a system of vital movements and a set of needs. The prime need of any social collectivity is solidarity among its members, and Durkheim's main attempts at functional explanation, as in his treatments of the social division of labor, punishment, and primitive religion, were designed to show how such institutions or practices contribute to the type of solidarity peculiar to the societies in which they occur. The function of a practice is not to be confused with any aims of its practitioners; this would be to confuse sociology with psychology. But neither did Durkheim identify the function of a practice with its cause. The function of a fact does not explain its origin or nature: that would imply an impossible anticipation of consequences. Explanations of origins require the concept of an "efficient cause," though the persistence of a practice may be explained by the fact that its function helps to maintain a preexisting cause.

The causes of social facts are always to be found in preceding social facts, in the "internal constitution of the social group," or "social milieu." This concept, Durkheim held, is what makes sociology possible, by facilitating the establishment of genuinely social causal relations. Without it there could be only historical explanation, showing how events were possible, but not how they were prede-

termined. The social milieu was defined in terms of the volume of the group, the degree of communication between its members, and their concentration. Durkheim used this last concept to explain the development of the division of labor. Greater density of population brings with it a sharpened struggle for existence between individuals and this, in turn, makes necessary a greater degree of specialization. The division of labor is thus a "mellowed dénouement" of the struggle for existence.

Durkheim regarded causation as a species of *logical* relation; it was J. S. Mill's failure to recognize this, Durkheim held, that led him to speak erroneously of a possible plurality of causes. The most important method of establishing causal relations in sociology is that of concomitant variations, which can establish a genuine "internal bond" between phenomena as opposed to a merely "external" relation.

### PRIMITIVE RELIGION AND CATEGORIES OF THE INTELLECT

In his treatment of primitive religion Durkheim was more immediately interested in functional than in causal questions, though he did not distinguish these as carefully as in *The Division of Labor in Society*, using apparently interchangeable phrases like "respond to the same needs" and "depend on the same causes." He also seems to have confused questions about the function of religions with questions about their meaning and truth. All religions "hold to reality and express it"; all "are true in their own fashion; all answer, though in different ways, to the given conditions of human existence." Durkheim rejected both the animistic account of primitive religions offered by Spencer and E. B. Tylor and the naturalistic account originating with Max Müller; both went astray, he felt, in masking such religions vast systems of error. Durkheim saw totemism as the most fundamental feature of primitive religions; he tried to show that the totem symbolizes not merely the totemic principle (or "god"), but also the clan itself, and this is possible because "the god and society are only one." Religion is "primarily a system of ideas with which the individuals represent to themselves the society of which they are members, and the obscure but intimate relations which they have with it." He thus regarded the explicit content of religious ideas as relatively unimportant. The reality they express is a sociological one, concealed from the worshipers themselves.

Durkheim regarded religion as the mother of thought. The categories of the intellect, such as "class," "force," "space," and "time," originate with religion. Moreover, since the reality expressed by religion is a social one,

these categories themselves originally correspond to forms of social organization and activity. Because totemism involves the idea of forces permeating both the natural and the human realms, it solves the Kantian problem of how men can apply these categories to nature. The a priori necessity of these categories is a reflection of society's coercive insistence on the ritual performances in terms of which such concepts are originally used.

## DUTY

In practical reasoning of an informal sort, the concept of duty plays a limited, relatively unproblematic role. In thinking about what to do, reasonable people try to see their wants in relation to their interests and to the interests of others; they evaluate alternatives in the light of their previous commitments and bear in mind their obligations and responsibilities. Duty is one among other factors to be taken into account. The reason is obvious: A person's duties are the things he or she is expected to do

by virtue of having taken on a job or assumed some definite office. One could say (although it sounds somewhat redundant) that believing that one's duties entail doing something or other is a reason, though not a conclusive one, for doing that thing, and believing that a possible line of action would count as a neglect of duty is a reason against adopting that line of action. How much weight such considerations have depends on what duties are in question and on the agent's obligations as they affect the particular situation. Duties, then, are counted as one of the considerations that guide and constrain rational choice.

The concept of duty in theoretical ethics is quite a different matter. Some moral philosophers (F. H. Bradley would be one example, Cicero another) have concerned themselves with duties of the everyday sort, those that go with being a parent, voter, teacher, or whatever. But many philosophers use "duty" quite indiscriminately to refer to particular obligations, moral principles, or indeed to anything that is held to be a requirement of conscience. "Duty" is a technical term in ethics and the rules for its use vary from one writer to another. For the most part, these differences are of no theoretical interest, but there is one important exception, the doctrine of Immanuel Kant. His views, set forth in the *Critique of Practical Reason* and in the *Foundations of the Metaphysics of Morals*, mark a radical break with traditional ethics, and since what he takes to be the central concept of morals he calls "duty," it is worthwhile finding out what he means by it.

## ORDINARY DUTIES

As noted above, ordinary duties are tasks or assignments for which a man becomes responsible as a result of holding a particular job or office. When the tasks are intricate and have to be done just right, for example, the duties of an airplane pilot, then they are spelled out in detail; thus also for tasks that are relatively simple but for which applicants are unlikely to be highly motivated or imaginative, for example, the duties of a night watchman. In contrast, the duties that go with being a parent or with the practice of a profession are not codified, and responsibility for deciding what should be done is assigned to the individual.

Someone who neglects his duties deserves blame. Censure, if reasonable, is graduated to accord with the degree of neglect and with the importance of the task. A host who fails in his duties to his guests is inconsiderate but does not deserve to be pilloried. Negligence on the part of a pharmacist or a bus driver is a more serious matter. A characteristic of duties, as distinct from other con-

straints on conduct, is that a man who is delinquent loses, at some point, his title to the office that his duties define. He is court-martialed, unfrocked, disbarred, or fired (compare the euphemism "relieved of his duties"). Ceremonial dismissals are appropriate, of course, only when the duties in question are, in a broad sense, institutional and have been formulated explicitly. Not all duties fit this pattern; a man may become unfit for an office without being declared to be so, without his dereliction being so much as noticed by anyone, including himself. Someone who fails in the duties of friendship is simply no longer a friend, no matter what he or anyone else may think.

Legal penalties attach to neglect of duties where such neglect is held to be seriously detrimental to human welfare. Where a verdict has to be reached, an offense must be clearly defined. Parents, physicians, and legislators are among those to whom the greatest measure of discretion is granted in discharging their duties. It is an odd consequence that in matters of the greatest human importance only gross and flagrant derelictions of duty are punishable by law. Of course there are extralegal sanctions, and the threat of contempt and blame, of ostracism from one's group, may be a strong incentive to duty. The penalties of social disapproval, however, are distributed in a capricious and often unreasonable way, and a man may neglect all sorts of duties and yet, given discretion and a certain amount of luck, escape criticism altogether. Appreciation of this fact is what leads those concerned with moral education to try to instill in their charges a sense of duty. The attempt succeeds to the extent that the subject becomes habitually conscientious and carries out his duties without thinking about whether he might neglect them with impunity. A more primitive stratagem is to introduce the fiction of an all-seeing Providence in the hope of making the subject believe that no lapses go unnoticed and that all who neglect their duties will, on some unspecified future date, be punished.

Since duties are required minimal performances, no special merit accrues to someone who does his duty. A hero, one who does something that is both worthwhile and hazardous, acts "beyond the call of duty." A modest hero disclaims credit by saying that he did no more than his duty required. A man may be praised for carrying out some particular duty under difficult conditions. Such praise is sometimes justified and sometimes not; the claims of any duty may on occasion be outweighed by the claims of obligation or moral principle.

Although being conscientious is a virtue, it is not the only one, and unless it is mediated by intelligence and moral sensitivity, it may do more harm than good. A man

must learn, for example, how to deal with conflicting duties. If he is a jobholder, a parent, and a citizen, then he holds three offices concurrently. Even if his life is well organized, situations are likely to arise in which he has to determine which of two duties takes precedence. Such questions have to be worked out in particular cases; there is no formula or principle of ranking that can be applied. Moreover, as noted earlier, questions about duties are not independent of broad moral issues: if, as seems likely, there are offices one ought not, as a matter of moral principle, to hold, then there are duties no one ought to perform, even when called upon to do so.

### KANT'S DOCTRINE

The idea of taking duty (*die Pflicht*) as the central moral concept originates with Kant. There are earlier doctrines that appear, especially when paraphrased, to be analogous, but the similarities are inconsequential in contrast with the differences. Kant himself maintained that his basic thesis is neither original nor esoteric and that, on the contrary, it is self-evident to the plain man. Everyone, he held, recognizes the difference between doing something because one wants to do it and doing something because one feels that one is morally obligated to do it. Moreover, it is universally acknowledged that only what is done from a sense of moral obligation is meritorious. Kant's theory is an exposition of what he took to be the consequences of these premises. He did not claim that the *theory* is easy and familiar. (In fact, he is often obscure and difficult to follow.) He did claim that his theory is the one philosophers must eventually accept if they are consistent and if they take seriously the intimations of the plain man.

The views Kant ascribed to common sense appear to be correct: people do not deserve credit unless they act from reasons of conscience, and we do believe that such reasons are, somehow or other, distinctive. Kant used the word *duty* (and here he diverged, at least from ordinary English usage) to refer very generally to features he took to be distinctive of conscientious conduct. At times this practice leads to rhetorical vagueness, and "duty" becomes synonymous with "whatever ought to be done." However, he also gave it a more precise sense, one that appears in the set of interdependent definitions which, taken together, provide the framework of his theory. In brief, he held that the only unqualified good is the "good will" and that to have a good will is always to act from a sense of duty.

Duty involves recognition of and submission to the "moral law" that is the "supreme principle" of morality.

Since what the moral law prescribes goes (more or less) against the grain, that is, runs counter to inclinations, the law is expressed as an imperative. The imperative is described as being "categorical" and "unconditioned," and Kant meant these modifiers to reinforce the distinction mentioned earlier: objects of desire are variable and evanescent, and thus strategies for achieving such objects are applicable under some conditions and not under others. The moral law, however, applies to everyone and is unrestricted with respect to times, places, and particular situations.

The "categorical imperative" is formulated in three ways that Kant seems to have regarded as equivalent. They are as follows: "So act that the maxim of your will could always hold at the same time as a principle establishing universal law"; "Act so as to treat humanity, whether in your own person or in that of another, always as an end and never as a means only"; "Act according to the maxims of a universally legislative member of a merely potential kingdom of ends." Apart from the question of how to collate these formulas, difficult problems of interpretation arise for each of them taken separately. Nonetheless, one can see in a general way what Kant had in mind: A man is dutiful to the extent that he is seriously concerned with being equitable and fair, with treating other people like human beings and not like machines, and with trying to govern his own behavior by standards that could be adopted by everyone.

Kant believed that the concepts of duty, the good will, and the moral law are all such as can be apprehended a priori. Part of what he meant (and what is certainly true) is that no conclusions about what ought to be done can be derived directly from compilations of facts about what people do or have done. Although Kant was much concerned with distinguishing actual laws that depend on external sanctions from the moral law that the individual imposes on himself, he characterized the moral life by means of a set of juristic metaphors. The righteous man, for example, is said to "accuse himself before the bar of his conscience." This device suggests that Kant believed the "kingdom of ends" invoked in the third version of the categorical imperative to be an ideal beyond the hope of achievement. Human inclinations are apt to be anarchic, and as duty is a kind of inner law, so conscience is prefigured as a stern magistrate.

### PRE-KANTIAN DOCTRINES

It is customary to cite the Stoics as the earliest philosophers to elevate duty to the status of a first principle. As far as one can tell from their writings, however, which

tend to vagueness, and from sketchy accounts of what they were reputed to believe, their views were quite different from Kant's. In fact, their word *kathēkon*, usually translated as "duty," appears to mean "what it would be suitable or fitting to do." At any rate, the supreme duty is to live "in accord with nature," but it is not clear what that entails or how, if at all, one could avoid living in accord with nature. Particular maxims have to do with ways of avoiding anxiety and frustration, a goal that Kant would have regarded as morally unworthy. The one genuine point of contact, and also the most interesting contribution of Stoic thought, is the idea that morality transcends national boundaries and class distinctions. The cosmopolitanism of the Stoics marks an advance over the views of Plato and Aristotle, both of whom thought that the demands of morality can be satisfied without taking any account of the claims of barbarians, slaves, or foreigners. On the other hand, the Stoic one-world concept ought, perhaps, to be seen not so much as a moral ideal than as an implicit recognition of the changes brought about by the conquests of Alexander and, in later writings, as an aspect of the ideology of Roman imperialism.

Theological ethics attaches importance to the concept of duty, and, in this context, what is meant is, unlike Kantian or Stoic duty, something parallel to the ordinary notion. To be a believer or a member of a congregation is to hold a particular office, often one that is defined by clearly formulated rules of conduct and ritual observance. In some religions the faithful are told that they are in some sense children of God, and to the extent that this belief is taken seriously, a set of quasi-filial duties with respect to the deity will come to seem important. Kant, despite his Pietistic background, was clearly opposed to such a view. It is crucial to his doctrine that men should regard themselves and others as adults rather than as hapless children.

Anticipations of particular Kantian theses can be made out in a number of earlier writers: Richard Cumberland, Ralph Cudworth, Samuel Clarke, and Richard Price maintained (in opposition to Thomas Hobbes) that moral duty is based on self-evident axioms and that the requirements of duty are universally binding. Jean-Jacques Rousseau had much to say about conscience, which he regarded as a sort of inner voice—one that speaks with unique authority on questions of duty. David Hume explicitly remarked on the logical gap between the concept of what is done and the concept of what ought to be done. Nonetheless, it is not clear that anyone before Kant succeeded in holding in focus the idea of a morality

that is not, in some indirect way, dependent on considerations of prudence.

In his paper "Does Moral Philosophy Rest on a Mistake?" (1912), H. A. Prichard argued that traditional ethics (for example, the doctrines of Plato, Aristotle, Hume, Jeremy Bentham, and J. S. Mill) goes astray in trying to work out some general answer to the question of why it is reasonable or worthwhile to do one's duty. Prichard's point is that the question itself is the result of a confusion. That something is a duty is (or may be) a sufficient reason for doing that thing, and *if it is*, then no further reason is called for. If Prichard's historical thesis is right, and it seems quite plausible, then there is a sense in which Kantian doctrine and common sense agree and are jointly opposed to traditional ethics. Ordinary duties are not hierarchically ordered under a supreme moral principle; nor do the claims of duty (individually or collectively) provide a unique determination of morally right action. Nonetheless, and despite their untidy array, ordinary duties are "unconditioned" in that they provide us with reasons for acting such that if the reasons are accepted, there is no need for, indeed no room for, further justification.

## DWORKIN, RONALD

(1931–)

Ronald Dworkin, born in Worcester, Massachusetts, has been a leading participant in debates central to legal and political philosophy in the wake of the 1960s. After graduating from Harvard Law School and clerking for legendary federal judge Learned Hand, he held a number of distinguished faculty appointments in the United States and England, including Professor of Jurisprudence at the University of Oxford.

During the early portion of Dworkin's career, social movements such as those connected with civil rights, women's equality, the environment, and the Vietnam War, confronted philosophers with the task of reassessing liberalism. Influential radicals, including Herbert Marcuse, held liberalism responsible for the injustices of the era. However, other philosophers sought to reformulate and defend liberal ideas. John Rawls was the leading figure in the reformulation of liberalism, but next to Rawls, no thinker writing in English has played a larger role than Dworkin. His work is informed by the conviction that the moral task of citizens and public officials is not to jettison liberal democracy but to make their society a more faithful realization of liberal ideals.

Dworkin argues that legal reasoning has an ineliminable moral dimension and defends a form of liberalism that regards the right to equality as the sovereign political principle. His argument about legal reasoning rejects the positivist view that the existence of laws depends ultimately on social facts that can be ascertained without resort to moral judgments. It also opposes those natural law theories that hold the legal validity of a norm to depend on its consistency with substantive justice. Dworkin's defense of liberalism rejects the radical view that liberal principles are complicit in the perpetuation of oppression. It opposes as well the conservative view that liberal ideas have a corrupting influence on society. Writing as a public intellectual, Dworkin has contributed to controversies over civil disobedience, free speech, campaign financing, affirmative action, physician-assisted suicide, abortion, and civil liberties. He has also addressed debates over constitutional interpretation in the United States, rejecting theories resting on the framer's intent and advocating interpretations informed by moral principles that protect individual rights.

The most widely discussed thesis in jurisprudence for a decade was Dworkin's *rights thesis*, defended in *Taking Rights Seriously* (1977). The thesis holds that, in almost all legal cases, one side has the legal right to win.

Dworkin criticizes H. L. A. Hart's positivist classic *The Concept of Law* (1961) for claiming that in hard cases, where legal rules do not determine which side should win, judges have discretion to render decisions as social utility dictates. Dworkin argues that Hart neglects the moral principles that underlie legal rules and constitute part of the law. Such principles help to determine the legal rights of persons whereas rights function as "trumps" that an individual holds against the government and its efforts to promote utility or some other societal good at the individual's expense. Dworkin imagines a superhuman judge "Hercules," who knows all the best moral principles underlying the settled law. Though more limited in their cognitive capacities, human judges should, and characteristically do, seek out those principles that bear on the cases they decide.

The most comprehensive statement of Dworkin's legal philosophy is in *Law's Empire* (1986). The work of judges is presented as continuous with that of legal philosophers. Both involve "constructive interpretation," a way of understanding an object in light of the best purpose it can be seen to serve. Adjudication gives a constructive interpretation of the laws within the court's jurisdiction, with the aim of deciding cases under the law. Legal philosophy gives a constructive interpretation of law more generally, with the aim of determining the strongest justification for the existence of law. Dworkin argues that the strongest justification is that law serves the ideal of integrity: treating citizens according to a single, coherent scheme of moral principles.

Notable critics of Dworkin's legal philosophy include Joseph Raz and Jules Coleman, who counter his criticisms of positivism and develop their own versions of the positivist view. Although Dworkin has proved unable to dislodge positivism from its dominant position, it is widely agreed that his work has advanced legal philosophy by forcing positivists and natural lawyers alike to refine and elaborate their views.

Dworkin's political philosophy forms an integrated whole with his legal thought. He argues that a political community cannot have legitimate authority over its members unless it treats each of them with equal concern. He elaborates by developing a theory of distributive justice in which citizens have a right to an equally valuable bundle of resources with which to pursue their own conception of the good. The choices individuals make in utilizing their resources affect the value of their holdings. Resulting economic inequalities are justifiable, as they derive from the person's own values and tastes. Dworkin argues that a suitably regulated market is indispensable

for justice because markets provide the only acceptable measure of the value of the resources a person holds, namely, the opportunity costs of denying those resources to others.

Dworkin contends that equality demands that individuals be respected in the exercise of their liberties, including liberties to obtain sexually explicit materials, engage in homosexual relations, and voice publicly fascist and racist attitudes. He rejects the view that equality and liberty stand in tension. Equality is the ground for civil and political liberties; it is not a competing value. Equal respect entails that government must remain substantially neutral on questions concerning what makes a good life, leaving it up to individuals to decide such matters for themselves.

Raz formulates a liberal alternative to Dworkin, arguing that government fosters freedom not by remaining neutral on questions of the good but by supporting a social environment in which a wide variety of models of a good life are visible. John Finnis and Robert George criticize Dworkin's view of equality and liberty by invoking an account of basic human goods that derives from the conservative tradition of natural law theory. Other important critics include Rae Langton and Catharine MacKinnon, who mount feminist criticisms of Dworkin's position on pornography. G.A. Cohen rejects his theory of equal resources, arguing that market outcomes are morally arbitrary. Most sweepingly, Roberto Unger criticizes Dworkin's philosophy for rationalizing the shortcomings of liberal democracy and glossing over the need

for radical changes in existing forms of democracy and the market.

Dworkin has addressed many criticisms of his work, refining and revising his views in the process. His lasting contribution is to have developed a liberal account of law and politics that is original, nuanced, and systematic.

## EARMAN, JOHN

(1942–)

John Earman is an American philosopher and professor of history and philosophy of science at the University of Pittsburgh. He is perhaps best known for contributions to the history and foundations of modern physics—especially space-time theories, and often with the question of determinism in view—and confirmation theory.

Earman completed his PhD at Princeton in 1968, under the direction of Carl G. Hempel. After brief appointments at University of California, Los Angeles, and the Rockefeller University, where he enjoyed tenure for a year before its philosophy department was disbanded in 1973, Earman spent twelve years at the University of Minnesota, where he was promoted to full professor in 1974. He moved to Pittsburgh in 1985.

### SPACETIME AND DETERMINISM

A theme of Earman's earliest publications is that progress can be made on perennial philosophical problems by bringing modern physics and mathematics, thoroughly and properly understood, to bear on them. Through the late 1960s the reigning orthodoxy in the philosophy of space and time held the dispute between absolute and

relational accounts to have been settled conclusively, and in favor of the relationalist, by the advent of relativity theory. Presenting Albert Einstein's theory in the language of differential geometry—the mode of presentation favored by mathematical physicists—Earman argues persuasively, in “Who's Afraid of Absolute Space” (1970), that traditional terms of debate are hopelessly ambiguous. The scientifically respectable disambiguations he devises enable him to turn orthodoxy on its head. Isaac Newton's arguments for absolute space succeed, Earman contends, and absolute kinematic quantities abound in relativistic space-times. Along with the contributions of Howard Stein, Michael Friedman, and Larry Sklar, this work helped drag the philosophy of space and time into its modern era.

As Earman aged, he aimed less to resolve perennial philosophical problems than to deploy them as a sort of dragnet in which to ensnare important issues in the foundations of physics. The philosophical problems typically emerge from this deployment considerably complicated. *A Primer on Determinism* (1986), which won the Lakatos Prize in 1989, recasts the question of whether the world is deterministic as a question about whether there are other physically possible worlds—that is, other worlds obeying the same natural laws as the actual world does—that

agree with the actual world at some times but not others. Subsequent chapters subject the doctrine of determinism to trial by a variety of prominent theories. Surprising verdicts are reached: Earman declares classical Newtonian mechanics, the physics that inspired Pierre Simon de Laplace's chilling statement of determinism, indeterministic. Admitting infinite signal velocities, classical physics admits as well possible worlds that agree up to a time  $t$ , but differ afterward due to the unheralded arrival at  $t$  in one world but not the other of "space invaders" that have traveled infinitely fast from spatial infinity. More often, the jury is hung and the fate of determinism is entangled with "sticky interpretations problems [that] resist narrowly scientific solutions" (p. 197). "We can't just read off the lessons for determinism from various branches of physics, for the implications we read will depend upon judgments about the adequacy of physical theories, and those judgments will depend in turn on our views about determinism" (p. 78).

In *World Enough and Space-Time: Absolute versus Relational Theories of Space and Time* (1989) determinism probes the doctrine of absolute space Earman so energetically rescued from ill repute in the 1970s. Space-time substantivalism—the thesis that spatiotemporal relations between bodies are "parasitic on relations among a substratum of ... spacetime points that underlie events" (p. 12)—is a modernization of the doctrine with an impeccable pedigree: Newton himself, Earman argues, was a substantivalist. But Earman is not. He takes the lesson of Einstein's hole argument to be that anyone committed to substantivalism about general relativistic space-times is also committed to indeterminism (compare Earman and Norton 1987). On the principle that "if determinism fails, it should fail for a reason of physics" (Earman 1989, p. 181), Earman rejects substantivalism. He does not thereby embrace relationalism: "[M]y tentative conclusion is that a correct account of space and time may lie outside the ambit of the traditional absolute-relational controversy" (p. 4). The sample tertium quid he sketches—an interpretation mediated by Leibniz algebras—was later shown itself to imply indeterminism (Rynasiewicz 1992).

The hole argument turns on the fact that if one of any pair of space-times related by a *hole diffeomorphism*—roughly, a map between space-times that is the identity outside a region  $h$  (the hole) but is nontrivial inside that region—corresponds to a world possible according to general relativity, then so does the other. Supposing that substantivalists must take space-times related by a hole diffeomorphism to differ in properties

assigned space-time points inside  $h$ , Earman and Norton (1987) conclude that substantivalists must take there to be worlds possible according to general relativity that agree at some times but not others. The hole argument launched a thousand responses. Many philosophers took exception to its accounts of reference to, or criteria for transworld identity of, space-time points, while some physicists credited the hole argument for raising interpretive questions pertinent to ongoing efforts to quantize gravity.

One way determinism might fail for a reason of (general relativistic) physics arises from space-time singularities. Space-time singularities are, roughly speaking, regions of space-time at which Einstein's equations become mathematically ill defined, so that imposing those equations is insufficient to prevent determinism-destroying emanations—Earman seems particularly worried about televisions playing Richard Nixon's "Checkers" speech—from those regions. *Bangs, Crunches, Whimpers, and Shrieks: Singularities and Acausalities in Relativistic Spacetimes* (1995) discusses singularities and other eponymous acausalities. The book's topics—chronology horizons, inflationary cosmologies, and cosmic censorship—familiar to working physicists but less evidenced in philosophy journals, reflects a tendency, appearing in the mid-1980s and accelerating thereafter, for Earman to draw his problem agenda directly from contemporary physics.

## BAYESIAN CONFIRMATION THEORY

The first half of Earman's *Bayes or Bust?: A Critical Examination of Bayesian Confirmation Theory* (1992) skillfully surveys the grounds supporting Bayesian confirmation theory: for example, the perspicuity of the analyses it offers of other accounts of confirmation, and its ability to provide some sort of solution to the Quine-Duhem problem and the new riddles of induction. The second half ruthlessly undermines those grounds, for example, it finds Bayesianism incapable of addressing the problem of old evidence or accommodating changes of belief in so-called scientific revolutions. Characteristically, Earman considers the point of the exercise not to reach a verdict on Bayesianism—in the introduction he admits to a diurnal oscillation between being an "imperialistic apostle" of Bayesianism and doubting its very viability—but to uncover worthwhile problems in the course of weighing the evidence.

These problems include historical ones—how to understand Thomas Bayes's essay in the context of eighteenth-century work on probability, for example. A

concern, and a knack, for matters historical informs much of Earman's work. *Hume's Abject Failure: The Argument against Miracles* (2000), his most recent book, situates David Hume's argument against miracles in a historical context. That Bayes and Hume were contemporaries licenses Earman to develop Bayesian analyses of Hume's central contentions and the notions (e.g., multiple witnessing) they involve. Although *Hume's Abject Failure* was not universally well received by Hume scholars or philosophers of religion, some of whom charged it with insensitivity to Hume's broader epistemology and with harboring too many equations, the work accomplishes its self-described aim: "not simply to bash Hume . . . but also to indicate how, given the proper tools, some advance can be made on these problems" (p. 4).

## EBERHARD, JOHANN AUGUST (1739–1809)

Johann August Eberhard, the German theologian and "popular philosopher," was born in Halberstadt. He studied theology at Halle, and became a preacher at Halber-

stadt in 1763 and at Charlottenburg in 1774. In 1778 Frederick II of Prussia appointed him professor of theology at Halle. Eberhard became a member of the Berlin Academy in 1786 and a privy councilor in 1805. He wrote on theology, epistemology, ethics, aesthetics, philology, and the history of philosophy.

Eberhard received a Wolffian education, but, under the influence of Moses Mendelssohn and Christian Friedrich Nicolai, he soon developed a personal point of view. As a popular philosopher, Eberhard was averse to abstract speculation and interested in natural theology, psychology, ethics, and aesthetics. He opposed enthusiasm, sentimentalism, and occultism, and favored the empirical approach.

In his *Neue Apologie des Sokrates* (New Apology of Sokrates; 2 vols., Berlin, 1772–1778) Eberhard denied that salvation depended on revelation, and asserted that there is no original sin and that a heathen could go to heaven. He rejected eternal punishment as a contradiction of its aim—the moral improvement of the sinner.

Eberhard's *Allgemeine Theorie des Denkens und Empfindens* (General theory of thinking and feeling; Berlin, 1776) was dominated by the thought of John Locke, and by Gottfried Wilhelm Leibniz's *Nouveaux Essais*. Like Immanuel Kant and Johann Nicolaus Tetens, Eberhard vindicated sensation against the earlier tendency to stress reason; and like Kant, Tetens, and Johann Heinrich Lambert, he developed a thoroughgoing phenomenalism. He held that sensation is passive and supported Locke's view that all ideas derive from sensation. He claimed that sensing is a transition from thinking to acting.

Eberhard held that Beauty is not an objective characteristic of things, but an adequacy of the object to the representative power of the subject (a view he called—as Kant did later—"subjective finalism"). Beauty excites this activity, and the aim of art is therefore the awakening of pleasurable passions (a doctrine rejected by Kant and later German aestheticians). The first appearance of aesthetic activity in man is represented, according to Eberhard, in children's play (a foreshadowing of Friedrich Schiller's aesthetics of play).

Eberhard, as editor of the *Philosophisches Magazin* from 1788 to 1791 and of the *Philosophische Archiv* from 1792 to 1795, published a large number of articles critical of Kant's *Kritik der reinen Vernunft*, most of them written by himself. He claimed that Kant's views were entirely derived from Leibniz, and that they were only a special kind of dogmatism. Kant answered Eberhard in his *Ueber*

*eine Entdeckung, nach der alle neue Kritik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll* (Königsberg, 1790). It was one of the few times Kant deigned to answer unjustifiable criticism.

## ECKHART, MEISTER

(c. 1260–1327/1328)

Meister Eckhart, the German mystic, was born Johannes Eckhart at Hochheim in Thuringia. After entering the Dominican order at an early age, he pursued higher studies at Cologne and Paris. He became successively provincial prior of the Dominican order of Saxony, vicar-general of Bohemia, and superior-general for the whole of Germany (in 1312). During the last part of his life Eckhart became involved in charges of heresy. In 1329, twenty-eight of his propositions were condemned by Pope John XXII, eleven as rash and the remainder as heretical. Nevertheless, Eckhart was to have a lasting influence upon medieval mysticism.

Eckhart's account of God and the universe depended not only on theology and metaphysical speculation but also on his interpretation of mystical experience. Thus, he distinguished between *Deus* or God, as found in the three Persons of the Trinity, and *Deitas* or the Godhead, which is the Ground of God but is indescribable. The Godhead, through an eternal process, manifests itself as the Persons. In the same way, Eckhart distinguished between faculties of the soul, such as memory, and the *Grund* or "ground" of the soul (also called the *Fünklein*, *scintilla* or "spark"). By contemplation it is possible to attain to this *Grund*, leaving aside the discursive and imaginative activities that

normally characterize conscious life. In doing this, one gains unity with the Godhead. Although Eckhart gave some sort of explanation for the ineffability of the Godhead (namely, that it is a pure unity and thus not describable), the main motive for his doctrine lay in a feature of mystical experience—that it involves a mental state not describable in terms of thoughts or images.

The need to give an account of contemplative knowledge led Eckhart to evolve a complex psychology. The soul operates at the lowest level, through the body; thus it has powers of digestion, assimilation, and sensation. At a higher level the soul functions through the powers of anger, desire, and the lower intellect (the *sensus communis* or "common sense," which combines what is given through the various senses in perception). At a third level the soul works through memory, will, and the higher intellect. At the fourth level it is possible in principle to know things in total abstraction, that is, as pure forms, which is therefore to know them as they preexist in God's intellect. Finally, the spark of the soul can possess a kind of knowledge in which God is known as he is.

In the development of these ideas, Eckhart certainly spoke in ways which might have offended his more orthodox contemporaries. The notion of the spark within the soul seemed to imply that the soul is uncreated. The notion of God's birth within the soul, through mystical experience, seemed to present the sacraments of the church as mere means of preparing for such experience, rather than as efficacious in themselves. Likewise, Eckhart's language of deification could easily have been construed to mean that the historical Christ has only an exemplary and symbolic value. Eckhart's teaching that God creates the world in the same "eternal now" in which the emanation of the divine Persons from the Godhead takes place could be understood as implying the eternity of the world—a doctrine that conflicts with the literal sense of biblical revelation. His statement that all creatures are a "mere nothing" could be held to imply a kind of monism. Recently, however, among Catholic historians of philosophy an attempt has been made to show that his theology is less unorthodox than the above doctrines might suggest, and as a Dominican, Eckhart certainly employed the language of Thomism.

This recent discussion serves to underline the degree to which Eckhart permitted changes and inconsistencies in the formulation of his ideas. Thus, at one time he held that the divine essence is *intelligere*, or understanding (a thesis original to Eckhart, and one which reinforced the doctrine of similarity of the soul to God), and only secondarily is God *esse*, or being. Later, however, he held, in

accordance with Thomist doctrine, that God's essence is *esse*. Various other fluidities and antinomies can be detected in Eckhart's thought; these were partly caused by the shifting way in which he used key terms. For example, he asserted that God is above being and yet also, that he is being. The first use of "being" could be taken to refer to finite existence; the second use could be taken in a Thomistic sense. At times he spoke of God as both Godhead and God, and at other times he spoke of God as distinguished from the Godhead.

Although on occasion Eckhart used the term *emanation* to describe the creation of the world, he in fact adhered to an orthodox account of creation out of nothing. But he stressed the continuous creativity of God, and in this and other respects he was influenced by Augustine. Even though his language about creation could be misinterpreted to imply the eternity of the cosmos, Eckhart was at pains to evolve a two-level theory of time. In a sense all events are simultaneous for God, who is timelessly eternal (so that to speak of a temporal gap between the procession of the Trinity and the creation of the world makes no sense). Temporal concepts, however, are properly applied within the created order, and therefore the creation can be dated retrospectively. Eckhart's two-level theory of time corresponded to his two-level theory of truth. The truths that we assert are limited and partial (or, as Eckhart asserted, there is untruth in them), but there is an absolute truth which can be realized existentially, namely, the pure being of the Godhead.

The general shape of Eckhart's beliefs, if we except his doctrines of the Godhead and of the soul, was fully in accord with contemporary belief (for example, in regard to angels and purgatory). What made his sermons and teachings popular was the way in which he reiterated the need to penetrate beneath the externals of religion, while his free use of homely, striking, and sometimes paradoxical examples and similes effectively conveyed his message.

There is a remarkable parallel between some of Eckhart's central ideas and the doctrines of the Indian theologian Śankara (d. c. 820)—a parallel first expounded by Rudolf Otto. In Śankara's system, too, there is a distinction between the Absolute and God conceived as personal and a similar claim that the divine can be found within the soul. The comparison may give a clue to the reason for the shape of Eckhart's teachings. It certainly suggests that there are experiential reasons for this kind of doctrine, even though they may be complicated reasons. They seem to be as follows. The experience of the introvertive mystic includes a state of consciousness in which

there is both a sense of illumination and an absence of distinction between subject and object; that is, the contemplative is not having an experience like that of ordinary perception, where the thing perceived can be distinguished from the percipient. Consequently, if the mystic connects his experience with God (whom he believes in for independent reasons), he may be inclined to speak of merging with God. But since his experience is without differentiation and since the notion of God—and especially that of a Trinitarian God—includes the idea that he has attributes, it is not unnatural, although it appears unorthodox, to treat the entity experienced by the mystic as being "beyond" God conceived personally.

Indeed, Eckhart maintained that the true aristocrat (that is, the spark or ground of the soul) reaches beyond God, to the Godhead. It is likewise natural, in the Christian context in which Eckhart lived, to interpret this simple undifferentiated unity found in the Godhead as being the basis out of which the Persons of the Trinity proceed. In this way mystical experience, for Eckhart, was connected with the God of ordinary religion. Nevertheless, Eckhart endeavored to express himself in accordance with orthodox belief, despite the difficulties that he found in trying to do justice both to his experience and to the ordinary language of theism. Certainly, he did not seriously intend to deny orthodoxy.

Despite the papal condemnation of some of his propositions, Eckhart had a wide influence. Johannes Tauler, Heinrich Suso, Jan van Ruysbroeck, and the group known as the Friends of God were in different ways indebted to his teachings and example.

## EDDINGTON, ARTHUR STANLEY

(1882–1944)

Arthur Stanley Eddington was an English astronomer who was educated at Owens College, Manchester, and Trinity College, Cambridge, where he was Plumian professor of astronomy from 1913 to 1944. He never married, was socially rather diffident, and lived the quiet life of a Cambridge academic. He was elected a fellow of the Royal Society in 1914 and was knighted in 1930.

Eddington was one of the most brilliant theoreticians of his day, possessing an outstanding ability to survey complex and highly ramified subjects as wholes. His report to the Physical Society (1918) on the general theory of relativity, expanded into *The Mathematical Theory of Relativity* (London, 1923), contained important original contributions to the theory. Eddington's discovery of the mass-luminosity relation in stars and his explanation of white dwarf stars, which made possible the modern theory of stellar evolution, were published in *The Internal Constitution of the Stars* (London, 1926). These two books are considered to be his most substantial contributions to physics and astronomy. His interpretation of relativity theories led him to a belief in the profound importance of epistemology for physics. At first in semipopular books on modern physics—*Nature of the Physical World* (London, 1928) and *New Pathways in Science* (London, 1935) being the most important—Eddington argued for the

view that physics could be almost entirely based upon investigations into the nature of sensation and measurement. A more elaborate and purely philosophical defense of his view was given in *The Philosophy of Physical Science* (London, 1939). Formal attempts actually to produce physics as derived in this way were presented in *Relativity Theory of Protons and Electrons* (London, 1936) and *Fundamental Theory* (London, 1946), published posthumously.

Eddington's real contributions to philosophy, if any, lie in his work on the epistemology of physics. However, he also defended idealism and mysticism, and he claimed that the indeterminacy of quantum physics solved the traditional philosophical problem of free will versus determinism in favor of free will. Particularly in his semi-popular writings, Eddington was betrayed into philosophical excesses and, at times, gross confusion by a play of analogy and paradox, which, while part of his equipment as an immensely entertaining and brilliant writer, also served his love of mystery and obscurantism.

## SELECTIVE SUBJECTIVISM

Eddington gave to his epistemological view the two names "selective subjectivism" and "structuralism." He accepted the causal theory of perception, and with this theory Eddington's own system stands or falls. From this theory it follows, first, that we know directly only the contents of our own consciousness (sense data) and, second, that these contents cannot be claimed to resemble elements of the objective world in any qualitative way. Our sensory apparatus selects from objective reality what we are able to observe and what is therefore the material for physical knowledge, just as, to use Eddington's own analogy, a net of a certain size mesh selects fish only of a size greater than the mesh. Just as we could generalize, prior to examining any catch of fish, about the size of fish the net would yield, so we can generalize in physics prior to the results of observation, merely by reflecting upon observational procedure, especially metrical procedures.

Despite distortions, mostly qualitative, in the picture that our senses thrust upon us, we may conclude that the picture has a structure in common with the unknowables that stimulate the senses. We notice patterns of recurrence in sensation, and it is the task of physics to elaborate the structure of these patterns. In particular, the structure of pointer-reading observations should be studied, since pointer readings—being merely observed coincidences—are minimally corrupted by the qualitative veils cast by our senses. However, Eddington denied the

pointer readings directly represent anything objectively real.

### APRIORISM

Like Immanuel Kant, to whose system Eddington admitted that his own was distantly similar, he claimed that knowledge must conform to certain primitive rational patterns if it is to be intelligible. One of these forms of thought is that we believe in the existence of minds other than our own. The recognition of a common structure in the experience of many minds leads to a belief in an objective reality independent of these minds. There is no primitive belief in an objective reality. This route to the existence of an external world is an unobtrusive but significant part of Eddington's idealistic metaphysics.

Using the notion of structure as defined in the mathematical theory of groups, Eddington was able, out of highly generalized material from epistemology (for example, the claim that only relations between things are observable) and from the forms of thought, to build quite intricate group structures, for example, the structure found in Paul Dirac's mathematical specification of an elementary particle in an elementary state giving charge and spin. In addition to this a priori derivation of the formal structure of laws, Eddington also exploited the theory of groups in deducing a priori the basic natural constants, such as the gravitational constant and the fine structure constant, from various features of the group structure of the type of mathematics employed. In this, he compared himself with Archimedes, who deduced the nature of  $\pi$  from the axiom of Euclid, whereas previous determinations of its nature had relied upon merely empirical methods.

On this basis Eddington claimed that the mind fits nature into a pattern determined by the nature of the mind itself; that the discoveries made by the physicist are just what his sensory, intellectual, and metrical processes dictate that he shall find.

It is difficult not to share the general view that Eddington vastly overstated the extent to which convention enters into theory construction. Extensive criticism in this entry without more extensive elaboration of the complexities of his group structure derivations would be unjust. Some brief comments must suffice.

Eddington's view was that observation was required only for the purpose of identifying, on the one hand, the elements of the group constructed by pure mathematics with, on the other hand, the theoretical terms of, say, electromagnetism. It is far from clear where he thought the

complete theoretical structure then stood from the point of view of its a priori status. If such "identification" demands that it be fully observed that the electromagnetic field is properly (that is, truly) described by Maxwell's equations, which have the group structure in question, then Eddington was requiring "observation" to add a very great deal more than he seems to have been prepared to admit.

Eddington fell into confusion that illustrates well his mistakes in general. This was his claim that the basis of the special theory of relativity may be deduced a priori because it depends on the fact that simultaneity of events at a distance from each other is not observable, that is, that it depends upon an epistemological fact. It is true that to decide a question about the simultaneity of spatially separated events, one must make assumptions as to the speed of the signals that inform one that the events have occurred. And it is also true that in the last resort these assumptions could be checked only if one could decide independently on the simultaneity of events spatially distant from each other. But this epistemological circularity is an insufficient basis for relativity theory. Moreover, further contingent facts, not deducible a priori (for example, the fact that in any inertial system light takes the same time round any closed paths of the same length, whatever their orientation) are required. Eddington claimed that the result of the Michelson-Morley experiment could have been foreseen on a purely epistemological basis. It seems quite clear that he was wrong.

### IDEALISM

"To put the conclusion crudely—the stuff of the world is mind-stuff," Eddington wrote in *Nature of the Physical World*. The idealist conclusion was not integral to his epistemology but was based on two main arguments.

The first derives directly from current physical theory. Briefly, mechanical theories of the ether and of the behavior of fundamental particles have been discarded in both relativity and quantum physics. From this Eddington inferred that a materialistic metaphysics was outmoded and that, in consequence—the disjunction of materialism or idealism being assumed exhaustive—an idealistic metaphysics is required.

The second and more interesting argument was based on Eddington's epistemology and may be regarded as consisting of two parts. First, all we know of the objective world is its structure, and the structure of the objective world is precisely mirrored in our own consciousness. We therefore have no reason to doubt that the objective world, too, is "mind-stuff." Dualistic meta-

physics, then, cannot be evidentially supported. (The conclusion appears to be a valid deduction from its premises.)

But, second, not only can we not know that the objective world is nonmentalistic, we also cannot intelligibly suppose that it could be material. To conceive of a dualism entails attributing material properties to the objective world. However, this presupposes that we could observe that the objective world has material properties. But this is absurd, for whatever is observed must ultimately be the content of our own consciousness and, consequently, nonmaterial. This last argument confuses, among other things, the supposition that the objective world has certain properties with the supposition of our observing that it has them.

## EDUCATION, PHILOSOPHY OF

See *Philosophy of Education, History of*

## EDWARDS, JONATHAN (1703–1758)

Jonathan Edwards, the Puritan theologian and philosopher, was born in East Windsor, Connecticut. He was the only son of Timothy Edwards, the pastor of the Congre-

gational Church at East Windsor; his mother was the daughter of Solomon Stoddard, pastor at Northampton, Massachusetts. About the age of twelve or thirteen he wrote several essays in natural science that reveal remarkable powers of observation and deduction. "Of Insects" describes the habits of spiders. Another essay, on the rainbow and colors, shows an acquaintance with Isaac Newton's *Opticks*. Around the same time Edwards wrote a short demonstration of the immateriality of the soul. These writings are the work of a precocious mind, deeply interested in nature and finding in it the marks of a provident God.

In 1716, Edwards entered Yale, where the world of philosophy opened up to him. For a short time his tutor was Samuel Johnson, who introduced him to the new philosophical ideas coming from England, especially those of John Locke. He read Locke's *Essay concerning Human Understanding*, from which, he claimed, he derived more enjoyment "than the most greedy miser finds, when gathering up handfuls of silver and gold, from some newly discovered treasure." His precocity in philosophy is proved by his notes "Of Being" and "The Mind," both probably written before his graduation in 1720.

There followed two years of graduate study in theology at Yale, in preparation for the ministry. During this period Edwards had a profound religious experience, which he described later, in his *Personal Narrative* (1739), as having given him a new awareness of the absolute sovereignty and omnipresence of God and of complete dependence on him. Edwards's religious philosophy grew out of this transforming experience.

In 1722 he became pastor of a Scotch Presbyterian congregation in New York, but the life of study and teaching attracted him, and two years later he was back at Yale as senior tutor. In 1727 he was ordained assistant minister to his grandfather Solomon Stoddard, and when Stoddard died, in 1729, Edwards took over the Northampton parish.

For almost twenty years Edwards preached and wrote in this parish. During that time he continued his boyhood custom of jotting down his reflections, which he called "Miscellanies" or "Miscellaneous Observations." They fill nine volumes and contain 1,360 entries. These journals, most of which are still unedited, were intended to be a first draft of a monumental book provisionally titled "A Rational Account of the Main Doctrines of the Christian Religion Attempted." This proposed summa of Calvinist theology was not completed.

Edwards's pervasive theme was the Calvinist doctrine of God's sovereignty and the complete helplessness of man to effect his own salvation by good works. In a famous sermon preached in Boston in 1731, titled "God Glorified in Man's Dependence," he opposed Arminianism—a doctrine derived from the Dutch theologian Jacobus Arminius (1560–1609) and then gaining ground in the colonies—which granted to men some part in their salvation through benevolence and good works. Edwards played a vigorous role in the revivalist movement known as the Great Awakening, which swept through New England in the 1740s, reaching hysterical peaks of religious enthusiasm. His own conception of religious experience is found in *A Treatise concerning Religious Affections* (1746).

Through sternness of doctrine and lack of prudence Edwards alienated his parishioners, and in 1748 he was dismissed from his parish. His next post was the missionary parish at Stockbridge, Massachusetts, where he preached to a small group of Indians and a few whites. He had plenty of leisure to write, and a major work, *Freedom of the Will*, defining and defending his Calvinist doctrine of human freedom, appeared in 1754. The sequel, *The Nature of True Virtue* (1765), places virtue in the emotions rather than in the intellect. His last completed work, "Concerning the End for Which God Created the World," is a speculative theological work on God's purpose in creation.

At Stockbridge, Edwards began a vast synthesis of theology called *The History of the Work of Redemption*, but this was interrupted by his election, in 1757, to the presidency of New Jersey College, now Princeton University. He died at Princeton the following year.

### PHILOSOPHICAL ORIENTATION

In the language of the day, Edwards was a "philosophizing divine." His primary interests were religious, and his main writings were theological. Apart from his college notes he produced no purely philosophical works. However, his theological treatises abound in philosophical reflections, all of which were intended to clarify and defend his theological positions. For him the arts, sciences, and philosophy ideally had no status separate from theology; as they become more perfect, he said, they "issue in divinity, and coincide with it, and appear to be as parts of it."

Edwards's philosophical views reflect his college training in Puritan Platonism, itself an offshoot of Cambridge Platonism and the Platonism of Peter Ramus. He attempted to synthesize with this Christian Platonism elements from the English empiricists, especially Locke,

Newton, and Francis Hutcheson (1694–1746), whose works were introduced into New England in the early 1700s. Puritan Platonism taught Edwards that the spiritual world alone is real, that the visible universe is but its shadow, created to lead the mind, under the divine illumination, to an awareness of the presence of God. Into this general idealistic philosophy he wove strands of doctrine from the empirically minded Locke and the scientist Newton, whose works were beginning to make a stir in the colonies. From Locke he took the notion that all our ideas originate in sensation; from Newton, the conception of space as the divine sensorium.

### BEING

In his notes "Of Being," Edwards took up the Parmenidean thesis of the necessity of Being, arguing the impossibility of absolute nothingness on the ground that it is a contradictory and inconceivable notion. Since pure nothingness is an impossibility, he held, there never was a time when Being did not exist. In short, Being is eternal. He also established the omnipresence of Being, arguing that we cannot think of pure nothingness in one place any more than we can think of it in all places. Thus, Being possesses the divine attributes of necessity, eternity, omnipresence, and infinity. Consequently, Being is God himself.

Further attributes of Being deduced by Edwards are nonsolidity and space. Solidity, he argued, is resistance to other solids, and since there are no beings outside of Being, Being itself, or God, cannot be conceived as solid. That Being, or God, is identical with space Edwards proved by the impossibility of conceiving the nonexistence of space. We can suppress from thought everything in the universe but space itself. Hence, space is divine. Following the Cambridge Platonists and Newton, Edwards conceived of God's mind as the locus in which material things spatially exist.

### NATURE OF MIND

Edwards's notes titled "The Mind" are heavily indebted to Locke. Like the English philosopher, he distinguished between two faculties of the mind, understanding and will. Understanding he defined as the faculty by which the soul perceives, speculates, and judges. Its first operation is sensation, for without the activity of the senses there can be no further mental operations. The mind needs the senses in order to form all its ideas. The objects of the senses are not real qualities of bodies but impressions and ideas given to us by God. Edwards agreed with Locke that secondary qualities, such as colors, sounds, smells, and

tastes, do not inhere in bodies but are mental impressions. Every intelligent philosopher, Edwards wrote, now grants that colors are not really in things any more than pain is in a needle.

**IDEALISM.** Edwards went beyond Locke in applying to primary qualities, such as solidity, extension, figure, and motion, the arguments against the reality of secondary qualities. All the primary qualities, he insisted, can be reduced to resistance. Solidity is simply resistance; figure is the termination of resistance; extension is an aspect of figure; motion is the communication of resistance from one place to another. Hence, a visible body is composed not of real qualities but of ideas, including color, resistance, and modes of resistance. Resistance itself is not material; it is “nothing else but the actual exertion of God’s power.” Consequently, the visible universe has only a mental existence. It exists primarily in God’s mind, where it was designed by a free act of the divine will. It also exists in our minds, communicated to us by God in a series of united and regularly successive ideas.

Historians have debated whether Edwards owed his idealistic philosophy to George Berkeley or to his own precocious genius. At the time he formulated it, Berkeley’s works were not yet available at Yale. Although it is possible that he heard reports of Berkeley’s idealism, it is more likely that he arrived independently at his idealistic conclusions.

According to Edwards, minds alone are, properly speaking, beings or realities; bodies are only “shadows of being.” Goodness and beauty belong to anything in proportion to its intensity of being. Hence, minds alone are really good and beautiful; the visible world has but a shadow of these perfections. Its value is to lead the mind to the enjoyment of spiritual and divine goodness and beauty.

**CREATION.** The created world depends entirely on God for its existence and preservation. He freely created it, and he constantly holds it in existence, as colors are continually renewed by the light of the sun falling on bodies. The universe constantly proceeds from God as light shines from the sun. Under the activity of God the universe is a revelation of the divine mind to created minds; it is a panorama of shadows and images exhibiting the divine mind and will. Edwards, in his notebook titled *Images or Shadows of Divine Things*, described nature as a symbol of God. God, he said, revealed himself in the Bible and also in the visible universe and the souls of men, which are made in the image of God. In order to interpret correctly

the symbols of God in the created world, the mind has to be purified by a divine illumination. To Edwards there is no more sublime or delightful activity than to discover and to contemplate the traces of God in nature.

**THE WILL.** The second faculty of the mind described by Edwards is the will. The importance of the will lies in the fact that it is the seat of the passions or affections, the chief of which is love. According to Edwards, all the other passions originate in love and are for its sake. Love is the excellence and beauty of minds. In *A Treatise concerning Religious Affections* he argued that all human activities, especially those of religion, arise from affection. The affections, he said, are the “very life and soul of all true religion.” The essence of religion lies in holy love, especially the love of God. Although Edwards’s doctrine of religious experience, under the influence of pietism, gives ample scope to the emotions, and he appealed to them in his sermons, he generally maintained a Puritan sobriety of expression and avoided the sensationalism that marked the Great Awakening. He insisted that religion be centered in what he called the “gracious affections” that spring from the awareness of God and divine things.

## RELIGION AND ETHICS

Religious experience is possible, according to Edwards, through a supernatural sense that the elect receive by divine grace. This new sense, which is different from the five bodily senses, gives humankind, reborn by grace, a new kind of sensation or perception by which he passively receives from God ideas and truths about divine things. By a kind of sense experience the elect enjoy an inward, sweet delight in God, which unites them to God more closely than all rational knowledge of him. The way to God is through the heart rather than through the head.

**PROBLEM OF FREEDOM.** Edwards regarded the will, like the intellect, as an essentially passive power, moved to action by external forces. As the intellect passively receives impressions and ideas from God, so the will is inclined to agreeable objects and repelled by disagreeable objects. The will is not a self-determining power; its actions are determined by causes. God alone is free in the sense that he can determine his own volitions. The principle of causality, according to which everything that happens has a cause, applies to the movements of the human will as it does to everything created. Of course, the will is moved not by physical causes but by motives or moral causes. These motives are presented to the will by the understanding, and the strongest of them determines the movement of the will.

Edwards opposed the Arminians of his day, who attributed to the human will an inner spontaneity and power of self-determination. In his view this kind of freedom is a divine prerogative; the human will does not have this kind of inner freedom. Its actions are determined not by being physically coerced but by being morally necessitated. A man cannot help willing as he does, given the motives presented to him. And since these motives are determined by God's providence, the movements of man's will are entirely within the divine power.

Although Edwards denied that the human will has freedom of self-determination, he granted that in a sense man is free. Like Thomas Hobbes and Locke, he defined human liberty as the ability to carry out what the will inclines man to do. Liberty is the absence of impediments to action. This denial of the essential freedom of the will harmonizes well with Edwards's Calvinist belief in the total depravity of man and in predestination.

**VIRTUE.** The third earl of Shaftesbury (1671–1713) and Hutcheson influenced Edwards's ethics. With them he denied that true virtue consists in the selfish pursuit of pleasure or in the utility of human actions. Rather, virtue is disinterested benevolence or affection; it is the intrinsic beauty of the dispositions of man's heart. An action is good not because it is advantageous to ourselves or to others but solely because it springs from a beautiful disposition of will. Virtue is a spiritual beauty or excellence that commends itself to us for its own sake. Any other motive for acting is based on self-love and consequently does not measure up to true virtue.

Edwards did not think that man has a natural impulse to such disinterested virtue. In his view man, owing to original sin, is totally depraved and given over to self-love. Only by the election of God and the gift of efficacious grace can man rise above his "dreadful condition" and perform truly virtuous actions. Without supernatural aid seemingly disinterested affections, such as the natural love of parents for their children, are accompanied by self-love and hence are not truly virtuous. At most they are secondary virtues or the shadows of true virtue.

Edwards was the most gifted and articulate theologian-philosopher in the New England colonies and perhaps in American history. He supported a losing cause in his defense of Puritanism, but for a while he gave it new life and spirit. The liberal theology that he combated all his life finally won the day; in the form of Unitarianism it dominated New England culture in the nineteenth century. But Edwards's powerful religious and philosophical stimulus remained. New England transcendentalists, such

as Emerson, although rejecting all systematic theology and proclaiming the divinity of humankind, continued the Puritan's passionate search for the divine in the communion with nature.

## Bibliography

### WORKS BY EDWARDS

- Works*. 8 vols, edited by S. Austin. Worcester, MA: Isaiah Thomas, 1808–1809; reprinted in 4 vols., New York, 1844, 1847. An old but useful edition, found in some libraries.
- Works*. 10 vols, edited by S. E. Dwight. New York: Carvill, 1829–1830. This is the standard and best edition of Edwards's works, except for those newly edited. Vol. I contains a "Life of Edwards" by Dwight.
- Representative Selections*, edited by C. H. Faust and T. H. Johnson. New York: American, 1935; rev. ed. (paperback), with rev. and updated bibliography, 1962. Useful selections from Edwards's works and a good bibliography.
- Images or Shadows of Divine Things*, edited by P. Miller. New Haven, CT: Yale University Press, 1948.
- Puritan Sage: Collected Writings of Jonathan Edwards*, edited by V. Ferm. New York, 1953. Useful selection of Edwards's works.
- Works*, edited by P. Miller. New Haven, CT: Yale University Press, 1957–. Vol. I: *The Freedom of the Will*, edited by P. Ramsey. Vol. II: *Religious Affections*, edited by J. E. Smith. A new edition that will supersede Dwight's.
- The Nature of True Virtue*. Ann Arbor: University of Michigan Press, 1960. Foreword by W. Frankena. Best edition of this work.
- Letters and Personal Writings*. Edited by George S. Claghorn. New Haven, CT: Yale University Press, 1998.
- Sermons and Discourses, 1730–1733*. Edited by Mark R. Valeri. New Haven, CT: Yale University Press, 1999.

### WORKS ON EDWARDS

- Chai, Leon. *Jonathan Edwards and the Limits of Enlightenment Philosophy*. New York: Oxford University Press, 1998.
- Daniel, Stephen H. *The Philosophy of Jonathan Edwards: A Study in Divine Semiotics*. Bloomington: Indiana University Press, 1994.
- Davidson, Edward H. *Jonathan Edwards: The Narrative of a Puritan Mind*. Cambridge, MA: Harvard University Press, 1966, 1968.
- Delattre, Roland André. *Beauty and Sensibility in the Thought of Jonathan Edwards: An Essay in Aesthetics and Theological Ethics*. New Haven, CT: Yale University Press, 1968.
- Hatch, Nathan O., and Harry S. Stout. *Jonathan Edwards and the American Experience*. New York: Oxford University Press, 1988.

- Holbrook, Clyde A. *The Ethics of Jonathan Edwards: Morality and Aesthetics*. Ann Arbor: University of Michigan Press, 1973.
- Jenson, Robert W. *America's Theologian: A Recommendation of Jonathan Edwards*. New York: Oxford University Press, 1988.
- Lesser, M. X. *Jonathan Edwards: A Reference Guide*. Boston, MA: G.K. Hall, 1981.
- Marsden, George M. *Jonathan Edwards: A Life*. New Haven, CT: Yale University Press, 2003.
- McClymond, Michael James. *Encounters with God: An Approach to the Theology of Jonathan Edwards*. New York: Oxford University Press, 1998.
- McDermott, Gerald R. *Jonathan Edwards Confronts the Gods: Christian Theology, Enlightenment Religion, and Non-Christian Faiths*. New York: Oxford University Press, 2000.
- McDermott, Gerald R. *One Holy and Happy Society: The Public Theology of Jonathan Edwards*. University Park: Pennsylvania State University Press, 1992.
- Miller, P. *Errand into the Wilderness*. Cambridge, MA: Belknap Press of Harvard University Press, 1956. Both this and *Jonathan Edwards* (below) are first class.
- Miller, P. *Jonathan Edwards*. New York: W. Sloane Associates, 1949; paperback ed., 1959.
- Schneider, H. W. *A History of American Philosophy*, 11–31. New York: Columbia University Press, 1946; 2nd ed., 1963.
- Schneider, H. W. *The Puritan Mind*. New York: Holt, 1930; paperback ed., Ann Arbor, MI, 1958.
- Smith, John Edwin. *Jonathan Edwards: Puritan, Preacher, Philosopher*. Notre Dame: University of Notre Dame Press, 1992.
- Winslow, O. E. *Jonathan Edwards, 1703–1758*. New York: Macmillan, 1940; paperback ed., 1962. Pulitzer Prize-winning biography—excellent and fascinating account of Edwards's life and times, with good bibliography.

## EGOISM AND ALTRUISM

Why do we sometimes prefer to consult the interests of others rather than our own interests? What is the relationship between selfishness and benevolence? Is altruism merely a mask for self-interest? At first sight these may appear to be empirical, psychological questions, but it is obviously the case that even if they are construed as such,

the answers will depend on the meaning assigned to such key expressions as “self-interest,” “benevolence,” “sympathy,” and the like. It is in connection with elucidating the meaning of such expressions that philosophical problems arise—problems that are of particular interest because we cannot understand such expressions without committing ourselves, in some degree, to some particular conceptual schematism by means of which we can set out the empirical facts about human nature. That there are alternative and rival conceptual possibilities is a fact to which the history of philosophy testifies.

The problems with which we are concerned do not appear fully-fledged until the seventeenth and eighteenth centuries. That they do not is a consequence of the specific moral and psychological concepts of the Greek and of the medieval world. In neither Plato nor Aristotle does altruistic benevolence appear in the list of the virtues, and consequently the problem of how human nature, constituted as it is, can possibly exhibit this virtue cannot arise. In the *Republic* the question of the justification of justice is indeed raised in such a way as to show that if Thrasymachus's account of human nature were correct, men would find no point in limiting themselves to what justice prescribes, provided that they could be unjust successfully—and Thrasymachus's account of human nature is certainly egoistic. But Plato's rejoinder to Thrasymachus is a statement of a different view of human nature in which the pursuit of “good as such” and the pursuit of “my good” necessarily coincide.

In the medieval world the underlying assumption is that man's self-fulfillment is discovered in the love of God and of the rest of the divine creation. So although Thomas Aquinas envisages the first precept of the natural law as an injunction to self-preservation, his view of what the self is and of what preserving it consists in leads to no special problems about the relation between what I owe to myself and what I owe to others. It is only when Thomas Hobbes detaches the doctrines of natural law from their Aristotelian framework that the problem emerges in a sharp form.

## INITIAL HOBBSIAN STATEMENT

Hobbes is the first major philosopher, apart from Niccolò Machiavelli, to present a completely individualist picture of human nature. There are at least three sources of Hobbes's individualism. First, there is his reading of political experience. His translation of Thucydides reveals his preoccupation with the topic of civil war, with the struggle of one private interest against another. Second, there is Hobbes's commitment to the Galilean resolutio-

compositive method of explanation: To explain is to resolve a complex whole into its individual parts and to show how the individual parts must be combined in order to reconstruct the whole. To explain the complex whole of social life is, therefore, to resolve it into its component parts, individual people, and to show how individuals must combine if social life is to be reconstructed. Since the individuals in terms of whose coming together social life is to be explained must be presocial individuals, they must lack those characteristics that belong to the compromises of social life and be governed only by their presocial drives. Third, there is the detail of the Hobbesian psychology, which insists that such drives must be competitive and aggressive because of the will to power over other men that ceaselessly and restlessly drives men forward.

Thus, from all three sources arises a picture of human nature as essentially individual, nonsocial, competitive, and aggressive. From this view it follows that the apparent altruism and benevolence of individuals in many situations need to be explained; the Hobbesian explanation is simply that what appears to be altruism is always in fact, in one way or another, disguised self-seeking. Undisguised, unmodified self-seeking leads to total social war. The fear of such war leads to the adoption of a regard for others from purely self-interested motives. John Aubrey in his sketch of Hobbes in *Brief Lives* tells of an exchange between Hobbes and a clergyman who had just seen Hobbes give alms to a beggar. The clergyman inquired whether Hobbes would have given alms if Jesus had not commanded it; Hobbes's reply was that by giving alms to the beggar, he not only relieved the man's distress but he also relieved his own distress at seeing the beggar's distress. This anecdote compresses the central problem into a single point: Given that human nature is competitive and self-seeking, why and how can altruism and benevolence be treated as virtues? One's immediate response to this brief and cryptic statement of the problem may well be to inquire why—if one does not share Hobbes's premises—one should take it as given that human nature is essentially self-seeking. To this one replies by posing another question: How can any actual or possible object or state of affairs provide me with a motive, appear to me as good or desirable, unless it appears to be what will satisfy some desire of mine? If the (necessary and sufficient) condition of an object's providing me with a motive is that it satisfy some desire of mine, then it will surely be the case that all my actions will have as their goal the satisfaction of my desires. And to seek only to satisfy my own desires is surely to have an entirely self-seeking nature.

## EIGHTEENTH-CENTURY RESTATEMENTS

The root of the problem lies in the apparently egoistic implications of the psychological framework within which the questions of moral philosophy have been posed by a whole tradition of British thinkers from Hobbes on. Within this framework philosophers have oscillated between two positions: the Hobbesian doctrine of altruism as either a disguise or a substitute for self-seeking and the assertion of an original spring of altruistic benevolence as an ultimate and unexplained property in human nature.

On the one side we find, for example, the earl of Shaftesbury, who argues that men are so contrived that there is no conflict, but an identity, between what will satisfy self-interest and what will be for the good of others; the practice of benevolence is what satisfies man's natural bent. Bernard Mandeville, in *The Grumbling Hive, or Knaves Turn'd Honest* (later retitled *The Fable of the Bees: or, Private Vices, Public Benefits*), argues by contrast that the only spur to action is private, individual self-seeking and that it is for the public and general good that this is so. Francis Hutcheson, who treats benevolence as constituting the whole of virtue, provides no argument to back up his view, nor does he explain why we approve of benevolence rather than of self-interest.

BUTLER. Bishop Joseph Butler's position is at once more complex and more interesting than Hutcheson's or Mandeville's. Butler believes that we have a variety of separate and independent "appetites, passions and affections." Of these, self-love is only one, and it is not necessarily opposed to benevolence. We satisfy the desire for our own happiness in part, but only in part, by seeking the happiness of others. A man who inhibits those desires of his that find their satisfaction in achieving the happiness of others will not in fact make himself happy. By refusing to be benevolent, he damages his own self-interest and disobeys the call of self-love. Cool and reasonable self-love consists in guiding our actions by reference to a hierarchy of principles; supreme among these is moral reflection or conscience, by means of which human nature is defined and the good that will satisfy it discerned. Thus, self-love itself refers us to the arbitration of conscience, which in turn prescribes that extent and degree of benevolence that will satisfy the needs of self-love.

The chief objection to Butler is likely to arise from the apparently self-enclosed character of his account. In Butler's system the harmony between self-love and benevolence appears to reign by definition rather than in

fact, that is, in human nature itself. But this criticism misconstrues Butler's stand, although we can deduce from Butler's psychology empirical consequences of a testable kind that at first sight render it liable to refutation by the facts. For if Butler is correct, those who are benevolent to the required degree do not find their benevolence at odds with their self-interest. In this sense, at least, virtue and happiness may be required to coincide, and if they do not coincide, Butler's view of human nature is false. But Butler allows himself an escape clause. He concedes that in the world as we know it, the pursuit of self-interest and devotion to benevolence may not appear to coincide, but, he says, the divergence seems to exist only if we do not allow for divine providence, which ensures that the world to come will be such as to ensure that self-interest and altruistic benevolence required the same actions of us.

### THEOLOGY AND THE LONG RUN

In contrast with Hobbes's view that altruistic behavior (or at least just behavior) is in our immediate interest as a means of preserving ourselves from the war of all against all and in contrast with Butler's view that benevolence and self-interest are two distinct springs of action that move us to the same actions, there is the view that benevolence is to our long-term, as opposed to our short-term, self-interest. Butler, as already noted, uses something like this view to supplement his basic position, but it is the stock in trade of a form of theological egoistic utilitarianism to be found in Abraham Tucker and William Paley.

In both writers the crucial psychological premise is that men are so constructed that they always pursue their own private and individual satisfaction. In both writers the fundamental moral rule is an injunction to universal benevolence, which is equated with the promotion of the greatest happiness of the greatest number. The problem is how, given the character of human nature, a motive can be found for obeying the fundamental moral rule. The solution is to say that God has so contrived the afterlife that only if we obey the fundamental moral rule will we in the long run, that is, in the eternal run, secure our own happiness. In Paley it is clear that we could find no good reason to be moral if God did not exist, but God's function in bridging the gulf between self-interest and morality is veiled in conventional theological terms. In Tucker's *The Light of Nature Pursued* the account of how God bridges the gulf is more explicit. God has arranged that all the happiness that men either have enjoyed or will enjoy is deposited in what he calls "the bank of the universe." By working to increase the happiness of others, I increase the amount of happiness so deposited. But by increasing the

general stock of happiness, I also increase my own happiness, for God has arranged to divide this stock of happiness into equal shares, to be allotted one to a person, and so by increasing the size of the general stock, I also increase the size of my own share. I am, as it were, a shareholder in a cosmic bank of which God is at once the chairman and the managing director.

Tucker's absurdities, though unimportant in detail, do bring out how impossible is the task of reconciling an egoistic theory of human nature with a moral theory of benevolent utilitarianism. Of such impossibilities are absurdities born; to this the secular utilitarianism of David Hume, Jeremy Bentham, John Stuart Mill, and Henry Sidgwick is as much a witness as is the theological utilitarianism of Tucker and Paley.

### HUME AND THE UTILITARIANS

Hume's initial approach to the problem is as flexible and undogmatic as that of any philosopher. In the *Treatise of Human Nature* Hume poses the question why we approve and obey rules that it is often in our interest to break. He makes no assumptions of the kind found in other eighteenth-century writers (men are entirely ruled by self-interest). He merely remarks, apparently on empirical grounds, that it is often the case that self-interest would, if it were followed, lead us to disregard the rules of justice. Nor does he invoke any compensating natural regard for the interests of others. We do have some regard for the interests of others, but it varies with the closeness of their ties to us, and we have by nature no regard for the public interest as such. "In general, it may be affirm'd that there is no such passion in human minds as the love of mankind, merely as such, independent of personal qualities, of services, or of relation to oneself" (*Treatise*, Bk. III, Part II, Sec. i).

If, then, self-interest would lead us to disobey the rules of justice and if we have no natural regard for the public interest, how do the rules come into existence, and what fosters our respect for them? The crucial fact is that did we not have respect for the rules of justice, there would be no stability of property. Indeed, the institution of property could not and would not exist. Now the existence of property and its stability is to all our interests, and we are always conscious of how much we are injured by others failing to observe the rules. So we have become conscious that although our immediate and short-term benefit rests in breaking the rules on a given occasion, our long-term benefit resides in insisting upon a universal observance of the rules.

By the time Hume came to write the *Enquiry concerning Human Understanding*, he had shifted his ground. He now sees self-interest and “a tendency to public good, and to the promoting of peace, harmony, and order in society” as two independent, coexistent springs of action; he sees the independent power of sympathy and of a sense of the public good, rather than a rational view of what is of long-term benefit to self-interest, as moving us to benevolence and altruism.

BENTHAM, GROTE, MILL, SIDGWICK. The utilitarians present the problem in terms differing somewhat from those of Hume because they were more rigidly committed to a psychology derived from David Hartley, according to which only pleasure and pain ever move us to action. In this psychology both “pleasure” and “pain” are the names of sensations. Clearly in this view the only pleasure whose prospect attracts me is *my* pleasure, and the only pain the prospect of which repels me is *my* pain. It seems to follow that all action is egoistically motivated, yet all four utilitarian writers make “the greatest happiness of the greatest number” either the only criterion of action or at least a central criterion. How can so egoistically motivated an agent as the utilitarians assume consult the general happiness? That he will have to learn to do so is what Bentham takes for granted in his legal and political writings. Bentham provides for inducements that will counteract the self-interest of legislators, for example. He affirms expressly that “the only interest which a man is at all times sure to find adequate motives for consulting is his own.” But in the *Deontology* he seems by contrast to take it for granted that the pursuit of *my* pleasure and the pursuit of the greatest happiness of the greatest number will always as a matter of fact coincide.

This assumption of coincidence is abandoned by John Grote, who tries to minimize the difficulties by reducing our obligation to consult the general happiness to an injunction to consult the general happiness insofar as to do so will ensure our own happiness. Yet even Grote presupposes that, for the most part and generally, my happiness and that of the greatest number will not conflict.

Mill’s arguments are of two kinds. He first argues that pleasure and the absence of pain are desired by all; here what is meant is clearly that each desires his own pleasure. The proof, and the only possible proof, that pleasure is desirable is that all people desire it, and since all people do desire it, it must be admitted to be desirable. Hence, everyone must acknowledge that it is desirable to produce as much pleasure as possible, and here what is

clearly meant is that each ought to desire the pleasure of all. The fallacy in the transition from the premise that each desires his own pleasure to the conclusion that each ought to desire the pleasure of all is usually thought to reside in the transition from fact to value, but it lies, rather, in the transition from an assertion about the agent’s own pleasure to conclusions about the general happiness.

However, elsewhere in *Utilitarianism* Mill faces the difficulties in such a transition explicitly. He reproduces familiar arguments in an interesting form. The feelings of sympathy that Hume stressed in the *Enquiry* reappear as a man’s “feeling of unity with his fellow-creatures.” A man who has this feeling has a “natural want” to live in harmony with others. It is often overshadowed by selfish emotions, but those who do possess it know that they would be worse off if they did not possess it. The reason for this conviction is that the best prospect of realizing such happiness as is attainable is a willingness to sacrifice the prospects of one’s own present and immediate happiness to an ascetic devotion to altruism and benevolence. Sidgwick became conscious of the difficulties that Mill brushes aside in this account. In the *Methods of Ethics*, however, Sidgwick could find no way to make the transition from the desire for one’s own pleasure to that for the general happiness, and these remain for him independent goals, as they had been for some eighteenth-century philosophers.

## THE PROBLEM IN EMPIRICAL PSYCHOLOGY

The philosophers from Hobbes to Sidgwick who analyze the concepts of egoism, altruism, and sympathy often write as if they were empirical students of human nature, disputing the facts of human action and motivation. But it is more illuminating to read them as offering conceptual accounts of what it is to have a good reason for action and of what the limits upon the range of possible good reasons are. But so closely allied are conceptual and empirical issues at this point in the argument that it is not surprising to find that the would-be empirical accounts that psychologists claim to have derived from observation should sometimes turn out to be a rendering of conceptual schemes which have already been encountered in philosophy. So it is with Sigmund Freud, most strikingly in his earlier writings. The important place in Freudian theory held by the pleasure principle, the concepts of gratification and of libido, and the consequent view of socialization all lead to a theory in which the gratification of the self is primary and in which altruism and benevo-

lence are interpreted as secondary phenomena that acquire the regard that they do because they are originally associated with forms of self-gratification. Freud's genetic account differs in detail from that given by Mill, but the form of the account is the same. Nor is this accidental; the pre-Freudian psychologies of Hartley, who influenced Mill, and of Alexander Bain, Mill's contemporary offer associationist accounts in which the genetic order is the same as it is in Freud. There is, therefore, not only the task of clarifying the concepts involved in these accounts, but also the task of settling how far the issues raised are genuinely empirical and how far genuinely conceptual. The concepts in need of clarification are of five kinds: the nature of desire; self-interest; altruism and benevolence; motives, actions, and sympathies; and the genetic fallacy.

**NATURE OF DESIRE.** If I want something, it does not follow that I want it because it will give me pleasure to have it or because it is a means of getting something further which will give me pleasure. It is, of course, true that if I get what I want, I have thereby satisfied one of my wants. Having any of my wants unsatisfied is certainly less satisfactory than having them satisfied, but it is not necessarily painful or even unpleasant. So it is neither true that I necessarily desire pleasure nor true that in seeking to satisfy my desires, I necessarily seek pleasure or the avoidance of pain.

Moreover, if I do something, it does not follow that I do it because I want to, let alone that I do it because I shall get pleasure from it. It has sometimes been suggested that the performance of an action is itself an adequate criterion of the agent's wanting to do whatever it is, and those who hold this view interpret such an expression as "doing what one does not want to do" when it is applied in cases of action under duress as meaning that the agent would not want to perform that particular action normally but does want to do it on this occasion rather than endure the threatened consequences of not doing it. This contention is less than self-evident. Moreover, if there is a sense of "want" such that if I do something, it is thereby true that I want to do it, that sense is a weaker and a different one from that given when I explain what I do by citing as a, or the, reason that I want to do it. For it is precisely because we have independent criteria for asserting that the agent did or did not want to do what he did that the want can be cited as an explanation for the action.

Action, desire, and pleasure, then, do not stand in so close a conceptual relationship that we cannot ask as a matter of contingent fact on any given occasion whether a man acted to get pleasure or whether he did what he did

because he wanted to or not. To understand this is a necessary preliminary to understanding the notion of self-interest.

**SELF-INTEREST.** What is to my interest depends upon who I am and what I want. This elementary but too often unnoticed truism underlies one of Socrates's implied answers to Thrasymachus in Plato's *Republic*. The question "Is justice more profitable than injustice?" will, as Plato makes clear, be answered differently depending upon whether it is answered by a just man or an unjust man. For what the just man wants is not what the unjust man wants. Thus, there is not a single spring of action or a single set of aims and goals titled "self-interest" that is the same in every man. "Self-interest" is not in fact the name of a motive at all. A man who acts from self-interest is a man who allows himself to act from certain motives in a given type of situation. The same action done from the same motive in another type of situation would not be correctly characterized as done from self-interest. So if I eat to sate my hunger or do my job well in order to succeed, I do not necessarily act from self-interest. It is only when I am in a situation where food is short or my rising in the world requires a disregard for the legitimate claims of others that to consult only my hunger or my ambition becomes to act from self-interest. The notion of self-interest therefore has application not to human behavior in general but to a certain type of human situation, namely, one in which behavior can be either competitive or noncompetitive. Equally, in this type of situation alone can the notions of benevolence and altruism have application. Therefore, it is to the elucidation of these that we must next turn.

**ALTRUISM AND BENEVOLENCE.** The question canvassed in the eighteenth century whether benevolence might not be the whole of virtue could have been raised only in an age in which the concept of virtue had been greatly narrowed or the concept of benevolence had been greatly widened or both. For in most of my dealings with others of a cooperative kind, questions of benevolence or altruism simply do not arise, any more than questions of self-interest do. In my social life I cannot but be involved in reciprocal relationships, in which it may certainly be conceded that the price I have to pay for self-seeking behavior is a loss of certain kinds of relationships. But if I want to lead a certain kind of life, with relationships of trust, friendship, and cooperation with others, then my wanting their good and my wanting my good are not two independent, discriminable desires. It is not even that I have two separate motives, self-interest and benevolence,

for doing the same action. I have one motive, a desire to live in a certain way, which cannot be characterized as a desire for my good rather than that of others. For the good that I recognize and pursue is not mine particularly, except in the sense that I recognize and pursue it.

We can now diagnose one major cause of confusion in the whole discussion. All too often from Hobbes on, a special type of human situation has been treated as a paradigm of the whole moral life—that is, a situation in which I and someone else have incompatible aims and my aims are connected only with my own well-being. Of course, such situations do arise, but the clash between self-interest and benevolence that characterizes them is only one case out of many in which incompatible aims have to be resolved.

**MOTIVES, ACTIONS, AND SYMPATHY.** We can now understand that at the root of the confusions lies a belief in the possibility of a purely a priori characterization of human motives. From Hobbes on there has been a tradition, shared by empiricists as well as by their critics, which seeks to discuss human motivation almost entirely in the light of general conceptual considerations about desires, the passions, and pleasure and pain. What evades this tradition is not only the variety of aims and motives that can inform action, a variety to be discovered only by empirical inspection, but also the specific and particular character of certain motives.

The difficulties in the notion of sympathy, for example, are such that one cannot inquire straightforwardly whether there is or is not a sympathy for humankind as such. To say that a man acted from sympathy is always to refer to a set of particular occasions when sympathy was aroused for particular people in some particular plight. How wide the range of a man's sympathies is, is an empirical fact, and there is no conceptual limit to the possibilities. But it is a conceptual point that just as a generalized ambition can be manifested only in particular aspirations, so a generalized sympathy can be manifested only in particular acts of charity and benevolence. Now, suppose a man to perform a charitable and benevolent action; we would be wrong to suppose that we can always answer the question whether he was sympathetic to them because they were his relations (or his countrymen or his next-door neighbors) or whether he would have been equally sympathetic if they had been strangers or foreigners. A man can act out of sympathy without the range of his sympathies being determinate. Thus, the eighteenth-century question whether there is, as such, a

general benevolence toward humankind implanted in human breasts is misleading.

**GENETIC FALLACY.** The question of innate benevolence toward humankind is also misleading because the eighteenth-century view disregards both the variety and the variability of human nature. Philosophers discuss what passions men have and not what passions they might acquire. Learning is, at best, peripheral to their inquiry; insofar as it does enter, there is another fallacy in writers from Hobbes on—that of confusing the question of what motives there were originally (for Hobbes, in the state of nature; for Freud, in early childhood) with the question of what the fundamental character of motives is now, in adult life. Because the instinctual drives and desires of young children have to be socialized, it does not follow that adult attitudes and emotions are only masks for such drives and desires. This is not to say that they cannot be such masks, but if the notion is to have any content, whether they are must be an empirical question.

## EHRENFELS, CHRISTIAN FREIHERR VON (1859–1932)

Christian Freiherr von Ehrenfels, the Austrian psychologist and philosopher, was born in Rodaun near Vienna. He studied at the University of Vienna under Franz Brentano and Alexius Meinong, and took his doctorate at Graz in 1885. He taught at Vienna as a *Privatdozent* from 1888 to 1896, when he became extraordinary professor at the German University of Prague. He was a full professor at Prague from 1900 until 1929. Besides his professional work, Ehrenfels wrote two essays on Richard Wagner and several plays.

### GESTALT PSYCHOLOGY

In psychology, Ehrenfels is best remembered for inaugurating gestalt psychology in his article “Über Gestaltqualitäten” (1890). Starting from Ernst Mach’s thesis in his *Beiträge zur Analyse der Empfindungen* (Jena, 1886), that we can sense (*empfinden*) spatial and temporal forms (“wholes,” *Gestalten*), Ehrenfels argued that sensing is limited to the present but that the apprehension of a complex datum requires recollection and so seems to lack the immediacy of sensing. This is particularly evident in the case of acoustic data, but it also holds for visual data perused successively. The immediate apprehension of a melody or a figure must therefore be otherwise accounted for than by sensing. Discussing acoustic complexes, Ehrenfels showed that what is in fact apprehended differs from the complex or sum of the component elements, since these vary while the gestalt remains unchanged. This is corroborated by the fact that acoustic forms (melodies) are more easily remembered than are tonal intervals or absolute pitch. Similarly, figures do not depend for their apprehension on absolute location. This implies that gestalt qualities are positive representational contents bound up with the occurrence in consciousness of complexes consisting of separable elements. In Meinong’s language (adopted by Ehrenfels in a later paper), they are “founded contents” (*fundierte Inhalte*).

Ehrenfels’s notion of gestalt was essentially developed from a differential analysis of data, complex, and unity, unity being regarded as a quality. The phenomenological account of a gestalt in terms of contrast, background, and poignancy—features essential to subsequent gestalt psychology—was secondary in Ehrenfels’s analysis, although he did mention such features.

Ehrenfels extended the notion of gestalt to numbers and to the field of logic. He viewed the contradiction in

such concepts as that of a round square as a temporal gestalt quality of the psychic process of attempting to form a representation of the concept, an attempt that proves unfeasible. Ehrenfels also used the notion of gestalt in cases, such as phenomena of style and behavior, in which an analysis into component elements is practically impossible. In general, a gestalt is a novel and creative feature with respect to its component elements (in contrast to David Hume, who admitted only the composition of impressions or ideas and imaginative interpolation within the continuum of sensory qualities).

### VALUE THEORY

Ehrenfels made important contributions to value theory and ethics. His series of articles, “Werttheorie und Ethik,” although inspired by Meinong’s lectures, was published before Meinong’s ethical works and possessed at least partial originality. Ehrenfels’s subsequent *System der Werttheorie* (1897–1898) discussed points of difference with Meinong’s first publications on value theory. Ehrenfels defined value as “the relation, erroneously objectified by language, of a thing to a desire directed towards it” (“Werttheorie und Ethik,” in *Vierteljahrsschrift für wissenschaftliche Philosophie*, Vol. 17, p. 89) or to a disposition of desire or feeling (*ibid.*, pp. 209–210). “The value of a thing is its desirability” (*System der Werttheorie*, Vol. I, p. 53). Ehrenfels took value not simply as instrumental to the promotion of one’s happiness but insisted that instrumental value (*Wirkungswert*) is valuable only relative to intrinsic value (*Eigenwert*). We desire the existence or nonexistence of something, and do not necessarily strive for its possession as a means to our happiness. The valuable object is not bound up with utility (*Nutzen*) but possesses a more general fittingness (*Frommen*) for us. Ehrenfels adapted the economic theory of marginal utility to explain the strength of any desires possessing a fittingness for us (*Grenzfrommen*). He thus introduced a quantitative element of valuation: Values and valuation are conditioned by the prior existence of other value objects.

In view of their dependence on emotional dispositions, values have a certain relativity, but there exists wide agreement among human beings as to the value of pleasure and pain and of certain other psychic phenomena, both in ourselves and in others. We value those valuational dispositions of others that are directed toward objects valued by us. In fact, Ehrenfels restricted intrinsic values to psychic realities.

The relativity of values is also apparent in changes in valuation brought about by various causes. Ehrenfels also

distinguished trends of valuation, for which he offered a theoretical scheme. Means may turn into ends, as when the satisfaction of feelings of hunger replaces nourishment as the end of eating. By contrast, superior values may feature as ends, as when in the interest of nourishment we suppress our feelings of hunger in the presence of poisonous food. A third factor in trends of value is survival, which is best assured if the object serving it coincides with it. Ends transcending mere survival are exemplified in cultural progress, in which values become nonindividualistic. Superior nonindividualistic values are transmitted through example and suggestion, and cause further value promotion in a value milieu. Ehrenfels found reason to believe that with the increasing integration of human knowledge an upward trend toward superior values could be expected.

### SOCIAL ETHICS

Ehrenfels's theory of value formed the basis for his ethics, which he subdivided into social and individual ethics. Social ethics is concerned with ethical valuation, that is, valuation of psychic (or supposedly psychic) objects that are causally related to certain actions. These objects are intrinsic values, and we demand that a plurality of individuals coincide in their valuation of them. The ultimate object of ethical valuation is not action, or its means or ends, but the desiderative and emotional disposition behind it. It is then called moral (or immoral) disposition, and its valuation moral (or immoral) valuation. (Accordingly, morality is distinguished from law and custom, which do not consider disposition.) Moral dispositions are the emotional dispositions of taking pleasure in others as intrinsic values, that is, as individuals themselves possessing a disposition toward actions serving intrinsic values, particularly the dispositions of love of one's neighbor, of humanity, of God. Such pleasure in others psychologically depends on an awareness of them in thought or in more or less vivid representation. There is a perspective of comparative closeness or distance in valuation. Among other moral dispositions are justice, constancy, and honesty, and their negative counterparts.

### INDIVIDUAL ETHICS

Individual ethics is concerned with man's response, through "mystical" or "tragic elevation," to his fate as a finite body. The craving for such elevation is the source of the valuations (ethical sanction, conscience) of whatever goes to promote it. These private valuations do not strictly encompass the socioethical ones, but do as a matter of fact coincide with them. Ehrenfels's individual

ethics thus was a separate strain centering on an aesthetic desire for psychic harmony. To reach such a state, belief in God or metaphysical convictions are helpful though not indispensable.

### SEXUAL AND RACIAL VIEWS

Ehrenfels's tendency to emphasize biological factors led him in later writings ("Sexuales Ober- und Unterbewusstsein," 1903–1904; *Sexualethik*, 1907; "Sexualmoral der Zukunft, 1930; cf. the earlier statement in "Werttheorie und Ethik," *Vierteljahrsschrift für wissenschaftliche Philosophie*, Vol. 17, p. 354) to question moral restraint on sexuality and to advocate greater frankness, honesty, and delicacy in marital relations. He won Sigmund Freud's praise for his pioneering work in this field. His biological tendency also led him to recommend selective breeding practices for man (cf. "Die sexuelle Reform," 1903–1904) and to embrace ideas bordering on race prejudice ("Leitziele zur Rassenbewertung," 1911).

### METAPHYSICS

In his *Kosmogonie* (1916) Ehrenfels contributed to metaphysics a theory of the origin of the world. Rejecting a monism that admits only the cumulative effects of accidental events, he regarded the origin of the world as the result of the interaction of two principles, a principle of chaotic disorder and a principle of psychoid unity of gestalt that, with infinite improbability but with infinite time to allow for its incipience, has been solicited by the opposing principle. Once the principle of unity has been engaged, the resulting gestalt survives because it is infinitely improbable that chaos is capable of continuous destructive action of its own even in infinite time. The gestalt principle, in turn, is credited with creativity, making for further development. Ehrenfels's cosmogony can be taken as a speculative abstraction intended to put the theory of evolution on a new footing in that it tries to give a plausible account of emerging nonrandomness in the universe.

## EINSTEIN, ALBERT

(1879–1955)

Albert Einstein was born in Ulm, in the south German kingdom of Württemberg on March 14, 1879. Following his graduation from the Federal Polytechnical Institute (*ETH*) in Zurich in 1900 he obtained a job as a patent examiner, (“technical expert, third class”) in the Swiss patent office in Bern, starting in the summer of 1902. In January 1903 he married his first wife, Mileva Maric, a fellow student of physics at the *ETH* and, with Mileva’s support, continued his investigations in physics, earning a PhD from the University of Zürich in 1905.

That was Einstein’s “miracle year.” In 1905 Einstein published the founding papers of the special theory of relativity, including a version of the famous  $E = mc^2$ . Also in 1905 he developed the light quantum hypothesis to treat the photo-electric effect, a work important in the subsequent development of the quantum theory and the official basis of his 1922 award of the Nobel Prize. There were also two papers on Brownian motion he produced that year, which helped demonstrate the reality of molecules.

Einstein left the patent office in 1909, moving to Berlin in 1914 to assume the directorship of the new Kaiser Wilhelm Institute for Physics. There his marriage quickly dissolved and his wife moved back to Zürich with their two sons, Hans Albert and Eduard. Einstein had been working on extensions of relativity since 1907 and in 1916 he published an account of what he called the “general theory” of relativity, which is essentially the modern theory of gravity. It predicted the bending of light rays around the sun. When that was confirmed during the solar eclipse of 1919, Einstein became a worldwide celebrity overnight, the first scientific superstar.

Einstein’s celebrity status made him a target of growing German anti-Semitism. His own interest was growing in Zionist and pacifist causes. Amidst this turmoil, in 1917 Einstein became ill and was cared for by his cousin Elsa Einstein Löwenthal, recently divorced and with two daughters, Ilse and Margot. Following his own divorce in 1919, he married Elsa, whose daughters also took the name Einstein.

In the period from 1914 to 1919 Einstein’s scientific work continued to flourish. He began investigations into gravitational waves and cosmology, where he reluctantly introduced the cosmological constant, which he subsequently rejected, but which has come back to represent what now appears to be substantial density and pressure associated with empty space. Einstein also worked on statistical aspects of the quantum theory, developing the coefficients of spontaneous and induced emission and absorption that provided the theoretical opening for laser technology.

In the 1920s Einstein traveled extensively in aid of science and of Zionism. His scientific contributions slowed down in this period, although he made some preliminary attempts at tying together the electromagnetic and gravitational fields geometrically in a unified field theory. He made important contributions to the quantum theory of gases, developing Einstein-Bose statistics to treat radiation as a quantum gas of indistinguishable particles. This led to his discovery of the Bose-Einstein condensation, a low temperature phenomenon displaying quantum behavior at nearly macroscopic scale. In the 1927 Solvay conference Einstein began to “debate” with Niels Bohr over the foundations of the emerging quantum mechanics.

Einstein left Germany in 1932 for the Institute for Advanced Study in Princeton. He became a United States citizen in 1940. A year earlier he had signed a letter drafted by Leo Szilard advising President Franklin D. Roosevelt of the military potential of atomic energy. Later

he was an advocate for the control of atomic energy and for institutions supporting world peace. He was also a prominent critic of McCarthyism and a defender of civil liberties, as well as an outspoken opponent of racism and a defender of civil rights. Einstein died on April 18, 1955, of complications following a ruptured aortic aneurysm. His last scientific work was on the unfinished project for a unified field theory. His last phrase, written a few days before his death, was in a document with the pungent title, “Political Passions, Aroused Everywhere, Demand Their Victims.”

## PHILOSOPHY OF PHYSICS

Throughout his life Einstein read deeply in philosophy, where he was influenced both by David Hume and Immanuel Kant, as well as by Spinoza. His views in turn influenced the development of neo-positivism, whose more extreme doctrines he rejected in his criticism of the quantum theory. His philosophical reflections on the epistemology of science, as well as on metaphysical issues relating to space, time and causality, constitute an important chapter in twentieth century thought.

**RELATIVITY.** Einstein was a critic of the spatio-temporal framework of Newtonian physics, following a path marked out by Ernst Mach, who attacked Newton’s introduction of “absolute” space and time not as unobservable (a fact advertised by Newton himself) but as unnecessary for doing physics. In Einstein’s hands, however, Mach’s critical method became a tool for positive theory construction.

Newton argued that acceleration must be absolute in order to explain inertial effects, such as the way water crawls up the sides of a rotating bucket. From absolute acceleration Newton moved (questionably, it turns out) to absolute space and time. Mach countered that inertial effects, like others, could be seen as purely relational. In particular, if one could rotate large enough masses and leave the bucket alone the same water-crawling effects would occur. This idea came to be known as Mach’s Principle, which strongly influenced Einstein’s development of the general theory of relativity. Sympathetic to Mach’s relational conception of space and time, Einstein criticized an asymmetry built into the Newtonian framework. There space and time affect the behavior of bodies in so far as, in the absence of impressed forces, bodies move inertially, along spatially straight lines with temporally constant speeds. But there is no reciprocity. If space and time are absolute, bodies cannot affect spatio-temporal structure. Once space and time were merged into a uni-

fied spacetime, the field equations of general relativity allowed a reciprocal interplay between spacetime and matter.

The introduction of four dimensional spacetime, however, comes from the 1905 special theory of relativity. There Einstein dealt with an apparent conflict between the principle of relativity (any inertial frame is suitable for the representation of electrodynamic as well as mechanical phenomena) and the constancy of the speed of light for inertial observers. In the 1905 paper Einstein approaches this conflict by applying a technique of conceptual analysis that he learned from Mach (and from David Hume). He asks what is time and quickly shifts, epistemologically, to how one tells time in reading a clock. Telling time involves a spatially local judgment of simultaneity (where are the hands, when?); that is, it involves events in more or less the same place. What about events that happen very far apart?

The suggestion is that here one reaches the limit of applicability of the concept of simultaneity. In Mach’s hands (or Hume’s) one might stop here, with skepticism about the very meaningfulness of assertions of distant simultaneity. But, as Einstein commented later, although he respected Mach’s hobbyhorse of seeking the limits of concepts he felt that it does not give rise to anything living. To employ conceptual analysis constructively one needs a theory. In the 1905 paper that theory is grounded on a quasi-operational definition using light signals to determine when distant events happen at the same time. Armed with that definition of simultaneity one can not only reconcile the principle of relativity with the constancy of the velocity of light, one can go on to develop a spacetime framework in which descriptions of events in different inertial frames are tied to one another by Lorentz transformations that leave the so-called spacetime “interval” invariant. Einstein had wanted to refer to this work as a theory of invariants. Ironically, Max Planck coined the term “relativity,” and it stuck.

One of the conceptual innovations in special relativity is the variation of relativistic mass with velocity, which no longer appears to be a constant property of matter. This shift in the conception of *mass* prompted Thomas Kuhn and Paul Feyerabend to feature an “incommensurability” between Newtonian and relativistic physics. Einstein was unequivocally against the idea that the so-called “relativistic mass” is a proper notion at all. He rejects it as coordinate dependent and, hence, merely perspectival and thinks “the—unhappily—often mentioned concept of a mass which depends on speed is quite misleading.” Instead, in keeping with his emphasis on invariance (as a

touchstone for scientific objectivity), Einstein says, “It is better to use the word mass exclusively for rest mass ... which is always the same, independent of the speed ...” (Earman and Fine 1977, p. 538). It is worth noting that the mass term  $m$  in  $E = mc^2$  denotes precisely the rest mass.

Einstein was an early supporter of logical empiricism. He was also one of its icons, in part because his positivistic analysis in special relativity seemed evident also in the general theory. In his 1916 account, Einstein defends the relativity of all motion (not just inertial) by requiring that laws of nature be expressed by equations “valid for all coordinate systems.” Called general covariance, this requirement, he says, “takes away from space and time the last remnant of physical objectivity.” (Einstein 1987, Vol. 6 [1996], p. 287 and 291). In support he appears to offer a straightforwardly verificationist analysis. “All our space-time verifications invariably amount to a determination of space-time coincidences.” (Einstein 1987, Vol. 6 [1996], p. 287 and 291). Thus it is only space-time coincidences (“to which all our physical experience can ultimately be reduced”), that is, the coordinate systems, that the laws of nature need respect.

Recent scholarship suggests that this positivist reading is mistaken (Einstein 1987, Vol. 6 (1996), p. 287 and 291). For in these passages Einstein is probably reacting to an earlier argument of his own (called the “hole argument”) posing a conflict between general covariance and determinism (Einstein 1987, Vol. 6 (1996), p. 287 and 291). The key to unraveling that argument was his recognition that, by themselves, coordinates (the bare mathematical points) have no physical significance. Significance comes from the fields of the theory, as determined from given sources by the theory’s field equations. That’s what makes space-time coincidences observable. Einstein later held that, in general, scientific theory determines what one can observe. Thus the positivist reading has things exactly back to front. Whereas in special relativity Einstein follows a positivist line in grounding theoretical notions (simultaneity) in what is observable, here he entheorizes the observable and takes an anti-positivist line in grounding the observable in the theory itself.

**QUANTUM THEORY.** Einstein made fundamental contributions to the early understanding of quantum phenomena and his ideas, which emphasized the problem of wave-particle duality, influenced all subsequent developments. However Einstein became the foremost critic of the quantum mechanics that emerged from 1926 to 1930.

His dissatisfaction is often portrayed as a last ditch longing for determinism or causality (“God does not throw dice”), as against the essentially probabilistic character of quantum physics. To be sure, although Einstein was a master at statistical physics, he was certainly troubled by a science where probability occurs fundamentally. Nevertheless his problem with the quantum theory was not about determinism alone, nor even primarily about determinism at all. In a 1930s letter to his old friend and translator, Maurice Solovine, Einstein expresses his concerns this way. “I am working with my young people on an extremely interesting theory with which I hope to defeat modern proponents of probability-mysticism and their aversion to the notion of reality in the domain of physics” (Solovine 1987, p. 91). This is a typical linkage in Einstein’s thought. In almost every context in which Einstein expresses reservations about quantum indeterminism he couples it with reservations about the irrealism of the theory; that is, giving up the ideal of treating individual events, or what he referred to as real states of affairs.

As usually understood, the quantum theory does not treat real states of affairs at all, not even probabilistically. It does not tell us whether an electron is likely (even) to be here or there, spinning up or down. Quantum theory only gives the probability for finding the electron here, or finding it spinning up, if one actually measures it for that particular property. This is the irrealism that Einstein found so disturbing. That there could be laws, even probabilistic laws, for finding things if one looks, but no laws of any sort for how things are independently of whether one looks, was mysticism, a “mindless” (1987, p. 119) form of empiricism.

Einstein responded with a program just as in the development of relativity. First he set out to establish the limitations of the concepts used in the quantum domain and then he explored the possibility of transcending those limitations with a positive theory. He began by challenging the uncertainty formulas. He accepted that they limit the simultaneous, precise measurement of conjugate quantities (like position and linear momentum) but he questioned the ontological reading in which they limit what is simultaneously real. He went on to examine the rationale offered, especially by Bohr, both for the statistical character of the quantum theory and for its irrealism.

Bohr postulated an uncontrollable interaction introduced in every act of measurement that, he argued, made a statistical treatment necessary and also prevented states of affairs being defined independently of the measurement. In a series of thought experiments Einstein devel-

oped the concept of indirect measurement as a challenge to Bohr's postulate. This culminated in a 1935 paper, co-authored with his research assistants Boris Podolsky and Nathan Rosen, and composed by Podolsky. Usually referred to as *EPR* this paper involved the idea that Schrödinger dubbed "entanglement" (*Verschränkung*).

Entanglement occurs when, after quantum systems interact, certain quantities become linked among the systems. In the *EPR* case, for a pair *A*, *B* of previously interacting particles—now far apart—both position and momentum are so linked that determining the position of one automatically determines the position of the other, and similarly for momentum. By directly measuring, say, the position of *A* one can determine *B*'s position and apparently without any "uncontrollable interaction" or disturbance of *B*, contra Bohr's postulate. Moreover by assuming a principle of local action according to which, provided the systems are sufficiently far apart, the "reality" at *B* is not affected by the measurement carried out at *A*, it follows that the position determined for *B* must have been *B*'s all along. Thus, contrary to Bohr, one can define a coordinate of position for *B* that is independent of measurement or observation there – a real state of affairs. Unfortunately, in *EPR* it is difficult to track these considerations clearly. It appears that Einstein never saw Podolsky's text before publication. When he did he expressed misgivings that it obscured his central concerns.

*EPR* has been seen as suggesting the possibility of a "hidden variables" account of quantum theory, an account that would introduce simultaneous values for both position and momentum, along with other quantities, and still, somehow, respect the uncertainty relations. But Einstein, who had toyed with and abandoned a hidden variables approach in 1927, was never again interested in such an account. In the context of *EPR*, he told Schrödinger explicitly that he "couldn't care less" about simultaneous values for position and momentum (Fine 1996, p. 38). In fact Einstein thought these point-particle concepts were not appropriate for the quantum domain. He hoped to introduce different concepts and explored how they would emerge from a unified field theory. Einstein pursued that quest unsuccessfully for many years. In the end he questioned whether even a field theory would do the job and speculated about the need for a purely algebraic kind of physics, one not based on a spatio-temporal continuum. He sometimes despaired, however, that this was like trying to breathe in empty space.

## GENERAL PHILOSOPHY OF SCIENCE

Einstein's attempt to develop new concepts for the quantum domain accords with his anti-inductivist principle that ideas (or concepts) are free creations. By "free" he meant both that concepts are not innate and also that they are neither given in nor logically derived from experience. The only test for scientific concepts is whether they can be organized in a logically simple system that finds fruitful empirical applications. This highlights logical simplicity as a paramount factor in theory choice. It also represents a holistic attitude to theories, gleaned perhaps from Pierre Duhem. Holism is apparent in Einstein's acute analysis of the testability of geometry where, while rejecting Henri Poincaré's conventionalist defense of Euclidean physical geometry, he ultimately agrees with Poincaré that only the whole system of physics plus geometry is testable.

Einstein's work in relativity and his project for a unified treatment of gravity and quantum phenomena shows unification as central to his scientific outlook. His study of Baruch Spinoza, whom he read and re-read over the years may have influenced this attitude (or reinforced it). Certainly realism was another central feature. This is evident in his introduction of the light quantum and in his use of the kinetic-molecular picture in treating Brownian motion. It is evident as well in his worries over the instrumentalist understanding of the quantum theory. Nevertheless he ridiculed "assertions" of realism as meaningless, like chiming "cock-a-doodle-doo." For Einstein realism was not a doctrine but rather a motivational program. The program was to develop scientific theories that describe individual events themselves, without reference to conditions of observation. That is what he believed science had always done, and with great success. It was motivational because, at the personal level, he thought individuals would have no motivation to pursue science unless they felt that in doing so they were unlocking the secrets of nature. Clearly this program conflicts with the enormously successful but irrealist quantum theory, which is why Einstein struggled to make room for the possibility, at least, of a realist reinterpretation.

Determinism (or causality—he hardly draws a distinction) is another important item in Einstein's outlook. Here, again, he did not advocate a doctrine like, "The world is deterministic." Characteristically, he favored a program to entheorize determinism; that is, to build deterministic theories. His reaction to the dilemma between determinism and general covariance posed by the hole argument shows this concern, as does his sense that the probabilistic quantum theory involves a retreat

into statistics. Nevertheless, in reluctantly accepting that one might have to move to an algebraic physics, he did acknowledge that science might abandon the ideal of representing events in spacetime altogether, and hence move beyond causality (or determinism).

Einstein's views are sometimes described in terms of the philosophical "isms": holism, realism, determinism and so forth. While there can be some truth to these descriptions (provided one entheorizes them), he generally regarded philosophical positions pragmatically. He saw them as tools that may be useful at certain moments for building better scientific theories, judged by the criterion of empirical success. His sometimes strong statements for or against one of the "isms" are best seen in the terms of the dialogism described by Mara Beller in her *Quantum Dialogue*, a dialectical view that highlights the creative role of scientific disagreement in shifting contexts. Einstein himself described it this way:

I do not feel comfortable and at home in any of the "isms." It always seems to me as though such an ism were strong only so long as it nourishes itself on the weakness of its counter-ism; but if the latter is struck dead, and it is alone on an open field, then it also turns out to be unsteady on its feet. *So, away with the squabbling.*

## ELIMINATIVE MATERIALISM, ELIMINATIVISM

"Eliminative materialism" espouses the view that our commonsense way of understanding the mind is false, and that, as a result, beliefs, desires, consciousness, and other mental events used in explaining our everyday behavior do not exist. Hence, the language of our "folk" psychology should be expunged, or eliminated, from future scientific discourse.

Two routes have been taken to get to the eliminativist's position. The first and less popular stems from a linguistic analysis of mentalistic language. Paul Feyerabend argues that the commonsense terms for mental states tacitly assume some version of dualism. Insofar as materialism is true, these terms cannot refer to anything in the physical world. Thus they should not be used in discussing ourselves or our psychologies since we are purely physical beings.

The second and better-developed approach comes out of the philosophies of science developed by Feyerabend, David Lewis, Willard Van Orman Quine and Wilfrid Sellars. Two suppositions are important for eliminativism. (1) There is no fundamental distinction between observations (and our observation language) and theory (and our theoretical language), for previously adopted conceptual frameworks shape all observations and all expressions of those observations. All observations are "theory-laden." These include observations we make of ourselves; in particular, observations we make

about our internal states. There are no incorrigible phenomenological “givens.” (2) The meaning of our theoretical terms (which includes our observational vocabulary) depends upon how the terms are embedded in the conceptual scheme. Meaning holism of this variety entails that if the theory in which the theoretical terms are embedded is false, then the entities that the theory posits do not exist. The terms would not refer.

Two more planks complete the eliminative argument. (3) Our way of describing ourselves in our everyday interactions comprises a rough and ready theory composed of the platitudes of our commonsense understanding. The terms used in this folk theory are defined by the platitudes. (4) Folk psychology is a radically false theory.

In support of this position, Patricia Churchland and Paul Churchland argue that belief-desire psychology wrongly assumes sentential processing; moreover, belief-desire psychology is stagnant, irreducible to neuroscience, and incomplete. Stephen Stich argues that our very notion of belief and, by implication, the other propositional attitudes is unsuitable for cognitive science. Patricia Churchland, Daniel Dennett, Georges Rey, Richard Rorty, and others argue that our notion of consciousness is confused. They all conclude, as do other eliminativists, that folk psychology should be replaced by something entirely different and more accurate, though views differ on what this replacement should be.

Attacks on eliminative materialism generally have come from four fronts, either on premise two, premise three, or premise four of the second approach, or on the eliminativist position itself, without regard to the arguments for it. Premise two asserts meaning holism and a particular theory of reference. If that theory were false, then the eliminativist’s second argument would be undermined. There are alternative approaches to reference that do not assume holism; for example, causal-historical accounts do not. If meaning is not holistic, then even if folk psychology were incorrect, the terms used in that theory could still refer, and elimination of folk psychological terms would not be warranted.

Arguments that our folk psychology is not a true theory deny premise three. Here some detractors point out that even if a completed psychology did not rely on the propositional attitudes or consciousness, that fact would not entail that those sorts of mental states do not exist; instead, they just would not be referred to in scientific discourse. Nevertheless, they could still be used as they are now, in our everyday explanations of our behavior.

Others charge that premise four is false; folk psychology might be a rudimentary theory, but it is not radically false. While agreeing that belief-desire explanations or explanations involving conscious events might not be entirely empirically adequate or complete, champions of folk psychology argue that no other theory is either. In addition, our folk psychology has developed over time, is coherent, and its status with respect to neuroscience is immaterial. These arguments are generally coupled with the claim that no other alternative, either real or imagined, could fulfill the explanatory role that the propositional attitudes play in our understanding of ourselves. And until the eliminativist’s promise of a better conceptual scheme is fulfilled folk psychology is here to stay. At least some properly revised version of folk psychology would remain.

Lastly, some supporters of folk psychology argue that any eliminativist program would be fatally flawed, regardless of whatever particular arguments are given, for the very statement of eliminative materialism itself is incoherent. In its simplest form, the argument runs as follows: Eliminative materialism claims that beliefs do not exist. Therefore, if eliminative materialism were true, we could not believe it. Therefore, no one can believe eliminative materialism on pain of inconsistency.

Replies to the four sorts of attacks are ubiquitous. However, answering the first three turns on (primarily empirical) issues yet to be settled. Which theory of reference is correct, whether folk psychology is actually a theory, and what revisions are required to make it adequate depend upon facts we do not yet know about ourselves or our linguistic practices.

The last point is more conceptual. In responding to it, eliminative materialists hold that something else will replace “belief,” or some instances or aspects of “belief.” Call this “schmelief.” It is true that eliminative materialists cannot believe that eliminative materialism is true on pain of inconsistency. But, eliminativists maintain, they can “schmelieve it.” Defenders of a revised folk psychology answer that, as used in this context, “schmelief” seems to be some other intentional operator or relation, a mere revision of belief. Without better exposition of what the replacement for folk psychology will be (and how it will be radically different), we simply cannot tell what the future holds for our commonsense theory of self: simple revision, peaceful coexistence, or outright replacement.

## ELIOT, GEORGE

(1819–1880)

Born Marian (or Mary Ann) Evans, George Eliot was the assumed name of the English novelist, poet, essayist, and translator. She was reared near Coventry and in her early years attended a school run by a fervent evangelical mistress. From this woman she acquired intense religious beliefs, but she gradually lost her faith. In 1842 she wrote that she thought Christian dogmas "dishonorable to God" and pernicious to human happiness. Within a few months, however, she had come to regard the dogmas in themselves as of little importance. "Speculative truth begins to appear but a shadow of individual minds, agreement between intellects seems unattainable, and we turn to the *truth of feeling* as the only universal bond of union," she wrote in a letter in October 1843; a belief in the importance of feeling remained central to her life and work.

In Coventry she had a group of friends with literary and philosophical interests, and under their influence she undertook, in 1844, a translation of D. F. Strauss's *Das Leben Jesu*; the translation was published in 1846. She went to London in 1851 to work for John Chapman as assistant editor of the *Westminster Review*. She published occasional essays and read much. Among her numerous friends in London were Herbert Spencer, to whom she

was falsely rumored to be engaged, and George Henry Lewes, the philosopher and critic. Lewes was married but separated from his wife. In October 1854 Eliot and he decided to live together. They never married, but they lived a life of exemplary domesticity until Lewes's death, in 1878. On May 6, 1880, to everyone's surprise, she married John W. Cross, long a family friend. She died that same year, after a short illness.

In 1854 Eliot's translation of Ludwig Feuerbach's *Das Wesen des Christentums* was published. She also translated Benedict (Baruch) de Spinoza but did not publish the translation. Upon Lewes's urging, she tried writing fiction; her first story was published in *Blackwood's Magazine* in 1857. She was immediately successful as a writer of fiction. To her fiction—notably *Adam Bede* (1859), *The Mill on the Floss* (1860), *Silas Marner* (1861), *Middlemarch* (1871–1872), and *Daniel Deronda* (1876)—rather than to her poetry or her essays, she owed her fame and her considerable influence as a moral teacher.

Eliot's views on moral, religious, and metaphysical problems pervade and profoundly shape her writings, but they are never presented in abstract, systematic form. She had no faith in general moral principles: "to lace ourselves up in formulas," she wrote, is to repress the "promptings and inspirations that spring from growing insight and sympathy." Like Strauss, Feuerbach, and Auguste Comte, she thought of religious and metaphysical doctrines as projections and symbols of feelings, and as valuable only to the degree that the feelings they express and reinforce are valuable. Her "most rooted conviction," she told a friend in 1859, was that "the immediate object and the proper sphere of all our highest emotions are our struggling fellow-men in this earthly existence," and she declared that one of her main aims in her writing was to show that human fellowship does not depend on anything nonhuman. Christianity can foster many valuable emotions, she held, but the insistence of some Christians that all action must be for the glory of God stifles benevolence and love and directs feelings away from men. The idea of God has been beneficial only insofar as it has been "the ideal of a goodness entirely human."

Eliot thus belongs with those Victorian writers who tried, in different ways, to work out a humanistic morality capable of satisfying the deep human needs that they thought the older, religiously based morality could no longer satisfy. Her view is naturalistic and deterministic; men are seen as being as much under the dominion of the laws of nature as are other parts of the world, though the comparisons are usually with organic growth and decay rather than with purely mechanical processes. Hereditary

and social influences on character are heavily emphasized, as is the effect one's repeated actions or evasions will have on one's own character and hence on one's future actions.

The morality that springs from this view is primarily one of sympathy and compassion. The complexity and obscurity of motives and the mixture of good and evil in personality and in deed are constantly displayed in the novels. It is usually difficult, Eliot suggested, to know what one ought to do in particular cases; one must rely ultimately on one's deepest feelings when these are enlightened by sympathy and by knowledge of circumstances and consequences. Wrongdoing is usually traced to stupidity, callousness, or thoughtlessly excessive demands for personal satisfaction, rather than to deliberate malice or conscious selfishness. Vice and crime are shown as eventually bringing retribution, but the reward of virtue is at best the peace that comes with acceptance of one's lot. Eliot saw quiet renunciation and patient selflessness as the chief virtue. She frequently traced the career of an unusually sensitive and intelligent person who hopes to do great things for others but after painful defeats ends by settling into a life of unheroic and routine benevolence. She suggested that this is the only feasible way of achieving lasting good. In the thought that what we do will have some good effect on future generations and we shall be remembered by them with love, she held, there was a sufficient motive to virtue and a sufficient replacement of the belief in personal immortality and personal reward.

### Bibliography

Two essays reprinted in George Eliot's *Essays and Leaves from a Notebook*—"Evangelical Morality: Dr. Cummings" (1855) and "The Poet Young" (1857)—are especially relevant to her moral views.

The standard biography is John W. Cross, *The Life of George Eliot*, 3 vols. (London, 1885–1887); it is composed mainly of her letters, heavily censored. *Marian Evans and George Eliot*, by Lawrence and Elisabeth Hanson (London: Oxford University Press, 1952), is more accurate and contains a good bibliography. *The George Eliot Letters*, edited by Gordon Haight, 7 vols. (New Haven, CT: Yale University Press, 1954–1955), is a masterpiece of scholarship. Two essays by R. H. Hutton, reprinted in his *Modern Guides to English Thought* (London: Macmillan, 1887), give an assessment by a younger contemporary from an orthodox Christian standpoint.

There are numerous studies of Eliot's life, intellectual development, and writings. See especially Joan F. Bennett, *George Eliot: Her Mind and Her Art* (Cambridge, U.K.: Cambridge University Press, 1948); Gordon Haight, *George Eliot and John Chapman* (New Haven, CT, and London, 1940); Barbara Hardy, *The Novels of George Eliot* (London: University of London, Athlone Press, 1959); and Leslie Stephen, *George Eliot* (London, 1902).

## ELIOT, THOMAS STEARNS (1888–1964)

Thomas Stearns Eliot is best known as a poet and literary critic (he received the Nobel Prize for literature in 1948), but his work in social and cultural theory has also been widely influential. His principal works of this kind are *After Strange Gods* (London, 1934), *The Idea of a Christian Society* (London, 1939), and *Notes Towards the Definition of Culture* (London, 1949).

Eliot was born in St. Louis but lived in London from 1915 on and became a British subject in 1927. He was graduated from Harvard University in 1909 and engaged in advanced studies in philosophy there, at the Sorbonne, and at Oxford until 1915. In the year 1913/1914 he served as an assistant in philosophy at Harvard, studying methodology with Josiah Royce and logic with Bertrand Russell. Eliot and Russell, despite enormous differences in political, social, and religious outlooks, became close friends. Eliot's Harvard doctoral dissertation, completed at Oxford in 1915, was published as *Knowledge and Experience in the Philosophy of F. H. Bradley* (London and New York, 1964). Francis Herbert Bradley's idealism influenced Eliot's critical doctrines, and in 1926 Eliot published an essay on Bradley, reprinted in *Selected Essays* (London, 1951). In this essay he praised especially Bradley's critique of utilitarianism: "He replaced a philosophy which was crude and raw and provincial by one which was, in comparison, catholic, civilized, and universal." But even before completing his studies, Eliot had finished some of his finest early poems, and he never produced any technical philosophical studies aside from his thesis.

In his early poetry and criticism, Eliot was a considerable innovator, but it was a main goal of his experiments to try to recover the sense of a fruitful tradition. In particular, this meant rejecting the literary theory and practice of romanticism and finding earlier sources. In a famous comment in 1921, he argued that there had been, in the seventeenth century, a major change in the English

mind, which he called the “dissociation of sensibility”—the separation of feeling and thought. He came later to stress a loss of a sense of order, both internal and external, and to associate it with the decline of the Christian and classical cultural framework. To counteract this loss, the poet and critic must strive to recover a sense of the whole European tradition. At the end of this phase of his development Eliot described himself as a classicist, and he was to write henceforward as a declared and orthodox Christian.

*After Strange Gods* is the bridge from his mainly literary to his mainly social and cultural criticism. The book’s subtitle is *A Primer of Modern Heresy*. Its argument is that modern writers, deprived of tradition, have constructed private or esoteric systems of belief, and, deprived of a common language and imagery, they have been forced to experiment. The struggle for common meanings, always difficult, is now even more difficult. This failure of communication is profoundly damaging to the whole society. The writer’s task is to develop the full potential maturity of the language of his society. Paradoxically, therefore, the most creative work is that which begins from and is most aware of the full tradition and history of the language in which it is written. The loss of this tradition makes the modern writer’s task overwhelmingly difficult.

In *The Idea of a Christian Society*, Eliot applied and extended this argument to social questions. He argued that the Western democracies, although nominally Christian, in fact live by quite other values. The idea of a Christian society is at best an understanding of the social ends that would deserve the name of Christian, but in the modern world there is an unusually wide gap between such ends and the main principles of social organization. Many of the driving forces of modern society—especially its false emphasis on profit, its substitution of exploitation of men and things for right use, and its general adoption of commerce as the central human concern—are in fact hostile to any Christian life in the world. It is therefore not surprising, Eliot claimed, that society is far from being Christian; what is surprising is that people retain as much Christianity as they do.

In *Notes towards the Definition of Culture*, Eliot’s most substantial theoretical work, he distinguished three senses of “culture”—the culture of the individual, of the group, and of the whole society. He argued that it is false to set as the goal of the group what can be the aim of the individual alone, and to set as the goal of the whole society what can only be the aim of a group. This argument became Eliot’s main theoretical justification for what is

ordinarily called “minority culture,” and for his critique of egalitarian doctrines in education: It is false to educate the whole society to perform the cultural tasks of a particular group. At the same time, culture in each sense is necessarily connected with culture in the other senses. The group depends on the whole way of life of the society, as social organization depends upon tradition. Likewise, the culture of the individual cannot be isolated from the culture of the group.

Eliot further emphasized the extent to which the culture of a whole society is a matter of custom and behavior and is often unconscious: It is all the characteristic interests and activities of a people, whether or not some of these are thought of as “culture” in the narrower sense. What is often called “culture”—religion, arts, laws, and intellectual activity—is the conscious expression of the total culture, the whole way of life.

It follows from this, Eliot argued, that the maintenance and extension of the conscious culture of a society cannot be delegated to an elite, a group of specialists selected by merit. However skilled an elite may be in the special activities themselves, its members will necessarily lack the continuity with the rest of the society that is ultimately necessary for the health of the conscious culture. An elite, newly selected in each generation, will inevitably lack a sense of tradition. Eliot therefore saw no alternative to the maintenance of classes in society, and in particular to the maintenance of a governing class with which the specialists will overlap and interact. The need for continuity in culture, and for a tradition as opposed to a group of specialists with unrelated skills, argues, finally, for a social conservatism that will keep a proper relationship between continuity and change. This last phase of Eliot’s social thinking has been especially influential since World War II.

## ELISABETH, PRINCESS OF BOHEMIA (1618–1680)

Elisabeth Simmern van Pallandt was born in Heidelberg on December 26, 1618, the third child and eldest daughter of Frederick V of Bohemia and Elisabeth Stuart, daughter of James I of England. Her parents' marriage represented the rising political strength of Protestantism. In August of 1620, Elisabeth's father, Frederick, departed

Heidelberg for Prague to assume the position of Emperor of the Holy Roman Empire. In November 1620, Frederick lost the battle of White Mountain and with it his empire; he was forced into exile. This event is usually taken as the onset of the Thirty Years War. In the late 1620s Elisabeth joined her parents in The Hague. There, she was tutored by the Dutch humanist Constantijn Huygens and the mathematician Johan Stampioen. She also interacted with Anna Maria van Schurman. She was accomplished in Greek, Latin, German, English and French. Throughout her life, she was involved in her family's political affairs. In 1660, Elisabeth entered the Lutheran convent at Herford in the Rhine Valley. She died on February 8, 1680, as abbess of the convent.

Several of her siblings were accomplished as well. Her older brother Charles Louis rehabilitated Heidelberg University after the Thirty Years War. Her brother Rupert was known for his chemical experiments, his soldiering, and his role in founding the Hudson's Bay Company. Her sister Louise Hollandine was an accomplished painter. Her youngest sister Sophie through her marriage became Electress of Hanover and corresponded with Leibniz and Diderot among others.

In 1643 Elisabeth began a correspondence with René Descartes that continued until Descartes's death in 1650. This exchange constitutes the whole of Elisabeth's extant philosophical work. However, record of Elisabeth's intellectual interests predates this correspondence. Edward Reynolds dedicates his *Treatise of the Passions and the Faculties of the Soule of Man* to Elisabeth, suggesting that she had seen and commented on a draft manuscript. In the 1660s the British mathematician John Pell contacted Elisabeth, through Theodore Haak, regarding her solution to Apollonius's Problem (that of finding a fourth circle whose circumference touches three given circles) undertaken in her correspondence with Descartes. In the 1670s, after Elisabeth had become abbess at Herford, she was contacted by English Quakers and corresponded with William Penn and Robert Barclay. She was also in contact with Nicholas Malebranche, Francis Mercury van Helmont, and G. W. F. Leibniz.

In the seven years of their correspondence, Elisabeth and Descartes address the full scope of philosophical inquiry. They discuss metaphysics, as well as topics in natural philosophy, including physics, geometry, and medicine. Equally, their exchange includes discussions of moral psychology, ethics, and political philosophy. Because all we have of Elisabeth's philosophical writings are her letters to Descartes, and those letters principally involve reactions to his work, it is hard to determine Elis-

abeth's own positions. Nonetheless, by considering the presuppositions of her questions and objections, it is possible to adduce her philosophical commitments.

Elisabeth, in her letter of May 6, 1643, begins the exchange by asking Descartes how the two really distinct substances of mind and body can causally interact with one another to effect voluntary action. That is, she poses the problem of mind-body interaction. Elisabeth's problem lies in understanding the nature of the causation at work between an immaterial substance (mind) and a material one (body). It is clear from her posing of the question, and her subsequent pressing of Descartes about his answers, that Elisabeth is willing to accept only efficient causal explanations of mind-body interaction. Insofar as she is skeptical that any such explanation can be offered of the interaction between an immaterial mind and body, she is inclined to think that the mind is material, but nonetheless has a capacity for thought.

Elisabeth's questions about mind-body interaction demonstrate her commitment to a mechanist account of the natural world and shows her to be well-versed in the varieties of mechanist accounts of causation available to adopt. This interest in natural philosophy is perhaps best reflected in Descartes's dedication to her of his *Principles of Philosophy*, the work in which he lays out his physics most clearly. It is also reflected in her remarks regarding human physiology and observed natural phenomena later in the correspondence.

In 1645, in part to help Elisabeth find some comfort from the effects of the English Civil War on her family, Descartes undertook to outline his views on moral psychology—the regulation of the passions—and the nature of the sovereign good. For him, the sovereign good consists simply in virtue, which Descartes takes to be simply a firm and constant will to do all that we judge to be the best. Once again, Elisabeth raises pointed objections. Here she is concerned with preserving the traditional tie between virtue and contentment. On Descartes's account, she charges, virtue would be insufficient for contentment. Given that our knowledge is incomplete, our best judgments would inevitably be wrong sometimes, and on those occasions we would regret our actions. Elisabeth takes this regret to be incompatible with virtue. Our incomplete knowledge also raises another problem for her, that of measuring the value of things. While Elisabeth admits the passions to be sources of value, she also recognizes that different individuals evaluate things differently. For her, the central problem of ethics is not achieving the sovereign good but rather reconciling competing evaluations of things. Her interest in the passions as sources of

value leads her to request Descartes to enumerate and describe all the passions. In response, Descartes drafted his last work, *The Passions of the Soul*. Descartes sent this portion of the correspondence, including Elisabeth's letters, to Queen Christina of Sweden when she requested his views on the sovereign good.

Elisabeth and Descartes also address the problem of reconciling free will with determinism. Whereas Descartes asserts that human freedom is consistent with divine providence, though how it is so might escape us, for Elisabeth simply asserting that the two are consistent is insufficient. In addition, Elisabeth's request that Descartes lay out some maxims for civil life results in an extended discussion of Machiavelli's *The Prince* and the obligations of a good ruler to his subjects.

## EMANATIONISM

Emanationism explains the origin and structure of reality by postulating a perfect and transcendent principle from which everything is derived through a process called emanation (Greek *aporroia*, *probolē*, *proodos*; Latin *emanatio*), which is comparable to an efflux or radiation. Emanation is timeless and thus can be called a process only figuratively. It leaves its source undiminished, so that

the source remains transcendent; but as the process continues, each of its products is less perfect.

In these three respects emanationism is opposed to evolutionism because evolution is a temporal process in which the principle itself is involved (immanent) and in which an increase in perfection is usually conceived. Emanationism is also opposed to creationism, according to which the principle creates the rest of reality (from which it differs absolutely), either out of nothing or by transforming a preexisting, chaotic matter into a cosmos. There is some affinity between emanationism and pantheism, except that the latter teaches the immanence of the principle in its product. Some philosophers characterize emanationism as panentheism.

Emanationism forms an important part of several philosophic and religious doctrines, though it is somewhat elusive in the latter.

### PHILOSOPHIC EMANATIONISM

A theory of emanation can be found to a certain extent in the philosophy of Plato and the Old Academy as presented by Aristotle. Out of two highest principles (usually called the One and the Indefinite Dyad), ideas, in some way identified with or comprising mathematical (numbers; geometrical entities, i.e., point, line, plane, solid) evolve; out of solids, the physical world evolves. But the nature of the process (for which Aristotle used the term *genesis*) remains unclear. The Stoa, Neo-Pythagoreanism, and Philo contributed some ideas to emanationism, but the philosophy first appears in full clarity in the system of Plotinus. His supreme principle, because it is transcendent, ineffable, and absolutely simple (One), must “overflow,” just as what is mature must beget. The first product of this overflowing is intelligence (*nous*), which roughly corresponds to Plato’s idea. From intelligence emanates psyche (corresponding to Plato’s mathematical) which becomes, by degrees, less and less perfect, more and more multiple. From the psyche emanates matter that, when “illuminated” by the psyche, becomes the physical world.

Often, although not always, Plotinus describes emanation as a necessary, involuntary, “natural,” and therefore blameless process, somewhat like a point of absolutely intense light that emits a cone of light without any loss of its own substance. As the cone of light expands in volume, it grows dimmer, finally passing into complete darkness, on which the light produces images as on a screen. But just as the ontic status of darkness is ambiguous (Is it a minimum of light or its complete absence and therefore not its product?), so the status of matter in Plotinus is never quite clear.

The emanationism of Plotinus was taken over by all Neoplatonists, but among them, Proclus deserves particular mention. By subdividing Plotinus’s emanative steps, Proclus made the process more continuous; and to the “vertical” emanation he added something like a “horizontal” one, fully articulating the realms of intelligence and psyche. From Neoplatonism, emanationism passed into the Christian, Muslim, and Jewish philosophies of the Middle Ages (Dionysius the Pseudo-Areopagite, John Scotus Erigena, Nicholas of Cusa, al-Farabi, Avicenna, Averroes, the book of Zohar), often with pantheistic or creationistic modifications. In modern times, evolutionism has obliterated the emanationist philosophy.

### RELIGIOUS EMANATIONISM

In religion, emanationism appears in many Gnostic systems, most conspicuously in *Pistis Sophia* (Faith-wisdom) and in some writings of Valentinus. But in neither of these is it the exclusive principle explaining the origin of everything outside the highest principle. Furthermore, emanation appears in these writings as the result of some reflection and will. It produces, not abstract principles, as in Plotinus, but a host of mythological characters—the first products of emanation according to Valentinus are thirty Aeons—performing a cosmic drama. In addition, what remains entirely in the background in Plotinian theory becomes prominent in Gnosticism; namely, that some acts of the will, which produce emanations, are the result of error or shortcomings. The physical world is created by one of the products of emanation, the Demiurge (identified with the Mosaic creator, the Platonic divine craftsman). The Demiurge is evil himself, and his creation, the world, is an evil place in which man finds himself entrapped and from which gnosis shows the elect ones a way to salvation. Although soteriology plays some part in Plotinian theory, it does not occupy a central place in the system. According to Plotinus, the efflux is balanced by a reflux, which takes place *pari passu* with the efflux. For humankind, the enactment of this reflux remains the most important task; and every person is, by nature, capable of performing it. Gnostic emanationism is ultimately motivated by a feeling of complete hostility to and estrangement from the material world—a feeling that the emanationism of Plotinus, in spite of some ascetic and pessimistic strains, explicitly refuses to countenance.

## EMANATIONISM [ADDENDUM]

The sort of philosophy that the Islamic world discovered when it came into contact with the main centers of civilization in the Middle East was neoplatonism. This represented a long tradition of philosophy that had as one of its main planks a theory of how the world is linked with its ultimate cause. Emanation is an important neoplatonic concept that provides an account of this relationship. The existence of this world and the other worlds that exist along with it are taken to flow from the ultimate cause, the One that is the cause of multiplicity, and a main difference from a normal causal relationship is that the cause and the effect are often taken to occur at the same time as each other. This is because emanation represents an eternal process, not only bringing other things into existence but also sustaining their continuing existence.

This concept was taken up with enthusiasm by most of the main Islamic philosophers, and subsequently by Jewish philosophers in the Islamic world. Emanation was often identified with grace, in that God's grace could be seen as eternally influencing lower forms of existence. The identification of the One from which everything else flows is not difficult to link with the God of Islam and Judaism, and the emphasis on the unity of the deity must have struck a chord with these two monotheistic religions. What is problematic from a theological perspective is that emanationism is different from the notion of ex nihilo creation that does seem to be mentioned in both Islamic and Jewish religious texts. On this notion of creation God decides at a particular time to create the world, so first of all there was nothing in existence except God, and subsequently the world came about through his fiat.

Yet with emanation there never was nothing except God. God eternally thinks, and from that thought the worlds are produced, and the worlds always existed because God has always existed and thought. Moreover, the notion of emanation implies that God is not aware of what comes about as a result of his thought, because anything lower than the abstract level at which he thinks is beneath his dignity to contemplate.

The language of emanationism is useful for mystical thinkers in both Sufism and kabbalah. The notion of God being in constant contact with the world and everything in existence being connected to everything else provides theoretical underpinning for an immanent view of God's relationship to his creation. God is then in a radical sense *in* the world, and everything that exists is an aspect of him, even what looks insignificant. Mystics tended to argue that it is possible to come close to God by following the emanationist process back to where it starts, with God, but this is a tortuous route that only a few adepts are likely to entirely follow. For most philosophers, however, the route to perfection only goes as high as the active intellect, the most abstract form of thought of which we are capable. Once we go beyond this form of thinking we enter into realms of the emanationist cosmology that we cannot properly grasp except in general terms.

## EMERGENCE

Emergence is, broadly speaking, the fact that there are features of the world—objects, properties, laws, perhaps other things—that are manifested as a result of the existence of other, usually more basic, entities but that cannot be completely reduced to those other entities. Theories of emergence tend to fall into two basic types: ontological emergence and epistemological emergence—with conceptual emergence serving as a subcategory of the latter.

Advocates of ontological emergence consider emergent phenomena to be objective features of the world, their emergent status being independent of human existence and knowledge; advocates of epistemological emergence consider emergent features to be a result of the limited abilities of people to predict, to calculate, to observe, and to explain; and advocates of conceptual emergence consider emergent features to be a product of theoretical and linguistic representations of the world.

Emergence has considerable philosophical importance because the existence of certain kinds of ontologically emergent entities would provide direct evidence against the universal applicability of the generative atomism that has dominated Anglo-American philosophy in the last century. By generative atomism is meant the view that there exist atomic entities, be they physical, linguistic, logical, or some other kind, and all else is composed of those atoms according to rules of combination and relations of determination. The failure of various reductionist programs, especially that of physicalism, would have significant impact on this program. In addition, the various accounts of epistemological emergence pose difficulties for the long established Cartesian requirement of completely transparent access to evidential relations.

Although there is no consensus upon what counts as an emergent entity, a cluster of features tends to recur in philosophical accounts of emergence. Emergent phenomena are irreducible, they are novel, they are usually unpredictable on the basis of theory, they are often unexplainable, they frequently involve global rather than merely local properties, and an emergent entity must emerge from something. This last feature separates emergent features from those entities whose existence does not depend upon anything else, such as the objects of fundamental physics or certain abstract entities. It also allows for two distinct kinds of emergence: static or synchronic emergence within which the emergent entities exist simultaneously with the entities from which they emerge; and dynamic or diachronic emergence, within which the emergent entities temporally develop from antecedent entities. Although it is rarely stated explicitly, dynamic emergence is generally held to result from more than causal processes alone.

At one time, life and chemical compounds were considered to be good candidates for emergent features, covered by what John Stuart Mill in book III of his *A System of Logic* (1843, ch. VI, pts. 1–2) termed heteropathic laws, but with advances in molecular biology and an understanding of the chemical bond that view fell into disfavor. Perhaps as a consequence, emergence came to be viewed

with a certain degree of suspicion, apparently requiring a commitment to occult qualities that was at odds with the analytic methods of science and philosophy. It is thus ironic that emergence has reemerged as a vigorous and lively field of investigation, has shed much of its air of mystery, and plausible candidates for emergent phenomena have been discovered in fundamental areas of physics as well as in other areas of science such as complexity theory. As a result, it is important when considering emergence not to restrict one's range of examples to the widely discussed cases of mental properties.

This entry will emphasize contemporary positions on emergence, although occasional historical references will be made to illustrate conceptual continuities. For a history of the area, the reader is referred to Brian McLaughlin's 1992 survey article, "The Rise and Fall of British Emergentism."

## ONTOLOGICAL APPROACHES TO EMERGENCE

One influential ontological approach to emergence uses supervenience relations to account for emergent features. An early version of this approach by James van Cleve (1990) asserted that a property P of a system is emergent if and only if P supervenes with nomological necessity but not with logical necessity on properties of parts of the system, and some of the supervenience principles linking the basal properties with P are fundamental laws. That is, once the features of the most fundamental level are fixed, so—via laws of nature—are the features of all higher levels. Advocates of supervenience approaches, especially the widely canvassed position known as Humean supervenience, generally hold that supervenience is all that is required to account for higher-level features of the world. David Lewis provided an influential statement of this position in the second volume of his *Philosophical Papers* (1986, pp. ix–xvi). Supervenience approaches usually contain the irreducibility and novelty aspects of emergence. Whether the global, unpredictability, and unexplainability features are present depends upon the type of supervenience involved.

A different ontological position, developed by Jaegwon Kim in his article "Making Sense of Emergence" (1999), begins with the idea that a higher level property P is reducible if: (a) P can be functionalized—that is, defined in terms of its causal role; (b) realizers of P can be found at a lower level; and (c) there is a lower level theory that explains how the realizers operate. In contrast, a property is emergent if it is neither a physical property nor reducible to physical properties in the sense just

described. Kim's position retains the irreducibility, novelty, theoretical unpredictability, and unexplainability features of emergent phenomena but apparently has the consequence that there is little scope for their existence, except perhaps in the case of qualia or consciousness.

The novelty of emergent features is usually captured in the idea that an emergent entity E must be qualitatively different from the entities from which it emerges. A popular version of this idea asserts that a property P is emergent if it has novel causal powers not possessed by entities at lower levels. The causation involved can be horizontal (to entities at the same level), upwards (to a higher level), or downwards (to a lower level). When downwards causation is involved, one of the most difficult problems facing advocates of supervenience emergence and many other ontological accounts of emergence occurs. This is the problem of causal exclusion, of explaining how emergent features can influence lower levels via downwards causation if one subscribes to the causal closure of lower levels as, for example, do most physicalists. For if the lower level is causally closed, any downwards influence is redundant, unless causal overdetermination is allowed. A clear statement of this argument can be found in Kim's 1992 article "Downward Causation' in Emergentism and Nonreductive Physicalism."

A third ontological approach to emergence, found in Paul Humphreys' 1997 article "How Properties Emerge," addresses this problem. It has as its core idea the view that in certain cases of dynamic emergence the original elements or their properties fuse together in a way that the identities of those elements are lost in forming the new emergent entity. This feature allows emergent phenomena to avoid the causal exclusion argument because the lower level entities no longer exist and a fortiori cannot be causal competitors to the emergent entity. The position entails the irreducibility, novelty, and holistic features of emergent phenomena, but allows their predictability and explainability. Certain holistic quantum systems possessing states of joint systems but not states of individual components seem to be examples of fusion.

## EPISTEMOLOGICAL APPROACHES TO EMERGENCE

Turning to epistemological accounts of emergence, one of the oldest approaches emphasizes the essential unpredictability of emergent phenomena. It is sometimes loosely and unhelpfully characterized in psychological terms by noting that emergent phenomena are surprising. A more precise version asserts that a property P

belonging to domain E is emergent relative to a domain D, where E is at a higher level than D, if it is impossible to predict the occurrence of instances of P on the basis of any ideal theory about D. Early accounts of emergence based on unpredictability can be found in Stephen Pepper's article "Emergence" (1926) and C. D. Broad's book *The Mind and Its Place in Nature* (1925).

This unpredictability approach conforms to Ernest Nagel's well-known approach to the reduction of one theory to another in chapter eleven of his *The Structure of Science* (1961). Within Nagel's account, one theory is irreducible to another if the laws of a higher level theory cannot be deduced from those of a more fundamental theory by employing bridge laws connecting the two levels. Thus, in a somewhat crude manner the essential unpredictability approach to emergence captures the idea that if biology is Nagel-irreducible to physics then biological phenomena are emergent from physical phenomena. It satisfies the novelty, irreducibility and, trivially, unpredictability aspects of emergence and also accommodates nomological emergence, the view that entities of type B are emergent from entities of type A if and only if entities of type B have type A entities as constituents and there is at least one law that applies to type B entities that does not apply to type A entities. A statement of nomological emergence can be found in the physicist P. W. Anderson's much cited 1972 article "More Is Different."

A diachronic version of the unpredictability approach to emergence is widely used within the field of complexity theory and rests on the idea of stable patterns spontaneously emerging in a system. Although these patterns are, simply in virtue of being patterns, nonlocal, they are not the result of a central organizing principle but result from local, often nonlinear, interactions between members of a population. Examples of pattern emergence abound in what are commonly termed self-organized systems, one simple example of which is the formation and maintenance of bird flocks. The general area of agent-based or individual-based models, which include many examples of self-organizing systems, is of interest to philosophy because it combines a bottom-up commitment to individualism with the dynamic emergence of higher level structures possessing the features of novelty and holism. Such models can illuminate the traditional philosophical issue of methodological individualism, an issue that divides those who hold the view that there are *sui generis* facts in the social sciences from the individualists who deny this.

Because the dynamic emergence of the patterns can often be modeled only via computer simulations, an

important aspect of these systems is captured by Mark Bedau's concept of weak emergence (2003). A weakly emergent property  $P$  is one possessed by a structured system  $S$ , where  $P$  is incapable of being possessed by components of  $S$ , and  $S$ 's possessing  $P$  is a fact that can be derived only by a step-by-step simulation of  $S$ . Despite its connection with prediction via computer simulations, weak emergence is ultimately a metaphysical rather than an epistemological account of emergence. The structure of the system places objective constraints on the possibilities of computation and complex physical and biological systems must step through their own development, thus making weak emergence a claim about the world itself.

A particularly interesting kind of weak emergence occurs when a pattern  $P$  exists independently of the nature of the specific components of the system exhibiting the pattern so that the structure is in that sense autonomous. There are connections here with the multiple realizability of higher level properties, a topic that has played an important role in arguments against reduction. One approach to emergence that explicitly considers multiple realizability is Robert Batterman's asymptotic emergence (2002). This sort of emergence involves a relation between two theories, one of which is a limiting case of the other and it is unusual in not relying on the part/whole relationship upon which most other theories of emergence are based.

### CONCEPTUAL APPROACHES TO EMERGENCE

Running parallel with the issues of epistemological and ontological emergence is the phenomenon of conceptual emergence, based upon the idea that theories employed at different levels of the hierarchy employ different concepts and that these concepts require the introduction of distinctive, irreducible, predicates and relations. This approach is captured in Paul Teller's characterization: An emergent property of a whole is one that is not explicitly definable in terms of the nonrelational properties of the object's proper parts (1992). Because definability depends upon the linguistic resources available in a given language or theory, this criterion for emergence is relative to the theory or language employed and reflects a common feature of linguistic development. If psychological and sociological features, to take two examples, are ontologically emergent, one should expect the resources of explicit definability to fail and to force the invention of new vocabulary. It is not difficult to see how each of the approaches to emergence described above can necessitate this kind of linguistic innovation, and it calls into ques-

tion various enterprises of linguistic reduction. Although it is not couched in terms of emergence, the influential arguments found in Jerry Fodor's 1974 article "Special Sciences" against reduction and in favor of the autonomy of the special sciences can be construed as reasons in support of conceptual emergence.

### OTHER ISSUES

In contemporary philosophy, a commitment to emergent entities is generally held to violate physicalism, the position that the world's ontology contains nothing but the ontology provided by physics. What "nothing but" means differs from one version of physicalism to another, as does what is included within the scope of physics, but the core idea is that anything not required by fundamental physics is in principle redundant, even though one may employ a nonphysicalist vocabulary for practical reasons. Thus, mental entities such as beliefs are mere *façons de parler* on the reductionist view, and the social sciences have no genuine subject matter of their own. Strict versions of reductionism maintain similar views about biological and chemical entities.

All three approaches to emergence—ontological, epistemological, and conceptual—tend to appeal, implicitly or explicitly, to a layered view of the world that is divided into levels, with features at higher levels emerging from those at lower levels. This appeal to levels is usually grounded in the idea that larger entities such as molecules spatially include as parts smaller constituents such as atoms, this inclusion relation resulting in the familiar hierarchy of elementary particle physics, solid state physics, chemistry, biochemistry, biology, neurophysiology, and so on. Although this levels picture serves as a natural image within synchronic emergence, it can be a seriously misleading metaphor for diachronic emergence.

There is much casual talk in the literature on emergence about the difference between aggregate features and emergent features, the latter, in contrast to the former, being more than "mere sums" of the features of their components. It has turned out not to be informative to try to precisely capture what constitutes a "mere sum" but traditionally, holism—summed up in the slogan that the whole is greater than the sum of the parts—remains a core part of what is wanted from emergent phenomena. It is preferable to replace "greater than" by "different" and if this is done one has the suggestion that a property  $P$  is emergent only if it is a property of an entire system  $S$  that is composed of subsystems  $S_1, \dots, S_n$  but none of the  $S_i$  possess  $P$ . This feature is possessed by, at least, the fusion,

asymptotic, weak, and nomological approaches to emergence.

The principal aim of any philosophical account of emergence should be to make emergence intelligible and nontrivial. It is a separate matter, one with which science is properly concerned, whether the universe contains any examples of emergence. It is, nevertheless, a matter of considerable interest to philosophy whether examples of ontologically emergent phenomena exist because, if they do, our universe is more than an ontologically modest combinatorial device.

## EMERGENTISM

See *Emergence*

## EMERSON, RALPH WALDO

(1803–1882)

Ralph Waldo Emerson, the American author and leader of New England transcendentalism, was born in Boston, Massachusetts. His father, a locally distinguished Unitarian clergyman, died in 1811 leaving Emerson and five other children in the care of a pious mother and a very learned aunt on the father's side. From 1813 to 1817 Emerson attended the Boston Latin School; then, after four undistinguished years at Harvard, he became a schoolmaster while he continued to study extramurally at Harvard Divinity School. "My reasoning faculty is proportionally weak," he confessed in his *Journal* in 1824, on deciding to become a minister, "nor can I ever hope to write a Butler's Analogy or an Essay of Hume. ... [But] the preaching most in vogue at the present day depends chiefly on *imagination* [italics added] for its success, and asks those accomplishments which I believe are most within my grasp." Made just before he was twenty-one, this acute piece of self-analysis marks the stage in Emerson's life when he really began to understand himself and gain a genuine premonition of his future role as literary artist. For Emerson is, more than anything else, an imaginative writer. (Thus Friedrich Nietzsche, who was at an early stage influenced by Emerson—admiring his "manifoldness" and "cheerfulness"—recognized him as one of the nineteenth century's few great masters of prose.)

### FORMATIVE EXPERIENCES

Unitarianism was at first the main formative influence on Emerson, but it was not the most far-reaching, and the sort of preaching he was eventually to excel in had little to do with any established church or, for that matter, with Christianity as such. A trip to Florida for health reasons, in the winter of 1826–1827, brought about a chance meeting with the aristocratic Achille Murat, whose "consistent Atheism" Emerson found combined, to his sur-

prise, with moral perspicuity. By the late 1820s the young theological student had already got through a prodigious regimen of philosophical and occult reading that included (as the most important authors for his maturer orientations) Zoroaster, Confucius, Muḥammad, the Neoplatonists, Jakob Boehme, Gottfried Wilhelm Leibniz, Baron de Montesquieu, Jean-Jacques Rousseau, Edmund Burke, the Scottish philosophers, Emanuel Swedenborg, Johann Gottfried Herder, and—above all—Madame de Staël (the *De l'Allemagne*). Emerson's attention was being irresistibly drawn to the new cultural movement in Germany. The disturbing advances in German biblical criticism were beginning to penetrate to him via his brother William's enthusiastic letters from Göttingen (William had also met and talked with Johann Wolfgang von Goethe). Soon Emerson was absorbed in Thomas Carlyle's pioneering essays on German literature, and in Samuel Taylor Coleridge's *Aids to Reflection* (1825)—in which Emerson discovered the pseudo-Kantian distinction between “Reason” and “Understanding.”

In 1829 Emerson was appointed pastor of the Second Church of Boston; shortly afterward he married Ellen Louisa Tucker. Ellen's tragic death of tuberculosis early in 1831 had a deeply anguishing and yet strangely liberalizing effect upon Emerson. He questioned himself about immortality; preached sermons that expounded embryonic versions of his own later doctrines of “self-reverence” (or “self-reliance,” as he sometimes called it), “compensation,” and “correspondence”; found he was bored with weekday Bible classes; and eventually gave up his pastorate.

On January 2, 1833, he sailed for Europe. This first European tour (he made two more, one in 1847–1848 and one in 1872–1873) was crucial in helping him shape into something like a whole the new philosophical outlook he had been consciously groping toward since at least 1824 and to which he ultimately gave poetic expression in his major works. During a short stay in Britain he managed to get an interview with Coleridge at Highgate, met William Wordsworth, and spent twenty-four hours with the Carlyles at Craigenputtock. Carlyle immediately became a lifelong friend.

The conversations with Coleridge and Carlyle, the two men who were to the disenchanted young American living embodiments of all that was viable in contemporary European culture, had simply the effect of confirming Emerson's old belief: As a guide to solving the problem of life's meaning, there is “really nothing external, so I must spin my thread from my own bowels.” He reasoned to himself that “the purpose of life seems to be

to acquaint a man with himself” and “the highest revelation is that God is in every man.” In his *Journal* entry for September 8, 1833, written while sailing back to America, Emerson included with the above affirmation of his maxim of “self-reverence” two other by then quite explicit convictions: (1) “There is a *correspondence* [italics added] between the human soul and everything that exists in the world,” and (2) since “a man contains all that is needful to his government within himself;” it must be that “nothing can be given to him or taken from him but always there is a *compensation* [italics added].” Here were brought together the key notions that Emerson was to elaborate for the rest of his life, first in his original transcendentalist manifesto, *Nature* (1836), and then in practically all the later works, including *Essays* (First Series, 1841; Second Series, 1844), *Representative Men* (1850), *English Traits* (1856), *Conduct of Life* (1860), *Society and Solitude* (1870), and *Letters and Social Aims* (1875).

In 1835 Emerson married Lydia Jackson, with whom, he soberly remarked to William, he had found a “quite unexpected community of sentiment and speculation.” Soon he was settled in unusual domestic serenity with his wife and his mother in Concord, which remained his home for the rest of his life. Emerson's writings, his sage-like personality, and his roles as the leader of New England transcendentalism and the editor of the *Dial* gradually brought him an international reputation as perhaps America's leading man of letters.

## MATURE WRITINGS

If propounded by a philosopher, Emerson's assertions concerning “correspondence” and “compensation” would demand further explication and defense. But to expect anything resembling epistemological lucidity, or even concern, in a writer like Emerson would be to approach him with misconceptions. Indeed, those who read him as one would a philosopher like Immanuel Kant, Friedrich von Schelling, G. W. F. Hegel, or even Coleridge (all of whom certainly had a great influence upon Emerson), largely miss the peculiar merits and significance of his works. For Emerson was neither a critical philosopher nor an idealist metaphysician, but an intuitive sage-poet: “In Emerson,” wrote Nietzsche to Overbeck, “*we have lost a philosopher.*”

Like his artistic models Michel Eyquem de Montaigne, Blaise Pascal, and the Goethe of the *Maximen und Reflexionen*, Emerson was a virtuoso of the *pensée*, in which style and content, symbol and “meaning,” are inseparably conjoined. His meditations are exploratory rather than defining or definitive, and the nonproposi-

tional, revelatory use of language with which Emerson alternately enraptures and ensnares his reader renders inappropriate the conventional task of giving a systematic conspectus of his leading ideas. The analysis to be applied to any work by Emerson is that of the literary critic rather than the philosopher. His method of exploration consists in the cumulative and often dialectical juxtaposition and attempted coalescence of *aperçus* relating to a single broad theme—"Nature," "Friendship," "Wealth," "Immortality"—usually in the form of an essay, lecture, or address. In fact, all Emerson's prose works are homiletic: They are secular sermons that differ from the sermons of his ancestors, the New England Puritan divines, largely by virtue of a greater breadth and subtlety of message and the intense personalism of their inner soliloquy.

Yet, despite the epistemological imprecision of his views, Emerson is philosophically interesting in at least two ways. First, because of the very full *Journal* he kept throughout his life, he affords an extremely well-documented record of a major writer who found it urgently necessary to struggle with philosophical ideas in order to achieve personal (and artistic) integration in an age "destitute of faith, but terrified at scepticism," as Carlyle characterized it. (The ideological perplexities of his age, moreover, lead directly to our own.) Emerson strove to discover for himself "an original relation to the universe": a kind of personal *Weltansicht* that would somehow keep vital his essentially religious sensibilities and give succor to his pressing emotional needs. Since Christianity could no longer do either of these things, he meditated upon his own experience in the light of those pieces of philosophy that seemed most accommodating. That Emerson found the Germanic philosophical tradition more to his liking than the Anglo-Saxon was the natural result of his individualism, his belief in the primacy of personality, and his closely related admiration for the hero, genius, or great man, in which he joined Johann Gottlieb Fichte, Carlyle, and Nietzsche (see especially *Representative Men*). He expressed these fundamentally anthropocentric and aristocratic orientations quite succinctly: "No object really interests us but man, and in man only his superiorities; and though we are aware of a perfect law in nature, it has fascination for us only through its relation to him, or as it is rooted in the mind."

Both Schelling and Hegel influenced Emerson in profound and clearly traceable ways—Schelling first, through Coleridge, and Hegel later, particularly through W. T. Harris and the St. Louis School of Hegelians, with whose *Journal of Speculative Philosophy* Emerson was closely associated in the late 1860s and early 1870s. The

primacy of "personality," or "self-consciousness," as it was usually called, was already an established axiom with the Germans. And if the all-embracing dichotomy between mind and nature—with its innumerable manifestations in the troublemaking divisions of "reality and illusion," "religion and science," "moral law and physical law," "the eternal and the temporal," in effect, the division of "the transcendental ideal and the banal actual"—could be shown to be only an immature stage in the development of Absolute Spirit whose final blossoming would exhibit all as one: Then, indeed, there would be not only "a correspondence between the human soul and everything that exists in the world" but, even better, a coalescence.

Much in the manner of Hegel, Emerson came to see History, or God, or the Oversoul as a kind of primordial schizophrenic, originally split into mind and nature and now victoriously struggling to personal integration in and through the creative achievements of human culture. Metaphysically speaking, human culture is identical with mind's reintegration with nature. Indeed for Emerson science itself becomes the handmaiden of transcendentalism: Man's conquest of the material environment shows nature to be not alien but fully transparent to mind, and since whatever is intelligible must somehow be itself intelligence, mind and nature are in reality one. But in such a panspiritualistic universe every apparent evil can only be for the greater universal good; the "compensation" for evil lies in the ultimate self-harmony of mind. This is the tortuous metaphysical hallucination that forms the basis of Emerson's optimism. As far then as it can be discerned, his *philosophia prima* is that of the German idealists, and one sympathetic way of characterizing him would be to say that where Schelling and the rest made the fundamental mistake of attempting to give rational and systematic expression to the mythology of romanticism, Emerson put the whole thing into poetry—which was exactly where it belonged.

But Emerson's individualism had a further and more practical consequence. He could never reconcile himself to the values of a civilization that, as he saw it, was "essentially one of property, of fences, of exclusiveness"; and the incisive manner in which this dissatisfaction with the prevailing social reality found expression in his writings gives Emerson a special place in the great line of romantic critics of mass society from Rousseau to Karl Jaspers. Brilliantly critical of emergent American commercialism, which necessarily seemed to involve cultural superficiality, Emerson was particularly virulent against the species of democracy that in fact often demands only conformity to depersonalizing custom, and a consequent sacrifice of

individual autonomy, of “self-reliance.” He did not limit his criticism to America; *English Traits* is still, among other things, a major indictment of European cant, Philistinism, and materialism by an American.

The second reason why Emerson is philosophically interesting is his influence on philosophers. Nietzsche has been mentioned; so also should be Henri Bergson. A number of Bergson’s fundamental concepts often seem in part to be systematizations of Emerson’s eclectic intuitions (compare, for example, the *élan vital* with Emerson’s “vital force” in the essay “Experience”); perhaps the most noteworthy is the decided interest in Emerson shown by the pragmatists William James and John Dewey.

Emerson’s most pervasive influence, however, was not so much on professional thinkers or writers, but on the public, through the great popular sale of his works. His highly personal yet persuasive and accessible form of romanticism insinuated itself into the general intellectual consciousness of America, and to a lesser extent into that of Europe. “His relation to us is . . . like that of the Roman Emperor Marcus Aurelius,” said Matthew Arnold in *Discourses in America* (published in 1885, three years after Emerson’s death); “he is the friend and aider of those who would live in the spirit.”

### **Bibliography**

*The Complete Works of Ralph Waldo Emerson* in the twelve-volume Centenary Edition (Cambridge, MA: Riverside Press, 1903–1904) is the standard edition of Emerson’s works. Emerson’s *Journals* were originally edited by E. W. Emerson and W. E. Forbes (Boston: Houghton Mifflin, 1909–1914). A more recent version is *Journals and Miscellaneous Notebooks of Ralph Waldo Emerson*, edited by William H. Gilman and others, 3 vols. (Cambridge, MA: Belknap Press of Harvard University Press, 1960–1963). For more bibliographical details consult *Eight American Authors: A Review of Research and Criticism*, edited by Floyd Stovall (New York: Modern Language Association of America, 1956; reprinted with a bibliographical supplement extended to 1962, New York: Norton, 1963). An informed and brilliantly perceptive account of the role of German thought in Emerson’s intellectual development is contained in H. A. Pochmann’s *German Culture in America* (Madison: University of Wisconsin Press, 1961), pp. 153–207. Among recent studies of Emerson’s mind and art, the most illuminating is Jonathan Bishop, *Emerson on the Soul* (Cambridge, MA: Harvard University Press, and London: Oxford University Press, 1965).

## EMOTION

Over the centuries, the emotions have proven to be a notoriously recalcitrant philosophical subject, defying easy classification and stubbornly straddling accepted philosophical distinctions. With changing conceptions of the mind and its powers, categories such as emotion, desire, appetite, passion, feeling, and sentiment come and go. The general term *the emotions* is a relatively recent arrival to the English language, first gaining prominence in the nineteenth century, long after terms such as *fear*, *shame*, and *joy* were in common use. Its introduction was an attempt to clump together states that were supposedly marked by a degree of “emotion,” a metaphorical extension of the original sense of the word, namely, agitated motion, or turbulence. Only the vagueness of the metaphor allows it to stretch far enough to cover typically quiescent “emotions” such as being pleased or sad about something.

Probably one influence on the extension of the term is the older category of “passions,” in the sense of ways of being acted upon. In many languages nearly all emotion adjectives are derived from participles: for example, the English words amused, annoyed, ashamed, astonished, delighted, depressed, embarrassed, excited, frightened, horrified, irritated, pleased, terrified, surprised, upset, and worried—and even sad (from “sated”). When people are, for example, frightened, something acts on them, that is, frightens them: typically, something of which they are aware. However, even if the terms commonly used for the various emotions suggest that the notion of passivity is central to the ordinary concept of emotion, that notion seems irreparably vague, at best reflective of a prescientific picture of a person (or, for that matter, a physical object) as acting and acted on, as doing and “suffering.” Indeed, it is not obvious that the states we call emotions have anything interesting or important in common that distinguishes them from all other mental states. Some philosophers and scientists have argued that what we call “the emotions” do not belong to a “natural kind” or class, and even that the concept of emotion should be banished entirely, at least from scientific discourse. These issues will be taken up in a later section.

### THE PHILOSOPHICAL TRADITION

Since William Alston published his seminal article on “Emotion and Feeling” in the first edition of this Encyclopedia, philosophical scholarship in the area has undergone tremendous growth and variation. Among the major catalysts for change in philosophical thinking about the emotions have been new developments in psychology and neuroscience. However, the medium within which this ferment has largely been taking place is linguistic and conceptual analysis. Although analytic philosophers of emotion use relatively sophisticated logical and linguistic tools, their task has not been much different from that of the many classical philosophers who attempted definitions of various emotions: for example, Aristotle in the *Rhetoric*, Descartes in *The Passions of the Soul*, Hobbes in the *Leviathan*, Spinoza in his *Ethics*, and Hume in *A Treatise on Human Nature*. Moreover, the most important outcome of the analytic thrust was a view that had been at least implicit in traditional accounts, namely, cognitivism. Although there are several varieties of cognitivism, perhaps the most influential versions hold that the various emotions are distinguished in part by the types of situation that evoke them; or, more exactly, by the types of situation the awareness of which evokes them; more exactly still, by the content of the beliefs and

other propositional attitudes that cause them. Note the importance of situational and cognitive features in Spinoza’s definitions, for example:

Fear: an inconstant pain arising from the idea of something past or future, whereof we to a certain extent doubt the issue.

Regret: the desire or appetite to possess something, kept alive by the remembrance of the said thing, and at the same time constrained by the remembrance of other things that exclude the existence of it.

The classical philosophers contributed more than definitions, of course. For example, some declared certain emotions to be the primary or basic emotions. However, the philosophers remained armchair theorists, putting forward at best introspective or anecdotal data. The scientific advances of the nineteenth century, particularly in biology, made it possible to move beyond this.

### BODILY RESPONSES AND FEELINGS: DARWIN AND JAMES

In *The Expression of Emotions in Man and Animals*, published in 1872, Charles Darwin investigated the various, mostly involuntary physiological changes, especially in the facial and skeletal muscles, which constitute the so-called “expressions” of emotions (1998 [1872]). Others broadened the investigation to include the internal visceral phenomena associated with various emotions. Still, these were thought to be investigations into mere manifestations or accompaniments of emotions. As John Dewey pointed out, “The very phrase ‘expression of emotion,’ ... begs the question of the relation of emotion to organic peripheral action, in that it assumes the former as prior and the latter as secondary” (p. 553). It was left to the introspectionist psychologists, most notably Wilhelm Wundt and Edward Titchener, to offer a systematic account of what they regarded as “the emotions themselves,” namely the subjective feeling qualities characteristic of the various emotions, an account that relied heavily on what subjects reported.

To William James, these descriptive studies of “what it is like” to feel the various emotions afforded no insight or understanding. Turning instead to the causes of these feelings, he argued, in his classic 1884 paper, “What is an Emotion?” that they were actually the felt awareness of precisely those physiological “manifestations” of emotion that Darwin and the biologists had been studying. Thus, according to James’s theory (also known as the James-Lange theory), an emotion is the felt awareness of reverberations of the “bodily sounding-board,” that is, of

bodily reactions to something perceived or thought: reactions such as trembling, quickening of pulse, crying, running, or striking someone. It is this perception of one's own bodily responses that endows each type of emotion, such as fear, anger, and joy, with its special feeling quality. From this premise James drew the radical conclusion that emotions or emotional states were effects rather than causes of these bodily reactions. Thus common sense has it backwards: The truth is that "we feel sorry because we cry, angry because we strike, afraid because we tremble, and not that we cry, strike, or tremble, because we are sorry, angry, or fearful" (James 1884, p. 190). However, this conclusion drew on the further assumption, which James inherited from the introspectionists and from Darwin himself, that the various emotions or types of emotional state were nothing but particular feeling qualities. That is, *if* the emotions are just a subclass of feeling qualities, and *if* these feeling qualities are caused by the bodily reactions that commonsense regards as manifestations or expressions of emotion, *then* common sense has it backwards.

Whatever the merits of his arguments, the influence of James brought about a major shift in philosophical and scientific thinking about the emotions. Most important, the study of emotional feelings could no longer be regarded as a special introspective science, insulated from our general theory of human beings as biological organisms.

### PHILOSOPHICAL COGNITIVISM

Opposition to the first of the Jamesian premises, which treats the various emotions as just so many feeling qualities, was a major impetus to the cognitive turn in the philosophy of emotion. However, it was above all the intentionality of emotions that put the cognitive revolution on its positive course. Starting with Anthony Kenny (1963), various authors endeavored to show that, unlike the brute physiological feeling states celebrated by James, emotions and their associated feelings had the characteristic of being *about* things and events. Thus, people sometimes are (and feel) scared of snakes or angry about the fact that their car was stolen. In this respect, emotions were thought to differ from mere bodily feelings, which, if they are about anything at all, are about bodily phenomena, rather than snakes or car thefts.

The intentionality of emotions also distinguishes them from moods, which are general response templates that are not about anything in particular, even though they may have been precipitated by the awareness of particular facts or events. In many languages the same term

may be used for both a mood and an emotion: one may be sad (or: depressed, euphoric) about something, or simply in a sad (depressed, euphoric) mood or frame of mind; or both at once. How deep the distinction between emotion and mood goes is debatable, as many so-called emotions tend to spill over from one category to the other: Initially about their original precipitant ("He's angry about the theft of his car."), they develop into a general response template ("Don't go near him, he's in an angry mood!").

Among cognitive theorists, the notion that the content of emotions takes a propositional form assumed special importance. Suppose I believe that John stole my car. I may say that my anger is about the car, about the car theft, or about what John did. However, fully parsed, my anger attribution can be logically reformulated by the phrase: I am angry about the fact that "John stole my car." Because propositions are the primary vehicles of logic and cognition, the propositional nature of emotion and its intentional objects made it easy to think of emotions in both cognitive and logical terms. It was now possible to articulate and debate what were termed the logic and structure of the various emotions and even their inferential ties to one another.

An early and forthright propositional theory is due to Robert Solomon (1976), who, with a strong emphasis on phenomenology, revived the Stoic view that emotions were themselves simply normative judgments of an urgent kind. Ronald de Sousa (1987) argued that emotions are better assimilated to perceptions. Emotions of a given type, such as fright, represent what they are about as having the corresponding property—for example, as being frightening. They also impose "determinate patterns of salience" on our thought processes: guiding our attention, our lines of inquiry, and our inferential strategies. De Sousa's view in some ways anticipates Jesse Prinz's "embodied appraisal" theory, described in the section, "Somatic Wisdom" (2004). Robert Gordon (1987) argued that most emotions are propositional attitudes that are identified by their causal relations to other propositional attitudes, especially beliefs and wishes. Most emotions are "factive," that is, about a fact (or what the subject takes to be a fact) that frustrates or satisfies a wish; others, such as being afraid or hopeful, are uncertainty emotions.

Some critics argue that propositional accounts would exclude animals and infants lacking language. This criticism would seem committed to the controversial thesis that animals without language do not have any propositional attitudes, including desires or beliefs.

Nonetheless, it would be a mistake to try to force all emotions into a propositional framework. It is hard to think of a *that*-clause that describes what love or hate is about. In some cases, what is called the same emotion (or emotion type) has both propositional and nonpropositional forms. Although one may be startled (to discover) that something is the case, one may also be startled by a sound—with no associated proposition or cognition at all. Even in the case of an emotion about a fact, it is not obvious that its content is exhausted by its propositional content.

Finally, even where propositionality is not in dispute, one may not be able to explain it in terms of standard states such as beliefs and desires. For example, to sustain the claim that fearing (hoping) that *p* depends on being uncertain whether *p*, one needs to allow for compartmentalization, for example, to distinguish between emotional and intellectual certainty; otherwise one could not account for cases where the fear (hope) that *p* persists despite a belief that it is not at all possible (epistemically) that *p*. To make such a distinction with any clarity, however, may be beyond the competency of analytic philosophy. It may require reference to the underlying neural architecture. For example, Joseph LeDoux (1998) discovered that there are distinct pathways by which the amygdala may be activated, a cortical “high road” that is cognitive, and a “low road” that bypasses the cortex and is strictly perceptual. This hypothesis nicely complements the claim that some emotional states and processes might be *modular*, that is, “hardwired” in a manner that makes them impenetrable by changes in beliefs and desires. The “quick and dirty” low road often alerts us to emergencies that our cortex “knows” do not exist. These examples suggest an analogy with perceptual illusions, which a correct belief sometimes fails to dispel.

## VALENCE

Emotions are often classified by their *valence*. Theorists and laypeople tend to readily agree that emotions, or most of them, are either positive or negative. The agreement evaporates, however, as soon as they are asked, “In what respect?” One point of disagreement concerns what is being evaluated: Is it what the emotion is characteristically about that makes it positive or negative (intentional valence), or is it one’s having or experiencing the emotion (experiential valence)? What it is about may be good, or something the subject appraises favorably or would wish to be the case, as in pride, delight, and hope; or it may be bad, or something the subject appraises unfavorably or would wish not to be the case, as in shame, regret, and

fear. Having or experiencing the emotion might also be judged positive or negative in any of several respects. It might be characteristically positive or negative in affect (i.e., pleasant or unpleasant), or even unconsciously aversive or attractive, and it might be beneficial or harmful, or morally good or bad. Because of such disagreements, some argue that the idea of emotional valence is of dubious value and should be abandoned.

However, it may be an important feature of emotions that they have multiple dimensions of valence. If an emotion’s experiential valence is of the same sign (positive or negative) as its intentional valence—for example, an aversive emotion that is about something that is bad for you or goes against your wishes—then it is likely to promote rational decision-making and action. The actions people take to alleviate the unpleasantness or aversiveness of fear (a negative aspect of having or experiencing the emotion) tend to reduce the risk of bad things happening (a negative aspect of what the emotion is about): for example, fear of a flood leads the inhabitants to retreat to high ground, thereby averting disaster. (There are of course thrill-seekers for whom the very aversiveness of fear has a second-order attractiveness, and, within the safe confines of dramatic art, many people can enjoy the fear or “as-if” fear they empathetically experience.)

Likewise, the possible negative consequences of a decision tend to be amplified in our minds by our anticipation of regret and remorse: For example, if I buy this appealing but unreliable car, I may kick myself if anything goes wrong with it. These premonitory influences may on the whole guide us to useful behavior, in roughly the way that hunger, thirst, and sexual feelings lead us, wittingly or not, to behavior that is conducive to biological fitness. Add to this theme of doubly valenced emotions a revival of James’s second premise, that emotional feelings are perceptions of bodily reactions, and we are led to the topic of the next section.

## SOMATIC WISDOM

From Plato onward, European and North American philosophers have thought the regulation of emotion essential to a rational life, and a similar view was promoted even earlier in Buddhism and other Asian religions. The underlying supposition was that unregulated emotions are impediments to the rational life. However, this is compatible with the thesis held by a number of philosophers that emotions, or at least some of them, make a positive and possible indispensable contribution to rational decision-making. According to De Sousa, for example,

emotions are indispensable for guiding our attention, our lines of inquiry, and our inferential strategies.

It was suggested earlier in this article that if an emotion's experiential valence matches its intentional valence, then it is likely to promote rational decision-making. A similar view has received support from findings in neurology and neuroscience, most prominently by the cognitive neuroscientist Antonio Damasio (1994) and his coworkers. Damasio's somatic marker hypothesis holds that successful and unsuccessful decision outcomes produce differing bodily responses—for example, as measured by skin conductance—and the accumulation of such responses over time leads to anticipatory bodily responses that guide future decision-making. One need not be aware (phenomenally conscious) of these responses in order for them to influence decision-making. However, a part of one's frontal cortex (functionally, the somatosensory or body-sensing cortex) must keep track of them. Most of the supporting data have come from observations of decision-making deficits in people with prefrontal damage and comparison with normal subjects in experimental gambling tasks. Additional data suggest that the capacity to recognize and to name certain emotions in others on the basis of their facial expressions also depends on the capacity to monitor one's bodily responses when observing them. Damasio's theory goes far beyond this, and some of it is controversial; but this brief statement makes it clear why Damasio thinks the aversiveness or attractiveness of undergoing certain emotions can be a premonitory influence that sometimes "knows" better than pure reason does which decision paths are likely to lead to preferred outcomes.

Prinz is probably the first philosopher to build a general theory of emotion on a broad and richly detailed account of empirical research. Although sympathetic to the somatic theories of James and Damasio, he argues that our emotional "gut reactions," unlike pains, tickles, and feelings of fatigue, are representational states. Applying Dretske's thesis that a state may be representational in virtue of having an evolved function of carrying a certain class of information, he argues that these bodily changes constitute perceptual appraisals or evaluations of our relationship to the environment with respect to well-being. He calls his view a non-propositional appraisal theory, because he holds that emotions need not involve propositional attitudes such as belief, judgments, and desires (2004).

## THE NATURE OF THINGS

The classical definitions of emotions were answers to questions of the traditional Socratic form: "What is

regret?" "What is fear?" and so forth. The aim was not to capture the nuances of ordinary usage, but rather to be telling us something about ourselves: to explain, as Spinoza said, "not the meaning of words, but the nature of things" (1883 [1677], p. 178). However, if this is the ambition of the philosophy of emotion, then some philosophers would reply that it is up to science and not philosophy to tell us about the nature of things. In particular, we have to look beyond the terms of ordinary language and the concepts embedded in our everyday "folk" psychology, beyond even the best philosophical attempts to regiment these terms and concepts, if we are to discover what the emotions *really* are. This appears to be a special application of a more general view in philosophy of mind, that of eliminative materialism. However, whatever the merits of that general indictment of everyday psychology and any philosophy that attempts to build on it, there may be special reasons to be skeptical of traditional philosophical thinking about the emotions in particular.

Paul Griffiths maintains that we should use biological evolutionary principles of classification to determine what emotions *really* are. Following Paul Ekman (1992), a leading innovator on the role of facial expression in emotion, Griffiths posits surprise, anger, fear, disgust, sadness, and joy as the basic emotions. These adaptive responses are *evolutionary homologues*, discrete genetically ordained behavioral syndromes that are a legacy of our shared mammalian heritage. Appearing in all cultures, these adaptive responses are associated with the same facial expressions in each culture. The classification here is by descent and homology, rather than by resemblance and analogy, which is more typical of analytic approaches. The special evolutionary status of these basic emotions is reflected in Griffith's philosophical declaration that they are *natural kinds*. That is, they are *projectible* kinds: They share causal properties that are sufficiently well correlated to sustain generalizations from known to unknown cases. However, the term *emotions* does not designate a natural class of kind, for it would serve no scientific purpose to group them with the so-called higher cognitive emotions, such as envy, regret, and shame. Predictably, this thesis has sparked controversy, just as the general thesis of eliminative materialism did two decades earlier. Prinz counters that all emotions are valenced appraisals that exploit common aversive or appetitive mechanisms. Louis Charland (2002) suggests that there is a natural kind of organism that might be called an *emoter*, in virtue of having a brain that meets certain criteria of functional organization.

## NORMATIVITY AND CULTURE

Evidently all cultures have implicit rules governing at least some emotions: not just whether and how they should be expressed, but also whether and under what conditions and in what degree one should have them. In European and North American cultures, at least, emotional responses are commonly measured by standards of rationality, appropriateness, and morality. A particular instance of an emotion may be thought irrational if it is based on an irrational belief or desire. However, it is common to think an instance of emotion may be irrational even if it is not based on an irrational belief or desire; typically, because it is not suited to what it is about. We also judge instances of emotions as too little or too much, for example, in the case of grief or remorse.

It was suggested earlier that the notion of passivity, of being acted on, may be an important feature of the ordinary concept of emotion. However, it is widely assumed that people have some control over how the environment acts on them and are to some degree responsible, not only for the expression of emotion, but for their having the emotion. Aside from regulating one's exposure to eliciting situations, it is supposed that one can in many cases alter the course of the emotion—for example, by intervening cognitively to reappraise the eliciting situation. Indeed, attending to one's emotional state and labeling it may alter the state. It is plausible that when we use emotion labels in giving expression to our emotion, as in, "I'm angry!" Or "I'm in love!" We are shaping as well as describing our emotional state. Emotion kinds would thus be what Ian Hacking (1995) calls "interactive kinds," like race, ethnicity, and gender: To classify one's own state as of a particular interactive kind, or to be so classified by others, tends to alter the state and to influence one's feelings and behavior accordingly.

Social constructionists would emphasize that we are shaping our emotions to fit it into an acceptable cultural mold. The psychologist James Averill argued that the various emotion concepts are merely cultural creations that shape our assessment of certain transitory syndromes. While pretending to be passively moved to behave in certain ways, people are actively adjusting their behavior to fit these cultural categories. Although this theory is a valuable counterbalance to the widely held assumption that our emotions simply "are what they are," it would be extreme to assert that our emotion categories simply create our emotions *ex nihilo* or to deny that the categories themselves are, perhaps in some societies more than in others, flexible and open to change (Reddy 2003).

Emotions seem a particularly nuanced category, varying in uncharted ways from instance to instance. They also vary in the course they follow from moment to moment and day to day. For reasons such as these, as Iris Murdoch (1970), Martha Nussbaum (2001), and Jon Elster (1999) have emphasized, often the best way of defining an emotion type is by reference to literary examples. Literary examples also make it clear that conceptions of emotion vary over time as well as from one present-day culture to another.

The issues addressed in this section may seem hopelessly tender-minded to philosophers who prefer to focus on biological mechanisms and natural kinds. In turn, philosophers drawn to the issues of this section may find the naturalistic focus excessively narrow. What is chiefly at issue is the proper equipment to bring to philosophical thinking about emotions. Should we allow ourselves to conceive human organisms as people and to employ the full panoply of concepts, learned or biologically preordained, that appear to be indispensable for everyday social perception and understanding? Or should we lay aside these concepts and steadfastly conceive human beings only as complex biological systems?

Retaining our everyday tools of social perception, we will find normative questions, matters of passivity and freedom, and the richness and perspectivity of narrative understanding coming to the fore. Laying these tools aside, we can focus on purely naturalistic explanations of emotional phenomena and the natural kinds that enter into these explanations. Partisans of the naturalistic approach may be tempted to assert that only by laying aside the accustomed tools can we discover what emotions "really" are. Partisans of the other approach might argue that to lay down these tools of social perception is precisely to forego understanding people. One important challenge task for the philosophy of emotion will be to determine whether and how to reconcile these two approaches.

## EMOTIVE THEORY OF ETHICS

The term *emotivism* refers to a theory about moral judgments, sentences, words, and speech acts; it is sometimes also extended to cover aesthetic and other nonmoral forms of evaluation. Although sometimes used to refer to the entire genus, strictly speaking *emotivism* is the name of only the earliest version of ethical noncognitivism (also known as expressivism and nondescriptivism).

Classical noncognitivist theories maintain that moral judgments and speech acts function primarily to (a) express and (b) influence states of mind or attitudes rather than to describe, report, or represent facts, which they do only secondarily if at all. For example: To say "Stealing is wrong" is not primarily to report any facts about stealing but to express one's negative attitude toward it. Emotivists also deny, therefore, that there are any moral facts or that moral words like *good*, *bad*, *right*, and *wrong* predicate moral properties; they typically deny that moral claims are evaluable as true or false—at least in respect of their primary meaning. The attitudes expressed by moral judgments are held to be "conative"

(that is, they have a motivational element) and not “cognitive” (that is, they are not beliefs/do not have representational content). Species of noncognitivism are differentiated by the kinds of attitude they associate with moral thought and discourse: emotivism claims that moral thought and discourse express emotions (affective attitudes, sentiments, or feelings) or similar mental states, typically of approval and disapproval, and is therefore sometimes called the “boo-hurrah” theory of ethics.

To understand emotivism, it is important to contrast it with subjectivism, the view that moral judgments and utterances represent, report, or describe someone’s attitudes (for example, that we can translate “Stealing is wrong” as “I disapprove of stealing”). Noncognitivist theories deny that moral expressions of attitude take the form of report or description: They are often vague about the expressive mechanism, but it is supposed to bear a family resemblance to that of ejaculations (for example, uttering “Ouch!” to express being in pain) and performatives (for example, saying “Thank you” to express gratitude). Saying “Stealing is wrong” is therefore like saying “Boo to stealing!”

The significance of this difference is apparent, to the advantage of noncognitivism, when one examines what the strategies have to say about moral disagreements. Subjectivists must accept—whereas noncognitivists deny—that moral claims are made true or false by facts about people’s attitudes. If A asserts “Stealing is wrong,” and B responds “Stealing is not wrong,” it is possible, from a subjectivist view, for A and B to be expressing compatible judgments—if they are reporting the attitudes of different people—and therefore not actually to be disagreeing at all. Although noncognitivism does not portray A and B as disagreeing about any fact, it does claim a “disagreement in attitude”: A opposes stealing, and B does not.

According to emotivists, we engage in moral discourse in order to influence the behavior and attitudes of others. They claim, therefore, that moral utterances have a psychological function of arousing emotions in others, based on a human susceptibility to emotional influence by exposure to the emotional expressions of others. Charles L. Stevenson even identifies a statement’s emotive meaning with this causal tendency.

Almost all emotivist theories acknowledge that moral judgments possess some content that is descriptive and truth-apt. Consider first “thick” evaluative terms such as the names of virtues or vices (for example, *brave*) and pejoratives (for example, *geek*); here it is easy to distinguish a descriptive meaning and an emotive meaning.

But most emotivists also ascribe descriptive content to “thin” evaluative terms like *good* and *right*. One common account of this content (Stevenson 1944, Edwards 1955, Hare 1952, Dreier 1990, Barker 2000, Gibbard 2003) is that the property predicated of an object T by *wrong*, for example, is the property for which the speaker disapproves of T. Suppose Elizabeth declares “Stealing is wrong” and disapproves of stealing because she believes it typically causes misfortune to its victims; then the descriptive meaning of her utterance is that stealing typically causes misfortune to its victims. However, this meaning is deemed secondary because (a) it depends upon the emotive meaning—the descriptive meaning of *wrong* will differ from context to context, speaker to speaker, and even occasion to occasion, according to what arouses speakers’ emotions, and (b) it has little or no moral significance. A and B will argue over whether stealing is wrong if they differ in attitude toward stealing but not if they differ only with regard to which properties arouse their disapproval of stealing or over whether stealing has some particular property.

## HISTORY AND DEVELOPMENT

Although suggestions of emotivism can be found throughout the history of philosophy (David Hume and other early modern sentimentalists have particularly close affinities), the emergence of the theory is usually attributed to a series of short suggestions by British philosophers in the 1920s and 1930s (Ogden and Richards 1923, Barnes 1933, A. S. Duncan Jones as reported in Broad 1933–1934, Ayer 1936); however, earlier formulations appear in German/Austrian value theory from the late nineteenth century (Lotze 1885, Windelband 1903, Marty 1908, and see Satris 1987 for this influence on Anglo-American emotivism). The British emotivists were reacting, in part, to the metaethical theory of nonnaturalism (or intuitionism) advocated by G. E. Moore, H. A. Pritchard, W. D. Ross, and others.

Moore had persuasively argued that moral words could not be defined except in terms of other moral words and inferred (invalidly, as was revealed by the discovery that nonsynonymous terms could be coreferential) that moral words could not refer to “natural” or empirical properties and that moral sentences could not describe natural or empirical facts. Any such attempted definition left out something essential. (This claim is closely related to the alleged is/ought distinction, or “fact-value gap”). Emotivists were convinced by these arguments, but some, influenced by logical positivism—the doctrine that only sentences which are empirically verifi-

able are meaningful—balked at the notion of “nonnatural,” nonempirical moral properties and facts. In their diagnosis, the essential something that cannot be captured by any naturalistic analysis of moral language is the expression of speakers’ emotions.

Emotivism found its greatest and most dedicated champion in the person of the American philosopher Charles L. Stevenson (1937, 1944) and enjoyed its heyday in the 1940s and 1950s (Nowell-Smith 1954, Edwards 1955) before being largely supplanted by forms of noncognitivism that were thought to be less vulnerable to objection (especially the prescriptivism of Hare 1952, 1963). To philosophers seeking to condemn the horrors of World War II in absolute terms, the claim that moral judgments merely express feelings appeared inadequate. Emotivism’s legacy is a widespread recognition today of the significance of emotions for ethical thought, and the efforts of a number of contemporary philosophers since the 1980s—most notably Simon Blackburn (1993, 1998)—who continue to argue for its central tenets.

## THE CASE FOR EMOTIVISM

The philosophical stature of emotivism has risen from a number of solidly argued foundations: the apparent failures of efforts to give naturalistic definitions of moral words or to identify natural properties as their referents, epistemological scruples about the existence of nonnatural properties, and the reliable link between moral judgment and emotion. Philosophers still vigorously disagree about whether or not it is possible to find objective referents for moral terms, however, and there are alternative explanations of the connection between moral judgment and emotion: perhaps moral words name properties that reliably arouse emotional responses in us, perhaps they name the dispositional properties of reliably arousing emotional responses, or perhaps their use conversationally communicates speakers’ approval and disapproval without in any strict sense “meaning” it.

Further, many philosophers maintain that it is possible and not very unusual for people to make sincere moral judgments without feeling or expressing the relevant emotion (this discussion centers on a figure known as the “amoralist”) and that emotive meaning is, therefore, not an essential element of moral judgment. Emotivists commonly respond with the claim that these are not genuine moral judgments but are made in “inverted commas”—i.e. that they merely mimic the practice of moral judgment. The case for emotivism is not bolstered by this claim, however, unless grounds can be found for

accepting the “inverted commas” diagnosis that are independent of emotivist convictions themselves.

The emotivist explanation of moral language also provides simple answers to a number of puzzles in metaethics: First, it explains the fact that people are typically motivated to behave in accordance with their moral judgments. Cognitivists have some difficulty explaining this motivational connection because they identify moral judgments with beliefs. On an orthodox view, a belief is not enough to motivate action by itself; it needs to be combined with a desire or similar conative attitude. But, according to emotivism, moral judgments consist in favorable and unfavorable attitudes, and people are likely to perform the actions they feel favorably toward and likely to avoid actions toward which they feel unfavorably.

Second, emotivism explains the synthetic a priori character of moral judgment stressed by nonnaturalists: that is, that despite the fact that an empirical description of a state of affairs or action entails neither by logic nor by meaning the goodness or badness or rightness or wrongness of that state of affairs or action, its description alone nonetheless suffices for us to be confident in passing moral judgment on it. Although it may seem mysterious how anyone could know just from description of a state of affairs or action that it necessarily possesses some further, unspecified property, we have no such need for further information in order to respond emotionally.

Third, emotivism explains the supervenience of the moral on the empirical: why moral characteristics are such that if two states of affairs differ in any moral respect, they must also differ in some nonmoral or empirical respect. If a person is disposed to have a certain emotional response to some state of affairs, then he or she is disposed to have the same response to any qualitatively identical state of affairs. A person will be disposed to make the same moral judgment about two states of affairs, therefore, unless there is some difference between those states that arouses different emotions. While emotivism has an easier task offering solutions to these problems than most descriptivist theories, it must contend with noncognitivist rivals that offer similar explanatory resources.

## PROBLEMS

Most of the objections to emotivism in particular are also objections to noncognitivism in general and focus on respects in which moral thought and discourse behave like ordinary, factual, truth-evaluable cognitive thought and discourse. These objections have been widely believed to refute noncognitivism of all varieties, and

accordingly the emphasis in recent noncognitivist writing is on the “quasi-realist” project (Blackburn 1993) of explaining how nondescriptive thought and discourse can mimic ordinary descriptive thought and discourse. The treatment here focuses on the significance of these objections for emotivist theories.

#### THE EMBEDDING (OR FREGE-GEACH) PROBLEM.

Emotivism purports to tell us the meaning of moral sentences; however as P. T. Geach (1960, 1965) and John Searle (1962) have pointed out, it and other forms of noncognitivism appear to succeed at most at explaining one kind of use of simple moral sentences: their use in direct assertion (for example, saying “Stealing is wrong”). Emotivism claims the descriptive form of simple moral sentences is merely a disguise. However simple moral sentences are also given many other uses in which they also behave like descriptive sentences and for which emotivist explanations seem inappropriate or impossible. Consider embedding of simple moral sentences into complex sentences and indirect contexts: disjunctions (“Either stealing is wrong, or Robin Hood was a saint”), belief ascriptions (“Elizabeth believes that stealing is wrong”), conditionals (“If stealing is wrong, then Joe ought not take Mary’s lunch”), predications of falsehood (“It is not true that stealing is wrong”), and interrogatives (“Is it true that stealing is wrong?”). In each case, a speaker uses the simple moral sentence “Stealing is wrong” but does not express emotions or unfavorable attitudes towards stealing. The emotivist proposal therefore is not helpful in understanding the simple moral sentence in these uses, which is reason to doubt whether it has captured its meaning at all.

It is possible to extend the emotivist account by assigning meanings in each of these contexts, but doing so introduces a further difficulty. Consider a simple moral argument: *P1. If stealing is wrong, then Joe ought not take Mary’s lunch; P2. Stealing is wrong; P3. Therefore, Joe ought not take Mary’s lunch.* This looks like a standard instance of *modus ponens* and therefore a straightforwardly valid argument. But if we attribute different meanings to “stealing is wrong” as it occurs in each premise, then the argument equivocates, and the conclusion doesn’t follow. (Indeed, if P2 is interpreted as a mere expression of emotion without truth value, nothing can logically follow from it). Emotivism therefore casts doubt on the possibility of drawing inferences to or from moral claims—something we do all the time.

Emotivists as early as Stevenson made use of minimalist theories of truth to argue as follows: to claim that

*p is true* is simply to claim that *p*, so anyone who is disposed to claim “Stealing is wrong” is entitled to claim that “Stealing is wrong is true.” But as the discovery of the embedding problem postdates emotivism’s heyday, we do not find solutions to it from self-identified emotivists. Contemporary noncognitivists, however, devote much attention to the problem (especially Blackburn), and there are two broad strategies available: First, if some meaning can be found for the simple moral sentence that is common to these various embeddings and is compatible with emotivism, then arguably standard logic will allow moral inferences. There are two possibilities here. (a) Some seek to identify a noncognitive content that is common to all uses of moral sentences and that plausibly can be embedded in different sentential contexts. These efforts are characteristically found outside of the emotivist tradition (particularly in the work of Hare and Allan Gibbard), and the strategy does not seem so compatible with the emotivist doctrine that simple moral sentences express emotions; (b) Emotivists can turn to the supposed secondary descriptive content of moral claims to explain moral inferences. Because these descriptive contents have truth values, there is no difficulty in forming valid arguments with them. The success of any such explanation depends on the plausibility of the emotivist’s claim to have identified the truth-conditional content of the premises and conclusions of moral arguments; it is also arguable that any success must come at the cost of abandoning genuine emotivism and noncognitivism.

Second, even if it is granted that there are no truth relations between the premises of moral arguments and between the contents of moral judgments, it is arguable that there are relations of coherence or consistency between the judgments or states of mind that express those contents. Blackburn accordingly proposes and develops a “logic of attitudes,” a system of norms governing the consistency of combinations of attitudes. The conditional premise P1 above, on this view, expresses approval of disapproval of Joe’s taking Mary’s lunch in the circumstance that one disapproves of stealing. A’s attitudes are then allegedly inconsistent if A holds both this second-order attitude and the attitude of disapproval towards stealing expressed by P2 but does not also disapprove of Joe’s taking Mary’s lunch, the attitude allegedly expressed by P3. Accused by a number of critics of conflating logical inconsistency with pragmatic incoherence (Hale 1986, Schueler 1988, Brighthouse 1990, and Zangwill 1992), Blackburn suggests that we can expand the concept of consistency to encompass pragmatic and logical forms. Critics argue that this strategy is not successful: because there is no form of merely pragmatic incoher-

ence that exactly mimics logical inconsistency, Blackburn must claim that some apparently valid moral arguments are actually inconsistent (Hale 1993 and Van Roojen 1996), but noncognitivists have not been deterred.

**REASONS AND JUSTIFICATION.** Emotivism is charged with being unable to accommodate the important role of rational argument in moral discourse and dispute. Although it emphasizes moral discourse's function of influencing others' behavior, it is thought to characterize this efficacy wrongly, as similar in kind to that employed in manipulation, intimidation, and propaganda. According to emotivists, we engage in moral argumentation with the immediate aim of arousing emotions in others, and moral utterances accomplish this by direct psychological causation. Their opponents object that genuine moral discourse involves furnishing others with reasons, as rational agents, to recognize as correct and thereby accept one's moral views (Hare 1951 and Brandt 1959).

It is true that conscientious moral debaters offer factual considerations as evidence or justification for their positions, and emotivists do not deny it. According to Stevenson, moral argument can take both "rational" and "nonrational" (or "persuasive") forms. On Stevenson's view, by a "reason" for a moral judgment we mean any factual consideration that might influence someone's emotions in the direction of that judgment, and therefore "rational" means of moral argument consist in offering such considerations. Protagonists in a debate over the morality of legalized abortion, for example, might dispute the facts about its consequences. "Persuasive" argumentation, on the other hand, consists in the use of emotive language for its direct psychological effects.

One line of objection, spearheaded by Richard Brandt, observes that it is possible to be emotionally influenced by considerations that are morally irrelevant, and argues that emotivism cannot accommodate the distinction between what is morally relevant and morally irrelevant. Stevenson's reply exhibits a typical noncognitivist strategy: he insists that we can meaningfully distinguish between morally relevant and irrelevant influences on people's attitudes but that when we do so, we are making further moral (and hence emotive) judgments. To judge a consideration morally irrelevant is therefore to express disapproval of being emotionally influenced by it.

**OTHER OBJECTIONS.** Clearly not just any emotional response constitutes a moral judgment. Emotivists therefore distinguish moral judgments from other kinds of affective or conative reaction by appealing to a distinctive

kind (or kinds) of moral emotion. Some critics object that moral approval and disapproval cannot be adequately differentiated from other kinds of affective and conative states without invoking the very moral concepts that emotivists seek to explain by them—and therefore that moral emotions are in fact cognitive attitudes. Moral approval, for example, can arguably only be adequately characterized as the attitude of judging something to be morally good. If this is correct, then emotivism puts the cart before the horse in attempting to explain moral judgments by appeal to emotional states. However, if moral attitudes are not cognitive and are simply affective or conative responses, then it is questionable whether they have the sort of first-person authority that moral judgments purport to possess. If Gary's judgment that homosexuality is morally wrong rests on nothing more than a disposition to have an unpleasant feeling when he contemplates homosexuality, then he may have as good or better reason to resist, suppress, or work to change his emotional sensibilities as he has to oppose homosexuality.

Another concern addresses whether emotivism has the resources to distinguish between accepting the negation of a moral claim and not accepting that moral claim. Believing that the next president of the United States will not be a woman is not the same mental state as not believing that the next president of the United States will be a woman; likewise it seems that accepting that abortion is not wrong is not the same mental state as not accepting that abortion is wrong. Critics charge, however, that emotivism has to explain both in terms of not feeling disapproval toward abortion.

Stephen Finlay (2005)

## EMPEDOCLES

(5th century BCE–after 444 BCE)

Empedocles, the Greek poet, prophet, and natural philosopher, was the originator of the doctrine of four elements that dominated Western cosmology and medical thought down to the Renaissance. Empedocles was born in Acragas (Agrigento), Sicily, in the early fifth century BCE and died sometime after 444 BCE. He played a political role in his native city, apparently as a democratic leader, was later exiled, and traveled through other Greek colonies in southern Italy. In one of his poems he describes himself as a "deathless god, no longer a mortal," surrounded wherever he goes by admiring crowds asking for advice, for prophecy, and for a "healing word" to cure them from disease (Fr. 112). A number of anecdotes illustrate his reputation for supernatural powers (including the raising of the dead), and the legend that he died by throwing himself into the crater of Etna gives us an idea of the charismatic impression he left behind in the popular imagination. Modern scholars have often found it difficult to reconcile the scientific and the religious sides of Empedocles' thought. He expounded his views in powerful hexameters, of which considerable fragments are preserved from two distinct poems, *On the Nature of Things* (*Peri Physeōs*) and *Purifications* (*Katharmoi*).

### NATURAL PHILOSOPHY

Theophrastus said that Empedocles was much influenced by Parmenides and even more by the Pythagoreans. Pythagorean influence must be seen in his religious teaching and probably also in the role that he assigns to numerical proportion in the natural combination of the elements. From Parmenides he accepted the fundamental principle that nothing can arise out of nothing, nor can anything perish into nonentity. But whereas for Parmenides this meant that all motion and change must be illusory, Empedocles admits that there is real process in nature: "the mixture and separation of things mixed."

By accepting four distinct elements, or "roots of all things," in place of Parmenides' monolithic Being, Empedocles is able to explain natural change as a result of the combination, separation, and regrouping of indestructible entities. There remains, of course, something illusory about the kaleidoscopic appearance of change. Since there can be no generation or annihilation of anything real, Empedocles insists that to describe natural processes in terms of birth and becoming or death and destruction is to follow a linguistic usage which is systematically misleading (Frs. 8–12). In reality there is only the mixing, unmixing, and remixing of permanent entities.

One generation later a similar view of the discrepancy between the appearance of continual change and the reality of unchanging entities led Democritus to distinguish between primary (or true) and secondary (or conventional) sense qualities. However, there is no reason to believe that Empedocles envisaged any such distinction. He assigns the qualities of color, heat, and moisture to the elements themselves and describes the formation of compounds by analogy with the action of a painter mixing his colors. He seems not to have faced the difficult question posed by such analogies: In what does the indestructibility of the elements consist if their essential properties are those that are seen to change?

Nevertheless, the simplicity of this tetradic scheme and its direct application to the great cosmic masses of land, sea, atmosphere, and celestial fire (that is, sun, stars, and lightning) led Plato, Aristotle, and most of their successors to adopt the doctrine of four elements in variously modified forms. Empedocles himself developed the doctrine in a grandiose cosmology that can be reconstructed only in part. The four elements interact under the influence of two cosmic powers, Love (or Aphrodite), on the one hand, and Strife (or Quarrel), on the other. These powers function respectively as forces of attraction and repulsion, but they are also conceived of concretely as ingredients in the mixture. They operate as a kind of dynamic fluid, comparable in some respects to the concept of phlogiston in early modern science. The power of Love or attraction acts first by bringing like together with like—for instance, earth to earth, fire to fire—but it also assimilates the elements to one another, so that what were originally unlikes become like and are united in a new, homogeneous compound (Fr. 22). Love thus represents the power of organic unity and creative combination.

The process of world formation occurs in a cycle that may be said to begin with a totally homogeneous fusion of the elements in a primordial sphere under the exclusive influence of Love. The process of differentiation is set off when Strife makes its entry into the sphere, in accordance with some fixed periodic scheme. It would seem that the cosmic sphere is always saturated with one or the other of these powers or, more frequently, with both of them in a variable ratio; the quantity of Love present in the world varies inversely to that of Strife (Frs. 35 and 16). The life cycle of the universe thus oscillates between the poles of unity and diversity: “Now there grows to be one thing alone out of many; now again many things separate out of one; there is a double generation of mortal beings, a double disappearance” (Fr. 17). This has generally been taken to imply that the creation of things occurs twice,

first in the passage from unity under Love to complete diversity under Strife and again in the reverse process from separation of all things to total fusion. (The standard interpretation has recently been challenged by Jean Bollack, who denies that Empedocles intended a double cosmogony. See bibliography.) The present phase of the world cycle is apparently regarded as one of the increasing prevalence of Strife.

Empedocles gave some account of the structure of the heavens and also of the phenomena of earth, sea, and atmosphere which the Greeks studied under the title of meteorology, but the remains of his physical poem show an equal or greater concern with zoology and botany. In the microcosm of plants and animals he discovered the same principles of elemental mixture, harmony, and separation at work. Following up an idea of Anaximander's, he imagined several phases in the emergence of living things from the earth (in combination with other elements), plants preceding animals, and he describes earlier, monstrous forms of animal life. As in Anaximander sexual reproduction appears only in the latest phase of the development. But the details of his doctrine are obscure, and it is difficult to say how far there is any significant anticipation of the theory of evolution.

**PHYSIOLOGY AND PSYCHOLOGY.** Empedocles shows a keen interest in embryology and physiology, explaining the structure of the eye by analogy with that of a lantern (Fr. 84) and comparing the process of respiration (including the movement of the blood) with the siphon effect of the clepsydra or water pipe, which retains or releases fluid by means of air pressure (Fr. 100). The notion of elemental combination is specified in numerical terms for certain living tissues. Bones are formed by earth, water, and fire in the ratio 2:2:4. The blend of the elements is most equal in flesh, especially in blood (Fr. 98).

Physiology passes over into psychology without a break. (It is clear that as a doctor Empedocles would have practiced psychosomatic medicine.) Blood is the primary seat of thought and perception (Fr. 105) precisely because it is here that the elements are most equably blended. Fundamental in Empedocles' psychology, as in his physics, is the principle of like to like. We see earth with the earth that is in us, water with water, love with love, strife with strife (Fr. 109). This and other passages in Empedocles suggest a one-to-one correspondence between the corporeal elements as such and our conscious experience of them. More precisely, his view seems to be that of a radical panpsychism in which, on the one

hand, all elemental bodies are endowed with thought and sensation (Frs. 102–103) and, on the other hand, knowledge itself is treated like a physical thing obeying the laws of combination, attraction, and repulsion. Thus, Empedocles announces that his own teachings, if carefully assimilated, will form part of the character and elemental composition of the student, whereas, if neglected, “they will leave you in the course of time, yearning to return to their own dear kind; for you must know that all things have intelligence and a share in thought” (Fr. 110). Hence, all our conscious thought and feeling has its direct counterpart in the elemental blend within us (Frs. 107–108), which is itself continually being altered by the stream of incoming and outgoing material (Frs. 89, 106).

### RELIGIOUS TEACHING

The religious views stated in the *Purifications* are so strange and so dogmatically presented that some scholars—H. Diels and Ulrich von Wilamowitz, for instance—have supposed that this poem dates from a later, less scientific period in Empedocles’ life, reflecting some religious conversion after the bitter experience of exile. Now, the *Purifications* may, in fact, have been composed later than the physical poem, but no biographical development can resolve the alleged contradiction between the scientist and the mystic in Empedocles, for the physical work also presupposes a religious point of view.

In particular, *On Nature* proclaims the immortality and preexistence of the soul (or life principle) as a special case of *ex nihilo nihil*. In Empedocles’ view the Parmenidean law of conservation for all real entities guarantees the indestructibility of life in exactly the same way as it guarantees the imperishability of the elements. Hence, only fools can “imagine that men exist merely during what we call life, but that they are nothing at all before being composed or after they are dissolved” (Fr. 15; compare with Fr. 11). Since it is precisely the doctrine of immortality that is supposed to contradict the psychophysics of Empedocles, this contradiction, if it exists, must be located within the physical poem. Furthermore, the same poem implies a developed theology in the description of the primordial cosmic sphere as a “god” (*theos*, Fr. 31), in the reference to the four elements as immortal deities (*daimones*, Fr. 59; compare with Fr. 6), and in the apocalyptic pronouncement of the power of Love-Aphrodite (Fr. 17). Some readers might be inclined to discount such expressions as mere features of poetic style, but such a literary interpretation of theological language, which may be appropriate in the case of Lucretius, seems unconvincing for Empedocles, who appeals to

principles of piety and purity throughout the poem (Frs. 3–5, 110, and so on).

The religious views thus alluded to in the physical poem receive emphatic statement in the *Purifications*. Here Empedocles proclaims his own divinity and traces his career as an immortal *daimōn*, banished from the company of the other gods for some prenatal crime; passing through a series of vegetable, animal, and human incarnations; at last attaining the purified life of “prophets, poets, doctors, and leaders”; and now ready to escape from human misery altogether and return once more to the blessed fellowship of the gods. Part of the process of purification consists in the ritual abstinence from meat and certain other foods, such as beans and laurel leaves. This joining of the belief in transmigration with the religious practice of vegetarianism is distinctly Pythagorean. If one adds Empedocles’ notion that birth in human form means that the *daimōn* is clothed in an alien garment of flesh (Fr. 126) as a result of a lamentable fall from bliss (Fr. 118), one has a particularly striking example of that otherworldly tendency in Greek religion that is generally known as Orphic and that exercised such a profound influence on Plato as well as on the religious thought of late antiquity.

Remote as this view may seem from the biology and physics of the poem *On Nature*, Empedocles has taken care to preserve a sense of continuity between his religious teaching and his cosmology by a number of parallels, in particular by identifying the primeval sin of the *daimōn* (for which it is punished by incarnation in the cycle of rebirth) as “reliance on Strife.” The fellowship of the purified spirits is conceived by contrast as a realm of Love and affection. Thus, the precosmic sphere of the physical poem is paralleled in the *Purifications* by an account of a bygone golden age in which war and bloodshed were unknown, affection prevailed between man and beast, and Aphrodite was queen (Frs. 128–129). Although both poems (which are addressed to different audiences) probably cannot be fitted together at every point, Empedocles clearly thought of the two as compatible, perhaps as complementary views of the world of nature (or physical transformation) and the world of spirit (or divine life). As a result of his panpsychism, Empedocles was able to conceive of nature and spirit as forming two aspects of a single whole rather than as constituting two entirely distinct realms. In any case the essential structure of both worlds is characterized by the same, almost Manichaean rivalry between the beneficent force of Love and the destructive power of Strife. If one sees Love in the physical poem as the cosmic counterpart

of the immortal *daimōn* and his extramundane homeland, Empedocles' whole cosmology will appear as a construction designed to find a place for the Pythagorean doctrine of the transmigrating soul within the shifting and unstable world of elemental strife that had been described by the Ionian natural philosophers.

This reconciliation of the two poems is possible only if one admits the identification of the transmigrating *daimōn* with the element of divine Love—that is, with the unifying principle of intelligent organization present within each one of us but also present throughout nature. This identification has been accepted by Francis Macdonald Cornford and by others, and there is much to be said for it. But it is only fair to add that the identification cannot be proved from the extant texts and that some responsible scholars have denied that there is any possibility of reconciling the doctrine of immortality with the physical psychology of *On Nature*.

One should note Empedocles' clear statement—the first by any Greek—of the notion of an invisible, incorporeal, nonanthropomorphic deity, characterized as a “holy mind [*phrēn*] alone, darting through the whole cosmos with rapid thoughts” (Frs. 133–134). Before Empedocles, Xenophanes had insisted that the “greatest god” must be nonanthropomorphic, but he did not specify its incorporeality. On the other hand, Anaxagoras' principle of mind is clearly noncorporeal, but it is not described as a deity. Empedocles seems to have worked the Anaxagorean principle into his own theology. The phrasing of his account of the spiritual deity recalls the verses concerning Aphrodite as well as the description of the divine sphere. All three principles—the sphere in which the elements are joined, the attractive force of Aphrodite, and the “holy mind” of the cosmos—must somehow have been related in Empedocles' theology, perhaps as three different expressions of the universal power of Love. If so, Empedocles' theology forms the direct continuation of his psychology, since (on the interpretation offered above) it is this same power of Love that figures in the human microcosm as the transmigrating *daimōn*.

## EMPEDOCLES [ADDENDUM]

The philosophy of Empedocles remains the subject of widely diverging interpretations. This is so despite the discovery of important new evidence, which, far from dousing old debates, has instead further inflamed them. The following account seeks to chart the impact of the new material on a number of these still-open questions, without, however, ignoring significant contributions made to scholarship before it. Because the assessment of this material is still in its early days, the debate on many points may yet shift in one or the other direction.

### THE NEW EVIDENCE

Notwithstanding the addition of a few elements to the corpus since Diels's edition, the study of Empedocles truly entered a new era in 1999 with the publication, by Alain Martin and Oliver Primavesi, of the Strasburg papyrus of Empedocles. The papyrus, assembled from numerous smaller pieces, consists of four larger sections, called by the editors sections a, b, c and d, and a few left-over scraps. These comprise a total of seventy-four hexameter lines, some very partial, of which twenty overlap with lines already known, making the identification of the text certain. By a stroke of luck, the largest section, a,

continues the thirty-five-line Fr. 17, for another thirty-four lines, and thanks to a line-numbering mark in the margin of the papyrus, we can establish that the whole of Fr. 17 section a spanned lines 232 to 300 of its book. That book, as we know from Simplicius, the Aristotelian commentator, was book I of the work he calls the *Physics*, or *On Nature*. In these new lines, Empedocles moves from the broad cosmic cycle described in Fr. 17 to assert the capacity of the six principles to generate “all things,” including men and women, trees, and “long-lived gods.” The elements as cosmic bodies are described next, including a possible reference to a “we”—that is, humanity—within the churning world masses, but the reconstruction of these lines is controversial, the papyrus being poorly preserved. The section ends with a ten-line address to the disciple in which Empedocles promises to put before his eyes and ears “truthful proofs of my words” by showing Love and Strife at work in all manner of living creatures.

The second-longest new passage, however, section d, is the most significant for the interpretation of Empedocles. Its importance comes from the fact that, for the first time, we can see Empedocles moving from the theme of death and reincarnation, in lines 5–9, to cosmology and the origins of life, in lines 11–18, through a one-line transition at d 10. (Notably, d 5–6 overlap with the previously known Fr. 139, linked by its source to “purifications,” and where Empedocles laments “shameful deeds” for the sake of food [that is, meat-eating]. The new text shows that these deeds were wrought “with claws,” presumably in an earlier incarnation; the previous text had “for my lips,” a much weaker reading.) Thus, unless we are willing to imagine that section d is from a different poem than the other papyrus sections, we are forced to admit that the poem that Simplicius called the *Physics* dealt with reincarnation as well.

### THE NUMBER OF WORKS

Before the papyrus, the most important development in Empedoclean scholarship was the attempt to reject the older division of the fragments and assign them all to a single work, forcefully argued by Catherine Osborne in 1987 and Brad Inwood in 1992. But if section d now stands against any neat division of the fragments between religious and scientific content, it does not directly prove that there was only one work. Here one may speak, rather, of a shift in probabilities. In favor of the thesis that there was but a single work section d shows that *Purifications* material featured in the other supposed poem, raising the possibility that when Diogenes Laertius gives both titles (*Lives of the Philosophers* 8.77, the only source where they

occur together), he might in fact be giving one long title, like Hesiod’s *Works and Days*. In that respect, it is noteworthy that Diogenes gives a single line total for *both* supposed works. Further, the position of Fr. 17, well into Book I, combined with the testimony of Plutarch (who, at *De exilio* 607 c, says that Fr. 115, on the exile of the *daimōn*, was “proclaimed in the beginning of [Empedocles’] philosophy”), argues for a long opening section, or proem, on more traditional themes, as in Parmenides or Lucretius.

But against the single-work thesis there still stands the difficulty that Empedocles has two sets of addressees, the “Friends from Acragas” in Fr. 112, to whom he declares himself a god, and his single disciple Pausanias, to whom he imparts the *On Nature*. A critique of the single-work approach was made by Denis O’Brien (1969), before the discovery of the Strasburg papyrus, whereas the case for a single work has been renewed by Trépanier (2004) on the basis of the new evidence. But the debate on the number of works should not obscure the more fundamental contribution of section d to our understanding of Empedocles: the renewed emphasis it places upon the unity of his thought.

### THE UNITY OF EMPEDOCLES’ THOUGHT AND THE DAIMŌN

The unity of Empedocles’ thought seems to be the one area of emerging consensus. This is in part the result of section d but was also a trend before the papyrus was discovered. Yet if it now seems likelier than ever that Empedocles had only one philosophical system, this may also make the apparent also seem to drive the contradiction between the reincarnated *daimōn*—or more strongly, its immortality—and Empedocles’ physics all the more potent. The contradiction seems to be the following: If the transmigrating *daimōn* is a compound of elements, then even if it could survive from one reincarnation to the next, it could not survive that phase of the cosmic cycle when Strife dominates and no stable compounds endure—at least on the traditional reading of the cycle. To deal with this, a number of alternatives have been put forth. One may downplay the apparent contradiction in various ways: (1) a developmental scheme, no longer favored, posits that Empedocles changed his mind—he wrote two poems, at different stages in his life; 2) less charitably, it has been suggested that, as a poet, Empedocles did not see a contradiction, or if he did, did not care; 3) more subtly, some propose that the *Purifications* constituted the exoteric, popular version of his philosophy, meant to thrill the crowd with promises of personal sal-

vation, whereas the esoteric *On Nature* reinterpreted that salvation as a more stringent and impersonal elemental immortality.

Alternatively, one can try to remove the contradiction by reconciling his conception of the *daimōn* with his physics. One version of this argument identifies the *daimōn* with the first principle Love, thereby denying that is a compound but granting it immortality. Or one may allow that the *daimōn* is a compound, admitting its reincarnation but denying its survival beyond one full cosmic cycle—that is, denying it full-blown immortality. To long-lived but not immortal being one can compare the “long-lived gods” of Fr. 17. The again, some interpretations of the cosmic cycle have held that Strife, while still powerful and active, will never again have complete sway. Thus, immortality might be possible for some compounds.

## THE COSMIC CYCLE

That Empedocles held a doctrine of cyclical cosmic history has been generally accepted, but the actual form it took has been the subject of a surprisingly vast debate. The traditional account was the object of several challenges in the 1960s, but also of several powerful rehabilitations, of which O’Brien (1969) is the most comprehensive. Although the traditional version stresses the symmetry of the cycle and thus the equality of Love and Strife, in most alternative versions Strife is denied any creative and hence positive role in the world. Instead of the full pendulum swing found in the traditional version, and the dual creation and destruction it implies, Love would always be creative, Strife always destructive. This view was argued at greatest length by Jean Bollack (1969). To be sure, the constructive role Love plays in Empedocles’ biology is far more prominent than that of Strife, whereas in his cosmology Strife is more conspicuous. But this imbalance may be no more than a difference of depiction in the original, for, as Daniel Graham (1988) has well shown, in the passages where the two powers are described together, waxing and waning over the whole macrocosm, they are systematically portrayed as equals.

## EMPIRICISM

Empiricism is the theory that experience rather than reason is the source of knowledge, and in this sense it is opposed to rationalism. This general thesis, however, can

receive different emphases and refinements; hence, those philosophers who have been labeled empiricists are united only in their general tendency and may differ in various ways. The word *empiricism* is derived from the Greek *εμπειρία* (*empeiria*), the Latin translation of which is *experientia*, from which in turn we derive the word *experience*. Aristotle conceived of experience as the as yet unorganized product of sense perception and memory; this is a common philosophical conception of the notion. Memory is required so that what is perceived may be retained in the mind. To say that we have learned something from experience is to say that we have come to know of it by the use of our senses. We have experience when we are sufficiently aware of what we have discovered in this way. There is another, perhaps connected, sense of the term *experience* in which sensations, feelings, and so on, are experiences and in which to perceive something involves having sense experiences. These are experiences because awareness of them is something that happens to us. Indeed, the suggestion of passivity is common to uses of the word. To go into refinements here would not be relevant; one need only appreciate that the statement that experience is the source of knowledge means that knowledge depends ultimately on the use of the senses and on what is discovered through them. Sense experience may be necessary for the attainment of experience, but for present purposes that is unimportant.

The weakest form of empiricism is the doctrine that the senses do provide us with “knowledge” in some sense of the word. This could be denied only by one who had so elevated a conception of knowledge that the senses cannot attain to it. Plato, for example, held at one stage that because of the changeability of the world of sense, sense knowledge lacks the certainty and infallibility that true knowledge must possess. Hence, knowledge cannot be derived from the senses, but only from some other kind of awareness of what he called Forms. The most that sense perception could do would be to remind us of this genuine knowledge. This conception of knowledge demands an infallibility that sense perception cannot provide. Normally, we do not demand such high standards of knowledge, nor do we succumb to this kind of skepticism about sense perception. The commonsense view is that the senses do provide us with knowledge of some sort, and most people, when philosophizing, adopt this kind of empiricist view.

This weak form of empiricism can be generalized into the thesis that *all* knowledge comes from experience. The extreme form of this thesis would be the claim that no source other than experience provides knowledge at

all. But this formulation is ambiguous, because there could be various reasons why all that we know might be dependent in some way upon experience. One reason might be that every proposition that we know is either a direct report on experience or a report whose truth is inferred from experience. A *prima facie* exception to such a thesis is provided by the propositions of mathematics; they have usually been thought to be *a priori*, not *a posteriori*—that is, we can know their truth independently of experience. There have, however, been philosophers who have denied the *a priori* nature of mathematical propositions. J. S. Mill, for example, maintained that the propositions of mathematics are merely very highly confirmed generalizations from experience and, consequently, all propositions are either reports on experience or generalizations from experience. This view has not been widely accepted.

A second reason for maintaining that all knowledge is dependent on experience would be that we can have no ideas or concepts that are not derived from experience, that is, that all concepts are *a posteriori*, whether or not the truths which can be asserted by means of these concepts are themselves *a posteriori*. It may be that we know some propositions without having to resort immediately to experience for their validation; for their truth may depend solely on the logical relations between the ideas involved. Yet these ideas may themselves be derived from experience. If all our ideas are so derived, then knowledge of any sort must be dependent on sense experience in some way. According to this thesis, not all knowledge is derived immediately from experience, but all knowledge is dependent on experience at least in the sense that all the materials for knowledge are ultimately derived from experience. St. Thomas Aquinas was an empiricist in this sense. He thought that all our concepts are derived from experience, in that there is “nothing in the intellect which was not previously in the senses” (a doctrine supposedly derived from Aristotle). He did not think, however, that all knowledge either consists of sense experience or is inferred inductively from experience. Similarly, John Locke held and tried to show that all our ideas are derived from experience, either directly or by way of reflection on ideas of sense. He did not hold, however, that all knowledge was sense knowledge.

It is possible to argue an even more complex thesis. It may be held that while there are ideas which are not derived from experience—*a priori* ideas—and while there are *a priori* truths which may or may not involve *a priori* ideas, such ideas and truths only have application on the precondition that there is experience. That is to say

that—for human beings at any rate—reason can function only by way of some kind of connection with experience; “pure” reason is impossible. This was, in effect, Immanuel Kant’s position, and although he did not call himself an empiricist *simpliciter*, he was certainly opposed to what he called dogmatic rationalism. He held that there is no place for forms of knowledge of reality which are derived from pure reason alone.

It is possible, then, to maintain a general empiricist thesis that all knowledge is derived from experience on the grounds either that (1) all that we know is directly concerned with sense experience or derived from it by strictly experiential means, that is, learning, association, or inductive inference; or (2) all that we know is dependent on sense experience in that all the materials for knowledge are directly derived from sense experience; or (3) all that we know is dependent on sense perception in that even though we can know some things a priori, this is only in a relative sense, since the having of experience is a general precondition for being said to have such knowledge. None of these theses demand any more than the ordinary conception of knowledge. They do not demand that the knowledge in question should possess absolute infallibility so that the possibility of error is logically excluded. For none of the theses in question is essentially designed to be an answer to skepticism.

### EMPIRICISM AND SKEPTICISM

Some forms of rationalism, for example, the Platonic theory already referred to, are meant to be answers to skepticism. They presuppose that an adequate reply to philosophical skepticism can be given only by showing that reason can provide forms of knowledge where error is logically excluded. The search for certainty, so intimately associated with seventeenth-century rationalism in general and René Descartes in particular, aimed at showing that knowledge is possible because there are some things about which we cannot be wrong. Empiricism can be a rival to rationalism, not just in the sense already noted—that it may reject the supposition that reason by itself, without reference to sense perception, can provide knowledge—but also in the sense that it proposes an alternate way of arriving at certainty. Empiricism, in this sense, is the thesis that the certainty required to answer the skeptic is to be found in the deliverances of the senses themselves and not in the deliverances of reason. Rationalism and empiricism, in this sense, are agreed that some such certainty must be found if skepticism is to be answered. They disagree about the sources of that certainty and about the method by which the rest of what we

ordinarily call knowledge is to be derived from the primary certainties. Whereas rationalism seeks to derive knowledge in general from certain primary axioms (the truth of which is indubitable) by means of strictly deductive procedures, empiricism seeks to build up or construct knowledge from certain basic elements that are, again, indubitable. The clearest expression of this point of view is probably to be found in twentieth-century empiricism, especially that associated with the logical positivist movement. This point of view is also found in the British empiricists of the seventeenth and eighteenth centuries, Locke, George Berkeley, and David Hume, but in their case it is overlaid with other elements and other forms of empiricism, some of which have already been noted. A short historical survey may serve to pinpoint the main issues.

### EMPIRICISM IN GREEK AND MEDIÉVAL PHILOSOPHY

It is often said that, in one sense, Aristotle was the founder of empiricism. Certainly Thomas Aquinas believed that he had Aristotle’s authority for the view that there is nothing in the intellect which was not previously in the senses. It is not clear, however, that Aristotle ever raised this question. When he spoke of the relations between reason and the senses, he was concerned with issues in the philosophy of mind rather than with epistemology. Certainly Aristotle seems to have believed that knowledge is possible outside the immediate sphere of the senses and that reason can and does furnish us with necessary truths about the world. Aristotle’s place in the development of empiricism, then, remains unclear.

Perhaps the first declared empiricist was Epicurus, who maintained that the senses are the only source of knowledge. Epicurus was an extreme atomist and held that sense perception comes about as a result of contact between the atoms of the soul and films of atoms issuing from the bodies around us. By this means *phantasiae* (appearances) are set up. These are all veridical. All sensations are true, and there is no standard other than sensation to which we may refer our judgments about the world. Sensations are set up in the soul by external stimuli, and for this reason Epicurus takes them to be “given.” They constitute *phantasiae* when they occur in bulk. There is no further evidence that can be adduced in order that their veridicality may be assessed, either from other sensations or from reason. This is not to say that we cannot be in error concerning objects of perception; the films of atoms may become distorted in transit or the *phantasiae* caused by them may be fitted to the wrong *prolep-*

sis (conception). The last is a kind of abstract idea built up from successive sensations; the fitting of a *phantasia* to a *prolepsis* is what corresponds to judgment in Epicurus. It would appear that what Epicurus meant by his assertion that all sensations are true was that since they are caused in us, we can go no further in seeking information; they may not make us have true knowledge of objects, but in themselves they are incorrigible. Precisely how all knowledge was to be built up from these sensations is not clear, and it has often been remarked that the axioms on which Epicurus's metaphysical system rests are far from the data of sense and are often based on more or less a priori arguments. Nevertheless, Epicurus's ideal of knowledge is one which not only depends on experience for its materials but is based on basic truths of experience.

A theory of knowledge similar in many ways to that of Epicurus may be found in St. Thomas Aquinas, although the main sources of Thomas's philosophy are to be found in Aristotle. Thomas was not a complete empiricist, for he did not think that all knowledge was derived from truths of experience. Knowledge of God, for example, could be obtained in other ways, and his existence could be proved by logical argument. Yet Thomas did think that the materials for knowledge must be derived from sense experience, and he gave an account of the mechanism by which this comes about. Roughly, when the sense organs are stimulated, there also results a change in the soul, which is the form of the body; this is a phantasm, a kind of sensory image. In order for sense perception to occur, the universal character of the phantasm must be seen as such. For this purpose, Thomas resorted to Aristotle's distinction between an active and a passive reason. The active reason has to make possible the acquisition by the passive reason of the sensible form of the object of perception by a process which Thomas—probably adapting an analogy used by Aristotle—described as the illuminating of the phantasm. The active reason reveals the sensible form of the object by abstraction from the phantasm. This form is imposed upon the passive reason, which produces a *species expressa*, or verbal concept, which in turn is used in judgment. This process is called the *conversio ad phantasmata*; all concepts are arrived at in this way, by abstraction from phantasms. Hence, in applying them to entities that cannot be objects of perception, we must do so by means of analogies of various kinds with sensible objects. Thomas's empiricism is, therefore, limited to concepts, and it is only in this limited sense that he held “there is nothing in the intellect which was not previously in the senses.”

## THE BRITISH EMPIRICISTS

When thinking of empiricism, one tends to think, above all, of the British empiricists of the seventeenth and eighteenth centuries.

LOCKE. John Locke was an empiricist in roughly the same sense that Thomas was, and he set the tone for his successors. His “new way of ideas,” as it was called, had as its purpose “to inquire into the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent.” The reference to certainty makes it appear that he was concerned with skepticism or with skeptical arguments similar to Descartes's method of doubt. Locke's solution to this problem, however, was by no means consistently empiricist. His main target for attack was the doctrine of innate ideas, the doctrine that there may be ideas with which we are born or, at any rate, which we do not have to derive from sense experience. The first book of his *Essay concerning Human Understanding* is devoted to a biting attack on this doctrine. In the rest of the book he sets out a positive account of the way in which ideas are built up, explaining that by “idea” he means that which the mind “is applied about whilst thinking.” Ideas may be either of sensation or of reflection upon those of sensation; there is no other source. Ideas are also classified as simple or complex, the latter being built up out of the former. The mind has a certain freedom in this process, which may lead to error. (Locke later admitted ideas of relation and general ideas alongside the simple and complex.) The second book of the *Essay* is an exhaustive account of the way in which all objects of the mind are built up from ideas of sense. In this respect, then, Locke's philosophy may be considered an attempt to show in detail the truth of the kind of view which Thomas had embraced, without accepting the same view of the mechanism whereby ideas come into being.

But Locke wanted to assess the certainty of our knowledge as well as its extent. The mind's freedom in forming complex ideas is a source of error, but in the case of simple ideas the mind, to Locke, was like a great mirror, capable of reflecting only what is set before it. Nevertheless, he did not maintain that all our ideas reflect the exact properties of things nor that all knowledge is of this character. In the fourth book of the *Essay* he asserts that all knowledge consists of “the perception of the connection of and agreement, or disagreement and repugnancy, of any of our ideas,” but he goes on to distinguish three degrees of knowledge—intuitive, demonstrative, and sensitive. We can have intuitive knowledge of our own exis-

tence, demonstrative knowledge of God's existence, and sensitive knowledge of the existence of particular finite things. Intuition and demonstration bring certainty with them; they provide in effect a priori knowledge. The question of how there can be a priori knowledge of the existence of anything and how this can be a matter of the agreement or disagreement between ideas presents many problems.

These problems become acute in connection with sensitive knowledge. Locke tried to argue at one point that knowledge of the existence of particular finite things is a matter of the perception of the agreement of our ideas with that of existence. This will not do; to know that something exists is not to know merely that the idea of it fits in with the idea of existence. Hence, Locke admitted that this knowledge has not the certainty of the other two, although he insisted that it goes beyond mere probability and is commonly thought of as knowledge. He also tried to argue for the claim that we do have knowledge of sensible things, maintaining that simple ideas are caused in us in such a way that the mind is passive in receiving them. Moreover, the senses may cohere in their reports. None of these considerations really show that we do have knowledge of sensible things, and Locke admitted that they did not amount to proof.

Locke did not claim that *all* our ideas correspond to the properties of things. He felt this claim was true in the case of the so-called primary qualities, for example, bulk, figure, and motion, qualities without which, he maintained, a thing could not exist. It was not true of secondary qualities—for example, color and taste. In this case, the properties of things cause us to have ideas that are not representative of those things; the term “secondary *quality*” is thus a misnomer. Locke's denial of the real existence of secondary qualities turns on his assimilation of our ideas of them to feelings like pain. (His acceptance of primary qualities was probably influenced by the success of physics in his time and its preoccupation with these properties of things.) As for things themselves, Locke maintained that we have little or no knowledge of their real essence, only of their nominal essence—their nature as determined by the way in which we classify them. This is due to the weakness of our senses. We cannot penetrate to the real essence of things, and our ideas of substances are mostly those of powers—the powers that things have to affect us and each other. It can be seen from all this that Locke was an empiricist in a very limited sense. In his view all the materials for knowledge are provided by sense perception, but the extent and certainty of sensible

knowledge is limited, while on the other hand, there is nonempirical a priori knowledge of nonsensible things.

BERKELEY. One aim of Berkeley, the second of the British empiricists, was to rid Locke's philosophy of those elements that were inconsistent with empiricism, although Berkeley's main aim was to produce a metaphysical view which would show the glory of God. According to this view, there is nothing that our understanding cannot grasp, and our perceptions can be regarded as a kind of divine language by which God speaks to us; for God is the cause of our perceptions. The *esse* of sensible things is *percipi*—they consist in being perceived and they have no existence without the mind. There exist, therefore, only sensations or ideas and spirits that are their cause. God is the cause of our sensations, and we ourselves can be the cause of ideas of the imagination.

Berkeley argued against those elements of Locke's philosophy that presupposed a physical reality lying behind our ideas. He attacked Locke's conception of substance and the distinction between primary and secondary qualities, pointing out that there was no distinction to be made between them in respect of their dependence on mind. He also attacked the doctrine of abstract ideas which Locke had held, the doctrine that we have general ideas of things abstracted from the conditions of their particular existence—Locke's theory of universals. This Berkeley did because he believed that Locke's theory might provide a loophole for asserting the existence of an idea of substance. The outcome of this was Berkeley's claim that there are no restrictions on the extent of our knowledge. We have knowledge of the existence of God and ourselves to the extent that we have notions of these spirits. We have knowledge of everything else, since the existence of everything else is a matter of its being perceived. There is nothing further beyond our ken. Even subjects such as geometry, which might be supposed to involve knowledge of nonempirical matters, had to be limited in scope in order to rule out nonempirical objects of knowledge. Thus, Berkeley maintained that there is a least perceptible size; hence, there can be no ideas of infinitesimals or points.

In addition to claiming unrestricted scope for our knowledge, Berkeley asserted that knowledge is entirely dependent on sensations for all its materials other than the notions we have of God and ourselves. Berkeley claimed that this view “gives certainty to knowledge” and prevents skepticism. At the same time it defends common sense, he argued, because it does not involve the postulation of a reality behind ideas. His view gave certainty, he

held, because sensations are by definition free from error; for error can arise only from the wrong use of ideas in judgment. The certainty of our sensations is due to the fact that there can be no question whether they actually represent a reality behind them; and this is the basis of Berkeley's claim to deal with skepticism. In general, all knowledge apart from that of our own existence and of God must, for Berkeley, ultimately be derived from sense perception. With these exceptions, therefore, Berkeley was an empiricist not only in respect of the scope and materials of knowledge but also in respect of its foundations. All truths must be founded on the truths of sense experience. The relations between ideas, which Locke had found a source of knowledge, were, for Berkeley, the result of the mind's own acts.

The mind operates upon the ideas given to it, comparing or contrasting them; it does not merely record what is there. Formal disciplines like mathematics, which might be thought to turn on the relations between ideas, thus depend on the ways in which the mind arbitrarily puts ideas together. Hence, to put the matter in terms more familiar today, mathematics is as much a matter of invention as discovery.

HUME. In respect to relations between ideas Hume perhaps went back to Locke, but in other respects much of Hume's philosophy may be represented as an attempt to rid empiricism of the remaining excrescences of nonempiricist doctrine in Berkeley. As to the materials for knowledge, Hume tried to improve on his predecessors with attempts at greater precision. He distinguished first between impressions and ideas, the former being the contents of the mind in perception, the latter those in imagination, and so on. He further subdivided ideas into those of sense and those of reflection, and again, into those which are simple and those which are complex. Like Berkeley, he denied the existence of anything behind impressions, and a cardinal point of his empiricism, to which he returned again and again, was that every simple idea is a copy of a corresponding impression. The understanding is therefore limited to these mental contents. Hume's main method in philosophy was what he called the "experimental method," the reference in all philosophical problems to the discoveries of experience. In effect, the conclusions which he drew from this are the opposite of Berkeley's. They can produce only skepticism. No justification can be given for belief in the existence of the self and an external world, for example. Reason cannot justify such beliefs, for all that we are given is a bundle of impressions and ideas. Only a psychological explanation can be given to account for our having such

beliefs. Hume gives such an explanation in terms of the constancy and coherence of our impressions and ideas, and the principles of the association of ideas.

Hume's theory of knowledge is based on a distinction between two kinds of relations of ideas. In the *Treatise of Human Nature* he makes the distinction between relations that depend completely on the related ideas and those that can be changed without changing the ideas. The former, in effect, constitute necessary connections, the latter factual ones. In the later *Enquiry Concerning Human Understanding* he short-circuited the discussion by distinguishing simply between relations of ideas and matters of fact. Mathematics depends entirely on relations of ideas and is thus concerned with necessary truths, the denial of which involves a contradiction. Matters of fact may rest simply on observation, but in the causal relation Hume finds the only case of a matter-of-fact relation that can take us from one idea to another. He shows that statements of causal connection cannot be logically necessary truths, in spite of the fact that we do attach some necessity to causal connections. After a long discussion he finds the explanation for this in the fact that causes precede their effects, are contiguous to them, and are such that there is a constant conjunction between them. As a result, the mind, through custom, tends to pass from one to the other. The feeling derived from this, which is an impression of reflection, constitutes the feeling of necessity that we find in the causal connection.

Hume denied any real connection between cause and effect but tried to explain why we think that there is such. His demonstration that the causal connection is a contingent one is of the utmost importance, but his conclusions about it are skeptical. He held that there can be no real or objective justification for inference from cause to effect. He did allow, it is true, that certain rules can be provided which, when followed, will give some kind of probability to those inductive inferences which we actually do make. The aim of these rules is to make custom reliable and to avoid superstition. Hume has really no right, according to his own principles, to allow so much, and in doing so, he deserts skepticism in favor of a reductionist positivism, which seeks only to deny any necessary connection among things, while retaining belief in inductive inference. The concept of causal connection is thus in effect reduced to that of constant association of events contiguous in space and closely related in time. This is a position incompatible with his general skepticism. Apart from this, Hume's philosophy is of a piece. In Hume, then, extreme empiricism led to skepticism. Apart from relations of ideas, he held, the only *knowledge* we can have is

of what we can directly observe, and any attempt to palliate this conclusion can produce only inconsistency.

In British empiricism, therefore, the gradual weeding out of anything inconsistent with empiricism, either in the form of the claim that the materials for knowledge must be derived from experience or in the form of the claim that knowledge cannot go beyond experience in its objects, resulted in skepticism about most of the things which we ordinarily claim to know. Kant proposed a reconciliation between this thesis and rationalism, maintaining that the rationalist claim of a priori knowledge about reality must be restricted to its application to experience. There is no room for a priori knowledge of anything that is not an object of experience. Pure reason can provide no real knowledge, despite the claims of rationalist metaphysicians. Such nonanalytic propositions as we do know a priori constitute principles that lay down the conditions to which experience must conform if it is to be objectively valid and not just a product of the imagination. A priori truths other than mere analytic truths have validity only in reference to experience; hence, while all knowledge is based on experience, it is not all derived from experience. This is scarcely empiricism in any recognized form, nor did Kant claim that it was; but it is a thesis that gives an important role to experience in knowledge.

One final point may be made about the British empiricists: They all employed a common method of trying to build up the body of knowledge from simple building blocks. The model for this method may have been the empirical science of the day. (Hume claimed to derive his experimental method from Isaac Newton.) The rationalists claimed more for reason and sought to reveal sources for knowledge and its materials other than experience; but they were also opposed to the empiricists in their choice of method, finding their inspiration in the method of axiomatic geometry.

**JOHN STUART MILL.** J. S. Mill, the main figure in nineteenth-century empiricism, followed directly in the tradition of Hume. Mill's account of our knowledge of the external world, for example, was in part phenomenalist in character; it maintained that things are merely permanent possibilities of sensation. But it was mainly an account of the way in which we come to believe in such a thing as an external world and thus followed Hume in its psychological character. In one respect, however, Mill was more radical than Hume. He was so impressed by the possibilities of the use of induction that he found inductive inference in places where we should not ordinarily

expect to find it. In particular, he claimed that mathematical truths were merely very highly confirmed generalizations from experience; mathematical inference, generally conceived as deductive in nature, he set down as founded on induction. Thus, in Mill's philosophy there was no real place for knowledge based on relations of ideas. In his view logical and mathematical necessity is psychological; we are merely unable to conceive any other possibilities than those that logical and mathematical propositions assert. This is perhaps the most extreme version of empiricism known, but it has not found many defenders.

## TWENTIETH-CENTURY EMPIRICISM

Empiricists in the twentieth century generally reverted to the radical distinction between necessary truths, as found in logic and mathematics, and empirical truths, as found elsewhere. Necessity is confined by them, however, to logic and mathematics, and all other truths are held to be merely contingent. Partly for this reason and partly because it has been held that the apparatus of modern logic may be relevant to philosophical problems, twentieth-century empiricists tended to call themselves "Logical Empiricists" (at least those who were connected in one way or another with logical positivism). Bertrand Russell, however, who derived something from the positivists, but who owes equally much to the British empiricists, always claimed that there are limits to empiricism, on the grounds that the principles of inductive inference cannot themselves be justified by reference to experience.

In general, twentieth-century empiricists were less interested in the question of the materials for knowledge than in that of the empirical basis for knowledge. Insofar as they considered the former question, the tendency has been, as in other matters, to eschew psychological considerations and to raise the problem in connection with meaning. All descriptive symbols, it is maintained, should be definable in terms of other symbols, except that ultimately one must come to expressions that are definable ostensively only. That is, there must ultimately be terms which can be cashed by direct reference to experience and to it alone; ostensive definition consists of giving the term together with some direct act of pointing, such that no other understanding of meaning is required. In regard to nondescriptive terms the situation is less clear, but the general tendency is to assume that the only possible source of ideas which might be called a priori is logic and mathematics. Following Russell, twentieth-century empiricists assumed that mathematical notions can be reduced to logical ones or can at least involve similar fea-

tures and that logical notions are concerned only with relations between symbols and can be defined accordingly. Russell, it is true, suggested that terms such as *or* might also be defined ostensively, for example, by reference to feelings of hesitation, but this suggestion has not been generally accepted.

If the views on the question of the materials for knowledge are not clear-cut, there has not been the same indefiniteness over the basis of knowledge. Although some positivists, the so-called physicalists, have maintained that the language of physics should be taken as providing the basic truths, most philosophers of positivist persuasion have gone to direct experience for the truths on which knowledge is taken to rest. These truths are to be found in sense-datum propositions—propositions that are a direct record of experience and which are for this reason incorrigible, consisting of ostensibly definable terms, that is, names of sense data. It is not clear what would constitute an example of this. (Russell, for example, suggested “Red here now,” where every expression is what he called a “logically proper name,” such that its reference is guaranteed.) Nevertheless, it has been assumed that all propositions except logical ones must be reducible to these “basic propositions,” which are about sense data.

However, propositions about physical objects are not incorrigible. Yet to suppose that such propositions deal with entities that lie behind the immediate data of the senses and that can only be inferred from those data would be to suppose that there is a gap between us and physical objects, the crossing of which is problematical. This would allow an opening for the skeptic. An alternative view is phenomenalism, the doctrine that the meaning of our statements about physical objects can be analyzed in terms of propositions about sense data. Physical objects are logical constructions out of sense data (“logical” because the issue concerns the correct logical analysis of propositions about physical objects and not the question of how, as a matter of psychological fact, we construct our ideas of physical objects). In general, according to positivists, all propositions other than those that are logically necessary must be verifiable by reduction, either directly or indirectly, to propositions about sense data. Anything which is not so reducible is non-sense. In epistemological terms, any contingent truth that we can be said to know must be founded on and reducible to propositions concerning sense experience. Necessary truths, it is generally held, are true by convention or in virtue of the meaning of the words involved. They tell us nothing about the world as such.

This program has run into difficulties of two main kinds. First, there have been difficulties in actually carrying out the analysis demanded. It would be almost universally agreed that propositions about physical objects cannot be analyzed in terms of propositions about actual and possible sense data, since the analysis would have to be infinitely long. This is an objection of principle. Second, the criterion of verifiability tends to exclude some kinds of propositions that we ordinarily think that we understand. There have been difficulties in this respect, for example, over propositions of natural law, as well as propositions of ethics, etc. There has been widespread dissatisfaction with attempts to justify empiricism of this sort.

It should now be possible to offer some assessment of empiricism. As an answer to skepticism it claims that the certainty and incorrigibility that knowledge demands can (apart from logical truths) be found only in immediate experience and that the rest of knowledge must be built upon this. In this sense, the theory is misguided as well as unsuccessful in carrying out its program. The lack of success can be seen in the fact that eighteenth-century empiricism led to skepticism, while the twentieth-century program of reduction was very widely admitted as a failure. The attempt was misguided in that knowledge does not require this kind of certainty and incorrigibility. Skepticism is not to be answered by providing absolutely certain truths, but by examining the grounds of skepticism itself. According to our ordinary conception of knowledge, what we claim to know must be true and based on the best of reasons. But by the best of reasons is not meant proof. Experience certainly provides justification for belief in, for example, physical objects, but if this belief is to amount to knowledge, it is not necessary that the justification should amount to proof. It is futile to argue whether experience or reason alone can provide proof of what we ordinarily claim to know. No one could have knowledge of the world unless he had experiences and could reason, but this does not mean that either experience or reason by themselves could provide the kind of absolute certainty which would constitute proof. Nor is it required that they should provide proof in order that knowledge may be possible.

What of the thesis that, whether or not experience can provide certainty, all knowledge is derived from experience? In Mill’s sense, that all truths, of whatever kind, receive their validation from experience, the thesis is obviously false and need be considered no further. The thesis that all the materials for knowledge are derived from experience may seem more plausible. Yet, despite

the number of philosophers who have maintained this thesis, it is not altogether clear what it means. The version of the doctrine held by Locke and Thomas looks like a psychological account of the origin of our ideas; in logical dress it amounts to the view that all our concepts or all the words which we use are definable in terms of those which are ostensibly definable. Whether or not there are any a priori notions outside logic and mathematics, it certainly seems implausible to say that logical and mathematical notions may ultimately be definable ostensibly.

More important, the notion of ostensive definition is itself suspect. How could one understand what was going on when a noise was made, accompanied by a pointing to something, unless one knew the kind of thing which was being indicated and, more important perhaps, was aware that it was *language* that was being used? In other words, much has to be understood before this kind of definition can even begin. The notion that words can be cashed in terms of direct experience without further presuppositions is, thus, highly suspect. This is not to say that there are no distinctions to be made between different kinds of concepts or words, but merely that the distinctions in question cannot be made by means of any simple distinction between empiricism and rationalism.

There remains the Kantian point that the having of experience is a condition for any further knowledge. This would certainly be the case for creatures of our kind of sensibility, as Kant would put it. Yet the logical possibility of the possession of knowledge by nonsensitive creatures remains, whether or not any such creatures exist in fact.

## ENCYCLOPÉDIE

Encyclopédie, or the French Encyclopedia, is a famous and controversial work of reference embodying much of what the French Enlightenment liked to call "philosophy."

### PURPOSE, HISTORY, AND INFLUENCE

Begun simply as a commercial undertaking to translate and adapt Ephraim Chambers's *Cyclopaedia* (1728), the *Encyclopédie* was first entrusted to the Englishman John Mills and the German Godefroy Sellius, and then to the Abbé Gua de Malves of the French Academy of Sciences. Denis Diderot became chief editor in 1747 and, with Jean

Le Rond d'Alembert as his principal colleague, greatly expanded the scope of the enterprise. Diderot's prospectus (1750) promised, as a principal and novel feature, a description of the arts and especially the crafts in France, with numerous illustrative engravings, and was accompanied by an elaborate "Chart of the Branches of Human Knowledge," which Diderot referred to as "the Genealogical Tree of All the Arts and Sciences." This *Système figuré des connoissances humaines* was avowedly inspired by the work of Francis Bacon, whose empiricism greatly influenced the entire work. Assuming that all knowledge comes originally from sensations, the *Système figuré* subsumed all branches of learning under either memory, reason, or imagination, to which corresponded, respectively, history, philosophy, and poetry. The correlation of philosophy with reason, while history was associated merely with memory, was very characteristic of the Enlightenment.

The first volume of the *Encyclopédie*, which included d'Alembert's influential "Discours préliminaire," was published in 1751, and revealed at once that the work would be carried on in the spirit of John Locke's sensationalistic psychology and epistemology. Pierre Bayle, in addition to Francis Bacon and Locke, also served as a model and inspiration for the *Encyclopédie*, though its editors rarely found it expedient to admit the fact. The *Encyclopédie* was greatly influenced by Bayle's skepticism, while falling short of his thoroughgoing Pyrrhonism. The work went much beyond him, however, in its attention to natural science, to the nascent social sciences, to economic processes, and to social reform.

The first volume established the *Encyclopédie* at once as a work that was both controversial and indispensable. It was much more comprehensive than previous works of reference, and even included copious articles on grammar, synonyms, and gazetteer-like articles concerning countries and cities. It constantly attempted to explode vulgar errors (see the article "Agnus Scythicus"), to be as precise in definition as possible, to make exact technological explanation an accepted part of the language, to suggest social reforms (see the article "Accoucheuse") or greater civil liberties (see "Aius Locutius"), and to weaken dogmatisms. In biblical criticism (for example, see "Arche de Noé") or in articles touching upon political theory (for example, "Autorité politique") or materialism (for example, "Âme"), the *Encyclopédie* proved itself to be adventuresome and bold.

As a result, the *Encyclopédie* encountered much opposition and suspicion, especially from orthodox religious groups. In particular, the Jesuits, whom Diderot

and d'Alembert suspected of wanting to take over the editing of the work for themselves, delighted in exposing plagiarisms in the *Encyclopédie* and in insinuating that it was subversive. In 1752, just after the publication of the second volume, the Royal Council of State prohibited further publication, although, a few months later, this decree was tacitly rescinded. Thereafter, the *Encyclopédie* was published at the rate of a volume per year until 1757, when it had reached through the letter G. By this time it was evident, as Diderot himself had stated in his remarkable article "Encyclopédie" in volume five, explaining the intentions and editorial policies of the work, that the object of the *Encyclopédie* was "to change the general way of thinking."

In 1757 there commenced a long and complicated crisis that resulted in d'Alembert's retiring from his part in the editing and finally in the suppression of the work by royal decree, on March 8, 1759.

Nevertheless, through the courage and tenacity of Diderot and the publishers, and as a result of the authorities studiously looking the other way, the work continued to be written, edited, and printed in secret, pending the time when it might once more be authorized. In 1765–1766, the rest of the alphabet (ten volumes of letterpress) was published. Meanwhile, the 11 volumes of plates were also being prepared and published under Diderot's supervision, the first appearing in 1762 and the last in 1772. About 4,225 sets of the original edition were sold, the price being 980 livres (326 for the 17 volumes of letterpress and 654 for the 11 volumes of plates). Inasmuch as the purchasing power of a livre was roughly equivalent to rather more than a dollar in current (1966) purchasing power, it is evident that this was a large commercial undertaking.

Each of the first seven volumes of the *Encyclopédie* had been subjected to previous censorship, but this was impossible with the last ten volumes, because they were edited secretly. There was, therefore, a considerable risk that the government might outlaw the whole edition if the articles were too forthright on theology and politics. In the end, there was little difficulty: By 1765–1766, when the final volumes were distributed, the order of the Jesuits had been suppressed and public opinion generally was moving irresistibly toward the point of view represented by the *philosophes*. But Andre-François Le Breton, the printer and chief publisher of the *Encyclopédie*, had meanwhile surreptitiously altered many of the most controversial articles after Diderot had edited them and read the proofs. Diderot discovered this treachery in 1764, too late to undo it. The subsequent discovery of a volume of

proof sheets permits a before-and-after comparison of some of the articles mutilated by Le Breton; a study of these shows that the changes were substantial. The exact number of Le Breton's alterations is not known even yet, though Diderot always remained convinced that the publisher's depredations had been extensive. In spite of the maiming of the text, however, the articles in the last ten volumes are rather more sharp and critical about religious, social, and political topics than the first seven volumes had dared to be.

One of the novel features of the *Encyclopédie* was that it identified many of its contributors, the most famous being Diderot, d'Alembert, Voltaire, Jean-Jacques Rousseau ("Économie politique" and articles on music), Baron de Montesquieu ("Goût"), François Quesnay ("Fermiers," "Grains"), Baron de L'Aulne Turgot ("Étymologie," "Existence"), Jean-François Marmontel, Baron d'Holbach, and Louis de Jaucourt. After the suppression of the work in 1759, many of the contributors (a total of 160 have been identified) discontinued their collaboration, thus greatly increasing the burden on Diderot. The *Encyclopédie* represented the greatest feat in the technology of printing and publishing up to that time. It was a symbol of the intellectual preeminence of France in the eighteenth century. But it was also the symbol of a new public philosophy; and its final publication, with editorial policies and practices consistent and unchanged, was a triumphant vindication of the energy and moral courage of Diderot and even, though to a lesser extent, of his publishers.

### PHILOSOPHY IN THE ENCYCLOPÉDIE

The numerous and lengthy articles in the *Encyclopédie* concerning philosophers or schools of philosophy, from "Aristotélisme" to "Zend-Avesta," constituted in themselves a stage in the development of recording the history of philosophy. Most of these articles were written by Diderot himself. In the compilation of them, he avowedly relied upon works by Thomas Stanley and Boureau Deslandes and, very heavily, upon Johann Jacob Brucker's *Historia Critica Philosophiae* (Leipzig, 1742–1744). But Brucker's work, relaxed in style and blandly deistic, was changed by Diderot into a history of philosophy that was nervous and sometimes edgy in style and, in its implicit challenging of idealism and in its inclination toward materialism, very representative of the point of view of the Enlightenment in France. Some of the articles not written by Diderot are flabby or conformist in their thought (for example, "Aristotélisme," "Spinoza"), but Diderot's own most famous ones ("Chaldéens,"

"Cyniques," "Cyrénaique," "Éclectisme," "Éléatique," "Épicurisme," "Hobbisme," "Leibnitzianism," "Platonisme," "Pyrrhonienne") substantiate the claim that through the *Encyclopédie* Diderot was one of the creators of the history of philosophy in France.

**ONTOLOGY AND EPISTEMOLOGY.** It was a favorite sport of the Encyclopedists to inveigh against "metaphysics." This criticism was primarily an expression of their dislike for the great rationalistic constructions of the seventeenth century, the systematic philosophy of René Descartes, Nicolas Malebranche, Benedict Spinoza, and Gottfried Wilhelm Leibniz. In reality, since the Encyclopedists—like the logical positivists of the twentieth century—had a theory of being and a theory of knowledge, they were more metaphysical than they acknowledged or perhaps realized. The Encyclopedists predicated a real world of brute fact, and steadfastly resisted the Berkeleyan philosophy, although they were familiar with it (see d'Alembert's article, "Corps"). This real world was knowable, according to the Lockean system of epistemology, through the testimony of the senses and reflection thereon. Diderot stated, for example, in the article "Inné" that "there is nothing innate except the faculty of feeling and of thinking; all the rest is acquired." Such reference to external reality interpreted by reason, led to the great emphasis given by the Encyclopedists to *expérience*, which in the French of their day had the double meaning of experiential and experimental (see d'Alembert's article, "Expérimental").

With this empirical approach to the problems of reality and knowledge, the *Encyclopédie* contributed greatly to the strengthening of the rationale of scientific hypothesis and scientific method (see, for example, "Hypothèse"). In this respect, especially noteworthy in the articles written by d'Alembert (for example, "Cosmologie" and "Cartésianisme"), the *Encyclopédie* was a forerunner to the development of positivism. Nor were the Encyclopedists lamed by Humean skepticism. They knew David Hume personally and loved him and had read his books, but they simply overlooked the implications of Hume's philosophy in respect to their own ontology and epistemology. The sensationalistic psychology of the Encyclopedists, in combination with their view of the world, strengthened them in their faith in reason, by which it was deemed possible to know and evaluate objective reality, while making it unnecessary for them to have much faith in faith. The philosophy of the *Encyclopédie* was about as far from fideism as it is possible to be.

**OPPOSITION TO RELIGIOUS DOGMATISM.** The *Encyclopédie* was often accused by its enemies of favoring a philosophy of materialism. This it never did outright, yet many of its articles pointed that way, especially those that had to do with the mind-body problem (for example, “Spinosiste,” “Âme”). Moreover, the Encyclopedists were constantly eager to undermine dogmatic and intolerant religious orthodoxy. This function they considered as one of their most “philosophical,” and it is in this connection that they helped to establish a new historiography. The Encyclopedists often wrote as though they were historical pessimists and indeed distrustful of history: “One can scarcely read history without feeling horror for the human race,” wrote Voltaire in “Idole, idolatrie.” Nevertheless, in their desire to shake religious dogmatism, they used criteria of historical criticism, for example, in trying to establish the correct chronology of the Bible (see “Chronologic sacrée”), and explored the nature of historical evidence (for example, as to miracles) in a way that secularized and modernized historical techniques. (In this respect the articles “Bible,” “Certitude,” “Mages,” “Synchrétistes,” are of particular interest.) As for the philosophy of history, the Encyclopedists’ convictions regarding the spread of enlightenment led to a faith in progress which became one of the conspicuous features of eighteenth-century thought.

**ETHICS.** The *Encyclopédie* was much concerned with ethics, especially because of its insistence, as expressed by Diderot in “Irréligieux,” that “morality can exist without religion; and religion can coexist, and often does, with immorality.” In ethical theory many of the articles still spoke in terms of *jus naturae*, and sometimes, as in “Irréligieux,” identified this moral law as “the universal law that the finger of God has engraved upon the hearts of all.” But this rather conventional ethics was constantly being blended with, or superseded by, utilitarianism. The articles in the *Encyclopédie* advanced a theory of ethics that was founded not so much in the will of God as in the nature of man. And inasmuch as man was conceived of as being by nature sociable, it logically followed that an ethic grounded in man’s nature was also socially conscious and other-regardful. The *Encyclopédie* also endeavored to undermine notions of free will, teaching that man, precisely because he is modifiable and educable, is capable of virtue even in a deterministic universe (see “Liberté,” “Modification,” “Malfaisant”).

**SOCIAL AND POLITICAL THEORY.** The social philosophy of the *Encyclopédie* was shaped in like manner by the conviction that man by his nature is sociable (see

“Philosophe”). As a result, the *Encyclopédie* was much interested in theories of social origins, and devoted a good deal of attention to the ethnography of primitive peoples, using travel books as a principal source. The article on “Humaine espèce” is a remarkable exercise in physical anthropology; and articles such as “Laboureur,” “Journalier,” and “Peuple” are examples of a groping toward a recognizable sociology. Thus, the *Encyclopédie* figured importantly in the development of the social sciences, as well as in the dissemination of a utilitarian social philosophy. The *Encyclopédie* had a passion for improvement and constantly applied to institutions the criterion of social usefulness.

The *Encyclopédie* also possessed a quite clearly articulated political theory, even though it was difficult to discuss political philosophy critically in a country that was professedly an absolute monarchy and exercised censorship. This political philosophy was, as might be expected, greatly influenced by Locke. Articles such as “Droit naturel” and “Égalité naturelle” spoke of “inalienable rights” and continued, as Locke and Samuel von Pufendorf had done, to explore the implications to political philosophy of new and emerging insights into the nature of man. In articles such as “Autorité politique” and “Loi fondamentale,” the *Encyclopédie* praised limited monarchy and suggested that proper government rests upon consent (see “Pouvoir”). In the article “Représentants” a theory of representative government was advanced, and numerous articles suggested the guarantee of civil liberties (for example, “Habeas corpus,” “Aius locutius,” “Libelle”) or advocated reforms (“Impôt,” “Vingtième,” “Privilège”). An English writer, reviewing the *Encyclopédie* in 1768, remarked that “whoever takes the trouble of combining the several political articles, will find that they form a noble system of civil liberty.”

**LINGUISTIC THEORY.** The *Encyclopédie* was much engrossed in theories regarding the origin of language, and devoted a great deal of space to articles on grammar and on synonyms. In part this was social philosophy, in the sense that it was hoped that such speculation would throw light upon social origins; even more, it was an early manifestation of scientific and philosophical interest in the nature of language. In articles such as “Étymologie,” “Éléments de science,” and “Encyclopédie,” Turgot, d’Alembert, and Diderot, respectively, analyzed problems of definition, semantics, and nomenclature in the attempt to explore accurately the relationship between words, concepts, and things. The Encyclopedists were remarkable for realizing that knowledge itself depends upon the correct use of language.

**AESTHETICS.** Aesthetic theory was not systematically developed in the *Encyclopédie*, although there were numerous articles on belletristic subjects, especially those contributed by Jean-François Marmontel (see his article “Critique”) and Voltaire. Special mention should be made of Diderot’s articles “Beau” and “Beauté,” which reviewed extensively the aesthetic theories current in the first half of the eighteenth century and argued that it is the perception of relationships that is the basis of the beautiful.

**HUMANISM.** The philosophy of the *Encyclopédie* was strongly humanistic in tone. Oriented toward science, and progressive (in the sense of believing in progress), the work was integrated by the particular philosophy of man that underlies the whole. It was a philosophy, Protagorean in savor, that made man the measure of all things. This point of view was summed up by Diderot in the article “Encyclopédie”: “Man is the sole and only limit whence one must start and back to whom everything must return.”

## Bibliography

### EDITIONS

*Encyclopédie, ou dictionnaire raisonné des sciences, des arts et des métiers, par une société de gens de lettres ...*, 35 vols. in folio. Paris, 1751–1780. Diderot was editor-in-chief for 17 volumes of letterpress (1751–1766) and 11 volumes of plates (1762–1772); these 28 volumes were reprinted in folio at Geneva (1772–1776). The remaining volumes consist of four volumes of *Supplément*, one volume of supplementary engravings, and two volumes of index. Other editions, all published in French, appeared at Lucca (28 vols. in folio, 1758–1771), Livorno (33 vols. in folio, 1770–1779), Yverdon (58 vols. in quarto, 1770–1780), Geneva (45 vols. in quarto, 1777–1781), and Lausanne and Berne (36 vols. in octavo, 1778–1781). Reproductions of 485 of the original engravings are available in the admirably edited and inexpensive *Diderot, Denis, Pictorial Encyclopedia of Trades*

and *Industry*, edited by Charles C. Gillispie. 2 vols. New York: Dover, 1959.

## ENERGETICISM, ENERGETISM

See *Ostwald, Wilhelm*

## ENERGY

Energy, from the Greek *energeia* (*en*, in; *ergon*, work), originally a technical term in Aristotelian philosophy denoting “actuality” or “existence in actuality,” means, in

general, activity or power of action. In the physical sciences it is defined as the capability to do work, as accumulated work or, in the words of Wilhelm Ostwald, as “that which is produced by work or which can be transformed into work.” Energy is measured in terms of units of work, to overcome a resisting force of one dyne over a distance of one centimeter. (The joule =  $10^7$  erg = the watt-second; the kilogram-meter =  $9.81 \times 10^7$  erg. In atomic physics the unit is the electron volt;  $ev = 1.6 \times 10^{-12}$  erg.

In physics, energy is either kinetic or potential. A body of mass  $m$  moving with a velocity  $v$  possesses, owing to its motion, the kinetic energy  $\frac{1}{2}mv^2$ , which is the work necessary to overcome the inertial resistance in accelerating the body from rest to its final velocity and which is again transformed into work if the body is brought to rest. The energy that a system of bodies possesses by virtue of the relative geometrical position of its constituent parts, if subjected to gravitational, elastic, electrostatic, or other forces, is its potential energy. If, for example, a stone is raised from the surface of the earth, the potential energy of the system stone-and-earth is increased; if an elastic spring is expanded, its potential energy increases with increase of length. The attribute “potential” thus merely characterizes the latency of temporarily stored energy and does not call into question the reality of this kind of energy. With the recognition of the principle of the conservation of energy, it became apparent that the concept of energy applies to all branches of physics and to all physical sciences. Because of the at least partial convertibility of any energy into mechanical work, the aforementioned units of work also serve as measures of such energies as thermal, electric, magnetic, acoustic, and optical. For thermal energy (heat) it proved practical also to retain as a separate unit the caloric unit of heat, the calorie (equal to  $4.18 \times 10^7$  erg).

### HISTORY OF THE CONCEPT

In spite of its universality, the general notion of energy as a basic concept in science is a relatively recent result of a long and intricate conceptual process. From the scientific point of view this process may conveniently be divided into five consecutive stages: (1) early conceptions of energy as a source of force, (2) the rise of the concept of mechanical work, (3) the recognition of different forms of energy, of their interconvertibility, and of the conservation of their sum total, (4) the emancipation of energy as an autonomous existent, and (5) the mathematization of energy as an integral invariant. From the philosophical point of view—that is, with respect to the ontological and

epistemological status of the concept of energy—one may speak of (1) accidental, (2) substantial, (3) relational, (4) causal, and (5) formal conceptions of energy.

**ENERGY AND FORCE.** Aristotle was the first to use *energeia* as a technical term in his conceptual scheme, where it often signified the progressive “actualization” of that which previously existed only in potentiality. He also seems to have formed, though in an implicit manner, the idea of energy in the sense of accumulated force or accumulation of force. Force, for him, was not only the cause of motion but also the factor determining the duration or extent of motion. In the *Physics* he formulated the fundamental law of his dynamics, which, in modern terminology, states that the velocity,  $D/T$  (distance divided by time), of a mobile is proportional to the ratio of the magnitude of the moving force,  $A$ , and the resistance,  $B$ , a relationship that he described by enumerating exhaustively all possibilities under which  $AT/BD$  remains constant (with the exception of doubling the distance,  $D$ , as well as the time,  $T$ ). He argued that a given finite force cannot move a mobile over an infinite distance or for an infinite time. Aristotle thus associated with every force a capacitative limitation, or, in modern terms, an energy content.

The implications of this statement for cosmology—in particular, for the motion of the celestial spheres, which derive their eternal motion ultimately from the “first mover” in accordance with the axiom “all things that are in motion must be moved by something else”—called for further clarifications. Thus, for example, Averroes, in his “Commentary on the Physics,” distinguished between the primary motive force, the *motor separatus*, and the secondary forces, the *motores coniuncti*; the latter, in direct contact with the spheres, corresponding to the medieval “intelligences,” draw finite quotas of force from the inexhaustible supply of the former. By this process, according to which only finite amounts are subtracted from an infinite accumulation of force, Averroes thought he was able to explain both the eternity of celestial motion and the fact that this motion does not occur instantaneously (*in instanti*), as motion under the effect of an infinite cause should do.

Considerations of this kind, which engaged Aristotelian commentators until the times of Thomas Aquinas, show clearly that the notion of force signified not only the immediate cause of motion or acceleration but also its cumulative determination, or energy content. Thomas considered the possibility of a finite and yet invariable moving force, which, being immutable, acts

always in the same manner (*vis infatigabilis*), and thus he conceived of force as a moving agent independent of and separated from a constantly rejuvenating source, a notion essential for the future conception of the universe as a clockwork in action without the need of a constant supply of additional energy. Early in the fourteenth century the nominalist Peter Aureoli, in *Liber Sententiarum*, distinguished explicitly between two different aspects of force: its velocity-determining property and its capacity of consumption, or measure of exhaustibility. His differentiation can rightfully be regarded as the first ontological distinction between force and energy.

This, of course, does not imply that allusions to particular forms of energy are not found in early scientific writings. In fact, already in the *Mechanica*, commonly ascribed to Aristotle, the notion of kinetic energy is clearly referred to when it is asked:

How is it that, if you place a heavy axe on a piece of wood and put a heavy weight on the top of it, it does not cleave the wood to any considerable extent, whereas, if you lift the axe and strike the wood with it, it does split it, although the axe when it strikes the blow has much less weight upon it than when it is placed on the wood and pressing on it? It is because the effect is produced entirely by movement, and that which is heavy gets more movement from its weight when it is in motion than when it is at rest.

**MECHANICAL WORK.** The modern concept of energy, as the definition shows, is a generalization of the notion of work in mechanics. The concept of work can be traced back to the principle of virtual displacements, or virtual velocities, which, in turn, has its ultimate origin in Aristotelian dynamics. Aristotle's conclusions (in *De Caelo*) concerning one single force (under whose action "the smaller, lighter body will be moved farther . . .; for as the greater body is to the less, so will be the speed of the lesser body to that of the greater") were soon generalized for the case of a force counteracting a load, as exemplified in simple machines such as the wheel and the axle. In particular, the study of the law of the lever, as mentioned in the *Mechanica*, in Archimedes' *On the Equilibrium of Planes*, in the writings of Hero of Alexandria, and in the *Liber Karastonis*, a Latin version of the ninth-century Arabic text by Thabit ibn Kurrah, contributed to the gradual establishment of the principle of virtual displacements for which finally, in the thirteenth century, Jordanus Nemorarius tried to give a theoretical proof. The Renaissance formulation of this law—namely, that the ratio between force and load is reciprocal to that of the

spaces (distances) traversed within the same time—as pronounced by Guidobaldo del Monte (*Mechanica*, 1577), by Simon Stevin (*Hypomnemata Mathematica*, Leiden, 1608, Book 3), and by Galileo Galilei (*Opere 2*), formed the basis for the definition of work as force times distance traversed.

Pierre Varignon, in his *Nouvelle Mécanique ou statique* (Paris, 1725), reported a letter from Johann Bernoulli, dated January 26, 1717, in which the term *energy* appears in this connection, apparently for the first time in the modern period: "For all equilibrium of forces in whatever manner they are applied to each other, whether directly or indirectly, the sum of the positive energies will be equal to the sum of the negative energies taken positively." Although some historians, referring to this letter, have ascribed to Bernoulli the definition of energy as "force times distance," a critical study of the text shows undoubtedly that he still defined energy as "force times virtual velocity." In spite of the fact that this notion and its derivative, namely, the notion of work defined as "force times distance," played at least implicitly an important part in the establishment of classical mechanics—Joseph Louis Lagrange saw in the principle of virtual velocities the fundamental basis for his *Mécanique analytique* (1788), the highlight of classical mechanics—energy considerations were rarely found in theoretical or even practical mechanics prior to the middle of the nineteenth century. Before the development of the steam engine and the rise of thermodynamics, industry had little interest in energy calculations: Force, not its integrated form, counted in the use of simple machines. The primary object of theoretical mechanics, moreover, was still celestial dynamics, where, again, energetics was of little avail. This certainly is also one of the reasons why Isaac Newton's *Principia* contains practically no reference to the concept of energy or to any of its applications.

According to Ernst Mach, in *Die Mechanik in ihrer Entwicklung* (Leipzig, 1883; translated as *The Science of Mechanics*, La Salle, IL, 1942), the delay of the development of energetics as compared with that of general mechanics stemmed from what he called "trifling historical circumstances," namely, the fact that in Galileo's investigations of free fall, the relationship between velocity and time was established before the relationship between velocity and distance, so that, as multiplication with mass shows, the notions of quantity of motion or momentum and force gained priority and were regarded as more fundamental than the concept of energy, which thus appeared as a derived conception. Whatever the reason for energetics' lagging behind Newtonian mechanics,

it is an indisputable fact that the concept of energy became a subject of discussion among philosophers rather than among physicists or mechanicians.

**THE MEASURE OF "FORCE."** Foremost among the philosophical discussions was the controversy between the Cartesians and Gottfried Wilhelm Leibniz over whether the true measure of "force" (i.e., energy) is momentum (the product of mass and velocity) or *vis viva* (as defined by Leibniz, the product of mass and the square of velocity). René Descartes, having shown in his *Principles of Philosophy* that the (scalar) quantity of motion or momentum (the vectorial nature of this quantity was recognized only by Christian Huygens) is conserved, concluded that momentum is the measure of energy. Leibniz, in "A Short Demonstration of a Remarkable Error of Descartes" ("Brevis Demonstratio Erroris Memorabilis Cartesii," in *Acta Eruditorum*, 1689), opposed this view. Lifting a load of 1 pound, he claimed, to a height of 4 feet requires the same work as lifting 4 pounds to the height of 1 foot. Since, according to Galileo, the velocities (of free fall) are proportional to the square roots of the heights (of fall), the velocity of the first object is twice that of the second before reaching ground, or  $v_1 = 2v_2$ . Assuming that the "forces" (energies) are proportional to the masses (moles), Leibniz concluded that  $m_1 \cdot f(v_1) = m_2 \cdot f(v_2)$ , where  $f(v)$  is an as yet unknown function of the velocity,  $v$ . Substituting  $m_2 = 4m_1$  and  $v_1 = 2v_2$  yields  $f(2v_2) = 4 \cdot f(v_2)$ , which shows that the unknown function is quadratic in its argument,  $v$ . What is conserved and hence is the measure of "force," Leibniz concluded, is  $mv^2$ .

This controversy between the Leibnizians, among them Johann Bernoulli, Willem Jakob Gravesande, Christian von Wolff, Georg Bilfinger, and Samuel König, and the Cartesians, among them Colin Maclaurin, James Stirling, and Samuel Clarke, was essentially only a battle of words, since the Leibnizians considered force acting on bodies traveling over equal distances and the Cartesians considered force acting on bodies during equal intervals of time, as Jean Le Rond d'Alembert in *Traité de dynamique* (1743) and Lagrange in *Mécanique analytique* (1788) made clear.

**CONSERVATION OF "FORCE."** The interesting aspect of the Leibnizian-Cartesian controversy is the fact that both sides argued on the basis of the conservation of their respective "measures": for the Cartesians it was the conservation of momentum, for the Leibnizians that of "living force" (kinetic energy). Both contentions, as we know today, were correct, since both measures are integrals of the equations of motion. One of the most ardent sup-

porters of Leibniz was his disciple Christian von Wolff, who in the *Cosmologia Generalis* (1731) declared: "In all the universe the same quantity of living force is always conserved." Johann Bernoulli, in the essay "De Vera Notione Virium Vivarum" (in *Acta Eruditorum*, 1735), was probably the first to treat this statement of the *conservatio virium vivarum* as a fundamental principle in mechanics. The apparent loss of "living force" in inelastic collisions was usually explained away by the hypothesis that the invisible small parts of matter gain in *vis viva* just as much as the macroscopic bodies seem to lose, a view Leibniz had already expressed in *Essai de dynamique* and reaffirmed in a letter to Samuel Clarke (Fifth Letter, August 18, 1716), where he stated that "active forces are preserved in the world" and continued: "'Tis true, their wholes (unelastic colliding bodies) lose it with respect to their total motion; but their parts receive it, being shaken by the force of the concourse. And therefore that loss of force is only in appearance. . . . the case here is the same, as when men change great money into small." Johann Bernoulli, in contrast, explained this apparent loss as an absorption of force required for the compression of the colliding bodies.

**TRANSFORMATION OF POTENTIAL ENERGY.** What Bernoulli had in mind was obviously the so-called latent force, subsequently to be called potential energy, and his is the earliest description of transformation of kinetic energy into potential. The idea of such "latent force" was soon generalized to nonmechanical processes. Already in 1738 Daniel Bernoulli, in his *Hydrodynamica, sive de Viribus et Motibus Fluidorum Commentarii*, spoke of the "latent force" of combustible coal, which "if totally extracted from a cubic foot of coal and used for the motion of a machine, would be more efficient than the daily work of eight or ten men." But the measure of this "latent living force" was still  $mv^2$ .

Strictly speaking, the notion of potential—that is, a function whose space derivatives yield the force components and which therefore equals the potential energy for a unit of mass, charge, etc.—preceded the idea of potential energy. For in 1777, Lagrange, in "Recherches sur l'attraction des spheroides homogènes" (*Mémoire de l'Académie*, Paris), calculated the potential for an arbitrary discrete distribution of mass particles, and in 1782, Pierre Simon de Laplace calculated the potential for a continuous distribution. Potentials were still spoken of as "force functions"; the term *potential function* was introduced for the first time in 1828 by George Green in his *Essay of the Application of Mathematical Analysis* and later (1840), independently, by Karl Gauss.

When, in 1788, Lagrange derived the principle of the conservation of mechanical energy, or what subsequently was generally called the “theorem of the living force,” as an integral of the equation of motion, he asked himself how many such integrals exist and under what conditions. The question, however, whether a similar principle exists also for nonmechanical processes did not occur to him.

The first clear and consistent terminology of energy conceptions, still in the domain of mechanical processes, was used by the Paris school of practical mathematicians and mechanicians, not by the purely analytical school headed by Lagrange and Laplace. It was Lazare Carnot who, in his *Essai sur les machines en général* (1783; republished in 1803 in a revised and enlarged edition under the title *Principes fondamentaux de l'équilibre et du mouvement*), declared that the “living force” can manifest itself either as  $mv^2$  or as  $Fd$  (force times distance), the second being a measure of the “latent living force.” Jean V. Poncelet, in *Mécanique industrielle* (1829), finally introduced for this quantity the term *mechanical work* and stated distinctly that it is the inertia of masses that serves for the accumulation of work and thus enables the transformation of work into “living force” and vice versa. Poncelet also measured this quantity by the kilogrammeter, a unit of energy universally adopted since then.

We thus see how at the beginning of the nineteenth century the notions of work and living force and their transformability became firmly established within the confines of mechanics proper. Even the *energy* was used in this connection. In *A Course of Lectures on Natural Philosophy* (London, 1807), Thomas Young, though an adherent of the Cartesian measure of force, admitted that “in almost all cases of the forces employed in practical mechanics, the labour expended in producing any motion, is proportional not to the momentum, but to the energy which is obtained.” But it took another fifty years until the term *energy* in its present meaning acquired full citizenship within the vocabulary of the physical sciences. This was brought about from quite a different quarter. It derived from the study of those phenomena where heat and chemical change are the characteristic features.

**CONVERSION PROCESSES.** Although Francis Bacon, in his *Novum Organum*, had already stated that “the very essence of heat, or the substantial self of heat, is motion, and nothing else,” and although similar statements had been made even before the seventeenth century, the late eighteenth century, in general, interpreted heat as a fluidum, in the spirit of the phlogiston theory. Still Jean B. J.

Fourier, in his *Théorie analytique de la chaleur* (1822) declared: “Thermal processes are a special kind of phenomena which cannot be explained by the principle of motion and of equilibrium.” Although Joseph Black’s doctrine of latent heat accounted for the disappearance of heat on the basis of the fluidum theory, the appearance of heat, as Count Rumford’s experiments, at Munich in 1796 and 1798, with the boring of cannon clearly showed, was incompatible with this theory. Having eliminated all sources from which the heat produced during the boring could have originated, Rumford concluded that “it appears to be extremely difficult, if not quite impossible, to form any distinct idea of anything capable of being excited and communicated in the manner the heat was excited and communicated in those experiments, except it be motion.”

At the same time (1799) Humphry Davy performed at the Royal Institution in London his famous experiment in which two pieces of ice were rubbed together by a clockwork mechanism in a vacuum, the whole apparatus being maintained at the freezing point of water. Davy concluded that heat was “a peculiar motion, probably a vibration of the corpuscles of bodies” (*Essay on Heat, Light, and the Combinations of Light*, London, 1799). Rumford’s and Davy’s experiments, though in their quantitative aspects not yet fully explored, suggested the interchangeability of heat and motion and thus led to the more general idea of an interconvertibility, or “correlation,” of the forces of nature, previously regarded as disparate and incommensurable.

Approaching this problem from a chemical and biological point of view, Justus von Liebig, one of the earliest investigators of the economy of living organisms, advanced the theory that the mechanical energy of animals, as well as the heat of their bodies, originated from the chemical energy of their food. Such physiological experiments as those carried out in Liebig’s laboratory made possible the study of conversion processes and together with increased concern with engines and natural philosophical considerations, seem to have been responsible for the independent discoveries, between 1837 and 1847, of the principle of energy conservation. In fact, Liebig’s pupil Friedrich Mohr, adopting the mechanistic view that all forms of energy are manifestations of mechanical force, wrote as early as 1837: “Besides the known fifty-four chemical elements there exists in nature only one agent more, and this is called ‘Kraft’ [‘force’]; it can under suitable conditions appear as motion, cohesion, electricity, light, heat, and magnetism.”

**ENERGY CONSERVATION PRINCIPLE.** Robert von Mayer, a physician from Heilbronn, Bavaria, who had served on a ship in the tropics, had noted that the venous blood of his patients there was redder than it had been in Europe. He explained this difference by an excess of oxygen due to a reduced combustion of the food that provided the heat of the body. He thus concluded that chemical energy, heat of the body, and muscular work are interconvertible, an idea that he pursued upon his return by a quantitative investigation of the mechanical equivalent of heat. The first enunciation of the energy conservation principle, combined with the determination of the mechanical equivalent of heat, is found in Mayer's article "Bemerkungen über die Kräfte der unbelebten Natur" (in Liebig, ed., *Annalen der Chemie und Pharmacie*, 1842, Vol. XLII, pp. 233–240). His calculations, as explained in greater detail in his *Die organische Bewegung* (1845) were based on the difference of the specific heats of air at constant volume and at constant pressure, as measured by F. Delaroche and others, yielding, in modern units, 3.65 joule per calorie; had Mayer employed Henri Regnault's more accurate results he would have arrived at 4.2 joule per calorie, the currently accepted value. The amount of heat liberated by the expenditure of mechanical or electrical work was systematically measured by James Prescott Joule, a Manchester brewer and amateur scientist. In heating liquids by the rotation of paddle wheels, forcing water through narrow tubes, or compressing masses of air, Joule demonstrated that the expenditure of the same amount of work, irrespective of the manner in which this work was done, resulted in the development of the same amount of heat. His measurements of such conversion processes gave a firm quantitative support for the conservation principle.

The discovery of the physical principle of the conservation of energy was soon found to be in full agreement with the principal tenets of the prevailing natural philosophy, the German *Naturphilosophie*, whose early proponent, Friedrich Wilhelm Joseph von Schelling, had declared in 1799, in *Einleitung zu dem Entwurf eines Systems der Naturphilosophie*, "that magnetic, electrical, chemical, and finally even organic phenomena would be interwoven into one great association ... [which] extends over the whole of nature." Mayer supported his own conclusions by the metaphysical argumentation that forces are essentially causes and "causes equal effects"; since causes are indestructible and convertible into effects, forces must likewise be indestructible and interconvertible. Even the experimentalist Joule, in an article "On the Calorific Effects of Magneto-electricity, and on the Mechanical Value of Heat" (*Philosophical Magazine*, series

3, 23 [1843]: 442), declared: "I shall lose no time in repeating and extending these experiments, being satisfied that the grand agents of nature are by the Creator's fiat indestructible." In another paper (in *Philosophical Magazine*, series 3, 26 [1845]: 382) he stated: "Believing that the power to destroy belongs to the Creator alone, I entirely coincide with Roget and Faraday in the opinion, that any theory which, when carried out, demands the annihilation of force, is necessarily erroneous." The conduciveness of the philosophical climate toward the enunciation of the energy principle can most clearly be recognized from the arguments of A. Colding, who arrived at the principle independently of Mohr, Mayer, and Joule:

The first idea I conceived on the relationship between the forces of nature was the following. As the forces of nature are something spiritual and immaterial, entities whereof we are cognizant only by their mastery over nature, these entities must of course be very superior to everything material in the world; and as it is obvious that it is through them only that the wisdom we perceive and admire in nature expresses itself, these powers must evidently be in relationship to the spiritual, immaterial, and intellectual power itself that guides nature in its progress; but if such is the case, it is consequently quite impossible to conceive of these forces as anything naturally mortal or perishable. Surely, therefore, the forces ought to be regarded as absolutely imperishable. ("Nogle Soetninger om Kraefterne," 1843, in *Philosophical Magazine*, series 4, 27 [1864]: 56–64).

Even the classic paper of Hermann von Helmholtz, the physiologist turned physicist, "On the Conservation of Force" (*Über die Erhaltung der Kraft*, Berlin, 1847), shows clearly the impact of contemporaneous philosophy, with its renunciation of Hegelianism and its reversion to an idealistic rationalism, when it declares:

The final aim of the theoretic natural sciences is to discover the ultimate and unchangeable causes of natural phenomena. Whether all the processes of nature be actually referrible to such—whether changes occur which are not subject to the laws of necessary causation, but spring from spontaneity or freedom, this is not the place to decide; it is at all events clear that the science whose object it is to comprehend nature must proceed from the assumption that it is comprehensible.

The requirement of referring the phenomena of nature back to unchangeable final causes was interpreted by Helmholtz as reducing physical processes to motions of material particles possessing unchangeable moving forces that are dependent on conditions of space alone. Thus, Helmholtz, starting with the eighteenth-century dynamics of bodies acting under mutual attraction, generalized the Newtonian conception of motion to the case of a large number of bodies and showed that the sum of force and tension (what we now call kinetic and potential energies) remain constant during the process of motion. Applying conventional analytical mathematics, Helmholtz proved that the principle of the conservation of living force not only can be derived from Newtonian dynamics but may also serve as an equivalent point of departure for the deduction of theoretical mechanics.

This fundamental assumption may be formulated as the principle of the impossibility of a *perpetuum mobile*. When a system of particles acting under central forces passes from one configuration to another, the velocities acquired can be used to perform some work; in order to draw the same amount of work a second time from the system, one would have to restore its initial conditions by expending on it forces or energy from outside the system. The principle now requires that the amount of work gained by the transition from the first position to the second and the amount of work lost by the passage of the system from the second configuration to the first be equal, no matter in what way or at what velocity the change has been effected; otherwise a *perpetuum mobile* could be constructed on the basis of this cycle, contrary to the principle. So far Helmholtz's reasoning is but a paraphrase of the arguments used by Sadi Carnot and Benoît Clapeyron in their foundations of the thermodynamics of heat engines. By replacing the concept of work by that of "tensions" (*verbrauchte Spannkraft*), which are equal but of opposite sign to the work performed, Helmholtz transformed the equation between living force (kinetic energy) and work into the statement that the sum of living force and tension is a constant, the tension being a function of the instantaneous state of the system. Although prima facie an insignificant change, this reformulation of the mechanical principle of the conservation of living force through the introduction of "tensions" opened up incalculable perspectives in that it could be applied to all branches of physics, not only to mechanics proper. Moreover, the new formulation was strikingly analogous to that of the principle of the conservation of matter, or mass, an accepted axiom in physical science since the times of Antoine Lavoisier. Exploiting the adaptability of the concept of "tension" to nonmechanical phe-

nomena, Helmholtz not only reconciled the new doctrine of heat with the theory of mechanics, heat explicitly being treated as a form of energy, but also demonstrated the validity of the conservation principle for electrodynamics and other departments of physics. The recognition that mechanical work, heat, and electricity were only different forms of one and the same physical substratum—a result that can rightfully be considered the greatest physical discovery of the nineteenth century—found its analytical vindication in Helmholtz's paper.

At first, however, Helmholtz's memoir was hardly recognized, since its argumentation was based on mathematical reasoning, which at this time was accessible to but a small number of specialists. Another fundamental obstacle in the way of a just assessment of the new truth was the indiscriminate homonymous usage of the term *force* in both its Newtonian and its Leibnizian significations. Once the semantic difficulties had been removed, the principle of the conservation of energy found general acceptance and even popularity, owing to the writings of William Thomson (Lord Kelvin). In a discourse before the Royal Institution in 1856, Thomson distinguished carefully the significance of the Newtonian notion of force from what he called "energy." The term *energy*—apart from its early usage by Bernoulli and Young—had already been used three years earlier by William Rankine in his "On the General Law of the Transformation of Energy" (*Philosophical Magazine*, series 4, 5 [1853]: 106), but only Thomson's application led to its universal acceptance. "Any piece of matter or any group of bodies, however connected, which either is in motion, or can get into motion without external assistance, has what is called mechanical energy. The energy of motion may be called either 'dynamical energy' or 'actual energy.' The energy of a material system at rest in virtue of which it can get into motion, is called 'potential energy'" (*On the Origin and Transformation of Motive Power*, 1856). In 1893, in a footnote to a reprint of his 1856 lecture (in *Popular Lectures and Addresses*, London, 1894, Vol. II), Thomson wrote: "Shortly after the date of this lecture I gave the name 'kinetic energy' which is now in general use. It is substituted for 'actual' and for 'dynamical.'" Thus Helmholtz's "tension" was renamed "potential energy," and the sum total of kinetic and potential energies, the total energy of the system, was shown to be a constant that is characteristic of the system.

These innovations, however, had still to overcome some opposition. The Rankine-Thomson designation "potential energy" was rejected by John F. W. Herschel ("On the Origin of Force," in *Fortnightly Review and*

*Familiar Lectures*, 1857) as “unfortunate,” being too common a name for such a “great truth.” Even the term *conservation* of force or energy was subjected to severe criticisms, particularly by T. H. Huxley and by Herbert Spencer in his *First Principles* (1862), on the ground that “conservation” implies a conserver and an act of conserving and therefore the assumption that without such an act, force (energy) would disappear—an idea at variance with the conception to be conveyed. But in addition to the terminology, the conception itself, particularly that of potential energy, was still a matter of debate. An interesting testimony to these difficulties is Michael Faraday’s paper “On the Conservation of Force” (*Philosophical Magazine*, series 4, 13 [1857]: 225–239), in which the following problem is raised: Is there creation or annihilation of force if the distance between two gravitating bodies is changed and the attractive force varies inversely with the square of the distance? “Gravitation,” Faraday continued, “has not yet been connected by any degree of convertibility with the other forms of force. . . . That there should be a power of gravitation existing by itself having no relation to the other natural powers, and no respect to the law of the conservation of force, is as little likely as that there should be a principle of levity as well as of gravity.” Rankine’s answer to Faraday’s objection (*Philosophical Magazine*, series 4, 17 [1859]: 250) seems to have had little effect, for as late as 1876, James Croll, in his paper “On the Transformation of Gravity” (*Philosophical Magazine*, series 5, 2 [1876]: 242–254), attempted to solve Faraday’s query with the assumption that “a stone when in the act of falling [may] be acted upon by gravity with less force at any given moment than it would be were the stone at rest at that instant.”

**THE EMANCIPATION OF ENERGY.** Although Croll’s paper is full of misconceptions, which, interestingly, were clarified in an answer by the Viennese physiologist Ernst von Brücke, “On Gravitation and the Conservation of Force” (*Philosophical Magazine*, series 4, 15 [1858]: 81–90), it was of great importance for the subsequent development of the concept of energy. It connected the notion of energy for the first time with that of space. That space and change of position are necessary conditions for energy transformations Croll tried to demonstrate by the following consideration: four possibilities of energy transformations are conceivable—a change of potential energy into kinetic, of kinetic into potential, of kinetic into kinetic, and of potential into potential. Since, however, there “is evidently no such thing in nature, so far as is yet known, as one form of potential passing directly into another form” of potential energy and the existence

of kinetic energy always implies change of position, the point is proved. Having thus associated energy with space, Croll went on to dissociate it from the material medium. “Our inability to conceive how force can exist without a material medium has its foundation in a metaphysical misconception,” an idea he explained in greater detail in his book *Philosophy of Theism* (London, 1857). Croll’s almost casual remarks, though scientifically rather objectionable and philosophically highly speculative, may be regarded as the earliest objection to the prevailing view, which still conceived of energy as an attribute, so to speak, of the dynamic system.

Meanwhile, James Clerk Maxwell’s *Treatise on Electricity and Magnetism* (1873) appeared, opening the way for a field-theory treatment of electromagnetic phenomena. It showed, in particular, that the work necessary to build up an electromagnetic field can be regarded as equivalent to the energy produced in space with a certain density that depends on the squares of the magnitudes of the electric and magnetic fields. In the case of nonstatic fields these calculations lead to the conclusion, as was shown by J. H. Poynting in “On the Transfer of Energy in the Electromagnetic Field” (*Philosophical Transactions of the Royal Society* 175 [1885]: 343–361), that energy has to flow from one place in space to another in order to compensate for changes that occur in a particular region of space. A transfer of energy, it is true, had been associated with electricity before Poynting, but the energy flow was always considered as being confined to the conducting wires.

But the existence of induced currents and of electromagnetic actions at a distance from a primary circuit from which they draw their energy, has led us, under the guidance of Faraday and Maxwell, to look upon the medium surrounding the conductor as playing a very important part in the development of the phenomena. If we believe in the continuity of the motion of energy, that is, if we believe that when it disappears at one point and reappears at another it must have passed through the intervening space, we are forced to conclude that the surrounding medium contains at least a part of the energy, and that it is capable of transferring it from point to point.

Thus the surrounding medium or empty space became the arena in which energy moves, and energy, disjoined from matter, was raised in its ontological status from a mere accident of a mechanical or physical system to the autonomous rank of independent existence: matter

ceased to be the indispensable vehicle for its transport. Mechanics, with its restricted conception of transfer of energy by matter, could proceed only as far as Gaspard de Coriolis's notion of "energy currents," described in his *Traité de la mécanique* (1844). The complete emancipation or reification of energy could be achieved only by a theory of action-at-a-distance, such as Maxwell's theory of electromagnetism. Here energy could be labeled and traced in its motion or change of form just as a piece of matter is ticketed so that it can be identified in other places under other conditions.

The recognition of the new ontological status of energy led to a result of great philosophical importance: It strengthened the position of those who opposed the prevailing kinetic-corpuseular theory of nature, according to which all processes are reduced to motions of particles and motion is the fundamental concept for physical explanation. Referring to the demonstrated equivalence of all forms of energy, the opponents claimed that kinetic energy is only one of the forms in which this quantity appears. In their view, energy was a much more general conception than motion, a conception that should not be narrowed down to mean only energy of attraction and repulsion of gravitational or electrostatic nature or energy of various forms of motion. One of the earliest exponents of this school of "energetics" was G. Helm, who, in a treatise, *Die Lehre von der Energie* (Leipzig, 1887), revived the term *energetics*, originally coined by Rankine, to characterize his position, according to which energy is the basic physical reality responsible for all natural phenomena. Helm referred to Gustav Zeuner, Ernst Mach, Josiah Gibbs, James Clerk Maxwell, A. J. von Oettingen, and Joseph Popper as advocating similar ideas. In particular, he claimed, energy can always be broken down into two factors, an intensity and an extensity factor, which characterize the quantity of energy as well as the direction in which changes of energy take place (the intensity factor always decreases).

In spite of further expositions, Helm's ideas did not attract much attention until Wilhelm Ostwald incorporated Helm's "factorization of energy" into the second edition of his treatise on physical chemistry, *Lehrbuch der allgemeinen Chemie* (1893), as the foundation of his theory of chemical affinity. In the period between the first and second editions of his treatise Ostwald embraced the new doctrine of energetics, and with his address in 1895 to the German Congress of Naturalists at Lübeck, "The Conquest of Scientific Materialism" (*Die Überwindung des wissenschaftlichen Materialismus*), he became the principal speaker of the new movement. In his view, not

only was energy the universal currency of physics, but all phenomena of nature were merely manifestations of energy and of its manifold transformations.

In "Lectures on Natural Philosophy" (*Vorlesungen über Naturphilosophie*, Leipzig, 1901) Ostwald contended that since substance is by definition that which persists under transformations or changes, energy is substance. Methodological as well as epistemological considerations, he claimed, force us to see in energy the only substance—methodologically because the alternative view, scientific materialism, has failed to give an exhaustive explanation in even a single case of natural phenomena; epistemologically because "what we hear originates in work done on the ear drum and the middle ear by the vibrations of the air. What we see is only radiant energy which does chemical work on the retina that is perceived as light. . . . From this point of view the totality of nature appears as a series of spatially and temporally changing energies, of which we obtain knowledge in proportion as they impinge on the body, and especially upon the sense organs fashioned for the reception of the appropriate energies." Ostwald's conception of a physical object in terms of energy, of its volume in terms of compressibility, and of its shape in terms of elasticity is one of the final stages in a development that began with John Locke's sensationalistic conception and eventually put an end to the substantial conception of matter.

The "dissolution of matter" into energy was particularly welcomed by the adherents of the monistic school of thought in their search for a unified conception of the universe. Gustave Le Bon, for instance, in his *L'évolution de la matière* (Paris, 1905), spoke of the "dematerialization of matter into energy," a philosophical conclusion that in the same year found a far-reaching and profound scientific foundation. For in a paper titled "Does the Inertia of a Body Depend upon Its Energy Content?" ("Ist die Trägheit eines Körpers von seinem Energieinhalt abhängig?" in *Annalen der Physik* 18 [1905]: 639–641), Albert Einstein showed, on the basis of the Maxwell-Hertz equations of the electromagnetic field, that "if a body gives off the energy  $E$  in the form of radiation, its mass diminishes by  $E/c^2$ ," where  $c$  denotes the velocity of light. Since then the mass-energy relation,  $E = mc^2$ , has been of fundamental importance, particularly in nuclear physics, where P. M. S. Blackett, G. P. S. Occhialini, O. Klemperer, and others showed that the total mass of a particle can be transformed into energy.

Whereas in classical mechanics differences of energy alone were of physical significance, so that energy could be determined only up to an additive constant, in mod-

ern physics energy lost this indeterminateness and became a physical quantity of absolute magnitude. Moreover, in the theory of relativity the principles of the conservation of energy, or mass, and momentum, the latter being the basis of the Cartesian measure of “force,” revealed themselves only as different aspects of one and the same conservation law, the conservation of the momentum-energy four-vector. On the basis of the Einstein equation  $E = mc^2$  the problem of the source of solar (or stellar) energy could be solved, the “packing effect” in nuclear physics could be explained, and the release of nuclear energy could be predicted. Energy was released mass, and mass was frozen energy, or as Bertrand Russell, in *Human Knowledge: Its Scopes and Limits* (New York, 1948), summarized the situation: “Mass is only a form of energy, and there is no reason why matter should not be dissolved into other forms of energy. It is energy, not matter, that is fundamental in physics.”

**CONSERVATION AND INVARIANCE.** Although the theory of relativity threw new light on the conservational aspects of energy, or mass, the relationship between conservation and invariance found its final elucidation in Emmy Noether’s article “Invariant Variational Problems” (“Invariante Variationsprobleme,” in *Göttinger Nachrichten* [1918], pp. 235–257), which demonstrates the conservation of certain quantities (for example, the canonical energy-momentum tensor) for dynamic systems that are invariant under continuous transformations of the coordinates or, more generally, of the field functions involved. Conservation thus appeared as a consequence of symmetry properties, a fact that was in part known already from the Hamiltonian formulation of classical mechanics. In particular, if homogeneity of space and time is assumed, that is, if it is postulated that the system is invariant under translational transformations of the origins of space-coordinates and time-coordinates, then the conservation of momenta and of energy is but a mathematical consequence. The principle of the conservation of energy of a given dynamic system is therefore ultimately a consequence of the invariance (or symmetry) of the system under changes in the zero-point of the time scale, that is, a consequence of the homogeneity of time.

## ENERGY [ADDENDUM]

Force is among the most fundamental concepts in Newtonian physics. Energy became an important unifying concept in nineteenth-century physics. Energy and force take on somewhat different roles in relativity and quantum mechanics.

### **FORCE IN CLASSICAL PHYSICS**

In classical physics, force is a vector quantity. Isaac Newton’s second law of motion ( $F = ma$ ) relates the net force ( $F$ ) on a body to its mass ( $m$ ) and acceleration ( $a$ ) in an inertial reference frame. Newton’s third law says that the force exerted by body  $A$  on body  $B$  is equal and opposite to the force that  $B$  exerts on  $A$ . To apply Newton’s laws of motion in a non-inertial frame, correction factors with the dimensions of force (“pseudoforces”) must be introduced, such as the Coriolis and centrifugal forces.

The constituents of a system of bodies (such as a macroscopic object) exert “internal forces” upon one another, whereas “external forces” are imposed on the system from without. By Newton’s third law, the internal

forces cancel. Newton's second law then applies to the system as a whole: The net external force on the system equals the product of the system's total mass (the sum of its constituents' masses) with the acceleration of its center of mass. The system of bodies therefore itself constitutes a body in classical physics.

If the net force on a body is *defined* as (or is nothing over and above) the product of its acceleration and mass, then Newton's second "law" is true *trivially*. One way to avoid this result is to take "force" as defined partially by the various force laws (gravitational, electric, magnetic, etc.). Another way is to take forces as real entities existing alongside masses and accelerations and serving as simultaneous causes of accelerations. Philosophers who believe in the reality of forces have disagreed about whether component forces or only net forces are real. If component forces are real, then a zero net force may have real nonzero components. These components apparently cannot be understood as real parts of a nonexistent whole. Perhaps the components along arbitrary axes are unreal, whereas the components given by the various force laws are real. According to Nancy Cartwright, net forces are real but components are not. Hence, there is no component gravitational force between two bodies for the gravitational force law to relate to the bodies' masses and separation. The law must concern merely those (unreal) situations where a body feels only a single influence—from one other body's mass; the law then covers the net forces in those cases.

### FORCE IN MODERN PHYSICS

Henri Poincaré and Hans Reichenbach distinguished differential forces (such as electric and magnetic forces) from universal forces, which cannot be shielded against and would have the same effect on any body (whatever its charge, mass, chemical constitution ...) in a given spatiotemporal location. A pseudoforce is a universal force, since it reflects the reference frame's acceleration, not the character of the body affected. Phenomena cannot reveal any universal forces acting on a given body, since measuring devices would be affected in the same way. Reichenbach argued that phenomena determine the geometry of spacetime only up to a conventional choice of universal forces.

According to Albert Einstein's general theory of relativity, gravity's "effects" on a body's trajectory result not from an external force, but from spacetime's geometry. To Einstein, this was suggested by the equality of inertial and gravitational masses, rendering a body's acceleration due to gravity independent of its own mass. That is, gravity

functions as a universal force, and by adopting a non-Euclidean spacetime geometry, general relativity geometrises gravity away. Einstein's "principle of equivalence" says that in any sufficiently small spatiotemporal region, there is a reference frame in which no phenomena are attributed to gravity, and so the laws do not refer to gravity. (In the canonical example, the phenomena in an elevator falling freely in a gravitational field are explained, without appealing to gravity, in a reference frame falling with the elevator. In that frame, all phenomena are indistinguishable from those experienced in an inertial frame.) This principle thus treats gravity as a pseudoforce.

In quantum physics, a body's state can be affected even as the body passes exclusively through regions where it feels no force. This occurs in the Aharonov-Bohm effect, for example.

### FIELDS OF FORCE

A force at some spatiotemporal location may be interpreted as having, apart from the affected body's charge, no causes nearer in space (time) than an appropriately charged body's being some distance away (sometime earlier). This would be (retarded) action at a distance. Although Newton regarded action at a distance as impossible, he failed to offer any local causal mechanism for gravity. Accordingly, gravity was later often interpreted as action at a distance.

Alternatively, a force may be interpreted as having an entirely *local* cause: the affected body's charge and the corresponding field at the body's spatiotemporal location. A field is a vector quantity equal at a given location to the force per unit charge that would be felt by a charged point body, were one present there. In the nineteenth century, Michael Faraday, James Clerk Maxwell, Oliver Heaviside, and Heinrich Hertz developed an electromagnetic field theory. Maxwell argued that the electric and magnetic fields are real, rather than mere mathematical devices (like the electric potential), on the grounds that fields possess energy (and momentum). According to Faraday, we can account for matter's impenetrability without positing that matter consists of hard "stuff"—namely, by positing that material objects are surrounded by short-range fields of repulsive force. Accordingly, we have no reason to believe in a solid body lying somewhere deep beneath its surrounding atmosphere of fields; Faraday speculated that matter is nothing but inertia-bearing centers of fields. Max Abraham, Wilhelm Wien, and Gustav Mie were among those who later tried to develop an "electromagnetic theory of matter," according to which

bodies are just local concentrations of the electromagnetic field.

### ENERGY IN CLASSICAL PHYSICS

A system's energy is a scalar quantity reflecting the amount of "work" (force accumulated over distance) needed to assemble the system. Another way of putting the point is that a system's energy is its capacity to do work. The energy of a closed system is a conserved quantity.

Energy comes in two forms: kinetic and potential. A body moving with speed  $v$  has kinetic energy (equal to  $\frac{1}{2}mv^2$ ). A system's potential energy reflects its configuration. For example, a pair of like electric charges (which mutually repel) has greater electric potential energy insofar as the two charges are nearer (and so required more work to be squeezed together to their current separation). A system's total energy is the arithmetic sum of its various kinetic and potential energies.

Energy conservation was the great unifying principle of nineteenth-century physics. All forms of energy—whether chemical (as stored in a battery), thermal, molecular (as in a chemical bond), elastic (as stored in a spring), kinetic, electric, magnetic, or gravitational—could be interconverted according to fixed rates of exchange, providing a common currency for nature's economy. A system's energy could be calculated—and some of the system's behavior thus predicted—even if a detailed mechanical model of the system was unavailable, either because the system was too complicated (e.g., a large collection of molecules) or because its presumptive inner workings were unknown (as in the case of the aether, the space-pervading medium purportedly responsible for long-distance electromagnetic interactions).

Potential energy is ascribed to a system *as a whole* (e.g., to the *pair* of charged bodies) but is assigned no definite distribution among the system's constituents. Prior to Maxwell's electromagnetic field theory, physical law also seemed silent on the *absolute* value of the system's energy; energy *differences* alone matter to energy's conservation. That is, the system's potential energy reflects the work needed to assemble it, but since we may take any configuration as constituting the initial "raw material" out of which the system is assembled, it is arbitrary which configuration is assigned zero potential energy. The arbitrariness of energy's spatial distribution and absolute value suggested that energy is not a real substance that is spread around space and "neither created nor destroyed." It suggests, rather, that energy is just an arithmetic combination of various physical quantities (e.g., charge,

velocity) that is useful for predicting a system's behavior by virtue of its maintaining a constant value.

All this was greatly affected by Maxwell's electromagnetic field theory. The retarded character of electromagnetic action results in violations of Newton's third law in nonstatic cases and, therefore, in energy nonconservation—unless there are some additional energy terms beyond those used in calculating the system's total energy in a static case. Maxwell's theory supplied corrected terms for the electric and magnetic potential energies, restoring energy conservation. These corrected terms are most naturally interpreted as ascribing energy to the electric and magnetic fields—that is, to the apparently empty space surrounding charged bodies. The field energy density at a point is proportional to the square of the field's strength there. The field's zero level, as determined by the condition in which zero force per unit charge would be felt by a test body, designates a non-arbitrary condition of zero energy. Thus, by ascribing energy to the field, we find electromagnetic potential energy to have an absolute value and a determinate distribution in space. This result suggests that energy is a real substance and that the electric and magnetic fields, by virtue of containing energy, are real.

By assuming that parcels of energy have continuing identities as they move and, moreover, that energy obeys a "continuity equation" (in that parcels of energy must travel through space along continuous paths), John Henry Poynting found an expression for the energy flux density (the rate and direction of energy flow at each location in the electric and magnetic fields). This solution, the "Poynting vector," gives results that many (such as Hertz, James Jeans, and J. J. Thomson) found counterintuitive in certain cases (as when it entails that a tremendous flow of energy circulates around a stationary magnet near an unmoving charged body). Moreover, an individual parcel of energy cannot be marked in order to follow its trajectory. Furthermore, the Poynting vector is not the unique solution to the continuity equation for energy flow. All of the solutions have counterintuitive consequences like the above. They agree on the net energy flow across a closed surface. However, they disagree on the energy flow across an open surface (i.e., a surface that fails to completely enclose a volume). These results suggested to some (e.g., Heaviside and Hertz) that energy is not a substance. Perhaps it is a property (like velocity). In that case, its possession by fields might entail their reality. Alternatively, perhaps energy is merely a theoretical fiction (as Jeans believed). In that case, energy would lack

sufficient ontological status to underwrite the reality of fields. This issue is not resolved within classical physics.

### ENERGY IN MODERN PHYSICS

In the special theory of relativity, energy is conserved but is not Lorentz invariant. Hence, a system's energy reflects not only its real state, but also the inertial reference frame in which we have chosen to describe it. Energy and momentum are the components of a 4-vector whose length is a Lorentz invariant quantity: the (rest) mass. That is, a system's mass appears in different inertial frames as different combinations of energy and momentum.

It is sometimes said that energy and mass are interconvertible according to Einstein's famous equation  $E=mc^2$ , as when a ball of gas is heated and the added thermal energy becomes additional mass. Such talk of energy's being "converted" into mass (or matter) is highly misleading, since energy and mass are radically different quantities: mass is real whereas energy is not. Mass (or matter) thus cannot be or be transformed into energy; bodies are not made of energy. Physical transformations of a closed system cannot result in the appearance or disappearance of some mass, since mass is a conserved quantity.

When we consider the ball of gas as a collection of bodies, we characterize the added heat as having boosted various molecules' kinetic energies, though not their masses. When we instead consider the gas as a single body, the kinetic energy contributed by the heat counts toward the gas's mass (which is not the sum of the masses of the gas molecules). This "conversion" of energy into mass is not a real physical transformation. It is an artifact of *our* shift from treating the gas as many bodies to treating it as a single body. As in classical physics, a system of bodies is itself a body.

In quantum mechanics, the value of a system's energy is more definite insofar as the moment at which it possesses that energy is less definite. This is a form of Werner Heisenberg's "uncertainty principle." Though the proper interpretation of this principle is controversial, it is generally held responsible for the brief departures from energy conservation required for the existence of virtual particles and states. A charged point particle's infinite self-energy also remains a source of controversy in quantum mechanics, though renormalization techniques allow it to be finessed in calculations.

## ENGELS, FRIEDRICH

(1820–1895)

Friedrich Engels, the intellectual companion of Karl Marx, although generally considered inferior to his colleague as a thinker, contributed more than Marx to the development of the philosophical aspects of Marxism. Indeed he was the creator of orthodox Marxism as a system based on historical materialism and on dialectics. Engels was born in Barmen in the German Rhineland. His father was a textile manufacturer who had interests in England, and Engels went there to work in a cotton mill in Manchester, first as clerk, later as manager and part owner. Engels was a man of many talents, a scholar, linguist, pamphleteer, soldier, military commentator, and businessman. He was all those things with a thoroughness and distinction that would have brought him recognition

in his own right, but it was his intellectual partnership with a man of genius that brought him fame. Engels met Marx briefly in Cologne in 1842, became acquainted with him in Paris in 1844, and worked actively with him before and during the revolutionary ferment of 1848, when they wrote the *Communist Manifesto*. In 1850 Engels reluctantly returned to his business in Manchester, in part because he saw that Marx needed financial support in order to continue his researches. This help Engels gave unstintingly throughout Marx's life and for years after his death, to his surviving children. Outliving Marx by twelve years, Engels edited his friend's manuscripts, notably the two volumes of *Das Kapital* left unfinished by Marx. He also served as official interpreter of Marxist doctrine during the years when it was beginning to attain worldwide influence over workingmen's movements.

Beginning with works written during Marx's lifetime and with Marx's express approval—for example, *Anti-Dühring* (1878)—Engels emphasized the scientific, positivist component in their joint theories, which he compared with those of Charles Darwin. Engels believed that he and Marx had discovered a rigid system of historical laws that would lead with inexorable necessity to socialism. These laws, Engels held, were dialectic rather than mechanical in character. That is, instead of being like the laws previously discovered in natural science and extrapolated to social studies by men whom Engels called vulgar materialists, they were laws that took account of the contradictions in reality and of the fact that development occurred in revolutionary leaps to higher levels. Engels took from G. W. F. Hegel the doctrine, which he called the law of the interpenetration of opposites, that objective contradictions exist in reality. He enunciated the law of the transformation of quantity into quality, which asserts that change occurs abruptly, after a period of gradual progression. The last dialectical law, the negation of the negation, states that progress takes place by a series of detours, from position *A* to the opposite, position—*A*, and then back to the opposite of that position, which turns out to be position *A* “raised to a higher power.” To give one of Marx's own examples, the industrial bourgeoisie generates its opposite, the miserable proletariat, which then negates bourgeois capital in a revolutionary leap to the higher stage of classless industrial society.

Engels adumbrated these theories in *Anti-Dühring* and stressed them in a special excerpt from that work, *Socialism: Utopian and Scientific* (1892), but the extent to which he carried them was not known until his *Dialectics of Nature* was published in 1925. In this work he extended

materialist dialectics to the natural sciences, with results that are often held to be ludicrous, and implied that dialectics would supersede formal logic. The lengthy controversies that these questions provoked in Soviet philosophy arose, then, from the work of Engels rather than of Marx.

While it is certain that Engels stressed such questions more than Marx and that he lived on to formalize a Marxist tradition out of reverence for a friend who disliked just such formalism, one must be wary of attempts to set Engels, as a scientific pedant, against Marx, as an existentialist or idealist. It is tempting for certain neo-Marxist philosophers, but in the end impossible, to purge Marxism of all its allegedly scientific content that has since been proven untrue and to lay all these errors at Engels's door, leaving only the “profound” (or ambiguous) speculations of the young Marx as true Marxism. For one thing, it was Engels who suggested those early speculations to Marx, in 1844. And decades later it was not Engels alone but the age and his own ambitions that led Marx to present his mature theory of history as a “scientific system” (decorated with some Hegelian flourishes). At all events, it was Marx's thought as understood by Engels that came to constitute Marxism and, in particular, Soviet dogma.

## ENGINEERING ETHICS

"[F]or all of its influence on our modern world, the engineering profession remains a mystery to many Americans." (ASEE *Action*). These words in President Bill Clinton's statement for Engineer's Week of 1999 capture the curious situation of engineering: its products shape the world, but engineers are virtually invisible.

The academic study of ethics and responsibility in engineering began in the United States in the mid-1970s at a time of social ferment and heightened public scrutiny of the professions. Scholars from philosophy and engineering, collaborating in workshops and conferences, teaching, and research, began to penetrate the mystery. They concentrated on engineering in the United States.

Engineering originated in France in the seventeenth century and led in France to the development of the first engineering curriculum during the eighteenth century. Subsequently, engineering took shape as an occupation elsewhere, notably in the United States, Britain, Germany, and Russia. The French curriculum, with its emphasis on mathematics, physics, and chemistry, became the model for the engineering curriculum in the United States and most other countries. Despite persisting differences among countries in the status of professions and of engi-

neers, the academic study of engineering ethics spread to a number of other countries.

Engineering ethics critically examines the behavior of engineers and engineering institutions in light of the special standards of the profession and the common standards of morality. The discipline studies engineers' actions, practices, and workplace, focusing philosophical analysis on standards and concepts such as responsibility and loyalty, to help identify ethical problems and options for resolving them.

Cases or vignettes are essential starting points for teaching and research. For example, during an economic downturn, an engineer overseeing the testing of fuel pumps for a company receives instructions to curtail the testing process. The engineer's ethical concern is that he or she will not be able to ensure the life expectancy of the pumps relied on by the company's customers.

From the latter part of the nineteenth century, engineering in the United States organized as a profession, creating engineering professional societies and promulgating technical and ethical standards. The latter incorporate ordinary morality, for example, in requiring engineers to "issue public statements only in an objective and truthful manner." They include special standards, for instance, the canon requiring engineers to act "for each employer or client as faithful agents ... and avoid conflicts of interest." (Accreditation Board for Engineering and Technology [ABET] 1977, p. 1).

In the ferment of the mid-1970s engineering societies revised their codes of ethics. Unsatisfied with a commitment to "due regard" or "proper regard" for the public, almost all the societies adopted as the first canon, "Engineers shall hold paramount the safety, health, and welfare of the public in the performance of their professional duties" (Florman 1986, p. 77–78).

A great majority of engineers are employees of large business organizations where they do not easily acquire authority or visibility. Still, through their professional societies, engineers profess a commitment to serve society and continue to promulgate technical and ethical standards supporting that commitment. Ethical standards articulate values underlying the technical standards, the core values—safety, reliability, and efficiency—that are also embedded in routines of engineering practice.

The engineering workplace features complexities and intricacies of large, generally hierarchical organizations. The role of engineers in business and in other organizations is elastic. They manage a range of responsibilities from narrowly technical to managerial and, while

often subordinate to managers, must cooperate with them in decision making. The major ethical challenge for engineers is to deal with these complexities (including cost constraints) as employees bound by the special ethical standards of a profession as well as by moral rules. For example, they must find ethically justified, practical options for coping with instructions to curtail testing or to drastically revise public statements.

Adding to the complexity of the engineering workplace is the legal environment, including contracts, the federal and state regulatory systems for health and safety, product liability litigation, and common-law adjudication involving expert witnesses. The legal framework both constrains engineers and generates questions about additional ethical responsibilities, for example, about the extent of their responsibilities to help formulate or implement government standards to control pollution.

Individual engineers' ethical obligations derive from requirements of morality, the obligation of everyone to exercise a reasonable standard of care, the special standards of the profession, and the duties they have as employees. All these ethical imperatives inform the exercise of practical judgment by engineers, the professionals who determine specifications for the design, development, testing, operation, maintenance, and disposal of technological products and systems.

Regarding concerns about safety, for instance, they have a duty to protect the public while avoiding injury to their employers. Engineers are thus subject to tension between the duty of loyalty to the employer (complicated by having to distinguish between interests of the company and what managers want) and the obligation to hold public safety paramount. An engineer's judgment that his or her company's environmentally damaging spill should be reported to the regulatory agency might encounter resistance challenging his or her loyalty. In handling the reporting obligation, the engineer must take due care to avoid injury to the company and to a manager perhaps more concerned with self-protection than other interests.

The moral status of loyalty and the idea of critical loyalty are central in research and teaching. Discussion focuses on a range of ways to express independent judgment, from disagreement and dissent to the extreme of whistle-blowing. Dissent, such as resisting assignment to a particular project out of safety concerns, may invoke the code of ethics as support. Disagreement and dissent require tact and sensitivity so as not to cause avoidable opposition or injury.

Whistle-blowing, that is, transmitting information outside normal channels, ruptures relationships and requires justification that trumps the harm it causes. Engineers blocked from obtaining images to assess the impact of foam debris on the space shuttle *Columbia* had justification for blowing the whistle. To help engineers perform responsibly without resorting to extreme measures, research and teaching focus on impediments to responsible conduct in organizations, for example, fear, deference to authority, and "group think."

The space shuttle *Challenger* disaster revealed another impediment: normalized deviance (Vaughan 1996). It is a form of complacency, the phenomenon of gradually accepting certain anomalous, originally unexpected occurrences that portend serious harm. As the occurrences continue without leading to actual serious harm, they come to be viewed as normal. Strategies to counter this relaxation of vigilance and other impediments to responsibility are current research subjects. This is preventive ethics, catching engineering ethics problems early before they ripen into disasters.

Canon one, the code provision that enjoins engineers to "hold paramount the safety, health and welfare of the public," (ABET 1977, p. 1) requires interpretation. Analysis begins with the question: Who is the public? Should the public include, for example, the crew on the *Columbia*, workers within the engineering workplace, or everyone who might be affected by an engineering product?

Michael Davis (1998) points out the need to determine a characteristic that identifies the relevant public, that is, the vulnerable parties who may be harmed by engineers' work. He suggests identifying members of the public by their ignorance and consequent helplessness in the face of dangers from engineers' work. On this interpretation, members of the *Columbia* crew, unaware of the extent of damage from the break off of insulation and therefore helpless to do anything about their perilous situation, were members of the public.

Analysis continues by asking: How can engineers translate the *paramountcy* provision into guidelines that are less vague? Kenneth Alpern (1983) draws attention to the importance of a standard or principle of due care that holds for everyone. Its corollary, a standard of care proportionate to the magnitude of harm and "the centrality of one's role" in producing the harm, further reduces the vagueness for engineers.

Mindful that this principle can demand moral heroism and that few people are capable of heroism, engineering ethics specialists focus on sources of support for

engineers and on constructing options for responsible problem solving within the capacities of most people. In constructing options for resolving ethics problems, engineers use methods resembling those for solving design problems (Whitbeck 1996).

Further analysis of the paramountcy provision addresses another problem: managers typically balance or trade off factors, such as cost, schedule, marketing, and safety. In their deliberations, managers include safety as a factor, but only as one factor that, like others, may have to be sacrificed. Because safety is a priority for engineers, they cannot treat safety in that way. Philosophers suggest interpreting canon one as requiring engineers to meet a threshold of safety before taking a balancing approach (Harris, Pritchard, and Rabins 2005). This interpretation can help engineers hold their ground with managers.

Employers' demands for secrecy and confidentiality give rise to a cluster of specific issues concerning disclosure and withholding of information and protection of intellectual property, including trade secrets and patents. Societal interests in open circulation of knowledge (and propagation of new technology) and engineers' interests in using their knowledge to advance their careers come into conflict with the interests of firms in protecting information perceived to be economically valuable.

Employment contracts generate ethical responsibilities for engineers and their employers and figure in the balancing necessary to reconcile these interests. These contracts commonly require engineers to keep information confidential even after moving to another company. Such contracts make employers responsible for clearly specifying information to be kept confidential over a reasonable period of time. Engineers become responsible for taking due care at a new job to protect specified information for an appropriately limited time. Drawing such lines between privately owned knowledge and public knowledge is an important practical issue for engineers as well as a subject for analysis in engineering ethics.

Among problems that readily arise for engineers is conflict of interest (COI). While specifying vendors, suppliers, contractors, materials, and components, engineers must be alert to affiliations, investments, and associations they have that can threaten the reliability of their engineering judgment. Philosophical investigation has explicated the concept of COI, the harm of COI, and appropriate responses for dealing with COI. Disclosure of the investment or affiliation that threatens reliable judgment is essential to avoid deceiving and betraying the party relying on professional judgment.

Because of the impact of engineers' work and the priority of safety, it is essential for engineers to acquire a sophisticated understanding of risk and approaches to dealing with risks to humans, other creatures, and the environment. One approach to fostering such understanding is to provide engineers an overview of important perspectives on risk and critical discussion of cost-benefit analysis.

Ethics specialists consider several perspectives alongside one another, those of risk experts (specialists in defining and assessing risks, usually relying on cost-benefit analysis), government regulators, and lay people. It is part of the engineering approach to provide knowledge about risks, for example, concentrations of pollutants in water. The engineering perspective also includes an understanding of cost-benefit analysis and its limitations, an orientation toward protecting the public (similar to, but not the same as that of the government regulator), and an appreciation of lay attitudes toward risks (e.g., those imposed as contrasted with those voluntarily assumed).

Accommodating lay attitudes introduces issues associated with informed consent, that is, explicit acceptance of risks by affected parties. Recognizing that many situations in engineering make it impractical to obtain voluntary informed consent, ethics analysis considers substitutes and compensatory policies. This and other engineering ethics topics encompass problems that arise for individual practitioners but point toward engineering responsibilities of the profession as a whole because they call on the collective capabilities of the profession.

Accordingly, engineers' responsibilities regarding the environment have begun to engage U.S. engineering societies as well as ethics specialists. Some societies have added provisions to their codes of ethics that provide a distinct place in decision making for attention to environmental implications.

Engineers work increasingly in an international environment. A decision-making situation may bring into play engineering standards and government regulatory standards of different countries. The tasks of finding common ground and making adjustments among differing standards consistent with morality and the paramountcy provision are appropriate responsibilities for the profession through its professional societies. For engineering ethics research, addressing international variations in standards is an important task. Advances in international law, which have been prompted by economic globalization, may encourage such research.

As radically innovative technologies have followed rapidly one after another, especially in the decades since World War II, issues associated with emerging technologies have come to the forefront. For individuals and the profession as whole, emerging technologies present issues not only regarding potential risks but also regarding the role of engineers (and the technologies they help create) in shaping the physical, social, and cultural world.

## ENLIGHTENMENT

The term *enlightenment* is generally used to designate a period in European history stretching from the 1680s to the close of the eighteenth century, but this usage is not

without ambiguities and controversy. During the eighteenth century the word *enlightenment* referred not to a period but to a process, a set of activities in which individuals engaged. These activities were viewed as involving the application of what was then termed *philosophy* to a range of concerns in what would subsequently be classified as the natural sciences, the humanities, and the social sciences. It was not until the nineteenth century that *the Enlightenment* came into general usage as a designation for the historical period defined by these various projects. Attempts to specify the character of the period have tended to spur reflection on the nature and scope of those projects and activities that are claimed to characterize the age. As a result, discussions of the Enlightenment typically slide into reflections on the nature and merits of the activity of enlightenment itself.

### THE HISTORY OF THE CONCEPT

At the close of his 1784 essay in the *Berlinische Monatsschrift* in response to the question "What is enlightenment?" Immanuel Kant asked whether his might be characterized as an "enlightened age." He responded, "No, but it is an age of enlightenment" (p. 35). Kant's emphasis on enlightenment as an ongoing process, rather than as an achieved state, was typical of eighteenth-century usage, which favored such formulations as "century of philosophy" (Jean Le Rond d'Alembert), "age of critique" (Kant), or "age of reason" (Thomas Paine).

The question of what the process of enlightenment involved sparked an extended discussion in German journals during the 1780s, a discussion in which Kant's response would prove to be the most famous. The German *aufklären*—a word that had been used to designate a clearing of the weather and, metaphorically, a return to consciousness after a period of sleep—had been employed since the beginning of the eighteenth century as a translation for the French *eclairer* (an important term in the works of René Descartes and Gottfried Wilhelm Leibniz) and for the English *enlighten*. More generally, the use of light as a metaphor for knowledge had a long history in Western philosophy as well as a central place in religious discourse. Hence, the particular use to which these metaphors were put during the eighteenth century by those thinkers now associated with the Enlightenment had a polemical edge: True enlightenment, it was argued, resulted from the application of reason and philosophy, rather than appeals to revelation or to the mysteries of faith. Critics could, in turn, marshal the same metaphors and argue that what was proposed as enlightenment was instead a form of spiritual darkness.

The application of the term to a particular historical period was greatly influenced by Georg Wilhelm Friedrich Hegel's lectures on the history of philosophy and the philosophy of history from the 1820s, and his usage was widely imitated in German histories of philosophy and of literature. The French term for the period—*siècle des lumières*—suggested a more elastic understanding of the period: a century of “lights” rather than a single movement. English usage followed the German, but lagged behind it, with *the Enlightenment* replacing *the Illumination* as a label for the period only in the waning years of the nineteenth century. As late as 1910 the Princeton philosopher John Grier Hibben, in the first book in English to use the term consistently, treated the term as a neologism in need of explanation. Indeed, for much of the twentieth century *age of reason* remained a widely used alternative.

The seminal historical studies of the period date from the 1930s: Ernst Cassirer's *Die Philosophie der Aufklärung* (1932/1951), Paul Hazard's *La crise de la conscience européenne* (1935/1953); and Carl L. Becker's *The Heavenly City of the Eighteenth Century Philosophers* (1932), a work whose fame rests more on the novelty of its argument than on the quality of its scholarship. Peter Gay's *The Enlightenment: An Interpretation* (1966–1969) remains the most influential of the many subsequent studies. Some scholars criticize the tendency to exaggerate the unity of the Enlightenment and emphasize the diversity of enlightenments, sometimes distinguished by their “national context” (see Porter and Teich 1981), for example, the “Scottish Enlightenment,” the “Berlin Enlightenment,” and the “British Enlightenment.” Still others (e.g., Israel 2001) maintain that a focus on national contexts ignores the cosmopolitan character of the Enlightenment, particularly in its more radical manifestations. Since the 1970s there has been a tendency for historical discussions of the Enlightenment to turn from the focus on prominent thinkers and their works that had been the defining feature of earlier studies in favor of approaches influenced by developments in social history and histories of publishing and reading. The work of the historian Robert Darnton (1995) has been particularly influential in this regard.

## THE ROLE OF PHILOSOPHY IN THE ENLIGHTENMENT

In the earliest discussions the relationship between philosophy and the Enlightenment was pervasive and unproblematic: The Enlightenment was typically defined in terms of the philosophers who were said to have artic-

ulated its ideals. Some of the early controversial literature spurred by the French Revolution traced the origins of the Revolution to the writings of François-Marie Arouet de Voltaire, Denis Diderot, and the other *philosophes*, and terms such as *philosophism* and *Illumination* figured prominently in the writings of British opponents of the Revolution and in accounts (notably Augustin Barruel's [1743–1820] *Memoirs Illustrating the History of Jacobinism* [1798]) that traced the Revolution to a conspiracy of *philosophes* and Freemasons.

A more sober analysis could be found in Hegel's *Lectures on the History of Philosophy* from the 1820s, which tended to reserve the term *Aufklärung* for the German phase of the broader movement of modern philosophy that began with Descartes. In other lecture cycles Hegel extended the term to denote the modern attempt to deduce both the laws of nature and of morality from individual consciousness. In subsequent nineteenth-century German histories of philosophy the term (sometimes divided into French and German branches) was used to refer to both rationalist and empiricist tendencies in eighteenth-century philosophy, with Kant frequently portrayed as a thinker who managed to transcend the alleged limits of the movement and thus ushered in a new epoch. The early scholarship in English was heavily influenced by this tradition, with the work of Hibben (1910) representing one of the more sophisticated versions of this approach.

Cassirer offered an even more nuanced account, viewing the Enlightenment as the pivotal phase in the broader process through which “modern philosophic thought gained its characteristic self-confidence and self-consciousness” (1932/1951, p. vi). The book's opening chapter followed d'Alembert in distinguishing the *esprit de système* (the deductive system of seventeenth-century rationalism) from the *esprit systématique*, with its emphasis on induction and empirical analysis that marked the new era. In the discussions of approaches to nature, psychology, religion, history, politics, and aesthetics that followed, Cassirer (1932/1951) portrayed the Enlightenment as a European movement in which German thinkers such as Leibniz and Gotthold Ephraim Lessing stood on equal terms with their French counterparts. While Cassirer eschewed a historical account of various “individual doctrines” in favor of a study of “the form and manner of intellectual activity itself,” Hazard (1935/1953) traced the history of responses to what he characterized as a “crisis of the classical mind” (i.e., seventeenth-century rationalism). If Hazard was less certain than Cassirer that this crisis had been resolved, his

account nevertheless saw the Enlightenment (though the term itself does not figure prominently in his work) as an attempt to respond to a philosophical problem: the problem of finding an alternative to religious belief as a foundation for normative judgments. In contrast, Becker (1932) held that far from providing an alternative to religious faith, the *philosophes* simply substituted one sort of faith for another, with a faith in the power of reason occupying the place previously occupied by religion.

However problematic as historical narratives, such studies capture one important feature of eighteenth-century discourse. In France figures such as Voltaire, Diderot, d'Alembert, Baron Paul-Henri Thiry d'Holbach, Claude-Adrien Helvétius, and others described what they were doing as philosophy and called themselves philosophers. Still, while accounts of "the philosophy of the Enlightenment" tend to emphasize the role of epistemological questions, the reach of the term *philosophy* during the Enlightenment was considerably more expansive. Isaac Newton published his laws of motion in a work that announced itself as a contribution to *natural philosophy* and the concerns of the American Philosophical Society, founded in Philadelphia by Benjamin Franklin in 1768, were closer to the modern natural sciences than to philosophy as it is now conceived. For much of the period, treatises on natural law provided thinkers with a context for exploring a wide range of issues in the areas of anthropology, the philosophy of language, political economy, and morality that were central concerns during the period.

The emergence of the salon and the coffeehouse spurred the growth of new forms of expression—for example, Diderot's remarkably open-ended dialogues and publications such the *Tattler* and the *Spectator*, journals edited by Joseph Addison (1672-1719) and Richard Steele (1672-1729) that aimed at improving the discourse and the mores of those who frequented coffeehouses. Many of the period's most influential works—for example, Pierre Bayle's *Historical and Critical Dictionary* (1697), Diderot's *Encyclopedia* (1751-1765), and Voltaire's *Philosophical Dictionary* (1764)—were lexicons, rather than philosophical treatises, while other important texts—including Jean-Jacques Rousseau's educational treatise *Emile* (1762) or Guillaume-Thomas-François de Raynal's influential *History of the Two Indies* (1770)—defy assimilation into familiar genres of philosophical writing.

The staggering variety of works labeled as philosophy is mirrored by the Enlightenment's conception of the vocation of the *philosophe*. The entry in Diderot's *Encyclopedia* (an abridgement of a text generally cred-

ited to the grammarian César Chesneau Dumarsais [1676-1756]) characterized the *philosophe* as an individual who is chiefly concerned with those "sociable qualities" that make individuals useful members of society, "For him, civil society is, as it were, a divinity on earth; he flatters it, he honors it by his probity, by an exact attention to his duties, and by a sincere desire not to be a useless or embarrassing member of it" (p. 510). Diderot's article on "Encyclopedia" stressed the differences between the "geniuses" of the seventeenth century, who engaged in solitary and unconstrained reflection on the nature of things, and the collaborative work of the *philosophes* of his own century, whose interest lay less in making new discoveries than in organizing and disseminating the knowledge that had already been attained by artisans and other useful members of society.

A similar view of the mission of the *philosophe* is found in the posthumously published work by the thinker who is often regarded as the last of the species: Marquis de Condorcet's *Sketch for a Historical Picture of the Progress of the Human Mind* (1793). He saw *philosophes* as "concerned less with the discovery or development of truth than with its propagation." Gathering under the banner of "reason, tolerance, humanity," they "made it their life-work to destroy popular errors rather than to drive back the frontiers of human knowledge—an indirect way of aiding its progress which was not less fraught with peril, nor less useful" (pp. 136-137).

Thus, while the Enlightenment saw the publication of works—for example, John Locke's *Essay concerning Human Understanding* (1689), David Hume's *A Treatise of Human Nature* (1739-1740), and Kant's *Critique of Pure Reason* (1781)—that are among the foundational texts of modern philosophy, the eighteenth-century *philosophe* engaged in activities that no longer occupy professional philosophers and a good many of the works that the eighteenth century classified as *philosophy*—for example, the political libels and philosophical pornography that were labeled philosophical books in the clandestine book trade—fall outside the discipline as it is now practiced. For this reason the Enlightenment invoked by philosophers and the Enlightenment studied by historians working in the area of eighteenth-century studies tend to diverge. For the former, the Enlightenment was a philosophical movement that emphasized the application of reason (defined for the most part in terms associated with modern science) to all aspects of life, a project that has been embraced by some (e.g., in Karl Raimund Popper's ideal of the "Open Society") and criticized by others (e.g., in Max Horkheimer and Theodor Adorno's

[1947/2002] account of the collapse of Enlightenment into totalitarianism). In contrast, scholars working in the area of eighteenth-century studies have tended to see the Enlightenment as a network of individuals and institutions, sometimes bound together by common interests or purposes, but in many cases diverging according to local contexts or their particular concerns and commitments.

## ENLIGHTENMENT PROJECTS

**THE PUBLIC USE OF REASON.** As a general characterization of the movement's aims, there is much to recommend Kant's definition of enlightenment as "the freedom to make a *public use* of one's reason in all matters" (p. 36). Both the essay's demand that individuals make use of their own reason and its invocation of a cosmopolitan public sphere of readers and writers reiterated ideals that had accompanied the Enlightenment from the start. The requirement that the claims of religious, political, and other authorities be brought before what Kant called the "tribunal of reason" had, for example, been a point of honor for the deist John Toland, who opened his *Christianity Not Mysterious* (1696) by observing that he had "been very early accustom'd to Examination and Enquiry, and taught not to captivate my Understanding no more than my sense to any Man or Society" (p. 7). The idea that individuals might best carry out this project of thinking for themselves in the company of others had been central to Pierre Bayle's conception of a "republic of letters" consisting of readers and critics who were bound together, despite their separation in different countries, into a common endeavor.

The emergence of what the social theorist Jürgen Habermas termed the *public sphere*—the network of institutions, including coffeehouses, salons, Masonic lodges, and reading societies in which "private people come together as a public" (1989, p. 27)—is viewed by many historians as a defining feature of the period. Coffeehouses, particularly in England, provided a venue for the circulation and discussion of news, Parisian salons played an essential role in coordinating the activities of the *philosophes*, and the Masonic movement opened a space in which new forms of sociability, expressing the ideal of fraternal solidarity, were possible. No less significant was the emergence of an international book trade, with both legal and clandestine branches. Indeed, the most compelling evidence for the spread of enlightenment in eighteenth-century Europe may be the explosion of books and periodicals that made their way into new markets, the dramatic shift in the content of these books (with works on religious subjects eclipsed by a growing

interest in science and literature by the end of the century), and the shift in reading practices from the repeated reading of a few texts (typically devotional in character) to the successive reading of a series of books, a practice that further increased the demand for new works.

**TOLERATION AND RELIGIOUS HETERODOXY.** Kant's suggestion that "religious matters" were central to the concerns of enlightenment and his insistence that restrictions on the public use of reason in this area were both "harmful" and "dishonorable" aptly summarized the views of those who saw themselves as engaged in efforts at enlightenment. The initial impetus behind the Enlightenment stemmed, in part, from Protestants' revulsion at Louis XIV's (1638–1715) campaign against the Huguenot minority (culminating in his Revocation of the Edict of Nantes in 1685) and reservations regarding the policies of the Catholic monarch James II (1633–1701) in England (culminating in his removal in the "Glorious Revolution" of 1688). Such concerns were particularly evident among the political and religious exiles from France and England who gathered in the Dutch Republic at the close of the seventeenth century, where they produced tracts on religious and political questions that ranged from such classic texts as Locke's *Letter concerning Toleration* (1689)—a work that had a pervasive influence throughout Europe and the New World on discussions of the proper roles of church and state—to the infamous *Treatise of the Three Imposters*, a clandestine manuscript that pieced together bits of Benedict (Baruch) de Spinoza, Thomas Hobbes, and various materialists to argue that Judaism, Christianity, and Islam owed their origins to the attempts of "imposters" (i.e., charlatans or magicians) to gain political power.

Toleration was the common cause of all those associated with the Enlightenment. In England Protestant dissenters such as Joseph Priestley and Richard Price drew on the arguments of Locke in their campaign against the limitations on political participation suffered by those who refused to swear conformity to central articles of the Anglican faith (e.g., the doctrine of the trinity). Similar arguments could be found, at the end of the century, in Moses Mendelssohn's *Jerusalem* (1783), a treatise on the relation between civil and ecclesiastical power. In France Voltaire—profoundly influenced by the diversity of religious practices he observed during his visit to England—waged a life-long campaign in support of toleration, culminating in an effort to clear the reputation of Jean Calas, a Huguenot executed under circumstances that, for Voltaire, epitomized the corruption of justice by religious fanaticism. By the end of the period the campaign for tol-

eration could claim such legislative achievements as Thomas Jefferson's *Virginia Statute of Religious Freedom* (1786) and Article X of the French *Declaration of the Rights of Man and Citizen* (1789).

The period was also marked by efforts at purifying Christian doctrine from what were seen as subsequent distortions and fabrications. Both Locke's *Reasonableness of Christianity* (1695) and Toland's *Christianity Not Mystrious* presented themselves as attempts to recover Christ's original teaching—which they argued contained nothing that contradicted what could be ascertained through “natural” reason—from what the more pugnacious Toland characterized as “the craft and ambition of Priests and Philosophers” (p. 96). More moderate versions of such arguments persisted to the end of the period in the so-called neologism embraced by Berlin clergy, whose sermons and writings denounced popular superstitions and religious enthusiasm as contrary to a conception of Christian doctrine and emphasized the importance of moral and civic responsibilities. Parallel efforts at reform could be found within the Ashkenazic Jewry in what came to be designated the *Haskalah* (the Hebrew term for *enlightenment*).

Projects of reform, however, easily crossed over into the advocacy of heterodoxy, with Socinian and pantheist doctrines having a broad appeal. For example, Toland's later writings, which hailed the Druids as practitioners of a “natural” religion, articulated positions that are difficult to reconcile with any established version of Christianity. The same is true for the work of Lessing, especially his *Education of the Human Race* (1777), a text that influenced Hegel's early writings. While explicit endorsements of atheism remained a minority position within the Enlightenment (Holbach's *System of Nature* [1770] was the famous notorious exception), Spinoza's writings held a particular interest for more radical free-thinkers, and various pantheist and materialist doctrines lent support to formulations in which references to the deity contributed rather little to the argument.

#### THE NEWTONIAN IDEAL AND THE RISE OF A SCIENTIFIC CULTURE

Though known chiefly by reputation or through popularizations, the work of Newton had a significant impact during the period. His influence was felt in England both in the increasing interest in experimental approaches to natural philosophy and in the popularity of his arguments among religious dissenters. On the Continent advocates of Newton's cosmology challenged Cartesian and Leibnizian approaches, with Newtonians eventually

gaining the upper hand within the French Academy of Sciences and the Berlin Academy. Voltaire and Alembert were effective advocates of Newtonian positions before the broader reading public, as was Voltaire's mistress Émilie du Châtelet (1706–1749), a skilled translator of and commentator on Newton's work.

Attempts to extend Newton's approach to other areas were frequent, with the *Optiks* (1704) rather than the more daunting *Philosophiae Naturalis Principia Mathematica* (1687) serving as a paradigm. The study of electrical phenomena attracted a great deal of interest, with Franklin's contributions to the field enjoying a wide readership in Europe. There were also notable attempts to apply what were viewed as Newtonian approaches to moral philosophy. Hume subtitled his *Treatise of Human Nature* (1739) “an attempt to introduce the experimental method of reasoning into moral subjects,” Adam Smith employed analogies to gravitational attraction in his *Theory of Moral Sentiments* (1759), and Condorcet attempted to bring mathematical approaches to bear on political decision making.

More generally, science and scientific reasoning came to enjoy an enhanced status among educated laypersons. The predictive success of Newton's laws in mapping the paths of celestial bodies—most notably Edmond Halley's (1656–1742) application of these laws to the path of the comet that now bears his name—played a role in this process, as did such practical innovations as Franklin's lightning rod. Scientific academies—both state sponsored and private—also had a significant impact in demonstrating the practical implications of scientific inquiry.

#### HUMAN NATURE AND CULTURAL DIVERSITY

The application of Newtonian approaches to the study of politics and society was but one example of a broader interest in the study of human nature. Accounts of the voyages of James Cook (1728–1779) and Louis-Antoine de Bougainville (1729–1811) brought reports of peoples whose social arrangements, moral practices, and views on religion differed radically from European norms and that posed significant challenges to assumptions regarding the uniformity of human nature. Theories that attempted to explain this diversity in terms of differences in modes of subsistence (hunting and gathering, pastoral, agricultural, and commercial) were particularly prominent among thinkers associated with the Scottish Enlightenment. There were also extended debates on the origin of different races (a term that had a much wider meaning

during this period than it would take on during the nineteenth century) between those who, like the French naturalist Comte de Georges-Louis Leclerc Buffon, maintained that all human beings descended from a common origin and that racial differences were the result of climate, and those who, like the Swede Carl von Linné (1707–1778), argued that the different races had descended from different ancestors.

Beyond these theoretical disputes, the literature on “savage peoples”—particularly accounts of the allegedly idyllic life of the natives of the newly discovered island of Tahiti—provided a means for criticizing European society. Rousseau’s *Discourse on the Origins of Inequality* (1755) and Diderot’s *Supplement to Bougainville’s Voyage* (begun in 1772) can serve as examples of this mode of argument, which had an influential predecessor in Baron de Montesquieu’s *Persian Letters* (1721).

#### EFFORTS AT “IMPROVEMENT”

The political views of those associated with the Enlightenment diverged widely. Some favored constitutional monarchies (with England representing one possible model), while others placed considerable hope in the efforts of reform-minded absolutists such as Frederick II of Prussia (1740–1786) and Joseph II of Austria (1741–1790). In the wake of the American Revolution republican ideas gained supporters in both England and France.

What was more pervasive than an allegiance to any particular political ideology was a concern with what was loosely characterized as “improvement.” The interest of Scottish enlighteners in the promises of commercial development was reflected in Adam Smith’s *Inquiry into the Nature and Causes of the Wealth of Nations* (1776). In France Jacques Necker (1732–1804) and his protégé Condorcet wrestled with the worsening fiscal and political crises that plagued the French monarchy in its final decades. Throughout Europe various societies examined ways of improving agricultural production, fostering the growth of manufacturing, and increasing the circulation of commercial goods. For example, the Lunar Society of Birmingham—whose membership included the inventors James Watt (1736–1819) and Matthew Boulton (1728–1809), the manufacturer Josiah Wedgwood (1730–1795), and the polymaths Priestley and Erasmus Darwin—waged a wide-ranging campaign for political reform and commercial development.

Perhaps there is no more compelling testimony on the role of the Enlightenment in shaping the modern world than the emergence, since the 1940s, of critiques of

the so-called Enlightenment Project that hold it responsible for the various alleged pathologies of modernity (for discussions, see Baker and Reill [2001] and Gordon [2001]). While this literature tends to be rather selective in its conception of what this alleged project involved, the diversity of charges that have been leveled against the Enlightenment speaks to the complexity of the movement and its perceived relevance for the present.

## ENLIGHTENMENT, ISLAMIC

### BEGINNINGS

The Islamic *Nahḍah* (rebirth, renaissance) started in Syria and achieved its real momentum in Egypt in the nine-

teenth century, then as subsequently the intellectual engine room of Islamic intellectual life. The *Nahḍah* movement represented an attempt to do two things. One was to introduce some of the main achievements of European culture into the Islamic world. The other was to defend and protect the major positive features of Arab and Islamic culture and revive them despite the assaults of European imperialism. The important features of the movement were the attempt to combine these policies and the reaction to the apparent decadence of the Arab world not by rejecting Arab culture but by purifying it and introducing it to aspects of modernity from without that were seen as acceptable from an Islamic point of view.

### DEVELOPMENT

The main *Nahḍah* thinkers were Sayyid Jamāl ad-Dīn al-Afghānī (1838–1897), and Muḥammad ‘Abduh (1849–1905), who in their different ways sought to confront modernity not by rejecting it nor by rejecting Islam, but by effecting some kind of synthesis. The Renaissance movement suggested that one could accept some European ideas and reject others, thus preserving tradition while adopting modernity at the same time. *Nahḍah* argued that Islam is itself a profoundly rational system of thought and has no problem in accepting science and technology. So there is no reason for Muslims to abandon their faith while at the same time accepting the benefits of European forms of modernity. Interestingly, the significance of reviving Islam or Arabism played a considerable part in the political rhetoric of the time.

The most important intellectual figure in this movement was undoubtedly al-Afghānī, who as his name suggested had close connections with Afghanistan, where part of his early education took place. He seems to have been deliberately unclear about his precise ethnic origins to prevent that from being a divisive factor in his attempts to address the whole Islamic community. At the age of around eighteen he moved to India, where he came across the modernist ideas of Sayyid Ahmad Khan (1817–1898), whom he later attacked in his *Refutation of the Materialists*. Ahmad Khan was intent on proving to the British rulers of India that Islam was a religion capable of accepting rationality, and it was this apologetical tone that al-Afghānī attacked. His arguments were not based on Islam alone; they also borrowed a great deal from what he regarded as science and philosophy. He argued that Islamic philosophy was perfectly compatible with modern science and technology and should encourage Muslims to acquire the necessary skills to resist the impact of

European imperialism. Part of the Islamic Renaissance ideology was that there should be a rebirth and rediscovery of the main intellectual and political achievements of the Islamic world during its high point.

Al-Afghānī's *Refutation of the Materialists* argues that the source of evil is materialism, the philosophical doctrine that argues that the world has developed out of a set of material preconditions. He also criticizes the theory of evolution, which he sees as denying God's role in designing the world. His critique also has a social aspect in that materialism is held to reject founding society on any common moral values, and in being critical of religion as such, and of Islam in particular. This sort of critique of what is seen as European culture has since the nineteenth century become common in the Islamic world.

The influence of his ideas was amplified by the efforts of Rashīd Riḍā (1865–1935), who founded in 1898 the journal *al-Manar* (The Lighthouse) in Cairo. The central theme of the journal was that there is no incompatibility between Islam on the one hand, and modernity, science, reason, and civilization on the other. Riḍā tended to emphasize religion and was a firm opponent of secularism, arguing that supporting modernity did not imply advocating secularism.

Muḥammad 'Abduh used his position as head of al-Azhar, the leading theological university in the Sunni Islamic world, to propound the message of the *Nahḍah* that the Islamic world should accept modernity while at the same time not rejecting Islam. The period of stagnation that he identified with the tenth to the fifteenth centuries was a time when the early scientific and philosophical progress of the Islamic cultural world came to an end and the political and religious authorities had a mutual interest in maintaining control by restricting the intellectual curiosity of those over whom they ruled so effectively. What was now needed, he argued in the nineteenth century, was reform of all the institutions of the Islamic world, while preserving the timeless truths of Islam itself. He suggested that the connection between religion and modernity, in particular between Christianity and modernity, is entirely misplaced. Christianity itself advocates belief in the transience of everyday life, by contrast with the concern for possessions and comfort so characteristic of modern industrial societies. Still, Christianity found no inconsistency in combining religion with modernity, so this need not be a worry for Muslims either.

## ENLIGHTENMENT, JEWISH

Growing emancipation of European Jews in the eighteenth century was matched by an intellectual movement that came to be called the Jewish Enlightenment or *Haskalah*. Jews started to enter the mainstream of European society, in particular in major German cities such as Berlin, and Jewish thinkers had to accomplish two tasks. They needed to show their Gentile peers that they were just as committed to rationality as anyone else, and they needed to persuade other Jews that they should establish links with the local non-Jewish cultures in which they lived.

The main embodiment of this movement was Moses Mendelssohn, who participated fully in German philosophy and culture, and lesser thinkers were Marcus Herz (1747–1803), Salomon Maimon (1753/4–1800), and Nachmun Krochmal (1785–1840). Mendelssohn first of all emphasized the importance of mastery of the local secular language, and of the contemporary culture. But this did not imply abandoning Judaism; he argued on the contrary that one could use modern ways of argumentation to explain and justify religious systems such as Judaism. He comes to argue that Judaism is a profoundly rational religion and so highly appropriate for those committed to reason. Mendelssohn was here reacting to the widespread view that Judaism was a rule-bound and legalistic system that only those stuck in a worn-out culture would persist in following. It came to be argued in German philosophy by Kant and Hegel that Judaism was a religion essentially superseded a long time ago in the past, fossilized and unsatisfactory, and Mendelssohn and other *maskilim* (Enlighteners) argued that these criticisms were misplaced.

The basis of *Haskalah* was respect for reason, as the word suggests (*sekhel* being *reason* in Hebrew) and this was to have longstanding effects on Jewish culture. It contributed to the start of Reform Judaism in Germany, its basis being a putative rational attitude to traditional Judaism. It also played a part in the secular nature of Zionism, the idea that the Jews, like other national groups, had a right to a homeland that was based on reason not tradition. After its growth and development in Germany, *Haskalah* moved east to affect the Jewish communities there, and produced a schism between the “modernizers” and those concerned to defend tradition. The *Haskalah* raised the issue of how far a religion upheld by a minority excluded from mainstream society could survive when that minority was allowed to join that society. If it could be argued that the traditional religion was as rational as anything else in society then the intellectual presuppositions of such a change might not threaten the survival of the religion. The *maskilim* were confident that both Judaism and secular European society would benefit from a more intimate relationship, because the basis of both is reason.

## ENTAILMENT, PRESUPPOSITION, AND IMPLICATURE

*Entailment*, as used by philosophers, is a term of art that, unlike *logical consequence*, lacks a precise definition that is consistently adhered to by those who employ it. Through-

out much of the twentieth century, especially its early and middle years, many philosophers connected entailment with analyticity, requiring the material conditional ‘ $A \supset B$ ’ to be analytic when A entailed B. In later years, as conceptions of analyticity became less expansive, and philosophical uses of it more restricted, the presumption that entailment was to be understood in terms of analyticity waned. However, the relationship between entailment and necessity has remained robust. Standardly, when it is claimed that A entails B, B is taken to be a necessary consequence of A in the sense that it is impossible for A to be true without B’s being true. Often, though not always, B is required to be apriori deducible from A, as well. The relata, A and B, are naturally thought of as propositions, or statements—in the sense of that which is stated by an assertive utterance of a sentence. However, sometimes theorists speak of sentences themselves as entailing other sentences. In such cases, it is natural to construe the relation holding between sentences as deriving from the primary entailment relation holding between the propositions they express.

A potentially more restrictive understanding of entailment requires that when A entails B, the falsity of A is a necessary consequence of the falsity of B. When entailment is understood in this way, it is sometimes contrasted with logical presupposition: A proposition A logically presupposes a proposition B if and only if the truth of B is a necessary condition for A’s being either true or false. The most widely discussed (putative) examples of logical presuppositions are so-called existential presuppositions, corresponding to uses of singular terms. (These are also sometimes called *referential presuppositions*.) For example, according to a Fregean analysis of definite descriptions, the propositions expressed by (1a) and (1b) logically presuppose the proposition expressed by (1c).

1a. The person who proved Goldbach’s conjecture is brilliant.

1b. The person who proved Goldbach’s conjecture isn’t brilliant.

1c. One and only one person proved Goldbach’s conjecture.

For Frege, singular definite descriptions are complex singular terms, and the predicate *is brilliant* designates a function that assigns truth to some individuals and falsity to others. Because the sense of *the person who proved Goldbach’s conjecture* fails to pick out any individual, the function designated by *is brilliant* has no argument to operate on, and (1a) is characterized as being neither true

nor false. The same is true of (1b), which is taken to be the negation of (1a). Because, for Frege, the negation function—which assigns truth to falsity, and falsity to truth—has no argument to operate on in this case, proposition (1B) is not assigned any truth value. On this analysis, the truth of the logical presupposition, (1c), is a necessary condition for (1a) and (1b) to be either true or false.

## THE SEMANTICS OF FREGE AND RUSSELL

Although the compositional semantics of Frege (1891, 1892a, and 1892b) produce elegant results in cases such as this, they run into trouble when fully generalized. For Frege,  $n$ -place truth-functional operators designate  $n$ -place truth functions, and the truth value of a truth-functional compound is the value of the relevant truth function at the  $n$ -tuple of truth values of its sentential constituents. Hence, the argument used to show that the negation of a proposition is truth valueless if and only if the proposition negated is truth valueless can be generalized to yield the conclusion that a truth functional compound is truth valueless if and only if one of its constituents is. This result is demonstrably incorrect, as is shown by (2a) and (2b)—based on an example given by Bertrand Russell in “On Denoting” (1905). (Read *if, then*, in (2a) as material implication.)

2a. If one and only one person proved Goldbach’s conjecture, then the person who proved Goldbach’s conjecture is brilliant.

2b. Either it is not the case that one and only one person proved Goldbach’s conjecture, or the person who proved Goldbach’s conjecture is brilliant.

Far from being truth valueless, these examples are made true because no one has proved Goldbach’s conjecture.

This was one of the considerations that led Russell to analyze the examples in (1) differently from Frege. On his analysis, the logical form of (1a) is (R1a), while (1b) is ambiguous between (R1bw), in which the description is said to have wide scope, and (R1bn), in which it takes narrow scope.

R1a.  $\exists x [\forall y ((y \text{ is a man} \ \& \ y \text{ proved Goldbach's conjecture}) \leftrightarrow x = y) \ \& \ x \text{ is brilliant}]$

R1bw.  $\exists x [\forall y ((y \text{ is a man} \ \& \ y \text{ proved Goldbach's conjecture}) \leftrightarrow x = y) \ \& \ \sim x \text{ is brilliant}]$

R1bn.  $\sim \exists x [\forall y ((y \text{ is a man} \ \& \ y \text{ proved Goldbach's conjecture}) \leftrightarrow x = y) \ \& \ x \text{ is brilliant}]$

When (1c) is false, (R1a) and (R1bw) are also false, but (R1bn) is true. On this analysis, (1c) is a necessary consequence of (1a), and of the reading of (1b) represented by (R1bw). However, on this reading, (1b) is not the (logical) negation of (1a). Hence, for Russell, these examples are not instances of logical presupposition.

## STRAWSON’S THEORY OF PRESUPPOSITION

In “On Referring” (1950), Peter Strawson considered such cases, and presented his own analysis that included the following theses: (i) meaning is a property of expressions; referring, saying something, and being true or false are properties of uses of expressions in contexts; (ii) to give, or know, the meaning of a sentence  $S$  is to give, or know, a rule for determining the contexts in which  $S$  is used to say something true, and the contexts in which it is used to say something false; (iii) the primary referring use of a name, demonstrative pronoun, or singular definite description is one in which the term is used to refer to something that the rest of the sentence is used to say something about; the meaning of such a term, when used in this way, is a rule for determining its referents in different contexts; (iv) if a singular term  $b$  in a sentence ‘ $Fb$ ’ is used referringly in a context  $C$ , then ‘ $Fb$ ’ says something true (false) in  $C$  if and only if, in  $C$ , the referent of  $b$  has (does not have) the property that  $F$  is used to express; if  $b$  fails to refer to anything, then ‘ $Fb$ ’ fails to say anything true or false in  $C$ ; (v) definition:  $S$  presupposes  $p$  relative to  $C$  if and only if the truth of  $p$  is a necessary condition for a use of  $S$  in  $C$  to say something true or false; and (vi) uses of ‘ $\lceil$ The  $F$  is  $G$ ’, ‘ $\lceil$ All  $F$ s are  $G$ ’, ‘ $\lceil$ Some  $F$ s are  $G$ ’, ‘ $\lceil$ No  $F$ s are  $G$ ’, and ‘ $\lceil$ Some  $F$ s are not  $G$ ’ presuppose (in the sense of (v)) that expressed by ‘ $\lceil$ There is at least one  $F$ ’.

Thesis (ii) is problematic. As it stands, it does not rule out, and may even seem to suggest, that the meaning of a sentence is a function from contexts of utterance to truth values. According to a better picture, presented by David Kaplan in “Demonstratives” (1989), the meaning of a sentence is a function from contexts to propositions, where the latter determine functions from circumstances of evaluation to truth values. When this view is substituted for (ii), corresponding changes must be made in theses (iii) and (iv). Strawson’s emphasis on referring as the semantic function of a singular term, plus his tendency to treat referring uses of demonstratives as prime examples of this function, suggest a reformulation of (iii)

and (iv) in which all referring uses of singular terms are, in Kaplan's words, *directly referential*. (iii<sub>K</sub>) A referring use of a singular term *b*, as part of a sentence *S*, in a context *C* contributes the referent of *b* in *C* to the proposition expressed by *S* in *C*; the meaning of a singular term is a rule for determining the propositional constituents contributed by uses of *b* to the propositions expressed by sentences containing *b* in different contexts. (iv<sub>K</sub>) If a referential use, in a context *C*, of a singular term *b* in a sentence 'F*b*' refers to *o*, and if *F* is used to express the property *P*, then 'F*b*' expresses a proposition in *C* that is true (false) in a possible circumstance *w* if and only if *o* has (doesn't have) *P* in *w*, if *b* fails to refer to anything in *C*, then there is no propositional constituent corresponding to *b* in *C*, and 'F*b*' fails to express a (complete) proposition in *C*.

The theory of presupposition that emerges from this reconstruction of Strawson's theses is a theory of what may be called *expressive presupposition*: A sentence *S* expressively presupposes a proposition *p* relative to a context *C* if and only if the truth of *p* is necessary for *S* to semantically express a (complete) proposition in *C*. This theory provides a plausible account of examples in which a pronoun, demonstrative, or demonstrative phrase is used referringly. However, the theory produces incorrect results when extended to the range of cases mentioned in thesis (vi). Such an extension also conflicts with Strawson's expressed intentions. In *Introduction to Logical Theory* (1952), he defines presupposition as follows: A statement (proposition) *S* presupposes a statement (proposition) *S'* if and only if the truth of *S'* is a necessary condition for *S* to be true or false. Because this is a definition of logical presupposition, Strawson's adoption of it belies any clear commitment to expressive presupposition, or any systematic analysis of the examples in (vi) along directly referential lines.

This suggests a second possible reconstruction of his position. On this interpretation, his theory of presupposition is substantially the same as Frege's, without the compositional semantics, but with the stipulation that statements involving certain generalized quantifiers bear existential presuppositions. This theory is broad in scope and has been historically influential. However, its leading ideas are not original with Strawson. As a historical point, it would be a mistake to attribute to him either an account of presupposition that is systematically Fregean (logical), or an account that is systematically expressive. His major discussions include elements of both, the conflict being masked by the flawed account of meaning

given in thesis (ii), and the failure to articulate the more satisfactory picture later provided by Kaplan.

## PRAGMATIC PRESUPPOSITION AND CONVERSATIONAL DYNAMICS

An important advance in the study of presupposition, signaled in Stalnaker (1973, 1974) and Lewis (1979), integrates presupposition into a broader theory of conversational dynamics. The crucial observation is that sentences are used in communication to contribute to an existing conversational record, which contains background assumptions shared by conversational participants. Because of this, it is natural for speakers to develop conventional means of indicating what assumptions they are making about the conversational record to which their utterances contribute. Pragmatic presuppositions may then be understood as requirements imposed on such records by utterances. Suppose, for example, that a use of *S* (e.g. "It wasn't Andrew who solved the problem") requires the set of background assumptions prior to the utterance to contain a specific proposition *p* (that someone has solved the problem). Imagine a conversation in which *p* is not already among the shared background assumptions prior to the utterance of *S*, but conversational participants are willing to accept *p* as uncontroversial. What response would be reasonable in such a case? The legalistic response would be to object to the speaker's remark on the grounds that *p*, which was required by the utterance of *S*, had not already been established. The speaker could then ask whether hearers were willing to accept *p*, and be told that they were. After adding *p* to the conversational record, the speaker could repeat the original remark, and continue.

But there would be no point to this. Because hearers are ready to accept *p* anyway, they may as well add it to the background, and let the speaker go on without objection. In short, the most efficient response is to accommodate the speaker by updating the conversational record so that it meets the requirements of the utterance. Knowing that hearers can work this out on their own, the speaker can exploit this strategy of accommodation by uttering sentences the presuppositional requirements of which are not already satisfied by the conversational record—provided the requirements are both recognizable and uncontroversial. One virtue of this pragmatic approach is its eclecticism regarding different factors that may give rise to presuppositional requirements. As indicated in Soames (1989), logical presupposition, expressive presupposition, conventional implicature, constraints on the interpretation of anaphora, and non-conventional pragmatic facts

have all been suggested as sources of pragmatic presuppositions. Further developments are found in Heim (1982, 1983) and Beaver (2001).

## CONVERSATIONAL AND CONVENTIONAL IMPLICATURES

Closely related to pragmatic presuppositions, are conversational and conventional implicatures, introduced in Grice (1989) (originally delivered as the William James Lectures at Harvard in 1967). For conversational implicatures, the key insight is that the efficient and rational exchange of information by cooperative speakers is governed by maxims that include: (i) don't make your conversational contribution too weak (or too strong); (ii) don't say that which you believe to be false, or that for which you lack adequate evidence; (iii) be relevant; and (iv) avoid obscurity and ambiguity; be brief and be orderly.

Conversational implicatures are propositions that a speaker is committed to, above and beyond that which is said or asserted, by virtue of the presumption that the conversational maxims are being obeyed. According to Grice, a speaker *s* conversationally implicates *q* by saying *p* if and only if (a) *s* is presumed to be observing the conversational maxims, (b) the supposition that *s* believes *q* is required in order to make *s*'s saying *p* consistent with that presumption, and (iii) *s* assumes that the hearers can recognize both this requirement and that *s* is assuming this. For example, if *s* assertively utters a disjunction 'A or B', then standardly *s* conversationally implicates that there are non-truth-functional grounds for the assertion (because if *s*'s grounds were truth-functional, and hence sufficient for asserting either disjunct alone, then *s*'s utterance of the disjunction would be too weak, and hence violate maxim (i)). This shows that the simple truth-functional semantics for disjunction do not have to be complicated in order to explain why assertive utterances of disjunctive sentences standardly convey non-truth-functional information.

Another example of some philosophical significance involves the observation in Austin (1964) that it would be an abuse of language for a man who can see that there is a pig in front of him—without having to make any special investigation or to infer the presence of the pig from other propositions—to assert merely that it seems to him as if a pig is present, or that he has evidence of the presence of a pig. From this Austin concludes that such assertions would be false, and that, in a case such as the one imagined, a person can have empirical knowledge without having evidence for the proposition known. However,

as pointed out in Ayer (1967), Austin's observation does not support his conclusion. Because the speaker in the imagined situation is in a position to make the stronger claim that a pig is present, the decision to make the weaker statement instead violates Grice's maxim (i). The abuse of language here is not that of stating a falsehood, but of conversationally implicating one.

Like conversational implicatures, Gricean conventional implicatures are propositions to which the speaker is committed, despite their not being parts of what is said by the speaker's utterance. The difference between the two is that the former arise from the conversational maxims, whereas the latter are due to aspects of meaning. For example, an utterance of "She is poor but honest" conversationally implicates—in virtue of the nonassertive meaning of "but"—that there is some contrast between poverty and honesty, an utterance of "He is an Englishman, and therefore, brave" conversationally implicates—in virtue of the nonassertive meaning of "therefore"—that being brave is an expected consequence of being an Englishman, an utterance of "Mary hasn't arrived yet" conversationally implicates—in virtue of the nonassertive meaning of "yet"—that Mary's arrival is expected, and an utterance of "It wasn't Andrew who solved the problem" conversationally implicates—in virtue of the nonassertive meaning attached to the construction "It was (wasn't) NP who VPed"—that someone solved the problem. (Contrast this with "Andrew didn't solve the problem.") A significant point, developed in Karttunen and Peters (1979), is that conventional implicatures such as these may plausibly be regarded as pragmatic presuppositions. This suggests that the nonassertive meaning that generates them may be presuppositional in nature.

## ENVIRONMENTAL AESTHETICS

The term *environmental aesthetics* can apply to a variety of quite disparate sorts of cases—*aesthetic appreciation of natural environments, of works of art situated in nature, of works of art—for example, landscape paintings—that are of or about nature, of works of art that*

take nature as their medium, and of gardens, a special category that seems to straddle the divide between culture and nature. In each case the philosophical challenge is the same: to determine the proper object and mode of appreciation. While these issues have not been definitively decided in the case of art appreciation, it remains helpful to use that example as a counterpoint against which an account of environmental appreciation can be constructed.

### NATURE APPRECIATION

Nature scenes and natural items figure in our culture's most clichéd examples of aesthetic appreciation. Images of sunsets, rainbows, flowers, and baby animals are the stuff that enrich greeting card companies. But nature appreciation is also addressed by aestheticians and serious philosophers in the Western tradition. Immanuel Kant's examples of free beauty in *Critique of Judgment* (1790/1987) were natural items—flowers, birds, seashells. Beautiful items, Kant believed, provided a source of disinterested pleasure, their form alone triggering a pleasurable free play of imagination and understanding.

Nature appreciation is, of course, not confined to the beautiful. Kant's contemporary, Edmund Burke, indicates this even via the title of his 1757 work *A Philosophical Inquiry into the Origins of our Ideas of the Sublime and Beautiful* (1968). According to Burke, our attention is elicited not only by natural items that are small, lovely, and delicate, but also by those that are large, awesome, and terrifying. Surprisingly, such experiences are sought out. Kant concurs, offering the starry heavens, mountain peaks, and deep chasms as examples of the sublime. Certainly, nature is as much a repository of infinity and power as of delicacy and beauty.

Convinced that these two poles, the beautiful and the sublime, do not exhaust the grounds for aesthetic appreciation, eighteenth-century writers such as Sir Uvedale Price (1747–1829) and Richard Payne Knight (1750–1824) posited a third aesthetic category, the picturesque, situated midway between the beautiful and the sublime. Though the picturesque was initially defined as a species of beauty—that sort that would look pleasing in a picture—it soon came to be identified by an independently specified set of characteristics—roughness, sudden variation, and irregularity.

Additional factors of various sorts shape our nature preferences. Some are beliefs of which we are aware. Consider Thomas Burnet's (1635–1715) theory of the broken world. Promulgated in 1681 the theory impugned mountains as blemishes visited on the previously perfect

(smooth and spherical) earth in payment for humankind's Fall. In her classic study *Mountain Gloom and Mountain Glory* (1959/1997), Marjorie Hope Nicholson documented the changes that allowed Romantic poets to embrace mountain scenery. Less accessible instincts and emotions may also affect our attitudes toward nature. In the 1970s Jay Appleton formulated prospect-refuge theory according to which we all have a hard-wired preference for the savanna-type landscapes that afforded our long-ago ancestors crucially valuable opportunities to see yet not be seen. And in addition to such shared influences, we have each accumulated a vast store of personal experiences and associations that contribute to our landscape preferences.

### CONTEMPORARY PHILOSOPHICAL DEBATES

Ronald Hepburn (1972–) is often credited with ushering in the current era of environmental aesthetics with his article “Contemporary Aesthetics and the Neglect of Natural Beauty” (1996/2004). Hepburn there pinpointed two crucial differences between the aesthetic appreciation of nature and the aesthetic appreciation of art: (1) The objects of nature appreciation are often unframed and unbounded, and (2) we are often immersed *in* those objects. Hepburn's rehabilitation of nature as an object of aesthetic appreciation has been welcome and effective. But it may be that in crafting his argument, he was focused on a particular subset of examples: macroscopic rather than microscopic objects of appreciation. We can savor entire panoramas: lofty mountain ranges, vast seascapes, all the sorts of scenes Donald Crawford (1938–) calls *postcardesque*, but we can also zoom in on tiny focussed delights: an alpine flower; a polished pebble; a single, wondrous insect. These are neither unbounded nor capable of immersing us. In addressing such objects we seem to adjust our focus at will; this may well counter the standard practice of the art world where conventional modes of appreciation are in place for each type of work.

Present-day philosophers have taken up Hepburn's challenge and examined the scope or proper objects of appreciation, its theory-ladenness, and the supporting roles of association, imagination, and emotion. Arnold Berleant's (1932–) 1991 theory of engagement proposes an approach to both nature and art in keeping with Hepburn's insights. Berleant emphasizes the participatory aspect of aesthetic experience, the reciprocity of perceiver and object in the aesthetic field. By contrast, Allen Carlson (2000, 2004) has built a distinctive theory of nature

appreciation by rejecting at least part of the analogy between art appreciation and nature appreciation. Carlson argues that treating nature as a set of scenes or a collection of discrete but absorbing objects (e.g., the way we treat painting or sculpture) ignores just those hallmarks that were shown by Hepburn to set nature apart as unbounded and enveloping. Yet Carlson maintains that nature appreciation must be informed by some body of theory that plays the role that art theory and the history of art play in art appreciation. Carlson proposes that science fills this void in the case of nature appreciation. Thus geology, physics, astronomy, earth science, biology, and botany can all play a role in informing our appreciation of nature.

Just as it seemed that Hepburn's proposed hallmarks characterized some chunks of nature but not others (the macro rather than the micro), so, too, it seems that Carlson's theory works best for a certain subset of cases. Viewing the Rocky Mountains or the Grand Canyon, a Yellowstone geyser or a rampaging tornado, it seems that our appreciation can only be enhanced by knowing the forces that shape these expanses and events. Science here provides knowledge of origins. It is less clear that scientific knowledge is helpful in appreciating things that are small, or ordinary, or the sites of local, ongoing, yet invisible processes. Is my aesthetic appreciation of a forest path, of red maples in fall or of a spider's web glistening with dew enhanced by knowledge of the decomposition of leaf mold, of the loss of chlorophyll, or of the extrusion of spider silk?

Carlson's theory has generated a voluminous secondary literature. Among the challenges raised is the exact nature of the theories he urges appreciators to call upon—science only, or science mingled with common sense. Other critics challenge the exclusivity of Carlson's approach, suggesting that the appeal to scientific theory is one way to appreciate nature but that it can coexist with other ways. In this vein, Noel Carroll (1993) argues for the role of emotional responsiveness, insisting that it is often appropriate for people to be emotionally moved by natural scenes and events. Emily Brady (2003) argues for an expanded role for imaginative response and distinguishes four different kinds of imaginative activity—exploratory, projective, ampliative, revelatory—that are summoned up by nature. The first is a playful examination of form and its attendant associations, the second a deliberate exercise of seeing as, the third an inventive contextualizing that takes us beyond the perceptual image, and the fourth an arrival at aesthetic truth. These, too, seem compatible with the appeal to science—for exam-

ple, one might wander through a forest in spring, imagine it ablaze with fall reds and oranges, and acknowledge the mechanisms that would bring this about.

In her book *Aesthetics of the Natural Environment* (2003), Brady sorts various accounts of nature appreciation into cognitive and noncognitive camps. Since Brady basically elides the cognitive with the scientific, her taxonomy classes theories that appeal to association, imagination, emotion, or nonscientific information as noncognitivist. Thus she deems Hepburn, Berleant, and Carroll noncognitivists, along with Cheryl Foster (1998) who argues for an ineffable aspect of nature that she calls the ambient; Thomas Heyd (1956–), who champions the ascription of various narratives to natural goings on (the narrative is also how Foster labels the approach opposed to the ambient); and Yuriko Saito, who believes that nature appreciation should include a moral dimension—what she calls appreciating nature on its own terms.

The foregoing discussion has not touched on one profound, underlying problem, namely, the identification or definition of nature itself. There is good reason to think that there is no unsullied nature to be found on our planet. All nature has been intermixed with or affected by culture. Malcolm Budd (1941–) believes we are always able to abstract from such mixed cases and appreciate nature as nature even when, say, viewing an animal in a zoo (2002). The degree of mental/imaginative activity required here to arrive at an all-natural, intentional object of appreciation could be considerable. The water flowing from my kitchen faucet is natural only if I abstract away the changes wrung in the city treatment plant, or better yet, imaginatively travel back to the rainfall that was its source.

#### ART IN NATURE / ART FROM NATURE

This last topic of mixture lays the groundwork for considering cases where art and nature blend. The most innocuous in the continuum of such cases would be sculpture gardens and sculpture parks where works of art are simply arrayed in a natural setting. The effect would be very much that of an outdoor museum. Works of art in a sculpture garden can each be appreciated on their own. Additional insights arise from their juxtaposition.

While designers of a sculpture garden would of course take care to place each work in a setting conducive to its appreciation, there is no reason to think the arrangement could not be juggled just as curators can shuffle the order in which objects are arrayed in a museum. There is, however, one important feature that comes with outdoor exhibition. The works of art are

viewed against an ever-changing background. Light and temperature are no longer controlled, as in a gallery, and the viewing experience is constantly affected by ongoing natural cycles: night and day, changing seasons, passing storms.

Additional complexities arise if the works of art exhibited outdoors connect with their setting in some way or other. One site might especially suit a given work on formal grounds. Alternatively, a work might comment on or interact with its setting. More explicit still are works that are *about* their settings. In such cases we enter the realm of site specificity, a trait made infamous by the controversy surrounding the removal of Richard Serra's (1930–) sculpture *Tilted Arc* from the site for which it was designed. Proper appreciation of site-specific works involves noting not only their formal, representational, and expressive properties but also their contextual properties. Thus the significance of Eero Saarinen's (1910–1961) *Gateway Arch* in St. Louis, Missouri, would be greatly compromised if it were not situated on the west bank of the Mississippi River marking the beginning of the western frontier brought about by the Louisiana Purchase. Nor would the work have the same significance if its legs were realigned to make the arch a portal for north–south rather than east–west travel. The environmental artist Robert Irwin (1928–) has codified four varieties of site specificity in his essay “Being and Circumstance.” Irwin classifies works of art as site-dominant, site-adjusted, site-specific, and site-conditioned/determined. These four categories sort works whose meaning and purpose can be understood without reference to their site, works that make some concessions (such as placement and scale) to their site, works conceived with a specific site in mind, and finally, works that draw all their cues or reasons for being from their site.

A limiting case of the phenomenon of site specificity would be works of art that take (aspects of) their site as their medium. This would be true of some of the earthworks of the 1960s and 1970s. Michael Heizer's (1944–) *Double Negative*, Robert Smithson's (1938–1973) *Spiral Jetty*, and James Turrell's (1943–) *Roden Crater* are works that result from forceful gestures in the landscape; other environmental artists such as Andy Goldsworthy (1956–) and Michael Singer (1950–) make their art of more ephemeral stuff, taking walks and documenting them, making slight, nuanced adjustments to nature and then letting them dissipate. Both Crawford and Carlson have questioned whether the more bold types of environmental installations stand in an adversarial relation to nature as a result of creating aesthetic affronts.

## GARDENS

When we turn to gardens, many of the topics already covered are still relevant. Gardens are in nature and their materials are often in large part natural. Japanese Zen gardens consisting of stones and raked sand are the most familiar counterexample to this expectation. And even more traditional gardens mix natural materials with a host of other components and features: paths, walls, benches, follies, fountains. Moreover, gardens bring to the forefront questions about *degrees* of naturalness. This has varied over garden history, with gardens that seemed utterly wild and untamed in one epoch coming later to be viewed as staid and artificial. Paradoxically, many gardens that are deemed natural in style achieve that effect through an intensive application of labor and care.

Unlike the sculpture parks and environmental works just discussed, the garden is a bona fide art form with its own history. Accordingly, Richard Wollheim's (1923–2003) notions of general and individual style take hold in gardening. Many garden styles are labeled in a way that includes a national designation—the French formal garden, the English landscape garden, the Italian villa garden, the Chinese scholar garden. This nomenclature flags the importance not only of cultural influences but also of topographical and climatological ones. (However, gardeners have always tried to trump nature with such aids as orangeries and greenhouses, trade in rare and exotic plants, breeding of entirely new species, and the bedding system—which allows several different gardens to succeed one another as the seasons unfold.) In addition to sustaining the notion of different general garden styles, the art of gardening also has practitioners whose individual style is recognizable. Thus we honor Andre Le Notre (1613–1700), Lancelot 'Capability' Brown (1716–1783), Gertrude Jekyll (1843–1932), Roberto Burle Marx (1909–1994), and many, many more.

Garden appreciation must respond to this complexity. The sort of scientific knowledge that Carlson claims enhances our appreciation of natural scenes is also relevant to the garden—especially with regard to the plant species in place and the degree of skill or manipulation required to bring about various effects. Moreover, since all gardens are created rather than naturally occurring, their designers' intentions are always there to be retrieved. These intentions can range from trying to create a sensory delight to vastly ambitious promulgation of meanings. Not many gardens are what Mara Miller (1944–) calls grand gardens—that is, those that can claim to be great works of art. But exemplars have been produced in many different cultures. Gardens *can* convey complex

meanings to those who view or walk through them. Through a judicious arrangement of plants, hardscape, topography, water features, statuary, buildings, inscriptions, and more, they can present disquisitions on matters of enduring interest and concern: politics, religion, love, war, the meaning of life, our place in the cosmos. Such gardens can sustain interpretive debates, with appreciators weighing in to defend alternative incompatible accounts of their meaning.

The sorts of garden content just discussed are pursued in much the same way that audiences track the meaning of works of art. Yet important aspects of nature appreciation also apply to gardens—especially the notions of unboundedness and surroundedness called to our attention by Hepburn. Though gardens are literally bounded, Miller (1993) has pointed out an important sense in which they cannot be controlled: since gardens are comprised of living things and are subject to natural forces, they are arenas of constant change. Plants grow; daily and seasonal cycles unfold; calamities occur. A garden designer's intentions are much less efficacious than those of other artists. The end result, as Miller puts it, is that gardens have no final form. There is no practical way to freeze a garden at a point in time and declare that to be the proper object of appreciation. In this regard, gardens truly do occupy a middle ground between nature and culture; wildness and art.

## ENVIRONMENTAL ETHICS

Spurred by growing environmental concern in the 1960s, philosophers paid increasing attention to environmental ethics in the 1970s and 1980s. The field is dominated by dichotomies: anthropocentrism versus nonanthropocentrism, individualism versus holism, environmental ethics versus environmental philosophy, organic versus community metaphors, citizen versus consumer perspectives, scientific versus social scientific justifications, and trade-offs versus synergism.

### ANTHROPOCENTRIC ENVIRONMENTALISM

Traditional Western ethics is anthropocentric, as only human beings are considered of moral importance. Because people can help or harm one another indirectly through environmental impact, such as by generating pollution, destroying marshes, and depleting resources, environmental ethics can be pursued as a form of applied ethics in an anthropocentric framework.

Some anthropocentric issues concern the nature and relative importance of values. For example, does the beauty or inspirational quality of a canyon make the canyon intrinsically valuable? If so, is that value an objective feature of the canyon or an aspect of the evaluators' subjective experience or judgment? Finally, how important to people is such intrinsic, noneconomic value compared to economic considerations? Is the canyon's

intrinsic value, assuming it has such value, sufficient to forgo its flooding to generate hydroelectricity that can power economic growth? Environmental ethics is a fertile testing ground for competing axiologies.

Environmental ethics also tests competing conceptions of the individual's relationship to society. A strictly economic approach views the individual as a consumer and directs government to regulate environmental matters to maximize the satisfaction of consumer demands. An alternative approach views the individual as a citizen concerned to promote individual excellence and to preserve and improve the community's best traditions and highest moral ideals. This dichotomy parallels that between liberalism and perfectionism in political philosophy. Just as many perfectionists would forgo the economic benefits of legal prostitution to protect the traditional family, many citizen-oriented environmentalists recommend preserving wilderness areas and species diversity to promote ideals of stewardship.

Environmental justice is primarily an anthropocentric ideal concerning the appropriate distribution of benefits and burdens among human beings affected by environmental decisions. Issues of resource depletion, nuclear waste, and population policy, for example, raise questions about intergenerational justice. Do future people have rights? Can a meaningful distinction be made between future people and possible people? Why should we care about future people if they can neither harm nor help us?

Issues of environmental justice arise when governments use cost-benefit analysis (CBA) to evaluate environmental policies. CBAs typically translate all values into monetary terms with the goal of identifying policies that maximize total social wealth. Exclusively monetary evaluations jeopardize future generations through the use of a discount rate that renders impacts 500 years from now insignificant. In addition, CBAs promote decisions that are unjust to poor people because the monetary value of items in a market economy, and therefore the total value of all such items, social wealth, depends on people's willingness to pay for things. Rich people can pay more than poor people, so the preferences of the rich are weighted more heavily in CBA than the preferences of the poor. Government policies guided by CBA therefore contravene the principle of justice that the interests of each individual person be considered equally.

Environmental racism concerns practices, in derogation of environmental justice, that subject people of non-European origin to disproportionate amounts of pollution and other negative side effects of economic

development. Within most industrial countries, such people are racial minorities. Internationally, such people reside in Third World countries. In both cases, many economists reject charges of environmental racism. They claim that people of color suffer disproportionate burdens not because of racist intent but because they are too poor to pay for better conditions. This is another area of tension between economic and noneconomic anthropocentric considerations.

### MORAL EXTENSIONISM

Opposed to anthropocentrism are those who consider many nonhuman animals to be worthy of moral consideration in their own right. These views extend some traditional ethical theories, such as utilitarianism and neo-Kantianism, to include nonhuman individuals. Paul Taylor (2005) advocates further extension, according equal moral consideration to every living individual, amoeba included.

Many environmental philosophers consider moral extensionism too human-centered and individualistic. It is too human-centered because it justifies valuing nonhumans on the basis of similarities to human beings, such as sentience, consciousness, or merely life itself. Human traits remain the touchstone of all value. Moral extensionism is too individualistic for environmental ethics because some matters, such as species diversity, concern collectives, not individuals. From an individualist perspective, saving ten members of a common species is better than saving one member of an endangered species, other things being equal. Environmentalists concerned with maintaining species diversity reject individualism for this reason.

They reject individualism also as ecologically unrealistic. Ecology teaches that ecosystems depend on individuals eating and being eaten, killing and being killed. For example, predators must kill enough deer to avoid deer overpopulation, which would threaten flora on which deer feed. Reduced flora threatens soil stability and the land's ability to support life. So protecting individual deer from untimely death, which valuing deer as individuals may suggest, is environmentally harmful. Such harm threatens natural ecosystems, such as wilderness areas, that foster biological evolution, which is the focus of value for some nonanthropocentric environmentalists.

Tom Regan (2005) calls holistic views "environmental fascism." Sacrificing individuals for evolutionary advance or the collective good resembles Adolf Hitler's program, especially when human beings may be among those sacrificed. Human overpopulation threatens species

diversity, ecosystemic complexity, and natural evolutionary processes, so consistent, nonanthropocentric environmental holism may be misanthropic.

Holists reply that human individuals, as well as environmental wholes and evolutionary processes, are intrinsically valuable, so individual humans should not be sacrificed to promote the corporate good. However, the casuistry of trade-offs among individuals and corporate entities of various species and kinds is not well developed by the holists. But Regan (2005), for his part, does not show how all individual nonhuman mammals, for example, can be accorded the equivalent of the human right to life without destroying wilderness areas and causing the extinction of carnivorous species.

Because they value not only nonhumans but holistic entities, many environmental philosophers believe their discipline calls for thorough review of the place of human beings in the cosmos. They reject the title "environmental ethics" in favor of "environmental philosophy" or "ecosophy" to emphasize that their views are not applications of traditional ethics to environmental problems but fundamental metaphysical orientations.

### HOLISTIC ENVIRONMENTALISM

Holistic views tend to compare the environmental wholes they consider valuable in themselves with either communities or organisms. Aldo Leopold's "land ethic" (2005), for example, leans toward the community metaphor. Just as the benefits people derive from their human communities justify loyalty to the group, benefits derived from complex ecological interdependencies justify loyalty to ecosystemic wholes. J. Baird Callicott (2005) maintains that community loyalty is emotionally natural to humans, as our ancestors' survival during evolution depended on sentiments of solidarity. In this sense, ethics is based on Humean sentimentalism rather than on Kantian rationality or utilitarian calculation.

The Gaia hypothesis and deep ecology stress the similarity of holistic entities to individual organisms, thereby attempting to reconcile individualism with environmentalism. The Gaia hypothesis maintains that life on Earth operates as if it were a single organism reacting to altered conditions so as to preserve itself. This explains, for example, how Earth has maintained a relatively constant temperature over a 3-billion-year period while the energy emitted toward Earth from the Sun had increased 30 percent. Metaphorically, if Earth is alive, it is our mother because Earth's processes produce and sustain us. This metaphor justifies respect for Earth and Earth's processes analogous to respect for human mothers.

Deep ecology reflects the belief of the stoics and Benedict (Baruch) de Spinoza that reality is essentially one being. Accordingly, it questions the separateness of any individual from the environmental whole. Deep ecologists point out that the skin and other borders between individuals are really permeable membranes that connect as well as divide. Arne Naess (2005), deep ecology's founder, notes that human beings can possess the entire universe in their minds and suggests identifying one's real self with nature. Degrading nature is therefore unwise because it is a form of self-degradation. Deep ecology reconciles holistic environmental concern not only with individualism but also with individual self-concern. This metaphysical consideration is bolstered by observations about the lack of genuine fulfillment experienced by most people whose lives are dominated by consuming artifacts instead of appreciating nature.

### ECOFEMINISM

Whereas the land ethic and Gaia hypothesis rely primarily on information drawn from science, other environmentalists stress social scientific information. Using the results of anthropological studies, especially of foraging (hunter-gatherer) societies, some environmentalists maintain that human life is better where people do not attempt to master nature in the human interest. Many indigenous societies practice an environmental ethic, similar to the land ethic, of reciprocal exchange with non-human environmental constituents such as water, sun, trees, and game animals. This enriches human life and preserves the environment.

Ecofeminists emphasize the relationship between mastering nature in the supposed human interest and the oppression of women, indigenous people, and other subordinated groups. Ecofeminists claim that much Western thinking is dominated by what they call "the master mentality," which is dualistic thinking that values one member of each dyad more than the other and relegates the inferior member to serve the superior. Such dyads include men versus women, heaven versus earth, mind versus body, reason versus emotion, culture versus nature, and progress versus stagnation. White Western men are associated with the superior member of each dyad: heaven, mind, reason, culture, and progress; whereas women, indigenous people, and other subordinated groups are associated with the inferior member: earth, body, emotion, nature, and stagnation. The master mentality thus justifies the continued subordination of women and non-Western, nonindustrialized men, because humanity in

general flourishes, the masters claim, when the inferior serves the superior.

The master mentality's association of women with earth and emotion explains traditional exclusions of women from high religious offices and from professions emphasizing the use of abstract reason. The association of progress with economic growth explains Western insensitivity to the disruption of traditional patterns of life in many Third World countries. Traditional agriculture returns little money but produces a large variety of food for local consumption. It suffers in comparison with Western-inspired commercial agriculture that emphasizes remunerative monocultures when progress is associated with economic growth. The master mentality also generally undervalues work traditionally done by women because much of it is done free, whether it is childcare or tending a garden to feed the family.

Ecofeminists claim that the master mentality approach to the environment serves humanity badly. Worldwide, it marginalizes and impoverishes women and other subordinated people. Humanity would fare better if people's interactions with nature were guided more by thinking traditionally associated with women. Women tend to think more relationally, organically, and holistically than (Western) men, who favor individual rights, commercial success, and mechanistic processes. Whereas typical male patterns of thought and action precipitate ecocrises, typical female patterns ameliorate them. Empowering women can save ecosystems and species diversity.

Most anthropocentrists and nonanthropocentrists believe that in general a tension exists between protecting nature and serving humanity. Nonanthropocentric concern for nature as valuable in itself precludes actions that can make human life better, they think. This is the trade-off perspective. The synergistic perspective, by contrast, is that valuing nature for itself most often precludes action that is mistakenly undertaken in pursuit of human welfare but that is actually counterproductive. For example, the Green Revolution attempted to improve human life by mastering nature but it harmed people more than it helped them because it disrupted traditional social systems and more holistically productive agriculture, argues Vandana Shiva (1991). Like the hedonic paradox, which claims that happiness is best achieved by not seeking it directly, synergists claim that human flourishing is best achieved by nonanthropocentrically valuing nature for itself rather than by trying anthropocentrically to maximize returns from nature for human beings. The land

ethic, deep ecology, and ecofeminism are compatible with environmental synergism.

Because environmental ethics/philosophy questions basic assumptions in economics, technology, metaphysics, ethical theory, moral epistemology, and gender relations, it approaches religion in its attention to the fundamental concerns of human existence.

## EPICTETUS

(55 CE–c. 135)

Epictetus became a slave of Epaphroditus, himself a freedman who was secretary to Nero. After being freed by his master, Epictetus studied with the Stoic Musonius Rufus, and he taught in Rome until Domitian banished the philosophers in 89 CE. He then established a school in Nicopolis in Epirus, a town in northwest Greece founded by Octavian to commemorate his victory at Actium. Epictetus was lame, perhaps because of his sufferings as a slave, but was a renowned teacher.

Like Socrates, Epictetus wrote nothing, but his pupil Arrian compiled a record of his oral teachings. Four books of these *Discourses* survive, together with a digest of central points known as the *Manual*. Although these works reveal that Epictetus taught his students through the careful study of Stoic doctrine (II 13.21, III 16.9–10), they also make it plain that the goal of philosophical learning is not to be an exegete of Chrysippus (I 4.6–9, I 17.13–18). In fact, the discourses themselves do not offer much exegesis, nor do they often develop heavily theorized explanations, careful distinctions, or involved arguments, as a usual philosophical treatise would. For years, scholars explained this by the hypothesis that Epictetus's teachings fit a particular genre of "diatribes"—the Greek title of the *Discourses* is *Diatribai*—but, because the evidence of such a genre is very thin, the hypothesis is no longer widely accepted.

It now seems, instead, that the discourses simply teach in the ways that Epictetus associates with his three philosophical heroes: They manifest the examining role of Socrates when Epictetus refutes unnamed interlocutors by question-and-answer; they display the rebuking and kingly role of Diogenes the Cynic when Epictetus hectors pupils and exemplifies haughty leadership; and they take on the teaching, doctrinal role of the founding Stoic, Zeno of Citium, when Epictetus offers terse, straightforward principles for the guidance of life (III 21.18–19). In all of these ways, the *Discourses* and *Manual* are concerned primarily with the concrete task of helping others live better lives.

So, when Epictetus outlines the "three topics" on which a person must train to become good, they are not abstruse philosophical matters or even the broad parts of

Stoicism, logic, ethics, and physics. Rather, he insists that one must study, first, desires and aversions; second, impulses, rejection, and in general, appropriate action; and third, infallibility in assent (III 2.1–2). He counsels that the first step is to extinguish desire—to rein in the passions and to free one to do what is appropriate (III 2.3–4, *Manual* 2). Epictetus here supposes the Stoic views that passions are defective judgments about what is good and bad for one, and that desire is an impulse for what is good. To eliminate desire, then, is to free oneself from making so many judgments of what is good and bad for one. This freedom from passionate attachments, in turn, frees one to consider coolly what is merely appropriate and act accordingly. Without passions and desires, one lives by weaker impulses, in terms of what is merely appropriate. The last topic is reserved for those who have already made substantial progress in taming their desire and managing their impulses (III 2.5).

This focused deployment of Stoic ideals without the full discussion of logic and physics recalls the Cynics, who traditionally offer the Stoic a “shortcut to virtue.” Epictetus does in fact endorse a brand of Cynicism (III 22), and his Stoicism is much more austere than that of, say, Cicero’s *On Duties*. Nevertheless, Epictetus is not hostile to all conventional roles and the activities appropriate to them, and he does not reject logic and physics so much as he keeps the focus away from them in the *Discourses*, to keep his pupils concentrated on bettering themselves.

Accordingly, the special features of Epictetus’s Stoicism serve his practical aim of helping people, and most are probably due more to it than to any doctrinal disagreement with other Stoics. Among these features, perhaps the most prominent is the oft-repeated distinction between what is up to us and what is not. This distinction, which is highlighted in the first sentence of the *Manual*, tells one to care only for one’s mind or soul. Often, Epictetus puts this by saying that our volition (*prohairesis*) is up to us (see, for example, I 1.23). Because the word *prohairesis* is common in Aristotle’s ethics but not among early Stoics, who used it to pick out a limited sort of impulse, some scholars see Epictetus’s concentrated concern for *prohairesis* as an especially innovative suggestion of a will, inspired by Aristotle and perhaps by debates about freedom and determinism. But this interpretation is hard to support, for the resources Epictetus uses to explain what he means by *prohairesis* do not much stretch the boundaries of earlier Stoicism, and the freedom that he connects with *prohairesis* is just the moral freedom familiar from earlier Stoicism.

Another special feature of Epictetus’s Stoicism is its intensely personal theology. Stoics always locate divinity in the cosmos; they attribute the orderly workings of nature to the divine reason in which all humans have a share. Epictetus personalizes all of this. He considers the goal of living to be to follow the god or gods (I 12.5, I 30.4), and he considers himself a servant of god (IV 7.20). Moreover, he refuses the picture of servitude to a distant king; on Epictetus’s view, Zeus has stationed a divinity within each of us, a “god within” (I 14.12–14, II 8.12–14).

According to this thought, which clearly reinforces the emphasis on what is up to us, we all have the resources we need to live well within us. Two additional ways in which Epictetus develops his appeals to our inner resources are among the most innovative features of his Stoicism. For one, he regularly insists that we have capacities of trustworthiness and self-respect that cannot be taken from us (see, for example, I 25.4). This appeal to personal integrity and to an ability to evaluate reflectively what is appropriate to oneself suggests the modern notion of conscience, and it clearly invokes a notion of self-respect (*aidôs*) that is distinct from what is attested for earlier Stoics. Epictetus makes another interesting departure from earlier Stoics when he insists that our notions of good and bad and the like are innate (II 11.1–8). Although earlier Stoics insist that human minds are blank slates at birth, Epictetus encourages us to take heart in our substantial inheritance from the gods.

Epictetus’s Stoicism is fully realized for the purpose of encouraging others to progress as Stoics. His articulation of self-reliance has attracted many readers over the centuries, and his subtle moral psychology has deservedly found a wide audience, from the second-century emperor Marcus Aurelius to the sixth-century Neoplatonist Simplicius (who wrote a massive commentary on the *Manual*) and from the sixteenth-century neo-Stoic Justus Lipsius to the twentieth-century American prisoner of war James Stockdale.

## EPICUREANISM AND THE EPICUREAN SCHOOL

The Epicureans perpetuated their founder's teaching with little change. Of Epicurus's immediate circle, the most distinguished was Metrodorus of Lampsacus (c. 330–277 BCE), who predeceased his master. Metrodorus was elevated by Epicurus to a position of eminence—he alone shared the appellation “wise” (*sophos*), and his works were regarded as authoritative statements of doctrine. He wrote on epistemology, ethics, religion, poetry, and rhetoric, and he composed polemics against Plato's *Gorgias* and *Euthyphro*, and against Democritus.

Colotes of Lampsacus, another member of the original circle, published a comprehensive refutation of other schools under the title “That the Doctrines of the Other Philosophers Actually Make Life Impossible.” Our knowledge of it comes from Plutarch's *Reply to Colotes*. His other writings included attacks on Plato's *Lysis* and *Euthydemus* and on the myth of Er in the *Republic*.

Hermarchus of Mytilene (325–c. 250 BCE) was Epicurus's successor as head of the school. His chief work, in twenty-two books, was on Empedocles. He also wrote on the arts (including rhetoric), attacked Plato and Aristotle, and left a collection of letters.

Polystratus succeeded Hermarchus. Two of his works have been recovered in part from the library at Herculaneum; the better preserved is “On Unreasonable Contempt for Popular Opinion.”

In the second and first centuries BCE the school continued to flourish. One member, Philonides, enjoyed the friendship of Antiochus Epiphanes (king of Syria, 175–164 BCE) and attained some standing as a mathe-

matician. Later in the second century Zeno of Sidon lectured in Athens on logic, rhetoric, poetry, and mathematics; and he introduced into his ethical teaching many of the commonplaces of the popular moral essays developed by rival schools, including the use of moral examples drawn from literary sources. Zeno's older contemporary, Demetrius of Laconia, also composed popular moral essays and wrote on logic and poetics. These men's rivals were chiefly Stoics, and under the pressure of controversy they occasionally gave new formulations to Epicurean teaching. Whether they were concerned to any great extent with the atomic theory is uncertain; it appears that they did align themselves more closely than did their predecessors with the traditions of Greek *paideia*, perhaps for the added prestige it gave them as they spread their doctrine to the east and west. (Both Zeno and Demetrius counted Romans among their students.) Yet there were a few diehards; one of the rare schisms in the school developed over the question of whether rhetoric is an art. The use of literary embellishment as a means of persuasion was contrary to the principles of the strict Epicureans, who seem to have been influenced by Plato's *Gorgias*. Yet one group accepted epideictic oratory as a legitimate pursuit.

In the first half of the first century BCE Philodemus of Gadara (in Syria), who had attended the lectures of Zeno in Athens, founded at Naples an Epicurean group with liberal tendencies. The Epicurean library at Herculaneum has yielded extensive passages from his many writings, which included moral treatises, biographies of philosophers, a history of the philosophical schools, and such polemical works as “On the Gods” and *On Methods of Inference*. Among his followers were persons of considerable eminence, notably Piso Caesoninus, Roman consul in 58 BCE, who was his principal patron. To such as these, we may suppose, he addressed “On Wealth,” “On the Management of Property,” and “On the Good King in Homer.” This last piece is remarkable, not so much for its concern with a political matter (Epicurus had written “On Kingship”) as for its use of Homer as an authority. (The Epicureans' rejection of the traditional Greek education led them to minimize the importance of the Homeric poems and to challenge the wisdom of Homer.)

Philodemus's treatises “On Rhetoric,” “On Poems,” and “On Music” were orthodox to the extent of maintaining that these arts are not suitable media for philosophical teaching or moral training; yet Philodemus conceded to them a positive value as art forms. Indeed, he himself had literary pretensions and composed a number of short poems. As a philosopher he won a qualified

respect from Cicero. With Siro, his colleague, he attracted to the school a group of young Latin poets, among them Vergil; there is, however, no evidence to connect the school at Naples with the Roman Epicurean Lucretius.

Under the empire the Epicureans, true to their own precept, withdrew from public view. The last conspicuous member of the school was Diogenes of Oenoanda (a town in Lycia), who about 200 CE published the wisdom of Epicurus for his fellow townsmen by having a number of Epicurean writings inscribed on a wall at the entrance to the town. Most of the texts, apparently, he composed himself; two are on natural science, the remainder on ethics. He also included some of Epicurus's sayings and a letter from Epicurus to his mother.

### Bibliography

Our knowledge of the Epicurean school is being improved by the constant publication and reediting of the Herculaneum papyri. Most of this material can be found, with good introductions and commentaries, in the series *La Scuola di Epicuro* (Bibliopolis, Naples) and also in the journal *Cronache Ercolanesi* (Naples, 1971–). For a history of the study of the papyri see Mario Capasso, *Manuale di Papirologia Ercolanese* (Galatina: Congedo, 1991). Diskin Clay, *Paradosis and Survival: Three Chapters in the History of Epicurean Philosophy* (Ann Arbor: University of Michigan Press, 1998), contains essays on a range of topics from different periods of Epicurean philosophy.

On Metrodorus see Alfred Koerte, “Metrodori Epicurei Fragmenta,” in *Jahrbücher für klassische Philologie*, Supplementband 17 (1890): 531–570. (There is a 1987 facsimile reprint by Garland, New York, which also contains Vincenzo de Falco, *L'Epicureo Demetrio Lacone* [Naples, 1923].) For Hermarchus see: Francesca Longo Auricchio, *Ermarcho: frammenti* (Naples, 1988).

For Polystratus see: Giovanni Indelli, *Polystrato: Sul disprezzo irrazionale delle opinioni popolari* (Naples: Bibliopolis, 1971), and James Warren, *Epicurus and Democritean Ethics: An Archaeology of Ataraxia* (Cambridge, U.K., and New York: Cambridge University Press 2002), Chapter 5. On Demetrius of Laconia: de Falco (see above); Enzo Puglia, *Demetrio Lacone: Aporie testuale ed esegetiche in Epicuro* (Naples, 1988); Costantina Romeo, *Demetrio Lacone: La Poesia* (Naples: Bibliopolis, 1988). There is a commentary on Plutarch's reply to Colotes (*Adversus Colotem*) by Rolf Westman, *Plutarch gegen Kolotes* (Helsinki: Acta Philosophica Fennica, 1955). See also Wilhelm Crönert, *Kolotes und Menedemos* (Leipzig, 1906).

The best introduction to Philodemus is: Marcello Gigante, *Philodemus in Italy* (Ann Arbor: University of Michigan Press, 1995). There are also useful discussions in recent editions of Philodemus's works: Dirk Obbink, *Philodemus: On Piety, Part I* (Oxford: Clarendon Press, 1996) and

Richard Janko, *Philodemus: On Poems Book I* (Oxford, 2000). There are useful articles in Dirk Obbink, ed. *Philodemus and Poetry* (Oxford: Clarendon Press, 1995) and Voula Tsouna, “Philodemus on the Therapy of Vice,” *Oxford Studies in Ancient Philosophy* 21 (2001): 233–258, is a good introduction to his ethical approach.

For Lucretius: Diskin Clay, *Lucretius and Epicurus* (Ithaca, NY: Cornell University Press, 1983) and David Sedley, *Lucretius and the Transformation of Greek Wisdom* (Cambridge, U.K., and New York: Cambridge University Press, 1998) discuss the Latin poet's use of early Epicurean works. See also: Keimpe Algra et al., eds., *Lucretius and His Intellectual Background* (Amsterdam and New York: North-Holland, 1997).

For Diogenes of Oinoanda see the edition with introduction and commentary by Martin F. Smith, *Diogenes of Oinoanda: The Epicurean Inscription* (Naples, 1996; supplementary volume, 2003).

## EPICURUS

(341–270 BCE)

Epicurus was born on Samos to parents who were Athenian citizens. Evidence about his philosophical debts and development must be sifted from conflicting reports arising out of the agonistic context of ancient Greek philosophical rivalry and invective. While rivals charge him with merely plagiarizing his atomism from Democritus and hedonism from the Cyrenaics, his advocates praise his singular originality, probably encouraged in this by Epicurus himself. Like Parmenides, René Descartes, and other seminal figures in philosophy, Epicurus presented himself as a solitary herald of truth, creating his system *de novo* because of the inadequacy of his predecessors and teachers. Modern scholarship tends to split the difference, seeing a variety of possible influences—Democritean atomism, Cyrenaic hedonism, Aristotelian *eudaimonism*, skeptic impeturbability—while fully recognizing that however much Epicurus worked within an existing framework, he is responsible for a succession of remarkably influential innovations.

### LIFE AND SOURCES

Epicurus spent most of his first thirty-five years in Asia Minor. There he began formulating his doctrines and collecting important adherents before embarking for Athens where he founded the Garden in 306 BCE. Alone among the major Athenian meeting places for philosophers (the Academy, Lyceum, and Stoa), it remained an authoritative center for the study and dissemination of its

founder's teachings late into the Roman period—largely, no doubt, because it alone continued to flourish as an institution with endowed property, stable traditions of teaching and doctrine, and generations of faithful advocates. It was distinguished as well by its admission of women and slaves. Epicurus's death, although physically painful, is portrayed in our sources as having been appropriately philosophical.

Diogenes Laertius (third century CE), our chief source for his writings (including his will), relates that Epicurus was the most prolific author of his time (some 300 papyrus rolls). Pitifully little survives. Diogenes himself preserves three short letters outlining Epicurus's physical theory, ethics, and explanations of celestial phenomena, though doubts exist that the last is from Epicurus's hand. *Kuriai Doxai*, a collection of excerpts quoted by Diogenes, and a parallel collection surviving in another manuscript, *Sententiae Vaticanae*, were apparently designed to remind adherents of Epicurus's key claims.

Although critical, the philosophical treatises of Cicero, written some two centuries after the time of Epicurus, offer our most articulate evidence for many Epicurean arguments. Other scattered citations are preserved, especially in Plutarch, Sextus Empiricus, Seneca, and the Aristotelian commentators, though it often is difficult to discern from them the original context and intent of his arguments. *De Rerum Natura*, by the Roman poet Lucretius (d. 50 BCE), renders into verse Epicurean atomic theory, epistemology, and social thought, relying especially on Epicurus's major treatise, *On Nature*. Badly damaged parts of *On Nature* and several works by Philodemus, an Epicurean roughly contemporary with Lucretius, were recovered in Herculaneum (1752) from the Casa dei Papiri, buried by the eruption of Vesuvius in 79 CE. New methods of reconstructing these texts are yielding important information about many facets of Epicureanism. Finally, in Oenoanda, in what is present-day southwestern Turkey, a large inscription erected by one Diogenes encapsulates several basic Epicurean doctrines.

## PHILOSOPHICAL SYSTEM

Although not as insistent as the Stoics about the systematic coherence of all his philosophical doctrines, Epicurus believes that his arguments from the domains of physics, epistemology, psychology, and ethics are mutually supporting. So, for instance, a linchpin in his arguments against the fear of death is the claim that persons are material entities of the sort that no longer continue to

exist upon death and are therefore no longer subject to harm. This being the case, we have no reason to fear a future state that can cause us no harm.

Such a view of persons similarly undergirds his theological claim that we have no reason to fear punishment from the gods in an afterlife. Since we do not survive our deaths, the gods can hardly mete out any post mortem punishment, even if they so wished. At the same time, the relation of his materialism to many of his other central doctrines is less immediately straightforward. Epicurus sometimes describes perceptual experiences, actions, and psychological properties in ways that, to many at least, do not look easily reducible to talk about atoms and the void, and one of the persistent problems in understanding his philosophical thought is gauging the extent to which he offers, or at least intends to offer, fully reductive material accounts of each of the primary domains of his philosophical system.

Gaps in our evidence, at least at present, preclude giving a precise accounting of his philosophical successes in coping with the demands of materialism within his general thinking. But one thing seems clear. By adopting a materialist physical theory and working through its implications, Epicurus formulates a series of questions about the material bases of perception and thought, the mechanisms of choice and avoidance, and the possibility of free agency in a world consisting of matter in motion that sets him on a path distinct from such predecessors as Plato and Aristotle. Moreover, he rejects their *polis* bound conceptions of ethics and politics and offers accounts of ethical motivation and political obligation strictly rooted in notions of individual agents and their mutual relations per se. In so doing, Epicurus and his followers develop both a professional philosophical vocabulary and ways of conceiving a broad range of philosophical issues that often appear distinctly modern. Indeed, it might be more historically precise to say that many modern ways of formulating arguments can strike one as being Epicurean—no doubt because a significant number of them in fact have their origins in ancient Epicureanism.

The philosophical challenges that Epicurus faced because of the convergence of his atomism, empiricism, hedonism, and politics of solitary individualism provided a basic conceptual framework for a whole range of thinkers who helped set the terms of modern philosophical debates. Michel de Montaigne, Thomas Hobbes, Pierre Gassendi, Robert Boyle, Jean-Jacques Rousseau, Baron d'Holbach, Jeremy Bentham, and John Stuart Mill—to name just a few who particularly felt his influence—all show basic debts across a wide variety of their

theoretical concerns—debts not only to more general Epicurean philosophical preoccupations, but also in many instances to Epicurus's particular methods of argument, his specific conclusions, and, above all, to the way that he originally devised the philosophical framework and individual terms in which they came to carry on their own debates.

Epicurus himself is frank about the role of materialism in his system. He asserts that if we were not made unhappy by the fear of death or suspicions that natural phenomena depend upon meddling gods, we would have no need to inquire into nature. He therefore rejects both Aristotle's defense of purely theoretical inquiry and the Socratic claim that ethical beliefs can be examined independently of a complete understanding of nature. But this does not commit him, of course, to a rigidly pragmatic conception of scientific truth. To the contrary, he insists that just as with respect to our health, what we want is not merely the semblance of health, in our scientific theories what we want is truth, not merely some beliefs that may appear true. Extra-scientific concerns may motivate our inquiries into nature, but that does not mean that our use of evidence or our procedures themselves need be compromised.

## THE FEAR OF DEATH

Given, however, that Epicurus maintains that philosophical inquiry is driven by our need to understand the sources of unhappiness, it might be helpful to turn to his analysis of these, chief among them the fear of death. In contrast to most contemporary philosophers, Epicurus argues that we have no reason to fear death because it cannot harm us in the slightest. That said, however, he thinks that most people at some level do indeed fear death and that their mental lives, along with many of their actions, are affected in unhappy ways because of what turns out to be simply an irrational and readily eliminable misconception. So for instance, we find in Epicurean texts a version of the so-called symmetry argument.

Assume for the moment the Epicurean claim that death annihilates us. Before we were conceived, we also did not exist. Yet we typically are troubled only by our post mortem nonexistence. How are we to explain this asymmetry in our attitudes to two apparently similar states of our nonexistence? Epicurus argues that whenever we think about our future nonexistence, we find it difficult to view it as the total annihilation of our consciousness and to eliminate ourselves from our conception of it in the required way. This is because whenever I

try to conceive of my death, I become a kind of conscious eyewitness to it in my imagination. I thus have the illusory experience of witnessing my ongoing annihilation, with death continually depriving me of things I value. When I look back at the time before I was conceived, however, I readily see it as the state of nothingness that it is. However explicable, holding asymmetrical attitudes to two equivalent states of our nonexistence, Epicureans argue, is irrational and we should come to view both death and the time before our conception with equal indifference.

This argument, no doubt, raises quandaries about our attitudes towards our past and future, questions about whether such general temporal attitudes apply to states that we do not consciously experience, and dilemmas about the contributions of past or future potential losses in fixing the identities of persons. It also is liable to backfire. We might instead begin viewing the time before our conception as another regrettable state of lost potentialities and thus merely duplicate our anxieties.

Epicurus's central argument against the fear of death, however, is an attempt to demonstrate that all such worries about states of our nonexistence are irrational. His claim is best illustrated by his deceptively simple observation, "When we are there, death is not, and when death is there, we are not" (*Epistula ad Menoeceum* 125). Anyone wishing to show that a state of nonexistence harms us, Epicurus insists, must show who is harmed, when the harm occurs, and how one is harmed. Although these questions make sense regarding harms to existent subjects, no meaningful conception of harm, he argues, can be applied to the nonexistent. Who is harmed by death? No one, since in death there is no longer any subject to be harmed. When are we harmed by death? At no time, since when we are alive, death is not there, and when we are dead, we are not there. How are we harmed by death? In no way, since harm, whether conceived of as deprivation or lost potential, can attach only to something that exists.

The Epicurean claim that any conception of the harm of death requires there to be an existent subject of that harm has challenged philosophers to explore and clarify the metaphysical status of the dead, the place of potential losses or deprivations in accounts of personal identity, the nature of counterfactual propositions about future and past persons, and the conception of time needed to justify the intuition that death harms us. However simple at first glance, the increasingly sophisticated literature generated in response to Epicurus's argument suggests that the verdict is hardly in.

## HEDONISM

One might wonder, however, as did many of Epicurus's ancient critics, how his arguments about the harmlessness of death are compatible with another of his central claims, that pleasure is our final end. Shouldn't a hedonist fear the interruption and loss of pleasure that death threatens? To understand the particular nature of Epicurean hedonism it first must be placed in its ancient dialectical context. Epicurus argues that pleasure is our ultimate goal and the sole component of our *eudaimonia*, or happiness. He further supports his ethical hedonism with a version of psychological hedonism by appealing to a so-called cradle argument; that is, that the observation of infant behavior shows that we naturally seek pleasure and avoid pain. More surprisingly, however, Epicurus argues that the pleasures that comprise individual happiness can be specified objectively because they meet non-subjective criteria and arise from pursuits limited by objective, natural constraints.

By way of contrast, for instance, take John Locke's account of the patient with sore eyes who prefers the pleasures of drink to those of sight and who remains the sole arbiter of his own pleasures, however self-destructive. (*Essay* 2.xxi.55). For the Epicurean, such subjectivity about pleasure and the good fails to meet the minimal demands placed on *eudaimonia* in ancient ethical arguments. So, for instance, desires are open to objective assessment, he claims, because they fall into three distinct classes. Some, for example desires for immortality or power, are incapable of being satisfied and depend on erroneous beliefs, many of which have been inculcated by society. They are therefore both unnatural and unnecessary. Moreover, since they have no natural limits and attempts to satisfy them inevitably lead to frustration, they are to be rejected as sources of unhappiness. Other desires, such as for sex or for particular types of pleasant food, are natural but unnecessary. They can be satisfied if the opportunity arises, but they are not necessary for happiness. Indeed, they can become sources of unhappy disturbance and pain if one becomes troubled by their unavailability or loss.

Finally, there are desires that are both natural and necessary. These have objective, natural limits and are easily satisfied. One needs only so much bread to satisfy one's natural and necessary desire for food, and that desire, unlike those for power or immortality, has a natural limit. By focusing on the satisfaction of natural and necessary desires and by adapting our desires to our circumstances, we can avoid the frustrations of pursuing pleasures that prove "empty." What we can hope to

achieve instead is a natural state of satisfaction entirely free from both mental disturbance and bodily pain. Indeed, such a seemingly neutral condition, Epicurus insists, is the most pleasant state possible. Many have found this claim about pleasure to be paradoxical, arguing that such a state is merely intermediate between pleasure and pain. He denies, however, the existence of any intermediate states, maintaining that the lack of pain and disturbance is the highest pleasure possible.

It is easy to view this, perhaps, as a mere verbal ploy since it flies in the face of what most hedonists and non-hedonists alike have found salient about pleasure, its intensity and variability as a sensation. Epicurus, however, bolsters his argument by distinguishing *katastemmatic* from *kinetic* pleasures. Although its exact force is disputed, as is the extent to which it picks out two different types of atomic movement, this distinction seems to capture two readily identifiable, though perhaps not so readily separable, aspects of pleasure. Kinetic pleasures arise, he argues, during the process of satisfying a desire. Katastemmatic pleasures are the states of satisfaction that supervene when a desire has been satisfied. Most accounts of pleasure, Epicurus claims, make the mistake of focusing only on the pleasures of satisfying desires, when in fact the different ways one satisfies desires are simply interchangeable variants. What we value above all is the attendant state of satisfaction and the freedom from want or disturbance that it signals.

To the charge that he offers us the pleasures of a corpse, the Epicurean responds that the wise prefer no longer having an itch to the pleasures of scratching. More controversial still, Epicurus argues that the highest state of pleasure is itself complete and cannot be made more valuable by lasting longer. To his critics, this account of pleasure seems suspiciously tailor-made to his claim that death in no way harms the pleasant life. To his followers, it served as a powerful explanation of how pleasure, when properly understood, can meet the demands that our happiness be not only self-sufficient, but also complete and invulnerable to any harm at the hands of death.

## THE VIRTUES AND FRIENDSHIP

An undeniable optimism about the power of reason pervades every facet of Epicurus's ethics. He thinks that reason can lead us to eliminate easily any fears based on mistaken beliefs and he lauds its sober power to focus each of our choices on our final good. Like Socrates, he denies that we can know the good and yet fail to pursue it either because of unmanageable desires or incorrigible weaknesses in our character. He does not go as far as the

Stoics in simply identifying irrational desires with mistaken beliefs, but he likewise eschews Aristotle's emphasis on the necessity of habituating desires and character in the ways of virtue. For Epicurus, the therapeutic benefit of rational argument transforms lives at any stage and in any condition. Unsurprisingly, his account of virtue is strongly cognitive. All of the virtues including justice, he insists, are a species of rational prudence, instrumentally useful in securing and maintaining a life of pleasure.

Yet while prudence, courage, and moderation arguably might be claimed as virtues useful to the hedonist, the other-regarding demands of justice seem more problematic. Surely, we might suppose, one might have prudential reasons for being unjust. Why restrict one's pleasures in the interests of others? Epicurean texts offer a panoply of arguments in defense of justice that probably work best if they are taken to have as their addressees Epicurean and non-Epicurean alike. For instance, some texts single out the fear of being caught as the key incentive in obeying laws. Such a motive for being just fits rather badly with the picture of the Epicurean who is supposed to eliminate all disturbing fears and live quietly, and who in any case, has little motive for transgressing laws given the limited range of his necessary desires. Other texts praise the psychologically calming benefits of justice—hardly a motive for the non-Epicurean searching for less tranquil experiences. The central and most lastingly influential component of Epicurus's theory of justice, however, is his account of the origins and nature of justice as a mutual contract among agents “neither to harm nor be harmed.” Although not the first contractual theory in antiquity, it was the Epicurean account with its postulation of an original prepolitical state of nature that took center stage for Rousseau and his predecessors.

Interestingly, Epicurus's particular formulation of the contractual theory rejects the conventionalism of many later theorists, since he argues that contracts failing to reflect mutual usefulness no longer constrain. By placing his theory of justice in the larger context of his accounts of virtue and pleasure, he insists on the essential connection between agents' continuing interests and the contracts they have formed.

Although he denies that the virtues are valuable for their own sake, Epicurus insists that one can achieve happiness only by being virtuous. His ancient critics often doubted, however, whether purely instrumental motives were sufficient for maintaining one's commitments to virtue. A parallel problem arises in his account of friendship. Epicurus often speaks of friendship in the most extravagant terms and some later Epicureans proclaim

that a hedonist can value his friends for their own sakes. But if one's motives in acquiring a friend are securely rooted in one's own pleasure, how can one maintain this seemingly altruistic commitment to friends?

Various later Epicureans struggled with the problem. Some conceded that if one properly focused on one's own pleasure, one could not treat a friend's pleasures as one's own, while others argued that friends might enter into mutually self-interested contracts to value each other's pleasures equally. A few went so far as to claim that one could come to value friendship in a way that went beyond motives of individual egoistic pleasure. All, perhaps, reflect a worry about what has come to be called the hedonist paradox. We can gain the pleasure we seek from friends only by maintaining the other-regarding values of friendship and by valuing friends' pleasures as much as our own. If we instead concentrate on our own pleasures, as hedonism seems to demand, we will undermine the very values that bring us pleasure. It is unlikely, however, that Epicureans would take this as evidence against their theory. Rather, for them, valuing friends' pleasures as much as their own represents an enlightened hedonist strategy that they need to fit, however awkwardly, within the confines of their overall theory.

## INDETERMINISM, FREE WILL, AND THE MIND

Whether or not Epicurus, as many have claimed, was the first to formulate questions about determinism and free will in their modern form, it is clear that he attempts to find room in a mechanistic universe for our rational pursuit of pleasure and hence for our ability to rationally discriminate among alternative choices. Like Aristotle, he rejects logical determinism, as a threat to rational deliberation, and he denies that statements about future contingent events have truth value. Likewise, he contends that if the laws of atomic motion utterly determined everything in the universe, rational argument and choice could have no meaning and they would be robbed of their efficacy. What underwrites the manifest efficacy of reason and frees us from the bonds of both logical and mechanistic fatalism, Epicurus claims, is a slight indeterminacy or swerve in the movements of atoms at no fixed time or place. Such swerves break the bonds of necessity by interrupting the endless chains of causal interactions among atoms. Attempts at understanding the physics of these random swerves and their precise effects on human action abound. Some, for example, have seen the origins of libertarian defenses of free will in Epicurus's account,

with each random swerve of atoms underwriting a free and uncaused act of human volition.

Others, worried about the plausibility of such a strict correlation between micro and macroscopic events, have postulated more infrequent effects by swerves on human actions or character generally. Still others have argued that Epicurus's account is nonreductive or emergentist in a way that defuses the randomizing effects of atomic indeterminism at the macroscopic level. Swerves break causal bonds among atoms, but without generating randomness in emergent properties, thereby insuring the efficacy of rational deliberation and action. In the face of these disagreements, a few have concluded that Epicurus's main worries are innocent of such theoretical niceties and that ascribing to him either libertarian or emergentist views is merely anachronistic. Wherever the truth ultimately lies, it is certainly the case that from the early modern period onward, Epicurus was held to be the chief ancient proponent of libertarianism. And as is often the case in the history of philosophy, the subsequent reception of one's views can be far more influential than one's actual views.

Similar difficulties arise for Epicurus's philosophy of soul or mind. On the one hand, he regularly holds out the ambition of giving a strict identity theory of mind and explicates its materiality with an array of arguments showing that materialism alone explains the mutual causal interactions between mind and body. He claims, moreover, that the mind is composed of particular types of atoms whose specific properties are directly correlated to particular mental functions; for example, the smoothness of specific atoms accounts for the quickness of thought. It was the explanatory power of such instances of Epicurean reductionism that so influenced Julien de La Mettrie and d'Holbach and set the agenda for subsequent eliminativist theorists. Yet Epicurus also emphatically insists that mental properties are real properties and not mere epiphenomena. Some have taken his robust commitment to the reality of macroscopic properties as evidence for anti-reductionism or emergentism, while others have argued that his commitment to physicalist explanation not only entails reductionism, but that reductionism is entirely compatible with his endorsement of the reality of macroscopic entities. Perhaps if our own distinctions between explicative and nonreductive physicalist theories could be more confidently drawn, a choice among these options for Epicurus would be more easily forthcoming.

## KNOWLEDGE AND ATOMS

However he intended to explain the relation between atoms and our world of perceptual experience, it is clear that Epicurus thinks we can attain certain knowledge of both. Epicureans share with Plato and Aristotle a conviction that skepticism is self-refuting both in theory and practice, but they disagree markedly about the criterion for knowledge immune to skeptical attack. Epicurus's epistemology, or "canonic," begins with the emphatic assertion that all sensations are true. What guarantee their truth are the mechanisms of their production. Films or images of inconceivable speed are continually streaming from bodies and striking our senses, which function simply as passive receptors that in no way distort the information they receive. Error can occur only if we extrapolate to the world from these sensations with mistaken assumptions or judgments. This we can avoid by applying to our sensations simple concepts (*prolepseis*) that, arising naturally from repeated sensations, are preserved in memory and embodied in the ordinary meanings of words.

Distrusting Aristotelian-style logics, Epicureans elaborate inferential methods for eliminating false judgments based on what they call confirmation or disconfirmation by the senses. For most subsequent empiricists, such an attempt to skirt formal logic became a dead end. However, Epicurus's arguments in defense of empiricism, especially his materialist accounts of the mechanics of perception and concept formation, enjoyed a long philosophical run, providing basic templates for a succession of empirical theories based on effluences, sense data, and other factors. Few, however, rival his ingenious attempts to work out the actual mechanics of perception in the face of what were to become standard objections to imagist theories of thought and perception.

Armed with empirical knowledge, the Epicurean believes, we can confirm the basic principles of atomism. For instance, from our perception of motion in the world, we can infer that atoms must move—an inference for which only the existence of void offers adequate explanation. Similarly, to explain the multiplicity of things we see in the world, we must postulate an indefinite number of atomic shapes. The existence of atoms themselves is confirmed by our observation that nothing comes from nothing and that division must stop somewhere for there to be something.

Interestingly, Epicurus allows multiple and competing theoretical explanations for some natural phenomena. But he indulges no such operationalist sensibilities toward the basic principles of his atomism. Collisions,

rebounds, and the compounding of atoms are the basic mechanisms of the material world. In an infinite, eternal world of atoms in continual motion, there is no room for teleology or interference from the gods, who in any case are indifferent to human concerns and, at least in some Epicurean sources, seem to have no stable constitution of their own but arise in relation to our mental conceptions of them. Atoms have the properties of shape, size, and weight. Explaining differences in atomic sizes and shapes presented Epicurus with difficult puzzles, however. Unlike later philosophers, such as Agostino Nifo, who constructed atoms from independently existing minima, Epicurus denies their physical divisibility. He postulates, instead, only conceptual divisibility, which required him, with rather mixed success, to theorize spatial and temporal quanta. His argument that atoms have weight, however, was fundamental. It changed the course of ancient atomism and gave the theory its essential shape down to the time of John Dalton.

## EPISTEMIC LOGIC

See *Modal Logic*

## EPISTEMOLOGY

Epistemology attempts to explain the nature and scope of knowledge and rational belief. Its purview also includes formulating and assessing arguments for skeptical conclusions that we do not have knowledge of various kinds. In addition, epistemologists address topics that are closely related to these core concerns, including evaluations of thought processes and the relationship of science to philosophy. What follows is an overview of contemporary developments in epistemology.

### THE ANALYSIS OF KNOWLEDGE

The traditional analysis of knowledge is that it is a combination of three conditions: truth, belief, and justification. The idea is that for someone to have factual knowledge, what is known has to be a fact and thus true; the person has to regard it as true, that is, believe it; and the person must have an adequate basis for believing it—that is, have sufficient justification for believing it. These conditions yield knowledge defined as a sufficiently justified true belief.

The publication by Edmund Gettier (1963) of one brief critical discussion of the traditional analysis brought about a flurry of activity in epistemology. Gettier refuted the traditional analysis by offering convincing counterexamples. He described examples in which someone forms a belief on the basis of strong justifying evidence, but the belief merely happens to be true as a result of a fortunate accident, independently of the evidence. Here is an example similar to Gettier's. Someone sees something that looks perfectly sheeplike in a nearby field.

On that basis the person justifiably believes that there is a sheep in the field. As it turns out, what the person sees is not a sheep. It is a highly realistic statue. However, the person's belief that there is a sheep in the field is true because of the fortunate coincidence that there is a real sheep hidden from view elsewhere in the field. Such a belief is clearly not a case of knowledge despite its being an instance of justified true belief. So justified true belief is not sufficient for knowledge.

Arguing that the person in the example does not have an adequate basis for believing that there is a sheep in the field seems to require taking the general position that few beliefs are justified. For if that person does not have an adequate basis and is not justified, then someone in a similar situation who actually does see a sheep would also be unjustified, given that her visual information would be no better. In almost all cases of actual knowledge of the world, there are possible, although unusual, cases in which one has the same belief on the basis of comparable reasons, yet that belief is only true in this accidental way. Therefore, responding to the Gettier cases by raising the standards for justification leads to the conclusion that we know very little.

Most epistemologists responded to Gettier's examples by seeking a fourth condition for knowledge in addition to justified true belief. Some proposed that to have knowledge, it is also required that the justification for one's belief be *undefeated*, meaning roughly that there is no truth that would undermine the justification for the belief (Klein 1976). Others have suggested that in cases of knowledge the justification does not involve a falsehood (Chisholm 1989). Still others have required that the reasons justifying a known belief be *conclusive*—roughly, reasons that would not exist unless the belief were true (Dretske 1971). Counterexamples refuted the original versions of these analyses, more complex analyses replaced the originals, and new counterexamples followed. (See Shope [1983] for a detailed summary of responses to Gettier's examples.)

Not all epistemologists accept the necessity of the three traditional conditions for knowledge. Some reject the justification condition. One proposed replacement requires a suitable causal connection between a known belief and the facts that make the belief true (Armstrong 1973, Goldman 1967). Another proposed replacement requires a known belief to vary counterfactually with the truth of that belief: if the belief were not true, it would not be believed by the same method, and if it were true, it would be believed by the same method (Nozick 1981). Others have taken the more drastic tack of denying that

any set of necessary and sufficient conditions for knowledge can be given. An alternative explanation of knowledge is that it is the most inclusive *factive* mental state (Williamson 2000). A mental state is *factive* if the existence of the state guarantees its truth. Unlike the traditional analysis, this approach does not imply that the concept of knowledge can be decomposed into parts.

Although epistemologists have learned much about knowledge from this research, no consensus has emerged about the solution to the problem raised by examples like Gettier's.

### JUSTIFICATION: FOUNDATIONALISM AND COHERENTISM

Justification itself has been investigated intensively in the wake of the Gettier problem. A central issue underlying views about justification is the infinite-regress problem. Typically, a belief is justified because it has support from other beliefs. For example, someone might be justified in believing that there are people in the next room by inference from the justified belief that Allen, Barbara, and Carol are in the next room. The supporting beliefs garner support from still other beliefs. The belief that Allen, Barbara, and Carol are in the next room might be justified by inference from the justified belief that they said they would enter the next room and then shouted that they had done so. However, given that our minds are finite, there cannot be an infinite regress of justifying beliefs. Therefore, either there are some beliefs—*basic* beliefs—that are justified without the support of other beliefs; or our beliefs form some sort of circle or web, with each justified/rational belief getting support from other beliefs within the system; or our beliefs are not justified at all. *Foundationalism* favors the first alternative, while *coherentism* favors the second. The third alternative, that no belief has any justification, seems indefensible.

The classic foundationalist view is that a belief is justified provided that it is a basic belief or rests upon a foundation of basic beliefs. Usually, the contents of basic beliefs are taken to be propositions about the mental states of the believer. For example, when someone observes an ordinary physical object in good viewing conditions, that person's visual system produces an experiential state. This is an internal mental state of the observer, knowable by introspection. Believing about oneself that one is in this experiential state is said to be a basic belief. Beliefs of this sort are supposed to provide a secure foundation for the rest of our justified beliefs. Classic foundationalists differ about the source of the security of basic beliefs. Candidate sources include the

alleged infallibility of our introspective capacities and the alleged immunity from doubt of some beliefs. According to classic foundationalism, we acquire whatever justified beliefs we can get about the external world by inference from our introspectively justified beliefs about our own states. Some foundationalists hold that only a deductive (logically necessary) connection can secure sufficient justification for knowledge, whereas others hold that inductive or explanatory relations also suffice. The question of what support is sufficiently strong for knowledge is central to the discussion of epistemological skepticism.

Some foundationalists have relaxed the requirements for basic beliefs (Chisholm 1989, Huemer 2001). The central foundationalist view is that each justified belief is basic or derives its justification from basic beliefs. This view does not require basic beliefs to be certain or infallible. A more modest level of independent support is enough to stop the regress of derived justification. Foundationalists can consistently hold that support from other beliefs gets the basic beliefs beyond this modest level. If the basic beliefs need not be maximally secure, then another departure from the classic view becomes attractive. Basic beliefs can include ordinary perceptual beliefs. For example, the belief that one sees a dog can be basic. It can gain some justification that is independent of other beliefs directly from an experience, which is visually just as though one is seeing a dog. Modest foundationalism is widely thought to be an improvement upon classical foundationalism.

Modest foundationalism has its share of critics, however. Its defenders have been challenged to explain how the basic beliefs can receive even modest support from experience (BonJour 1985). The main problem is that the best understood sort of epistemic support is the justification that is given by the premises of a strong argument for its conclusion, yet the experiences cited by modest foundationalists as providing foundational support do not seem to qualify as premises of arguments. This is because experiences are not statements, but the only kinds of things that can be premises are statements.

Coherentism is the chief rival to foundationalism (Lehrer 1974, BonJour 1985). Coherentists deny that there are any basic beliefs. The secure foundations that classic foundationalists have sought are, according to coherentists, impossible. They contend that all justified beliefs get their justification from a relation of coherence that holds among a body of beliefs. Coherentists have attempted to say what constitutes coherence, often appealing to explanatory relations among beliefs as the source of coherence. Some propose that justification

arises from *reflective equilibrium*—a mutual adjustment of beliefs about particular cases and beliefs about general principles covering these cases that maximizes explanatory relationships among them (Goodman 1984).

Coherentists have been challenged to avoid the apparent implication of their theory that justified beliefs can have an implausible sort of detachment from sensory input. A body of beliefs can be internally coherent while the beliefs fail to take into account the person's experience, yet coherentism seems to imply that these cohering beliefs would be justified. Intuitively, however, such beliefs seem to be as unjustified as the beliefs formed by accepting as true everything in some well-crafted, elaborate, but fantastic story.

Not all philosophers agree that we must choose sides between foundationalism and coherentism. Several have argued that the central epistemological considerations on both sides can be reconciled (Alston 1989, Haack 1993, Sosa 1991).

## JUSTIFICATION: OTHER ISSUES

In addition to formulating and assessing foundationalism, coherentism, and other theories of justification, epistemologists have addressed a variety of other questions about epistemic justification. Standard versions of foundationalism and coherentism share the presupposition that justification is determined by relations among the reflectively accessible contents of our minds—experiential states, beliefs, memories, inferences, and so on. Some philosophers, however, have opposed this *internalist* presupposition, engendering extensive discussion of the contrast between this view about justification and its *externalist* alternatives. (See Kornblith 2001 for essays on these issues.)

For internalists, justification is determined entirely by internal mental factors, whereas externalists assert that justification is at least partly determined by other things. Some internalists also require the believer to be aware of all justifying factors. A typical internalist theory is *evidentialism*, which holds that evidence held in mind determines the epistemic status of beliefs (Conee and Feldman 2004, Haack 1993). *Reliabilism* exemplifies the externalist viewpoint (Goldman 1979). Reliabilism maintains that a belief's justification is determined by a propensity to produce true beliefs of the process or mechanism leading to the belief. This reliability is not an internal factor because the truth of a belief is usually not an internal fact.

A good example to point out the difference between an internalist theory and reliabilism involves the victim of

a deceptive demon. The demon induces the victim to have the experiences like those a reasonable person might have through the perception of an ordinary environment. The demon's victim forms the same external world beliefs on the basis of these experiences. It is a further part of the example that the external world of the demon's victim is not at all an ordinary environment, and so her beliefs about her external world are not true. In such an example, the processes leading to the victim's external world beliefs seem to be unreliable because they produce her thoroughly false external world beliefs. So reliabilism seems to imply that such beliefs are not justified. The belief-forming processes of the counterpart person in a normal environment are presumed to be reliable, so that reliabilism implies that this person's beliefs are justified. In contrast, according to any internalist theory, the beliefs of both the normally situated person and the demon's victim are equally well justified if the individuals are in the same internal states.

Reliabilism has been a subject of intensive critical scrutiny since its introduction. Critics contend that reliabilists cannot plausibly specify the types of belief-forming processes or mechanisms on which the theory relies (Conee and Feldman 2004). For instance, the process of forming a typical visual belief can be classified as perception, visual perception, belief acquisition while relaxed, uninferred belief acquisition, and so on, indefinitely. The problem is to specify which of these process types has to be reliable in order for the resulting beliefs to be justified. Reliabilists must specify the relevant type for all of the processes that lead to justified beliefs. Critics have also charged that beliefs resulting from a reliable process can be unjustified when accompanied by a sufficient reason to think that the process is not reliable (BonJour 1985) and that beliefs resulting from an unreliable process can be justified when accompanied by reason to think that the process is reliable.

Some theories of justification require supplements to reliability. For instance, a proper functionalist theory holds that a belief is justified when the belief results from the operation of a generally reliable cognitive system that is functioning properly in an appropriate environment. One theistic variant of this view holds that the proper function of human cognitive systems is the result of the intentions of a creator (Plantinga 1993). In a nontheistic version, proper function is determined by natural selective forces. One prominent criticism of the proper functionalist approach is that it is possible for a cognitive mechanism to function improperly but felicitously. A perceptual mechanism might accidentally happen to

work much better than it was designed to work. A resulting belief could be especially well justified by the acute perception.

Epistemologists also make comparisons between epistemic justification and ethical concepts such as obligation. Discussions of what a person is justified in believing easily slide into discussions of what the person *should* believe or is *entitled* to believe. Such talk is at least superficially similar to ethical evaluations of how a person should behave and what things the person is entitled to do. It can seem that the epistemic and ethical evaluations are fundamentally the same. However, there is some question about the applicability of ethical evaluations to beliefs. It is widely thought that what one morally should do is limited to those things that one can do. If something similar holds in epistemology, then what one should believe is limited to those things that one can believe. It apparently follows from this premise that beliefs must be under our voluntary control if we are to speak of our being justified in having them. Yet it seems that beliefs are not typically under voluntary control. Some philosophers respond by arguing that, contrary to appearances, we have sufficient control over our beliefs; some contend that it is acceptable to hold that we have justification for believing some propositions even though we are not able to control whether we believe them; and others conclude that few, if any, beliefs are justified since few, if any, are under our control. There is also concern about the connections between the epistemic justification of a belief and the moral or practical benefits of the belief. (Essays on this topic are collected in Steup 2001.)

Another widely discussed set of issues turns on a distinction between a priori justification and a *posteriori* justification. Justification of a belief is a priori when it does not derive from experience, and justification is a posteriori when it does. The leading candidates for a priori justification and knowledge are beliefs in basic truths of mathematics and logic. Other candidates include beliefs apparently made true entirely by conceptual relations, such as the belief that anything red is colored. These allegedly a priori justified propositions are, if true, necessarily true.

A priori justification seems mysterious to many philosophers, since it is difficult to understand what could justify beliefs independently of experience. A wide range of proposals has been made concerning how beliefs can have a priori justification. In the naturalistic approach a priori justification results from the operation of belief-forming processes that guarantee truth and justification (Kitcher 1980). The modal-reliability approach

holds that conceptual intuitions necessarily present us with mostly truths (Bealer 2000). And a resolutely traditional approach holds that humans have a capacity for rational insight that finds truth-making, necessary connections in some thoughts (BonJour 1998).

It appears that a belief could not be a priori justified or known unless its truth is somehow abstractly guaranteed. It also appears that if there is an abstract guarantee that a belief is true, then the truth of the belief must not be merely contingent. So a priori knowledge of contingent truths would be surprising. Yet some philosophers have argued that we can have such knowledge (Kripke 1980), advancing the following kind of argument: Suppose that there is a unique tallest spy; knowing nothing about this and reasoning entirely in our armchairs, we can stipulate that the name "Stretch" refers to whoever happens to be the tallest spy, if there is one. Having done this, it seems that we can logically infer from what we have done, and thereby know a priori, the following contingent truth: if there is a unique tallest spy, then Stretch is a spy. Perhaps this knowledge would not be strictly a priori, since we would be using the experience of our introduction of the name "Stretch." Nonetheless, it seems to be a way to know a contingent truth that is at least remarkably similar to a priori knowledge.

## SKEPTICISM

Many traditional skeptical arguments appeal to the possibility of error. Skeptics often point out that it is possible for us to be wrong about even our most confident beliefs about the world external to our minds, perhaps because we are under the influence of a deceptive demon or some other source of deception. Skeptics typically make the further claim that this possibility implies that we lack knowledge of even the things about the world that we most confidently believe. (Many influential essays on skepticism may be found in DeRose 1999.)

Fallibilism is the heart of one influential response to skepticism (Chisholm 1989, Pryor 2000). Fallibilism is the view that knowledge is compatible with the possibility that the same belief on the same basis is false. For example, someone who has a clear view of a tree in the front yard and believes on a normal perceptual basis that there is a tree in the front yard is subject to some possibility of error. An experience that is visually just as though one is seeing a tree could have resulted from things like the efforts of a deceptive demon. However, a typical person who sees a tree has no reason at all to think that any such odd thing is actually occurring and every reason to think that there really is a tree present. Falli-

bilists hold that in such cases people often have sufficiently strong justification to know that there is a tree in the yard. According to fallibilists, a skeptical argument like the one about the possibility of error relies on setting the standard of justification for knowledge too high. We can have knowledge even though we cannot have the sort of absolute immunity from error that the skeptics wrongly associate with knowledge.

Fallibilism is not without problems. It is no easy task to explain what it is about our experiential evidence that makes it a good reason for thinking that we are in the presence of ordinary objects rather than the victims of some sort of deception. Some epistemologists contend that our justification for our external world beliefs depends upon an *inference to the best explanation* of our experiences (Vogel 1990), whereas others contend that there is something intrinsic to the character of experiences that makes them indicative of external world objects. Adequately spelling out just why our beliefs are even fallibly justified remains an unfulfilled task.

Some influential arguments for skepticism are updated versions of arguments based on possibilities of deception by dreams or demons. The newer arguments often appeal to the possibility of being a *brain in a vat*. The brain-in-a-vat arguments make use of the possibility that a fully functioning human brain, immersed in a life-sustaining vat of chemicals, receives computer-controlled neural stimulation that exactly matches the neural stimulation of an ordinary person in an ordinary environment. A premise of one brain-in-a-vat argument is that any of us might, for all we know, actually be such a brain in a vat. The argument also assumes that, since this possibility might be actual, we lack knowledge of the actual external world.

A much-discussed reply to such arguments employs a causal view of reference (Putnam). On one interpretation, the reply begins with the surprising contention that what a vat-entrapped brain would express by *I am a brain in a vat* would be a falsehood. A lifelong vat-entrapped brain would have learned the term *vat* from some computer-generated stimulations. The origin of the stimulation within the computer would have no causal connection to the brain's container of a sort that would be required for the brain's term *vat* to apply to the container. Hence, according to a causal view of reference, the brain's sentence *I am a brain in a vat* would not be true. Of course, what people in normal circumstances express by that same sentence is also false. Thus, the sentence *I am a brain in a vat* does not express a truth, whichever of these situations we are actually in. The antiskeptical reply

concludes that by this use of a causal view of reference, we can justify denying the brain-in-a-vat argument's premise that, for all we know, we might be brains in a vat.

The success of this sort of antiskeptical reply is in dispute. In any event, a notable limitation of the approach is that at best it refutes skeptical arguments that rely on only some brain-in-a-vat possibilities. For instance, one possibility that is unaffected by the reply is that we recently became brains in a vat, and our term *vat* refers to the vat containing us because proper causal connections were forged in our pre-vat situation.

Skeptical arguments frequently rely on an *epistemic-closure* principle that says that if a person knows one proposition and sees that another proposition follows immediately from it, then the person knows the latter proposition, too. If someone knows an ordinary fact such as that she is seeing a table, then the closure principle implies that she could know by deduction that she is not a mere brain in a vat. Since, according to some skeptics, she cannot know that she is no brain in a vat, the skeptics conclude that she does not know anything from which she could deduce this, such as that she is seeing a table. Some philosophers have denied the closure principle in an effort to argue against this case for skepticism about knowledge of ordinary facts. Most philosophers, however, contend that some version of the closure principle must be true and any mistakes in skeptics' arguments must lie elsewhere (Hawthorne 2004).

Another response to skepticism appeals to *epistemic contextualism* (Cohen 1999, Lewis 1996). Contextualists endeavor to account for the intuitive pull of the arguments for skepticism while allowing that many of our ordinary attributions of knowledge are correct. Their central thesis is about *truth conditions* for uses of sentences including the word *know* and kindred terms. A statement of the truth conditions for a particular use of a sentence specifies the conditions that have to be realized in order for that use of the sentence to state a truth. The main form of epistemic contextualism holds that the truth conditions of particular uses of any sentence including *know*, or cognate expressions, vary with the context in which the sentence is used.

Typically, the varying aspect of the truth conditions is said to be the strength of the epistemic position that is required of the subject of the sentence for a use of *know* to apply to the subject. Usually, contextualists assert that the required strength of epistemic position varies across a range that allows, at its low end, many true sentences that attribute "knowledge" to someone. Thus, what we say is often true when, in ordinary circumstances, we classify as

"knowledge" beliefs that are based on perception, memory, testimony, and perhaps inductive generalization and inference to the best explanation. Contextualists typically also assert that some contexts, at the high end of the range of variation, are demanding enough to make true denials of "knowledge" of the external world. For instance, contextualists often claim that where issues concerning skepticism are salient, the standards for true attributions of "knowledge" are very high and that consequently, in those contexts, skeptical denials of "knowledge" are correct.

Some critics of contextualism deny that skepticism is true even when arguments for it are salient. Appealing to antiskeptical grounds such as the fallibilism discussed above, the critics contend that the arguments fail and that skepticism is wrong whether or not we are thinking about it (Conee and Feldman 2004). Other critics question the linguistic foundations of contextualism (Stanley 2004).

## DEPARTURES FROM TRADITION

The philosophical study of knowledge, justification, and skepticism is the core of traditional epistemology. Some epistemologists have extended the discipline. One such extension involves connecting epistemology to scientific research about how people form beliefs and how they process information. Naturalism in epistemology is roughly the view that there is substantial overlap between epistemology and the sciences that study human cognition. Some philosophers endorse naturalism, whereas others find a reasonably clear distinction between the scientific/empirical questions about cognition and the conceptual questions at the heart of epistemology. A radically naturalistic epistemology advocates abandoning traditional epistemology and replacing it with the closest empirical discipline, cognitive psychology (Quine 1969). Few philosophers defend this extreme view. However, many urge close ties between epistemology and empirical studies of human cognition. For example, epistemologists who highlight the search for ways to improve our reasoning contend that the empirical study of how people actually reason is crucial for developing useful recommendations (Kornblith 1994). Philosophers who believe that the primary role of epistemology is to explain the concepts of knowledge, justification, and the like typically see less room for empirical input. Some advocate a less extreme form of naturalized epistemology that requires explaining central epistemic concepts in terms that they deem naturalistically legitimate.

Traditional epistemology has been largely individualistic in its emphasis on questions about knowledge and

justification as they apply to individuals. However, a social epistemology has arisen that raises questions about what it is for groups to have knowledge and how social factors influence the spread and development of knowledge (Schmitt 1994, Goldman 1999).

Another approach in epistemology highlights epistemic virtues (Sosa 1991). One version of virtue epistemology is a variant on the reliabilist view discussed earlier. This approach attempts to characterize knowledge or justification in terms of epistemic virtues that yield reliably true beliefs, such as open-mindedness and a willingness to consider new evidence. In a greater departure from traditional issues, other versions of virtue epistemology propose that epistemologists replace or supplement the traditional topics with that of virtuous epistemic conduct.

## EPISTEMOLOGY AND RELATED DISCIPLINES

There has been extensive and significant epistemological work done in relation to issues in the philosophy of mind. Externalism in the philosophy of mind, usually called *content externalism*, is the widely held view that environmental factors can help to determine the identity of some mental states. One simple content-externalist claim is that the content of a person's thoughts formulated with natural kind terms, such as *elm* and *water*, depends on causal connections to the kind that was actually involved in the person's learning the term. If the connection had been to a different natural kind, then the person's thoughts formulated with the same term would have included a concept referring instead to the other kind. There need not be any distinguishing feature that displays to the person which kind the person's thoughts are about.

Seemingly, if this simple content externalist theory is true, then we can know it a priori. We can know that external causes help to determine some thought contents by just considering how the reference of our natural-kind terms intuitively varies in some causally different hypothetical situations. If this is correct, then the theory appears to be incompatible with the conjunction of two plausible epistemological doctrines. One of the doctrines is that we can know the contents of our own thoughts by just giving introspective attention to them. If so, then we could combine our a priori knowledge of the simple content externalist theory with our introspective knowledge of the content of one of our thoughts that is expressible using *water*. We could infer that water is causally connected to the thought and that water therefore exists. Yet, according to a second plausible epistemological doctrine,

knowledge of our environment is not so easy. It requires empirical information. Thus, the simple content externalist theory seems to imply that either we cannot know the contents of our thoughts as easily as it otherwise seems we can, or that empirical knowledge of the existence of things in our environment is easier than it otherwise seems to be.

Critics of this line of reasoning have asked whether it can really be known, without empirical investigation, that content externalism applies to any of our concepts. The applicability of the version of content externalism described here to a concept is contingent on the existence of an appropriate causal connection between the concept and some natural kind. This dependence suggests that empirical information about the existence of a properly connected kind is needed to justify applying content externalism to our concepts. (For further discussion, see the essays in Nuccetelli 2003.)

Much that qualifies as epistemology has been done in other areas of philosophy. What follows is a brief inventory of some epistemic work in allied fields. One classic epistemological topic is the problem of induction. This is the problem of establishing whether or not people can use observation of some cases to draw justified conclusions about unobserved cases, and if this can be done, explaining when and why such inferences are reasonable. This problem has been pursued within the part of philosophy of science known as confirmation theory. Second, factual knowledge entails truth. Truth is a traditional topic in epistemology. Various theories of truth are also presented and discussed in metaphysics, the philosophy of language, and philosophical logic. Third, rational change of belief is closely related to the epistemological topic of justified belief. Rational belief change is a focus of probability theory, especially under the classification of Bayesian epistemology. Fourth, epistemological issues are often important to issues of morality and religion. Epistemic concerns pertaining to morality, such as the question of how we can know what is morally right, are usually discussed in works that are primarily about moral philosophy. Similarly, epistemic issues pertaining to God are discussed primarily in works in the philosophy of religion. Finally, in the vicinity of the border between epistemology and cognitive science there has been considerable attention devoted to the nature of purported sources of knowledge and to the ways in which they do their epistemic work. Topics here include perception, memory, intuition, and testimony.

## EPISTEMOLOGY, CIRCULARITY IN

Issues concerning circularity figure prominently in epistemology, finding a place in discussions of topics ranging from the Cartesian circle, to the problem of the criterion, to knowledge of the reliability of ways of forming belief.

## DESCARTES AND CARTESIAN CIRCLES

Issues of circularity arise in the works of René Descartes. In his *Meditations*, in his search for items of certain knowledge (indubitable items given even the possibility of massive deception), Descartes finds that he is certain that he is a thinking being. But what makes this certain for him? The only explanation he finds is that he clearly and distinctly perceives this fact. Furthermore, he finds that clear and distinct perception could not be the source of such certainty if such perceptions could be false. So, he tentatively concludes, whatever is clearly and distinctly perceived is true. But does he really know this general principle? Could it not be that God has caused him to err even in what he clearly and distinctly perceives? Descartes then sets off to prove that a nondeceiving God necessarily exists.

In pondering the matter, Descartes seems to commit himself to the following two claims: (1) He can be certain that whatever he clearly and distinctly perceives is true only if he is first certain that God exists and is not a deceiver. (2) He can be certain that a nondeceiving God exists only if he is first certain that whatever he clearly and distinctly perceives is true. Accepting both these claims gives rise to the Cartesian circle. The problem is that if both (1) and (2) are true, then one cannot be certain of either the general principle or the view that a nondeceiving God exists. In general, if one must first know *A* to know *B* and one must first know *B* to know *A*, then it seems that one cannot know either *A* or *B*.

A related problem for Descartes concerns his use of his clear and distinct perceptions to support the general principle that whatever he clearly and distinctly perceives is true. To support this principle, he attempts to prove there is a nondeceiving God. Yet in his reasoning, he relies on premises that have no other support than his clear and distinct perceptions. Descartes thus relies on his particular clear and distinct perceptions to prove the general principle that whatever is clearly and distinctly perceived is true. To many critics, this is an epistemically unacceptable procedure. Seeing a similarity, the Scottish philosopher Thomas Reid objected that if a man's honesty were called into question, it would be ridiculous to trust his own testimony concerning his honesty. Epistemic circularity consists in using beliefs from source *A* to support the proposition that source *A* is reliable. Descartes's use of his clear and distinct perceptions to support the principle that whatever is clearly and distinctly perceived is true exhibits just such circularity. Whether such circularity is vicious is still debated. Below are some late-twentieth-century views on the issue.

## CHISHOLM AND THE PROBLEM OF THE CRITERION

Another problem of circularity, one made prominent in contemporary epistemology by Roderick Chisholm (1973), is the ancient problem of the diallelus, or wheel. The problem is that to know which particular beliefs are instances of knowledge, one must know some criterion of knowledge. But among the many contenders, which criterion is the right one? To know that some proposed criterion is the right one, one must know that it picks out only instances of knowledge. Thus, to know which criterion is right, one must already know which beliefs are instances of knowledge. Chisholm formulated the problem in terms of a pair of questions: (A) What do we know? What is the extent of our knowledge? (B) How are we to decide whether we know? What are the criteria of knowledge? The problem of the criterion arises insofar as one must know the answer to B before one can answer A, and one must know the answer to A before one can answer B. As in the case of the Cartesian circle, if this is so, then one can answer neither A nor B.

Chisholm identified three responses to these questions: skepticism, methodism, and particularism. The skeptic says that to answer A one must first answer B and to answer B one must first answer A. Therefore, the skeptic concludes, one can answer neither question. One can neither pick out instances of knowledge nor identify a criterion for it. In contrast, the methodist holds that one can answer B first and then answer A. Unlike the skeptic, the methodist believes that he can know a criterion of knowledge. He holds that one must know a criterion of knowledge to know or pick out particular instances of it. Chisholm took the empiricism of Locke and Hume to be forms of methodism. One difficulty with this sort of methodism, according to Chisholm, is that it implies that we know nothing about the external world, other minds, the past, or the future. The third approach, the one favored by Chisholm, is particularism. Unlike the methodist and the skeptic, the particularist holds that one need not know a criterion of knowledge to pick out particular instances of it. The particularist holds that he can answer A and then work out an answer to B. Chisholm took Thomas Reid and G. E. Moore to be particularists. They held that we know pretty much what we ordinarily think we know, and if some philosophical criterion implies that we do not, then so much the worse for that criterion. Thus, if some criterion implies that I do not know that there are other thinking people or that I was alive yesterday, then that criterion must be mistaken.

## RECENT DISCUSSIONS OF EPISTEMIC CIRCULARITY

The problem of epistemic circularity has received much attention in recent epistemology. As noted above, the problem of epistemic circularity arises for Descartes in his use of his clear and distinct perceptions to support the general principle that whatever is clear and distinctly perceived is true. Epistemic circularity also seems to be a feature of attempts to support the reliability of such doxastic sources as memory, sense perception, introspection, intuitive reason, and induction. To support the belief that one of these sources is reliable, one must appeal, it seems, to particular beliefs that issue from that source. For example, it seems that to support the belief that perception is reliable, one must appeal to beliefs produced by perception, and to support the reliability of memory, one must appeal to some memory beliefs. To many philosophers, epistemic circularity seems vicious and epistemically unacceptable. Other philosophers argue that it is not *necessarily* vicious or unacceptable.

To focus the discussion, consider the following track-record argument for the reliability of sense perception:

At  $t_1$ , I formed the perceptual belief that  $p$ , and  $p$  is true.

At  $t_2$ , I formed the perceptual belief that  $q$ , and  $q$  is true.

At  $t_3$ , I formed the perceptual belief that  $r$ , and  $r$  is true.

And so on.

Therefore, perception is a reliable source of belief.

In this track-record argument for the reliability of perception, one reasons inductively from a wide sampling of perceptual beliefs, notes that the vast majority have been true, and concludes that perception is reliable. But how does one know that the second conjunct in each premise is true? How does one know, for example, that  $p$  is true? Let us suppose that it is known on the basis of perception. In this case, one is using perception to support the conclusion that perception is reliable. This makes the track-record argument epistemically circular. But is it therefore vicious or epistemically unacceptable?

A circular argument in which a premise is identical to the conclusion seems epistemically to carry no weight. Consider an argument of the form “ $p$ ;  $q$ ;  $r$ ; therefore  $p$ .” Arguments exhibiting this sort of circularity seem useless for conferring justification on the conclusion. If, on the one hand, one is not justified in believing the premise that  $p$ , then the reasoning does not justify the conclusion

that  $p$ . If, on the other hand, one is justified in believing the premise that  $p$ , then it seems that the conclusion that  $p$  is already justified, and the reasoning or argument does not confer any justification on the conclusion that  $p$ . A defender of the track-record argument or epistemically circular arguments may concede that arguments of this form are epistemically without weight. He may still point out that the track-record argument above does not have this defect. The conclusion that perception is reliable is not identical with one of the premises, and so the argument is not for that reason unacceptable.

Another criticism of the track-record argument is based on a view about what is required for perceptual knowledge. A critic of the track-record argument might object that perceptual knowledge epistemically depends on one's knowing that perception is reliable. On this view, perceptual beliefs amount to knowledge only in virtue of one's knowing that perception is reliable. Knowledge of the premises of the track-record argument, says the critic, depends on knowledge of the conclusion, that perception is reliable. If this is so, then the premises of the track-record argument do not make the conclusion knowledge. Rather, they derive their positive epistemic status from one's knowing the conclusion. On this view of the nature of perceptual knowledge, a track-record argument would again seem unable to yield knowledge of the conclusion.

In response, one might argue that this objection rests on a mistaken view about the nature of perceptual knowledge. Perceptual knowledge, one might argue, requires that perception be reliable, but it does not depend on one's knowing that perception is reliable. In other words,  $S$ 's having perceptual knowledge that  $p$  requires that  $S$ 's perceptual belief that  $p$  be reliably formed, but it does not require that  $S$  know either that perception is reliable or that his perceptual belief that  $p$  is reliably formed. One might note that young children and brute animals can have much in the way of perceptual knowledge without knowing much about perception. They might even be unable to form the metabelief that perception is reliable. Indeed, one might maintain that perceptual beliefs are instances of immediate knowledge, and that they do not depend for their justification on any other belief.

## ALSTON ON EPISTEMIC CIRCULARITY

William Alston, who has addressed the issue of epistemic circularity with both subtlety and care, finds that epistemic circularity does not always render an argument useless for justifying or establishing its conclusion. In “A ‘Doxastic Practice’ Approach to Epistemology,” he writes, “Provided I can *be* justified in certain perceptual beliefs

without already being *justified* in supposing that perception is reliable, I can legitimately use perceptual beliefs in an argument for the reliability of sense perception” (1989, p. 3). Still, Alston himself worries that track-record arguments are not sufficiently discriminating. Part of the worry is that someone with clearly unreliable ways of forming beliefs could produce a track-record argument comparable to the simple track-record argument for perception given above. Imagine a crystal-ball gazer who reasons as follows:

At  $t_1$ , I formed the belief that  $p$  on the basis of crystal-ball gazing, and  $p$  is true.

At  $t_2$ , I formed the belief that  $q$  on the basis of crystal-ball gazing, and  $q$  is true.

At  $t_3$ , I formed the belief that  $r$  on the basis of crystal-ball gazing, and  $r$  is true.

And so on.

Therefore, crystal-ball gazing is a reliable source of belief.

If the gazer is asked how he knows that  $p$  is true, he will reply that he knows it on the basis of gazing into his crystal ball. Alston worries that if we allow the use of epistemically circular arguments, then clearly unreliable sources of belief can be supported by such reasoning. In particular, it appears that the gazer’s beliefs about the reliability of gazing would then be on a par with our beliefs about the reliability of perception. Alston believes that we need to try a different approach.

He argues that it is rational for us to form beliefs on the basis of certain sources such as perception and memory. The argument goes roughly as follows: (1) Many of our doxastic practices, our ways of forming beliefs, including perception and memory, are firmly established. (2) It does not seem to be in our power easily to avoid forming beliefs on the basis of these practices. (3) Moreover, even if there are alternative ways of forming beliefs, the very same problems of epistemic circularity that beset our attempts to support the reliability of our current practices would also confront these alternatives. (4) Therefore, it is rational for us to continue forming beliefs as we do, such as on the basis of perception and memory. But how does the fact that it is rational to continue to engage in these doxastic practices support the belief that they are reliable? Alston’s view is that in taking it to be rational to form beliefs on the basis of our firmly established practices, I “commit” myself to judging that those ways of forming beliefs are reliable. I cannot reasonably judge that it is rational for me to form beliefs in those

ways and deny that those ways of forming beliefs are reliable.

Alston’s response to the problem of circularity is controversial. Some critics object that Alston’s argument from firmly established doxastic practices is itself epistemically circular. Consider the claims that memory and introspection are firmly established practices and that one cannot easily avoid forming such beliefs. That certainly is true. But how does one know that? Clearly, one knows it on the basis of memory and introspection. Again, it does seem rational to form beliefs on the basis of reason. But in arguing that it is rational for one to form beliefs in that way, one must use reason itself. It does not seem, then, that Alston’s strategy of appealing to our firmly established doxastic practices avoids epistemic circularity. If the track-record argument is unacceptable because it is epistemically circular, how would Alston’s reasoning be any better? Furthermore, Alston worries that some clearly unreliable ways of forming beliefs can be supported if we allow epistemically circular arguments. How, critics object, does appeal to beliefs about firmly established practices help? Could not the gazer look into his crystal ball, form the belief that gazing is firmly established, and construct an argument analogous to Alston’s? In short, if one problem with track-record and epistemically circular arguments is that clearly unreliable sources can be supported by them, the same seems true about arguments that appeal to beliefs about what is firmly established.

## SOSA ON EPISTEMIC CIRCULARITY

Ernest Sosa (1994) holds that epistemic circularity is unavoidable if reflection on the reliability of our sources of belief is pushed far enough. In some cases, one might be able to support the belief that one source of beliefs is reliable by appealing to beliefs from another source. But we can always ask how we know that the second source is reliable. At some point, when reflection is pushed far enough, we cannot support the reliability of our sources except by appealing to beliefs that are the output of those sources. But if epistemic circularity is ultimately unavoidable, Sosa denies that it is necessarily vicious. Suppose, says Sosa, that  $W$  includes all our ways of forming beliefs, encompassing perception, memory, reasoning, etc. Suppose further (i) that  $W$  is reliable, indeed, that in our circumstances and with our nature, it is the most overall reliable way of forming beliefs we could have; (ii) that we are right in our description of  $W$ : it is exactly  $W$  that we use  $W$  in forming beliefs; and (iii) that we believe that  $W$  is reliable. Here our belief that  $W$  is reliable is formed by

means of *W* and is true. Sosa asks, how could we possibly improve our epistemic situation? Our belief that *W* is reliable is based on *W* itself, but Sosa does not see that there is anything epistemically vicious or unacceptable about our belief that *W* is reliable. Since our belief that *W* is reliable is formed on the basis of *W*, we have not avoided epistemic circularity, but in what way does our belief fall short epistemically? Recalling Descartes's initial, tentative reasoning concerning the truth of what he clearly and distinctly perceives, Sosa suggests that we might reason in a similar way for the reliability of other sources. Consider the following reasoning: (1) I know that there is a hand in front of me. (2) The best explanation for this knowledge is that I perceive the fact that there is a hand in front of me. (3) But perception could not be the source of such knowledge if it were generally unreliable. (4) Therefore, perception is not generally unreliable.

Sosa asks what is supposed to be so bad about epistemic circularity. Alston worries that if we allow epistemically circular arguments, then someone could give arguments in favor of their unreliable ways of forming beliefs that are analogous to those we might give in favor of perception and memory. Sosa grants that the crystal-ball gazer, for example, could construct arguments analogous to the track-record argument, and he notes that the gazer might also appeal to his crystal ball and "see" that gazing is a firmly established practice and thus is rationally engaged in. Sosa concedes that the gazer's belief in the reliability of his way of forming beliefs might cohere with his other beliefs and, more generally, that someone could have a coherent, yet false, view about the reliability of his sources. Yet Sosa denies that this fact puts the gazer's beliefs about the reliability of his doxastic practices on a par with our own. The fact that beliefs cohere with one another might provide some degree of epistemic justification, but for Sosa, it is not the only thing relevant to the epistemic status of belief. What makes our view about our doxastic practices epistemically superior is the fact that it was formed on the basis of reliable sources or intellectual virtues. Thus, our beliefs about the reliability of memory, introspection, perception, and reason are epistemically superior to the beliefs of the gazer about crystal-ball gazing in virtue of the fact that our beliefs are based on reliable sources or intellectual virtues, whereas the gazer's are not.

Noah M. Lemos (2005)

## EPISTEMOLOGY, HISTORY OF

Epistemology, or the theory of knowledge, is that branch of philosophy which is concerned with the nature and scope of knowledge, its presuppositions and basis, and the general reliability of claims to knowledge. The pre-Socratic philosophers, the first philosophers in the Western tradition, did not give any fundamental attention to this branch of philosophy, for they were primarily concerned with the nature and possibility of change. They took it for granted that knowledge of nature was possible, although some of them suggested that knowledge of the structure of reality could better come from some sources than from others. Thus, Heraclitus emphasized the use of the senses, and Parmenides in effect stressed the role of reason. But none of them doubted that knowledge of

reality was possible. It was not until the fifth century BCE that such doubts began to emerge, and the Sophists were chiefly responsible for them.

During the fifth century BCE human practices and institutions came under critical examination for the first time. Numerous things that had previously been thought to be part of nature were seen not to be. Thus, a general antithesis was drawn between nature and human convention or custom, and the question of where the line was to be drawn between them arose. The Sophists asked how much of what we think we know about nature is really an objective part of it and how much is contributed by the human mind. Indeed, do we have any knowledge of nature as it really is? Protagoras, for example, seems to have held, if Plato's report is to be believed, that everything is as it appears to a man, that appearances are the only reality. This is the meaning, or part of it, of his famous dictum "Man is the measure of all things." Gorgias was, if anything, more radical, claiming that there was no such thing as reality, that if there were, we could not know of it, and that even if we could know of it, we could not communicate our knowledge of it.

This general skepticism led to the beginning of epistemology as it has been traditionally known—the attempt to justify the claim that knowledge is possible and to assess the part played by the senses and reason in the acquisition of knowledge. Before Plato, Democritus, the Greek atomist, had already drawn a distinction between those properties ordinarily attributed to things which, in his view, really belong to them—for example, size and shape—and those which, as he put it, are a matter of convention (*nomos*), a function of the mind—for example, color. It was Plato, however, who can be said to be the real originator of epistemology, for he attempted to deal with the basic questions: What is knowledge? Where is knowledge generally found, and how much of what we ordinarily think we know is really knowledge? Do the senses provide knowledge? Can reason supply knowledge? What is the relation between knowledge and true belief?

## THE NATURE OF EPISTEMOLOGY

Epistemology differs from psychology in that it is not concerned with why people hold the beliefs that they do or with the ways in which they come to hold them. Psychologists can, in principle, give explanations of why people hold the beliefs they do, but they are not necessarily competent, nor is it their province, to say whether the beliefs are based on good grounds or whether they are sound. The answer to these questions must be sought

from those who are experts within the branches of knowledge from which the beliefs are drawn. The mathematician can give the grounds for believing in the validity of Pythagoras's theorem, the physicist can give the grounds for believing in, say, the indeterminacy principle, and an ordinary but reliable witness can provide the grounds for believing in the occurrence of an accident. Normally, when the beliefs are true and the grounds sufficient, it is permissible to claim knowledge, and whether a particular truth can be said to be known may be determined by reference to the grounds that are appropriate to the field from which the truth is drawn. The epistemologist, however, is concerned not with whether or how we can be said to know some particular truth but with whether we are justified in claiming knowledge of some whole class of truths, or, indeed, whether knowledge is possible at all. The questions that he asks are therefore general in a way that questions asked within some one branch of knowledge are not.

**ROLE OF SKEPTICISM.** To characterize the questions asked by the epistemologist as extremely general is not, however, sufficient. Interest in very general questions of this sort and in the nature of general concepts is typical of philosophy as a whole. What distinguishes epistemology other than the fact that its interests center on the concept of knowledge? When a philosopher asks whether something is possible, the question must be set against the consideration that this thing may not be possible. It must be set against a general skepticism concerning the matter in question. To be called upon to justify the possibility of knowledge or of certain kinds of knowledge makes sense only on the supposition that it or they may not be possible. It is no coincidence that epistemology began in the context of a form of the Sophists' general skepticism about knowledge, for until such doubts had been raised, the possibility of knowledge was bound to be taken for granted. Once the doubts had been raised, they had to be answered. How they were to be answered depended on the nature of the doubts and on the degree to which any particular philosopher was susceptible to them.

*Views on the nature of knowledge.* Perhaps the most characteristic form of skepticism about knowledge has been based upon the premise that we ought not to claim knowledge about anything unless we are absolutely sure about it, unless there is no possibility of our being wrong. Once given this, it is possible to point out that it is at least logically possible to be wrong about most, if not all, the things that we ordinarily claim to know. Philosophers who have been impressed by this argument have generally tried to show that there are at least some things that we

can claim to know, about which we cannot be wrong. Even so, most of the things that we normally think we know cannot, on this view, be said to be known at all. This consequence can be mitigated, although not removed, if it can be shown that the things accepted as known in the strict sense give reasons for believing the things that we normally take ourselves to know. Philosophers who have taken this course have differed both on what this “certain knowledge” is and on how it is connected with what we ordinarily suppose ourselves to know. Rationalists have generally attempted to show that the primary truths that constitute this certain knowledge are related to other truths somewhat as the axioms of a formal or geometrical system are related to the theorems.

Empiricists, on the other hand, have taken the view that the truths which constitute ordinary knowledge can be constructed out of the primary truths, as a building is built up from its foundations. They have differed again on the nature of the primary truths themselves. Rationalists have looked for them among the deliverances of reason, whereas empiricists have claimed that sense experience alone can provide such truths. Other philosophers have accepted part of the skeptical argument to the extent of denying the status of knowledge to some class of truths, reserving that status for some privileged class. Plato is a case in point in that for at least part of his life he maintained that sense experience never provides knowledge at all, this being reserved for a kind of awareness of or acquaintance with a world of quite distinct entities called Forms. In respect to the world of sense experience we have only opinion or supposition. This view of sense experience has not been uncommon among philosophers.

*The concept of knowledge.* A quite different way of dealing with the skeptical argument would be to question the initial premise that knowledge requires absolute certainty. One would not normally claim knowledge about something unless one were sure about it, but that is very different from asserting that a man could not be said to know something unless what he claimed to know was absolutely certain. Knowledge does not actually require this; it requires only that there be the best of grounds for what is claimed. To say this is to say something about what knowledge is, about the concept of knowledge itself. Hence, the skeptical arguments and the answers to them are not entirely independent of the conceptual question about the nature of knowledge. An understanding of the concept of knowledge is a prerequisite of embarking upon any attempt to answer other epistemological questions. Most philosophers have had something to say

about the nature of knowledge, although many have taken its nature for granted. From this have stemmed a number of traditional epistemological difficulties.

## GREEK PHILOSOPHY

**PLATO.** Plato (c. 428–347 BCE) was influenced by several views—the moral teaching and philosophical practices of his master Socrates, the views of the Sophists already mentioned, and such pre-Socratic views about the nature of reality as the Heraclitean view that the sensible world is in a state of flux and the Eleatic view that reality is one and unchanging. He came to hold that reality cannot be changing or imperfect and that it must therefore consist of a world of Forms or Ideas independent of the sensible world. The exact reasons why Plato postulated a world of Forms are not altogether clear. But probably, as Aristotle says, he was influenced by Socrates’ search for the essences of, for example, moral virtues. But because justice, for instance, is never found in this world in a proper and perfect form, he postulated its separate, ideal existence in order to provide the standard by which sensible instances of justice might be judged. The Forms might be known by reason, not by the senses. Whether there was a Form for every sensible particular is arguable, with respect to Plato’s earlier philosophy. However, it is clear at any rate that by the time he came to write the *Timaeus* he believed this to be the case. Thus, in the first place the Forms were probably standards or exemplars of which sensible things were imperfect copies. At the same time, however, they functioned as universals, entities meant to explain how it is possible to think generally about things of one kind and how it becomes possible to attach a meaning to common names. The fact that the Forms had to fill both these roles gave rise to certain logical difficulties which Plato himself pointed out in the dialogue *Parmenides* and which he tried to deal with in the later dialogues. The Forms were always objects of knowledge and, in his earlier thought, the *only* objects of knowledge. Sensible things were, in his view, objects of opinion only.

*Knowledge and true belief.* The distinction between knowledge and true belief is first made by Plato in the *Meno* in the context of another Platonic epistemological doctrine—the theory of recollection (anamnesis). In this dialogue Socrates claims to elicit from a boy without instruction the answer to a geometrical problem. Since the problem is a geometrical one, it is one that cannot be answered by an appeal to the senses. Socrates therefore claims that he is enabling the boy to recollect something that he had known in a previous existence. He maintains that it is a doctrine well known to priests and poets that

the soul has long ago experienced all things in its various existences. Hence, in a sense the soul knows all things, but because it has forgotten them, it has to be reminded of them. The example suggests that Plato may intend the doctrine, at least in part, as an explanation of our knowledge of a priori truths. Indeed, in the *Phaedo* he uses the doctrine to explain how we see things as instances of the Forms: Sensible things remind the soul of what it already knows and what it cannot know from sense experience—the perfect Forms. The *Meno* does not claim so much. Indeed, Plato goes on to suggest that merely arriving at the right answer to a problem may not constitute knowledge but only true belief. Knowledge requires an ability to give the grounds (logoi) on which the answer rests. Nevertheless, Plato says, true belief may sometimes be, in its practical effects, as good as knowledge.

This distinction between knowledge and true belief is retained by Plato in later dialogues, although he is not always so charitable to belief as such. At the end of Book 5 of the *Republic* Plato begins a long argument, involving the famous similes of the sun, line, and cave to show how the soul may be drawn up by education to a true knowledge of the Forms, the final stage in the process that Plato calls dialectic. At the outset Plato makes a threefold distinction between knowledge, ignorance, and an intermediate state that he calls belief. Each of these states of mind has, he says, an object. The object of knowledge is what exists; the object of ignorance is, paradoxically, what does not exist; and the object of belief is that which is between existence and nonexistence. The last seems to be identified with the sensible world. Plato appears to think of these states of mind as forms of acquaintance with some kind of object, although the allocation of the objects in question is puzzling on any account. He rejects the identification of knowledge and belief on the grounds that belief is liable to error, whereas knowledge can never be. His conception of knowledge is thus a strict one.

**Knowledge and sense perception.** Plato's reasons for maintaining that we cannot have knowledge of the sensible world are that we should be in error if we attributed properties to sensible things absolutely. A thing is beautiful, heavy, or good only in relation to other things; hence, Plato concludes, nothing is really beautiful, heavy, or good except the standards of Beauty, heaviness, and Goodness themselves, and they cannot be sensible things. When we judge that sensible things are beautiful, heavy, or good, we are in error and cannot therefore be said to have knowledge.

There are two objections to this argument. First, if we realize that terms like “beautiful” are relative terms, we

shall not necessarily be in error in saying that sensible things are beautiful; error will arise only if we are tempted to think that they are beautiful absolutely. Second, not all terms are relative in this way; “red,” for example, is not. Perhaps Plato eventually took account of both of these points, but it seems clear that he tried to deal with the second by reference to the Heraclitean doctrine that the sensible world is in a state of flux. If this doctrine is true, it is impossible to attribute any property to sensible things unequivocally. This position is put forward in the *Cratylus* and most fully expressed in the *Timaeus*. It depends, of course, on whether the Heraclitean doctrine is true and free from unpalatable consequences. It is examined in Plato's most extensive consideration of knowledge, the *Theaetetus*, a dialogue probably written at about the same time as the *Parmenides* with its criticism of the traditional theory of Forms.

In the *Theaetetus* Socrates engages in a discussion with a young mathematician, Theaetetus, concerning the nature of knowledge. Theaetetus first answers the question “What is knowledge?” in a manner typical of the dialogues, by giving examples of knowledge, but is then prevailed upon to give the answer that knowledge is esthesis (perception or sensation; the Greek word from which it comes is ambiguous). This view is identified with that of Protagoras, the Sophist, to the effect that everything is what it seems to a man and that esthesis is of what is and must be infallible—that is, what seems to a man is so and cannot be wrong. If knowledge is esthesis, it is thus an incorrigible awareness of something purely relative to the perceiver. Socrates enlarges on this view, indicating the extent to which our judgments about empirical things are relative in this way. Finally, the point of view is made absolutely general by the introduction of the Heraclitean doctrine of the flux. The joint effect of the doctrines is that all judgments about empirical things are relative—the classic Platonic point of view. This conclusion is reinforced by reference to various versions of what has become known as the argument from illusion—an argument stating that we cannot be said to perceive the real properties of things because of the possibility of illusion or because of the causal aspects of perception itself.

Having expounded the view that all empirical judgments are relative, Socrates sets out to refute it. He refutes the pure Protagorean view that appearances are the only reality by pointing out that there are acknowledged experts in different fields of knowledge concerning objective phenomena; moreover, the Protagorean view is in essence self-refuting because no absolute truth can be claimed for it on its own terms. He refutes the Heraclitean

doctrine of flux by claiming that if it were true, it would be impossible to say anything about anything, a consideration which he treats as a *reductio ad absurdum*. This section of the dialogue ends with the consideration that certain properties of things—the existence of things, their identity with themselves, and their difference from other things—are ascribable to them only as a result of a judgment by the mind. Knowledge of the sensible world cannot therefore be a simple matter of having sense impressions, of esthesis in the sense specified; it must also involve judgment by the mind.

**Possibility of false beliefs.** In the next section Theaetetus suggests that knowledge consists of true judgment or belief. This suggestion is eventually refuted by the consideration that it is possible to believe something truly when one's grounds are insufficient. Most of the section, however, is given up to a discussion of false belief or judgment, for Socrates wonders whether this is possible. False belief cannot be a belief in what is not, for, as Parmenides showed, there is no such thing as what is not. On the other hand, if false belief consists in erroneously taking one thing for another, it is difficult to see how it is possible, for the believer must know one or both of the things in question if he is to be in the position of taking one for the other. However, if he knows at least one of the things, how can he mistakenly take it for the other? Socrates considers various possibilities, but the only cases in which he will allow the possibility of error are those in which a man fails to recognize something correctly because he has fitted the wrong sense impression to the wrong memory impression. (It is in the context of this discussion that Socrates introduces the analogy of the wax and the seal to illustrate the nature of the mind; the mind literally receives impressions from things outside it.) Since this account will not cope with judgments like  $7 + 5 = 11$ , where there is no question of erroneous recognition of a sensible thing, Socrates introduces another analogy, likening the mind to an aviary, with pieces of knowledge represented by the birds. A man may know something in the sense that the idea of it is in his mind as a bird is in the aviary, but he may not have it at hand. That is, he may know it implicitly but not explicitly. Even here the original difficulties recur, however. How can he mistake an explicit piece of knowledge for something else?

The difficulties in this section of the dialogue depend upon construing errors of judgment as mistakes of identity and equating knowledge with direct awareness. The mistakes allowed by Plato are not strictly mistakes of identity but mistakes in matching one thing with another, the sense impression with the memory impression. Plato

returns to the matter in the *Sophist*, where he tries to provide a new logical analysis of the nature of judgment. He distinguishes between judgments of identity and existential judgments and probably between both of these and subject-predicate judgments (as they were later called). Judgments generally assert that one thing participates in another (at least the latter being a Form), but judgments of identity and existence assert the participation of something in certain especially important Forms—those of sameness and existence. These Forms are two of a list of five to which Plato gave special attention, the others being difference, rest, and motion. To say that something is identical with another thing is to say that it participates in the Form of sameness in relation to that other thing. Mistakes of judgment can arise over whether something really participates in another thing, and to that extent the difficulties of the *Theaetetus* are resolved, although it may be questioned whether Plato has given a really adequate account of judgment.

**True beliefs and logoi.** In the last section of the *Theaetetus*, it is suggested that knowledge may consist of true belief together with the giving of a *logos*. It will be remembered that knowledge was associated with the ability to give a *logos* in the *Meno*. Here Socrates recounts a “dream” according to which the elements of reality are perceptible but unknowable and without a *logos*, whereas the compounds which are formed from them are knowable and have a *logos*. The notion of a *logos* is a vague and possibly ambiguous one, but its connection with knowledge seems to imply at least that knowledge must be expressible in propositions. Socrates rejects the “dream view” (which may possibly be attributable to Antisthenes) on the ground that knowledge of compounds would not be possible unless there was already knowledge of the elements. Propositional knowledge must depend upon a knowledge by acquaintance of something, in Plato's view presumably a knowledge of the Forms. But what is the *logos* which, when added to belief, may turn it into knowledge? Three suggestions are considered. First, that a *logos* is simply the manifestation of the judgment in speech (a possible meaning of the word) is clearly insufficient. Second, that it consists of the recounting of the elements of the thing known is insufficient in that this may not actually amount to knowledge of how the elements are put together. Third, that it consists in the identification of the thing in question is rejected on the ground of circularity, for if being said to know something requires that one know the distinguishing mark of the thing in question, the account is manifestly circular. But nothing less than this is sufficient. The dialogue therefore ends inconclusively.

It is clear that in this dialogue Plato was working toward a view of knowledge which is not too far from the ordinary one. His thought, however, was never entirely free from ambivalence in this respect, and perhaps he never entirely lost his distrust of the senses. The ideal of knowledge as a kind of apprehension of a system of Forms remained. It was the task of the philosopher to investigate this system by means of dialectic, the techniques of logical division and classification. For Plato knowledge was always a state of mind and had to be accounted for accordingly. This presupposition lies behind the inconclusiveness of the *Theaetetus*. Yet most of the traditional epistemological problems arise in the course of Plato's argument, and it is worth attention for this reason alone.

**ARISTOTLE.** Aristotle (384–322 BCE) was not so affected by skeptical arguments as Plato was. He does, it is true, try to answer Protagoras (*Metaphysics* Γ 5ff.), and he does so in a way very much like that of Plato in the *Theaetetus*, by pointing to the standard case in each class of judgment. Even in his early (and now fragmentary) work the *Protrepticus*, he had emphasized the necessity of an appeal to the expert in deciding issues in any particular art or science. This remained his approach throughout his life. Aristotle's preoccupations with epistemology appear in two provinces in particular—in his theory of science and in his theory of the mind and its faculties. But his approach to epistemology was not so much the attempt to justify the claim that knowledge exists as the description of what knowledge and its presuppositions are.

**Universals.** Like Plato, Aristotle held that knowledge is always of the universal. Insofar as we can be said to know particular things, we know them as instances of a universal; we know the universal in the particular. But it must be emphasized that for Aristotle universals are inherent in particulars; he vehemently rejects the Platonic notion of a world of separate universals or Forms. (The only exceptions to the inherence of forms in matter and God and the most divine part of us, reason in the highest sense.) Knowledge therefore depends ultimately on the soul's or mind's reception of the forms of things. The soul itself, as he made clear in *De Anima*, is not a distinct, spiritual entity but the set of faculties possessed by the body insofar as it has organs to manifest them.

**Means of knowledge.** Sense perception is the receiving by the sense organ, the faculty of which is the respective sense, of the sensible form of a thing, as he puts it, without its matter. He also describes sense perception as an actualizing of the potentiality that the sense organ

possesses as its faculty. It is not easy to see how this account of the matter can be worked out in detail. Granted that the hand becomes hot when it touches a hot object, what happens to the eye when we perceive color? Aristotle thinks that each sense is affected in a way peculiar to it, so that each sense has its own special sense object. The eye has color, the ear, sound; and so on. In addition to the special senses, there is a common sense, which has no sense organ peculiar to it. It is a faculty of all the sense organs or at least of those which are capable of perceiving the same qualities of objects; for example, size and shape are perceptible by both sight and touch. Aristotle speaks of both the special sensibles, such as color, and the common sensibles, such as shape, as essential to the respective senses. Apart from these there are the incidental sensibles, which are the things that possess these properties. Aristotle speaks of them as incidental sensibles because if we use our eyes, we are bound to see color; it is not essential that we see a particular object—to use Aristotle's example, the son of Diares. At any given time he may be the object of our vision, but he does not have to be. Some interpreters have spoken of these incidental sensibles as perceived indirectly, but there is no warrant for this interpretation in *De Anima*. As Aristotle points out, it is possible to see indirectly that sugar is sweet if we know that what we see directly is sweet. But this is quite different from perception of the incidental sensibles.

With this rather passive account of perception Aristotle gives a more active account when he stresses the role judgment plays in perception. Indeed, in the *Posterior Analytics* he speaks of the senses themselves as discriminative capacities. It is through such judgment that perceptual errors, such as mistaking the identity of a thing, can arise. Aristotle tends to say that when a sense is concerned simply with its own special object—for instance, sight with something white—there is the least chance of error. On occasion, however, he seems to imply that here error is impossible because the reception of the form in this case is something purely passive, so that there is no question of judgment. His position is not altogether clear, and there may be some confusion in his mind on this matter.

The same combination of passive impression and active judgment can be found in Aristotle's account of such faculties as imagination and memory, and to some extent there is a parallel account of the intellect itself. The persistence of the exercise of the sense faculty after its actualization by a sense object leads to the setting up of images. But imagination cannot exist in the full sense

without the exercise of some form of judgment. Likewise, memory must depend not only on having images but also on a referring to the past.

It is in the account of the intellect that the parallel with sense perception comes out most clearly. There is, first, a reception of form, in this case not sensible form but intelligible form. This corresponds to having concepts. Second, there is the combination of concepts in judgment, and it is only here that the possibility of error arises. Because the higher faculties depend for their existence on the lower, the exercise of the intellect, which is in itself nothing but a mere faculty, depends on the prior exercise of sense perception. Hence, Aristotle says, the soul never thinks without an image. Owing to the influence of St. Thomas Aquinas, this has often been interpreted as the basis of empiricism. If the issue had been raised by Aristotle, the outcome might have been this doctrine, but it is not clear that he did raise it. To say that the activities of the intellect are always dependent on the workings of the lower faculties is not in itself to say that the only ideas we can have are provided by sense experience. Finally, Aristotle distinguishes between an active and a passive intellect. The intellect thus far described is the passive intellect; the active intellect, something purely actual and without potentiality, is necessary in order to make possible the actualization of the faculties of the soul. In Aristotle's thought it is given no other function.

**What knowledge is.** Since knowledge is concerned with the universal—with form—any knowledge which is expressible in judgment must consist of an apprehension of an essential connection between forms. To know something about a thing is to be able to subsume it under species and genus and thus to know what is essential to it. It is matter which is responsible for what is accidental, and matter is in the last analysis—as prime matter—unknowable. To a large extent Aristotle's conception of knowledge in the full sense—that is, scientific knowledge—is coincident with Plato's. For Aristotle knowledge implies order; sense experience without this is something less than knowledge. This notion of order or organization is akin to Plato's notion of *logos*. Similarly, the idea that knowledge consists of classification in terms of genus and species and thus of a charting of the essential connections between forms is akin to Plato's conception of dialectic as concerned with the structure of the world of Forms.

**Knowledge and definition.** The connection in Aristotle's thought between knowledge and classification in terms of genus and species also entails a connection between knowledge and definition, for definition itself is in terms of genus and species. Aristotle distinguishes

between nominal and real definition, the first being designed to give knowledge of terms only, the second giving knowledge of the essence of the thing itself. The difference turns largely on the fact that giving the essence of the thing involves the explanation of its cause. Thus, Aristotle says that we think that we have knowledge in the primary sense when we can give the cause of the thing. To give the cause of a thing involves the demonstration of its essence from first principles, and this is the function of science. The first principles themselves can be known only by a form of intuition; one sees their truth in their instances. It is possible to explain the principles of one science in terms of another science, but this process must come to a stop somewhere. It is the mark of a foolish man, Aristotle says, to think that everything can be proved. Principles such as the law of contradiction, which are implied in all demonstration, can be proved only dialectically. A dialectical proof is one that starts not from necessary first principles but from what is commonly accepted. In this case the proof consists in getting the man who denies the law of contradiction to say something and then to show him that what he says implies the law; he is thus convicted by his own testimony.

Aristotle thus presents us with a concept of an ideal of scientific knowledge and gives some account of what is presupposed by it. The difference between knowledge and true belief is, in his account, presumably dependent on whether what is claimed is essentially and necessarily true, a part of science as he sees it. But Aristotle gives little in the way of a justification of the claim that knowledge is possible at all, for he clearly feels no need to do so. To that extent he is out of the main stream of epistemological thinkers.

**HELLENISTIC PHILOSOPHERS.** If anyone in the ancient world was an empiricist, it was Epicurus, the leading Greek atomist.

**Epicurus.** In the view of Epicurus (341–270 BCE) all knowledge resulted from contact with the atoms of which the soul is composed by atoms from outside. It is true that he said atoms could sometimes stimulate the soul directly without affecting the senses, providing humans with visions of the gods, but in general the senses had to be involved. Atoms affecting the sense organs produced sensations; mass stimulation of the sense organs resulted in a presentation or appearance (*phantasia*) to the soul. Sense experience in the more general sense occurs when an incoming presentation is fitted to a general conception or abstract idea, which itself results from repetition of sensations. This is the nearest thing to judgment in Epicu-

rus's system, and this is the most usual source of error. Epicurus insists that all sensations are true and that they are the ultimate standard to which we must refer all our judgments; they admit of no other check. Since they are the ultimate standard of judgment, there is no other source for a metaphysical theory about the world. This, it has often been pointed out, does not fit in very well with the claims that Epicurus makes in order to give an atomistic picture of the world.

It is not altogether clear what Epicurus meant in saying that all sensations are true, especially since he also maintained that *phantasmata*, dreams or the delusions of the mad, are true. In the context of the atomist conception of the physical basis of perception, however, the view seems to imply a doctrine, common in the history of the subject, that anything in the mind which is caused cannot be liable to error. In reality questions of truth and falsity do not arise in such circumstances, a consideration implicit in Epicurus's statement that sensations are without a logos (not the sort of thing to involve judgment), but the conclusion that error is impossible has frequently been drawn.

**Stoics.** The rival Stoic school was founded by Zeno (fl. c. 300 BCE), but the main figure was, perhaps, Chrysippus (c. 280–c. 204 BCE). The Stoics were also empiricists to a large extent, although there is doubt whether at least some of the school did not admit innate ideas. The central notion of Stoic epistemology was intuition or apprehension (*katalepsis*). This, as is put by the Skeptic critic Sextus Empiricus (c. 200 CE), was their standard of truth. Like the atomists the Stoics thought that things make impressions on the soul, although they differed from the atomists over which physical processes were involved. They made no suggestion, however, that these impressions were necessarily veridical. This was true only of those impressions that were clear and distinct (*enarges*). Whenever an impression is received in the soul, the soul has to register it by a process known as assent, but there cannot be said to be knowledge until there is apprehension, until the soul is gripped by the impression (*katalepsis* literally means “gripping”). When this apprehension can properly be said to exist is clearly open to question, and this was pointed out by the Skeptics. Hence, later Stoics were forced to say that apprehensive impressions were a guarantee of truth as long as there was no objection.

**Skeptics.** Meanwhile, the Skeptics were making attacks upon the dogmatic schools, as they called them. The general tendency of this school was to accept the doctrine of impressions and *phantasiae*, but to maintain that

there was no ground for going beyond them. Thus, it was necessary to be content with appearances and not to seek for the hidden truth about reality. The arguments against dogmatism were probably unsystematized initially, but they were gradually put into order. Probably under Aenesidemus (first century BCE) a list of ten (or eight) arguments (tropes) was drawn up. Some of these were forms of the argument from illusion, stressing the possibility of illusion and error in order to suggest that there was no reason to think that we ever gain knowledge of the real truth about things. Perceptions, they said, are always relative to the circumstances, the perceiver, and so on. Hence, no *phantasia* is a criterion of truth, and nothing else can be. A later Skeptic, perhaps Agrippa (first century CE), systematized the arguments even further by constructing general forms of skeptical argument. The final form stated that because of the earlier arguments nothing could be known in itself but only in relation to other things; however, something could be known relatively to other things only if these other things could be known absolutely. Because this had already been shown to be impossible, nothing could be known.

Some Skeptics came to see that this conclusion, put so baldly, was too dogmatic. When Arcesilaus of the Academy (the New Academy of the third century BCE) was sufficiently influenced by Skepticism to claim that knowledge was impossible, perhaps claiming Socratic practice as a precedent, the Skeptics still thought that this view was a species of dogmatism. Carneades (214–129 BCE), a later academic who tried to meet the arguments of Chrysippus of the Stoa, not only maintained that absolute knowledge was impossible but also tried to substitute a theory of probability for it. He distinguished three grades of probability in respect to perceptions: (1) the simply probable, (2) the probable and confirmed by its consistency with its concomitants, and (3) the probable, confirmed and tested for inconsistency with the system to which it belongs. The last grade is science as we ordinarily know it. But even this would have been too much for the pure Skeptic. Skepticism as a system received its fullest expression in the works of Sextus Empiricus in the second century CE.

**Neoplatonists.** In the third century CE Platonism was revived by Plotinus, the founder of the Neoplatonic school. This was Platonism in its more mystical aspects, although Plotinus often uses Aristotelian notions, sometimes with a Platonic twist. The soul, as opposed to the body, is given preeminence, so that perception and knowledge are made a function of the soul. The soul has its own activities, which are manifested in perception and

memory; the body and its impressions are merely instruments for the soul to use. The main function of the soul qua intellect is to contemplate the Forms, above which is the supreme principle or entity, the One. Unity with the One is the soul's goal.

## MEDIEVAL THOUGHT

It was Neoplatonism which, according to St. Augustine (354–430), brought about his salvation from Manichaeism in theology and skepticism in philosophy. Neoplatonism offered a supposedly positive doctrine in both metaphysics and epistemology and one which St. Augustine could largely accept, thus ignoring the other, heterodox views. St. Augustine's thought is therefore Neoplatonic in its essentials. As a result he took it for granted that knowledge—and, most importantly, knowledge of God—was possible, and he felt no further need to question this assumption. The same is true of most other medieval thinkers. Since philosophy was closely linked with theology, it was axiomatic that knowledge of God was possible in some sense, and skepticism about knowledge in general was rejected by an appeal to whatever philosophical system was thought best able to explain that knowledge. Insofar as there was argument, it was about the presuppositions and sources of knowledge, not about whether it existed.

Knowledge of a thing involves, it is commonly thought, knowledge of its general characteristics and, therefore, its subsumption under a universal. Medieval thinkers differed according to their philosophical tradition, according to whether they were Platonists or, after the Aristotelian revival in the thirteenth century, Aristotelians. But the main dispute was over theories of universals. Since the dispute had theological implication, it was heated. The argument had its source in certain questions put by Porphyry, a disciple of Plotinus, about the exact status of species and universals. These questions, the answers to which Porphyry thought were obscure, were discussed by Boethius in a commentary. The main schools of thought on the subject were the realists, conceptualists, and nominalists. Realists thought that universals had an objective existence, although their view of this existence depended on whether they were Platonists or Aristotelians. Conceptualists held that universals existed only as concepts in the mind; nominalists held that the only universal things were words. Such theories, however, were rarely found in their pure form.

**REALIST THEORIES OF UNIVERSALS.** The division among realists is best seen in the differences between St. Augustine and St. Thomas Aquinas (1225–1274).

*Augustine.* St. Augustine gave preeminence to the soul, in Neoplatonist fashion. In his view the soul has its own functions and is not directly influenced by the body. Perception is based on the impressions produced by the soul when the body is stimulated. Experience, however, involves inference, as the soul subsumes its impressions under concepts. To have such concepts is, for St. Augustine, to be aware of Forms in the Platonic sense, the one difference being that in his view the Forms are thoughts in the mind of God. Thus, universals have a real existence in the mind of God, and all knowledge, even sense knowledge, involves some awareness of God. There is an ascent from lower forms of knowledge, like perception, to higher forms, with knowledge of God at the peak.

*Thomas Aquinas.* The Aristotelian revival in the thirteenth century led to St. Thomas Aquinas's acceptance of a more Aristotelian point of view than Augustine's. Like Aristotle, Thomas rejected self-subsistent universals, maintaining that universality is a function of the mind. Nevertheless, there are real similarities between things because of their common form. Hence, species have more than a mere mental existence.

The Thomist theory of knowledge consists largely of an explanation of how knowledge of Forms is possible. When the senses are stimulated, the soul's potentiality is actualized; a sensory image, or *phantasma*, is set up, corresponding to the object of perception. But since the universal aspects of such objects can be apprehended only by the intellect, they must be transferred from the *phantasma* to the intellect. Indeed, *phantasmata* as such are not objects of awareness on our part. The mind is aware only of the universal aspects of things, not their particularity, which is available only to the senses. Something has to illuminate the *phantasmata* in order to make clear their universal characteristics. Thomas employs Aristotle's distinction between the active and passive intellects here. The active intellect abstracts the universal or species from the *phantasma*, and this is imposed upon the passive intellect as a concept, which is then verbalized. Concepts thus exist only as the result of an abstraction of the universal aspects of things, and the essence of Thomas's empiricism is that all knowledge depends on sense experience in this way. Even knowledge of self-evident truths, which Thomas admits, as well as knowledge of the essential nature of things, is in the last resort dependent on sense experience, and all our thoughts must be based on experience. Thomas can be looked on as the founder of

empiricism in the sense that he held that all the materials for knowledge come ultimately from experience and from nowhere else. Unlike the later philosopher John Locke, however, he did not set out to justify the doctrine in detail.

**CONCEPTUALIST THEORIES OF UNIVERSALS.** Although Thomas may be classed as a realist in his theory of universals because he maintained that there are objective similarities between things by virtue of their common form. He could not do so without the notion of concepts in the mind.

**Abelard.** Peter Abelard (1079–1142) had previously held a conceptualist theory of universals, emphasizing the extent to which universality is a function of the mind. He held that universals are really concepts (*sermones*) involved in judgments that particular things have something in common. They are arrived at by abstraction from particular things, by attending to features of things considered in themselves. Abelard even used the notion of a generic image—that is, an image not of any particular thing but, supposedly, of what is common to a whole class of things—in order to account for our ability to think of things generally. He was anxious to reject both realism and the contemporary nominalism held by Roscelin of Compiègne (d. c. 1125), who maintained that universals were just words or even names. He did not, however, deny that concepts had a basis in things. Hence, in a sense Thomist realism and Abelardian conceptualism are very much two sides of the same coin.

**NOMINALIST THEORY OF UNIVERSALS.** Similar considerations apply to the great nominalist thinker of the fourteenth century, William of Ockham.

**Ockham.** Even Ockham (c. 1285–1349) did not quite maintain that the only universal things are words, for he held that words are conventional signs corresponding to concepts that are natural signs of things. Universality lies in the sign-significate relation, in the fact that both words and concepts can be signs of a class of things. To the question “What are universals?” Ockham initially replied that they had only a logical existence; they were meanings, the contents of the mind when thinking generally. For Ockham the term *universal* was what he called a term of second intention. A first intention is the state of mind involved in the apprehension of particular things; a second intention is that involved in the apprehension of first intentions. The term *universal* thus picks out the content of our apprehension of our first-order apprehensions of a class of things. “Redness” is not the name of an entity but

of the content of the relation which exists between the sign or concept “red” and particular red things. Ockham later took another step toward conceptualism by holding that universals had a mental, not just a logical, existence. He then held that universals are the concepts that the mind has and which are the natural substitutes for things themselves. Ockham probably took this step for reasons of economy, for in the earlier account universals were a sort of intermediary between the mind and particular things. The place given to generality remained the same, however. There was nothing general in the world; generality depended on the relationship between the mind and particular things.

The real novelty of Ockham’s approach lay in his holding the view, new to medieval thought, that the mind itself could have apprehension of particular things. Thomas, for example, had denied this, holding that the mind could be concerned only with universal characteristics abstracted from *phantasmata*. The consequent gap between the mind and the senses inevitably involved a representative theory of perception; the mind was confronted only with the representatives of things. Ockham denied all this. He held that the mind could be concerned directly with the particular by means of intuitions. Intuitive knowledge is a direct knowledge of a thing or its existence. The senses provide an intuition of a thing’s existence, and the intellect provides an intuition of its nature. John Duns Scotus (c. 1266–1308) had held that intuition of a particular was a necessary condition of the abstraction of the universal from it, but he had also held that this intuition must, in this life at any rate, be confused. Ockham denied this. In his view intuitions may be perfect or imperfect respectively, according to whether they are dependent merely on present experience or whether they also involve past experience. The possibility of imperfect intuitions, however, depends on the possibility of direct, perfect intuitions.

Although Ockham thought that this kind of direct knowledge does exist, he did not claim that all intuition was equally clear; clarity, moreover, was not always enough to guarantee truth. In the first respect, he claimed, as St. Augustine had done earlier, that we have clearer knowledge of our own mind than of other things. In the second he maintained that God can give us an intuition of something that does not in fact exist (a consideration which looked forward to René Descartes’s suggestion that God might be a deceiver). This is not the natural course of things, however.

Much of Ockham’s thought is in the Stoic tradition, and to some extent this can be said about Descartes, the

first of the rationalist thinkers of the seventeenth century. By this time, however, the questioning of the accepted points of view of the Middle Ages had led to increased skepticism. Descartes's theory of knowledge is therefore in the fullest sense the beginning of that "search for certainty" whose elements were found in Plato but had not been prominent after him.

## SEVENTEENTH-CENTURY RATIONALISM

**DESCARTES AND CARTESIANISM.** The emergence of science during the Renaissance and the disputes that it produced led to a certain skepticism about claims to knowledge and to the search for a method, like that of science, which would determine the truth once and for all. Descartes (1596–1650) was the pioneer in this new tradition, and although his roots were in the Middle Ages, he was to a large extent an innovator. Being a mathematician of distinction, he saw the solution to problems of epistemology in the systematization of knowledge in geometrical form, although he did not carry out the full program himself. This involved starting from axioms whose truth was clear and distinct. He describes the ideal method in the second chapter of the *Discourse on Method* as (1) not to accept as true anything of which we have not a clear and distinct idea, (2) to analyze the problem, (3) to start from simple and certain thoughts and proceed from them to the more complex, and (4) to review the field so thoroughly that no considerations are omitted. Of what do we have clear and distinct ideas? To deal with this problem, Descartes employs the method of doubt—a form of skepticism. This method involves setting on one side anything that can be supposed false until one arrives at something that cannot be supposed false.

That there is a goal to this skepticism is, it might be objected, prejudged, for Descartes points to the fact that he has often been deceived to suggest that he may always be deceived. This conclusion is not, however, admissible, since to establish his premises, he must at least know that he has sometimes been deceived. The truth is that Descartes has a definite conception of what knowledge must be, and most of what we ordinarily call knowledge does not fit that conception. His approach is therefore not strictly that of the general skeptic. It consists in setting on one side anything that does not possess the mark of genuine knowledge, this mark being that we should have clear and distinct ideas of the thing in question. We have a clear idea of a thing when it is open to the mind, when we are clearly aware of it; an idea is also distinct when we have a full knowledge of the nature of its object and of the

means whereby that object can be distinguished from other things. Many philosophers have believed that we do not have certain knowledge of empirical truths but that we do have it of mathematical truths. Descartes agrees to the extent that he maintains that we can have clear and distinct ideas of the objects of mathematics, but he also maintains that if God were a deceiver, he might have caused us to have false beliefs even here. Hence, it is at least a possible hypothesis that there is an archdeceiver who brings it about that I am mistaken in all my beliefs. Is there anything which is free from this contingency?

**"Cogito ergo sum."** The result of Descartes's inquiry into this matter is that there is at least one proposition which is indubitable in the sense that I cannot be wrong in maintaining it. This is the proposition "I think, therefore I exist" (*Cogito ergo sum*). Descartes is definite that this is not to be treated as an argument despite its form; it is an indubitable proposition. (In a sense Descartes had been anticipated in this by St. Augustine's "If I am mistaken, I exist" [*Si fallor sum*], but St. Augustine had not used the proposition for exactly the same purposes.) It is reasonably clear that I cannot deny either "I think" or "I exist" without absurdity, although this is not enough to show that the *cogito* is in any way a logical truth. Yet for Descartes it must have the kind of necessity that is generally attributed to logical truths; it must be logically impossible for the proposition to be false. Moreover, it must have content such that its truth entails the existence of something with a specific nature—namely, a spiritual or thinking substance which has certain ideas, particularly those of God and material objects. Only then can Descartes go on to justify belief in such objects.

In effect, therefore, Descartes says that I can doubt everything except that I doubt. Since doubting is a form of thinking, I cannot doubt that I think, and since thought requires a thinker, I cannot doubt the existence of myself as the thinker. It might be objected that even if there is no reason to reject this position, it has not been shown to be necessary. If I cannot doubt that I doubt, this may be a contingent matter, not a logical necessity. Once given the *cogito*, however, Descartes can go on to use it as the premise of an argument whose outcome will be the justification of our belief in a world independent of ourselves.

**The status of perception.** Granted that we have ideas of a world of material things, what prevents those ideas being mere figments of the imagination? Ideas in themselves are purely mental entities (although Descartes is never very clear about their exact nature); they may or may not represent the things they purport to represent.

Ideas can be innate, adventitious, or fictitious. To say that they are adventitious is to say that they come from things outside us; to say that they are fictitious is to say that they are produced by the mind itself. Innate ideas are a priori, inborn. Which ideas these are, if any, may be disputed. But, at all events, our ideas of material things are clearly not innate. Why, however, are they not merely fictitious?

To say that an idea is fictitious is not to say that it is impossible for it to be an idea of something objective. To some of our ideas perhaps nothing could possibly correspond; these would be logical impossibilities and would have no objective validity in Cartesian terms. For an idea to have objective validity, the reality in it must be caused by something that has the same reality, either formally or eminently, in itself. A machine, to use Descartes's example, may be formally the cause of a man's idea of it; his idea may be a copy of the machine, the two having the same form. But if the man conceives of the machine himself, then he or his mind is eminently the cause of his idea; the idea is not a mere copy of its cause, for the source of the idea is something higher. If, then, our ideas of material things are to be objectively valid or have objective reality, they must either be copies of actual material things or be produced by something higher. If they are produced by something higher, they were produced either by our minds or by God. To show that our ideas of material things do correspond to those material things, Descartes has to show that they are not produced in this way either by our own minds alone or by God.

Now, ideas in themselves, Descartes maintains, cannot be strictly true or false; it is the use we make of them that can be true or false. Hence, truth and error are functions of judgment. Nevertheless, we have a natural disposition to believe that our ideas are veridical. In Meditation III, Descartes points to this natural disposition and to the fact that our perceptions do not depend on the will as reason for believing in the veridicality of our perceptions, although he rejects these considerations as insufficient. In Meditation VI, however, he has recourse to the same considerations, although they must now be viewed in the context of the view that perception is a faculty of the mind plus body and does not express the essence of the mind alone, which is concerned solely with thinking. The passivity of our perceptual ideas thus seems to be invoked in order to reject the notion that our ideas of material objects could be a product of our own minds. Ideas of material objects, however, might still be caused by God. Yet if this were true and if nothing answered to those ideas, God would be a deceiver, for he would be giving us a natural disposition to believe in the existence of things

which do not exist in fact. God, Descartes maintains, is not a deceiver. This point is taken as axiomatic and provides the ultimate guarantee of our belief that we do perceive an objective world.

*Existence of God.* The existence of God is therefore a cardinal point in the chain of argument. Descartes produces two sets of arguments designed to demonstrate his existence as a necessary truth. The first argument, in Meditation III, is based on the same considerations about the causes of our ideas as those adduced in connection with ideas of material things. The idea of God, which Descartes takes to be objectively valid, could be produced only by something having the same reality formally or eminently in it. We, being inferior creatures, could not produce it, and it could not come from any other source except God himself. Hence, there must be a God. This argument is a version of the so-called Cosmological Argument.

The other argument, to be found in Meditation V, is a version of the Ontological Argument first invoked by St. Anselm. God must through his essence possess all positive attributes in perfection. Existence is a positive attribute; hence, God must exist. It is now generally recognized that neither argument is sufficient to demonstrate the necessary existence of God. However, the necessary existence of God must be demonstrated if the argument concerning the existence of material things is to have any cogency.

If Descartes's argument for the existence of God had been sound, he would have shown that all the reality in our ideas must be in their causes. More is required if it is to be shown that our ideas are, at least in some cases, copies of their causes. This is a problem for any representative or causal theory of perception, any theory that holds that our ideas and perceptions are mental entities which are, at best, only representatives of things outside them. From Descartes's point of view there is the general consideration that God is not a deceiver; any errors or illusions to which we are subject are the results of judgments we make because of the ideas we receive. This makes it incumbent on us, if we are to avoid error, to take due account of the clarity and distinctness of our ideas. We are right in judging that our ideas correspond to their causes only if those ideas are clear and distinct.

*Primary and secondary qualities.* In Descartes's opinion there is a big difference between primary qualities, such as figure, magnitude, and motion, and secondary qualities, such as color. Primary qualities can be known by an intuition of the intellect (*inspectio mentis*). Our ideas of them are clear and distinct because of the

part they play in mathematics, and in mathematics, therefore, the intellect can be regarded as having a proper knowledge of reality. This is not to say that we cannot make mistakes concerning the primary qualities of objects; judgment can be as liable to error here as elsewhere. However, since the ideas of them are clear and distinct, we have the assurance that in general objects do have such qualities. We have no such assurance in the case of secondary qualities. The intellect is not involved here, but since the senses were, Descartes maintains, provided only for the conservation of life, it does not matter very much whether our ideas of secondary qualities correspond to the actual qualities of objects.

It would not be generally admitted today that mathematics does provide the kind of knowledge of reality that Descartes requires. The question of the exact connection between mathematics and the world is a complicated one. Granted, however, that mathematical ideas have a precision not possessed by other ideas, it does not follow that we have a precise knowledge of any qualities of physical objects. For it remains an open question to what extent such ideas are applicable to physical objects. There is a genuine distinction between primary and secondary qualities in that the first are measurable in a way that the second are not. This, however, is not sufficient to justify the claim that knowledge of primary qualities is knowledge of reality in a way that knowledge of secondary qualities is not. In some places—for instance, *Principles*, Part IV, Section XI, and *Dioptric*, Section VI—Descartes tries to reinforce this view by arguing that since the effects in the brain caused by the stimulation of our senses possess only the properties of motion, figure, and extension, there is no means whereby we could come to apprehend any other properties of objects. There is a circularity in this argument, since its premise is that we do know of the primary qualities possessed by brain processes, whereas all ideas, being the effects of physical processes, should be in the same position.

In sum, Descartes's theory of knowledge is essentially one of a representative kind. It is based on the idea that the mind or soul, being something very different and distinct from the body, can have as its contents only ideas, which are, at best, representatives of physical things. The mind has its own activities, and its nature is to be active. Through these activities it can come to have knowledge of abstract mathematical truths. But all sense knowledge, as opposed to intellectual knowledge, can come only through the medium of ideas, and that these ideas correspond in any way to the physical objects presented to the senses is inevitably open to question. The justification of

our belief that they do depends, in the long run, on the affirmation that there is a God and that he is not a deceiver. Descartes thinks that he can demonstrate that there is a God, taking as true by definition that he is no deceiver and that our natural disposition to trust our senses is therefore justified.

**Occasionalism.** Since Descartes conceived of the soul and the body as distinct substances with distinct essences—that of the soul being thought and that of the body extension—he was inevitably faced with the problem of how one could act on the other. He was never very clear on this point, although he came to insist that there must be some quasi-substantial union between the two. In some places—for example, the *Dioptric*—he speaks of brain processes giving “occasion” to the soul to have sensations or ideas. Some of his followers, who thereby became known as occasionalists, took up this notion and tried to explain the apparent link between soul and body by saying that God puts ideas into the soul on the occasion of the bodily processes. Arnold Geulincx (1624–1669) said that God puts the ideas there by means of the bodily processes; Nicolas Malebranche (1638–1715) said that God acts directly on the mind on the occasion of the bodily processes. Since Malebranche had leanings toward the views of St. Augustine, he interpreted this occasionalism in terms of the Augustinian doctrine that we know all things in God.

**Malebranche.** In other respects Malebranche tends to follow Descartes, although often with greater emphasis. He, too, insists that we have clear and distinct ideas of figure, extension, and movement, since these qualities, being conceivable in mathematical terms, are open to the intellect. He also lays great emphasis on our liability to error in anything connected with the senses, especially if we think that the senses provide us with knowledge of things as they actually are. In one respect, however, he adds a certain sophistication to the Cartesian distinction between the ideas or sensations that arise in the mind without any intervention on our part and the judgments that we make and which depend on our will. Sometimes what we see differs from what would be expected on the basis of the sensations resulting from the stimulation of our senses. We may see a thing in its right size, for example, although the actual pattern of stimulation received in the eyes is different; alternatively, we can be subject to illusion when the conditions of stimulation are not abnormal. In such circumstances we are not generally aware of making any judgment in order to correct the sensations received. Malebranche therefore distinguishes between natural judgments, or judgments of sense, and

free judgments. Free judgments depend on our will, but natural ones do not; they are, he says, a kind of complex sensation in that they do not depend on us. They are, he explains, made by God in us, in consequence of the laws of the union between soul and body. As judgments they can be true or false, but as sensations they may occur against our will and are certainly not due to our will. Malebranche is in an ambivalent position here, but his difficulties show a certain honesty.

**SPINOZA.** It has often been remarked that what makes the thought of Benedict (Baruch) de Spinoza (1632–1677) especially interesting is that it combines the quite different and, as generally conceived, quite disparate traditions of nominalism and extreme rationalism. In his nominalism he belongs to the tradition of William of Ockham and, more particularly, of Thomas Hobbes (1588–1679). Hobbes maintained that only names were universal. Although names were signs of images of things that constitute our conception of them, there was nothing universal in the conceptions themselves. Only the use to which names are put was universal, for they are taken as signs of many things. Hobbes used this to mount an aggressive attack on the paraphernalia of Scholasticism—essences, substance, and the like. He was a tough-minded mechanist who thought that reality consisted solely of corporeal bodies in motion.

Although he did not have the same motive, Spinoza was similarly opposed to the apparatus of Scholasticism. Indeed, he may have been influenced by Hobbes. In his *Ethics*, Part II, Spinoza held that as a result of the stimulation of our bodily senses by many things, confused, composite images arise, and it is these images that general words represent. There is no place for universals existing in things. Since these images may be set up differently in different men, “universal notions,” as Spinoza calls them, may differ from man to man. The knowledge that is expressed by their means can only be confused. Spinoza is not content to leave knowledge there, however; he has the conception of knowledge of a much higher kind, and his working out of this conception is in effect the systematizing of Cartesianism. To make Cartesianism consistent, however, he had to change much in it.

**Monism.** Although according to Descartes’s view the clarity and distinctness of an idea was a necessary condition of its truth, it was not a sufficient condition of its truth. It was always possible to raise the question of whether any particular idea did correspond to reality and, in particular, to its cause. This was a consequence of the dualism between the mind and its ideas and the physical

world, a dualism inherent in Cartesianism. Spinoza replaced this dualism by a monism according to which the mental and the physical were two aspects of one thing—ultimately, God or Nature. In adopting this view, he was again carrying out the implications of Cartesianism, for Descartes had asserted that in the proper sense the concept of substance belongs only to God, for only God is self-subsistent, or *causa sui*. Hence, in Spinoza’s view everything is a modification or mode of the one true substance, depending on God for its existence. The Cartesian distinction between mental and material substance becomes a distinction between the two infinite attributes of God in Spinoza’s theory. Bodies are modifications of God qua extended, and minds are modifications of God qua thinking. They are not distinct things; they are merely parallel aspects of the one true substance. The order of ideas in the mind is the same as the order of things. Hence, the objects, or *ideata*, of ideas, insofar as these have reference to God, are always truly represented by them. No ideas can be absolutely false, and insofar as they refer to God, they must be true. Ideas can be considered false only from the point of view of what we ordinarily call a single human mind, not from the point of view of God.

**Truth and falsity.** Because everything can be deduced from the essence of God, everything is subject to necessity, and this applies to ideas as much as to everything else. There is no room in Spinoza’s theory for the Cartesian distinction between ideas and the will; for him the will and the intellect are the same. Falsity cannot therefore arise from the exercise of our will in the employment of ideas. For Spinoza the exercise of the will in judgment is not something additional to having ideas, and he emphasizes that it is wrong to think of ideas as simple pictures that may or may not correspond to their objects. To have an idea of something and to make a judgment about it are one and the same, and it is by virtue of this composite conception that ideas, not only judgments, can be true or false. Considered as part of God’s thinking, ideas cannot, of course, be false, for in that case they must always correspond, qua modifications of God as thinking, to the modifications of God as extended. But considered as ideas in a single human mind, they can represent their objects confusedly or inadequately. In having a confused idea of an object, we fail to see it as following necessarily from the nature of things. Such ideas, Spinoza says, are like consequences without premises.

In the *Ethics*, Part II, Definition 4, Spinoza defines an adequate idea as “an idea which, insofar as it is considered in itself without relation to an object, has all the proper-

ties or intrinsic marks of a true idea.” If an idea is confused, it cannot be adequate. Therefore, truth must have an intrinsic criterion, not just the extrinsic criterion of the correspondence of an idea to its object. In other words, the clarity and distinctness that Descartes had looked to for the foundations of knowledge is the mark of every true idea. Truth and adequacy thus merge. For full truth an idea must be seen to be true, and this is possible only insofar as it is seen to follow from the nature of things. Truth, Spinoza says, is its own criterion. This is connected with another of Spinoza’s epistemological views—that knowledge must ultimately be reflexive. Anyone who really knows something must know that he knows. If a man knows that something is necessarily so, he must know that he knows this, since the truth of what he knows must be manifest.

The doctrine of truth that Spinoza presents is commonly referred to as the coherence theory of truth, and it is normally associated with the doctrine of degrees of truth, knowledge, and reality. The distinctions between grades of reality that exist between the one true substance and its various modifications is paralleled by distinctions between kinds of knowledge. True knowledge, the having of adequate ideas, entails seeing things as following from the essence of God. Knowledge can be more or less inadequate or confused to the extent that a thing is not seen as following necessarily from that essence. Absolute truth consists in having adequate ideas, although every idea has some degree of truth since it must have a counterpart in the order of things. In other words, an idea, although necessarily true in some respect, has greater truth to the degree that it is adequate and to the degree that its object is seen as fitting in with the order of things. Like most versions of the coherence theory of truth, this is really not a theory of what truth is or what is meant in calling an idea or judgment true, but, rather, a theory of when or under what conditions an idea or judgment can be seen to be true. A judgment can be seen to be true if it coheres with the system of judgments that characterize reality. But coherence theorists tend to say that any judgment which can be seen to cohere with other judgments in this way is thereby “more true” than those which do not cohere. In effect, they tend to use the word *true* so that it is more or less equivalent to *verified*. A judgment that has a higher degree of verification by virtue of its coherence with other judgments is said to be *ipso facto* more true. The coherence theory of truth is thus a genuine epistemological theory, a theory of the conditions under which we can be said to know a proposition as true.

*Kinds of knowledge.* Spinoza distinguishes three grades of knowledge. Full knowledge Spinoza refers to as the third kind of knowledge and characterizes it as intuition. This kind of knowledge, he says in the *Ethics*, Part II, “proceeds from an adequate idea of the formal essence of certain attributes of God to an adequate knowledge of the essence of things.” To have this knowledge is the goal of philosophy—to see things *sub specie aeternitatis*, as conforming to a kind of necessity. The right method in philosophy as set out in the *Treatise on the Correction of the Understanding* is to rid the mind of confused and inadequate ideas and to lead it to ideas which are adequate. It is significant that Spinoza calls this kind of knowledge intuition, because in its essence it consists of seeing the world as a coherent whole bound by necessary connections. Most rationalists have ended up with some such conception, and for them reason is inevitably second best. So it is for Spinoza.

What Spinoza calls reason is the second kind of knowledge, below intuition. This is best described by distinguishing it from the first kind of knowledge, which is knowledge derived from vague experience and is also called opinion or imagination. This corresponds roughly to sense experience. (Knowledge from hearsay, the fourth kind of knowledge, added in the *Treatise* to the bottom of the list, is of little importance for present purposes.) From sense experience we gain confused ideas of things without respect to their place in the general order of things. We may obtain knowledge of a similar status from signs—that is, from reading or hearing words which allow us to form ideas similar to those of the imagination. Both of these sources may lead to the setting up of the universal notions referred to earlier, notions that vary from person to person and cannot provide genuine knowledge. In the course of our experience, however, we may light upon notions that are common to all people, such notions as those of extension and other general attributes of reality. These notions Spinoza calls common notions, to be sharply distinguished from the universal notions already discussed. These common notions correspond to the ideas of primary qualities that Descartes had allowed to be clear and distinct because they were the objects of intellectual intuitions. For Spinoza, too, they provide the starting point of the sciences, and as such our ideas of them are adequate. They can be seen to be true of reality inasmuch as they reflect all-pervasive features of reality. It is for this reason that they are common to all humans; they are not subjective like the universal notions.

Reason or science thus consists in elaborating the essential features of the attributes of which we have common notions. Like Descartes, Spinoza conceived of science as based on the model of mathematics in general and geometry in particular. His conception of the right method in philosophy itself is modeled on the geometrical method. Indeed, Spinoza had tried to set out the Cartesian philosophy in a geometrical fashion according to the rules that Descartes had preached but had not practiced as well. Thus, although science, the systematization of knowledge, is ultimately derived from sense experience, it reflects the actual order of things more truly than experience does. Nevertheless, the goal of all knowledge is not just this systematization but the seeing of things as a whole, *sub specie aeternitatis*. For this reason intuition stands above reason.

Because the second and third kinds of knowledge involve adequate ideas, they cannot give rise to falsity. Sense experience alone can be the source of falsity. Through sense experience we can have only confused ideas, since ideas reflect particular modifications of reality in some finite respect, not in relation to the infinite attributes of God. Sense experience is ordinarily thought of as a passive form of knowledge, as opposed to forms of knowledge that demand the use of reason. This passivity, Spinoza thinks, is only a sign of the inadequacy of our ideas in this case. Activity on the part of the mind is, conversely, adequacy in its ideas. Spinoza points out that the human mind is part of the infinite intellect of God. Hence, "when we say that the human mind perceives this or that, we say nothing else than that God, not in so far as he is infinite, but in so far as he is explained through the nature of the human mind, or in so far as he constitutes the essence of the human mind, has this or that idea" (*Ethics*, Part II). Just as the ideas of sense experience are confused and inadequate only in relation to our mind, although when considered as God's ideas they are true, so the ideas of sense experience are passive in relation to our mind but are nevertheless part of God's active thoughts.

In sum, for Spinoza the goal of all knowledge is seeing the world as a single whole. On the way to this lies reason or science, which attempts to reveal things as subject to necessity by means of self-evident, necessary truths about things. All else, although not absolutely false, is the source of illusion. But, as in everything else in Spinoza, an adequate understanding of his theory of knowledge also involves an adequate understanding of his complete metaphysics or theory of reality. This is true of philosophers in general but never more so than in Spinoza's case.

LEIBNIZ. In many ways Gottfried Wilhelm Leibniz (1646–1716) is Spinoza with a strong dash of common sense. Spinoza's monism, especially its assertion of the necessity of things and the apparent consequence that free will is impossible, was anathema to Leibniz. In these respects Leibniz revolted against Spinoza, but in other respects he was very much like Spinoza. He, too, drew no distinction between the will and the intellect and made activity and passivity in the mind a function of the clarity and distinctness or otherwise of our ideas. Furthermore, although common sense told him that there must be a plurality of things, not just one, he had to conceive of each ultimate thing as a simple substance possessing all the properties of Spinoza's one substance.

Leibniz simple substances had to have a unity in plurality in that, although simple, each one had to be capable of reflecting the whole universe from its point of view. Since Leibniz took as axiomatic that in every true proposition the predicate is contained in the subject, everything that can be said about a substance is so because of the nature of that substance, and all the relations which it has to other things must arise from the nature of that substance and be internal to it. It is for this reason that every true substance must reflect the universe from its point of view and in this way be a microcosm of the macrocosm. The only thing, Leibniz thought, which could be both simple and capable of reflecting the universe in this way was something like the soul. In consequence, he postulated the existence of a plurality of simple substances, spiritual in nature, which he called monads. But for the monads, he said, Spinoza would be right.

*Necessary and contingent truths.* Since the properties of each monad were internal to it, it might be thought that Leibniz, like Spinoza, would have maintained that everything was a matter of necessity. However, although Leibniz maintained that all the properties of a substance are internal to it and thus follow from the nature of the substance, for other reasons he maintained a clear distinction between truths that are necessary in the logical sense and truths that are dependent on the facts. He was thus perhaps the first to draw a clear distinction between necessary or logical and contingent or factual truths. The first he called truths of reason, the second truths of fact. These truths had different principles as their basis. Truths of reason were dependent on the principle of contradiction, since their necessity turned on the fact that their denial would result in a contradiction. Leibniz thought that such truths, when their terms are defined, could be reduced to identical propositions of the form "A is A." The reduction to such identical propositions would

therefore proceed by means of chains of definitions. Mathematical truths are of this kind, and Leibniz was one of the first to seek a basis for mathematics in logic.

Truths of fact, on the other hand, could not be justified by reduction to identical propositions; their basis had to be found in a separate principle, the principle of sufficient reason. This principle received different formulations at different stages of Leibniz's thought. Insofar as it was meant to allow for the contingency of matters of fact while providing a rationale for them, Leibniz tended to formulate the principle by reference to the choice of God. In creating this universe, God could choose from a number of possible worlds each having a different order or structure. Since, as Leibniz thought, for various different reasons, the number of monads is infinite, the number of such possible worlds is also infinite. Any contingent truth about *this* world has for its justification the fact that in choosing this world, God chose it as the best of all possible worlds. The truth remains contingent because it is dependent on God's choice, but a sufficient reason for its truth is that God chose it as part of the best of all possible worlds. At other times, however, Leibniz's appeal to God's choice has fewer theological implications. For example, in his correspondence with Samuel Clarke, he tries to refute the idea of an infinite absolute space by saying that in such a space God would have no sufficient reason for putting the universe here rather than there. This means that there would be no way of telling where the universe was and that it would, in consequence, make no sense to speak of it as being in one place rather than another. This use of the principle of sufficient reason amounts to something like the use of the verification principle by logical positivists—the meaning of a proposition lies in the method of verification.

When Leibniz maintains, however, that in every true proposition the predicate is included in the subject, he seems to undermine the distinction between truths of reason and truths of fact. For this doctrine would make all propositions into what Immanuel Kant was later to call analytic propositions or judgments, propositions that are logically necessary. In consequence, it has been maintained (for example, by Louis Couturat) that in some of Leibniz's writings the principle of sufficient reason merely states that all true propositions are analytic, whereas the principle of contradiction states that all analytic propositions are true. In fact, this is probably a consequence of Leibniz's main views rather than a statement of it. If every proposition about a substance attributes to it a property that is part of its essence, then all such

propositions must be analytic even if they are to be characterized as truths of fact on other grounds.

Leibniz accepted this conclusion but tried to evade the contradiction implicit in characterizing a truth of fact as analytic by explaining that the number of properties possessed by any substance must be infinitely great, as the points of view from which a thing can be regarded are endless. We, being finite creatures, cannot complete the analysis of any given substance. Hence, we cannot know for certain whether any given attribute really does belong to it; we cannot, without completing the analysis, even know whether it is possible for this substance to possess the property; it may be a contradiction to suppose it. God, being infinite, can complete the analysis, and so for him all propositions about things are analytic or logically necessary. We, on the other hand, can know only that if a proposition is true, it is necessarily true, but we cannot know for certain whether any given proposition is true. In our judgments about the truth of propositions, we have to depend on probabilities—that is, we have to estimate what reasons are sufficient for our conclusions. Thus, for us any judgment of fact is contingent. For God contingency enters only in that he has chosen what substances there should be, which of all possible worlds should exist. For him everything thereafter is necessary. Hence, the principle of sufficient reason comes into consideration in two related ways—first, in that it guides, without determining, God's choice of a world and, second, in that it guides our decision concerning which world God has chosen.

*Perception and appetite of monads.* So much for the logical consequences of Leibniz's point of view. Given the metaphysical system according to which there exist, an infinite number of spiritual entities or monads, other consequences also follow. According to Leibniz, every monad has perception and appetite—the apparent passive and active features of mental life. Since everything about a monad is internal to it, these features can indeed be only apparent. Appetition is that aspect of a monad responsible for internal change and development. No monad can affect or be affected by any other monad. A perception is any property of a monad that results from its development but that may reflect changes in other monads. (This use of the term *perception* is, although influenced by Leibniz's metaphysics, clearly very general, but its use was very general throughout the seventeenth century.) What may seem to be activity on the part of one monad with respect to another is really having distinct perceptions, whereas passivity is having confused perceptions. Here Leibniz sides with Spinoza.

*Self-consciousness of monads.* Leibniz's criterion of a distinct idea of a thing is the ability to list the characteristics which distinguish the thing from other things. This clearly involves a degree of self-consciousness, and this is possessed only by the monads constituting the human soul. Although all monads have perceptions in that other things are represented in them, not all have apperception. To have apperception, the monad must be conscious of what is involved in its perceptions, and those perceptions must therefore be distinct. The distinction between perception and apperception means that perceptions can sometimes be unconscious. Leibniz brings forward a number of arguments in support of this view, ranging from the argument that reflection upon perceptions must come to a stop with perceptions that are not self-conscious to the argument that there must be what he calls *petites perceptions*. When we hear the roar of the sea, he argues, we are not aware of hearing each little ripple despite the fact that the waves are made up of ripples. Since the overall perception must correspond in complexity to its object, he concludes that there must be perceptions corresponding to the ripples, and these little perceptions are therefore unconscious. This is not a psychological discovery but a philosophical analysis the premises of which are open to dispute. Like Descartes, Leibniz accepts the representative theory of perception in thinking that perception consists in having ideas which are, or may be, representative of objects. If this theory is rejected, Leibniz's argument about *petites perceptions* loses much of its force.

*Error in perception.* Just as Leibniz sides with Spinoza in maintaining that activity and passivity are to be explained in terms of the distinctness of our ideas, so he agrees with him, against Descartes, over the explanation of error. There is no room for the individual will in Leibniz's system. Appetition is only the impulse that provides the development of the monad's perceptions; it in no way corresponds to the will. Error is merely a matter of having confused ideas, and since these are correlated with passivity, the passive aspects of mental life—sense perception and the like—are the source of error.

*Innate ideas.* Yet although Leibniz can distinguish between ideas of perception and ideas of reason, or the understanding, it remains true that according to his view in a sense all ideas are innate. None is literally produced by things affecting our sense organs. Yet the distinction between ideas in terms of their clarity and distinctness does mean that it is possible to say that some ideas are what Kant called a priori—in no way derived from the senses. These are ideas such as those of mathematics, and

Leibniz criticized his empiricist adversary Locke for failing to take sufficient account of these ideas. Indeed, to the empiricist principle that there is nothing in the intellect that was not first in the senses Leibniz replied, "Except the intellect itself."

Rationalism generally tends to emphasize the part played by the intellect in contradistinction to that played by the senses. It holds that real knowledge is that provided by the intellect, for only there is the certainty which knowledge requires. Moreover, it is by means of the disciplines that are peculiarly the province of the intellect that knowledge is to be obtained and preserved.

## BRITISH EMPIRICISM

In general, empiricism stands in opposition to rationalism both in its views about the main source of our ideas and in its views concerning the source of true knowledge. Thus, it is often, historically speaking, a reaction against rationalism. The so-called British empiricists of the seventeenth and eighteenth centuries, however, were empiricists only in tendency. The first, Locke, was a complete empiricist concerning the source of our ideas, but he was often a rationalist in allowing other than empirical knowledge. Locke's new way of ideas, as it was called, was an attempt to show that all the materials for knowledge are derived from sense experience. Locke did not claim, however, that all knowledge was founded on experience in any other sense. George Berkeley, who carried on Locke's new way of ideas and even sharpened some of Locke's claims, especially on the subject of abstract ideas, was fundamentally a metaphysician with a special way of looking at the world. David Hume, the last of the trio, claimed to introduce the experimental method into philosophy, following in the steps of Newton, and of the three he had by far the best right to be counted an empiricist. Indeed, his empiricism led him extremely close to skepticism concerning a number of claims to knowledge; such skepticism, he believed, could be avoided only by "inattention" to philosophical issues. But all three of these philosophers were united in their opposition to any doctrine of innate ideas.

**LOCKE.** Book I of Locke's *Essay concerning Human Understanding* is devoted to an attack on the doctrine of innate ideas, and the positive doctrine begins only in Book II. At the outset Locke (1632–1704) had claimed that he was following the "historical plain method," the object of which was to "set down any measures of the certainty of our knowledge." This historical plain method consists in classifying our different ideas and plotting

their source as a prelude to an assessment of claims to different kinds of knowledge. Despite appearances this is not a psychological method; it is a method of philosophical analysis designed to discover the logical character of different ideas. In this way Locke distinguishes between ideas of sense and ideas of reflection. Ideas of reflection result from the operation of the mind itself upon ideas of the sense. There is no other source of ideas.

Locke also distinguishes between simple and complex ideas of both kinds, complex ideas being formed by the mind in compounding simple ideas. He seems to think that what it is to have a simple idea of sense is fairly obvious; it is to be aware of a particular quality of an object mediated by a single sense. The criterion of simplicity was, however, a problem for all British empiricists. In having simple ideas the mind is passive, but some activity is allowable in the forming of complex ideas.

*Primary and secondary qualities.* Among simple ideas of sense Locke makes an important distinction—already implicit in Descartes and others—between ideas of primary and ideas of secondary qualities. Primary qualities, such as bulk, number, figure, and motion, are, Locke thinks, inseparable from the bodies in which they are found. Bodies could not exist without them. Secondary qualities, such as color, sound, and taste, are, on the other hand, “nothing in the objects themselves but powers to produce the various sensations in us by their primary qualities.” In other words, the primary qualities of things produce sensations in our minds that are ideas of secondary qualities, but “secondary quality” is a misnomer to the extent that there is really no such quality in things. Thus, our ideas of primary qualities actually correspond to the things that produce them, whereas our ideas of secondary qualities, although produced by things, resemble nothing in those things, being purely subjective. Locke brings forward a number of arguments for this conclusion, arguments based mainly on the assimilation of our perception of secondary qualities to sensations of pain. That is, he takes the perception of, for example, warmth or color to be the same kind of thing as feeling pain.

*Account of perception.* He thinks of perception in general as identical with merely having sensations, and he thus fully embraces the causal theory of perception according to which perceiving is having sensations caused by things. He goes further than this in respect to primary qualities, for here he also accepts the representative theory of perception according to which our ideas represent the things that cause them. This theory, as we have seen, was the stock in trade of seventeenth-century philosophy.

Like most theorists of this pattern, Locke can give no good reason for the view that any of our ideas resemble their causes, and he cannot take the rationalist course of appealing to an intellectual intuition of some properties of things. It is a fair guess that he, like Descartes and others, was influenced by the success of physical science in maintaining that physical properties like extension—properties which are measurable—are *the* properties of things. There is also the connected fact that these properties are perceptible by more than one sense, as Aristotle had noted in his theory of common sensibles.

*Modes, substances, and relations.* Complex ideas may be exhaustively subdivided into ideas of modes, substances, and relations. Ideas of modes are ideas of things that depend on substances for their existence—for example, the idea of a triangle or a murder. Ideas of substances are ideas of particular things taken as existing by themselves—the complex idea of substance, he goes on to say, consists mostly of powers. Ideas of relation, finally, result from a comparison of one idea with another. Locke came to have some dissatisfaction with this classification of complex ideas, and in the fourth edition of the *Essay* he introduces a fourfold classification of ideas—simple ideas, complex ideas, ideas of relation, and general ideas. However this may be—and there is room for dissatisfaction with Locke’s second classification, too—all ideas other than simple ones are in some way formed by the mind out of simple ideas.

Locke classified ideas of space, time, and number as ideas of modes. That is to say that they are ideas of entities which depend for their existence on particular things. We build up our ideas of these entities out of our ideas of particular things when seen in the appropriate relations. Kant later showed that such a view of the source of our ideas of space and time was untenable; Leibniz commented on the fact that Locke failed to take account of the a priori nature of the ideas of space and time and attributed the failure to Locke’s inexperience with mathematics.

Locke maintained that our ideas of physical substances are mostly ideas of powers and that the idea of power is an idea of another mode. Since what we know of physical substances is largely due to their effects on us or on other substances, ideas of physical substances all mainly ideas of power. The effects, Locke thinks, are due to the motions of the invisible parts of things, but owing to the weakness of our senses, we are unable to perceive the nature of these causes. We have little or no knowledge of the “real essences” of things. What we do know of things is of their “nominal essences”—their nature

merely in respect of the classifications into which we fit them. Such classifications may not correspond to the real nature of things. Here Locke clearly shows how much he was influenced by the physical sciences. He thought that classifications show the way to the nature of things, but that owing to the weakness of our senses, we are unable to do more than gain a general impression of the nature of those physical processes. Therefore, we have to be content with an ordering of things according to their effects rather than as they are themselves.

**Theory of general words.** Locke adds to the account of ideas a discussion of language and of the words corresponding to the various ideas. It is in the context of this discussion that he puts forward his theory of the meaning of general words, a theory that was to come under attack from Berkeley. This theory—that the meaning of general words is given by the general or abstract ideas to which they correspond—is in effect Locke’s theory of universals. He expresses the problem by asking, “Since all things that exist are only particulars, how come we by general terms; or where find we those general natures they are supposed to stand for?” His answer is that words are general by being signs of general ideas, and we form general ideas by abstraction, “separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence.” Thus, words become capable of representing a number of individuals by standing for an abstract idea. Locke’s view is therefore a form of conceptualism in that the universal or general element lies in our ideas or concepts, not in anything nonmental. Given a liberal enough interpretation of the word *idea*, there is perhaps no great difficulty in understanding what Locke is getting at, although the implication that the meaning of words must always consist in their standing for something (in this case an abstract idea) is certainly wrong. The idea terminology is a vague one, common though it was in the seventeenth and eighteenth centuries, but most of those who employed it would have denied that ideas were simple images of things. Moreover, such an interpretation is far from consistent with much that Locke says about ideas. Nevertheless, the use of the term “abstract idea” is not without its difficulties, especially since Locke says that such ideas must represent things.

**Kinds of knowledge.** In his account of ideas and their classification Locke is the strict empiricist, maintaining that all ideas must be ultimately derived from simple ideas of sense, either directly or as a result of the operations of the mind upon these. His account of knowledge, given in the last book of the *Essay*, is less empiricist in

character; indeed, it owes an obvious debt to Cartesianism. He begins with the claim that knowledge is nothing but “the perception of the connexion of and agreement or disagreement and repugnancy of any of our ideas.” This agreement or disagreement can be classified into four kinds: (1) identity or diversity, (2) relation, (3) coexistence or necessary connection, and (4) real existence. It is the fourth kind which presents the difficulties. How can the knowledge of the existence of a thing be a matter of the perception of the agreement or disagreement between our ideas alone? This could be so only if our knowledge of the existence of things could be a priori. Locke thinks that some knowledge of this sort can be shown to be a priori, but it is knowledge of the existence of sensible things that presents the greatest difficulties.

Locke distinguishes between three degrees of knowledge in a manner which is reminiscent of Spinoza’s distinction between the three kinds of knowledge. There is, first, intuitive knowledge; second, demonstrative knowledge; and, third, “sensitive” knowledge of particular finite existences. The last Locke adds almost as an afterthought on the ground that it has by no means the certainty that belongs to the first two, although it goes beyond mere probability and is commonly thought of as knowledge. (Locke’s conception of the standard to which knowledge must attain is noteworthy here.) Apart from the different degrees of certainty that are to be attached to these kinds of knowledge, they also differ in that intuitive and demonstrative knowledge can be concerned with relations between ideas (we can see that white is not black, and we can reason from one idea to another) but sensitive knowledge is concerned only with the existence of the objects of ideas. This is not to say that there cannot be intuitive and demonstrative knowledge of existence, too. Locke thinks that we have intuitive knowledge of our own existence (compare Descartes’s *cogito*) and demonstrative knowledge of God’s existence (by means of a version of the Cosmological Argument; Locke distrusts the Ontological Argument). But how can the existence of anything be known from ideas alone? Locke sometimes appears to say that such knowledge consists in the perception of the agreement of certain of our ideas with the idea of existence, but in general he acknowledges that more is required than this—real existence and not merely conceived existence. The difficulties here are especially evident in connection with sensible knowledge.

**Existence of external world.** In Book IV of the *Essay* Locke tries to justify the claim that we have knowledge of the existence of particular sensible things by showing that our ideas do correspond to the things that cause them.

Whereas complex ideas may not always correspond to things because of the part played by the mind in forming them, simple ideas receive no contribution from the mind; they are entirely passive. Unfortunately, it does not follow from this that they are necessarily veridical. He adduces further considerations, stressing the passivity of the mind in receiving ideas and the way in which the senses may cohere in their reports. None of these considerations is really sufficient, and Locke admits that they do not amount to proof. In fact, by simultaneously embracing a general empiricist approach and a representative theory of perception, Locke cannot provide a guarantee of, or even any general argument for, the veridicality of the senses. He cannot provide any independent access to the objects of perception other than that provided by the senses themselves. Like most empiricists, Locke accepts the correspondence theory of truth in that the truth of a proposition consists in its correspondence to the facts. (Truth, he says, signifies “the joining or separating of signs, as the things signified by them do agree or disagree one with another.”) But he has no general warrant for the belief in the correspondence of ideas to things.

**BERKELEY.** The main aim of Bishop Berkeley (1685–1753), as he conceived it, was to defend common sense and religion against skepticism and atheism. But both his metaphysics and his theory of knowledge, connected as they are, can be partially regarded as attempts to rid Locke’s theory of impurities. Locke’s view of the world involved, besides minds and their contents (ideas), material substances, for the most part unknowable. Berkeley wished to get rid of material substances precisely because they were unknowable. In his view the existence of material objects consists only in their being perceived; their *esse* is *percipi* (their existence is to be perceived). In consequence, they must be regarded as complexes of ideas whose cause cannot be any substance underlying them but must be a spirit, the only active thing. Some of our ideas may be caused by ourselves qua spirits, but insofar as ideas have what we normally think of as an objective order, they must be caused by the supreme spirit, God. The laws of nature according to which ideas are ordered are guaranteed by God, and our ordinary way of looking at and talking about the world obscures this fact. Berkeley therefore thought that it was necessary to rid Locke’s views of those elements which prevented this insight. The main issues concerned the notion of substance as the cause of our ideas, with the connected doctrine of the distinction between primary and secondary qualities. Berkeley also found fault with Locke’s doctrine of abstract ideas, partly for its own sake but also because he thought

it one of the main supports for the doctrine of substance. We might, that is, have an idea of substance by abstraction; it had to be shown that this was impossible.

**Knowledge of the external world.** At first, in the *New Theory of Vision*, a work on both optics and philosophy, Berkeley maintained that physical objects are primarily objects of touch. Vision, he asserted, could provide us with no direct perception of the distance of things, for the retina of the eye is only a two-dimensional surface. Our sensations of sight (and, like others of his time, Berkeley thought that perception fundamentally consists in having sensations) can only be of expanses of color. When we perceive things as at a distance from us, what really happens is that the visual sensations which we have suggest to us certain ideas derived originally from touch and connected with the visual sensations by experience. The *New Theory of Vision* consists largely in the working out of this theory in detail. Berkeley came to see, however, that there was no reason for making this distinction between sight and touch. All senses should be alike in these respects. Insofar as we have knowledge of what we take to be physical things, it is because we have, as the result of experience, so connected ideas that having certain sensations or ideas suggests other sensations or ideas. These ideas make up a collection that we identify as an object. Thus, for Berkeley objects are, in some sense, identical with collections of ideas.

In the beginning of the main part of his *Principles of Human Knowledge*, Berkeley flirts with the view, now known as phenomenalism, that all we mean when we say, for example, that there is a table in our study when we are not there is that if we were there, we should perceive it. But he adds as an alternative the suggestion that what we mean is that “some other spirit actually does perceive it,” and this is his main view. What we ordinarily take to be things are really bundles of ideas in some spirit’s mind; they have a certain stability even when we are not perceiving them because God still is. Indeed, it is God’s having ideas according to a certain order that guarantees the order of our ideas.

Sensations and ideas generally (for although sensations are, strictly speaking, one species of idea, Berkeley often uses the terms interchangeably) are entirely passive. Their *esse* is *percipi*. On the other hand, spirits—God or ourselves—can be active. We cannot have ideas of spirits, although we have a notion of them, since we can understand the word *spirit* and at least know that we are the source of some of our ideas. There is no room in this for any substance’s underlying our ideas, since we have no idea of such a thing. Furthermore, the special place that

Locke had given to primary qualities—that of being the properties essential to material substance—is untenable, and if what Locke said about secondary qualities is right, there are no grounds for making any distinction between them and primary qualities. They are equally dependent on the mind, so that if secondary qualities are subjective (and Berkeley accepts and adds to Locke’s arguments for this conclusion), they must all be. All qualities are ideas in the mind.

*Theory of universals.* Berkeley’s fiercest attack upon Locke was directed against his doctrine of abstract ideas. Berkeley interpreted Locke as asserting the existence of ideas or images that possess contradictory properties. The abstract idea of a triangle must be simultaneously scalene, isosceles, and equilateral. This is clearly impossible. It is doubtful whether Berkeley is right in this interpretation, but he clearly thought that if such ideas were admitted, there could be little objection to the admission of the idea of substance, too—that is, the idea of a physical but in principle imperceptible object.

In the place of abstract ideas, Berkeley introduced a theory of universals that was nominalist in character. Universals are merely particular ideas that are representative of other ideas in the same class in the way in which a particular man may be representative of other men; hence, their universality lies only in their power of representation. There is no need to assume the existence of general ideas since general words need not correspond to general ideas in order to have meaning. In other words, Berkeley challenged the theory of meaning that asserts that all words are names and refer to something—*unum nomen, unum nominatum* (one name, one thing named), as the Scholastics put it. In his view general words stand for a number of particular ideas belonging to the same class. General words are different from names in that general words represent a number of things indifferently. It must be confessed, however, that it is difficult to see clearly what, according to Berkeley’s view, is involved in understanding a general word. Certainly, it involves having an idea which indifferently represents a whole class of things, but what is it to see that it does so?

*Refutation of skepticism.* Berkeley’s general view has certain consequences. It means, for example, that important sections of mathematics have to be abandoned. There must, Berkeley believed, be a least perceptible size. Since all our ideas are ultimately derived from sensations, there can be no ideas of infinitesimals or points. For the most part, however, Berkeley considers himself to be defending common sense against the attacks of the metaphysicians. The vulgar, he maintains, believe that “those

things they immediately perceive are the real things” (that is, not imperceptible substance), but philosophers believe that “the things immediately perceived are ideas which exist only in the mind.” Berkeley characterizes his own view as the joining of these two notions in that he equated real things and ideas. He thinks that given his view that ideas, which are the objects of immediate perception, are the real things, there is no room for doubt concerning the real nature of things—a doubt which Locke had expressed. Moreover, since what is immediately perceived is by definition free from error, only the wrong use of ideas in judgment can give rise to error. Error is thus a product of the imagination. Insofar as we rely upon our sense perceptions as directly given, we must be free from error. Thus, Berkeley claims, his view prevents skepticism and “gives certainty to knowledge.”

*Concept of knowledge.* Apart from the reference to God and spirits, Berkeley is a strict empiricist not only in the sense that he believes that all the materials for knowledge are derived from sense perception (as Locke, too, believed) but also in the sense that knowledge is itself founded on sense perception. Locke was not such a complete empiricist; he thought that knowledge in the strict sense is founded on intuition and demonstration, and he made skepticism possible to a certain extent over sense perception because he thought that its veridicality could not be completely shown. According to Berkeley, knowledge derived from reasoning must ultimately be founded on knowledge based on sense perception. Sense perception, in turn, is no longer conceived of as having ideas that are produced by objects and may not always represent their causes.

Berkeley has given up the representative theory of perception with its assumption that something so underlies our ideas that they may be representative of it. His rejection of the representative theory of perception is the basis of his claim to combat skepticism. Yet, as Hume asserted, it has often seemed a claim that fails to produce conviction, because the claim that what is directly perceived is free from error is true by definition. The question of how we know when we have direct perception still remains, however. Not all ideas are objects of immediate or direct perception; some are ideas of the imagination. According to Berkeley, these are less regular, vivid, and constant than ideas of perception, and they are more “dependent on the spirit”; they can be distinguished from ideas of sense by these criteria. But are all ideas of perceptible things ideas of things immediately perceived, and if not, how do we tell which are?

In the first of the three *Dialogues between Hylas and Philonous*, Berkeley argues that by sight we immediately perceive only light, colors, and figures; by hearing, only sounds; by taste, only tastes; by smell, only odors; and by touch, only tangible qualities. Here he appears to be arguing from the premise that these things are the special or proper objects of the senses. Although it is difficult to know what, if anything, is special to sight and touch, it is easy to see what is meant in the case of the other senses. Even if we grant that we hear only sounds, taste only tastes, and smell only odors, it does not follow, however, that we cannot be mistaken about the characteristics of these objects in particular instances. Are we necessarily free from error in hearing when we hear that a sound is loud or soft?

Nor is our attribution of colors necessarily free from inference as it should be if the perception of color is immediate. What, then, really counts as an object of immediate perception? In answering this question, Berkeley is subject to the same difficulties that have beset more modern philosophers when they have sought to base the philosophy of perception on the notion of sense data. If the foundations of knowledge are found in the deliverances of the senses, there must be certain perceptions that are incorrigible in the sense that they cannot logically be subject to doubt. But what counts as incorrigible perception? Berkeley tries to answer this question by assimilating perception to having bare sensations. Sensations, however, are not the sort of thing that can be right or wrong. The mere passivity of sensation, as opposed to the will, does not show that error arises from the will. If this criticism is valid, Berkeley's theory does not satisfactorily prevent skepticism in the way that he supposes.

**HUME.** Locke thought that his inquiry had revealed the limitations of the understanding by showing that there are parts of nature that our senses cannot discern. Berkeley, on the other hand, thought that there was nothing which our understanding could not grasp. Sense perception gives us complete knowledge of reality, and we have in addition notions of spirits, including God. Indeed, we could regard our ideas as a sort of divine language by means of which God speaks to us, so that our senses, if viewed correctly, continually reveal the glories of God. Hume (1711–1776) agreed with Berkeley in thinking that there is nothing in nature that lies beyond the reach of our senses, but, contrary to Berkeley, Hume reached the conclusion that our understanding is very limited and that skepticism is the only reasonable attitude toward knowledge. That Hume was intentionally a skeptic has been disputed, but there is no doubt that this is the logi-

cal outcome of his views. He thought that whatever Berkeley's claims, his arguments were in fact skeptical: "They admit of no answer and produce no conviction." In effect, therefore, Hume's position is that of following the principles of empiricism to their conclusion without any ancillary claim to knowledge of the inner workings of nature or of God. His conclusions are also something of a *reductio ad absurdum* of empiricism.

**Nature of ideas.** Hume begins by drawing a sharp distinction between impressions and ideas, impressions being the perceptions of sense and ideas the perceptions of the imagination or memory. In this he claims to be restoring the term *idea* to its original use. Every simple idea must have a corresponding impression—the idea of red, for example, resembling the impression of red—and complex ideas may be formed out of simple ideas. As with Locke, both impressions and ideas may be divided into those of sense and those of reflection, impressions and ideas of reflection being impressions and ideas of the mind's reflection on impressions or ideas of sense.

The criteria of the simplicity of an impression or idea are as much a problem here as with Locke. To have a simple impression is to have an elementary perception that cannot be further broken down into other perceptions, and this will function as a building block out of which the rest of knowledge may be constructed. Hume takes very strictly the principle that to every simple idea or perception of imagination or memory there must correspond an impression, or perception of sense, although at the very outset he admits a possible exception in the idea of a color in a series. We may have the idea of such a color from the principle of a series without ever having seen it. This possible exception, however, Hume refuses to take as important.

The principle that every simple idea must correspond to an impression is vital for a delimitation of the understanding and as a weapon against rationalism. Impressions and ideas can, however, be distinguished only by the superior force and vivacity of impressions; they cannot be distinguished in terms of their relations to physical objects or minds, for our knowledge of physical objects is derived solely from impressions, if at all. Likewise, among ideas, ideas of memory have a superior liveliness to ideas of the imagination. It is extremely doubtful whether this is always true, and this, in turn, casts doubt on any attempt to characterize remembering and imagining on empiricist lines by reference to the contents of the mind alone.

**Theory of universals.** Hume follows Berkeley in his theory of abstract ideas or universals. In his view there are

no abstract ideas, strictly speaking; however, ideas can be particular in their nature and general in their representation. Hume's only addition to Berkeley's account is his attempt to indicate how this can happen through the association of ideas. The occurrence of one idea may dispose the mind to call up all other ideas associated with it. Hence, the understanding of a general word lies in the disposition of the mind to have the ideas of those things to which it may be applied. This is not a very plausible account in itself since the notion of understanding cannot be analyzed in terms of habits or dispositions of minds, but it is at least an attempt to tackle the problem. The solution is in accord with Hume's general approach; his account of belief is similar.

Space and time are difficult notions for an empiricist to deal with, for, as Kant pointed out, particular phenomena seem to presuppose space and time rather than vice versa. Hence, it is difficult to see how our ideas of space and time can be derived from our ideas of particular phenomena. Locke had nevertheless classified our ideas of space and time as ideas of modes. Hume attempts to deal with our perception of spatial extension and temporal duration in terms of the order in which impressions or ideas appear. But in consequence he has to admit that ultimately the impressions that are ordered in this way cannot themselves be extended or of extended objects, nor can they take time. In general, Hume's treatment of space and time is one of the more puzzling parts of his work.

**Causality.** Hume's greatest reputation derives from his treatment of causality, although his approach to this subject is similar to his approach to the problem of our knowledge of the external world or of ourselves. His approach is founded upon a distinction between different kinds of relation. There are "relations of ideas," which depend completely on the ideas related, and factual relations, which can be changed without changing the ideas. This is a distinction between logical and matter-of-fact relations, and it leads to a distinction between logical truths and factual truths that parallels Leibniz's. Hume is interested in the causal relation because he believes that it is the only matter-of-fact relation that can lead us from one idea to another. Causality is not a logical or a priori connection, but it is a connection. This assertion is of the utmost importance. Why, however, do we think that there is some necessity in causal connections? It cannot be a logical necessity; also, it cannot be derived from a more general necessity such as might be provided by a principle of universal causality, for Hume believes that such a principle must be contingent and that the evidence for it

must be derived from our knowledge of particular causal connections.

He therefore proposes to "beat about the neighbouring fields." He notes that we generally take a cause to be antecedent to its effect and contiguous to it in space. More important, in experience there is a constant conjunction between cause and effect. In a sense these factors provide the basis for our belief in the necessity of the causal connection. Hume takes belief to be a lively idea associated with a present impression, and here the principles of the association of ideas again play a part. What makes an idea a belief is the feeling of being determined by habit or custom to pass from the impression to the associated idea. This feeling is an impression of reflection. It is in such an impression that Hume finds the source of our idea of necessary connection between cause and effect, for the "experimental method"—the resort to experience—should show us that there is no impression of power as such. It is due to habit or custom that we pass from cause to effect, and our belief in the necessity of doing so arises from the impression of a reflection of being determined to do it.

It is important to note just what Hume has achieved here. He has not in any way justified our belief in the necessity of the causal connection; he has merely attempted to explain the origin of the belief by giving a psychological explanation, not a philosophical justification, of the belief. But he has rejected all theories of occult powers in things, so that in one sense he may be considered to have said that what we mean by calling one thing the cause of another is that it is a uniform and contiguous antecedent of another event. To this extent his account is a reductive analysis; he analyzes our notion of cause by reducing it to notions that we understand. Yet Hume can find no justification for inferring the occurrence of one event from that of another; certainly, one event does not logically imply the occurrence of the other, but what other justification is there? Hume's conception of justification fails just because he recognizes no other kind of justification except that one thing logically implies another. Although Hume is commonly said to have raised the problem of induction, he made no real attempt to solve it himself, nor could he within his framework.

**Knowledge of the external world.** In Hume's account of knowledge of the external world the skepticism already implicit in his account of causality comes to the fore. Like Berkeley, Hume distinguishes between the beliefs of the "vulgar" and of the "philosophical system." The vulgar believe that we are aware of perceptions only, but they

also believe that some of them—our perceptions of primary and secondary qualities—have permanent existence. The philosophical system holds that there is a distinction between objects and perceptions and that only objects are permanent. Hume claims to side with the vulgar, but he sees no reason to distinguish any perception from any other. The mind is like a theater in which scenes come and go. Yet he does admit that it is natural to believe in a world of permanent objects. Reason can provide no justification of this belief, but we can give a psychological explanation of it like the account of our belief in the necessity of causality.

Our impressions have a certain coherence and constancy—that is, they fit together and recur in the same order after intervals. As a result, the imagination tends to carry on by custom or habit, and it attributes more regularity to objects of perception than they actually possess. Thus, we come to believe in a world of permanent objects, and we tend to reconcile what reason tells us of the interrupted nature of perceptions and what our imagination suggests about their regularity by a “philosophical” (as opposed to a commonsense) belief in a world of permanently existing objects. Nevertheless, a “direct and total opposition betwixt our reason and our senses” remains. Hume often speaks as if objects were just bundles of perceptions, but he has to deal with the belief that they are more than this. For such a belief he can give no justification, although he offers an explanation of its origin. In the last resort he can only recommend inattention to both our senses and our understanding. This is nothing if not skepticism.

*Personal identity.* Very much the same account is given of our knowledge of ourselves, a fact which may seem even more paradoxical. Once again, Hume uses the appeal to experience to indicate that we have no impression of the self. He rejects once and for all Berkeley’s suggestion that we have a notion of the self. Belief in the self must therefore be parallel to belief in an external world, and Hume proceeds similarly. Belief in our identity through time must result once again from the coherence and constancy that exists between our impressions and ideas, as a result of which the imagination takes them to be impressions and ideas of a single self. Once again, however, no reason can be given for this belief, a fact that worried Hume more than his other tendencies toward skepticism. He returned to the topic in an appendix to the *Treatise of Human Nature*, but in the end he could find no way of ridding himself of his worry except a game of backgammon and a good dinner.

*Account of perception.* Hume rejected Lockean substance, with the result that perceptions—impressions and ideas—become the substantial entities in his ontology (as he in effect admits in *Treatise*, Book I, Part 4, Ch. 5). In retaining the terminology of perceptions, especially that of impressions, Hume clung to the skeleton of the causal or representative theory of perception. But the skeleton no longer had flesh, despite the suggestiveness of the terminology. Thus, Hume is forced to take his starting point from perceptions that are logically independent of any owner and any object. In one place he says that there is nothing objectionable in the idea of an unperceived perception—a very odd notion. From this he has to build a world that fits the common supposition that there are physical objects and persons. The premises from which Hume derives his position are unacceptable, but given them, he can provide no reason whatsoever for belief in such a world and has to say that the belief is just a product of the imagination. This is skepticism with a vengeance, but it is the logical outcome of his approach.

**REID’S CRITICISM.** Hume’s contemporary Thomas Reid (1710–1796) thought, rightly enough, that Hume’s conclusions were manifestly absurd. Finding nothing wrong with the arguments presented by Hume, he concluded that the fault must lie in the premises and proceeded to attack the whole “way of ideas” which was the source of these premises. Reid maintained that it was necessary to make a strict distinction between sensation and perception, a distinction that the doctrine of impressions and ideas blurred. Reid was quite right about this, and his account of the nature of sensation and perception is interesting for its own sake. Sensation, he said, is an act of the mind that has no object distinct from that act, its prototype being pain. Perception is a much more complicated affair, involving a conception of an object and a belief in its existence. In many cases we fail to note the distinction because most of our perceptions are accompanied by sensations. Sensations provide in themselves no basis for inference about the nature of perceived qualities of things, although things cause the sensations. Reid expresses the relation between perception and sensations by saying that the sensations suggest the perceptions; sensations are natural signs of perceived qualities. This suggestion and the sign relationship involved are not a matter of experience, for we do not experience sensations in the same way that we perceive things (to have a sensation is not to perceive anything in itself). The relationship is a natural one like, he says, that between expressions of emotions and the emotions themselves.

Whatever the worth of this account, it is certainly a completely different analysis of perception from that of other philosophers of the period. In claiming to defend our ordinary beliefs by this account against the skepticism introduced by Hume, Reid set himself up as a philosopher of common sense, a position adopted by G. E. Moore in the twentieth century. Reid did retain some of the features of British empiricism, however, especially in a distinction between original and derived perceptions, a distinction that is in some respects very similar to that between simple and complex ideas or impressions. Moore similarly employed much of the apparatus of sense data invoked by modern empiricists.

## KANT

Kant (1724–1804) represents the juncture of seventeenth-century rationalism and British empiricism. Brought up in the tradition of post-Leibnizian rationalism, he was, as he put it, awakened from his dogmatic slumber as a result of a reading of Hume. His critical philosophy, as expressed in the *Critique of Pure Reason*, can be characterized as an attempt to draw the boundaries between the proper use of the understanding and the improper use of reason in making assertions of speculative metaphysics and as an attempt to show how the understanding can provide objectively valid knowledge of those things which Hume left to the imagination.

**CLASSIFICATION OF JUDGMENTS.** Kant bases his approach upon a twofold distinction between types of judgment. There is, first, a distinction between a priori and a posteriori judgments, the first being judgments whose truth can be known independently of experience, the second being judgments whose truth can be known only through experience. A priori judgments are pure when they involve only concepts that are themselves independent of experience. On the other hand, it is not a necessary condition of a judgment's being a priori that it should involve only such concepts. The concepts that are involved in a posteriori judgments, however, must be derived from experience, must be empirical.

The second distinction, that between analytic and synthetic judgments, is different. Analytic judgments are judgments about a thing that give no information about the thing, although they may serve to analyze or explain the concepts involved. This is because the concept of the predicate is contained, albeit covertly or obscurely, in the concept of the subject. The denial of these judgments involves a contradiction; hence, they correspond to what Leibniz called truths of reason. Synthetic judgments, on

the other hand, do give information about a thing; in them the concept of the predicate is not included in that of the subject, and their denial does not involve a contradiction.

Kant now combines the two distinctions. Analytic a posteriori judgments are clearly impossible, but there is no difficulty, Kant thinks, about analytic a priori judgments or about synthetic a posteriori judgments. There remains the class of synthetic a priori judgments. It is on these, Kant thinks, that the claims for metaphysics rest, and it is these in particular that empiricists refuse to admit. Kant's program is to show whether and to what extent such judgments exist. The outcome of the program is that although metaphysics in the traditional sense is impossible, synthetic a priori judgments are admissible—first, in mathematics and, second, in the form of the presuppositions of objective experience or science. This program, which constitutes the critical philosophy, is Kant's substitute for traditional metaphysics.

**SYNTHETIC A PRIORI KNOWLEDGE.** The possibility of synthetic a priori knowledge means that not all knowledge about things can be derived from experience. Nevertheless, Kant thinks that all such knowledge is based on experience. It starts from what he calls intuitions, but since knowledge involves the possibility of making judgments about things, it cannot consist of intuitions alone; it must also involve concepts. To have a sensible intuition is to have a simple awareness of something by means of the senses. This awareness Kant analyzes in a way that derives much from the British empiricists. A sensible intuition consists, first, of a sensation as the content of the intuition. Its form consists of spatial or temporal extension. Hume had to admit that impressions have an order, but he drew the consequence that the impressions themselves were unextended and nontemporal when at their simplest. Kant generally argues that sensations have only intensive qualities, qualities that can vary only in degree. Nevertheless, since the intuition consists of the sensation plus the form—that is, its relations to other sensations—spatiotemporal form is something which is a necessary part of our experience. One cannot, as Locke seemed to suppose, build up ideas of extension from first impressions. Spatiotemporal form is a necessary, a priori characteristic of experience.

Since Kant, however, has assumed a theory of perception similar to the representative theory, this a priori spatiotemporal form applies only to things as they appear to us—to phenomena. It does not apply to whatever may be thought to lie behind our experiences (things-in-

themselves). This fact Kant expresses by saying that spatial and temporal characteristics (and primary qualities in general) are empirically real but transcendently ideal. The characteristics in question are not merely subjective; they are objective—valid for all men—but only in relation to phenomena, not to things-in-themselves. (Throughout, Kant's criterion of objectivity is the criterion of intersubjectivity—validity for all men; he is pointing out that from the point of view of the critical philosophy something may be objective in this sense without being a feature of something independent of the mind.)

*Pure a priori intuitions.* Kant goes on to argue that we have not only a sensible intuition involving a priori spatiotemporal features but also a pure a priori intuition of space and time themselves. It is by virtue of this that the science of mathematics is possible. In order to do geometry, for example, it must be possible to make constructions in space, an idea that presupposes that we have an intuition of space. (Kant insists that this is an intuition, not a concept, but his reasons for this are complex and difficult to understand.) Arithmetic similarly presupposes an intuition of time. It is for this reason that mathematical judgments are both synthetic a priori and possible. Kant took it for granted that Euclidean geometry was *the* geometry of space, so that his account provided the justification of that geometry. It has often been suggested that the discovery of other geometries has undermined his case, and to some extent it has. But Kant would still have insisted that some intuition of space is a necessary condition of the possibility of any geometry, and there is something to be said for this position. Our concepts of space and time are not concepts that can be simply abstracted from experience.

**CATEGORIES OF UNDERSTANDING.** Space and time, then, provide the form of all experience, just as sensation provides the content. What is given in this way must be subsumed under concepts in judgment if knowledge is to result. "Thoughts without content," Kant says, "are empty, intuitions without concepts are blind." But in itself the formation of judgments is not enough for knowledge. The judgments that we make might be just the work of the imagination, as Hume in effect supposed in considering our knowledge of the external world. What criteria, then, have to be observed in the case of objectively valid judgments? Kant's answer is that such judgments have to conform to certain principles of the understanding and that these principles are derived from the pure or formal concepts, which Kant calls categories, of the understanding. Only insofar as our judgments conform to these

principles can the judgments that we make about appearances be intersubjective, true for all men. Objectivity can be a question of this intersubjectivity alone because no valid judgments can be made about things-in-themselves. What, then, are these principles, and what are the categories?

In the section of the *Critique* known as the "Transcendental Analytic" Kant puts forward two arguments for categories. The first, the "metaphysical deduction," tries to argue for the existence of the categories directly, by finding the key to the list of categories in the traditional table of judgments provided by formal logic. To each of the traditional headings under which judgments can be classified logically, there corresponds, Kant believes, a concept that provides the principle of construction of an objectively valid judgment. The second argument the "transcendental deduction," attempts to show that the existence of categories of the understanding is a necessary condition of possible experience. The two arguments are complementary in that the transcendental deduction depends upon the metaphysical deduction for the actual list of categories, while the metaphysical deduction does not really show that categories are necessary to objective experience.

It is true that later, in discussing the principles derived from the categories, Kant brings forward specific arguments in each case, so that it might be said that the case for accepting each of these principles does not depend entirely on an acceptance of the metaphysical deduction. Yet, it is the metaphysical deduction alone that provides the guide to which categories and which principles we should seek. Today, the metaphysical deduction is almost universally rejected. There can be no validity in the attempt to derive a table of categories for objectively valid judgments from a table of judgments classified according to purely logical principles. It remains, therefore, that if the transcendental deduction is valid, it is possible to accept some categories as necessary, but apart from arguments for specific cases one cannot determine which categories are necessary by reference to any general rule.

*Transcendental deduction.* The argument of the transcendental deduction is very complex, and only the most general outline will be given here. First, the senses provide us with a manifold of sensations set out in space and time. Second, in order that they may form a unity, the understanding, with the aid of the imagination, has to synthesize them. The imagination helps us to see the manifold as a manifold in space, and in the form of memory it ensures that we also see it as a unity over a tempo-

ral period. Kant calls these two forms of synthesis the synthesis of apprehension and the synthesis of reproduction. Third, in the synthesis of recognition the manifold has to be given a principle of unity by subsumption under a concept, so that we see the manifold as a such-and-such. The results of this, however, could still be only subjective. In order to attain objective validity, the understanding must enable us to conceive of the manifold as united in an object. What Kant calls the transcendental unity of apperception is the awareness of experiences as part of one consciousness and as having an object, although neither the owner nor the object of those experiences can be found in the experiences as such. Objective experience presupposes these features; otherwise, the situation would be, as Hume in effect supposed, a mass of experiences whose connection with a person or objective world is merely contingent.

Fourth, the judgments we make about the manifold of experience thus unified must themselves conform to certain principles of unity. It must be possible, for example, to see certain connections within experience as that of ground to consequent, and our judgments must presuppose such connections in the things joined in them. Thus, we arrive at the idea that if objective experience is to be possible, it must conform to such categories as ground and consequent. The categories are concepts of the principles of connection of things in judgment, if that connection is to be more than a mere subjective one. They are categories because they are applicable to anything.

*Transcendental judgment.* The categories derived from the logical table of judgments according to the metaphysical deduction are purely formal. For example, Kant believes that the category of ground and consequent is derivable from the logical notion of a hypothetical judgment. This purely formal category of ground and consequent can be given content only by being applied to phenomena in such a way that it emerges in more material form in terms of the particular relation of ground and consequent that is applicable in the case of phenomena—that is, in terms of the relation of cause to effect. Kant formulated a doctrine of schematism to explain how we can apply the purely formal categories to experience. A schema is a kind of principle for the construction in the imagination of anything that falls under a given concept. It is that which enables us to identify a given object as an instance conforming to the concept. Thus, the schema for each of the categories can be thought of as the principle for the application of the pure category to phenomena in time. The notion of ground and consequent applied to

phenomena in time emerges, as we have seen, as the notion of cause and effect (an essentially temporal notion). It is only from these schematized categories that it is possible to derive the principles of the understanding according to which all objectively valid judgments must be viewed. These principles Kant discusses and argues for separately.

In all this Kant believes he has explained how judgments about mere phenomena can be objectively valid although they are confined to these phenomena. The judgments in question are by no means applicable to things-in-themselves, to whatever lies behind phenomena. Such notions as those of a world lying behind phenomena and of a real self that is aware of them are noumena, and as such they must be thought of as limiting concepts. To treat such concepts as if they were concepts of an ordinary kind and to use them in a systematization of knowledge, as is done in speculative metaphysics, is wrong and is liable to produce fallacies. A noumenon is merely a “nonphenomenon,” and the concept of a noumenon is essentially a negative one, but reason tends to treat such concepts as positive, and from this the illusions of speculative metaphysics stem.

**CRITIQUE OF METAPHYSICS.** The judgments that the understanding allows us to make are conditional in that they are relative only to possible experience. Pure reason tends to assume an absolute, something unconditional, which provides the basis of the unity of all judgments of the understanding. It thus provides us with ideas whose proper use is only regulative, in that they are ideas of the goals or limits toward which the understanding may strive without being able to apply them directly to experience. To use these ideas, as speculative metaphysics does, as ideas under which we can directly subsume reality—such ideas as those of the absolute unity of the thinking subject, the absolute unity of the world in space and time, and the absolute unity of the conditions under which anything can be thought at all, the entity of entities or God—is the source of antinomies and other forms of contradiction or fallacy. Kant sets out to expound these contradictions and their resolutions in detail, but it is impossible to follow the argument here. The section of the *Critique* known as the “Transcendental Dialectic” is a critique of rational psychology, speculative cosmology, and metaphysical theology with its attempts at a demonstration of the existence of God. Although there is much other material in the *Critique*, this section essentially completes the critical philosophy in its attempt to show that the understanding can provide objectively valid

knowledge of phenomena and to reveal the limitations of the proper use of the ideas of reason.

An assessment of Kant's work in the theory of knowledge is difficult to give. It contains many extraordinary insights, although their detailed development often leaves much to be desired. Above all, perhaps, it takes as its starting point the analysis of experience provided by the British empiricists, and this undoubtedly limits it.

## POST-KANTIAN IDEALIST PHILOSOPHY

**FICHTE.** German philosophy after Kant is in many ways a commentary upon Kant's philosophy, either as further development or opposition. The idealism which was so characteristic of nineteenth-century philosophy was begun when Johann Gottlieb Fichte (1762–1814) found fault with the Kantian view of things-in-themselves that are beyond the reach of knowledge and proceeded to reject the notion on grounds similar to those which are commonly used against any causal or representative theory of perception—there can be no good reason for believing in such things. With the rejection of things-in-themselves, even as a limiting concept, we are left merely with experiences or phenomena, and it is of these that, in the idealist view, reality must consist. The general problem of idealism that Fichte thus introduced was how it was possible to distinguish among experiences those which are purely subjective and those which are really objective. The problem is how we can distinguish between what is contributed by the mind and what is not, between the self and not-self, as Fichte put it. In Kant's view objectivity was equivalent to validity for all people, but that it was at all possible to distinguish between what was due to the mind and what was not seemed guaranteed only by the existence of things-in-themselves. With the rejection of the latter, experiences and experienter became only two sides of the same coin. For this reason the general trend of idealism was toward the coherence theory of truth—the view that experiences and judgments are true to the extent that they cohere with one another, forming a coherent system. This view was naturally associated with the doctrine of degrees of truth—that judgments have varying degrees of truth to the extent that they cohere with each other. This more or less intelligible view was, however, complicated by being involved with the view that judgments about the empirical world have a very low degree of truth because they bring with them paradox and contradiction. The sensible world is therefore only appearance, and reality must be something else.

**HEGEL.** The belief that the sensible world is only appearance is perhaps less marked in G. W. F. Hegel (1770–1831) than in some of his idealist successors—for example, F. H. Bradley. Hegel was influenced not only by Kant but also by Greek thought, especially by Platonist and Neoplatonist conceptions of an intelligible world of Forms with a structure of its own. Nevertheless, Hegel's relation to Kant may be roughly characterized by saying that he attempted to restore the functions of reason that Kant had forbidden. Whereas Kant had tried to justify the processes of the understanding while underlining the contradictions involved in an improper use of reason, Hegel tries to show that the understanding involves its own paradoxes, which can be resolved only by the use of reason; this, in Hegel's view, is by no means improper.

*Dialectical method.* Contradictions arise during the application of philosophical categories like those of the One and the many, so that the philosopher finds himself asserting both a thesis and its antithesis, in a manner similar to that expounded in Kant's antinomies. There is, Hegel thinks, a method which reason can pursue in order to resolve any such contradiction. Reason has to find a synthesis, some category that will reconcile those which produce the apparent contradiction. But the resolution may, in turn, find itself opposed to a further antithesis which demands another synthesis and so on. This method Hegel calls dialectic. According to him, it provides the key to understanding how the ideas of reason may be charted. In the end they will be seen to be dependent on the ultimate, absolute idea that provides the ground for everything else. Thus, the idea of something absolute and unconditional which Kant had rejected is restored.

It must be confessed, however, that as a method in the strict sense, Hegelian dialectic is sadly defective in that there appear to be no rules for its use. Hegel presents a series of insights, sometimes real, sometimes imaginary, into the relationships between very general and abstract philosophical ideas, like those of being and essence or consciousness, self-consciousness, and reason. Dialectic provides the architectonic according to which these relationships may be charted, and Hegel is excessively thoroughgoing in its use. The result—the Hegelian system—is a complete map of all forms of knowledge and of all philosophical ideas, constructed on a single plan. The attempt is ambitious; the ground for its validity, slender in the extreme. It would be foolish, however, to deny the incidental insights.

*Theory of knowledge.* Hegel's theory of knowledge may be found partly in his *Science of Logic* and partly in

his *Phenomenology of Mind*. In the *Science of Logic* he explains his view of Kant, criticizing Kant's trust of the understanding and Kant's, to Hegel's own mind, undue restriction of the functions of reason. Then, through the dialectic he charts the notions most central to reason, beginning with the opposition between the categories of Being and Nothing, the synthesis of which he finds in Becoming. These are notions which reason finds indispensable for any account of the world and upon which logic must depend.

In the *Phenomenology* Hegel sets forth his view of perception most clearly. There Hegel begins by pointing out that consciousness appears to be an apprehension of what is immediate, of what *is*, which is, it appears, a confrontation of the ego with something else (as Fichte also supposed). But sense knowledge proper must involve a subsumption of this immediate consciousness under universals or concepts, and, moreover, there is no way of grasping the particular that is thus subsumed under concepts except by reference to other concepts. Proper names and even words like "this" are, in Hegel's view, general words, since they apply to a multitude of different things (Hegel here ignores or fails to appreciate the way in which they so apply); hence, they furnish us with no means of identifying a particular independently of universals. Sense knowledge thus turns out to be a mediated knowledge, a knowledge which is possible only through the medium of universals and which is not a direct knowledge of reality.

There is, however, Hegel argues, a contradiction between the fact that we take ourselves to perceive things which are unitary entities and the fact that our knowledge of them can exist only through a plurality of universals which are themselves unconnected. This contradiction is resolved only because the intellect provides us with a higher universal that constitutes the basis or condition for applying the lower-order universals in sense perception. This higher universal is force, the idea of "lawlikeness." The unity of the objects of perception is due to the law-like connections that exist between the universals under which they are subsumed. This is something that can be discerned only by the intellect, which thus produces the synthesis of the contradictions apparent within consciousness. This, of course, does not end the matter for Hegel, as the phenomena of consciousness are equally phenomena of self-consciousness. The opposition between consciousness and self-consciousness requires a synthesis by reason.

BRADLEY. The kind of general argument that Hegel used can also be found in the English idealist Bradley (1846–1924), although he was far less attached to Hegel's method, referring to the dialectic as "the bloodless ballet of the categories." (In spite of being chronologically out of order, emphasis is placed on Bradley here because Bradley, although often difficult to understand, is generally easier than Hegel for English-speaking readers. The slight differences between Hegel and Bradley matter little in light of their essential similarity of purpose.) In his *Principles of Logic* Bradley argues that all judgments are only conditionally true in that the identification of the portion of reality which is their subject involves subsumption under universals. The judgment as a whole therefore says that some universal can be ascribed to reality only on condition that some other universal or universals may be ascribed to reality. All judgments, although categorical in that they are concerned with reality (reality being the subject of all judgments), are also hypothetical in this sense. Hypotheticals must likewise rest upon a ground; their truth is dependent upon connections within reality (Hegel's force).

In Bradley, however, there is greater emphasis on the idealism. For Bradley universals correspond to ideas, so that in judgment we are attaching an idea to reality. However, since what is known can be connections between ideas only, reality as we know it is a system of ideas joined by what he calls internal relations. A judgment is true to the extent that the ideas which it ascribes to reality cohere with the whole system of ideas. By an internal relation, as opposed to an external relation, Bradley means a relation that is more than a contingent one. The relations that form the system that constitutes what we know of reality are more than mere contingent relations, although they are not so close as to be logical entailments. All that we can know of reality apart from the ideas under which we subsume it is that it is experience; it is the bare fact of consciousness from which Hegel starts. Bradley is indeed Hegel made more palatable for English tastes.

It is only fair to add that in his most explicitly metaphysical work, *Appearance and Reality*, Bradley finds paradoxes in the notion of relations in general. The idea that two things may stand in a relation gives rise, he claims, to an infinite regress. What is relational must be set down as appearance only. It follows that judgment can never amount to absolute truth, for all judgment involves the setting of ideas in relation; all judgment, in other words, involves inference. No judgment can therefore furnish more than a limited degree of truth or be about

something which has more than a limited degree of reality.

Judgments about the Absolute, the sum total of reality, may have a certain intellectual incorrigibility, since they will in effect ascribe to the absolute reality what is merely part of itself, but they cannot add up to truth itself. This is inevitable, since Bradley takes all judgment to be asserting the identity of subject and predicate, of reality and idea, while maintaining an unbridgeable gap between them—between the “that” and the “what,” as he puts it. The notion of judgment therefore involves a contradiction in itself, and for this reason the understanding is condemned. Intuition or immediate awareness gives us the bare fact of experience as constituting reality. What it is unconditionally and absolutely only reason can tell us. Whereas Kant had maintained that reason can tell us nothing of what is absolute and unconditional and that only paradox can result from the attempt to make it do so, the Hegelian doctrine espoused by Bradley is that the limitations of the understanding can be seen only by going beyond its limits to what is not finite and not conditioned but absolute. The claims for reason had never been pushed so far before, nor have they been since.

**SCHOPENHAUER.** With Arthur Schopenhauer (1788–1860) there was a partial return to Kant. Schopenhauer thought that Hegel’s dialectical method was barren because it ignored Kant’s insights into the nature of reason and the understanding. Yet he retained Hegel’s idealist approach. Kant’s phenomena became presentations or ideas in a sense similar to Berkeley’s; that is, they became subjective experiences. Schopenhauer thought that the world consists of ideas or presentations and that necessary connections judged to exist between them are, as Kant thought, merely conditional; however, Schopenhauer does not accept the paraphernalia of Kant’s categories for justifying such judgments. In his view all justifications for claiming objective experience rest on the principle of sufficient reason, which takes various forms according to the form of knowledge involved. It acts as a logical ground (the *ratio cognoscendi*) in connection with logical truths, as a ground connected with the features of space and time (the *ratio essendi*) in connection with mathematical truths, and as causality (the *ratio fiendi*) in connection with ordinary empirical phenomena. Thus, the notion of causality is made to play the role of all Kant’s categories in relation to empirical phenomena; causality is their only ground for necessity in this sphere. Schopenhauer finally looks to the will as the only ground for action, for moral necessity. As one class of phenomenon, action finds its explanation only in the will.

*Will as the thing-in-itself.* The world as idea or presentation is only one half of Schopenhauer’s philosophy (his main work is titled *The World as Will and Idea*). Although he accepted the idealist framework, he thought that the demand for a thing-in-itself as the basis of all our ideas was inescapable. He finds the nature of the thing-in-itself in the will. Reality consists of the manifestations of one force, the will, which uses consciousness as an instrument for its own self-promotion. Only in art is there anything like freedom from it, for only there does the mind achieve a state akin to the contemplation of Platonic Ideas, a sort of permanency which is foreign to the general manifestations of the will.

Although the last part of Schopenhauer’s thought had some influence upon the romantic movement in nineteenth-century German thought, it has not received much welcome from the mainstream of philosophers. However, Schopenhauer’s theory of knowledge, contained in the part of his philosophy devoted to the world as idea, contains much of interest along lines which are, in origin, Kantian.

## LATE NINETEENTH-CENTURY PHILOSOPHY

Philosophical thought in Germany during the nineteenth century tended to be either romantic or neo-Kantian. Neo-Kantian philosophy came under empiricist influences from Britain, and at the end of the century under Franz Brentano and Alexius Meinong this finally led to a return to realism, a movement that not only produced phenomenology (perhaps the dominant philosophy in Europe today) but also to some extent influenced Bertrand Russell and other realist philosophers in the English-speaking world.

**BRENTANO.** Brentano (1838–1917) held that the objects of psychology were mental acts. Each mental act had an immanent object—what Brentano called an intentional object—thus reviving scholastic terminology. These objects were a kind of internal accusative to the relevant act, as a judgment is to the act of judgment. They provide the content of the act. But what is the status of these objects? Clearly, the question is especially pertinent because it is possible to think of or make judgments about things that do not exist. How can a real act have an unreal object?

**MEINONG.** This was the problem that Meinong (1853–1920) took up. He postulated nonexistent objects to explain the possibility of our thinking, for example, of

things that do not or cannot exist. Similarly, false judgments were said to correspond to what he called objectives—nonexistent states of affairs which would be facts if only the corresponding judgments were true. Objectives could not be said to exist, for they were not things, but they might subsist. From a linguistic point of view, this doctrine implied a realist theory of meaning, according to which the meaning of any expression was given by a corresponding entity. The fact that these entities were not themselves mental entities (although they gave content to what is mental) implied a return to realism in a more general sense. Objects could be real, according to Meinong, without being actual.

**HUSSERL.** Edmund Husserl (1859–1938), another disciple of Brentano, started from very much the same point of view as Meinong, maintaining that the proper philosophical task was to investigate the essence of mental acts and their objects. Philosophy consisted, in his view, in an inquiry into the essence of different manifestations of consciousness and the essences with which they are concerned. To study this, it was necessary to strip off all presuppositions, metaphysical or otherwise. Husserl later emphasized this aspect increasingly. He adopted the method of *epoch*—the bracketing of presuppositions—in a manner akin, as he pointed out, to the Cartesian method of doubt. This would lead to pure consciousness as the one absolute, the one firm thing, and from this the philosopher may turn back to investigate the essence of different phenomena as they appear to consciousness. Thus, in effect the initial realist point of view led back to one that was more like idealism. But this belongs, properly speaking, to the twentieth century.

**J. S. MILL.** Meanwhile, in Britain the predominant philosophy at the beginning of the nineteenth century was sensationalism with its attendant associationism. James Mill (1773–1836) took a radically empiricist point of view, trying to reduce perception to merely having sensations and other mental phenomena to sensations plus the ideas associated with them. His son J. S. Mill (1806–1873) brought greater sophistication to this point of view and, in so doing, led to its downfall. Like his father, J. S. Mill wished to reduce all knowledge to experience, to the association of certain ideas with basic sensations. He expressed a great admiration for Berkeley's *New Theory of Vision* and its explanation of how we come to see things as at a distance. He thought it possible to explain in a similar way how we come to think of ourselves as perceiving a permanent world of things. We have expectations that take us beyond the immediate sensations because of the

associations built up in experience between our immediate sensations and ideas of “permanent possibilities of sensation.” Our ideas of material things are simply ideas of these permanent possibilities of sensation. Like Hume, Mill approaches this problem psychologically; he seeks to explain why we believe in an external world. To the extent, however, that he is inclined to add that things are simply these permanent possibilities of sensation, his view is the extreme empiricist doctrine of phenomenalism, the doctrine that all we mean by “material object” is something about our experiences.

Mill's main contributions to philosophy perhaps lie in logic, ethics, and politics. His general approach, however, is psychological, based on a conception of experience as atomistic sensations which could be linked to derivative ideas by the processes of association. Mill's general point of view is perhaps nowhere more obvious than in his account of such necessary propositions as those of mathematics. These are, in his view, simply very highly confirmed generalizations. The only necessity is psychological necessity.

Mill's view of knowledge came under attack in the latter half of the nineteenth century from many sources in Britain and elsewhere. In Britain perhaps the main attack came from the returning idealism, particularly as represented by F. H. Bradley. His main line of thought, as already discussed, was Hegelian with less emphasis on the dialectic and greater emphasis on the idealist point of view, according to which reality consists of experience organized in thought by attaching ideas to it in judgment. In *Appearance and Reality* Bradley sought to show that all features of the empirical world are only appearance and that reality must consist of a form of experience which is absolute and unitary and transcends all the contradictions of appearance. His criticism of Mill is that the pure sensory given is a myth; all the content of our knowledge must come by way of ideas—that is, through thought—and association “marries only universals.” Experience in itself is nothing.

**BERGSON.** Criticisms of a different kind came from France and America. In France there were few philosophical developments of interest during the nineteenth century until Henri Bergson (1859–1941). Bergson was an anti-intellectualist who emphasized life against thought. Much of his approach was therefore biological. The space and time of which we are conscious, Bergson thought, are continuous; the division of it into things and processes is due to the intellect, which carries out the division according to our biological needs. Perception involves an aware-

ness of the possible moves that our body can make in relation to an object; in contrast, sensation corresponds to a simple response to a stimulus. Like Bradley, Bergson thought that the atomistic sensations of the sensationist were a product of intellectual analysis. There are actually no basic experiences of this sort. We perceive things as our biological needs cause us to do so. Similarly with memory; our body acts like a sieve. Without the body our mind might remember everything, and this would be both useless and even disastrous biologically. Our body saves us from this, causing us to select only that which is biologically useful.

Because of this emphasis on biological utility, there is a relativism inherent in Bergson's point of view, and it has much in common with American pragmatism as instituted by William James. Bergson went further than James in his emphasis on life, however. His starting point was a thesis about time that is really outside the scope of this article. Roughly, his view was that the time of consciousness (*la durée*) is continuous; the ideas which thought presents to us are or seem discontinuous. The continuity of consciousness must be due to an interpenetration of those ideas, and as a result, they form a developing series in which, given that each member developed from what has gone before, each member must be unique. The development itself is due to a vital spirit, and the same is true of the universe at large.

JAMES. Bergson's emphasis upon the continuity of consciousness has its counterpart in James's thesis of the stream of thought. In his *Principles of Psychology* William James (1842–1910) insisted, in opposition to the sensationists, that there were no atomic sensations or ideas; distinct ideas are selected phases of one stream of consciousness, and these phases make up a continuity because each idea has a fringe which overlaps that of its neighbors. Thus far, however, James was content to argue that our ideas are determined by what things there are. We must, he maintained, distinguish between knowledge by acquaintance and knowledge about something (not to be confused with a somewhat similar but really different distinction made by Russell). The baby is acquainted with the universe but he has not yet selected anything from the mass of sensation with which he is confronted. Thus, he knows nothing *about* anything. James was later to go further in Bergson's direction. In *Essays in Radical Empiricism* he rejected the distinction between thought and things, embracing a thesis that is known as neutral monism, the thesis that reality consists of one stuff (in this case experience) out of which both the mental and the physical are to be constructed according to the prin-

ciples which govern each. From this continuous experience a plurality of thoughts and objects can be developed, a plurality of things related by concatenation only, as experience tells us they are. In this James set himself in opposition to his other *bête noire*, idealism, with its emphasis on internal relations and its denial of plurality.

PEIRCE AND DEWEY. James's special claim to fame (although some would say notoriety) is perhaps his status as the founder of pragmatism, although this, too, has Bergsonian affinities. The original source for the pragmatist point of view was C. S. Peirce (1839–1914), a rather isolated figure. A man with a great wealth of ideas, Peirce, as a nonprofessional philosopher, was to some extent outside the main stream of philosophical thought. He came to philosophy as a mathematician and scientist. He was opposed to all intuitions of the Cartesian type, largely because of his belief in the power of hypothesis and his disbelief in ultimate inexplicables. Perhaps his greatest contribution, however, lies in his theory of signs and meaning. In this connection Peirce maintained that our conception of anything is determined by our conception of the practical bearings of that thing. In sum, meaningfulness is a question of practical utility, and the meaning of any given concept or expression is given by its precise utility.

James turned this theory of meaning into a theory of truth, much to Peirce's disgust. He maintained that the test of the truth of any belief was its fruitfulness. To say that a belief is true is to say that it is good in this sense. Such is the pragmatic theory of truth.

For John Dewey (1859–1952) it is knowledge that is successful practice; propositions are merely instruments which may take us to the goal toward which experimental inquiry is directed. There is no final truth; instead, there is "warranted assertability" when the judgments which we make lead us to the abstract goal of science in accordance with scientific method.

## TWENTIETH-CENTURY REALISM

The course of twentieth-century philosophy was not smooth, and it is therefore not easy to chart. No more than a sketch will be attempted here. Undoubtedly, however, the main philosophical event at the start of the century was a swing from idealism to realism. In America there were the neorealists, such as E. B. Holt, W. B. Montague, and R. B. Perry, influenced by James and his theory of neutral monism; in England there was Samuel Alexander, and in Germany there was Meinong. The most important figures in this revolution were G. E. Moore and

Bertrand Russell at Cambridge, and of these Moore was the originator in this respect.

MOORE. G. E. Moore (1873–1958) began with a criticism of Bradley. Moore thought that Bradley had not taken far enough his rejection of the view that we abstract our ideas from experience. Insisting that concepts or ideas should be regarded as the objects, the meanings, of our thoughts, Moore went on to argue that there must be propositions as the objects of beliefs. Things are merely collections of concepts and as such enter into propositions as their constituents. Propositions are what we believe when we hold any belief, true or false. This amounts to an insistence upon a distinction between any mental activity or form of awareness and its object. Moore's article "Refutation of Idealism" in his *Philosophical Studies* is founded on just this point, for he finds the refutation of the doctrine that *esse est percipi* in a distinction, somewhat after the manner of Brentano, between the act of awareness in perception and the object of awareness, between consciousness and its object. Idealists, he maintained, failed to notice the distinction.

Moore was later to give up his doctrine of propositions, for in considering the problem of false belief, he said that "there do not seem to be propositions at all, in the sense in which the theory demands them." If there were, there would have to exist something corresponding to false beliefs, and the fact of its existence would make the beliefs true, not false. Belief cannot therefore consist in a relation between ourselves and an object. The rejection of propositions in this objectively existing sense may look like the abandonment of the very foundations of his realism, and so in a sense it is. But Moore did not give up the view that we do know of a reality independent of our minds, and when he abandoned the account of false belief which implied the existence of objectively existing propositions, he nevertheless maintained categorically that we must not give up the view that truth somehow consists in correspondence with reality.

*Existence of the external world.* Moore sometimes said that he never doubted that we do know things about reality that we ordinarily think we know. Therefore, he was not influenced by the usual skeptical arguments against this position. In his view the real philosophical problem was to analyze what we mean when we say that we have this knowledge. Moore has generally been one who raises the difficulties about this problem rather than one who gives the answers. He has definitely maintained, however, that we do have knowledge of many different kinds of thing, and in his notorious "Proof of an External

World" (*Proceedings of the British Academy*, 1939) he gave as a good argument for the existence of such a world the fact that we can point to objects in it. Thus, he held up his hands, saying, "Here is one hand, and here is another," to prove the existence of an external world. Moore's thought moved toward the view that what requires defending is common sense, ordinary beliefs such as the belief that there are objective things, like his hand, in the world. When metaphysicians say such things as "Time is unreal," this is an affront to common sense and demands explanation. Ludwig Wittgenstein later said that the view defended by Moore was not strictly common sense, since it was a philosophical point of view. This seems correct; what Moore meant by common sense was a general realist point of view.

*Account of perception.* In his analyses of what we mean when we claim knowledge, however, Moore's discussion follows the lines of those which have been more influenced by skepticism. Thus, in his account of perception he brings in sense data as what we actually see or directly apprehend when we look at something. Characteristically, he distinguishes between the sense datum (the object that we actually see) and the sensation which we might be said to have of it. But in using the words "direct apprehension" and "actually seeing," he suggests that he wants that indubitability which other philosophers have sought as an answer to the skeptic. Direct apprehension cannot be of the physical object, for, he argues, when an envelope is held up, it cannot be this that we actually see, since some people may fail to identify it as such. There is room for error about the identity of the object but not, perhaps, about its color or even shape as seen, so it must be these that we actually see. Moore's main worry is about the exact relation that exists between sense data and physical objects, both of which, he thinks, certainly exist. The answer that he would like to give is that sense data are parts of the surfaces of physical objects, but the fact that different people may have conflicting views of these objects prevents him from giving this answer. The right answer and, for the same reason, the precise nature of sense data were always a puzzle to him.

It may be wondered why Moore felt it necessary to bring in sense data at all. The answer must be that for Moore there had to be things which we just know, and although we may know of the existence of physical objects, we may not be so sure of their exact qualities. Hence, the possibility of error plays a part in Moore's thought just as it has done in that of others, even if the influence of skepticism is not so explicit. Direct apprehension fills the same role in his philosophy of perception

as intuition in his ethics. The notion has its parallel in the conception of knowledge employed by his Oxford contemporary John Cook Wilson and his disciples, such as H. A. Prichard. They thought the trouble with idealism lay in its failure to see that there was a distinct state of mind, knowledge, in which there was no possibility of error.

**RUSSELL.** Bertrand Russell (1872–1970) was first an idealist but was converted to realism by Moore. From his early study of Leibniz, Russell took the view that philosophy consists in the analysis of propositions, and his interest in logic also brought him to a concern with language. During the early 1900s he became interested in Meinong, whose realism seemed to confirm Moore in Russell's line of thought. However, he came to think that Meinong's supposition that there had to exist objects to explain our ability to think of things which do not exist in fact, such as round squares, showed, as he put it, an insufficiently robust sense of reality. Partly in response to this and partly in response to a more complex theory of meaning put forward by the mathematical logician Gottlob Frege, Russell set forth the theory of descriptions.

According to the theory of descriptions, phrases of the form “the so-and-so” are incomplete in meaning. They have no meaning (in the form of an object of reference) in themselves; to give their meaning, it is necessary to analyze the meaning of the whole sentence in which they occur. Sentences of the form “The so-and-so is *F*” are really tantamount to composite sentences including as a part the sentence asserting that something exists corresponding to the description “the so-and-so.” Where nothing of the kind exists, the whole proposition is false (“proposition” here being equivalent to “statement,” not the objectively existing object of beliefs). The theory of descriptions became a tool of analysis, and Russell used it in many connections.

**Theory of knowledge.** The main importance of the theory in epistemology is connected with Russell's distinction between knowledge by acquaintance and knowledge by description. Knowledge by acquaintance is Moore's direct apprehension, but Russell has always been more concerned with the justification of claims to knowledge than was Moore. For Russell it was important that all knowledge be founded on knowledge by acquaintance, if it was to be possible at all, for only in knowledge by acquaintance is error absolutely impossible. In *Problems of Philosophy* Russell gave a list of entities of which we have knowledge by acquaintance—sense data, memory data, the self, and universals. Of physical objects we have

only knowledge by description because here error is possible.

Russell also declares that “every proposition which we can understand must be composed wholly of constituents with which we are acquainted.” (By “proposition” he meant the objectively existing entity in the early Moorean sense.) This is possible only if anything of which we have knowledge by description is reducible to things of which we have knowledge by acquaintance. Physical objects, for example, must be reduced to sense data or, since they are not always being perceived, to a combination of sense data and sensibilia—actual and possible sense data. They must, as Russell puts it, be considered as logical constructions from sense data; they are simply bundles of sense data and sensibilia.

From the logical point of view, names of physical objects are disguised descriptions, and the theory of descriptions shows that it is not necessary to suppose the existence of a special class of entities called physical objects in order to give propositions about them a meaning. What we are acquainted with when we perceive a physical object is a number of sense data; the physical object we know only by description, and any statement expressing a fact about it is a statement about a description. This statement is analyzable, so that it contains an existential proposition about something answering to that description, according to the theory of descriptions; it is, that is, about something falling under a set of universals, and these are objects of acquaintance as much as sense data are. The notion of an object of acquaintance is closely connected with that of a logically proper name, an expression that cannot fail in its reference. Descriptions can, of course, fail in that there may be nothing answering to them. With the reduction of physical objects to sense data, knowledge of physics is preserved, and this has always been a cardinal point in Russell's program. On the actual status of sense data, Russell's opinion varied, but when most impressed by physics, he made them, paradoxically enough, entities in the brain.

**Logical atomism.** At the beginning of World War I, when Russell had come under the influence of Wittgenstein, he held that the ultimate constituents of the universe are atomic particulars, which are terms of relations in atomic facts. All other facts were to be built up from atomic facts by the processes of logic. The atomic particulars are sense data, and the relations supply the universal element in the fact.

The theory of logical atomism is a metaphysical theory rather than an epistemological one, and this is even more obviously true of Wittgenstein's version in his *Trac-*

*tatus Logico-philosophicus*. Russell differs from Wittgenstein in his more explicit interest in the nature of the constituents of atomic facts, and it is clear that his choice of these constituents was determined by his desire to found all knowledge on knowledge by acquaintance. The one exception to the program that Russell found at this stage was that of mental states like belief, for he could not see how statements about beliefs could be reduced to more elementary statements. In order to deal with the problem, he has flirted with behaviorism, since if belief is analyzable only in terms of behavior, this, in turn, may conceivably be explained in terms of sense data.

Russell changed his mind over the details of his logical atomism, especially when he was influenced by the logical positivists, but the framework remained the same. His account of memory is similar to that of perception; it is founded on memory experiences only contingently related to the past, although they may have a feeling of familiarity. The memory data are objects of acquaintance, but the past itself is not. In one general respect, however, Russell acknowledges that empiricism fails—in our knowledge of the postulates on which, in his opinion, inductive inference and, therefore, science rest. Induction, he thinks, is founded on habit, and the principles implicit in such habits cannot themselves be derived from experience. Despite his belief in the limitations of empiricism, Russell never wavered in his defense of realism. He always embraced and keenly defended the correspondence theory of truth.

*Nature of mathematics.* Nothing has been said thus far of Russell's work on the foundations of mathematics, especially his great contribution, written with A. N. Whitehead, in *Principia Mathematica*, although this is in a sense part of his epistemology. In *Principles of Mathematics* Russell held that mathematical propositions were synthetic, but when, influenced by Frege, he embarked on the attempt to reduce mathematics to logic by deriving it from a small number of axioms containing only logical notions, he held mathematical propositions to be analytic. This is too complicated a matter for discussion here. The exact nature of mathematical propositions is still a matter of dispute, but the attempt to reduce them to logic may now be seen to be a great and splendid failure.

WHITEHEAD. It may be noted briefly that Russell's partner in *Principia Mathematica*, A. N. Whitehead (1861–1947), took a very different road in epistemology. He tried to explain the properties of things in terms of their relations to one another. In perception the mind tries to grasp—or in Whitehead's term to “prehend”—a part of

the system of nature around it; it is reacting to the environment in biological fashion. There are no atomic sense data; to suppose that there are is to be liable to the “fallacy of misplaced concreteness”—the view that because science has a concept (such as that of an instant), there must be entities of this sort in experience. To some extent Whitehead's thought is in the idealist tradition, but it also contains a certain Platonism. The particulars of which nature is composed, he thought, are events; the permanent characteristics that we recognize in them are objects. The objects are, as he puts it, ingredient “into events,” not into just one event but through an indefinite neighborhood of events. We do not, that is, see single things with isolated characteristics; we view them as part of a system. Whitehead's thought is, however, difficult, and little can be done to make it intelligible in a short space.

## LOGICAL POSITIVISM

Wittgenstein's *Tractatus* influenced a group of philosophers in Vienna who were mainly interested in the philosophy of science after the empiricist fashion of Ernst Mach. Wittgenstein had said that to understand a proposition is to understand what it would be like for it to be true. The Vienna circle, as this group became known, wrongly interpreted this as a general criterion of significance, and so the verification theory of meaning was born. According to this theory, meaningful propositions must be either analytic or empirically verifiable. The propositions of mathematics and logic were thought to belong to the first class, and the propositions of science to the second. Metaphysical propositions, belonging to neither group, were declared meaningless.

The members of the group differed over the details of this scheme, and a progressive relaxation in its rigor gradually took place. One of the biggest problems was the status of the verification principle itself, for on the face of it it is neither analytic nor empirically verifiable. The eventual outcome for some members of the group was to view it as a recommendation only. There were also other problems. The initial aim of the movement was, above all, to lay the foundations of science. Scientific propositions had to be preserved and metaphysics excluded. It became apparent that it was difficult, if not impossible, to provide a formulation of the verification principle which fulfilled both goals.

Moritz Schlick (1882–1936), the original leader of the group, felt compelled to interpret scientific laws as rules rather than statements. Another problem lay in the meaning of the phrase “empirically verifiable.” Schlick held that ultimately there had to be a direct confrontation

with experience. Other members of the movement—for example, A. J. Ayer (1910–1989)—held that there had to be basic propositions which were directly and strictly verifiable (and thus absolutely incorrigible), although others could be indirectly verified by reference to these. This led to a distinction between strong and weak verification; propositions about physical objects, for example, might be only weakly verifiable, since an indefinite number of propositions about immediate experience would have to be invoked in order to verify them conclusively. In this, positivism was associated with the thesis of phenomenalism that statements about physical objects are analyzable into a collection of statements about sense experiences. The fact that such an analysis must be indefinitely long has resulted in a progressive modification of the thesis on the part of its main proponents—for instance, Ayer.

**Truth.** Schlick's view brought with it the correspondence theory of truth. Otto Neurath (1882–1945), on the other hand, held that this involved an attempt to go outside the web of language and ran the risk of a lapse into metaphysics. Neurath maintained that there had to be “protocol propositions”—observation reports on which science might be founded—but that these need not be reports of immediate experience. The truth of a protocol proposition was determined by its coherence with other propositions making up the language of science. Thus, Neurath embraced a coherence theory of truth. This general line was developed by Rudolf Carnap (1891–1970) into a form of conventionalism. He put forward a “principle of tolerance,” maintaining that logic had no morals; verificationism thus became a proposal for the best way of developing the language of science. Whereas Schlick and the earlier Carnap had maintained that basic propositions must be about immediate experience, Neurath had maintained the thesis of physicalism that protocol propositions must be in the language of physics. In line with his relaxation of the criteria, Carnap came to accept what he called the “thing-language”—the language of the commonsense world—as the basis for scientific language. Today, positivism in its strict form is more or less a thing of the past.

**Nature of science.** It is noteworthy that Karl Popper (1902–1994), who was not a member of the movement but who was influenced by it and influenced it, held that the key to an understanding of science lay not in verifiability but falsifiability. He put this forward, however, not as a theory of meaning but as a criterion for the demarcation of science from metaphysics. The generalizations of science are, because of their very form, unverifiable, but they *are* falsifiable, whereas the propositions of meta-

physics are not. Popper developed these views into a thesis about science as based on the hypothetico-deductive method. The aim of science is to put forward bold hypotheses, the deductive consequences of which must be subject to rigorous testing and criticism. This view is associated with a form of skepticism, for Popper sometimes maintains that we can never *know* the truth. The best that we can do is to put forward hypotheses and subject them to rigorous tests, for this is the way in which science progresses. Truth itself is just an illusion.

## CONTEMPORARY MOVEMENTS

Contemporary philosophy is in an untidy state of nonuniformity. In Europe perhaps the most prevalent philosophy is a phenomenology deriving from Husserl. This movement is also associated with existentialism, originally a reaction against the superrationalism of Hegel and, therefore, to some extent a form of irrationalism. Existentialists have added little to epistemology; they tend to take for granted the existence of an objective world, aiming only to present a picture of it and of man's place in it. Those existentialists who derive something from Husserl—for example, Jean-Paul Sartre and Maurice Merleau-Ponty—are concerned mainly with descriptions of forms of consciousness, with phenomenology as descriptive psychology.

**ORDINARY-LANGUAGE PHILOSOPHY.** Perhaps the most significant movement, apart from latter-day positivism and pragmatism, is the so-called ordinary-language philosophy, today most closely associated with Oxford. The leading spirit of the movement is, however, the Cambridge philosopher Ludwig Wittgenstein (1889–1951), who has had an immense influence. His work is not easy to summarize; it is in part a series of comments upon his earlier logical atomist views and the theory of meaning that it espoused. Only a small part of his work can be mentioned here. He has criticized the attempts implicit in much sense-datum philosophy to construct a private language by arguing that the results of such attempts would lack the essential conditions of a language. There would be no way of distinguishing between the occasions on which one was following a rule in applying an expression and those on which one was making a new decision so to apply it. He has also stressed the importance of bringing back terms to the language game (as he calls possible languages) that is their original home—ordinary language. This, he maintains, is perfectly in order as it is; the important thing is to examine the uses to which expressions are put, with the recognition that language is a form of life and must be treated

accordingly. Among other things this has led to the recognition of truths which are necessary but not analytic, truths which he calls “grammatical.” These are truths which express nonanalytic connections between concepts. The emphasis upon such truths and the arguments which lead to them on the part of followers of Wittgenstein is in a sense a partial return to Kant. (The distinction between analytic and synthetic truths in general has in any case come under fire from several quarters, especially from the American logician W. V. Quine [1908–2000]. But his emphasis on the necessity of assessing the status of propositions only within a system is something more of a move toward the idealist point of view.)

The appeal to ordinary language has been used for many purposes. Gilbert Ryle (1900–1976), for example, has used it in order to plot, as he puts it, the logical geography of mental concepts such as mind, belief, or will. He, too, has attacked the notion of sense data, and he has made and emphasized an important distinction between knowing how and knowing that. For present purposes the main importance of the appeal to ordinary language lies in its confrontation of the skeptic. The most stringent appeals to usage (rather than merely to the functions of language, as in Wittgenstein’s case) have been made by J. L. Austin (1911–1960), who has emphasized the extent to which many philosophers including skeptics, have departed from our ordinary use of words. It is clear, however, as Austin in effect admitted, that an appeal to what we ordinarily say cannot settle these issues, however much it may be a good first move. Arguments are first required in favor of our ordinary way of speaking.

It has been argued, for example, that anyone who says that we never know anything but only believe or suppose it robs the concept of belief of an essential contrast with knowledge, without which it would be meaningless. This argument—the so-called argument from polar concepts—is invalid, because a philosopher can use the concept of belief as long as he has the concept of knowledge, as long as he knows what it would be like to know; he does not have to admit that anyone knows anything as a matter of fact.

Another argument is that we can never deny that we have knowledge altogether, because this would be denying the existence of the paradigm case by reference to which we have learned the meaning of the word *knowledge*. This argument—the so-called paradigm-case argument—fails, in the opinion of the present writer, because it assumes that meaning is given by the applications of a term. Whereas it might be difficult to see how we could

have come to attach meaning to a term unless we had learned some of its applications, it is not logically impossible that we should have done so. Hence, more complicated arguments are required.

This is the situation. Most philosophers would agree that if we are to be said to know a proposition  $p$ , we must believe  $p$ ,  $p$  must be true, and we must have good reasons for believing in  $p$ . There is perhaps little argument over the first two conditions, although there might be some hesitation over the details. The problem is what counts as good reasons for believing in  $p$ . In the ordinary way we recognize different reasons according to the nature of the proposition involved. The skeptic denies that any of these are sufficient, and it is impossible to produce any knock-down argument which will dispose of the skeptic’s claim. Each application of this claim must be assessed on its own merits, and the answer to the skeptic must therefore be a dialectical one in the Socratic sense. But the very existence of recognized forms of knowledge presupposes that there must be such knowledge. This is, however, only a presumption, not a proof.

Traditionally, and for good reason, skepticism has had biggest sway in connection with claims to knowledge of objects of perception, knowledge derived from memory, knowledge of other minds, and inductive knowledge. In each of these cases the skeptic may present too high a standard of knowledge, which cannot, in the ordinary way, be attained. But the temptation to accept such a standard may be increased by adopting certain views about the nature of—for example, perception or memory. If perception is thought of as merely having sensations or memory as merely having images or ideas in the mind, there is necessarily a gap to be crossed from our own minds if there is to be objective knowledge in these fields. Hence, the talk of knowledge of an external world, external to our own minds. With a different conception of memory or perception, in which an essential connection is recognized between memory and the past or perception and an objective world, this gap is removed. This is not to get rid of the skeptical problem at one fell swoop, since it remains a question whether and under what conditions these concepts of perception and memory can be applied. This, however, is merely the general problem of how knowledge is possible in different fields; it can be dealt with dialectically. In other words, an incorrect conceptual analysis can worsen the skeptical problem, but a correct one cannot solve it. But the presumption remains that objectivity is possible in these fields, even if it is incapable of proof. Each doubt can be alleviated only by argument; there is no overall answer. Finally, the supposition

that an answer can be provided by showing that there are forms of knowledge in which error is logically excluded and which are therefore absolutely indubitable is an illusion. First, there is no indubitable knowledge; second, it is not necessary for the general possibility of knowledge that there should be. Much of the history of epistemology has depended on this illusion.

## EPISTEMOLOGY, HISTORY OF [ADDENDUM]

Knowledge (*ilm*) has occupied a central place in the Islamic intellectual tradition. The religious incentive for this stems from the fact that the Islamic belief is

grounded in a knowledge claim about God's existence and His revelation. The theologians (*mutakallimin*) consider knowledge as a prerequisite for religious belief (*iman*). A related question is God's knowledge of things—how God as the knower (*al-'alim*) knows particulars, which are subject to change, without change in His essence. To address this issue, Ibn Sinā had absolved God of the necessity of knowing every particular thing and event because this might introduce change in his unchanging essence. Ghazālī, in turn, accuses Ibn Sinā of denying God the ability to know particulars. The general consensus on God's knowledge of things, however, is that His knowing is a generative act in that He knows things by creating them. In this sense, God's knowledge of things does not follow their existence, which would be to attribute ignorance to God, but precedes them.

In philosophy, four major theories of knowledge have developed. The first is the concept of knowledge as abstraction (*tajarrud*). Following Aristotle, the Muslim Peripatetics define knowledge as the abstraction of the intelligible forms of things from their material properties. We know things through their intelligible forms—that is, only as universals. When the mind encounters a particular object, it abstracts its form and turns it into a conception in the mind. This, however, raises the question of whether what we know is a universal or the things themselves.

Knowledge as abstraction leads to what we might call the representational theory of knowledge, according to which knowledge is an imprint or picture (*rasm*) of actually existing things in the mind. When there is a perfect correspondence between the thing and its representation in the mind, we arrive at true knowledge.

The second theory is based on knowledge as a relation (*idafah*) between the thing known and the knower. The knower intends things in the extramental world, and this intending creates a relation between a person and his or her object of knowledge. Defended by some theologians, knowledge as relation fails to account for self-knowledge where the knower and the known are one and the same thing. When I say, for instance, that I feel pain, object and subject are the same. Otherwise, we would have to admit a relation between myself and myself.

The third theory defines knowledge as a property of the knower. Knowledge belongs to the knower as a state of the mind (*hala nafsaniyyah*). Combining elements from the above theories, this view reduces knowledge to concepts in the mind. It also seems to suggest that what the mind knows is its internal procedures rather than the things in the external world. The goal of knowledge, how-

ever, is to know things as they are, not simply as they appear to us.

The fourth theory of knowledge proposed by Suhrawardi and developed by Mullā Ṣadrā argues for what is called knowledge-by-presence (*al-'ilm al-huduri*). Suhrawardi defines knowledge as presence rather as absence or negation, as the Peripatetic term “abstraction” implies. Ṣadrā takes this point further and equates knowledge with existence (*wujud*). According to him, knowledge is a mode of existence and knowing is a cognitive act of unveiling an aspect of the all-inclusive reality of existence. This leads Ṣadrā to his celebrated defense of the unification of the intellect and the intelligible.

## EPISTEMOLOGY, RELIGIOUS

The epistemology of religion, as practiced by philosophers, is seldom concerned with the sorts of epistemological questions that emerge on a practical level in ordinary religious life, such as how to determine the correct interpretation of a scriptural text or how to know whether someone's claim to special divine guidance is to be credited. Rather, it tends to focus on the epistemic evaluation of the most basic tenets of the religious worldview in question—the existence of God, the creation of the world and God's relation to it, and the possibility of recognizing divine action in the world and divine revelation. From the 1960s on, religious epistemology has been characterized by a marked decline of fideism, with a renewal of interest in evidentialism and an even more pronounced upsurge of what may be termed experientialism.

Fideism is best characterized as the view that one's basic religious beliefs are not subject to independent rational evaluation. It is defended by urging that religious

convictions are the most basic part of a believer's world-view and thus more fundamental than anything else that might be used to evaluate them. It is also said that to evaluate religious beliefs by standards other than the internal standards of the religious belief system itself is in effect to subject God to judgment and is thus a form of idolatry. In the mid-twentieth century fideism took two main forms, existentialism and Wittgensteinian fideism. In the succeeding decades philosophical existentialism has suffered a massive decline, as has its theological counterpart, neoorthodoxy. Wittgensteinian fideism, on the other hand, arose largely in response to the positivist contention that God-talk is cognitively meaningless; with the defeat of positivism it has lost much of its relevance. Many religious thinkers, freed from the need to defend religion's cognitive meaningfulness, have felt a renewed impulse to contend for the truth of their faith. And on the other hand, critics of religion have moved readily from the contention that belief in God is meaningless to the logically incompatible assertion that it is false and/or lacking in evidential support.

Evidentialism is the view that religious beliefs, in order to be rationally held, must be supported by other things one knows or reasonably believes to be true. Evidentialist defenses of religion typically rely heavily on theistic arguments, and all of the classical arguments saw renewed interest in the late twentieth century. Versions of the ontological argument propounded by Charles Hartshorne, Norman Malcolm, and Alvin Plantinga are clearly valid, though their premises remain controversial. William Rowe's work has directed renewed attention to the Clarke-Leibniz version of the cosmological argument, and new versions of the design argument teleological argument for the existence of God, focusing on God as the source of the basic laws of nature, have been developed by Richard Swinburne and others. Even the moral argument (Robert Adams) and the argument from religious experience (Gary Gutting) have come in for renewed attention. Two new arguments, or versions of arguments, are keyed to developments in cosmology. The "kalam cosmological argument" (William Craig) uses big-bang cosmology to argue that the physical universe as a whole has a temporal beginning and thus is in need of an external cause. And the anthropic cosmological principle is used by John Leslie, among others, to support a new version of the design argument: The apparent fact that the basic laws and initial conditions of the universe are "fine tuned" for life, with no apparent scientific explanation for this fact, is taken as evidence of intelligent design. Both of these arguments benefit from their association with cutting-edge science but also in consequence

become vulnerable to future changes in scientific thinking on cosmology.

Evidentialist arguments against religion take a variety of forms. Most basically, evidentialists argue that the theistic arguments are unsuccessful and that theism fails for lack of evidential support. There are various challenges to the coherence and logical possibility of the traditional divine attributes. In most cases, however, these arguments, if successful, lead to a reformulation of the attributes in question rather than to the defeat of theism as such. But by far the most active area of consideration for antireligious evidentialism has been the problem of evil; the volume of writing on its various forms, by both critics and believers, has probably exceeded that on all of the theistic arguments taken together.

Along with the renewed consideration of the various arguments there have been reflections on the requirements for a successful argument. Traditional natural theology claimed to proceed from premises known or knowable to any reasonable person (e.g., "Some things are in motion") by means of arguments any reasonable person could see to be valid. By these standards it is not difficult to show that all of the arguments fail. But the standard is clearly too high; it is difficult to find significant arguments in any area of philosophy that meet it. No doubt a good argument should not be circular or question begging, and its premises must enjoy some kind of support that makes them at least plausible. But what seems plausible, or even evidently true, to one person may not seem so to another, equally rational, person; thus, the recognition emerges that arguments and proofs may be "person-relative" (Mavrodes 1970).

Furthermore, even a good argument is not necessarily decisive by itself, so it is necessary to consider the ways in which a number of arguments, none of them in itself conclusive, can lend their combined weight to establishing a conclusion. One model for this has been developed by Basil Mitchell, who compares arguments for religious beliefs to the kinds of cumulative-case arguments found in fields such as history and critical exegesis as well as in the choice between scientific paradigms. Richard Swinburne, by contrast builds a cumulative case for divine existence using the mathematical theory of probability. While it is not possible to assign precise numerical probabilities to the propositions involved in theistic argumentation, Bayes's theorem does provide insight into the way in which evidence contributes in a cumulative fashion to the support or defeat of a hypothesis such as theism Bayesianism. In addition, John L. Mackie and Michael

Martin have developed what are in effect cumulative-case arguments for atheism.

### EXPERIENTIALISM

The most significant development in the epistemology of religion during the 1980s and early 1990s was the rise of a new type of theory distinct from both fideism and evidentialism. This theory, found in the writings of Richard Swinburne, Alvin Plantinga, and William Alston, lacks a generally recognized label (the term *Reformed epistemology* properly applies only to Plantinga's version) but may be termed experientialism in view of its emphasis on the grounding of religious belief in religious experience. Experientialism differs from fideism in that it does not seek to insulate religious belief from critical epistemic evaluation: rather, it affirms that religious experience can provide a sound epistemic basis for such beliefs. Experientialism is also importantly different from the evidentialist "argument from religious experience" in the following respect: The religious experience is not first described in ontologically neutral terms and then made the basis for an inference to the existence of the religious object. On the contrary, the religious belief is grounded directly in the religious experience, without mediation by inference, just as perceptual beliefs are grounded directly in perceptual experience.

This difference is important for a couple of reasons. For one thing it is more faithful to the phenomenology of both religious and perceptual belief: in typical cases neither form of belief involves such an inference. But more important, the direct grounding of belief in experience offers better prospects of a favorable epistemic status for the resulting beliefs than does the inferential approach. This is readily apparent in the case of perceptual experience: attempts at a "proof of the external world" have been notably unsuccessful, yet only those in the grip of philosophical theory doubt that we do in fact acquire a great deal of knowledge about the world through our perceptual experience. In the same way it is at least conceivable that believers acquire knowledge of God experientially even if no compelling inferential argument from religious experience is available.

Swinburne, Plantinga, and Alston share what may be termed a weak foundationalist approach to epistemology. That is to say, they accept the distinction between "basic" beliefs, which do not derive their rational acceptability from other beliefs, and "derived" beliefs, which gain their support from the basic beliefs. But they do not accept the traditional foundationalist restriction of basic beliefs to those that are nearly or entirely immune to doubt—

beliefs that are self-evident, evident to the senses, or incorrigible. Each of them, furthermore, includes some religious beliefs in the category of basic beliefs. The epistemological task, then, is to show that this inclusion is epistemically proper—to show that such religious beliefs are among our "properly basic beliefs." (The terminology is Plantinga's, but the issue is the same for all three thinkers.) Each of them approaches this issue in a different way, though the approaches are ultimately compatible. Plantinga argues, following Roderick Chisholm, that the proper approach to the question of which beliefs are properly basic is inductive: one first conducts an inventory of the beliefs one takes oneself to hold rationally, then eliminates those that derive their epistemic support from other beliefs, and those that remain will be taken as properly basic. The typical Christian believer, Plantinga thinks, will find that she considers her belief in God to be rational but does not ground it inferentially on other beliefs she holds; thus, she will conclude that this is a properly basic belief. To be sure, atheists or believers in other religions will not concur in this, but Plantinga finds this to be unproblematic: "Followers of Bertrand Russell and Madalyn Murray O'Hair may disagree: but how is that relevant? Must my criteria, or those of the Christian community, conform to their examples? Surely not. The Christian community is responsible to *its* set of examples, not to theirs" (Plantinga and Wolterstorff 1983, p. 78).

In contrast with Plantinga's "internal" justification of the rationality of belief, both Swinburne and Alston attempt to show that religious experiences should have some epistemic weight, even for those who do not share the belief system the experiences ostensibly support. Swinburne appeals to the "principle of credulity," which states that "(in the absence of special considerations) if it seems (epistemically) to a subject that *x* is present, then probably *x* is present; what one seems to perceive is probably so" (1979, p. 254). He argues that a general denial of this principle lands us in a "sceptical bog" and that there is no justification for excluding religious experience from its scope.

Alston develops a "doxastic practice" approach to epistemology (indebted to both Thomas Reid and Ludwig Wittgenstein), which holds that all socially established doxastic practices are "innocent until proved guilty"; "they all deserve to be regarded as *prima facie* rationally engaged in ... pending a consideration of possible reasons for disqualification" (1991, p. 153). Alston's delineation of the "Christian mystical practice" and his defense of its epistemic status constitute a systematic,

detailed, and highly sophisticated presentation of experientialism.

One major difficulty for experientialism is the existence of incompatible experientially grounded beliefs in different religions—in Alston’s terms, the existence of a plurality of mutually incompatible mystical practices. Alston concludes that religious experience alone probably cannot resolve this ambiguity and that “the knowledgeable and reflective Christian should be concerned about the situation ... [and] should do whatever seems feasible to search for common ground on which to adjudicate the crucial differences between the world religions, seeking a way to show in a non-circular way which of the contenders is correct. What success will attend these efforts I do not presume to predict. Perhaps it is only in God’s good time that a more thorough insight into the truth behind these divergent perspectives will be revealed to us” (1991, p. 278).

Critics, however, have urged more far-reaching objections to the experientialist program. According to Richard Gale, the analogy between religious experience and sense perception is weak, with the dissimilarities far outweighing the similarities. He also argues that religious experience could not be cognitive—that is, could not provide independent grounds for belief in the existence of its object—and that religious objects such as God or the One are not possible objects of perceptual experience, even if they exist. Alston, on the other hand, has argued in detail that the phenomenological structure of religious experience is perceptual and that “mystical perception” constitutes a genuine species of perception along with sense perception.

## EPISTEMOLOGY, RELIGIOUS [ADDENDUM]

The most significant development in religious epistemology at the beginning of the new millennium was the completion of Alvin Plantinga’s trilogy on warrant and religious knowledge. Plantinga’s earlier work on Reformed epistemology focuses on the question of whether religious beliefs can be justified, in the sense that they can be accepted without violating any epistemic duties. His later work is concerned with *warrant*, defined as that which, added to true belief, enables such belief to qualify as knowledge. Plantinga argues convincingly that warrant is distinct from justification and also from rationality, in any of the several senses of the latter term. His own view is most akin to reliabilism, but he argues that standard versions of reliabilism face debilitating objections, and comes out instead for a definition of warrant in terms of the proper functioning of a person’s epistemic faculties.

For these faculties to function properly, they must function as they were designed to function, and they must be functioning in an appropriate environment, the kind of environment for which they were designed. (The notion of *design* seems already to bring something like a theistic assumption into play. Plantinga, however, concedes provisionally that evolution may be thought of as “designing” people’s epistemic equipment, though in the end he thinks this cannot be spelled out satisfactorily.) Furthermore, a person’s faculties must be such that, in those circumstances, they function reliably, so as to produce as outputs a high proportion of true rather than false beliefs. Plantinga’s formal definition of warrant is: “A belief has warrant for a person S only if that belief is pro-

duced in *S* by cognitive faculties functioning properly (subject to no dysfunction) in a cognitive environment that is appropriate for *S*'s kind of cognitive faculties, according to a design plan that is successfully aimed at truth" (Plantinga 2000, p. 56).

Given this epistemological framework, can belief in God be warranted when this belief is held in a basic way and not derived from other held beliefs? Plantinga's answer to this is yes. He holds that there is a component in the cognitive equipment of every person that is specifically designed to produce a belief in God, given certain "inputs" that are commonly available in our ordinary environment. Such inputs would include such situations as when people contemplate the majesty of the starry heavens, find God speaking to them in the Bible, or feel disgusted because of something they did wrong. This component in the human cognitive makeup Plantinga calls—following John Calvin—the *sensus divinitatis* (sense of divinity). When the *sensus* does its work, and produces in someone a belief in God, it is doing exactly what it is designed to do. Furthermore, the *sensus* is reliable because the belief that it regularly produces—namely, a belief that there is a God—is in fact true. (Malfunction, leading to a distorted conception of God, is of course possible.) Belief in God, produced in this way, satisfies all the conditions for being warranted, and when the belief is held with sufficient firmness the believer may be correctly said to know that there is a God.

Plantinga wishes to claim warrant also for the specific doctrinal beliefs of Christianity—for the "great things of the Gospel" (Plantinga 2000, p. 80). Considerably simplified, the model he presents is as follows: God, desiring to reveal himself, has become the principal author of the Scriptures of the Old and New Testaments, which contain his message to humankind. The individual who becomes aware of the teachings of the Gospel, through reading them or otherwise hearing of them, may come to have faith in these teachings; this faith is produced by the Holy Spirit, and has both a cognitive dimension (the teachings are "revealed to our minds") and a volitional/affective dimension (they are "sealed to our hearts"). One then comes to believe these teachings in a basic way; they are not inferred from anything else one believes, but as Jonathan Edwards said, the spiritually enlightened "believe the doctrines of God's word to be divine, because they see divinity in them" (Plantinga 2000, p. 259). A somewhat surprising (and perhaps implausible) consequence of this is that the fact that these doctrines are taught in Scripture does not constitute any part of the warrant they have for the typical believer.

Plantinga argues, however, that beliefs so formed can be—and in typical cases are in fact—warranted when held in a basic way.

This model has been described on the assumption that the Christian faith is true, but that is an assumption Plantinga qua philosopher is not entitled to. Accordingly, his formal conclusion is not that belief in Christianity is warranted, but that, if Christianity is true, then belief in its truth is probably warranted. (If it is not true, then God has not endowed humans with the *sensus divinitatis*, nor is he the principal author of Scripture, nor is faith produced in believers by the Holy Spirit, as the model claims. In this case, belief in the truth of Christianity has other sorts of causes, and is probably *not* warranted.) Plantinga concludes that the *de jure* objection, which claims that Christian belief is unwarranted, cannot stand on its own without support from the *de facto* objection, that Christianity is in fact false.

As one may expect, all of Plantinga's principal claims have met with vigorous criticism. Internalist epistemologists such as Richard Fumerton regard his externalist proper functionalism as overly permissive in the beliefs it counts as warranted. Another criticism is directed at the somewhat negative and defensive character of his apologetic. Plantinga defends the propriety of holding certain kinds of basic beliefs, but this may be of little help to those (including many believers) who do not actually find themselves believing these things in a basic way. Richard Swinburne (2001), along with a number of others, has urged that Christian apologetics ought to go beyond this and present reasons that could be convincing to the inquiring nonbeliever. Plantinga, however, considers that determining the truth of Christian belief lies "beyond the competence of philosophy" (Plantinga 2000, p. 499).

## EPISTEMOLOGY AND ETHICS, PARALLEL BETWEEN

Usually, actions are taken and policies adopted to realize envisaged goals, and they are undertaken because of belief that they will probably realize the goals. Actions and policies may be criticized, then, on one of two grounds: that the goals are ill-chosen or that the belief that the actions or policies will probably achieve the goals is ill-founded. It is interesting, and perhaps indicative of the facts to be examined below, that many words of appraisal—such as “justified,” “warranted,” “reasonable,” “right”—are used, although possibly in slightly different senses, to indicate the acceptability or unacceptability of both goals and beliefs. Moreover, such appraisals obviously have two features in common. First, the appraisal of a particular goal or belief can be made only in view of some general principle or standard; second, the standards and principles in question are not self-certifying, and their rational justification must be a serious question for a thoughtful person. The appraisal of actions and policies thus raises two questions about both goals and beliefs: What are the proper principles or standards to be used in appraisals, and what is the rational basis for regarding any principle or standard as proper?

Historically, ethics has been the philosophical discipline concerned with these two questions about goals. (However, “goals” must be taken broadly to include not only the question of ultimate values but also the question of moral obligations and moral rights.) And historically, epistemology has been the discipline concerned with the same questions about beliefs. (Again, “beliefs” must be taken broadly to go beyond mere predictions of consequences of the use of certain means to include theories, explanations, and systems of mathematical thought.)

In order to develop the parallel between ethics and epistemology, it is convenient to identify ethical and epistemological statements. Ethical statements are those that imply a statement that could be expressed by some English sentence containing essentially “is a good thing that,” “is a better thing,” or “is morally obligatory that” (on the assumption that “morally obligatory” does not introduce special concepts different from a phrase such as “it is

morally wrong not to”). The class of statements thus specified will be identical with the class of statements that moral philosophers have traditionally been concerned with. Similarly, epistemological statements are those that imply a statement which could be expressed by some English sentence containing essentially “It is reasonable (or warranted) for a person *S* to place more confidence in *h* than in *i*,” in which it is understood that for *h* and *i* can be substituted expressions of the form “its being true that. . . .” The class of statements thus specified is identical with the class of statements that epistemologists have been concerned with. It is useful to identify as ethical terms those phrases whose occurrence in a sentence distinguish it as an ethical statement and to identify as epistemic terms those phrases whose occurrence in a sentence characterize it as an epistemological statement.

### PROBLEM OF ETHICS AND EPISTEMOLOGY

Moral philosophers have not, at least qua moral philosophers, been concerned with the acceptability of particular ethical statements such as “It would be a good thing if Jones learned to play the piano.” Rather, moral philosophers have attempted to arrive at acceptable universal ethical statements which could serve as standards for the appraisal of particular situations. Thus, moral philosophers have defended or criticized such statements as “Enjoyment is always a good thing, abstracted from all consideration of consequences; nothing else is so” and “An action is morally right if and only if it will produce consequences as good as those of any other action the agent could have performed instead.” The formulation of such generalizations, together with the proposal of reasons in support of them, is generally called normative ethics. Like moral philosophers, epistemologists are not concerned with the acceptability of particular epistemological statements such as “It is now highly probable that viruses are the cause of some forms of cancer.” Instead, they have attempted to arrive at acceptable universal epistemological statements to be used as standards in appraising particular statements. Thus, they have examined the acceptability of such statements as “If at a time *t* person *S* seems to remember that he had the experience *E* at an earlier time, then he is initially warranted in believing that he did have the experience *E*” or “If at time *t* person *S* believes the statement *h* about his own experience at *t*, then it is reasonable for *S* to place at least as much confidence in *h* as in any other statement.” The formulation of statements like these and the proposal of reasons in support of them have traditionally been the main

occupation of epistemologists. In order to distinguish this task from other concerns of epistemologists, we may call it epistemology proper.

**SOME MINOR POINTS OF SIMILARITY.** If it is morally wrong for a person to take action *A*, but he takes that action, then in the absence of any excuse we attribute to him a fault of character and say he is morally blameworthy. Similarly, if a person has good reason for believing a certain statement but he does not, then in the absence of any good excuse we attribute to him an intellectual fault and characterize him as intellectually open to criticism. (The excuse in either case might be much the same; for instance, a person might plead that he was very upset, not “himself.”) It is sometimes said that the parallel extends further in another direction, that just as there are several senses of “morally obligated,” so there are corresponding senses of “reasonable to believe.” For instance, it is widely believed that “morally obligatory” is sometimes used to mean the act which a being omniscient about the facts of the case and about moral principles would be morally blameworthy for not doing if he were in the place of the agent; this is said to be a sense of “morally obligatory” different from that employed when a person with possibly faulty information about the facts and imperfect clarity about moral principles is said to be morally obligated to do something. Correspondingly, it is sometimes suggested that there is a sense of “reasonable to believe” in which we may say that it is reasonable for a person to believe that any statement is *true*; this sense is contrasted with the sense in which we say it is reasonable for a man to believe what is supported by the evidence he has. Whether there are such different senses in either case we must leave an open question here.

### EPISTEMOLOGY REDUCIBLE TO ETHICS?

Some philosophers (R. Chisholm, for example) have thought that there is more than just a parallel between epistemology and ethics. They have thought that epistemic terms are properly defined by means of ethical terms. If this is correct, epistemological statements are complicated ethical statements, and, presumably, epistemology is a branch—doubtless a somewhat special one—of ethics. In accordance with this view, for example, the statement “It is warranted for *S* to place more confidence in *h* than *i*” might be taken to mean “For any good thing *G*, if *S* had to choose between risking it by a wager on the truth of *h* or risking it by a wager on the truth of *i*, he would be obligated to wager on *h*.” If sound, this defini-

tion has the advantage of reducing the number of undefined terms in one’s total system of concepts. The disadvantages of the definition are (1) that it is doubtful whether there is any useful sense of “obligated” in which the implied equivalence is true, (2) that the definition seems to be more obscure than the definiendum, and (3) that it does not seem that the meaning of “warranted belief” involves the notion of moral obligation but, conversely, that a person’s being obligated to do something, in one ordinary sense, can be explained only by reference to the propositions it is reasonable for him to believe about his situation.

### THEORIES OF MEANING AND VERIFICATION

If epistemology is not reducible to ethics, there is still a parallel between the higher-order questions and theories to which epistemology proper leads and those to which normative ethics leads. The discipline dealing with these epistemological questions and corresponding to the discipline of metaethics we may call metaepistemology. The central question of these disciplines, roughly, is how the statements of normative ethics and epistemology proper, respectively, can be supported, what is their “logic.” The task of showing this is different, of course, from the task of producing a specific line of reasoning in support of specific ethical or epistemological principles. Can such principles be supported in the same way that propositions in the empirical and mathematical sciences can be? Whether they can be depends in part on what the meanings of the special epistemological or ethical terms are. Moral philosophers recognize three main views about the meaning of ethical terms and, correspondingly, about the ways in which ethical principles may be justified. Three very similar views have been given by epistemologists for the meaning and support of epistemological principles.

**NONNATURALISM.** The first view, which we may call nonnaturalism in epistemology and ethics alike, affirms two things. It affirms (1) that epistemic and ethical terms are meaningful and that epistemological and ethical statements are true or false and (2) that epistemic and ethical terms do not name observable qualities (such as color or shape) and that their meanings cannot be defined, even partially, by citing a relation between them and names of observable qualities. Epistemic and ethical terms can be explained only by way of other epistemic and ethical terms. Hence, neither epistemic nor ethical principles can be confirmed by observation in the way that principles in the empirical sciences can be. This

means that when we know ethical and epistemological statements that are not analytically true (as contrasted with ones like “A person ought to do his duty” or “One cannot know something unless it is reasonable for him to believe it”), our knowledge is synthetic a priori knowledge. A clear example of this view is the theory of probability held by J. M. Keynes, who thought that “probable” is an indefinable concept and that the axioms of probability theory are a priori synthetic knowledge.

**NATURALISM.** The second view can be called naturalism or “definism.” It agrees with the first affirmation of non-naturalism but denies the second. It holds that epistemic and ethical terms can be explained without the use of other epistemic or ethical terms, that they can be explained exclusively by use of empirical and logical concepts. As a result it holds that nonanalytic epistemological and ethical principles have the same logical status as the principles of the empirical sciences and can be appraised ultimately by reference to the data of observation or introspection.

For example, according to one such definition of an epistemic term, the statement “It is reasonable for *S* to believe *h*” means just “*S* believes *h*.” A more plausible theory defines “know” as follows: “*S* knows that *h* at time *t*” means that *h* follows logically from the propositions *S* believes about his own experience at *t* (including what he seems to remember), plus the following (enumerated) principles of inductive logic and principles about the truth or probability of memory beliefs. Examples of parallel definitions in ethical naturalism are familiar. If the second definition given were accepted, it would be an analytic proposition that the principles of deductive and inductive logic are known by everyone, just as, given a utilitarian definition of “right,” the principle of utilitarianism is analytic.

Parallel to the claim of the ethical relativist that conflicting basic ethical principles may be affirmed with equal warrant by different persons or social groups, is it possible that conflicting basic epistemological principles may also be affirmed with equal warrant by different persons, even if a naturalistic analysis of epistemological terms is adopted? For instance, just as the ethical relativist may affirm that different assessments of the ethical obligation of making a promise may be made with equal warrant by different persons, may someone claim with reason that different assessments, say, of the weight of an additional observation in support of some general law may be made with equal warrant by different persons? Such questions must be left unanswered here. It is obvious, of

course, that given different evidence, it may be reasonable for a person *S* to believe some propositions which it would be unreasonable for person *S'* to believe.

**NONCOGNITIVISM.** The third view, which may be called noncognitivism, denies the thesis common to naturalism and nonnaturalism that epistemological and ethical statements are true or false but agrees with non-naturalism that epistemic and ethical terms cannot be defined by means of empirical and logical concepts. Noncognitivism holds, however, that epistemic and ethical terms have a function and, in a sense, ideas in meaning. Ethical terms have been assigned various functions by different writers (functions like expressing the speaker’s attitudes, changing the audience’s attitudes, issuing prescriptions, declaring one’s principles, giving advice, entreating, urging, exhorting, and so on).

Somewhat similar proposals have been made for epistemic terms. “It is probable that *h*,” for example, is sometimes said to be a guarded way of affirming *h* or a cautious way of encouraging others to believe *h*. Again, “it is probable that *h*” is suggested not to assert that the speaker believes *h* but to express his belief in *h*. A more complex suggestion is to say that “it is reasonable to believe *h*” declares or expresses the speaker’s own somewhat guarded inclination to believe and usually, at the same time, as a result of people’s conditioning in the use of the language, strengthens the beliefs of others in *h*.

Further, parallel to ideas in C. L. Stevenson’s ethical theory, one might say that epistemic terms also have some rather indefinite descriptive meaning, perhaps to the effect that acceptance of the proposition in question would conform to generally recognized standards—the standards, perhaps, of scientists. One could say, as P. H. Nowell-Smith does in his ethical theory, that epistemic terms have various functions in various contexts and that it is a mistake to look for some single function performed by them on every occasion. It could be added that the use of epistemic words (similar to the suggested parallel to Stevenson’s theory) carries special contextual implications which distinguish them from nonepistemic terms. Since the noncognitivist does not think that epistemic and ethical statements are either true or false, his view does not contain any theory about how the truth of such statements may be established, although it often contains a descriptive account of various ways in which persons do or could try sensibly, in view of the kind of statement in question, to remove their disagreements. Defenders of the noncognitive view in epistemology include R. Chisholm, Stephen Toulmin, and J. N. Findlay. Although they have

been popular, noncognitive views, in epistemology and ethics alike, appear to face some difficulties. (For instance, in conditional clauses, such as “If it were known that ..., then ...” or “If it were a good thing to ..., then ...,” the ethical and epistemological terms seem to be used in their normal sense, but obviously nothing is being urged or expressed. Again, whatever specific function one assigns to terms of either type, it seems possible to find affirmations which employ the terms and cannot plausibly be said to be performing that function.) Moreover, it is doubtful whether there are conclusive reasons for rejecting “definism” (naturalism) in all its possible forms.

### SOME BROADER PERSPECTIVES

One feature of both ethical and epistemic terms is that even very educated people do not have any clear idea of their meaning or of how to support their applicability in, for example, the way they are able to support the assertion that someone is a bachelor. Nor is it clear how an appeal to whatever vague meaning there is could be used reasonably to require anyone, on pain of inconsistency, to accept a corresponding ethical or epistemological principle; the fact that a person rejected such a principle would always be good reason for saying that his use of the epistemic or ethical term does not correspond to the sense needed in order to require the principle. It would appear that one of the functions of moral philosophy and epistemology is, rather, to propose helpful and clarifying uses for these terms.

What would be a helpful and clarifying use for these terms must presumably be decided by a broad view of human nature and society, a view of action and the requirements of reliable prediction for the purpose of action, the need of informal social controls in a complex society, and the necessity for impartial and general rules for such control, given that human beings are for the most part intelligent, self-interested creatures. However this may be, it is likely that reflection on the functions of science (reasonable beliefs) and conscience in society may provide, in the case of science at least as well as in the case of ethics, a guide for the philosopher’s reconstruction of the meaning of ethical and epistemic terms and a basis for the appraisal of epistemic and ethical principles.

It should be noted that metaethics and metaepistemology both have another part. That part is the explanation of various concepts necessary for the understanding of terms and statements of both epistemology and ethics and for an understanding of theories about how epistemological and ethical statements may be supported. Among the concepts that are epistemologically important

are “meaning,” “truth,” “reference,” “analytic,” and “a priori.” Some of these concepts are also important for ethics; other concepts important for ethics are “action,” “choice,” “free choice,” “voluntary,” “intention,” “motive,” and so on. Both metaethics and metaepistemology, then, have branches devoted to these auxiliary concepts.

If there is a parallel between ethics and epistemology, should we go on to say that there is a parallel between ethics and science since, after all, to assert any statement in science is at least to imply that there is evidence for what is stated, that it is generally known, and so on? Is not every scientific statement, at least covertly, an epistemological statement? It seems clarifying not to go this far. Epistemological statements are of the form “It is warranted for S to believe that ...,” and we should note that what comes after the “that” is the sort of statement that occurs in the textbooks of science. If the meaning of this statement also has to be construed as somehow epistemological, difficulties arise.

## EQUALITY, MORAL AND SOCIAL

The proposition "A and B are equal" may be descriptive or normative, but in either case it is incomplete without a statement of the respects in which the objects or persons compared are deemed to be equal. In instances where this appears not to be so, either the context supplies the complement or the comparison is of pure quantities, as in pure mathematics. Two objects equal in weight, or height, or value may be unequal in other respects; apart from the abstractions of mathematics and logic, no two objects could ever be said to be equal in all respects, only in all relevant respects.

Correspondingly, to say that two candidates are equal in merit would usually mean that with respect to their performances in some understood competition or examination, they deserve to be treated alike; it does not rule out treating them differently if they are unequal in other respects. Aristotle's celebrated account of justice in Book III of the *Ethics* amounts to this: No distinction ought to be made between men who are equal *in all respects relevant to the kind of treatment in question*, even though in other (irrelevant) respects they may be unequal. On the other hand, in any matter in which they are in relevant respects unequal, they ought to be treated in proportion to their relevant inequalities.

These analytical distinctions are of considerable importance in dealing with equality as a moral and social ideal. Thomas Jefferson's claim that "all men are created equal" cannot be rebutted by pointing to the obvious fact that some are taller, stronger, or more clever than others. The claim is intelligible only as a prescription, as saying that there is some respect, at least, in which no difference ought to be made in the treatment or consideration given to all men, whatever differences there might be in their qualities and circumstances.

## HISTORY OF EQUALITY AS AN IDEAL

Plato preached the political equality of the sexes, Aristotle that of all free citizens; nevertheless, both laid more stress on not treating unequals equally than on any general conception of equality. Aristotle believed that some men were slaves by nature, Plato that some souls were not merely capable of higher development than others but more valuable on that account. The political egalitarianism of Pericles' Athens, described by Thucydides, was concerned only with the equality of Athenian citizens and excluded slaves and foreigners. The first generalized egalitarianism was that of the Stoics, who stressed the natural equality of all men as rational beings with an equal capacity for virtue: "Virtue closes the door to no man; it is open to all . . . the freeborn, the freedman, the slave and the king . . . neither family nor fortune determines its choice—it is satisfied with the naked human being" (Seneca).

The New Testament doctrine of the equality of all souls in the sight of God (Galatians 3:26–29) is a religious expression of a similar principle: "Ye are all one in Christ Jesus." It was profoundly modified, however, by the Augustinian doctrine of election. Men were equal only in the sense that by sin all were totally, and therefore equally, unworthy; God in his mercy extended grace to some but not to others. Thomas Aquinas qualified the equality of all men in the sight of God by the doctrine that slavery is the consequence of sin. Though there are signs of a crude social egalitarianism in some of the protest movements of the later Middle Ages, such as the Lollards and the Husites, medieval social theory was, on the whole, antiegalitarian, deeming hierarchy to be natural both to society and to the whole universal order.

Modern egalitarianism had its beginnings in the seventeenth century. It is related in part to Calvinist doctrine, which, although it admittedly drew a sharp distinction between the saved and the damned, insisted at the same time on the equality of the elect, whether clerical or lay. This view of equality came to be associated with

a theory of church government—and indirectly of secular government—that derived legitimate authority (i.e., the right of superiors to command inferiors) from the voluntary agreement of natural equals to submit to such of their number as they chose. These doctrines were given their first completely secular expression—associated with theories of natural right and social contract—by some of the Parliamentarians in the English civil war, particularly the Levelers. Colonel Rainborough’s declaration in the General Council of the Army in 1647, that “the poorest he that is in England hath a life to live as the greatest he” and that no one can have a duty to obey a government that “he hath not had a voice to put himself under” is a classic expression of democratic political egalitarianism.

The idea of a natural equality of all men was a dominant theme from the seventeenth century on. Thomas Hobbes took it for granted that in the state of nature men are equal in right because roughly equal in strength and cunning. John Locke argued that by nature men are equally free, are subject only to natural law, and enjoy the same natural rights. This turns the problem of political authority and obligation into a search for reasons why free and equal men should accept the limitations of civil society. Political inequality, of ruler and ruled, must be justified as a conventional device for the better safeguarding of the rights and advantages that all men already possess but cannot securely enjoy, in a state of nature.

In eighteenth-century philosophy the idea of a natural equality of rights was reinforced by a theory of human nature, as put forth by Étienne Bonnot de Condillac and Claude-Adrien Helvétius, maintaining that all differences of character, talent, and intelligence are due to differences in environment and experience. By nature men are equal in the sense that at birth they have a limitless potentiality without natural characteristics to differentiate one from another. Consequently their diverse natures are, in fact, contingent; in principle all men are equally perfectible, given the appropriate social arrangements.

Jean-Jacques Rousseau explained social inequality by the pressures of a sophisticated way of life; in the state of nature men’s needs are simple, none need rely on anyone but himself, so none can exploit another or make him subject. For Rousseau the key problem for social philosophy, to which the sovereignty of the general will could provide a solution, was to reconcile the natural equality and autonomy of men with the social condition and political authority. Without this reconciliation men cannot realize their potentiality as morally self-governing persons. Immanuel Kant offered a philosophically sophisticated version of a very similar moral position: All

human beings must be treated as ends, not merely as means; all men are equally “legislating members of the kingdom of ends,” because all are equally capable of realizing the good will, the only thing in the world good in itself.

These doctrines permeated the great revolutionary movements in America and Europe at the end of the century and were made explicit in their declarations of rights. In America the doctrine of equality was a denial that any authority imposed on unwilling subjects could be legitimate merely on grounds of law or prescription; in France *l’égalité* repudiated privileges of prestige and opportunity based solely on noble birth. But alongside these broad popular movements were others, such as François-Noël Babeuf’s Conspiracy of the Equals, which challenged economic inequalities. Protests of this kind became increasingly important in the nineteenth century, in the evolution of socialist and communist thinking.

The target of modern egalitarianism, however, is by no means solely, or even primarily, economic inequality. Such inequality is objectionable to many socialists not so much as an unequal distribution of goods but as a source of unequal power, prestige, and regard. Other forms of differentiation have been as strongly attacked—in particular, differentiation by race and color and by sex. Again, egalitarians may make very general claims, such as that in the Universal Declaration of Human Rights (adopted by the United Nations General Assembly in 1948), that “all human beings are born free and equal in dignity and rights,” or they may claim, more specifically, “equality before the law” or “equality of opportunity.”

This history has two noteworthy features. First, there is a recurrent theme, the idea of a universal but imprecisely defined equality; behind all differences of talents, merits, and social advantages there is some characteristically human nature by virtue of which all men are equal. Second, the focus of egalitarianism has shifted continuously, now attacking the differential treatment of barbarian and Greek, now of freeman and slave, noble and commoner, black and white, rich and poor, male and female. Egalitarianism might be said not so much to assert equality as to deny the justice of some existing inequality of treatment based on some allegedly irrelevant differences of quality or circumstance.

### UNIVERSAL EQUALITY AS AN IDEAL

The notion of universal equality as an ideal is difficult to pin down. Many egalitarians have tried to argue that despite the many points of inequality, all men are alike in possessing reason, or a soul, or some other essentially

human characteristic or nature, by virtue of which they stand equal. The difficulty, however, is to find an important characteristic that all men possess in *precisely the same degree*, so that whatever differences their other inequalities might justify, this fundamental equality would make them equal *qua* men. And even if one could identify such a characteristic, what would follow from it? If all men are alike in having souls, in what respect should they therefore be treated alike? After all, God is widely believed to punish wicked souls and to reward virtuous ones.

The ideal of universal equality can often be reduced to the principle that all men ought to be equally considered. This does not mean that there is any respect in which they are all alike and by virtue of which they should all be treated alike; it is rather a principle of procedure: that all men ought to be treated equally, despite all their differences, until a case has been made for saying that some particular difference between them is relevant to the matter at hand. The onus of proof rests on whoever wants to make distinctions. And up to a point this might be said to be implicit in the notion of rational decision, because it would be irrational, within a given class of cases, to treat some differently from others if no relevant grounds could be found for distinguishing between them.

Nevertheless, the principle of equal consideration does presuppose an initial commitment or decision, for it takes for granted whose interests are to count. No one claims equal consideration for all mammals—human beings count, mice do not, though it would not be easy to say why not. The Greeks made a similar distinction between themselves and barbarians, Aristotle between natural slaves and naturally free men, the slaves counting only as tools for the free men. It is not easy to see how anyone who seriously held that white men mattered but black did not could be reasoned out of this position, any more than one could argue for the equality of men and mice. Of course, many people who practice discrimination profess to believe that black men are in some way inferior to white, in intelligence, sensibility, responsibility, or some such quality, and on this account ought to be treated differently. But this is to admit the principle of equal consideration for all men, that all men count, and that an argument has to be made to justify discriminating against some among them. The man who denies that they count at all is not bound to show reasons, any more than we feel the need to show reasons for treating inanimate objects, plants, or primitive organisms, such as amoebas, according to our pleasure. Although we hesitate to inflict unnecessary pain on sentient creatures, such as mice or

dogs, we are quite sure that we do not need to show good reasons for putting human interests before theirs. The boundaries of moral consideration are enlarged in practice by awakening sympathy and imagination; moral reasons presuppose an initial moral concern.

The principle of equal consideration may be more, therefore, than what is necessarily implied by the concept of rational action. The notion of acting with good reason does not in itself rule out any inequality of treatment, for it may always be possible to argue that there is some relevant difference between members of a given class. But the principle that all men should be treated as members of the class whose equality is procedurally presupposed is not necessarily implied by the notion of rational action.

However, to some philosophers universal equality has meant more than equal consideration for all men. John Plamenatz, for instance, has tied the notion closely to natural rights and has argued that there are some rights “so much more important than others that these others ought always, or nearly always, to be sacrificed to them, should the need arise” (“Equality of Opportunity,” in Bryson et al., eds., *Aspects of Human Equality*, pp. 79–107). The purpose of this equality of rights is to ensure equality of freedom and opportunity: “the equal right of all men to live the kind of life that seems good to them ... equality of opportunity to be oneself, to live as one pleases.” This is attractive, but it hardly touches the problem of what is to be done when what pleases one man interferes or competes with what pleases another. Nor does it cope with the diversity of inclinations—can one be said to have, on a given income, an equal opportunity to become a collector of Picassos or of seashells? Or does equality of opportunity require differential provisions, so that the chance of fulfillment matches the aspiration? Does it envisage open competition or a handicap? Plamenatz has attached very great weight to the principle that every individual’s view of where his own interests lie should be given equal consideration. He thus closely associates equality and freedom, denying both that one man’s interest might legitimately be subordinated to another’s and that anyone can be the proper judge of someone else’s interest.

For some philosophers (D. D. Raphael and Gregory Vlastos, for example) the ideal of universal equality requires that the inequalities of nature be mitigated or rectified. By this view, precisely because men born with superior talents or social advantages can claim no merit on that account, it should be the aim of social policy to compensate for such advantages by differentiating between men to redress the balance. It is of course true

that modern welfare states commonly do provide special amenities, such as wheelchairs for the crippled or hearing aids for the deaf, to bring naturally handicapped people up to some minimum standard of well-being. But an account in terms of meeting needs or deficiencies is more accurate than one in terms of rectifying inequalities, for the policy is not so much to remedy a handicap that one man suffers in comparison with another (wheelchairs are not meant to enable handicapped persons to compete in races with runners) as to provide conditions necessary to his well-being, understood in the light of some presupposed standard of what a good life requires. This standard will no doubt be governed by the advantages commonly enjoyed by most people in the community, so that in an affluent society a person will be taken to have more needs than in an impoverished one; however, the claim will still be grounded on his own needs and interests, not on the greater advantages enjoyed by those more fortunate.

### SPECIFIC EGALITARIAN IDEALS

The demand for equality is very often directed against some specific inequalities in social arrangements. It may take the form of a protest either against distinctions based on some specific ground (for example, racial equality, sexual equality) or against discriminations in a particular field (for example, equality before the law, economic equality). Each consideration necessarily involves the other; complaints of sexual inequality imply that sex is made a ground of distinction in some fields, unspecified but understood, where it is considered by the critic to be inappropriate (for example, salaries, jobs in the public service, voting rights). On the other hand, the claim to equality before the law implies that in legal relations or in relations between persons appearing before a court, some unspecified but understood difference (perhaps of sex, or of color, or of wealth) is made a ground of distinction and ought not to be.

The meaning of these ideals changes with their context. No one means by "equality before the law" that no distinctions should be legally recognized. A social system consists necessarily of different roles, such as father, son, tenant, landlord, and congressperson, each with its own appropriate qualifications and characteristic rights and duties, established and supported by law. A system is said to be unequal only if the differences in privileges are considered unjustifiable because they are irrelevantly grounded or because the qualifications for assuming a role are unduly restrictive (for instance, if a white skin is a necessary condition for voting rights). These ideals change their focus over time. "Equality before the law" in

eighteenth-century France meant ending the disabilities of the members of the third estate as compared with the privileges of the nobles and clergy. Today it may mean abolishing racial disabilities, such as existed in South African law and with Jim Crow sanctions in the United States, or seeing that prejudice does not interfere with the administration of law. It may also mean eliminating the advantages of wealthy litigants over poorer ones, by public legal aid schemes, or making certain that no one is prevented by poverty from getting a fair trial (see Justice Hugo Black's opinion in *Griffin v. Illinois*, 351 U.S. 12, 1956).

Equality very rarely means treating everyone alike; usually it means getting rid of one system of distinctions and replacing it with another. Thus, equality of opportunity in education hardly ever means giving everyone exactly the same education; rather, it means eliminating some hitherto determining factor such as ability to pay school or university fees and substituting a test of proficiency. More ambitiously, it might aim at a system with various arrangements, each meant for an appropriate grade of intelligence or type of aptitude. Those who call this equality do so on the ground that the treatment accorded to each is equally appropriate to his needs. Thus, R. H. Tawney argued that "the more anxiously a society endeavours to secure equality of consideration for all its members, the greater will be the differentiation of treatment which, when once the common human needs have been met, it accords to the special needs of different groups and individuals among them" (*Equality*, p. 39). The greater the equality of consideration, the greater the differentiation in treatment. If the latter is not called "inequality in treatment" it is because the word *inequality* has acquired, in this sort of context, a pejorative force; "inequalities" have come to mean *indefensible* differences in treatment.

## EQUALITY, MORAL AND SOCIAL [ADDENDUM]

Equality is a potent ideal that plays a major role in a wide-range of social, political, and moral debates. Unfortunately, equality defies easy characterization, and few ideals of such significance have been so poorly understood.

### EQUALITY OF WHAT?

Much debate concerns what kind of equality is desirable: income, resources, primary goods, power, welfare, opportunity, needs satisfaction, capabilities, functionings, rights, or liberties. Should the chief concern be legal, social, or political equality? These are extremely important questions, as equality of one kind fosters inequality of another. Although many assume that we should only be concerned with one kind of equality, it is arguable that various kinds of equality matter, perhaps to various degrees in different contexts.

### VARIOUS KINDS OF EGALITARIANISM

Philosophers have long distinguished between formal and substantive principles of equality. It is perhaps more useful to distinguish between equality as universality, as impartiality, or as comparability. A basic principle of rationality, equality as universality reflects the view that all reasons and principles must be universal in their application. Because it applies universally, even the view that all blondes should be rich and all brunettes paupers meets this egalitarian principle.

Equality as impartiality holds that all people must be treated with disinterested fairness. Of course, positions vary dramatically regarding what constitutes treating people impartially. For example, Kantians regard impartiality as treating people as ends in themselves and never merely as means, whereas for Utilitarians it requires neutrality concerning different people's interests when maximizing the good.

Although all plausible moral theories are committed to equality as universality and impartiality, equality as comparability reflects a deeper commitment to equality. Equality as comparability is concerned with how people fare relative to others. This is a distinctive substantive view that rivals nonegalitarian positions such as Utilitarianism and libertarianism.

Another important distinction is between instrumental egalitarianism, according to which equality is valuable only insofar as it promotes some other valuable ideal, and noninstrumental egalitarianism, which holds that equality is sometimes valuable in itself, beyond the extent to which it promotes other ideals. On noninstrumental egalitarianism, any complete account of the moral realm must allow for equality's value.

Many who favor significant redistribution from the wealthy to the poor are instrumental egalitarians; they favor such redistribution only as a way of reducing suffering, aiding the worst off, fostering solidarity, or

strengthening democratic institutions. Such reasons are morally significant and compatible with equality as universality and impartiality. But each is also compatible with the rejection of noninstrumental egalitarianism and equality as comparability.

Further distinctions: in person-affecting versions of egalitarianism, inequality only matters insofar as it adversely affects people; in impersonal versions, inequality can matter even when it does not adversely affect people. Similarly, deontic egalitarianism focuses on duties to address the legitimate complaints of victims of inequality by improving their situations, whereas telic egalitarianism focuses on removing objectionable inequalities as a means of improving the goodness of outcomes. Deontic egalitarianism focuses on assessing agents or actions in order to minimize the consequences of unavoidable inequalities for which no one was responsible, whereas telic-egalitarianism focuses on the goodness of outcomes in such a way that such inequalities may matter.

## UNDERSTANDING EQUALITY

The notion of equality is widely assumed to be:

holistic—concerned about (in)equality between groups or societies, blacks and whites, women and men, Ethiopians and Swiss, and so on. The aim is to address the factors accounting for objectionable inequalities between different groups or societies;

simple—we all know what equality is, that where everybody has the same amount of *x*, for whatever *x* we are interested in; and

essentially distributive—concerned with how certain acts or goods are distributed among various groups; *ceteris paribus*, an equal distribution is best.

The conventional assumptions are questionable. Arguably, the notion of equality is:

individualistic—groups and societies are not the proper objects of moral concern, individuals in groups and societies are. For example, though on average whites may be richer than blacks, if inequality of wealth matters, then it matters between rich and poor blacks, as well as rich blacks and poor whites;

complex—in judging outcomes regarding inequality, many considerations seem relevant, including how much deviation there is from a state of “pure” equality, how “gratuitous” the inequality seems, or the extent to which individuals have a “complaint” regarding equality. Moreover, the size of an individ-

ual’s egalitarian complaint may depend on how he or she fares relative to the average person, the best off person, or all those better off than he or she; and, in addition, one might add individual complaints, focus on the worst-off’s complaints, or add everyone’s complaints, but give special weight to larger complaints. On reflection, there are many distinct “aspects” of equality that underlie and influence egalitarian judgments; and

essentially comparative—equality is a relation that obtains between individuals, and the concern is for how individual’s fare relative to each other.

## LUCK EGALITARIANISM AND RESPONSIBILITY

Luck egalitarianism aims to rectify luck’s influence in people’s lives. Acknowledging the importance of autonomy and personal responsibility, luck egalitarianism holds that it is bad when one person is worse off than another through no fault or choice of his or her own. So luck egalitarians object when equally deserving people are unequally well off but not when one person is worse off than another due to his or her own responsible choices—perhaps to pursue a life of leisure or crime.

Some luck egalitarians distinguish between option luck—luck to which we responsibly open ourselves—and brute luck, luck that simply befalls us, unbidden. On this distinction, any option-luck inequalities such as those that result from people autonomously choosing to gamble or invest in the stock market are unobjectionable. By contrast, brute luck inequalities—such as those that result from some being born with less intelligence or to poorer parents or being struck down by lightning, cancer, or an accident—are objectionable.

Against luck egalitarianism, some claim that egalitarians should aid the worse off—for example lung-cancer victims or low-income earners—even if they were partly responsible for their predicament—say, because they smoked or dropped out of school. Against the option/brute luck distinction, some contend that drawing the line between them is difficult and that it is objectionable if Mary takes a prudent risk and John an imprudent one yet Mary fares much worse than John, because option luck frowns on Mary but smiles on John.

## EQUALITY AND FAIRNESS

If I give one piece of candy to Andrea and two to Rebecca, Andrea might immediately protest, “Unfair!” This natural reaction suggests an intimate connection between equal-

ity and fairness. On one view, concern about equality is a matter of comparative fairness that focuses on how people fare relative to others. Specifically, concern about equality reflects the view that inequality is bad when and because it is unfair, where the unfairness consists in one person being worse off than another no more deserving.

The intimate connection between equality and fairness illuminates the relevance and limitations of luck egalitarianism's "through-no-fault-or-choice-of-their-own" clause. On this view, among equally deserving people inequality is bad because it is unfair for some to be worse off than others through no fault or choice of their own. But among unequally deserving people inequality is not bad or unfair for someone less deserving to be worse off than someone more deserving even if the former is worse off through no fault or choice of his own. For example, egalitarians need not object if criminal John is worse off than law-abiding Mary, even if John craftily avoided capture and so is only worse off because, through no fault or choice of his own, a falling brick injured him.

Additionally, in some cases inequality is bad because unfair even though the worse off are responsible for their plight, as when people are worse off because they chose to do their duty or acted beyond the call of duty, in adverse circumstances not of their making. So, on reflection, luck itself is neither good nor bad from the egalitarian standpoint. Egalitarians object to luck that leaves equally deserving people unequally well off. But they can accept luck that makes equally deserving people equally well off or unequally deserving people unequally well off proportional to their deserts. Thus, luck will be approved or opposed only to the extent that it promotes or undermines comparative fairness.

## ARGUMENTS AGAINST EQUALITY AND RESPONSES

Many arguments have been offered against equality. Some contend that a world in which everyone would be the same would be undesirable. On some accounts, equality conflicts with freedom because even if one had a perfectly equal outcome, one could only preserve such an outcome by preventing people from voluntarily engaging in beneficial exchanges. Some argue that equality requires that we level down the better off if we cannot benefit the worse off. For example, we might have to blind the sighted, handicap the athletically gifted or disfigure the beautiful even if no one benefited from such actions. Thus, many believe that we should accept prioritarianism, and give priority to peo-

ple the worse off they are in absolute terms, rather than egalitarianism, which focuses on people's relative positions.

Some egalitarians soundly reject the radical egalitarian position that people should be equal in all respects. Only some inequalities are normatively significant, they argue, and they are compatible with vast inequalities in other respects. Regarding freedom, egalitarians may argue that genuine freedom involves the autonomous formulation and effective implementation of a meaningful life plan commensurate with one's capacities, a prospect that is incompatible with the levels of inequality prevalent throughout much of the world. Moreover, freedom is not all that matters; fairness does, too, so some tradeoffs may be necessary between freedom and equality when they conflict.

The leveling-down objection fails against person-affecting and deontic egalitarianism. Moreover, although it applies to telic versions of equality as comparability, it also applies to other impersonal moral principles to which many are committed, like proportional justice. Egalitarians can admit that worsening conditions for the better off might be bad but that this does not show that inequality doesn't matter, merely that it isn't all that matters. Equality is not the only ideal that would have terrible implications if exclusively pursued; the same is true of justice, utility, freedom, and perfection. The main lesson of the leveling-down objection is that we must be pluralists, a point readily granted by egalitarians.

## REMAINING QUESTIONS

Many questions have not been addressed. For example, does inequality matter more at high or low levels? Is it affected by variation in population size? Does it matter between societies as much as within societies? Or between different species? Should egalitarians compare whole lives, simultaneous segments of lives (say, today's elderly with today's youth), or corresponding segments of lives (today's elderly with tomorrow's elderly)? Should egalitarians be neutral regarding space and time, or does inequality's significance depend on whether societies are connected? These questions are all important, and their answers may significantly bear on our understanding of morality and equality. It is no accident that appeals to equality are ubiquitous. Equality remains a powerful human ideal.

## ERASMUS, DESIDERIUS

(1466?–1536)

Desiderius Erasmus, the great Renaissance humanist and scholar, was born at either Rotterdam or Gouda in Holland, the illegitimate son of a priest. As a child he studied at Gouda, and from 1475 to 1483 he studied at Deventer with the Brethren of the Common Life, a pious, modernist-humanist order. Next, he studied at Hertogenbosch, became an Augustinian friar at St. Gregory's (near Gouda), and, in 1492, was ordained a priest. Disliking monastic life, in 1494 he became the Latin secretary to the bishop of Cambrai. The next year he went to the University of Paris to study theology, but he found both the life and the scholastic philosophy distasteful. In 1499 he went to England, where he became a close friend of the humanists John Colet and Thomas More and devoted himself to the study of the classics and sacred literature, desiring to combine the new humanistic spirit, based on the revival of interest in the classics, with Christian learning. In 1500 he returned to the Continent and devoted himself to the study of Greek. One of his first famous works was published in this period, the *Enchiridion Militis Christiani* (Handbook of a Christian soldier; 1501), an appeal for a return to the simple spirit of early Christianity.

In Belgium, in 1504, Erasmus came across a manuscript of Lorenzo Valla's *Annotationes* on the New Testament, in which Valla criticized the Vulgate (Latin) version of the Bible and set forth a critical method for arriving at a correct text of scripture. Erasmus was tremendously

impressed and published an edition of Valla's work in 1505, after which he returned to England and copied the Greek New Testament from the manuscripts available to him there. He then went to Italy as a tutor to the sons of Henry VIII's doctor and took his doctorate of divinity at Turin in 1506. He lived in various Italian cities for the next three years and began publishing the famous edition of his *Adagia*, a collection of 3,000 proverbs from classical writers, at Venice in 1508. As a result of this work, he was soon recognized as the foremost scholar of northern Europe. In 1509 he returned to England and stayed with Thomas More. There, he wrote the *Moriae Encomium* (In praise of folly), a witty satire on worldly learning and activities and a presentation of simple, pious, nontheological Christianity. While in England he lectured at Cambridge on Greek and on St. Jerome's [c. 347–419] epistles. In 1514 he went to Basel, Switzerland, to assist the publisher Johann Froben (c.1460–1527) in preparing an edition of his works. While there he received a summons to return to monastic life, which he resisted strongly, and finally Pope Leo X (1475–1521) granted him a dispensation allowing him to live in the world.

In 1516 he published one of his most influential works, the Greek edition of the New Testament. Comparing various manuscripts and citations from the church fathers, he presented a more accurate text than the Vulgate, along with his own elegant Latin version and many learned and critical notes. This edition became a model and inspiration for the new learning and for critical scholarship. Theologically, its omission of an interpolated passage in I John 5:7–8, stating the doctrine of the Trinity, greatly influenced liberal reformers like Michael Servetus, and its emphasis on St. Paul and the Greek fathers strongly affected those early reformers and those who antedated the Reformation who were anxious to turn from the opulence of the Church of Rome and from the intricacies of late Scholasticism to the spirit of primitive and early Christianity.

From 1517 to 1521 Erasmus stayed chiefly in Louvain, where he was involved with the new college for the study of the sacred languages: Greek, Hebrew, and Latin. He corresponded with humanistic scholars all over the world and became, perhaps, the leading figure of the northern Renaissance. His influence was great in all Europe, especially in southern France and Spain (where he was offered a chair at the new University of Alcalá). Liberal and reformist theologians and classical scholars looked to him for inspiration. In 1521 he went back to Basel, where, with Froben, he published a long series of works on the church fathers (editions on St. Jerome, St.

Cyprian [third century], Pseudo-Arnobius [fifth century], St. Hilary [c. 315–c. 367], St. Irenaeus [c. 120 to 140–c. 200 to 203], Ambrose [339–397], St. Augustine, St. Chrysostom [c. 347–407], St. Basil [c. 329–379], and St. Origen [185?–?254]), all of which helped center attention on the theology of the early fathers rather than on that of the medieval Scholastics. His *Colloquies*, first published after 1518 and in many revised and expanded editions thereafter, is an excellent example of the revived and revitalized Latin style of the Renaissance; the several editions include biting and satirical attacks on various human institutions and beliefs, especially those connected with the church and with popular superstition.

Erasmus's merciless and witty critiques of church practices, monastic activities, Scholasticism, popular religion, and so on, as well as his scholarly efforts toward establishing the Greek text and the meaning of the New Testament and the doctrines of the early church fathers, had made him outstanding in the movement for church reform. As the reform movement became more revolutionary, however, Erasmus tried to stay aloof from the struggles. Both orthodox and reformist theologians pressed him to take a stand, while he sought means for mediation and reconciliation. When Martin Luther became more aggressive and violent in his words and actions, and when various early reformers criticized Erasmus for his refusal to join them, he, always hypersensitive to criticism, withdrew more and more.

Finally, in 1524 Erasmus spoke out against Luther in his work *De Libero Arbitrio* (On Free Will), in which he tried to show that Luther had dogmatically decided that man had no free will, even though (1) the issue was so complex that no human could really find a satisfactory solution to the problem and (2) the biblical texts were so obscure that no one could really tell what they asserted. Erasmus maintained that he preferred to recognize the inability of man to discover adequate answers to such theological problems and to rest content with the decisions of the church on such matters. Luther's furious reply, *De Servo Arbitrio* (The bondage of will; 1525), cried out against Erasmus's gentle humanistic skepticism and his willingness to accept church teachings uncritically. Christianity, Luther insisted, requires certainties, not opinions or probabilities. Salvation cannot be based on doubts. He concluded that if Erasmus wished to remain a skeptic, he should remember that *Spiritus sanctus non est scepticus* (the Holy Spirit is not a skeptic) and that judgment day is coming.

Erasmus wrote another answer, the *Hyperaspistes* (1526), and to a great extent broke with his former

reform-minded friends. When the reformers took control at Basel in 1529, Erasmus left for Freiburg im Breisgau, Germany, where he stayed almost until his death (which occurred in Basel seven years later as he was preparing to return to Holland). During his last years he continued to use his vast scholarship, his pen, and his influence to bring about religious and political peace. Attacked by both the radical reformers and the conservative churchmen, he tried to find a moderate solution before both sides became so rigid that a compromise maintaining the unity of Christendom was impossible. He advocated making sufficient internal reforms within the church to satisfy the less extreme reformers. Various popes and some Reformation leaders took him seriously (Pope Paul III [1468–1549] is supposed to have wanted to make him a cardinal), while the Sorbonne theologians condemned some of his works and views. The Spanish Inquisition stamped out the influence of his followers in Iberia, and the leading reformers attacked him both as a petty, self-serving person and as a heretical religious thinker.

## THOUGHT

Erasmus's ambiguous position in the religious struggles was probably the result of his peculiar nondogmatic point of view and his cautious attitude toward developments in human affairs. He claimed to advocate the "philosophy of Christ," in contrast with the various kinds of Scholastic theories put forth by the Thomists, the Scotists, the Ockhamites, and others. Their technical discussions about the nature of baptism, grace, and the freedom of the will left him entirely unmoved. Rather than take their arguments and analyses seriously and present refutations, Erasmus attempted to undermine the whole Scholastic approach with the force of his ridicule.

In place of the philosophical and theological systems of the time Erasmus set forth his "philosophy of Christ," to be arrived at by pious study rather than by disputations. This "philosophy" was supposed to represent the simple and essential message of Christianity in its spirit rather than its letter; it was a message to be lived, not to be formulated in abstract systems. It was a nondoctrinal religion, a religion without a theology, that could be approached through the early church fathers and the morality of the New Testament but not through the morass of distinctions, terminology, and theory built up in the Middle Ages. This outlook had a great impact on the most liberal reformers and the nondoctrinal mystics.

Erasmus, who was so fully aware of the foibles of man, was also extremely cautious about the genuine possibilities for reform or constructive improvement in man

and his institutions. This may account for his refusal to leave the Church of Rome (although he died without receiving the sacraments). Some have interpreted this refusal as due to personal fears, but it seems more probable that Erasmus remained within the church because he believed that it was better to preserve and improve what already existed than to risk the even greater abuses that might follow the destruction of the current order. Erasmus saw the Church of Rome as fossilized, in much the same manner that he portrayed the Jewish synagogue. On the contrary, he saw the reformers as revolutionists who, intentionally or not, were destroying the very fabric of human existence. He told Luther, "I always freely submit my judgment to the decisions of the Church whether I grasp or not the reasons which she prescribes."

He also declared, in the midst of the early Reformation struggles, "I will put up with this Church until I shall see a better." He apparently felt that, given the human condition, it was important to retain the (far from ideal) way that Christ's message had been institutionalized; at the same time he urged a revival of concern for the substance of this message and a revitalization of the church through the correction of as many abuses as possible and the encouragement of scholarly and moral efforts to recapture the original Christian spirit. Otherwise, he feared, the frail human world might be torn entirely asunder. But, for better or worse, the course of events carried the division of Christendom to a complete rupture; each side became more and more rigid and dogmatic rather than compromising on a vague or undefined Erasmian position.

## INFLUENCE

Although Erasmus can hardly be classified as a professional philosopher, he influenced the course of philosophy in many ways. His humanistic scholarship greatly affected the European educational system and, both personally and through his many writings, Erasmus greatly encouraged the teaching and study of Greek, Latin, and Hebrew—the languages that were most important to intellectual achievement. The upheavals in the curricula that occurred in most of the major institutions of higher learning at that time were in large measure due to Erasmus's influence and spirit, and the study of the hitherto unknown or neglected classics of both the Greco-Roman and the Judeo-Christian worlds (many in the editions prepared by Erasmus himself) that resulted from this was the source of many new ideas and theories that became part of the intellectual revolutions of the Renaissance.

Erasmus's ridicule of Scholasticism, although hardly a philosophical refutation of either its methods or its doctrines, created the generally accepted view that the medieval approach to philosophical questions was trivial and useless. He made it difficult for many intellectuals to take seriously the views of St. Thomas Aquinas, John Duns Scotus, William of Ockham, and such later Scholastics as Francisco Suárez.

Besides teaching future generations to scoff at the achievements of the school philosophers, Erasmus also had a major role in creating the critical spirit that culminated in the Enlightenment. Through his satire, his critical scholarship, and his undogmatic spirit Erasmus popularized a critical and questioning attitude toward accepted mores, institutions, opinions, and texts that was to flourish in many forms in the next centuries, undermining confidence in almost every area of traditional achievement.

Thus, Erasmus, who was essentially conservative by nature and who shunned almost all theoretical or philosophical discussion, not even wishing systematically to oppose dogmatism with skepticism, as Michel Eyquem de Montaigne later did, was one of the most influential figures of the sixteenth century in changing the entire intellectual climate of opinion and in establishing the direction in which modern thought developed.

## ERIGENA, JOHN SCOTUS

(c. 810–c. 877)

John the Scot (Irishman) or Erigena (of Irish birth) was active as a scholar in the court of Charles the Bald around 850 to 870. He intervened in the debate on predestination with a controversial treatise. At the request of the emperor, he made a Latin translation of the works of Dionysius the Pseudo-Areopagite (followed later by

translations of St. Maximus the Confessor [c. 580–662] and Gregory of Nyssa). The direct contact with the Greek theological tradition opened his mind for a more speculative neoplatonic interpretation of the Christian doctrine of creation than what he knew from his Latin authorities. Confronting both hermeneutic traditions with the requirements of “right reason,” Erigena composed his own theophilosophical synthesis, *Periphyseon*.

*Periphyseon* is an attempt to understand the “division of Nature” and its “unification,” thus offering a comprehensive interpretation of the Christian doctrine of creation, sin, and salvation as revealed in Genesis 1–3. Nature stands for the whole universe, encompassing both God and creation in all its divisions. It is the task of the philosopher to examine both the division of this Nature, that is, its articulation into a manifold of species from the most general to the most particular, and its unification from the utmost manifold to absolute simplicity. In the neoplatonic tradition *diairesis* (which divides a genus into specific forms) and *synopsis* (which brings a dispersed plurality under a single form) are not just two logical procedures of dialectic. They correspond to the movements of reality: the procession of multiplicity from the One and its return into the One; in Christian terms, creation and redemption.

At the start, Erigena introduces his famous fourfold division of nature, which will provide the main structure for the entire discussion. By applying the dialectical method of dividing a genus into species by differences, he presents a division that can be applied to the whole Universe, or Nature. The most fundamental difference is that between creating and being created. Applying four possible combinations of these differences one may discover the four fundamental species of Nature:

- (1) That which creates and is not created
- (2) That which creates and is created
- (3) That which is created and does not create
- (4) That which neither is created nor creates

The first species of nature is God, the uncaused cause of everything. The third species, which is diametrically opposite to the first, stands for the sensible world, comprehending the many species of animals and plants that come to be in times and places. The second species has attributes of both extremes: it is both created and creative. This is the level of the primordial ideas wherein God has from all eternity created all species (before they are manifested in time and place and individualized in matter). Finally, there is the fourth nature, which must be

understood again as God. It is, however, God not as the creative cause from which all things proceed, but as the ultimate Good toward which of all things return.

In this division the divine nature is that which stands first and last. Still, God is not simply a species among many, because he “transcends everything that is or can be” and thus seems to fall outside all system. But one could as well say that God is the whole system in its unfolding and that all four divisions of nature are moments within the circular process whereby the divine nature proceeds from and returns to itself. In fact, the most fundamental distinction, that between creative nature and created nature, must itself be overcome. This is most true on the level of the primordial ideas, wherein the creator expresses in his Word his being as the being of the creatures: therefore, that nature is said to be both creative and created. As Erigena provokingly says, “God is the essence of all things” (*essentia omnium*). “It follows that we ought not to understand God and the creature as two things distinct from one another, but as one and the same” (Vol. III, 678C). In fact, this sensible world has no subsistence on its own but exists only through participation in the divine being and the primordial causes.

If the being of the creature is nothing but a participation in the being of its creator, one may also understand the creation of the world as God’s creation of himself. “God is everything that truly exists because he himself makes all things and is made in all things.” By creating the manifold species God reveals and makes himself known proceeding from his ineffable nature, where he is unknown even to himself. In this sense creation is revelation and the whole world must be understood as a theophany, that is, an “appearing of God.” For everything that exists is nothing else but “the apparition of what is not apparent, ... the comprehension of the incomprehensible, the materialization of the spiritual, the visibility of the invisible” (Vol. III, 633A). When it is said in the Christian creed that God creates “from nothing,” it can only mean that God creates all things “out of the nothingness,” which he is himself as transcending all beings. Only in his creatures “he begins to be.”

In this cosmic process of emanation and return, human nature occupies a central place. Human nature, which comprehends body, vital powers, perception, imagination, reason, and intellect, is the “workshop of all things” (*officina omnium*), the intermediary connecting the whole universe, preventing its falling into separate sensible and intelligible realms. Apart from being created, human nature resembles the divine nature in all respects. Thus, as the divine mind, the human soul finds in itself

eternal *a priori* knowledge of all created things. In the divine wisdom, however, things exist as primordial causes or substantial forms, in human knowledge as the effects of those ideal forms.

Through the Fall, however, this connatural knowledge has been lost and the soul has fallen into ignorance of itself and of the content of its ideas. Human nature turned away from the creator, dishonoring its natural dignity and making itself similar to the beasts. This irrational nature does not belong to the image of God. In his original plan God had wanted to create humans similar to angels, not divided into male and female, without needing for their multiplication a sexuality similar to that of irrational beasts. But because God had foreseen from all eternity that humans would abuse their freedom and sin, from the first moment of their temporal existence, and thus fall from the status of equality with the angels to the level of the beasts, he introduced in the creation of the human being the consequences of sin before it occurred. Thus, the sexualized fleshy body (with all what it involves as pain, passion, sickness, and corruption) was created with the original rational nature, an addition required as a remedy and a penance for sin. It will be overcome when, at the resurrection, all shall rise in a perfect, sexless, spiritual body.

A philosopher must not only explain how creatures proceed from God but also how they return “by the same stages through which the division had previously ramified into multiplicity, until it arrives at that One which remains inseparably in itself and from which that division started” (Vol. II, 526A). Erigena makes a clear distinction between the general return to God, which is the common and natural destination of the whole creation (all corporeal things will return, that is, be resolved into their incorporeal causes), and the special return, which is only reserved to rational beings, the angels and the humans. At the end all human beings, blessed and damned alike, will return to the perfection of one and the same human nature. Still, they will be individually distinguished, not by differences in nature, body, or place, but by the different access each shall be granted to God’s self-revelation. Those who led a righteous life will be beatified and allowed to see God in differing gradations of his theophanies. The damned, on the contrary, will be refused access to that vision and will be eternally tormented with the “vain dreams” of those things that incited their desires while still living.

Erigena stands apart from any of his contemporaries in his original speculations on creation and redemption, showing a great confidence in the harmony of reason and

revelation. Still, he only exercised a limited direct influence in the Middle Ages, where he was mostly appreciated as a translator of Dionysius. *Periphyseon* was condemned as heretical in 1225 and copies of it were burned. From a philosophical point his greatest accomplishment is his understanding of creation as the self-creation of God. This doctrine attracted the admiration of idealist philosophers such as Friedrich Wilhelm Joseph von Schelling and Georg Wilhelm Friedrich Hegel, which led to his rediscovery in the twentieth century.

## ERROR

When we engage in discursive thought and declarative speech, we may attain various forms of success: intelligibility, precision, correctness, and so on. These felicities are best explained by contrast with the corresponding mishaps that threaten our beliefs, assertions, and especially our claims to know something. A person’s thinking may be inadequate because he is ignorant, and what he

says may be deficient because it is incoherent, rough, or, perhaps most important of all, downright false.

Many philosophers have been troubled in attempting to account for the occurrence of falsity in people's assertions and opinions, that is, in trying to understand how there could be such a thing as error at all. In examining these difficulties, we shall assume a man's statement is erroneous in case it is false and it reflects his belief. Thus, if a man lies, he may speak falsely, but not erroneously. We shall also assume that a person holds a false belief when he is inclined to express it in a statement that would be false. The statement would be erroneous; consequently we can say the belief it mirrors is erroneous as well.

Our inquiry will focus on a pair of famous knots:

(1) Do we believe anything when our belief is false? If a surgeon is convinced his patient will die, and he is correct, there is something he expects: the patient's demise. But if he is mistaken, there is no such event as the patient's death. Did the surgeon then expect nothing? Depicted thus, erroneous thinking seems impossible. Plato inherited this perplexity from Parmenides and finally resolved it.

(2) Granting that error can occur, is it ever voluntary? Clearly we are to blame for some of our mistakes, yet who knowingly and willingly goes in for false beliefs? This puzzle comes from René Descartes.

## THE POSSIBILITY OF ERROR

Parmenides' maxim was that only being—what is—can exist. From this he argued that we cannot “know that which is-not ... nor utter it; for the same thing can be thought as can be.” In other words, “You will not find thought without what is, in relation to which it is uttered” (G. S. Kirk and J. E. Raven, *The Presocratic Philosophers*, Cambridge, U.K., 1957, pp. 269–278). According to Plato, the Sophists drew an incredible doctrine from these enigmas: They argued that error is asserting and believing “what is not,” specifically, talking and “thinking contrary to the things that are” (*Sophist* 240C, D, F. M. Cornford translation). To state and think what is not is, however, to state and think nothing, which is not stating or thinking.

What could have led the Sophists to this paradoxical view? Naturally, it reinforced other logically quite independent doctrines of theirs regarding truth and falsity, for example, their claim that whatever seems true to any man is true for him and therefore *is* true (*Theaetetus* 161C–179C). The only direct support for their denial of error, however, derives from analogies. In *Euthydemus* (283E–288A) the stating of what is not is compared with

impossibilities such as doing but doing nothing or gesturing although there is no gesture one performs. The parallel with sense perception in *Theaetetus* (188D–189B) is renowned. If you see, hear, or touch, then there is something you perceive. To see what is not, is not seeing.

PLATO'S THEORY OF ERROR. In reply, Plato suggests alternative models that will incline us to regard falsehoods as full-fledged (though incorrect) assertions. His most promising comparison is with spelling, where misspelling is the natural counterpart to stating falsely. This analogy is central to Plato's unsuccessful third definition of knowledge in *Theaetetus* (201D–208B), and it reappears in his successful treatment of falsity in *Sophist* (242D–253, 261D–264B). We should imagine a student who tries to spell syllables and words as his teacher says them or inscribes them. When he answers, aloud or in writing, with the right letters in the right order, he uses letters to represent a thing “that is,” the teacher's utterance or inscription. According to conventions of spelling, the correct sequence of letters corresponds to what the teacher said or wrote. When the student misspells, he fails to represent the teacher's utterance or inscription, and nothing corresponds to the misspelling. Does the pupil therefore spell nothing? We describe his failure more accurately by saying: “When he misspells, what he spells is not; that is, not anything said or written by the instructor.” How shall we describe cases where he gets some letters right and thus represents phonetic or graphological elements of what the instructor said or wrote? Clearly he does not *spell* those elements. For suppose he answers, “w-i-n” after the instructor says “wine.” It makes no sense to claim: “He misspelled the word, but he correctly spelled some sounds the teacher made.” Further, if the student happens to give the correct spelling of another word (as in this case), we must realize that the other word “is not,” because the teacher did not say it. All this is secondary, however; the significant point is that when he misspells, the pupil is nevertheless engaged in the activity of spelling. This suggests that incorrect statements are statements after all.

Let us develop this parallel. If we restrict ourselves to the simplest paradigms—Plato used the true statement “Theaetetus is sitting” and the false statement “Theaetetus is flying”—we notice how words in declarative speech function like letters in spelling. Individual letters may represent sounds but do not spell them. Similarly, the name “Theaetetus” stands for a thing that is, but saying the name “Theaetetus” is not stating anything. Spelling words requires you to conjoin letters of different types, consonants and vowels, in appropriate patterns. Speech,

too, is fitting words together. “If you say ‘lion stag horse’ or any other names,” Plato remarks, “such a string never makes up a statement”; but joining a noun with a verb “gets you somewhere” and of such a compound “we say it ‘states,’ not merely ‘names’ something” (*Sophist* 262B–E).

Now if you proclaim, “Theaetetus is flying,” when he is not airborne, you refer by name to something that is, in the course of *stating* what is not. There is no aerial activity of Theaetetus to correspond to what you state. If you declare, “Theaetetus is sitting,” and his posture is appropriate, then something corresponds to what you state. In Plato’s words, the true statement “states about [Theaetetus] the things that are”; whereas “the false statement states about [him] things *different* from the things that are,” and therefore states “things *that are not* as being” (*Sophist* 263B).

This correspondence theory of true and false statements may be extended to thought by our assumption that a man thinks falsely in case he is inclined to express his thought in a statement that is false. So formulated, the Platonic theory illustrates how error, even though it is believing what is not, hardly consists in believing nothing. Therefore, Sophists cannot maintain that thinking erroneously is not thinking.

Plato’s account is, however, needlessly anchored to the type of counterexample he used against the Sophists. The falsehood “Theaetetus is flying” happens to be “about” an existing thing, but Plato makes this feature a prerequisite for every statement, true or false. He writes: “Whenever there is a statement, it must be about something” that exists (*Sophist* 262E; cf. 263C). Even if this ruling allows statements about things that do not exist now but did or will exist, it excludes too much. For instance, it would be impossible for me to state falsely, “There are flying saucers.” By Plato’s rule, saying this is not stating unless there are flying saucers for me to talk about. So if I *state* that there are flying saucers, I speak truly.

Here we should invoke Plato’s orthographic model. The student does not cease to spell when upon occasion he misses every letter and thus fails to represent any sounds his teacher made. By analogy, why disqualify my utterance simply because I fail to refer to existing things? A correspondence theory still explains why it is false to state, “There are flying saucers”: nothing corresponds to what is stated; that is, nothing corresponds to the existence of flying saucers, because none exist.

But the correspondence theory needs elaboration before it will transform Plato’s view into a general account of correct and incorrect assertion. What “things

that are” would I depict if I conceded “Flying saucers do *not* exist”? Does the nonexistence of flying saucers correspond to what I state? How can there be such a thing? Again, what “things that are” differentiate a true subjunctive conditional, for example, “If I had watered the lawn, it would not have died,” from its false contrary, “Even if I had watered the lawn, it would have died”? Does the same withered grass make one statement true and the other false?

Because of these obscurities it appears that Plato has demonstrated how incorrect belief and assertion can occur, but he has not produced an exhaustive analysis of them. Plato’s demonstration shows awareness of the distinctive features of assertion, sensitivity to the differences between referring and asserting, and perspicacity about the ontological status of what a person believes; indeed, treatments of error by such twentieth-century philosophers as G. E. Moore and Bertrand Russell are not more satisfactory in these respects.

MOORE AND RUSSELL. Moore’s *Some Main Problems of Philosophy*, adapted from lectures he delivered in 1910–1911, appears to contain two incompatible theories: (1) The dyadic theory, according to which believing pairs believers and propositions. “Error,” writes Moore, “always consists in believing some proposition which is false” (p. 66). (2) For complicated reasons Moore later contends that “there simply are no such things as propositions” for people to believe (p. 265), and he renounces his “attempt to analyse beliefs” (p. 266). Nevertheless, he characterizes truth and falsity of beliefs as follows: “To say that a belief is true is to say that the fact to which it refers is or has being; while to say that a belief is false is to say that the fact to which it refers is not” (p. 267). In technical terminology: “To say that [a] belief is ... false is to say that there is *not* in the Universe any fact to which it corresponds” (p. 277).

In his 1953 preface, Moore comments that his two theories may after all be consistent; perhaps he used the term *proposition* in different senses when he first maintained and later denied their existence as targets for believing (p. xii). Apart from this problem, fundamental questions arise concerning Moore’s treatment: Are there any facts for mistaken beliefs to be about? Are they non-existent facts “in the Universe,” or perhaps existent ones outside it? Besides, the very notions of “proposition” and “fact” are notoriously obscure.

Moore hints at a different analysis when he considers a person’s belief that we are now listening to a brass band. What the person erroneously believes is a “combination

of us at this particular moment with the hearing of that particular kind of noise”—a combination which “simply has no being” (p. 255).

Russell’s multiple relation theory, in his *Problems of Philosophy*, develops such an analysis. Concerning Othello’s mistaken belief that Desdemona loves Cassio, Russell says: “The relation called ‘believing’ is knitting together into one complex whole the four terms Othello, Desdemona, loving and Cassio” (p. 126). This belief is mistaken because there does not exist another “complex unity, ‘Desdemona’s love for Cassio,’ which is composed exclusively of the *objects* of the belief, ... with the relation [loving] which was one of the objects occurring now as the cement that binds together the other objects of the belief” (p. 128).

The snags in this analysis are well known. How does loving cement things? In case Desdemona is indifferent to Cassio, how does believing sew them together with loving and Othello? Can believing stitch together any collection of objects? Russell noted the last two problems in his 1918 lectures, “The Philosophy of Logical Atomism” (in *Logic and Knowledge*). He recognizes that the structure of Othello’s belief requires that “loves” should “occur as a verb”; but he is afraid that admitting the syntactical unity of “Desdemona loves Cassio” is tantamount to “assuming the existence of the non-existent ... [namely,] a non-existent love between Desdemona and Cassio” (p. 225). But as Plato saw, there can be units of speech—statements—and thought without correspondents in reality.

## ERROR AND VOLITION

Plato did not need to convince us that false belief is possible. But Descartes’s thesis, that error is always voluntary, seems a contrived solution to an entirely gratuitous theological muddle. This appearance is deceptive.

Descartes begins his *Meditations* with a survey of dreaming, sensory illusion, and the errors they occasion; next he shows we can prove a few things for certain, including God’s existence. Then he reasons: The deity “cannot have given me a faculty [of thinking] whose right employment could ever lead me astray”; however, “it seems to follow that therefore I can *never* go wrong” (*Meditation IV*, in *Descartes’ Philosophical Writings*, translated by P. T. Geach and G. E. M. Anscombe, p. 93). Descartes’s answer to this puzzle is that men have false beliefs, but through their own doing, not God’s. Men are endowed by God with such power of will that they can assent to propositions they do not know to be true—that is, to “ideas” that are not “clear and distinct.” Is God to blame for this disharmony between our limited capacity

for knowledge and our unlimited power of assenting? No, “will is just a single thing; it is incompatible with its nature that anything should be subtracted from it” (*Meditation IV*, p. 99). Besides, although we are free to, we do not have to believe propositions for which we lack conclusive proof. In order to avoid “unsuspected error,” we must restrain our desire for truth and withhold assent until we know for certain. (Descartes’s *Principles of Philosophy* XXIX, XXXII, XXXV, XXXIX, XLII explain these points in detail.)

Now if we put aside Descartes’s theological preoccupations, and his advice that we should only believe what is obvious, at least two genuine questions arise:

(1) Do we exercise any control over our convictions and opinions, as Descartes’s concept of “assenting” requires? Clearly, people may decide to make statements. Some criminals voluntarily confess their misdeeds, and others are forced, against their will, to admit guilt. How about belief? Can we choose to reject a proposition that seems most likely, according to available evidence, and believe another that seems less plausible? Perhaps not. But we often make decisions as we form our opinions, as we collect or neglect data and seek or ignore expert testimony. Men who undergo brainwashing are deprived of this control over the formation of their beliefs. The same holds, incidentally, for knowledge. It is absurd to say the investigator decided *to know* but not absurd to say he resolved *to find out* for certain who robbed the grocer. Moreover, children are compelled *to learn* things. In acquiring knowledge and forming opinions, we pursue rather obvious goals: conclusive proof and correct information.

(2) Even so, is it intelligible to suppose that people act deliberately and knowingly when they settle upon *false* beliefs? One everyday case should dispel the appearance of contradiction: I study the racing form, mull over the evidence, and conclude that Wayfarer is bound to take the handicap. I willingly commit myself to this belief by wagering my paycheck. I realize, however, that even well-grounded expectations like mine can prove erroneous. Consequently, if my horse loses, it is true to say, “I formed my erroneous belief willingly, after deliberation, with the intention of predicting the handicap winner; furthermore, I was aware that I could be mistaken.” It was not my goal to be wrong, but it was within the scope of my intention. Anyone who aims at truth is prepared for falsity, just as a marksman is prepared to miss the bull’s-eye. Can we say I erred “knowingly”? A man who punches another is hardly ever certain that his victim will be injured, but

from a legal standpoint he knowingly inflicts harm if he has reason to think injury might result from his blow.

There remains another type of error, fortunately quite infrequent, where such awareness is impossible. This is the unusual situation where you are convinced you know something, banish doubt from your mind, and still turn out to be wrong. Perhaps you acted deliberately and followed your inclinations in pushing your investigation until you believed you could not be wrong. But with this degree of conviction, you cannot have the least awareness that you are mistaken. Your error, then, is not fully voluntary.

## Bibliography

### PLATO

Plato's *Theaetetus* and *Sophist*, along with excellent commentary, are translated by F. M. Cornford in *Plato's Theory of Knowledge* (London: K. Paul, Trench, Trubner, 1935). For further analysis of Plato's theory, see Gilbert Ryle, "Letters and Syllables in Plato," *Philosophical Review* 69 (4) (1960): 431–451; D. Gallop, "Plato and the Alphabet," in *Philosophical Review* 72 (3) (1963): 364–376, and Raphael Demos, "Plato's Philosophy of Language," with comments by J. L. Ackrill, in *Journal of Philosophy* 61 (20) (1964): 595–613.

### MOORE AND RUSSELL

The views of Moore and Russell can be found in G. E. Moore, *Some Main Problems of Philosophy* (London: Allen and Unwin, 1953), especially Chs. 3 and 13–16, and Bertrand Russell, *Problems of Philosophy* (London: Williams and Norgate, 1912; reset 1946), Ch. 12, and "The Philosophy of Logical Atomism," in *Logic and Knowledge*, edited by R. C. Marsh (London: Allen and Unwin, 1956). For a view opposed to those of Moore and Russell, see Alexius Meinong, *Untersuchungen zur Gegenstandstheorie und Psychologie* (Leipzig, 1904), translated by Isaac Levi, D. B. Terrell, and Roderick Chisholm as "The Theory of Objects," in *Realism and the Background of Phenomenology*, edited by R. M. Chisholm (Glencoe, IL: Free Press, 1960).

There is a brilliant discussion of the connection between negative judgments and falsity in Gottlob Frege's essay "Negation," in *The Philosophical Writings of Gottlob Frege*, edited and translated by Max Black and P. T. Geach (Oxford: Blackwell, 1952).

### DESCARTES

See *Descartes' Philosophical Writings*, translated by P. T. Geach and G. E. M. Anscombe (Edinburgh, 1954). Spinoza's objections to Descartes's theory that belief necessarily involves assent can be found in the *Ethics*, Part I, Props. 29, 32, and appendix, and all of Part II; see also the lucid

analysis of Descartes and Spinoza by J. L. Evans, "Error and the Will," in *Philosophy* 38 (1963): 136–148.

## ERROR THEORY OF ETHICS

An "error theory of ethics" is the view that the ordinary user of moral language is typically making claims that involve a mistake. The concepts of ethics introduce a mistaken, erroneous, way of thinking of the world or of conducting practical reasoning. The theory was most influentially proposed by John L. Mackie in his book *Ethics: Inventing Right and Wrong* (1977). Mackie believed that ordinary moral claims presuppose that there are objective moral values, but there are no such things. Hence, the practice of morality is founded upon a metaphysical error.

Mackie's arguments against the existence of objective values are of two main kinds. One is the argument from relativity, which cites the familiar phenomenon of ethical disagreement. Another is the argument from "queerness." The moral values whose existence Mackie denies are presented as metaphysically strange facts. They are facts with

a peculiar necessity built into them: their essence is that they make demands or exist as laws that “must” be obeyed. In Kantian terms, the demands made by morality are thought of as categorical, “not contingent upon any desire or preference or policy or choice.” The foundation of any such demands or laws in the natural world is entirely obscure. Hence, the right response of a naturalist is to deny that there can be such things. It should be noticed that this is not supposed to be an argument against any particular morality, for instance, one demanding honesty or fidelity, but against the entire scheme of thought of which particular ethical systems are examples.

Another influential theorist whose work bears some resemblance to Mackie’s is Bernard Williams, whose *Ethics and the Limits of Philosophy* (1985) equally raises the doubt that ethics cannot possibly be what it purports to be, although Williams’s own arguments are more specifically targeted on the morality of duty and obligation.

Responses to the error theory have taken several forms. Both the argument from relativity and that from queerness have been queried, the former on the grounds that, even if ethical opinions differ fundamentally, this does not prevent one from being right and the others wrong, and the latter mainly on the grounds that Mackie suffered from an oversimple, “scientific” conception of the kind of thing a moral fact would have to be. Perhaps more fundamentally, it is not clear what clean, error-free practice the error theorist would wish to substitute for old, error-prone ethics. That is, assuming that people living together have a need for shared practical norms, then some way of expressing and discussing those norms seems to be needed, and this is all that ethics requires. Mackie himself saw that ethics was not a wholly illegitimate branch of thought, for he gave a broadly Humean picture of its function in human life. Even projectivists maintain that our need to express attitudes, coordinate policies, and censure transgressions is a sufficient justification for thinking in terms of ethical demands. Ethics does not invoke a strange world of metaphysically dubious facts but serves a natural human need.

## ESCHATOLOGY

“Eschatology” is a doctrine or theory (*logos*) of the end (*eschaton*). “End” here can have two meanings. First, it can mean the end of each individual human life. Second, it can mean the end of the world—or, more narrowly, of the human race. In the first, the individualistic, sense eschatology is an account of the destiny that awaits each person after death. In the second, the cosmic or social, sense it is a description of a goal (*telos*) in which history will be fulfilled. This goal may be of either a this-worldly or an otherworldly kind.

The distinction between these two senses is important, for it is possible to have an eschatological doctrine in one sense without having any in the other. Plato held that the soul, being immortal, would face judgment after death, that it would receive rewards and punishments according to the goodness or badness of its earthly life, and that it would be given an opportunity to choose the condition of its next existence (*Republic* 608c to end). However, he did not believe that there was any purpose to history as a whole. Conversely, a Marxist believes in a purpose of history although he disbelieves in personal survival.

It is doubtful whether eschatology in the second sense is to be found anywhere outside Zoroastrianism and Judaism—together with the religious and philosophical systems that have drawn inspiration from them: Mithraism from the first, Christianity and Islam, and Western thought in general, from the second. According to Greek and Indian thinkers history moves in cycles. Just as the seasons recur within each solar year, so all events recur in a sequence of “Great Years.” By contrast, the Persian Zend-Avesta and the Bible state that history is non-repeatable and that it is destined for a divine fulfillment in which good will triumph over evil.

In the Bible the second sense predominates. The Old Testament contains only a few vague references to a personal afterlife. But it often refers to a future time when God will establish his everlasting reign of righteousness and peace (for example, Isaiah 11:1–9). The New Testament affirms that this divine end or goal has been reached by the exalted Christ, who defeated the powers of evil on

the cross (see, for example, Acts 2:14–36; Colossians 2:8–15; Ephesians 2:11–22; Hebrews 2:5–18). Those who believe in Christ have eternal life here and now (John 3:36; 5:24). While living in “this age,” this spatiotemporal order that is still subject to sin and death, they have a foretaste of “the age to come,” a renewed cosmos that will be wholly subject to the will of God.

This view of history stands in contrast, first, to the Greco-Roman theory of recurrent cycles—a theory condemned by Origen and Augustine—second, to the humanistic dogma of inevitable social progress, and, third to Marxism. Although the Marxist philosophy of history owes its form to G. W. F. Hegel’s dialectic, its content has often been called a secularization of Christian eschatology. Materialistic determinism would be equivalent to a personal providence, the proletariat to the “chosen people,” and the “classless society” to the kingdom of God.

During the early centuries of the church most theologians taught that there will be a universal resurrection of the dead for a final judgment at the end of history, when Christ will appear again “in glory.” As a result of this judgment, it was also generally taught, some, the saved, will pass to paradise, where they will enjoy the beatific vision, but others, the damned, will be punished with everlasting torment. Four comments on this scheme are necessary:

- (1) One must distinguish between belief in the immortality of the soul and belief in the resurrection of the body. The first belief is derived from Plato, who held that the soul will survive in an incorporeal state. The second belief is based on biblical revelation. Thomas Aquinas held both beliefs. He considered the immortality of the soul to be rationally demonstrable. He also thought that the dogma of a bodily resurrection could be rationally justified on the ground that since soul and body constitute (as Aristotle taught) a single substance, the soul requires the body for its self-expression and beatitude. (To account for the obvious fact that the flesh decays at death, Origen proposed the theory that although the resurrected body will have the same “form” as its earthly counterpart, it will have a different “matter.”)
- (2) Origen maintained that all spiritual creatures—angels, humans, and devils—will be saved in a final “restoration” (*apocatastasis*). But although his doctrine (known as Universalism), which was shared by Gregory of Nyssa, could claim biblical

support, it was attacked by Augustine and formally condemned.

- (3) Even orthodox Christian Fathers (such as Irenaeus), as well as Gnostics and Montanists, were millenarians. They believed that Christ would reign on Earth for a thousand years before the end of terrestrial history. But since the fifth century millenarianism has been almost wholly confined to minor sects.
- (4) Although Clement of Alexandria and Origen spoke of a fire that would purge guilty souls, the full doctrine of purgatory (as a place of temporary punishment preparatory to the beatific vision) was not developed until the Middle Ages.

In the twentieth century there was a new attempt to understand the eschatological teaching of the New Testament (especially in the light of Albert Schweitzer’s thesis that Jesus expected an imminent end of history and therefore intended his moral teaching solely for an interim). On the other hand, Rudolf Bultmann attempted to “demythologize” biblical eschatology, to restate it in existentialist terms that will make it intelligible to modern man. These instances indicate a twofold revival of interest in eschatology among professional theologians.

## ESSENCE AND EXISTENCE

It will avoid misunderstanding if the topic of essence and existence is expounded in an order other than chronological.

### SEVENTEENTH-CENTURY VIEW

Thomas Hobbes and John Locke insisted that definitions are not of things but of names. In so doing, they conceived of themselves as breaking with Aristotelianism. Hobbes said that the essence of a thing is “that accident for which we give a certain name to a body, or the accident which denominates its subject”; he had earlier denied that “the definition is the essence of any thing”; and his example of an essence is that “extension is the essence of a body” (*De Corpore*, II, 8, 23).

Locke distinguished the real essence from the nominal essence; the nominal essence is the idea of the property or properties the possession of which justifies the application of a given name; the real essence is as it is understood by “those who look on all natural things to have a real but unknown constitution of their insensible parts, from which flow those sensible qualities which serve us to distinguish them one from another, according as we have occasion to rank them into sets under common denominators” (*Essay* III, 3, 17).

The mistake that Hobbes and Locke ascribed to Aristotelianism was that of confusing the meaning of an expression with the nature of the object which the expression characterizes. In the empiricist tradition this separation of questions of meaning from questions of characterization continued to be influential. One consequence is that the concept of the real essence is dropped altogether. Another is that philosophy itself becomes defined as the study of meaning, as a linguistic inquiry. But will the Lockean separation of the real and the nom-

inal, from which so much of this derives, bear scrutiny? Did Aristotle commit the error ascribed to him? Is it an error?

### ARISTOTLE AND THOMAS AQUINAS

For Aristotle, the essence of an object ( $\tau\acute{o}\ \tau\acute{\iota}\tilde{\eta}\nu\ \epsilon\tilde{\iota}\nu\alpha\iota$ ) was what finds expression in the concept that the object embodies, the concept under which it must be identified if it is to be identified as what it is. The natural response of someone trained in the empiricist tradition is to question this concept of an object. In any particular case the question “What is *this*?” can have more than one correct answer—for instance, “a coat” or “a piece of cloth.” To ask further what the essence of the thing indicated is, is to miss part of the Aristotelian point, which is best brought out by considering problems of identity. If I ask whether this is the same coat that you wore last year, I am not asking the same question that I would be asking if I inquired whether this is the same cloth made up into trousers that you used to wear in the form of a coat. “The same coat” and “the same cloth” pick out different identities. When I pick out “this” as an object, I can do so only by identifying it under some description, and the object does not have a nature apart from being identified under a description. For otherwise I could not identify what was to be characterized. In other words, we cannot identify an object solely by means of pronouns like “this” or by pointing.

It might be thought a fatal objection to this view that I can apparently identify an object without knowing what it is (a case which Aristotle allows for). Suppose I pick up something in your room and simply ask, “What is this?” The range of possible answers includes “a piece of stone,” “a carving,” “an image of a saint.” My ignorance may extend as far down the range of specificity as you please; I must still be able to find some description to add to my use of “this” or to my pointing. For if I pick it up twice, I must be able to identify it as the same object; and it is a condition of my identifying it as an object at all that I should be able in principle to pick it up, or otherwise indicate it, more than once. Possible reidentification is a necessary condition of identification. But if this is so, then I must, in picking it up, be able to characterize it, even if only as “that small colorless lump” or some such description. There is a limit to vagueness, at which such purely formal concepts as “thing” and “object” lie.

Insofar, then, as Aristotle is concerned with the minimal conditions for identifying and characterizing objects, he is justified in a view which makes understanding what something is, inseparable from understanding

the meaning of the description which must be applied to it if it is to be identified as what it is. The nominal and the real cannot be entirely divorced. But Aristotle expresses all this in terms of the concepts of substance and of matter and form, and in so doing he appears to lay himself open to the Hobbes-Locke type of criticism. What Aristotle meant by *τί ἦν εἶναι* is the subject of disagreement among translators and commentators. Hugh Tredennick in translating *Metaphysics* 1031a15 ff.) uses “essence”; Joseph Owens invents an arbitrary phrase, “the What-Is-Being” of a thing, and explains it in terms of the being of a thing which is the being of its form. The form is the necessary and unchanging element in a thing, in contrast with the matter and the composite, which may change, and the generic characteristics, which may belong to some other species (*Doctrine of Being in the Aristotelian Metaphysics*, p. 94).

Aristotle thus made the concept, under which an object must fall if it is to be identified and characterized as what it is, express a timeless and necessary element in the nature of the object itself. And insofar as Hobbes, for example, wished to deny that this timeless and necessary element was what a definition could refer to, it would be difficult to disagree. But any further discussion of Aristotle could only proceed by analysis of the doctrine of matter and form.

What is clear is that Aristotle inherited from Plato the notion of a range of fixed and timeless Forms, natures or essences which are embodied in the changing physical world. Less pessimistic than Plato about the possibility of knowledge of the nature of particular material objects, he retained the view that what the intellect grasps is always a form which could have been embodied in other matter. The name given to the being that the intellect grasps is *οὐσία*, which W. D. Ross renders as *essence*, following Quintilian and Seneca, who translated it as *essentia*. *Essentia* comes to mean the nature of a thing, the answer to the question *quid sit*. Augustine used *substantia* and *essentia* without difference of meaning, and Boethius translated *οὐσία* as *substantia*. From then on the word *substantia* was used in this sense and *essentia* was reserved for a new context which was first found in explicit form in Giles of Rome. This contrast is that between essence and existence, which received its completest statement in the work of St. Thomas Aquinas.

THOMAS AQUINAS. A substance is composite; it is an essence upon which existence has been conferred. When existence is conferred on an essence, what was hitherto merely possible becomes actual. In the case of physical

bodies, a form receives matter. Thus the concepts of essence and existence, potency and act, form and matter are mutually correlative. The notion of *esse* being conferred upon an *essentia* so that a substance is brought into being was foreign to Aristotle because the notion of creation was foreign to him. For Aristotle, analysis in terms of essence or substance was a way of approaching what already exists or is in the process of change. For Thomas, that anything at all exists must itself be explained. It is a purely contingent fact that any particular essence is an embodied existent. The only exception to this is God, in whom essence and existence are identical. But it does not follow that by grasping what God is, we can grasp that he is, as Anselm had supposed in his vision of the Ontological Argument. For we cannot grasp the divine essence.

### MODERN VIEWS

The vocabulary of essence and existence was preserved after the seventeenth century both by late Scholasticism and by its intellectual first cousin, rationalist metaphysics. Christian von Wolff inherited, perhaps from Francisco Suárez, whose influence he acknowledged, a view of the universe as a system of essences on which God has chosen to confer existence. But his view of essence as what can be conceived as a clear and distinct idea points to the influence of René Descartes and in his version of the Ontological Argument we can see the confluence of John Duns Scotus and Gottfried Wilhelm Leibniz. Knowledge of essences is expressed in propositions which are necessary truths. But these necessary truths are truths about possibilities, and it is a contingent matter of God's will being what it is that these particular essences have been actualized.

A line of thought that is only superficially like that of rationalist metaphysics runs from Spinoza to G. W. F. Hegel. In Spinoza the essence that entails existence is that of the single substance. But this version of the Ontological Argument is only part of Spinoza's whole set of theorems determining the all-inclusive *Deus sive natura*. Hegel treated the transition from essence to existence as part of the logical play with concepts that is an essential preliminary to the world of becoming. Of course we cannot deny that being is; but that, for Hegel, is only because the assertion is so bare and empty. When we deal with the realm of becoming, we have the sharpest of contrasts between the *Was-sein* (essence) and the *Das-sein* (existence), as Friedrich von Schelling, the enemy of all clear distinctions, complained.

The notion of an essence as a fixed possibility whose character may be delimited apart from our acquaintance

with the existence which embodies it was inherited from Scholasticism by Franz Brentano and Edmund Husserl, whose phenomenology is concerned with essences insofar as it is a study of what is involved in *any* act of judgment, belief, feeling, or willing, independently of the context of particular acts. The use of “essence” and “existence” by Jean-Paul Sartre is partly derived from phenomenology and partly from Scholasticism. The latter influence is apparent in the way in which Sartre uses the formula that existence precedes essence in order to deny that men are created by God. Sartre identifies such a conception of creation with the notion of God creating beings with fixed, already determinate natures who would therefore be unfree. Nothing of this appears to be entailed by Thomas’s use of “essence” and “existence,” but Leibniz and Wolff could be more convincingly convicted on this charge. Sartre wishes to convey by his formula that men do not have determinate natures, fixed in advance of their choices. By this he means that Smith does not have an existence determined for him which if he did not live out he would not be Smith; so it is Leibniz or Wolff, and not Thomas, whose propositions he is in fact denying.

What, then, is Sartre asserting? The contention that existence precedes essence may be interpreted as entailing various consequences, not all of which were necessarily intended by Sartre. Sartre clearly does believe that his contention not only constitutes the denial of one species of determinism, as has already been noted, but also involves the invalidity of any version of the Ontological Argument, whether Anselmian, Cartesian, or Hegelian. That is, no essence is such that it is a necessary truth that there must exist some individual embodying that essence. But unfortunately the Sartrean contention is so loosely stated that he might also be taken to imply—what he certainly would not want to imply—that there are no essences, that is, no meanings, apart from existences. This is plainly false. Many meaningful expressions do not name or denote anything that exists, many descriptions do not characterize anything that exists, as the common examples of “unicorn” and “glass mountain” make clear. The chief difficulty with the Sartrean thesis, however, is not that it plainly entails absurd consequences. It is, rather, that the thesis is stated so generally, and is so inadequately developed, that it is not at all clear what does or does not follow from Sartre’s contention.

## ESSENCE AND EXISTENCE [ADDENDUM]

There was a lively and extended debate in Islamic philosophy over the relative status of essence and existence. Avicenna argued that existence is preceded by essence, in that everything that exists only comes into existence because it is brought into existence by something else, except for the ultimate existent, God, the necessary being. Many things might exist, they have essences, but unless something brings them to existence they will remain mere essences

without existence. So essence precedes existence. This view was challenged by Averroes, who argued that in an eternal universe anything that could exist would exist, and the existence of a thing is not just an attribute added onto it, but is an essential aspect of its meaning. In any case, if existence is an additional attribute, suggested Shihāb al-Dīn Yaḥyā al-Suhrawardī, then essence would have to exist before the attribute was applied for it to be an essence, and an infinite regress is started. He took this stance to show that essence precedes existence since the latter is only an idea with no reality attached to it, and it is essence that characterizes reality.

Despite Averroes's arguments, the principle that essence is the most basic concept in ontology was widely accepted in Islamic philosophy right up to the time of Mullā Ṣadrā. Mullā Ṣadrā entirely reversed al-Suhrawardī's thesis, arguing that existence is equivalent to reality. This is because existence is a necessary aspect of what it is for something to exist and so there is no regress in treating the concept as an attribute. Reality is existence, albeit manifested in a variety of different ways, and these different ways appear to one to be essences. What affects one are things that exist, and one forms ideas of essences after they impinge themselves on one, so there is no doubt that one sees here a theory in which existence precedes essence.

The significance of the debate lies in what it tells of the nature of philosophy. For Avicenna and al-Suhrawardī, philosophy is the study of the essences or ideas of things, and one then moves on to wonder whether and how far they exist. For Averroes and Mullā Ṣadrā, philosophy is a study of existing things, and as one knows more about them one knows more about their properties, but they can have no properties unless they first exist. Averroes criticized the doctrine of essentialism since it implies that something has to come from outside of something to bring it to existence, and this implies that the universe constantly requires an outside force to activate it. He saw Aristotle as arguing that the natural world consists of entities that have to have the properties they have, and that if they exist they have to exist since otherwise they would be different (i.e., nonexistent) things. Taking any other position makes the acme of Aristotelian science, the definition, vacuous, since it suggests that there are aspects of a thing (its existence) that might or might not be present, thus reducing the power of the definition.

The position that is taken on essence and existence also affects the way in which philosophy is done. An essentialist uses thought experiments in philosophy, since the imagination can rule on what notions are possible or

otherwise. So Avicenna and his school accordingly used examples and potentialities to explore ideas and assess their possibility. If one's imagination cannot make sense of an idea, then that idea lacks possibility and so the state of affairs that it describes cannot exist. Those who are opposed to essentialism are critical of imagination in philosophy, since they argue that envisaging a possibility does not give one useful information about what is actually a possible existent.

## ETERNAL RETURN

"Eternal return" is the doctrine that every event in the universe, in all its details and in its whole cosmic context, will recur an infinite number of times in exactly the same way that it has already occurred an infinite number of times in the past. This doctrine must be distinguished from the belief in the general periodicity of nature, according to which the main features—but not the specific details—of human and cosmic history recur.

## THE PRE-SOCRATICS

The periodicity of various phenomena is a fact of daily experience; the alternation of day and night, of lunar phases and of the seasons of the year, and the rhythm of breathing and heartbeats were known to primitive people. Even the idea that cosmic history repeats itself in its general features appeared in various forms in mythological thought. Among the pre-Socratics the idea was held by Anaximander, Empedocles, and the atomists. The existing universe was regarded as a result of the differentiation of an original chaos—watery, fiery, or qualitatively undetermined—into which it would eventually return and from which a similar universe would emerge. This

idea of the periodicity of worlds soon became associated with the belief that not only the general features but also the most specific details would recur in the same order that they had occurred countless times in the past. According to Eudemus of Rhodes, this was the belief of the Pythagoreans: “Everything will eventually return in the self-same numerical order, and I shall converse with you staff in hand, and you will sit as you are sitting now, and so it will be in everything else, and it is reasonable to assume that time too will be the same” (H. Diels and W. Kranz, *Fragmente der Vorsokratiker*, 58B34).

The same idea of the cyclical nature of time was present, according to Pierre Duhem, in the thought of another Pythagorean, Archytas of Tarentum, who defined time as “the interval of the universe.” The length of this cosmic cycle, called the Great Year or Perfect Number, was variously estimated by different thinkers who were influenced by Pythagoreanism. For Heraclitus it was equal to 10,800 years (according to another source 18,000 years). According to the testimony of the Stoics and of Simplicius (whose reliability on this point has been doubted by Friedrich Schleiermacher, Ferdinand Lassalle, John Burnet, and G. S. Kirk), it measured the period separating two successive conflagrations in which an old world perishes and a new one is reborn.

### PLATO AND ARISTOTLE

Plato associated the period of the Great Year not with a periodically recurring cataclysm but with a return of all the celestial bodies to the same relative positions. Nor did Aristotle accept a universal conflagration, which was clearly incompatible with his idea of the incorruptible celestial realm. Nevertheless he did, if we accept his authorship of the *Problemata*, uphold eternal return in its most radical form: “Just as the course of the firmament and each of the stars is a circle, why should not also the coming into being and the decay of perishable things be of such a kind that the same things again come into being and decay?” (*The Works of Aristotle*, Vol. VII, p. 916a). Aristotle realized that the circularity of becoming would imply a relativization of succession: If the Trojan War will inevitably recur, in a sense we are living “prior” to it. The author of *Problemata*, however, was reluctant to accept the ultimate consequence of the idea of cyclical becoming: “To demand that those who are coming into being should always be numerically identical, is foolish” (ibid.).

### THE STOICS

The problem of cyclical becoming was faced by the Stoics, who believed that at the end of each cosmic cycle a uni-

versal conflagration (*ἐκπόρωσέις*) that dissolves the universe into the original fire will occur. This will coincide with the beginning of another cycle; the events of the previous cycle will then be reconstituted in all their details and in the same order. But Stoics followed Aristotle by claiming that another Socrates who will marry another Xantippe and be accused by another Meletus will not be numerically identical with the previous Socrates, since numerical identity implies an uninterrupted existence. Some younger Stoics, in conceding small differences between successive Socrateses, gave up the circularity of becoming in all but name.

### PLOTINUS

A curious argument for eternal return was given by Plotinus in the *Fifth Ennead* (Book VII, Chs. 1, 2). According to Plotinus, the intelligible world contains the ideal patterns not only of genera but also of all individuals, each of which successively finds its embodiment in the realm of change. But since the supply of these patterns is finite, a time will come when the same pattern—for example, of Socrates—will have to be incarnated again, and this will be possible only in the next identical cosmic cycle. Thus the successive cycles are identical, but there is no repetition within each cycle.

### JEWISH AND EARLY CHRISTIAN THOUGHT

Both Judaism and Christianity, with their emphasis on the finiteness and irreversibility of cosmic history, were strongly opposed to the doctrine of eternal return. According to both the Jewish and the Christian view, the history of the world is bounded by two unique and unrepeatable events: its beginning (the Creation) and end (the Last Judgment). Every individual human life is similarly unique.

Origen, while accepting with the Neoplatonists the eternity of the world and even metempsychosis, rejected the identity of successive cosmic cycles because such a concept was incompatible with human freedom. Nemesius (*De Natura Hominis*, Ch. 38) and St. Augustine (*De Civitate Dei*, Book XII, Chs. 11, 13) rejected the doctrine, Nemesius on the ground that the Resurrection cannot take place periodically, Augustine because the incarnation of Christ occurred only once.

### MEDIEVAL THOUGHT

A decree of 1277 threatening excommunication of those who accepted the Neoplatonic idea of a Great Year lasting

thirty-six thousand years demonstrates the survival of this belief into the Middle Ages. Although St. Thomas Aquinas rejected the cyclical view of time by claiming that the re-creation of numerically identical individuals would be contradictory, and as such was beyond even God's power, his view was not shared by John Duns Scotus and William of Ockham. Nicolas Bonet and François de la Marche explicitly insisted on God's power to restore any past motion, and therefore a corresponding past interval of time, since there was no difference between motion and time.

### EARLY MODERN THOUGHT

Thus, at the threshold of the modern era two of the central ideas of the modern cyclical view of time were present—the reversibility of motion and the relational theory of time. The third essential ingredient of the cyclical theory—the finiteness of the material universe—was excluded by Giordano Bruno's vision of innumerable worlds and limitless space. This may explain the absence of the idea of eternal recurrence in Bruno's contemporaries despite their Neoplatonic leanings. For if the number of constituent parts of the universe is infinite, the number of possible combinations is also infinite, and recurrence of the same configuration is not inevitable.

In Isaac Newton and his successors there was an additional motive for not considering the cyclical view. They regarded time as absolute, as intrinsically irreversible, irrespective of its content. Even a complete restoration of the content of the past moment would not make this moment itself present.

René Descartes came very close to the cyclical view when he wrote that matter must successively pass through all its possible forms, but since matter to him was coextensive with infinite space, the number of its configurations was inexhaustible. Furthermore, the pagan and astrological associations of the ancient cyclical theory made it thoroughly suspect.

### NINETEENTH-CENTURY VIEWS

Interest in eternal return was revived only with the development of modern cosmogony. The nebular hypothesis of Immanuel Kant (1755) and Pierre Simon de Laplace (1796) implicitly raised the question of the origin of any primordial nebula: Did it represent a truly initial stage preceded by an act of supernatural creation, or was it merely one of the countless stages in an unending cycle of successive worlds? The principle of the uniformity of nature in time, anticipated by Bruno's and Benedict (Baruch) de Spinoza's belief in the eternity of the uni-

verse, strongly favored the second answer. Although the law of entropy suggested the irreversibility of the whole cosmic process, because of its statistical character it did not exclude the general periodicity of nature. Various hypothetical mechanisms were invented to provide a "rewinding of the cosmic clock," at least on a local scale. The most popular one was that of cosmic clashes by which two stellar masses that had lost their heat could be transformed into another nebula, which would then develop into another world "ever the same in principle, but never the same in concrete results," as Herbert Spencer wrote in his *First Principles* (p. 550).

Such a new world could be the same even in concrete details only if the cosmic mass did not contain an infinite number of units. Eugen Dühring, in various writings (heavily annotated copies of which were found in Friedrich Nietzsche's library), rejected the concept of actual infinity as self-contradictory and inapplicable to the physical world.

In Nietzsche's thought the concept of a finite universe and of the discrete structure of matter implied a finite number of possible successive configurations, and therefore an inevitable recurrence of a configuration defining a state of the universe that had already occurred an infinite number of times in the past; and this recurring cosmic state must, according to the then accepted deterministic scheme, generate the series of the same events in the same order as in the previous cosmic cycles. This view, formulated by Nietzsche at the end of the fourth book of *Fröhliche Wissenschaft* (1881), became central to his philosophy. The intensely lyrical way in which this view was expressed in *Thus Spake Zarathustra* hid its intellectual origins, which are far more obvious in the posthumously published fragments of *The Will to Power* (see *The Complete Works of Friedrich Nietzsche*, Vol. XV, Ch. 2, esp. p. 430). Prior to Nietzsche only a few nineteenth-century thinkers held the same view: Louis A. Blanqui (*Éternité par les astres*, 1871), Gustave Le Bon (*L'homme et les sociétés*, 1881), Jean Marie Guyau (*Vers d'un Philosophie*, 1881). It was not held, however, by Dühring, who claimed that the continuity of space admitted an infinite number of configurations even if the number of atomic units was finite (*Cursus der Philosophie*, pp. 84–85). The same objection against eternal return was raised by Alois Riehl and Alfred Fouillée; against this view Franz Selety pointed out that concrete processes were discrete and not mathematically continuous, and therefore, he claimed, eternal recurrence was unavoidable; and G. N. Lewis claimed that the attempt at avoiding an exact recurrence by assuming a whole con-

tuum of possible values is eliminated by the quantum theory.

Henri Poincaré, although he formulated the theorem of phases, according to which any mechanical system of a finite number of particles will in a sufficiently long time pass through a configuration infinitely close to the previous one, nevertheless dismissed the application of the theorem of phases to cosmogony in his *Leçons sur les hypothèses cosmogoniques* (p. 23) as “the dream of eternal return.” C. S. Peirce (*Collected Papers*, Vol. I, pp. 498–500) held the cyclical view on the unusual ground that “since every portion of time is bounded by two instants, there must be a connection of time ringwise.” Furthermore, this view was entirely incompatible with the rest of his philosophy. The arguments of Abel Rey in favor of the cyclical view were not essentially different from those of Nietzsche, since they were based on the classical corpuscular-kinetic scheme of nature.

## CONTEMPORARY THOUGHT

The contemporary crisis of the classical scheme of nature makes the doctrine of eternal return extremely questionable. The doctrine was based on four fundamental assumptions: (a) that the universe is made up of distinct atomic units that persist through time without any intrinsic change, so that they may be identified in successive moments; (b) that the number of atomic units is finite; (c) that it is meaningful to speak of a definite “state of the universe” at each instant; (d) that one such particular state (embodied in a definite atomic configuration) causally determines all future states (Laplacean determinism).

Except for the thesis that the size of the universe is finite, which is favored by some cosmologists, none of these theses remains unchallenged by the recent developments in physics. The atoms of modern physics do not have the rigidity and permanence of classical atoms; and without permanent elements there can be no recurring configurations. The ontological status of “state of the universe at an instant” is challenged by the relativization of simultaneity, and the validity of rigorous determinism has been seriously questioned since the formulation of the indeterminacy principle in 1927.

Moreover, there are ambiguities and discrepancies within the theory of eternal return itself. The assumption of a completely identical repetition of cosmic situations makes the theory intrinsically unverifiable. Moreover, either the successive identical cycles are distinguished by their positions in time—which means that we surreptitiously introduce an irreversible time as their container—

or we insist on the numerical identity of the cycles. But we then have only one cosmic cycle, and it clearly becomes meaningless to speak of a “succession of cycles” or of their “repetition.” Although it is self-contradictory to speak of numerical identity of genuinely successive events, the two views have often been held jointly, as by the Scotists and Nietzsche.

The eternal return is rejected by all thinkers who insist on the irreversibility of becoming, genuine novelty, and the immortality of the past. Mircea Eliade regarded the theory as a manifestation of “ontology uncontaminated by time and becoming” (*The Myth of the Eternal Return*, p. 89); Émile Myerson saw in it an attempt to eliminate becoming (*L'identité et réalité*, Ch. 8). The emotional effect of the doctrine is equally ambiguous. Thus Nietzsche's mystical ecstasy over “the ring of eternity” was tinged by a note of anxiety and even despair. Gustave Le Bon compared the recurring cosmic cycles to the labors of Sisyphus, and Miguel de Unamuno, in *The Tragic Sense of Life*, regarded the doctrine as a poor substitute for personal immortality.

## ETERNITY

The word *eternal* is derived from the Latin *aeternus*, a contraction of *aeviternus*, which, in turn, is derived from *aevum*, a word from the same root as the English words *ever* and *aye*. In Greek the corresponding adjectives are even more obviously connected with the notion of everlasting existence. This is the original sense of the word *eternal* and probably also the sense that is still the most common in ordinary language. But in certain philosophical contexts the notion of everlasting existence is expressed rather by “sempiternal,” “eternal” being reserved for the sense of “timeless.”

## THE “TIMELESS PRESENT” IN SCIENCE

In English and other Indo-European languages there is a usage described by grammarians as the timeless present. When, for example, we say, “Seven is a prime number,” we do not intend our use of the present tense to convey anything about the present as distinct from the past or the future. For this reason we find something very curious in the sentences “Seven was a prime number” and “Seven will be a prime number.” Existential statements of a mathematical kind do not refer to the time of speaking. An assertion such as “There is a prime number between 5 and 10” could never be countered sensibly by the remark “You are out of date.” For this reason the entities discussed in mathematics can properly be said to have a timeless existence. To say only that they have a sempiternal or omnitemporal existence (that is, an existence at all times) would be unsatisfactory, because this way of talking might suggest that it is conceivable they should at some time cease to exist, an absurdity we want to exclude.

Mathematics, however, is not the only study in which use of the timeless present is appropriate. The same idiom can be found in all studies that are concerned with necessary truths as distinct from matters of fact. It may occur, for example, even in empirical studies when the propositions we formulate involve the notion of necessary connection. Thus, we say “The hydrogen atom contains only one proton” because we do not wish to allow that hydrogen atoms may in the past have contained or may in the future come to contain more than one proton.

Here, however, our use of the timeless present is certainly not intended to suggest that hydrogen atoms exist out of time. What we wish to call timeless is simply the connection between being a hydrogen atom and containing a single proton. Sometimes such connections have been called eternal verities, most commonly when it has been thought they could be known a priori, as in mathematics.

## GREEK THOUGHT

A different conception of timelessness appears in Parmenides' poem "The Way of Truth," where he says of the One, "It neither was at any time nor will be, since it is now all at once [*ὅμοῦ πᾶν*] a single whole." Since Parmenides and his pupil Zeno argued against the reality of change, we must suppose that this remark does not represent the One as existing merely for a moment but says rather that the One cannot be described in a language that employs tenses. The One exists all at once because it involves no temporal succession of earlier and later. But why should anyone talk in this way? Perhaps Parmenides accepted the religious teaching of Xenophanes, that the Whole is an everlasting god, and tried to defend it against Heraclitus's doctrine of universal flux by maintaining that the Whole is spherical in all respects—that is, temporally as well as spatially. For such a Whole could not itself be in time, and if we talk about it at all we must employ the timeless present. This is only a guess, but there is evidence to show that a conception of cyclical time order was current in the Pythagorean school with which Parmenides is said to have been connected in his youth.

From Parmenides the notion of a mode of existence that allows no distinction between past, present, and future passed to Plato, who applied it to his Forms, or Ideas. The most influential passage of his works dealing with this subject is in the *Timaeus* (37E6–38A6), where he contrasts the created world with the eternal living being, its timeless archetype.

The language of the passage is poetical, and it seems that we are not expected to take all the details seriously. In particular, Plato can scarcely have meant us to believe that time was an afterthought of the creator. Rather, we are to understand that time is to the perceptual world of becoming what eternity is to the intelligible world of being. For Plato said later (*Timaeus* 38B5), "Time was created with the heaven," and he seems to have held that it is identical with the movements of the heavenly bodies, which are commonly said to measure its passage. In many of his works Plato glorified the eternal and spoke of the temporal as something inferior, but he did not, like Parmenides and Zeno, deny the reality of time. The most he

said in this regard is that temporal things never have being but are always in a state of becoming, as Heraclitus had argued. However, this seems to be no more than a recognition that we cannot talk of temporal things in the timeless present as we talk of Forms and mathematical objects.

The connection with necessity that Plato had claimed for timeless eternity Aristotle claimed for sempiternity. For having rejected Plato's doctrine of the creation of time (*Physics* 251b14), he did not wish to say that anything was wholly severed from it. Thus, in one place he explicitly associated the objects of mathematics with the universe, which he certainly did not regard as timeless (*Nicomachean Ethics* 1112a22). In his view the objects of mathematics are eternal (*αἰδία*) but only in the sense that they exist always—that is, are sempiternal. He held that among sempiternal things there is no difference between possibility and actuality and also that there is nothing merely accidental (*Physics* 203b30, 196b10). In one place he even said that sempiternal things, insofar as they are sempiternal, are not in time, because they are not bounded by time or subject to aging and the other conditions of time (*Physics* 221b30). Apparently he had in mind not only mathematical objects, such as numbers, but also God and the sun and stars and the whole heaven. For he said elsewhere that the heavenly bodies, unlike perishable things, are not wearied by their motion. The sun is active forever, and there is no danger that it will give out, as some philosophers feared (*Metaphysics* 1050b24). Benedict (Baruch) de Spinoza may have been influenced, even if only indirectly, by Aristotle's doctrine when he used the word *aeternitas* to signify both necessity and sempiternity.

## CHRISTIAN THEOLOGY

The doctrine of Plato's *Timaeus* passed into Christian theology, with emphasis on the notion of timeless *life*. As early as the St. John Gospel (8:58) there is a curious passage in which Jesus is represented as saying, "Before Abraham was I am." But it is fairly clear that the author of this gospel knew something of Greek philosophy, possibly at second hand through the works of the Jewish theologian Philo of Alexandria, and also that his narrative is no mere historical record of the life of Jesus. By the end of the fifth century there was nothing at all strange in the use of Platonic thought for the exposition of Christianity, and St. Augustine, when commenting, in his *De Civitate Dei* (xi, 21), on the sentence in Genesis "God saw that it was good," referred to the passage of the *Timaeus* cited above. In his *Confessions* (xi, 13) he wrote also of God's "ever-

present eternity” and said that for God “all years stand at once” (*omnes simul stant*). A century later Boethius, in his *De Trinitate* (4), said that our “now,” by running as it were (*quasi currens*), makes time and sempiternity, whereas the divine “now,” by abiding, unmoved and immovable, makes eternity; in the final chapter of his *De Consolatione Philosophiae* he discussed this at greater length.

Eternity is the complete possession of eternal life all at once—a notion that becomes clearer from comparison with things temporal. For whatever lives in time moves as something present from the past to the future, and there is nothing placed in time that can embrace the whole extent of its life at once. It does not yet grasp tomorrow, and it has already lost yesterday. And even in the life of today you do not live longer than in the transitory moment. That, then, which is subject to the condition of time, even if (as Aristotle thought of the world) it has no beginning or end and its life extends through endless time, is still not such as may be rightly judged eternal. For though its life be endless, it does not grasp and embrace the extent of it all at once [*totum simul*] but has some parts still to come. . . . And so, if, following Plato, we wish to give things their right names, let us say that God is eternal, but the world everlasting.

All these notions reappeared in the Middle Ages. St. Thomas Aquinas, for example, quoting Boethius as his authority, said in his *Summa Theologiae* (I, x, 1) that there are two marks of eternity, namely, that the eternal has neither beginning nor end and that eternity contains no succession, being all at once (*tota simul existens*). This last phrase, though Thomas could scarcely have known as much, is a rendering of words Parmenides had used over seventeen centuries earlier. Not content, however, with the old distinction of time and eternity, medieval theologians sometimes spoke of *aevum*—that is, everlastingness—as something intermediate that was appropriate to the heavens and to angels. This was conceived by some as having a beginning but no end and by others (probably influenced in part by Aristotle’s account of God and the heavenly bodies) as possessing earlier and later, but without innovation and aging. Thomas regarded the latter view as self-contradictory, since, he held, there could be no succession without aging. *Aevum* does not necessarily include earlier and later, according to Thomas, though these can be joined with it, as is the case with angels, who have changeless being as well as the capacity of change according to choice (*Summa Theologiae* I, x, 5).

## CRITICISM OF THE THEOLOGICAL USE

Anyone who, like Boethius, speaks of eternity as “the complete possession of eternal life all at once” seems to be running together two incompatible notions, that of timelessness and that of life. For we can attach no meaning to the word *life* unless we are allowed to suppose that what has life acts. No doubt the word *acts* may be taken in a wide sense. Perhaps it is not essential that a living thing produce changes in the physical world. But life must at least involve some incidents in time, and if, like Boethius, we suppose the life in question to be intelligent, then it must also involve awareness of the passage of time. Purposeful action is action with thought of what will come about after its beginning. It is difficult to decide how much of this Plato was prepared to admit when he wrote the *Timaeus*. In his earlier works (for example, the *Meno* and the *Phaedo*) he tried to explain the possibility of a priori knowledge by a doctrine of reminiscence, which involves the hypothesis that before this life the human soul lived among timelessly existent Forms and contemplated them directly as in this life it sees things belonging to the realm of becoming. But he probably came to realize that there is something absurd in the suggestion that a soul can pass part of its time in a timeless realm and then at a certain date enter the temporal realm, for he appears to have dropped the doctrine of reminiscence in his later dialogues, where instead of glorifying the soul by treating it as something akin to the timeless Forms he praised it as the source of motion.

In the *Republic*, which belongs to the middle of his literary life, he spoke of God, who is presumably alive, as having created one and only one Form of each kind. But the wording of the passage (*Republic* 597c) seems to be obviously playful, and it is unlikely that Plato ever meant to suggest seriously that the Forms had been created. In the *Timaeus*, as we have seen, the Forms are said to be the timeless model used by the demiurge, or craftsman, who made the temporal world. Yet this same timeless model is said to be itself alive (*Timaeus* 37E6). Is this to be taken seriously? Unlike medieval theologians, for whom things predicated of the eternal were to be interpreted analogically, Plato maintained (*Timaeus* 29B) that discourse about the eternal is to be understood in the strict and primary sense of the words it employs.

How did the theologians come to commit themselves to talk about timeless life? The influence of Plato’s style counts for a lot, but not for everything. One might say in the case of Thomas that the surprising thing is that he held to Plato’s account of time and eternity though he

must have known it had been criticized by Aristotle. Probably the explanation is to be found in a peculiarity of Christian doctrine. Aristotle, though a theist of a sort, not only rejected the Platonic notion of the creation of time but also maintained the sempiternity of the heavens. To a theologian who had to produce a metaphysical scheme concordant with biblical revelation (which denied the sempiternity of the cosmos) this must have made Aristotle's criticism of Plato's doctrine of eternity seem unsatisfactory. But apart from that, Plato's doctrine had the positive merit of seeming to provide for the necessity of God's existence. If it is correct, once we have admitted that we understand the meaning of the word *God* and that it involves no inconsistency, we cannot sensibly deny that God exists. Another manifestation of this theological interest in the necessity of God's existence is Anselm's ontological argument. Admittedly, this was rejected by Thomas, but for epistemological reasons concerned with the limits of our capacities, not for the assumption it involves that divinity, by definition, entails existence. On the contrary, Thomas, following Boethius, said that God's essence and existence are one.

#### OTHER PHILOSOPHICAL USES

In later European thought Spinoza and various idealist philosophers used the word *eternity* to describe the existence of their God or Absolute. Spinoza, for example, said in his *Ethics* (I, Definition viii), "By *eternity* I mean existence itself in so far as it is conceived necessarily to follow solely from the definition of that which is eternal. Existence of this kind is conceived as an eternal truth, like the essence of a thing, and therefore cannot be explained by means of duration or time, though duration may be conceived without a beginning or an end." Here there is no longer any verbal connection of eternity with life, but there is still a wish to maintain that something concrete exists with the timeless necessity of which we speak in mathematics. Similar assertions have been made in Indian philosophy, which does not in any way derive from Parmenides or Plato, and we must therefore suppose that they correspond to a widespread demand of religious thought. In modern times even the Pythagorean notion of a cyclical time order has again been considered seriously, by Kurt Gödel.

#### ETERNITY [ADDENDUM 1]

Since Kneale wrote his article, many writers have argued against divine timelessness by claiming that it is inconsistent with divine omniscience. If God knows everything, they reason, he knows what time it is now. But the token of "now" in (say) "it is noon now" refers to the time at which the speaker speaks. So if one knows that it is noon now, and one knows this only if one is able to assert it truly, one exists now (see Stump and Kretzmann 1981). A variant has it that if God is always omniscient, at noon he believes that it is noon and not 1 PM, and at 1 PM that it is 1 PM and not noon. Plausibly, what a person believes is an intrinsic fact about that person. But a timeless being cannot change intrinsically: What changes intrinsically has an intrinsic property at one time that it lacks at another. Some would reply here that one can only know what is true, and if God is timeless, for him it is not noon, or any other time: it is noon for God only if some part of his life which is located at noon is temporally present, and if God is timeless, no part of his life is located at noon or is temporally present.

This raises, of course, the question of how it can be noon for us but not God. And this question leads to an argument others (e.g. Craig 2002) press, that divine time-

lessness is inconsistent with our ordinary view of time. We ordinarily think that the present exists and the future does not. But a timeless being's life has no future part: lives with future parts are ipso facto lives in time. If your death is still to come for a timeless being, your death lies in a future part of its life. So for a timeless being, your death is not still to come. But for you, it is still to come. Events yet to come for us must not be yet to come for a timeless being: they must already be there, in some way. And so it seems to follow that the future as well as the present exists: If all of time later than noon exists for God, it exists, period, even for us. Either divine timelessness entails the reality of the future, counter to our usual way of thinking about time, or else if God is timeless, some parts of time are real relative to some persons but not others: For us, it is (say) noon, as all of time that is later than noon does not exist, but for God, all of time later than noon exists, and so it is not noon.

Stump and Kretzmann (1981) argued (contra Kneale) that talk of timeless action makes sense and that the move to make here has been known since Aquinas. God's acts consist of atemporal intendings plus effects of these that occur at particular times. God's contribution to the acts is not located in time, but nonetheless his life can "involve some incidents in time" (Kneale). Purposeful action involves "thought of what will come about after its beginning" (Kneale), but "after" can have a sense involving causal as well as temporal precedence and can also refer to temporal effects of an atemporal intention that occur after other such effects. Stump and Kretzmann also claim that an eternal being's life endures in its own way: "timeless duration" is no contradiction, and neither is "timelessly present." Further, they argue, events in an eternal life are in a sense simultaneous with events in time: "simultaneous" does not always mean "at the same time"; in the eternal-temporal case it has a complex sense involving the coexistence of eternal and temporal presents.

Some might see Stump and Kretzmann as working out a hybrid doctrine of divine eternity, one involving neither sheer timelessness nor ordinary temporality but presentness and duration without the full range of temporal features. Such "intermediate" theories have multiplied. Craig (2002) suggests that God is timeless "before" creating and became temporal by creating. It is hard not to think this view contradictory: being over seems a paradigmatic temporal property, one only temporal events have, yet according to Craig the timeless phase of God's life is over. Padgett (1992) argues that God is "relatively timeless"—that is, in some but not all ways in time. As he

sees it, points in our time are points in the time God exists in, but length relations between these points do not exist for God. For us, noon is an hour before 1 p.m. but for God there is no definite length of time between the time we call noon and the time we call 1 p.m. Swinburne (1993) suggests that, whereas God exists in a time without definite length before he creates, once he creates, the lengths of time that exist for us exist for God.

## ETERNITY [ADDENDUM 2]

Islamic and Jewish philosophy emerged from a Hellenistic climate in which the universe was taken to be an everlasting emanation from a unitary source (Plotinus), so the debate that ensued among thinkers in these two traditions had to reconcile this philosophical conviction with the pronouncement of their respective revelational books: "In the beginning God created heaven and earth" (Genesis 1.1) and "God said 'be' and it is" (Qur'an 2:117). An absolute beginning linked to an initial moment of time is conflated here with the freedom of the creator to create. Plotinus never denied emanation to be free, although that freedom appropriate to the One would be vastly different from creatures: not being faced with anything—including alternatives—freedom in the One (so far as humans can grasp it) would be more like pure assent.

Al-Fārābī (d. 950), the first of the Muslim philosophers to elaborate this subject, introduced *necessity* into the founding emanation by modeling it on logical deduction: everything that is derives from a single premise. Ibn Sīnā (979–1037), "Avicenna" to Europeans and North Americans, refined this scheme to align it with the "wandering" heavenly bodies (planets)—identified as succes-

sive spheres—to create a philosophical cosmology to articulate, after a fashion, the transition from one to many. On the Muslim side, al-Ghazālī (1058–1111) countered this necessary emanation (proposed as an adaptation of the Qur’an) with the charge of *unbelief* (*kufur*), whereas Moses Maimonides (d. 1204), the Jewish thinker imbued with Islamic philosophy, took these charges and elaborated them into a strict division of creator from creatures in order to safeguard the freedom and transcendence of the creator from creation.

Thus the crucial distinction between *everlasting* and *eternal* emerges: while what always was (“everlasting”) might not have been, it is impossible for the One source of all that is not to be, so the One must be said to be “eternal.” By connecting *eternal* with origins and with an adequate distinction of creator from creatures (which al-Farabi’s logical model failed to do), these thinkers could affirm the creator God’s eternity without further exploring the issue. Timelessness will be a feature of the eternal One because time itself is created; but eternity will comprise more than timelessness (which could also be said of mathematical entities) because its reality explains the existence of the universe. This discussion can be distinguished from the question of whether the origin of the universe requires an initial moment of time; the creator God would have to be eternal even if some creatures were everlasting. One can detect a Neoplatonic concern for the origin of all things in a unitary source, here adapted to a free creator whose transcendence can be removed from any hint of anthropomorphism by the assertion of *necessary existence* (Ibn Sīnā), and by distinguishing even everlasting things that are created from their uncreated *eternal* source.

## ETHICAL EGOISM

Generally defined as the view that one ought to do whatever and only whatever is in one’s own maximum inter-

est, benefit, advantage, or good, “ethical egoism” contrasts with (1) psychological egoism, which says that people do in fact, perhaps necessarily, act in that way; and from (2) alternative ethical theories, which claim that we have other fundamental obligations such as to act for the sake of others, even at ultimate cost to ourselves, or in ways having no necessary relation to anyone’s benefit.

Egoism strikes many as cutting through pretenses and getting down to fundamentals. This appearance soon dissipates when we make essential distinctions. Foremost is that due to the classic work of Bishop Joseph Butler (1692–1752). Is “self-interest” in that theory to be understood as one’s interest in certain states unique to one’s own self—as distinct from certain states of other people? Or is it merely interests of one’s own self—the interests one happens to have, whatever they may be? Since action is necessarily motivated by interests of the agent motivated by them, the second interpretation is trivial: Whatever we do, we are somehow interested in doing it. But the first interpretation is implausible: People are notoriously capable of sacrificing themselves—for friends, loved ones, or causes.

Ethical egoism would also be vacuous if it said only that whatever we ought to do, we ought to do it only if we are motivated to do it. Only when self-interest is construed in the narrow sense, as describing certain of our interests—those focused specifically on oneself—but not others, does it make sense to say that we ought to act self-interestedly. Then the question “Why?” arises, for we have our choice.

This brings up the question of what is the ultimate good or interest of an agent. Alas, we must leave this important issue open in the present discussion. The next question, however, is crucial. What is meant by *ethical*? Here we must distinguish between a wide sense in which *ethical* means something like “rational” and a narrower sense in which specifically moral requirements are intended. I should choose Bordeaux 1989, but that isn’t a moral matter; that I should refrain from cheating is.

If ethical egoism is understood in the wider sense, it is a theory about rational behavior; and construing self-interest in Butler’s second way, egoism says that a rational agent acts so as to maximize the realization of whatever she or he is interested in attaining. This highly plausible idea is noncommittal about the content of our interests.

Now turn to the moral version. Moral rules call upon us all to do or refrain from certain things, whether we like it or not. Can there be a rational egoistic morality, then?

But the interests of different persons can conflict. This leads to a problem, which becomes clear when we distinguish two possible interpretations of moral egoism:

- (1) “First-person” egoism appraises all actions of all persons on the basis of the interests of the proponent alone. What Jim Jones thinks, if he is this kind of an egoist, is not only that Jim Jones ought to do whatever, and only whatever, conduces to Jim Jones’s best interests—but that everyone else should, too. This is consistent, to be sure, but from the point of view of anyone except Jim or his devotees, it is evidently irrational, if they too are self-interested.
- (2) “General” egoism, on the other hand, says that each person ought to do whatever is in that person’s interests. If Jim is an egoist of this type, he believes that Jim ought to do whatever is in Jim’s interests, but Sheila ought to do whatever is in Sheila’s interests, and so on.

Serious conceptual problems arise with general egoism. Suppose that Jim’s interests conflict with Sheila’s: Realizing his frustrates hers. Does Jim tell Sheila that it is Sheila’s duty to do what is in Sheila’s interests? Or what is in Jim’s interests? Or both? Every answer is unacceptable! The first is unacceptable to Jim himself: How can he, as an exclusively self-interested person, support actions of Sheila’s that are detrimental to himself? The second is unacceptable to Sheila: If she is exclusively self-interested, why would she take Jim’s “advice”? And the third is flatly inconsistent: For their interests to “conflict” means that they cannot both do what is in their own best interest.

A standard reply is to hold that egoism tells each of the differing parties merely to try to do what is in their interests. But this is either just wrong or turns the theory into something else: “Here, all you ought to do is try to bring about your best interests—but it doesn’t matter whether you succeed!” But self-interested agents are interested in results.

Or it might be held that the good life consists not in succeeding but in striving. This turns egoism into a game, and in conflict situations, a competitive game. And games are interesting, but also very special, requiring players to abide by certain game-defining rules. True chess-players do not cheat, even if they can—cheating is not really playing the game. They want opponents to do their best, even if they themselves lose. Of course, they prefer to win, but even if they do not, the game is worthwhile. This defense lacks generality. Ethical egoism is not about games, it is about life. Some people may make life into a game, but

most people do not. They want results, not just effort; in conflicts, they are not about to cheer for the other side.

So egoism seems to be self-defeating. What to do? The answer requires, first, that we utilize the vital distinction between egoism as (1) a theory of rationality—of what is recommended by reason; and (2) as a theory of morality. The latter is interpersonal, and concerns rules for groups. Such rules require that people sometimes curtail their passions and conform to the rules.

If we view egoism as a theory of rationality, then whether agent *A* should aim only at bringing about certain states of *A* is an open question. But that *A* should aim at bringing about only those states of affairs that *A* values is not: We can act only on our own values—in acting, we make them our own.

But when we turn to the subject of formulating specifically moral principles, we must attend to the facts of social life. From the point of view of any rational individual, moralities are devices for securing desirable results not attainable without the cooperation of others. To do this, mutual restrictions must be accepted by all concerned. They will be accepted only if they conduce to the agent’s interests. Therefore, moral principles, if rational, must be conducive to the interests of all, those to whom they are addressed as well as those of the proponent herself. Thus, egoism leads to contractarianism: Moral principles are those acceptable to each person, given that person’s own interests, if all comply. Undoubtedly, some will not; but noncompliance, as Thomas Hobbes observed, leads to war, which is worse for all.

Rational egoism, then, leads to the abandonment of moral egoism. Sensible people will condemn egotism, and regard selfishness as a vice: We do better if we care about each other, engage in mutually beneficial activity, and thus refrain from one-sided activity that tramples upon others, such as killing, lying, cheating, stealing, or raping. The core of truth in egoism leads to a fairly familiar morality, whose principles must cash out in terms of the good of every agent participating in society. Narrowly egoistic moral principles cannot do this, and thus are the first to be rejected by rational egoists—another of those fascinating paradoxes of which philosophy is full.

## ETHICAL NATURALISM

Philosophical naturalism, considered in general, is not a unified doctrine but a broad label applied both to methodological stances (e.g., “The methods of philosophy are continuous with those of empirical science”) and to substantive positions (e.g., “For a belief to be epistemically warranted is for it to be the product of a certain kind of causal process”). The two are often combined, as when a naturalistic interpretation of a given domain of discourse is justified as “the best explanation” of associated practices. However, the two are in principle independent. In the moral case, for example, it has been argued that a projectivist or noncognitivist interpretation gives a better explanation of moral practice than any substantive naturalism (Blackburn 1984, Gibbard 1990).

But what makes a method or interpretation naturalistic? Attempts to give an explicit definition have largely been abandoned in favor of pointing. Roughly, naturalistic methods are those followed in actual scientific research (including—according to some but not all naturalists—mathematics and social sciences as well as natural sciences). And a naturalistic interpretation of a discourse is one based upon predicates or terms that play a role in the explanatory theories that research has generated.

This characterization of naturalism is informative but incomplete. There are vigorous debates within the philosophy of science over just what the methods, concepts, or posits of contemporary science are. Moreover, interpretation based upon naturalistic terms encompasses some quite different tasks. Some examples follow, but first we should ask, Why stay within naturalistic terms at all? Science is a theoretical, descriptive/explanatory enterprise while morality is held to be essentially practical and normative. One might think, no sooner did morality emerge from the shadow of religion than philosophers began trying to push it into the shadow of science. Is it never to be allowed to stand in its own right as a distinctive domain of inquiry?

An answer of sorts is possible. Morality by its nature cannot stand entirely on its own. Moral discourse is supervenient upon the nonmoral and, specifically, the natural—two actions or agents cannot differ in their moral qualities unless there is some underlying difference in their natural qualities. This and other truisms about morality, such as “Ought” implies “can,” tie moral evaluation to the natural world in ways that no ethical theory can altogether ignore. Moreover, morality presents us with various epistemic and metaphysical puzzles. We

believe that we have come to possess at least some moral knowledge—but how? (See Harman 1977.) We treat moral statements as if they stated genuine propositions—but can this idea be sustained in light of the normative role of moral judgment? We freely make moral judgments, but do they have presuppositions or make claims that are incompatible with our understanding of the natural world?

Hard determinists, for example, have challenged intuitive attributions of moral responsibility by arguing that the notion of free agency they presuppose is incompatible with the world revealed by physics. And John L. Mackie is led to an “error theory” of morality by his diagnosis that moral evaluation attributes to states of the world an objective “to-be-pursuedness” that cannot be fit with any plausible empirical theory (Mackie 1977).

Immanuel Kant, for one, frankly accepted that he could see no way of reconciling the deliberative standpoint of morality with the causal perspective of science. Rational agents must, he held, postulate the compatibility of moral agency with the natural order, even though this remains inexplicable to them. But few philosophers have been willing to stop there. Empirical science affords the best-developed picture we have of ourselves and our world. Without the special authority of religion to back it up, morality inevitably becomes a focus of practical and theoretical concern.

Substantive moral naturalists in effect propose to overcome some of the mystery and potential conflict surrounding the relation of morality to our empirical self-understanding by showing just how much of morality might be found within the domain of the natural. This could be done by providing a naturalistic account of moral discourse that affords an analysis of moral terms (Lewis 1989), or permits a worthwhile revision of moral language that nonetheless can serve virtually all the same functions (Brandt 1979), or enables us to reduce moral properties to natural properties (Railton, 1993), or shows moral properties to be natural properties in their own right (e.g., thanks to their contribution to empirical explanation; see Boyd 1988, Miller 1985, Sturgeon 1985). Substantive ethical naturalism promises to explain such important features of moral discourse and practice as the applicability of notions of truth and falsity to moral claims, the supervenience of the moral upon the natural, the role of natural properties in justifying moral claims, and the possibility of semantic and epistemic access to moral notions through ordinary experience.

The first half of the twentieth century had not been kind to substantive ethical naturalism (for a brief history,

see Darwall et al. 1992). Condemned by G. E. Moore (1903) for committing the “fallacy” of trying to close an “open question” by analytic means and rejected by non-factualists (emotivists, prescriptivists, etc.) for failing to capture the special relation of moral evaluation to motivation and action, naturalism fell into disuse. But by mid-century naturalism had begun to win its way back. The initial steps were taken, independently, by Philippa Foot (1958–1959) and Geoffrey Warnock (1967), who argued that one could not be competent in moral discourse unless one possessed some substantive, contentful moral concepts. Moral evaluation is distinguished from aesthetic or prudential, for example, in part because it has a certain descriptive, arguably natural content—namely, a concern with the effects of our actions on the well-being of others. If we came upon a society in whose behavioral code the key notion was *guleb*, a term applied in the paradigm case to warriors who have killed an enemy bare-handed, we would certainly mislead if we translated *guleb* as “morally good” or “just” rather than “valiant” or “courageous.”

Meanwhile, Peter Geach (1965) showed convincingly that existing nonfactualist views could not account for the full grammar of moral discourse, in particular, the logical behavior of unasserted moral claims in conditionals.

Foot (1972) took the next step as well, challenging the “internalist” conception of the relation of moral evaluation to motivation that served as the basis for nonfactualism. She argued that ordinary moral agents are able to see themselves as motivated by a rationally optional concern for others. Those who lack such a concern might lack moral character, but they do not make a linguistic mistake in using the moral vocabulary.

This sort of moral “externalism” offers an alternative explanation of why moral evaluation and motivation are so intimately related, at least in paradigm cases. Concern for others is a very basic part of normal human life. An Aristotelian would say that human nature itself is social; a Darwinian would emphasize the contribution of concern for others to inclusive fitness and to the possibility of benefiting from reciprocal altruism. Speculative biology apart, it is possible to see how social norms involving concern for others, keeping promises, and so forth might emerge and be sustained in virtue of their contribution to solving various serious coordination and collective-action problems. Such norms will function best only if well internalized by a major part of the population. It should therefore be unsurprising that moral judgment is usually accompanied by a positive attitude. Moreover, it

should not be forgotten that moral judgment is a species of assertion and that assertion itself involves, not only signaling a cognitive attitude of belief, but also various forms of active endorsement or encouragement, as well as associated claims of authority. Moral externalism, by drawing upon these ingredients (and others) for an alternative explanation of the evidence—such as it is—offered on behalf of internalism, has attracted a number of defenders (see, for example, Boyd 1988, Brink 1989, Railton 1986).

Another sort of naturalism, however, takes the opposite tack. It treats the purported relation to motivation as fundamental but interprets it in a subjectivist rather than nonfactualist manner. Subjectivist interpretations of moral discourse have historically faced difficulties in accommodating all the elements of an interconnected set of features of morality: the critical use of moral assessment, the nonrelativistic character of moral judgment and the possibility of genuine moral disagreement across social or cultural differences, the limits on empirical methods in resolving moral disputes, and the seemingly normative character of the relation between moral judgment and motivation. Can new forms of subjectivism succeed where others have failed?

Consider the simple subjectivist formula:

- (1) Act *A* is morally good = *A* is such that one would approve of the performance of *A*.

Since approval is a positive attitude, (1) establishes a relationship with a source of motivational force. But is it the right relationship?

We do not typically regard our current tendencies to approve or disapprove as morally authoritative—they might, for example, be based upon hasty thinking or false beliefs. This has led naturalists to modify (1) to require that the approval be well informed and reflectively stable. (See, for example, Brandt 1979 and Firth 1952. For criticism, see Velleman 1988.)

Moreover, not all species of approval have a moral flavor. I can approve of an act because of its aesthetic or pious qualities, for example. Some naturalists therefore amend (1) to restrict the object of approval (e.g., to the set of rules one would—reflectively, informedly, etc.—approve for a society in which one is going to live [cf. Brandt 1979]). Others attempt to identify in naturalistic terms a specifically moral sort of attitude of approval or disapproval (e.g., an attitude of impartial praise or anger). Critics have argued that no noncircular characterization of this kind is possible (for a subjectivism without reductive ambitions, see Wiggins 1987).

Formulas like (1) also threaten to yield relativism. Since they introduce a necessary link to facts about motivation, moral attribution becomes tied to contingencies of individual psychology. That seems wrong, since moral evaluation purports to abstract from individual interest and motive and to prescribe universality. If one is not correspondingly motivated, that is a deficiency in oneself rather than an excusing condition or a limit on the reach of moral judgment. Each of us recognizes that he or she can in this sense be motivationally defective from a moral point of view. (But see Harman 1975 for a defense of a naturalistic moral relativism.) This has led naturalists to modify the formula away from the individualistic language of “one” or “I” and in the direction of a more inclusive “we” or “everyone” or even “normal humans” (see, respectively, Lewis 1989, Smith 1994, and Firth 1952). New problems arise. The notion of “normal human” threatens to introduce a term that itself requires naturalization—since we believe that statistically “normal” humans might be motivationally defective from a moral point of view—for example, in lacking sympathy with those from other groups. (Of course, one could at this point also embrace circularity.) If we insist that everyone approve, there is again a risk that contingencies of motivational idiosyncrasies will receive authority—this time, in preventing us from attributing moral value to states of affairs virtually all (but still not quite all) of us approve heartily on reflection. A less ambitious alternative is to replace “one” with “us” and seek moral consensus where we may. This would help explain the “outreach” function of moral discourse without altogether removing the account’s relativism.

An alternative approach avoids relativism by “rigidifying” the subjectivist formula (cf. Wiggins 1987). One fixes the truth conditions of moral judgments by reference to the motivations *actually* prevalent in one’s moral community (e.g., “*A* is such that we, with our actual motives and with full and informed reflection, would approve of it”). This secures the desirable result that changes in our motives will not in themselves change what is morally good. But it undermines some of the critical role of moral assessment in our own society (since, again, we can imagine that our actual motives are morally defective) and will have the result that those brought up in different social environments with different acquired motivations will lack a common subject matter even though they believe they are having a genuine moral disagreement (for discussion, see Johnston 1989).

No ethical naturalism has emerged that meets all the desiderata of an account of moral discourse and practice.

Nonnaturalists and nonfactualists attribute this to a mistaken starting point. But no alternative account has met all the desiderata, either. Moral naturalists have often been accused of “changing the subject”—shifting the locus of attention from the position of the agent involved in practical deliberation to that of the scientist engaged in theoretical description. But this criticism begs the question. Naturalists seek to explain, not ignore, moral experience; if they are right, the phenomena they study are the very stuff of moral thought and action.

## ETHICAL NATURALISM [ADDENDUM]

Substantive ethical naturalists believe that the ethical is natural, that is, that ethical properties are natural properties. *Strong*, or *reductive*, ethical naturalists hold that there is an interesting further question of *which* natural properties the ethical ones are, just as there is an interesting question of which chemical property water is (Railton 1986, Jackson 1997). *Weak* ethical naturalists deny this; some hold that ethical properties, though natural, are irreducible (Boyd 1988), while others are in the business of *revising* moral language (Brandt 1979).

Moore’s open-question argument was advanced against strong ethical naturalism, which he claimed committed the *naturalistic fallacy*. The basic idea of the argument is that we can test *cognitive significance* to test claims of property identity. So, for example, if *good* just is *pleasure*, then “Pleasure is good” should mean the same as “Good is good,” and be equally informative to speakers who understand the two statements. There are different versions of the argument, according to which test of cognitive significance is used. It looks like a good argument against those who think that such property identities are *analytic*, or follows from the meanings of the words or the concepts that they express, but not against those who think that this identity thesis is *synthetic*, like the thesis that water is H<sub>2</sub>O (Moore 1903, Brink 1989).

But synthetic naturalism may not have all of the same philosophical attractions as the analytic version. For example, naturalists have long held that naturalism can help explain how we can acquire moral knowledge. This seems easily true of analytic naturalism (Harman 1977), but synthetic naturalists have not yet explained how their

naturalism provides help in moral epistemology not available to nonnaturalists.

More striking is the fact that though it is widely known that synthetic naturalism escapes Moore's open-question argument, many still believe that the argument shows something against synthetic naturalism—a reaction that synthetic naturalists find puzzling. Nonnaturalists typically remain convinced, however, that Moore's argument illustrates how strong naturalism involves identifying ethical properties with something that they are not (Shafer-Landau 2003). And others maintain that naturalists do not really believe in ethical properties at all (Nagel 1985, McNaughton 1989).

It is not hard to see the force of these objections. If a friend tells you that he believes in God because God is love and he believes in love, you are bound to conclude that if he is really speaking literally, then he is an atheist. Whatever theists mean by saying that God is love, it is not simply that God is the relation that holds between two people when one loves the other. Naturalist theories about God seem bound to feel this way. They all seem to identify God with something else, and as a result they fail to be realist about God (Schroeder 2005).

By analogy, this can make ethical naturalism look hopeless. But that would be premature. Strong naturalism is clearly true about bachelors. Bachelors are just unmarried adult men. If your friend tells you he believes in bachelors because he believes in unmarried adult men, you will not conclude that he does not really believe in bachelors. Nonnaturalists think that ethical properties are more like God, but strong naturalists think that they are more like bachelorhood.

One salient difference between God and bachelors is that God is supposed to have features that love and other natural entities lack: omniscience and omnipotence, among others. If your friend does not believe that love is omniscient and omnipotent, then he does not believe in God. But in contrast, it is easy to see that unmarried adult men have the properties of bachelors (Schroeder 2005).

To find out whether ethical naturalism is more like naturalism about God or like naturalism about bachelors, then, we need to think about what features ethical properties have, and whether natural properties could have them. An old idea about the ethical is that ethical properties have to be related in some way to *motivation*. This is the thesis of *internalism*. Nonnaturalists have argued that natural properties could not motivate as internalism requires (Mackie 1977), but some naturalists have

responded by explaining how they can (see especially Smith 1994).

More recently, nonnaturalists have insisted that internalism, even if true, is not what is special about ethical properties. Rather, they say, what is special about ethical properties is that they are *normative*. And if natural properties are not normative, it follows that ethical properties cannot be natural ones (Hampton 1998). But the evidence that natural properties cannot be normative is no better than the evidence that they cannot be ethical. If anything, it is worse. Nonnaturalists typically say that to be normative is to involve *reasons*, in some way. But if *reason* is a natural property, then natural properties could involve reasons, and hence be normative (Schroeder 2005).

A different worry about ethical naturalism is that if ethical properties are natural, then they must be highly disjunctive, and therefore uninteresting. This notion seems to force us to give up the idea that ethical discourse carves nature at its joints. This impression is reinforced by some naturalists who write at a very abstract level, such as Jackson (1997), but it is not sustained by looking in detail at most serious strong naturalist proposals. The problem is one of level of description.

A final serious objection leveled against ethical naturalism applies just as much to weak naturalism as to strong naturalism. It is that naturalism makes ethics out to be an a posteriori discipline, whereas surely ethical knowledge should be a priori (Shafer-Landau 2003). Since nonreductive naturalists hold that what makes ethical properties respectable is that they play a certain explanatory role, they may be particularly susceptible to this charge. But perhaps synthetic strong naturalism can escape it. The fact that empirical investigation was the right way to investigate what natural property samples of water have in common does not entail that empirical investigation is the right way to investigate what natural property right actions have in common. On the contrary, it seems that philosophers engage in the study of what right actions have in common all the time. Such study is ordinary normative ethical inquiry.

## ETHICAL OBJECTIVISM

See *Objectivity in Ethics*

## ETHICAL PRINCIPLES

See *Moral Principles: Their Justification*

## ETHICAL RELATIVISM

The term *ethical relativism* is always used to designate some ethical principle or some theory about ethical principles, but within this limitation different authors use it quite differently. Contemporary philosophers generally apply the term to some position they disagree with or consider absurd, seldom to their own views; social scientists, however, often classify themselves as relativists. Writers who call themselves relativists always accept the first and second and sometimes accept the third of the theses described as descriptive relativism, metaethical relativism, and normative relativism, respectively.

### DESCRIPTIVE RELATIVISM

The first thesis, without which the others would lose interest, is that the values, or ethical principles, of indi-

viduals conflict in a fundamental way ("fundamental" is explained below). A special form of this thesis, called "cultural relativism," is that such ethical disagreements often follow cultural lines. The cultural relativist emphasizes the cultural tradition as a prime source of the individual's views and thinks that most disagreements in ethics among individuals stem from enculturation in different ethical traditions, although he need not deny that some ethical disagreements among individuals arise from differences of innate constitution or personal history between the individuals.

**FUNDAMENTAL DISAGREEMENT.** The most important and controversial part of the first thesis is the claim that diversities in values (and ethics) are fundamental. To say that a disagreement is "fundamental" means that it would not be removed even if there were perfect agreement about the properties of the thing being evaluated. (If disagreement is nonfundamental then it may be expected that all ethical diversity can be removed, in principle, by the advance of science, leading to agreement about the properties of things being appraised.) Thus it is not necessarily a case of fundamental disagreement in values if one group approves of children's executing their parents at a certain age or stage of feebleness whereas another group disapproves of this very strongly. It may be that in the first group the act is thought necessary for the welfare of the parent in the afterlife, whereas in the second group it is thought not to be. The disagreement might well be removed by agreement about the facts, and indeed both parties might subscribe, now, to the principle "It is right for a child to treat a parent in whatever way is required for the parent's long-run welfare." The disagreement might be simply about the implications of this common principle, in the light of differing conceptions of the facts. There is fundamental ethical disagreement only if ethical appraisals or valuations are incompatible, even when there is mutual agreement between the relevant parties concerning the nature of the act that is being appraised.

### METAETHICAL RELATIVISM

A person might accept descriptive relativism but still suppose that there is always only one correct moral appraisal of a given issue. Such a position has been widely held by nonnaturalists and by some naturalists (see, for example, the interest theory of R. B. Perry). The metaethical relativist, however, rejects this thesis and denies that there is always one correct moral evaluation. The metaethical relativist thesis is tenable only if certain views about the meaning of ethical (value) statements are rejected. For instance, if "A is right" means "Doing A will contribute at

least as much to the happiness of sentient creatures as anything else one might do," it is obvious that one and only one of the two opinions "A is right" and "A is not right" is correct. Thus, the metaethical relativist is restricted to a certain range of theories about the meaning of ethical statements. He might, for instance, subscribe to some form of emotive theory, such as the view that ethical statements are not true or false at all but express the attitudes of the speaker. Or he might adopt the naturalist view that "is wrong" means "belongs to the class of actions toward which I tend to take up an impartial attitude of angry resentment" (held by the relativist E. A. Westermarck) or the view (suggested by the anthropologist Ruth Benedict) that the phrase "is morally good" means "is customary."

**ETHICAL REASONING.** At the present time metaethical relativists do not wish to rest their case solely on an appeal to what ethical statements mean; nor would their critics. The point of active debate is rather whether there is some method of ethical reasoning whose acceptance can be justified to thoughtful people with force comparable to the force with which acceptance of inductive logic can be justified. Is there any such method of ethical reasoning that can be expected in principle to show, when there is a conflict of values or ethical principles, that one and only one solution is correct in some important and relevant sense of "correct"? Metaethical relativists deny that there is any such method, and their denial may take either of two forms: They may deny that there is any method of ethical reasoning that can be justified with force comparable to that with which scientific method (inductive logic) can be justified. Or they may agree that there is such a method but say that its application is quite limited, and in particular that the fullest use of it could not show, in every case of a conflict of ethical convictions or of values, that one and only one position is correct in any important sense of "correct."

**USE OF THE TERM RELATIVISM.** Many writers, both in philosophy and in the social sciences, accept a combination of descriptive relativism and metaethical relativism. Philosophers who hold this view, however, seldom label themselves "relativists," apparently because they think the term confusing in this context. There is seldom objection to "cultural relativism" as a descriptive phrase, for it can be taken to mean that a person's values are "relative" to his culture in the sense of being a function of or causally dependent on it. But if "ethical relativism" is construed in a similar way, to mean that ethical *truth* is relative to, in the sense of being dependent on or a function of, some-

thing (for example, a person's cultural tradition), then this term is thought to be confusing since it is being used to name a theory that essentially denies that there is such a thing as ethical "truth."

One frequent confusion about what implies ethical relativism should be avoided. Suppose metaethical relativism is mistaken, and there is a single "correct" set of general ethical principles or value statements. It may still be true, and consistent with acceptance of this "correct" set of principles, that an act that is right in some circumstances will be wrong in other circumstances. Take, for instance, the possible "correct" principle "It is always right to do what will make all affected at least as happy as they could be made by any other possible action." It follows from this principle that in some situations it will be right to lie (for instance, to tell a man that he is not mortally ill when one knows he is, if he cannot bear the truth) and that in other situations it will be wrong to lie. Thus, even if metaethical relativism is false there is a sense in which the rightness of an act is relative to the circumstances or situation. The fact that the rightness of an act is relative to the circumstances in this way does not, of course, imply the truth of metaethical relativism.

#### NORMATIVE RELATIVISM

Neither descriptive nor metaethical relativism commits one logically to any ethical statement. The former is simply an assertion about the diversity of moral principles or values actually espoused by different persons; the latter is only a general statement about whether ethical principles are ever "correct." Nothing in particular about what ought to be, or about what someone ought to do, follows from them. Of particular interest is the fact that it does not follow that persons, depending on their cultural attachments, ought to do different things. In contrast, a person who holds to some form of what I shall call "normative relativism" asserts that something is wrong or blameworthy if some person or group—variously defined—thinks it is wrong or blameworthy. Anyone who espoused either of the following propositions would therefore be a normative relativist:

(a) "If someone thinks it is right (wrong) to do *A*, then it *is* right (wrong) for him to do *A*." This thesis has a rather wide popular acceptance but is considered absurd by philosophers if it is taken to assert that what someone thinks right really is right for him. It is held to be absurd because taken in this way, it implies that there is no point in debating with a person what is right for him to do unless he is in doubt himself; the thesis says that if he *believes* that *A* is right, then it *is* right, at least for him.

The thesis may be taken in another sense, however, with the result that it is no longer controversial, and no longer relativist. The thesis might mean: "If someone thinks it is right for him to do *A*, then he cannot properly be condemned for doing *A*." This statement merely formulates the view, widespread in the Western world, that a person cannot be condemned morally for doing what he sincerely believes to be right. (In order to receive universal approval, some additions must doubtless be added to the thesis, such as that the person's thoughts about what is right must have been the product of a reasonable amount of careful reflection, not influenced by personal preferences, and so on.) The thesis is not relativist, since it is not asserted that any person's or group's belief that something is blameworthy is either a necessary or a sufficient condition of its being blameworthy.

(*b*) "If the moral principles recognized in the society of which *X* is a member imply that it is wrong to do *A* in certain circumstances *C*, then it is wrong for *X* to do *A* in *C*." This principle says, in effect, that a person ought to act in conformity with the moral standards of his group. Like the preceding principle, this one has a good deal of popular acceptance, is espoused by some anthropologists, and has some plausibility; it will be discussed below.

#### DIFFICULTIES IN THE RELATIVIST POSITIONS

The following appear to be the most important questions about the various relativist theses: (*a*) Is descriptive relativism supported by the scientific evidence? There are methodological obstacles in the way of answering the question whether there is fundamental diversity of ethical views. Such diversity would be established by producing two individuals, or cultures, who attribute identical properties to an act but nevertheless appraise it differently. But it is not easy to be sure when one has produced two such individuals or cultures. First, it is difficult to demonstrate that an act is believed to have identical properties by individuals or groups who appraise it differently. Is theft the same thing in societies where conceptions or systems of property differ? Is incest the same thing in societies with different kinship terminologies, different ways of counting lineage, and different beliefs about the effects of incest? It is possible to question members of different cultural traditions in an abstract way so that such differences in conception are ruled out, but then it is likely that the informant will not grasp the question and that his answer will be unreliable. The second difficulty is that there is no simple test for showing that groups or individuals really conflict in their appraisals. We may know that we think it

morally wrong to do so-and-so, but it is not clear how to determine whether a Navajo agrees with us. Perhaps we have first to determine whether the Navajo language contains an expression synonymous with "is morally wrong." Or can we show that a Navajo does not think it morally wrong to do *A* by the fact that he feels no guilt about doing *A*? Or perhaps a mere conflict of *preferences* is sufficient to establish a disagreement in personal values. These questions deserve more discussion among anthropologists than they have received.

The evidence for descriptive relativism consists mostly of reports from observers about what is praised, condemned, or prohibited in various societies, usually with only scanty information on the group's typical conception of what is praised or blamed. In some instances projective methods and dream analysis have been utilized, and discussions with informants have elicited fragments of the conceptual background behind the appraisals. On the basis of such material most social scientists believe there is some fundamental diversity of values and ethical principles. Several decades ago some investigators (among them W. G. Sumner and Ruth Benedict) supposed that the extent of diversity was practically unlimited, but by the 1960s it was believed that there is also considerable uniformity (for example, universal disapproval of homicide and cruelty). One reason for believing there is considerable uniformity is that it appears that it would be difficult for a social group even to survive without the presence of certain features in its value system. (A social system must provide methods for rearing and educating the young, for mating, for division of labor, for avoiding serious personal insecurity, and so on.) Uniformity of evaluation is the rule in areas that pertain to survival or to conditions for tolerable social relationships; in other areas there are apt to be fundamental differences. Psychology adds some support to this construction of the empirical data. It offers a theory of enculturation that explains how fundamentally different values can be learned, and it also suggests how some universal human goals can set limitations to diversity among value systems.

(*b*) Does descriptive relativism support metaethical relativism? It is evident that from descriptive relativism nothing follows about what ethical statements mean or could fruitfully be used to mean. It is also evident that nothing follows about whether there is some method of ethical reasoning that can correctly adjudicate between conflicting ethical commitments, at least in some cases. Descriptive relativism may very well have bearing, however, on whether a justifiable method of reasoning in

ethics (assuming there is one) could succeed in adjudicating between all clashes of ethical opinion. To be sure about this we would need to have an account of the reasonable method of ethical reflection before us. But let us take an example. Suppose we think that the only reasonable way to correct a person's ethical appraisal is to show him that it does not coincide with the appraisal he would make if he were vividly informed about all the relevant facts and were impartial in his judgment. Then suppose the descriptive relativist tells us that some people are simply left cold by the ideal of equality of welfare and that others view it as a basic human right, when both groups have exactly the same beliefs about what equality of welfare is and what its consequences would be. In this case we might be convinced that both parties were already impartial (if the views were not just typical of different social or economic classes) and that further information probably would not change their views. Doubtless much more analysis of the situation is necessary, but it is clear that given the described assumption about actual ideals and the assumption about the limitation of ethical argument, one might be led to a cautious acceptance of the view that not all ethical disputes can be resolved by this justifiable method of ethical reasoning.

(c) Are cultural and metaethical relativism necessarily committed to any form of normative relativism? Neither the cultural relativist nor the metaethical relativist is committed logically to any form of normative relativism. It is consistent to assert either of these positions and also to affirm any value judgment or ethical proposition one pleases. However, the second proposition cited under normative relativism (that a person ought to act in conformity with the moral standards of his group) at least presupposes the acceptance of cultural relativism. There would be no point in asserting this normative principle if cultural relativism were not accepted.

How strong are the arguments that can be advanced in favor of this form of normative relativism? Suppose that in *X*'s society it is a recognized moral obligation for a person to care for his father, but not for his father's siblings (at least to anything like the same degree), in illness or old age. Suppose also that in *Y*'s society it is recognized that one has no such obligation toward one's father or his siblings but does have it toward one's mother and her siblings. In such a situation it is hard to deny that *X* seems to have some obligation to care for his father and that *Y* seems not to have, at least to the same degree. (Some philosophers hold that there is no obligation on anyone, unless one's society recognizes such an obligation for the relevant situation.) So far, the principle seems intuitively

acceptable. In general, however, it appears less defensible, for the fact that *X*'s society regards it as wrong to play tennis on Sunday, to marry one's deceased wife's sister, and to disbelieve in God does not, we should intuitively say, make it wrong for *X* to do these things. Thus, our principle seems valid for some types of cases but not for others. The solution of this paradox probably is that for those cases (like an obligation to one's father) where the principle seems acceptable, the reasons for which it seems acceptable are extremely complex and are not based simply on the fact that society has asserted that an obligation exists. When society recognizes a moral obligation, there are many repercussions that basically affect the types of responsibility the individual may have toward other members of his society. For instance, one result of a society's recognizing a son's moral obligation to care for his father is that no one else will take care of the father if the son does not. Another is that a kind of equitable insurance system is set up in which one pays premiums in the form of taking responsibility for one's own father and from which one gets protection in one's old age. So it is at least an open question whether it can seriously be claimed that the moral convictions of a society have, in themselves, any implication for what a member of the society is morally bound to do, in the way our suggested principle affirms that they do.

## ETHICAL RELATIVISM [ADDENDUM]

Accepting ethical relativism can make a big difference. Opponents often think that the doctrine arises from conceptual confusion and encourages indifference to moral enormities. Advocates think that the doctrine is an antidote to an oppressive moral imperialism that often rationalizes the more worldly forms of imperialism. Both sides can agree that ethical relativism has significant implications for how we should do normative ethics.

### VULGAR AND NOT-SO-VULGAR RELATIVIST ARGUMENTS FOR TOLERANCE

A good example of debate over the normative implications of ethical relativism is Bernard Williams's (1972) criticism of "vulgar relativism," which he defined in three propositions: (1) "Right" means "right for a given society." (2) "Right for a given society" is to be understood in a functionalist sense (roughly, that conceptions of what is right are part of the social fabric). (3) It is wrong for people in one society to condemn or interfere with the values of another society. Williams pointed out that (3) employs a nonrelative sense of "right" and "wrong" excluded by (1). The vulgar relativist confusedly derives a universal

moral principle of toleration from a sense of "right" that excludes any universal principle.

Relativists might deny that they are arguing for universal toleration. Rather, they may view tolerance as a value prominent within certain kinds of moralities—ones that emphasize respect for the autonomy of individuals and peoples and that require intervention in their affairs to be justifiable to them (at least when the intervention is rational and informed). To practice such restraint is to treat individuals as ends in themselves. Moreover, relativists may be addressing those who value autonomy to persuade them in particular that the existence of apparently irresolvable moral disagreements over basic moral values and norms is an occasion for not intervening (Wong 1984).

Indeed, one of the apparently irresolvable disagreements might concern the value of autonomy itself. Some moral traditions emphasize that individuals have morally legitimate interests that ought to be protected when they come into conflict with social interests. Other traditions emphasize that individuals flourish only in relationship to others. The former will provide a central place for the value of individual rights, such as rights to choose one's vocation and rights to privacy. The latter will not, or will have to provide a different basis for such rights, probably in terms of their value to desirable relationships. Reflective and knowledgeable members of both kinds of traditions might become aware of this value difference, and some of them might conclude that members of the other tradition are not necessarily mistaken. It may be, however, that only members of an autonomy-valuing tradition, such as the traditions dominant in the industrialized countries of the West, have a reason to refrain from intervening in other traditions on the grounds that such an intervention impedes members of the other traditions from acting on their reasonable values.

The no-so-vulgar relativist argument for tolerance, then, starts from the premise of metaethical relativism—the doctrine that there can be conflicting moral judgments about a particular case that are both fully correct (Harman 1978b). This metaethical premise coheres perfectly well with a normative premise that values autonomy, and their conjunction yields the conclusion, addressed to those who value autonomy, to refrain from intervening in the affairs of other societies.

### NORMATIVE RELATIVISM

There is another way in which relativism can have implications for normative theory. Gilbert Harman (1978b) defined "normative moral relativism" as the position that

two people can be subject to conflicting moral demands and not be subject to some more basic moral demand that, in their situation, accounts for this. For example, some groups of people think that one ought not to cause animals needless suffering, and others do not. Normative relativism allows for the possibility that the former ought to refrain from causing animals needless suffering and that the latter are not subject to a similar constraint. Harman's path to normative relativism starts from two premises: Moral demands, when applicable, provide people with compelling reasons to act in the required way, and reasons to act are "internal." Reasons are internal if the relevant agents have available warranted practical reasoning leading to a decision to perform the relevant act, and if the practical reasoning is anchored in moral demands that the agents already accept or in other desires, intentions, and beliefs that they have. A controversial part of Harman's argument that reasons are internal is his rejection of the distinction between justifying moral reasons and motivating moral reasons. Justifying moral reasons, according to this distinction, warrant agents to do things without their necessarily being able to reason from existing desires, intentions, and beliefs to a decision to perform the actions.

#### IMPLICATIONS OF METAETHICAL RELATIVISM FOR DOING NORMATIVE ETHICS

Accepting metaethical relativism can shape one's conception of how to do normative ethics. Consider Harman's (1975) account of morality as constituted by the implicit agreements that structure relations among the parties. On this account, many moral disagreements must be understood as disagreements among members of a group bound together by an implicit agreement. They disagree in how to interpret the terms of their agreement or in how to solve or mitigate conflicts between different elements of their agreement. This conventionalist account of morality eliminates the possibility of resolving disagreements by appealing to ideal moral principles existing independently of any implicit agreement. Rather, people are left to work out their differences with each other in ways very much like the give-and-take of politics (Harman 1978a).

Harman applies this idea to explain why the duty not to harm others is commonly perceived to be stronger than the duty to help those in need. Everyone benefits equally from a stringent duty not to harm, but the poor and weak benefit much more from a duty of mutual aid. Since the poor and weak have much less bargaining

power, the expected compromise is just what is commonly accepted: a much stronger duty not to harm. Harman's conventionalist conception of morality prompts an attitude toward moral phenomena that would be different under a robustly realistic conception of morality. Under a conventionalist conception, one comes to view the belief in a stronger duty not to harm not as based on a moral fact existing independently of social convention, but as resulting from the calculus of bargaining. If one desires to change the terms of agreement, one must engage in politics. To strengthen a duty to mutual aid, for example, one might look for points of leverage with which to strike a more advantageous bargain for the poor and weak, or one might appeal to the desires or interests of the rich and strong that go beyond narrow self-interest and are served by a stronger duty to mutual aid.

Metaethical relativism need not rest on such a purely conventionalist conception of morality as Harman's. Rather, one might hold that morality is socially invented under constraints arising from its function in human life of promoting social cooperation and from the features of human nature that make some ways of promoting social cooperation better than others (Wong 1996). The constraints might eliminate some moralities as unsuitable but nevertheless leave several acceptable moralities yielding conflicting, yet fully correct, moral judgments about particular cases. In such cases, when adherents of different and equally correct moral positions must deal with each other, a conception of morality as politics can again seem appropriate.

#### THE NEED FOR A MORAL VALUE OF ACCOMMODATION IN THE FACE OF SERIOUS DISAGREEMENT

The politics involved need not be unconstrained by moral values. One such value is accommodation, defined as a commitment to supporting noncoercive and constructive relations with others in spite of one's disagreements with them (Wong 1992). Such a value is likely to be present in a wide range of moralities because it is needed to manage the divisive effects of moral disagreement. Serious moral disagreement is common even in a group with relatively homogeneous moral beliefs. For example, the source of disagreement over abortion seems to be not so much a difference in ultimate moral principles held by the opposing sides, but partly a difference over the applicability of a commonly held principle requiring the protection of human life and partly a difference over the relative weight to be given to the widely held principle of protecting individual autonomy. Serious disagreement of this kind is

ubiquitous, and if it always threatened to become a source of schism, no society could survive for very long without brutal repression.

Even if accommodation is necessary for managing the divisiveness of disagreement, it does not have automatic priority over the moral values that are the source of serious disagreement. Abortion opponents may accept legal abortion in the early stages of fetal development to accommodate abortion-rights advocates, but be unwilling to accept compromise on abortion in the later stages of fetal development. And they may be unwilling even if they see their disagreement with those who advocate late-term abortion as irresolvable through the use of a common reason. Ultimately, there seems to be no useful general theory that specifies when to accommodate and when not to. It is a matter of judgment in the concrete situation, and also a matter of creatively devising courses of action that both honor one's own values and accommodate others who disagree. Some abortion-rights advocates and foes, for example, have joined common ground in efforts to prevent unwanted pregnancies.

#### ETHICAL RELATIVISM AND THE HIGH AMBITIONS OF MODERN MORAL THEORY

Ethical relativism has a deflating effect on modern normative theory, and especially on its highest ambitions. Consider Thomas Nagel's (1979) classification of five different sources of value: first, specific obligations to other people or institutions that depend on some special relation to the person or institution in question (e.g., motherhood); second, constraints on action deriving from general rights that everyone has, such as rights to liberty of certain kinds or freedom from assault or coercion; third, utility, the effects of what one does on everyone's welfare; fourth, perfectionist ends and values, such as the intrinsic value of scientific achievements and artistic creations; and fifth, commitment to one's own projects and undertakings. On Nagel's view, each of these sources is irreducible. The typical ambition of modern normative theory, however, has been to identify some of these sources as basic and the rest as derivative. Utilitarians, for instance, typically strive to reduce all moral considerations to utility, basing the assignment of individual rights and special obligations on utility. Absent reduction of moral considerations to one source, the next highest ambition is to specify general rankings of sources of value to settle cases of conflict between the several basic values. Deontologists, for example, might strive to specify how individual rights constrain the goal of maximizing utility.

The relativist views such attempts as preaching to the converted. There is no viable reduction of all moral value to one source or even a uniquely correct ordering of several irreducible values. The sources of value reflect the disorderly diversity of what human beings value and the various ways they have of structuring their relations with one another. Relativists hold that social convention plays an ineliminable role in selecting which values a group's morality emphasizes the most and in dealing with conflicts between important values. While relativists might disagree on the degree to which moralities are constrained by independent factors such as the functions of morality or the limits of human nature, they agree that independent constraining factors cannot validate the highest ambitions of modern moral theory. Moreover, even if we descend to particular cases of conflicts between values, the relativist will argue, contrary to Nagel, that there is no uniquely correct answer as to how to resolve such cases (or at least many of these cases) without collective and individual invention (see Walzer 1983, 1987; Wong 1996). If ethical relativism is true, much, if not most, of modern normative theory is wrong-headed, and this perhaps partly explains the intensely negative reaction that the doctrine elicits from many moral philosophers.

See *Emotive Theory of Ethics; Ethical Relativism*

## ETHICAL SUBJECTIVISM

A subjectivist ethical theory is a theory according to which moral judgments about men or their actions are judgments about the way people react to these men and actions—that is, the way they think or feel about them. It follows that moral predicates are not possessed by actions or actors in the absence of people who pass judgments upon them or who respond to them with such feelings as admiration, love, approval, detestation, hate, or disapproval. It follows from this definition that nonpropositional or noncognitive ethical theories are not subjective, for according to them there are no moral propositions at all, and thus moral judgments cannot be propositions about people's feelings.

This definition is also intended to exclude views according to which moral judgments are judgments about how people behave; hence, views such as that “wrong” means “contrary to the accepted code of the society in which the action is performed” will not count as subjective, even if, as seems likely, statements about moral codes are statements about the prohibitory or permissive behavior of the communities possessing these codes. Although this distinction is not hard and fast (for statements about moral codes might often turn out to be statements about how the people possessing these codes think or feel), we shall maintain it in order not to trespass too far into the subject of ethical relativism, which is treated elsewhere. Elements of subjectivism can be found in so many ethical theories that it is almost impossible to give an account of them. The greatest, though not the most consistent, subjectivist was the eighteenth-century Scottish philosopher David Hume. The theory has also been popular among anthropologists, of whom Edward Westermarck was probably the most outstanding.

Subjectivist theories can provisionally be classified according to whether moral judgments are alleged to be about the speaker's thoughts or feelings, about the thoughts or feelings of some group of people, or about the thoughts or feelings of men as such.

### MORAL JUDGMENTS STATE WHAT THE SPEAKER FEELS

The view that moral judgments are about the feelings of the person making the judgment—that what I mean

when I say that an action is right or that a man is good is that the thought of that man or action evokes in me, personally, at this moment, a feeling of approval—has been subjected to an enormous number of objections. It has been argued that, so far from its being possible to identify moral judgments as those judgments that are about feelings of approval, it is in fact only possible to identify feelings of approval as those feelings that are evoked by the judgment that an action is right, and argued that if we feel approval of an action because we judge it to be right, our thinking that it is right cannot be identical with our approving of it. It has also been objected that if the theory is true, all I need do to settle any doubt I have concerning the rectitude of someone else's action is to introspect, and that it is very difficult, if not impossible, to be mistaken about one's feelings, although it is very easy to make a mistake about whether an action is right. More plausibly, it has been alleged that the theory implies that one can only criticize someone else's moral judgment on the ground that the other person is mistaken about how he himself feels.

Some of the worst difficulties for the theory arise from the fact that sentences offered as definitions of moral judgments contain such words as *I*, *now*, and *here*, whose reference depends upon who uses them, at what time, and in what place. From this it follows that one person's moral judgments can never be incompatible with any other person's moral judgments; the sentence “I do not feel disapproval of divorce,” when used by one speaker, does not express a judgment incompatible with that expressed by the sentence “I do feel disapproval of divorce,” uttered by a different speaker. It would appear, however, that when one person says, “Divorce is wrong,” he does mean to say something incompatible with what someone else means when he says, “Divorce is not wrong.” From the fact that moral judgments are alleged to have a covert reference to the feelings the speaker now has, it follows that if at one time he judges an action (say, Brutus's assassination of Caesar) to be right, his judgment is not incompatible with the judgment he may make at a later time when he judges Brutus's assassination of Caesar to be wrong. For according to this theory, what he meant on the first occasion was that he did not then feel disapproval of Brutus's assassination of Caesar, and what he meant on the second occasion was that he now does. Clearly there is no reason why both judgments should not be true.

G. E. Moore, in a famous argument, attempted to deduce that the subjectivist theory led to the paradoxical conclusion that the same action could be both right and

wrong, and that one and the same action could change from being right to being wrong. (It is important to remember that Moore thought classes of actions—for example, marrying one's deceased wife's sister—could change from being right to being wrong, that is, that an instance of a class of actions, performed at one time, might be right, while another instance of the same class of actions, performed at a later time, might be wrong.) First, Moore argued as follows. If Jones approves of Brutus's assassination of Caesar and says Brutus was right, it follows from the theory that Brutus was right. Similarly, if Smith disapproves of Brutus's assassination of Caesar and says Brutus was wrong, then Brutus was wrong. Hence Brutus was both right and wrong to assassinate Caesar. Second, to show that Brutus's assassination of Caesar can change from being right to being wrong, all Moore thought he need do was to point out that if Jones says (at a time when he approves of Brutus's action) that Brutus was right, then according to the theory, Brutus was right; if he later comes to disapprove of Brutus's action, then, if he says Brutus was wrong, according to the theory, Brutus was wrong. If Jones can truly judge at one time that Brutus was right and at a later time that Brutus was wrong, it must follow that Brutus's action has changed from being right to being wrong.

C. L. Stevenson has criticized Moore's argument in the following manner. Although Jones can truly say that Brutus was right to assassinate Caesar and Smith can truly say that Brutus's action was wrong, neither Jones nor Smith nor anyone else can say that this action is both right and wrong. For anyone to be able to say it is both right and wrong, someone would have both to approve of it and disapprove of it. Hence, although Jones, who approves of Brutus's action, can say it is right, and Smith, who disapproves of it, can say it is wrong, neither can say it is both right and wrong. Moore's mistake, perhaps, consisted in construing the theory we are considering as maintaining that "right" is a predicate like "disapproved of by *someone*" (from which it would follow that the same action can be both right and wrong), whereas "right" is alleged to be a predicate like "disapproved of by me, the speaker," from which it follows that the same action cannot be both right and wrong, since the speaker cannot both approve and disapprove, on the whole, of one and the same action.

A free exposition of Stevenson's criticism of Moore's argument (that if the view that moral judgments are statements about the speaker's feeling is true, one and the same action can change from being right to being wrong) might take the following form. Moore supposes that if ten

years ago I could truly say Brutus was right to assassinate Caesar (because at that time the thought of this action did arouse approval in me) and now I can truly say that Brutus was wrong to do this (because at this time the thought of his action arouses disapproval in me), it follows that the action must have changed from being right to being wrong. Stevenson, however, points out that the statement "Brutus's action has changed from being right to being wrong" is equivalent to the conjunction of statements "Brutus's action was right a while ago" and "Brutus's action is now wrong." Although the truth of the second of these statements is entailed by the fact that I now feel disapproval of Brutus's assassination of Caesar, the first of them is not entailed by the fact that I earlier felt approval of Brutus's assassination of Caesar. Although Moore supposes "Brutus's assassination of Caesar *was* right" to mean "I *once* approved of Brutus's assassination of Caesar," what it actually means is "I *now* approve of Brutus's erstwhile assassination of Caesar," and, *ex hypothesi*, "I do not now approve of Brutus's action, I disapprove of it." Moore's mistake is to suppose that the word *was* in the sentence "Brutus *was* right to assassinate Caesar" shows that the sentence is about my past approval, whereas in fact its function is to show that it is the action I am disapproving of, not my disapproval, that is past.

Although Stevenson's detailed criticisms of Moore are valid, it is possible to restate Moore's arguments in a way that avoids them. To take the second of Moore's arguments first, it would plainly be absurd for me to say that Brutus was wrong to assassinate Caesar and at the same time to say that I was correct many years ago when I judged that Brutus was right to assassinate Caesar. If I now say he was wrong, I am bound to say that when, earlier, I said he was right, I was mistaken. In regard to the first argument, although it does not follow from this subjectivist theory that anyone can say that an action is both right and wrong, it does follow that if Jones says that Brutus was right to assassinate Caesar, he is not saying anything incompatible with what Smith is saying when he says that Brutus was wrong to assassinate Caesar.

Clearly, however, Jones and Smith think they are saying something incompatible, and it is unlikely that they have such a poor understanding of how to use their own language as to be mistaken on this point. In other words, according to the subjectivist theory, if Jones says Brutus was right to assassinate Caesar, Smith can say to Jones that Brutus was wrong and at the same time agree that Jones is making a true statement when he says that Brutus was right. This is absurd. Stevenson has tried to over-

come this particular difficulty by saying that although insofar as Jones and Smith are making assertions, their assertions are not incompatible with one another, they are doing something over and above asserting things—namely, Jones is trying to evoke in Smith an attitude of approval toward Brutus's action, and Smith is trying to evoke in Jones an attitude of disapproval toward Brutus's action. Hence, although their beliefs are compatible, their interests clash. Jones aims to achieve something that is incompatible with what Smith aims to achieve. A consideration of this view of Stevenson's, however, would take us away from subjectivism to a consideration of non-propositional ethical theories.

The difficulties already mentioned may well be fatal to the type of subjectivist theory we are considering, at any rate as long as it is not bolstered by the nonpropositional theory. Moreover, there is a further difficulty that seems to settle the issue. Suppose Jones says that the death penalty for murder ought to be retained in Great Britain, and he says this because he wrongly supposes that abolishing the death penalty would lead to an increase in the number of murders. According to this kind of subjectivism, all Jones means when he says that the death penalty ought to be retained is that the thought of retaining it arouses in him feelings of approval, and since it does do this, his statement that it ought to be retained is true, however mistaken he may be about the facts of the situation. He is under no obligation to withdraw his statement, therefore, when he discovers his mistake. Again, this is absurd.

### MORAL JUDGMENTS STATE THE SPEAKER'S THOUGHTS

So far we have considered the view that moral judgments are judgments to the effect that the action under judgment arouses certain feelings in the person making the judgment. It is possible, however, to think that what someone making a moral judgment is asserting is that the action or person being judged arouses in the person making the judgment certain thoughts or beliefs. The most natural view is that someone who asserts that an action is wrong is saying that the thought of the action arouses in him personally the belief that it is wrong, or in other words, that all we mean when we say that an action is wrong is that we personally think it is wrong. This view is circular because even though it offers a definition of "wrong" (that is, it maintains that "X is wrong" just means "I think X is wrong"), the word *wrong* still occurs in the definition (compare "'thoroughbred horse' means 'horse both of whose parents are thoroughbred horses'").

It is obviously impossible to get rid of the circularity by again substituting "thought wrong" for "wrong" in the definition, however many times we do it.

### OBJECTIVE AND SUBJECTIVE SENSES OF "RIGHT"

It is quite commonly held that whenever one thinks one is acting rightly, one is acting rightly. Philosophers who hold this view, however, are not properly regarded as subjectivists. Clearly, if the word *right* is being used twice in the same sense when it is asserted that one is doing rightly if one does what one thinks is right, the view is contradictory. According to it, one would be acting rightly even if one did what one mistakenly thought was right: From the fact that one mistakenly thought it was right it follows that it is wrong, and from the fact that one is acting rightly if one does what one thinks is right, it follows that the act is right. Those philosophers who have held this view, however, have generally distinguished two senses of the word *right*, sometimes called an objective sense and a subjective sense, and have held that an action is right, in the subjective sense, if it is thought to be right in the objective sense. This removes both the contradiction and the suggestion that the property of being right depends on being thought to be right; the property of being subjectively right depends on the different property of being thought to be objectively right.

### MORAL JUDGMENTS STATE WHAT A COMMUNITY FEELS

Next to be considered is the view that when individuals make moral judgments they are talking not about the way they themselves think or feel about the things they are judging, but of the way some group of people thinks and feels about these things. Presumably the group of people might be named by a proper name—for example, "Englishmen" or "Melanesians," or more plausibly (to avoid the difficulty that Englishmen cannot be supposed to be talking about the feelings of Melanesians and vice versa) by a descriptive phrase such as "my group" or "the community to which I belong." The theory that moral judgments are about the feelings of the speaker's own community is open to a large number of the objections to which the private reaction theory is open and a few more besides. Although two people, one of whom says a given action is right and the other of whom says that the same action is wrong, will be saying incompatible things if they belong to the same community, if they belong to different communities their statements will be perfectly compatible. Again, if a man says at one time that an action is right

and at a later time that the same action is wrong, there is no need for him to withdraw his first assertion, provided that the attitude of the community to which he belongs has changed during the interval. In that case there is no reason why both his first assertion and his second assertion should not be true. It follows, too, that however ignorant or mistaken a given community may be concerning the nature of the action being morally assessed, the statement by a member of that community that the action is right will be true as long as his community does approve of it. For example, if a community disapproves of giving eggs to pregnant women because it believes that this will cause them to give birth to chickens, the statement by a member of the community that it is morally wrong to give eggs to pregnant women will be a true one, because this community really does have the feelings it is alleged to have.

Over and above these quite fatal objections, the theory that moral judgments state how members of a community feel about the actions under judgment is exposed to two difficulties, to which the view that they state how the speaker feels is not exposed. Although one might just accept the conclusion, implied by the latter theory, that one discovers a given action is right by introspection (in Hume's language, by looking inside one's breast and discovering there a sentiment of approval or disapproval), it is quite impossible to accept the view that one discovers a given action is right simply by asking other members of one's community whether they approve of it. The theory also leads to the quite unacceptable consequence that anyone who believes, for example, that most of his community approves of retaining a law against homosexuality and at the same time believes that the law against homosexuality ought to be abolished believes two logically incompatible things; for, according to this theory, what he is believing when he believes that the law against homosexuality ought to be abolished is just that most of his community would feel approval of its abolition.

A variant of this last theory would be the view that what we mean when we say that an action is right is that it is approved of by the agent's community, not the speaker's. This is more plausible because it means that instead of condemning actions performed in distant places or times because they do not accord with the moral attitudes of our community, we may praise them because they do accord with the moral attitudes of the community to which the man who performed them belonged. Hence, it appeals to a tendency in some modern moral philosophers to be rather absurdly uncritical of the moral attitudes of communities other than their own. They may

be less willing to accept this variant theory, however, when they realize that if it is true, they must be equally uncritical of the morals of their own community. It must be pointed out that according to this theory, if one says, "Introducing racial segregation into University *X* was wrong," one means that introducing segregation into the university was disapproved of by the community in which the action was performed. It is perfectly obvious, however, that one might perfectly well think that it was wrong and at the same time know that it was not disapproved of by the community in which it was performed. Again, this theory has the difficulty that even when a community disapproves of some practice only because the community is grossly mistaken concerning its nature (as in the case of the women and the eggs), we are still bound to say that the practice is wrong, providing the community does in fact disapprove of it.

#### MORAL JUDGMENTS STATE WHAT MOST PEOPLE FEEL

The objections that have already been raised against earlier types of subjectivism can be applied without much difficulty to the view that what we mean when we say an action is right is that most people approve of it. This theory does imply that any two individuals (whoever they are), one of whom condemns an action and the other of whom judges it to be right, really will be saying incompatible things, for it cannot be that most people approve of an action and at the same time disapprove of it. However, since people may change from approving of something to disapproving of it, the theory does entail that a man may judge an action to be right and later judge the same action to be wrong without having to retract his first judgment. The theory means that an action is wrong if most people feel disapproval of it, however ignorant or mistaken they may be about the nature of the action. It also means that it is impossible for a man to make up his mind concerning the rectitude of any action unless he has decided whether humankind in general would approve of it; it is obvious, however, that we can make up our minds on such questions without having the least idea what the attitude of most men would be. In view of what has already been said about the theory that what we mean when we say that an action is right is that the speaker thinks it is right, nothing need be said about the analogous views that an action is right if the speaker's community thinks that it is right, or that an action is right if most people think that it is right.

It is fairly obvious from what has been said that all subjectivist theories need to be amended, at least to

exclude the possibility that the attitude of the people we are alleged to be describing when we make moral judgments is not based on ignorance or mistake. Hence, a consideration of subjectivism may lead to the view that an action is right not if it is approved of by any actual person or group of people, but only if it would be approved of by a person of a very special kind—for instance, one who, at the very least, is never ignorant of or mistaken about any relevant matter of fact concerning the action toward which his attitude of approval is directed. Hence, a consideration of subjectivism must inevitably lead to a consideration of ideal observer theories; these, however, are best treated as a variety of ethical objectivism.

## ETHICAL THEORY

See *Metaethics*

## ETHICS

Ethics is the branch of philosophy that tries to understand a familiar type of evaluation: the moral evaluation of people's character traits, their conduct, and their institutions. We speak of good and bad people, the morally right or wrong thing to do, just or unjust regimes or laws, how things ought and ought not to be, and how we should live. One part of the subject, metaethics, is concerned with what such judgments mean, what, if anything, they are about, whether they can be true or false, and if so what makes them true or false. The other part of the subject, normative ethics, is concerned with the content of those judgments: What features make an action right or wrong; what is a good life; and what are the characteristics of a just society? This entry will concentrate on

normative ethics, though some comments on metaethics will be unavoidable. And within normative ethics it will concentrate on general principles and foundations (what is usually called moral theory) rather than on applied ethics, the discussion of specific cases. Moral theory seeks a systematic understanding of the full range of moral convictions and disagreements and of their possible grounds.

### WHAT IS MORALITY?

Morality of some kind seems to be a universal human phenomenon; it is a subpart of the broader domain of the normative, which seems also to be characteristically human. Normative questions and judgments are about what we ought to do, want, believe, or think (rather than just about what we actually do), and about the reasons for and against doing or believing one thing rather than another. Only rational beings, and probably only beings with language, are capable of normative thinking.

Many normative questions are not moral. If we ask whether we ought to believe on the basis of the available evidence that a painting is by Rembrandt, that is a normative question, but not a moral one. Moral questions are about what we ought to do and how we ought to live, not about what we ought to believe. In answering them we need to appeal to what are called practical reasons—reasons for doing or wanting something—rather than the purely evidential or theoretical reasons that determine the justification for factual or scientific belief.

But not all practical reasons and practical norms are moral, either. There are norms that tell you what you ought to do to keep your rose bushes healthy, the right way to make an omelet, or what to wear if you are going to be knighted by the queen, but these are not moral judgments. The moral is a subpart of the large normative domain of the practical.

Its further definition is the subject of controversy among different moral theories, but a rough approximation is this: Morality identifies certain norms that apply to everyone in a certain group and that should be recognized as valid for everyone by each member of the group although their separate individual aims and desires may differ and lead them into conflict with one another. In most, but not all modern moral theories, the group to which moral norms apply includes all mentally competent human beings. In such theories morality is conceived as consisting of universal norms.

Morality aims to provide us, in the practical domain, with a common point of view from which we can come

to agreement about what all of us ought to do. This may be different from what each of us might want to do or want other people to do, if we looked at the question only from our own personal point of view. Morality tries to discover a more objective standpoint of evaluation than that of purely personal preference.

Much of the content of moral norms has to do with our relations to each other—how we treat each other in our individual conduct and how they are treated by collective institutions that we support. There are also moral norms and evaluations having to do with the way we conduct our own lives, norms that tell us how anyone may succeed or fail in living well. Virtues like prudence and self-control are examples of this universal but partly self-regarding aspect of morality. There are also important moral questions about our relations to the rest of the natural world, especially to other animals. But the bulk of the subject has to do with our lives as members of the human community.

Though there are ethical relativists who disagree, moral rules such as those that condemn murder, injury, lying, stealing, and betrayal and endorse kindness, honesty, and generosity are usually thought to apply universally. Whether this can be shown is one of the big questions of ethics, but such norms are not supposed to depend for their validity on the code of a particular society or group or the laws of a particular government. They are not like local codes of etiquette, taboos, or specific traffic or commercial regulations. Even the wrongness of a crime like murder does not depend on its being against the law. Rather, moral norms are supposed to be recognizable by a form of thought that is available in principle to any adult human being—even though some people may be better at it than others.

At the center of morality are standards that serve not only the interests of a particular individual who follows them but also the collective good of the community, by making it a safer place or otherwise promoting the general welfare of its members. But for those standards to do their work, most people have to adhere to them. Normative ethics tries both to identify such standards and to explain how individuals, even though their interests diverge in many respects, can be attached to universal norms that serve the common good.

### OBJECTIVE REASONS OR SUBJECTIVE FEELINGS?

Most moral theories ascribe a kind of objectivity to moral judgments, because such judgments are supposed to issue from a point of view that different people can share and

that enables them to arrive at agreement about what should be done, what would be wrong, what would be fair, and so forth. Even when people disagree about such things, they usually share the belief that there is a right answer to the question, though they do not agree about what it is. They do not think of their moral disagreements simply as a divergence of personal preferences.

However, there is controversy about the exact nature of the convergence of judgments that we try to reach in moral thinking and about its source. This is one of the main questions of metaethics: Are moral judgments based on universally valid reasons, which would permit them to be objectively true or false, or do they merely express widespread subjective feelings that many people share? In the latter case, while we can come to agree in these judgments, they do not make claims that are either true or false; rather, they express certain attitudes or responses—though perhaps responses on which all human beings can converge.

One of the most important defenders of the subjective alternative is the eighteenth-century Scottish philosopher David Hume (1739, 1751). He argues for the claim that moral judgments express a special type of feeling, sentiment, or attitude on the ground that this is needed to explain how moral norms, like other practical norms, are capable of motivating people to act.

For example, if someone judges that it would be wrong to leave a campsite littered with garbage, this will probably move him or her to take the trouble to clean it up before he or she leaves. If we assume further that motivation must always start from some desire or feeling of the agent, it seems to follow that morality must get its motivational force from something of that kind—for example, from a sympathetic aversion to the unhappiness of others. For how could the recognition of any truth revealed by reasoning or thought alone, without the help of a desire, have the motivational consequences of a normative judgment?

Defenders of the objective alternative usually hold a different view of motivation. They are likely to maintain that while feelings and desires are often the source of motivation, there is also a form of practical reasoning that is capable of motivating rational persons on its own, through the recognition of existing reasons alone. If you decide, after considering the effect on others, that it would be wrong to leave the campsite a mess, you recognize that you have a reason to clean it up, and that will lead you, if you are a decent person, to do so. On this view the motive is produced by recognition of the norm,

rather than the norm being the mere expression of a pre-existing feeling or motive.

This opposition between the view that moral judgments express subjective feelings and the view that they express objective normative beliefs capable of being true or false has many different forms and subtle variations, but it is present everywhere in ethical theory, and in some cases it plays an important role in disputes over the normative content of morality, although it is primarily an issue of metaethics. It is also important in discussing the question whether moral standards have a universal basis, or whether they are really culturally relative. On the subjective or expressivist theory the relativist conclusion is not necessary, but it seems more of a possibility than on the theory of objective moral reasons.

## MORALITY AND SELF-INTEREST

One of the great questions of ethics is whether, and if so to what extent, morality requires us to subordinate our individual self-interest to the general good. There is one view, whose most important representative is the seventeenth-century English philosopher Thomas Hobbes (1651), according to which morality does not conflict with self-interest because its requirements actually derive from self-interest in a subtle way.

Hobbes's argument is that certain rules of conduct are necessary for human beings to live at peace with one another and to enjoy the benefits of civilization, because if people do not abide by those rules they will fall into a miserable condition of insecurity and violence. They are the rules of morality, prohibiting murder, assault, theft, fraud, breach of contract, and so forth, and it is in every individual's self-interest to live in a society in which they are followed. General adherence to morality serves the collective self-interest of all the individual members of any community.

This alone is not enough, however, to show that private adherence to those rules is in the individual self-interest of each member of the community. That general adherence is in the collective interest of all does not imply that individual adherence is in the personal interest of each, because an individual cannot by his or her own conduct bring it about that others will act in the same way. What would serve the collective self-interest therefore does not necessarily coincide with what people would be led to do by their individual self-interest.

Hobbes thinks that reasoning allows us to see that collective self-interest would be served by general adherence to the rules of morality, but that individual self-

interest makes it irrational to follow those rules on our own, since that would simply permit others to take advantage of us. He concludes that to bring the rule of morality into effect, it is necessary to provide all individuals with incentives guaranteeing that individual and collective self-interest will coincide. This can be done only by a system of law, enforced by a sovereign with a monopoly of force over the members of the community. Only then will it be safe for each person to follow the rules, knowing others will also follow them because it is likewise in their personal interest to do so.

According to this theory self-interest does not motivate us to abide by the requirements of morality directly. If we could get away with it, self-interest would lead us to prefer that everyone else followed the rules, while we ourselves were exempt from them. But that alternative is not available, and it would be much worse for each of us if no one followed the rules. So the uniform solution that serves all of our interests best is that everyone follow the rules and that a system of incentives be set up to ensure that no individual can do better for himself or herself by breaking them.

There are also theories descended from that of Hobbes that preserve the connection between morality and self-interest but do not rely for stability only on external incentives produced by the enforcement mechanisms of a legal system. The Canadian American philosopher David Gauthier (1986) proposes that some of the work of bringing individual and collective self-interest to coincide can be done by internalizing the moral rules, so that individuals are inhibited against breaking them even apart from the threat of punishment. Feelings of guilt, for example, are a kind of emotional self-punishment that people who have internalized the rules inflict on themselves when they break them. It is in our collective interest for each member of the community to be subject to such feelings, because a community in which the moral norms have been internalized in this way provides its members with the benefits of mutual trust and peaceful cooperation.

In views of this kind there is already a departure from the reliance exclusively on self-interest to motivate moral conduct, even though morality is thought to serve the interest of each of its adherents. But many moral theories put a much greater distance than this between morality and self-interest. In different ways, most modern accounts of morality part company with Hobbes and base the appeal of moral norms on a concern for everyone, not just for oneself. This means that morality may sometimes require the individual to sacrifice his or her own interests

for the good of others or to avoid transgressing the rights of others. That poses the question of the nature of the reasons or motives that can outweigh self-interest in these cases. If you can make a gain by harming someone else, why shouldn't you do it?

## CONSEQUENTIALISM AND UTILITARIANISM

One important type of answer to this question is that everyone's life is just as important or valuable as everyone else's, and in particular your happiness is no more valuable than other people's happiness. Therefore, you have a reason to care impartially about what happens to everybody, and in your conduct should try to promote the general good and not just your own.

This depends on an important distinction between two ways in which things can be good or bad: They can be good or bad for someone, or they can be good or bad, period. If something is good for me, that obviously gives me a reason to want and promote it, but it does not obviously follow that anyone else has a reason to want and promote it, unless it is also good for him or her. But if something is simply good, period, then it is something anyone has a reason to want and promote.

Some things, like health and pleasure, are clearly good for the person who has them. And it is possible to hold the view that this is the only kind of value there is—value for someone. On this view there may be things, like the destruction of the ozone layer, that would be bad for everyone, but even that would not make it bad, period. Most ethical theories, however, hold that some of the things that are good or bad for individuals, like pleasure and pain, or happiness and unhappiness, are also good or bad without qualification—objectively good or bad, one might say. And each person has a common reason to promote what is good and to prevent what is bad in this way—not only what is good or bad for him- or herself. Some theories derive the content of morality entirely from such a conception of objective value—maintaining that morality emerges once we recognize the objective value and disvalue of the occurrence of all those things that are good or bad for individuals.

Utilitarianism is the most fully developed version of such a theory. A version of it is found in Hume; it was further developed by the English philosophers Jeremy Bentham (1798), John Stuart Mill (1863), and Henry Sidgwick (1907) and continues to be influential. Utilitarianism holds that morality is simply the specification of those forms of conduct that contribute most effectively to

the greatest overall happiness for all persons—or all sentient beings—impartially considered.

The basic value on which the whole theory depends is some measure of what is good in the lives or experiences of particular individuals—what is in itself desirable for them, and therefore also objectively valuable. This may be pleasure and the avoidance of pain, happiness and the avoidance of unhappiness, the satisfaction of their desires or preferences and the avoidance of their frustration, or perhaps some other measure, depending on the particular version of utilitarianism. Whatever the measure, it must be roughly quantifiable in a way that allows comparison between persons, and addition and subtraction of the amounts of the value to determine the total that is present in complex cases involving many people with different experiences.

This measure of value is called utility (a technical term—in this context the word does not mean “usefulness”). Utilitarianism is the theory that we should act, and organize our institutions, so as to promote the maximum total amount of utility, weighing the utility that arises in the lives of all persons impartially. This is sometimes crudely expressed by the formula “the greatest good for the greatest number.”

What matters, according to this view, is not the quality of our actions themselves but the utility, as measured for example by general happiness, of the overall outcome of what we do, compared with the available alternatives. For this reason utilitarianism is an example of a consequentialist moral theory. It is results that matter, not the means by which we reach them. So an important feature of consequentialism is that it does not make a fundamental moral distinction between positive and negative responsibility for good or bad outcomes.

For example, one is positively responsible for someone else’s suffering if one deliberately hurts that person, but negatively responsible if one fails to save him or her from being harmed. According to utilitarianism this alone makes no moral difference between the two cases: Morality does not require merely that you not harm people; it makes you equally responsible for the prevention of harm, from whatever cause. It even requires you to cause harm if that is the most effective way to bring about the greatest overall balance of good. If there is a moral difference between harming and failing to prevent harm, it must be due to some difference in the utility of the results.

Another significant feature of utilitarianism is that what matters in determining the rightness or wrongness

of actions is the total utility that results, not how it is distributed among individuals. In calculating the total we add together or aggregate quantities of utility from different lives, and the sum of many small amounts of pleasure or pain from different people’s experiences may add up to much more utility than the intense pleasure or pain of one individual.

Working out the details for principles of conduct and political, social, and economic institutions depends on estimates of the likely results of the various alternatives, and combining probabilities and utilities to arrive at a measure of what is called expected utility. This is often uncertain and difficult. But the ultimate moral foundation is simple: What matters is that people should have good experiences and avoid bad ones, and the higher the overall balance of good minus bad, the better. The aim of morality is to tell us how to maximize the amount of good in the world, where good is measured objectively and impartially, so that our own personal good is no more important a part of the total than anyone else’s.

## RIGHTS, OBLIGATIONS, EQUALITY, AND DESERT

Some familiar aspects of ordinary moral thought do not seem to conform to the utilitarian standard. One of the most controversial issues in moral theory is whether those aspects can be explained by utilitarianism, and if not, whether we should conclude that utilitarianism is false or that those aspects must be rejected.

Apparently, counterutilitarian moral norms are those that either require or permit a course of action or policy that fails to maximize utility. One type of example is found in the large and diverse category of individual rights, which include rights against certain kinds of interference or violation by others, and rights to do what one wishes so long as one does not violate the rights of others.

For example, it seems to be widely accepted that each individual has a right not to be killed, injured, enslaved, kidnapped, or imprisoned if he or she is not hurting anyone else—even when violating one of those rights would be useful as a means to producing a large net balance of benefits overall. Even if someone else’s life could be saved by forcibly taking one of your kidneys and transplanting it to him or her, this would not be morally acceptable if you did not consent to it. For another example, each of us is generally thought to have a right to devote most of our resources and attention to our own life and the lives of our friends and family, even if we could do more good

overall by dedicating ourselves to the general welfare of everyone.

Other examples come from the sphere of special obligations, both those that arise from particular undertakings, like contracts and promises, and those that follow from standing conditions like citizenship and family membership. Conventional morality holds that one is obligated to keep a promise even if marginally more good than harm would be done by breaking it, that one should give special weight to the welfare of one's children, and so forth.

In ordinary moral reflection on social policy and public institutions, considerations of fairness seem to be sensitive not to the total aggregate welfare produced, but to the distribution of benefits and disadvantages among individuals. A distribution that produces greater total welfare at the cost of great inequality between rich and poor may be morally inferior to one with a lower total but less poverty and more equality of opportunity.

Finally, in thinking about the criminal law, the allocation of punishments seems to be justified not merely by what would produce the most utility, through deterrence and prevention, but also by the requirement that only those who are guilty be punished, and that the punishment deserved is proportional to the gravity of the offense. (The idea of moral desert brings up the large question of free will and moral responsibility. There are those who doubt that people can be responsible for their actions in a way that would mean they deserve punishment for wrongdoing, so that punishment can be justified only as a deterrent. But that issue is beyond the scope of this discussion.)

What these familiar moral ideas have in common is that they do not appear at first sight to interpret the right as what will maximize the overall good for individuals. They seem to rely instead on independent standards for what is right and wrong—standards that either permit or require certain types of actions even if we believe they will not produce the greatest impartial benefit. Such standards set certain moral limits on what we may do to other people and impose certain positive requirements as well, including moral requirements that must be met by the institutions of government. But they leave us morally free to lead our lives as we wish within those boundaries, without having to take the promotion of the general good into account in all our choices.

Standards of this kind (often referred to as deontological standards by contrast with the consequentialist variety) seem to require a foundation different from the

impartial concern for the interests of all, which is the basis of utilitarianism. But before discussing what that foundation might be, it is necessary to consider the utilitarian response.

## ACT-UTILITARIANISM AND RULE-UTILITARIANISM

Hume holds that all of morality can be accounted for by its tendency to promote utility, but that this works in two different ways. In some cases the relation of a morally good or bad act to utility is direct, as in the case of kindness or cruelty. These he describes as examples of the natural virtues and vices—types of conduct that increase or decrease utility act by act, through their direct causal effects.

But there is another set of moral requirements, which he calls the artificial virtues, where the effects on utility are not necessarily produced by each morally good act taken alone. Instead, the good effects are produced only by a general rule, convention, or practice, and it is one of the conditions of the utility of rules of this kind that they must be followed even in individual cases where the particular action they require is harmful to utility.

The utilitarian explanation of strict rights, obligations, and duties depends on this type of analysis, which is called rule-utilitarianism—by contrast with act-utilitarianism, which assesses the rightness of actions by their effects on utility taken one by one. For example, the institution of stable property rights, without which a functioning economy would be impossible, requires that property owned by one person should not be subject to appropriation by another person whenever the latter can get more utility from it than the former. A landlord has to be able to charge his or her tenants rent, even though they may need the money more than he or she does, or else no one would invest in rental property. The great utility of the general rules of property depends on their being consistently followed even in cases where violating them would advance utility, since that is the only way to ensure security and stability.

Likewise, the institution of promises has great utility because it makes it possible for people to rely on each other's future conduct and to create such reliance. But it can do so only because it is not permissible to break a promise whenever this would produce more utility than keeping it.

To some extent the utilitarian advantage of such rules can be obtained by embodying them in laws of property and contract that are enforced by the courts. But

the rules also seem to have moral weight apart from such enforcement: Violation of property rights and breach of promise seem wrong in themselves, and the rule-utilitarian explanation is that they are wrong because they violate valuable institutions or conventions.

Similar explanations can be offered of why it is morally permissible for individuals to live their lives without making every decision on the basis of how they can contribute the most to maximizing utility for humanity as a whole. The reason is that so much of human happiness depends on the pursuit of personal aims and fulfilling personal relationships, and a strict requirement that every act must strive to maximize general utility would make personal projects, friendships, and commitments impossible. In other words, a world governed by strict act-utilitarianism would be a world with much lower overall utility than a world in which not every action aimed to maximize impartial utility.

These are only some examples. The rule-utilitarian strategy can be applied to a wide variety of apparent exceptions to utilitarianism, including rights of bodily integrity, the requirement that punishment be deserved, the right to freedom of speech, the special obligation of parents toward their children, and the values of political, social, and economic equality.

Still, it is not clear just how much of the apparently counterutilitarian morality of rights, obligations, and permissions can be accommodated by rule-utilitarianism in this way. For example, the Australian philosopher Peter Singer (1972, 1979), a prominent utilitarian, argues that in the very unequal world in which we live, there is no justification for the moral latitude most well-off people in rich countries assume they have to favor themselves and their friends and families, when their resources could bring so much more benefit to the destitute in impoverished countries. In Singer's view utilitarianism should be seen as a radical position that cannot be used to underpin conventional morality, but requires that it be overturned.

There is also a theoretical problem about the relation between rule-utilitarianism and moral motivation. The problem is that, if a utilitarian is attached to property rights and the obligation of promises because of the contribution of those institutions to general utility, that does not explain what his or her reason is for abiding by the rule in an individual case that clearly does not serve utility. The utilitarian may say that there is a strong moral reason to want the institution of promises to exist. But if breaking a promise in a particular case will not cause the institution to disappear, or even weaken it noticeably, and if he or she can thereby produce more benefit than harm,

why should the utilitarian's moral aim of maximizing utility not lead him or her to conclude that breaking the promise is the right thing to do in that case?

Some utilitarians are prepared to accept this conclusion. This is the act-utilitarian position, according to which laws, conventions, and practices may change the circumstances in ways that affect what acts will best promote utility, but can never make it right to do what one knows will not produce the most benefit.

Others believe that, since utility is best served if individuals have internalized a strict attachment to certain rules so that they are unwilling to break them even to promote utility, this creates an independent reason for adherence in such cases. In a sense, the utility of the rule provides a justification for the moral fiction that there is a reason to act contrary to utility in the particular case.

## KANTIAN CONTRACTUALISM

The main rival to a consequentialist foundation for rights and special obligations is a theory that emphasizes the separate importance of each individual person instead of the value of maximizing the sum of benefits to the aggregate of all persons. According to this alternative the aim of morality is to find principles of conduct under which people are given equal consideration, not merely as elements in an aggregate, but as individuals. This would mean that the apparently counterutilitarian character of individual rights, for example, is real and cannot be explained away by rule-utilitarianism.

The most important representative of this type of theory is the eighteenth-century German philosopher Immanuel Kant (1785, 1788), who holds that moral principles can be identified directly by reference to a single standard, which he calls the categorical imperative. (He calls it *categorical* to indicate that its application to an individual is not conditional on what that person happens to want; the reasons provided by morality do not depend hypothetically on interests or desires, but apply categorically and unconditionally to all persons simply in virtue of their rationality.)

The categorical imperative says, roughly, that we should act only on principles that we would want everyone to act on. It is often referred to as the standard of universalizability, since it means that each of us should govern our conduct by principles that we would be willing to see followed universally. But if this test is to identify a single set of moral principles that apply to everyone, there must be a way to decide what principles we would want everyone to follow that will not give different

answers for different people depending on their interests and situation. That implies that in answering the question we must try to take into account the point of view of every person simultaneously, putting ourselves in the place of each of them, and rejecting those principles that could not be accepted by everyone.

The tradition deriving from the categorical imperative is sometimes called contractualism because it identifies moral principles through an imaginary agreement: They are the principles whose adoption by everyone would not be unacceptable to anyone. The results of such a test may be much less determinate than the utilitarian standard, but it does seem to imply some major differences from utilitarianism. First, the insistence on separate acceptability to each individual will rule out justifications that depend on aggregation of small benefits across many lives to outweigh a large cost to a single individual. Second, in deciding what principles are and are not universally acceptable, the determining factor will have to be some system of priorities among the things that matter in human life, and the effects that different principles would have on each person, as measured by these values.

### MODERN CONTRACTUALISM

One result will be that in the application of moral standards to social policy, there will be a direct reason to concentrate on the relief of poverty and improvement in the condition of the worst off, not merely as a means of improving the total or average welfare, as in utilitarianism. This is a feature of the American philosopher John Rawls's (1971) theory of justice.

Another result is that the justification for individual rights will be different from that offered by rule-utilitarianism. The right not to be killed, injured, or deprived of liberty even if it would promote the general welfare will depend not on the overall balance of costs against benefits for all people affected by the existence or nonexistence of such a right, but on the importance for each separate individual of the security that such a right provides, by comparison with the advantages for each individual that its absence might make possible.

The right to pursue one's personal aims, interests, and attachments rather than the general welfare in most of what one does will depend not on the effect of such a right on the general welfare, but on the importance for each person of this kind of freedom by comparison with the value for each person of the possible benefits of its general restriction.

The emphasis is on providing certain protections and basic benefits to everyone equally rather than maximizing the overall sum of benefits. This is a fundamental difference in the approach to the foundation of morality, a difference in the way in which the interests of all persons are combined from a moral point of view.

Modern successors to Kant attempt to make the standard more precise in different ways. Rawls claims that what is wrong with utilitarianism is that it does not take seriously the distinction between persons. Writing not about morality in general but about social justice, he embodies the contractualist ideal in an imaginary choice called the Original Position, in which people are supposed to choose the principles of justice for their society without knowing who they are; this forces them to choose principles that would be acceptable whoever they turned out to be. Though influenced by Rawls, T. M. Scanlon (1998), another philosopher in the contractualist tradition, proposes a different test. He maintains that to identify standards of right and wrong we must search for principles that no one seeking to arrive at common standards of interpersonal justification could reasonably reject, knowing both his or her own situation and that of others.

Unlike a consequentialist theory, the contractualist method cannot proceed simply by calculating the total expected costs and benefits of different rules of conduct or forms of political and social organization. Rather, it must evaluate the priorities among different kinds of costs and benefits, for each individual, of living under alternative rules or systems. Which principles and practices are morally acceptable will depend on these priorities, applied equally to everyone.

For example, both utilitarianism and contractualism condemn slavery, but they do so for different reasons. Utilitarianism says slavery is wrong because the total misery of slaves vastly outweighs the total benefit to slave owners. Contractualism says slavery is wrong because any reasonable person thinking about his or her own or any other life must regard the avoidance of the possibility of being a slave as having strict priority over the possibility of enjoying the advantages of being a slave owner.

### DEONTOLOGY: DOING AND ALLOWING

Not everyone who believes in rights and special obligations thinks they have to be justified by either contractualism or rule-utilitarianism. The general term for these apparently nonconsequentialist parts of morality is deontology, and there is an alternative ethical tradition, called

intuitionism (represented, for example, by the English philosopher W. David Ross [1930]), according to which the deontological elements of morality are fundamental. They do not derive from anything else, but they reveal themselves to reflection about what would and would not be the right thing to do in different cases.

On this view it is evident that we may not kill an innocent person to save five others (e.g., by harvesting the first person's organs for transplantation), and there is no more fundamental explanation of why we may not: It would be murder, that is all. The details of these moral requirements are sometimes complicated, but they can be discovered by exercising moral intuition in respect to real and imaginary cases that bring out the relevant distinctions.

One of the most important of these distinctions, mentioned earlier, contrasts the things we do to other people, for which we are positively responsible, and the things that happen to other people that we might have been able to prevent, for which we are only negatively responsible. If we kill an innocent person to transplant his or her organs to five others, for example, we would be positively responsible for the death of that person. But if we do not kill that person and the other five die of organ failure, we are not positively responsible for their deaths and have not violated their right to life. This means that the prohibition against murder must include some specification of the way in which one person's conduct has to be related to another person's death for it to count as wrong.

Different accounts have been offered of this relation. It might seem that what matters is whether your action causes the death or whether it is caused by something or someone else. But this turns out to be wrong in two ways. First, you may cause a death as an unavoidable side effect of something else you do, but if you were acting to save many more lives, you are not to blame. For instance, if you are the pilot of a plane that is about to crash, and you steer it from a densely populated area to a sparsely populated area, you are causally responsible for the deaths of a smaller number of people but you are not to blame, because it was a side effect of your aiming the plane away from the larger number.

Second, you may be to blame for a death that you didn't cause but could have prevented, if you deliberately failed to act to ensure that the death would occur. For example, if you let an otherwise healthy patient with asthma choke to death so that you can harvest his or her organs to save five others, you have intentionally allowed

the patient's death—aimed at it even without causing it—in a way that makes the action wrong.

So the element of intention—intentionally causing or permitting someone's death either as an end in itself or as a means to something else—is an important part of wrongful killing. And rights in general have to be understood as rights against the intentional imposition of harms of various kinds.

In a morality of this kind, we are not generally responsible for preventing what is bad and promoting what is good. Morality is defined instead by a set of constraints against the intentional imposition of harm or violation of rights, plus some well-defined and limited positive obligations—like keeping our promises and taking care of our families.

Instead of deriving the content of morality from a point of view that tries to take everyone's interests into account—either a consequentialist or a contractarian point of view—intuitionism understands morality as setting a kind of boundary around each person, that protects us from intentional violation and interference by others. Positive obligations are also understood individually, as arising from the specific commitment undertaken by a promise or a contract, explicit or implied, with another person.

#### AGENT-NEUTRALITY AND AGENT-RELATIVITY

The difference between deontological and consequentialist moral theories can also be described in terms of a formal distinction between two kinds of principles or reasons: agent-relative and agent-neutral.

An agent-relative principle specifies what each individual should do in a way that involves an ineliminable reference to that agent himself or herself, or his or her situation—even when the principle is stated in its most general form. For example, the principles “Everyone may give priority to their own interests over those of a stranger,” “Everyone should do what is best for their family,” “Everyone should keep their promises,” and “Everyone should refrain from killing innocent people” are all agent-relative.

The following principles, however, are all agent-neutral: “Everyone should promote the general welfare,” “Everyone should promote the stability and devotion of families,” “Everyone should try to minimize the breaking of promises,” and “Everyone should aim to minimize the killing of innocent people.” Agent-neutral principles depend on the objective value of certain kinds of hap-

penings or states of affairs, without regard to their relation to the agent. All that matters is whether the agent is in a position to affect the occurrence or nonoccurrence of the desirable or undesirable outcome. If the value attaches to a type of action, such as murder, an agent-neutral principle would not distinguish between a murder that the agent commits and one that someone else commits and that the agent could prevent. Accordingly, the principle that everyone should aim to minimize the occurrence of murders could authorize committing one murder to prevent several others.

For this reason, deontological principles naturally take an agent-relative form. They tell each individual what he or she may, must, and must not do, without giving all individuals a common outcome or state of affairs that they must try to promote. Deontological principles are universal, but the aims they assign to each individual always depend on his or her situation and are related to him or her. This logical feature unites the three aspects of deontology: deontological prohibitions—“Don’t (you) commit murder”; deontological requirements—“Keep your promises”; and deontological permissions—“You can enjoy your life instead of devoting it to the service of humanity.”

The exercise of moral intuition on different cases reveals a surprisingly detailed system of deontological principles on which many people can agree and that form a large part of conventional morality. But the view that there is no systematic foundation underlying these diverse principles, that their truth cannot be explained by something more basic, leaves many moral philosophers dissatisfied.

What they want is a general foundation for deontology to rival the clarity of consequentialism. Since it seems obvious that there is always a reason to prefer better results, deontologists need to explain in a clear fashion why morality often prohibits actions that would have the best overall results and permits other actions that would not have the best overall results. If promoting the best consequences is not, as utilitarianism maintains, the governing standard of morality, then it would be good to know what is.

## VIRTUE

Contractualism is the most prominent foundational alternative to consequentialism, and it works by offering an alternative interpretation of what it is to treat all persons with impartial respect. But there is another way of criticizing consequentialism, and that is to attack its

foundation directly, by denying the moral authority of the impartial point of view.

The criticism goes like this: Ethics is concerned with how people should live and what they should do, and the point of view from which we should seek an answer to that question is the point of view of the individual, not an impersonal point of view that takes into account all individuals at once. Even if this yields moral requirements on how one should treat other people, they must arise from considerations about how one has reason to live one’s life and what kind of person one wants to be.

One version of this approach takes as basic the question: What is the difference between a good and a bad person? Once we know the difference between a virtuous and a vicious character, we can identify the morally right thing to do as what a virtuous person would do in the circumstances. This way of understanding the subject is found in Aristotle’s *Nicomachean Ethics*.

The reason we all have to care about virtue, on this view, is not an impartial concern for others, but that being a good person is an aspect of being a good human specimen—analogueous to physical health and being in good physical condition. To be virtuous is to function well with respect to feelings, desires, motives, and actions, including interactions with other people. Moral virtue, like good physical functioning, is part of the good for each individual, and it has as elements the distinct virtues such as courage, temperance, prudence, generosity, honesty, and justice. Each of these is a set of motivational dispositions and dispositions to choose that lead to virtuous conduct.

Some of the virtues, like courage and temperance, are good partly because they enable the individual to pursue his or her own aims effectively. But a virtue like justice is good for the individual because people are essentially social beings and must be able to live in harmony with others. This conception of ethics leaves the content of interpersonal morality rather vague. Instead of principles of conduct, it offers a rough indication of the types of motivational and behavioral dispositions, recognizable by example in the character of virtuous individuals, to which everyone has reason to aspire, simply in order to be a good person. But at least this account, even if it does not start from impartiality, offers a kind of harmony between the interests of the virtuous individual and the interests of the community to which he or she belongs.

## RESISTANCE TO IMPERSONAL MORALITY

A more skeptical challenge to the impartial standpoint comes from the English philosopher Bernard Williams (1981, 1985). He argues that impersonal moral theories, whether consequentialist or contractualist, are incompatible with the integrity of an individual life, which is found in the unconditional commitment to particular projects and particular persons. Such commitments would be impossible if impersonal values were permitted to take precedence over them.

This is most forceful as a response to utilitarianism. Even if, from an impersonal standpoint, everyone's life is just as important as everyone else's, that is simply not true from your individual standpoint, and the impersonal standpoint has no authority on its own to overrule the standpoint of the individual. Ethics is supposed to govern individual conduct, so it must find its basis in the motivation of individuals. This may include some impartial values, but it also includes much else. For most people, life gets its substance and meaning from aims and attachments that are inseparable from the personal point of view. These cannot simply be abandoned when it turns out that there is something impersonally more valuable that one could do with one's life.

Utilitarians can reply in either of two ways. They may say that in rejecting the demands of impersonal value, Williams is simply rejecting morality, and that the whole point of morality is to replace the natural selfishness of individuals with an impartial perspective. Nobody said it would be easy. Alternatively, they may emphasize the ways in which utilitarianism takes into account the point of view of the individual, since it is the source of the happiness whose maximization over all persons utilitarianism takes as the aim of morality.

However, even after we take this second point into account, it is clear that utilitarianism, including rule-utilitarianism, will under some circumstances require the radical subordination of individual aims to the general welfare. There is an important difference of opinion here over what morality can reasonably demand of us.

The conflict between Williams's objection and contractualism is less stark, but here, too, he claims that it is incompatible with the nature of basic personal commitments to subordinate them to the test of what could be universalized, or what could be reasonably agreed to by everyone as a principle of conduct. Even to say, for example, that it is permissible to devote yourself to your children because you find it acceptable that everyone should

favor their own children is inconsistent with the immediate and unconditional nature of your attachment to your own children. It is, in Williams's phrase, "one thought too many." Williams's resistance to the ultimate authority of the objective, impersonal standpoint is partly inspired by the more radical resistance to impartiality of Friedrich Nietzsche (1897), the great nineteenth-century German critic of Christianity and moral universalism. Contractualists like Scanlon reply that it does not denigrate the independent force of personal attachments and projects to require that they be embedded in a moral framework that sets limits to their pursuit, since the desire to live on mutually acceptable terms with others is such an important human value that it must be allowed to shape other, more personal values.

The question of the relative weight and interaction between personal motives and the claims of impartiality in determining the content of morality is a fundamental one, and it generates continuing controversy. Uncompromising utilitarians like Singer maintain that the commonsense morality that most people accept and that strictly limits their responsibility to sacrifice their own interests and aims for those in greater need is much too undemanding. If we really take seriously the undeniable fact that other people's suffering is just as bad as our own, we will have to change our lives.

In contrast, defenders of more conventional morality hold that while it is admirable to be self-sacrificing, it is also supererogatory—that is, it is morally praiseworthy but goes beyond what is morally required. They maintain that utilitarianism, by holding people morally accountable for anything that happens for which they are negatively responsible, leaves them with an unacceptably diminished control over their lives.

These disputes pose the question of whether or to what extent the content of morality should depend on a prior assessment of the human motives available to induce people to live in accordance with its requirements. There is a division of opinion between those who think morality has to rely on preexisting motives and those who think it can create new motives, by revealing specifically moral reasons we all have to act in certain ways.

Among the first group we find Hobbes, who derives morality from redirected self-interest, and Hume who derives it from a natural moral sentiment arising from sympathy for the happiness and unhappiness of others. Among the second group is Kant, who believes that the recognition that an intention cannot be universalized will itself motivate us to refrain from acting on it. He holds

that the recognition of moral principles, without an antecedent desire, is enough to create a motive.

Even if morality introduces new motives, it may be important to take into account human nature, including natural self-interest and natural personal attachments, in constructing a workable moral code. The question then becomes: How can humans who are not naturally impartial live together in a way that acknowledges that objectively none is of more intrinsic value than another?

## RELATIVISM

So far this entry has discussed ethical theories that offer different accounts of morality conceived of as a single system—that is, as a set of general standards that will allow us to determine what is right or wrong for any person to do, in any society. That does not mean that the same specific actions will be morally required of everyone, since in different circumstances, different forms of conduct may satisfy or violate the same universal moral standards. For example, with overpopulation and environmental degradation, activities like deforestation and the unrestrained burning of fossil fuels, which on a small scale were once harmless, can become dangerous to future generations, and therefore wrong.

But is it also possible that the basic moral standards themselves should vary over time, or from culture to culture? The view that morality, even at the most fundamental level, is not universal but arises from local cultures or conventions that may vary is called ethical relativism. Relativism is not the view that there is a single overarching and universal moral principle, namely: “Follow the moral conventions of your culture”; nor is it the view that some other universal principle, such as utilitarianism, implies that it is always best to follow the conventions of the culture in which you find yourself. Relativism is the position that the true and ultimate source of moral standards is always a set of rules, practices, and attitudes shared by a historically situated community. While not everyone in the community will obey the rules, and some may reject them, there is often enough of a consensus about what the rules are to make it possible to identify them.

Morality, on this interpretation, is closer to etiquette or law than it is on the universalist interpretation. Naturally, there will be some overlap among moral systems—all of them can be expected to condemn murder and theft in some form, for example. But slavery, the subordination of women to their male relatives, polygamy, or homosexuality may be morally wrong in some societies and morally unquestionable in other societies, depending on the prevailing norms.

On this view it is probably a mistake to say that slavery in ancient Rome was wrong, that bullfighting in Spain is wrong, or that the subordination of women in Saudi Arabia is wrong. There is no universal, timeless standpoint from which to make these judgments. They would have to be defended from a standpoint internal to the cultures that they are about, and if that cannot be done, they should be abandoned.

That does not mean that it is impossible to criticize morally what a society does, for its conduct may sometimes violate its own moral principles. It may also sometimes be the case that there is no prevailing moral code in a particular culture, especially during periods of social transition or upheaval.

These qualifications mean that it will not always be easy for a defender of relativism to identify the standards that apply in a particular society. But relativism at least clearly rules out the attempt to appeal to universal standards. Even an internal moral critic of a society—someone who says, against the general consensus, that slavery is morally wrong—would be mistaken if he or she were making a universal claim. The critic has to be understood as trying to change the standards or as finding an inconsistency between one part of the prevailing standards and another part.

Relativism has the consequence that we must dismiss as confused certain judgments that we are strongly inclined to make, which implicitly or explicitly appeal to universally valid or objective standards in morality. They include judgments about societies other than our own, whose standards we think are mistaken, or judgments about our own society, whose present standards we think may be mistaken and may be rightly rejected by later generations.

Relativism cannot account for the apparent fact that when an individual rejects the moral standards that prevail in a culture, either from within or from outside, he or she may not be simply applying the standards of an alternative culture, but may be appealing to deeper moral reasons, such as unfairness to some members of the society or failure to give certain interests their true weight. Such arguments point to deeper and more general standards by which local conventions can be assessed.

This is connected with the question of the motivation for being moral. If morality is based on custom, the motivation for conforming to it is in a sense shallow. To be moral is to have internalized the patterns of conduct that prevail in one’s surroundings. If, however, morality is not relative but universal, this means that the motives

that attach us to moral norms must be deeper, and theories of the foundations of morality must try to identify them.

### MORALITY AND RELIGION

There is a way of defending the universality and objectivity of moral truth different from those that have been discussed so far. That is to claim that moral standards are laid down by divine command.

If this means that nothing would be right or wrong unless God declared it to be so—that “if God does not exist, everything is permitted”—then it is not a plausible view. Even if God does command that we not kill, lie, steal, and so on, it seems more plausible to hold that he forbids those things because they are wrong, not that they are wrong because he forbids them. (A polytheistic version of this point is made in Plato’s dialogue *Euthyphro*.)

Though we can understand how divine command might establish specific requirements like dietary restrictions or forms of worship—where we are obliged to follow them simply out of obedience—the ordinary standards of morality seem different: They seem to depend on the intrinsic features and effects of certain kinds of conduct rather than on something external to them. We can understand what is wrong with murder without reference to God.

On the other hand, it may be possible to preserve a version of the divine command theory by referring to the characteristics of God, as all-knowing, all-good, and loving the world and his creatures. The rules that a divine being enjoins people to obey might in that case be said to be correct in virtue of the features of God’s nature that lead him to choose those rules. But it also means that he chooses them for characteristics that themselves make them correct and that he could not have commanded a different morality.

Religion is sometimes thought to play another role, as the guarantor of an incentive to be moral through divine punishment and reward in an afterlife. The afterlife also serves a direct moral purpose in allowing us to hope that the world is not fundamentally unjust and that the virtuous will be rewarded, however much they may have suffered on this earth.

However, most modern moral philosophy has not depended on religion, but has tried to interpret ethics in secular terms. Those who believe that God commands our adherence to moral standards usually hold that we use our independent understanding of those standards in forming our idea of God’s will. An exception is John

Locke (1690), for whom the assumption that God gave the earth to human beings in common plays an important role in moral and political theory.

### ETHICS, POLITICS, AND LAW

One of the main applications of moral theory is to evaluate political and social institutions—institutions like representative democracy or the market economy—as well as the more specific actions of government. But there are two different ways of thinking about politics from a moral point of view.

The first way is to start by identifying moral standards that apply to everything, and then to figure out what they imply for the special and complex case of political institutions and political life. This is the method favored both by utilitarianism and by the radical form of individual rights theory called libertarianism. Utilitarianism holds that the right way to evaluate anything, from an individual action to a form of government, is by reference to the value of its overall consequences for the total welfare of all persons, impartially considered. Libertarianism, on the other hand, determines the rightness or wrongness of individual actions and social institutions alike solely by reference to whether they violate or protect the natural rights of individuals not to be harmed, to exercise their freedom, and to acquire and transfer property. Because these theories hold that a single moral standard governs everything from individual conduct to the design of large social institutions, they are sometimes known as monist theories.

By contrast, other theories (sometimes called dualist—the terms are due to Liam Murphy [1999]) hold that ethics is more complicated than this and that different standards are appropriate for the regulation of different kinds of thing. According to this second approach it is a mistake to assume that the moral evaluation of institutions should derive from the same norms that govern individual conduct.

An important example of the dualist approach is Rawls’s (1971) theory of justice. Rawls maintains that while private individuals should be free to pursue their own aims in life and favor their own and their families’ economic interests, the basic institutions of a society must be much more impartial toward the interests of all its members. The social structure should be designed with the aim of providing equality of opportunity for all, and with the aim of reducing social and economic inequality by raising the condition of the worst-off class as much as possible. These strongly egalitarian values, according to Rawls, apply not to the personal interactions

of individuals, but to the design of the common institutions, imposed and sustained by state power, that provide the unchosen public framework for their private lives.

Whether one is a monist or a dualist, politics and law are important subjects for ethical theory. Politics poses in the starkest way questions about how to combine the conflicting interests of many different people who are affected by an institution, law, or policy. It poses questions about the relations between different values—the value of life, of liberty, of prosperity, and of freedom from coercion and violation of different kinds. It poses crucial questions about the possibility of outweighing harms to some by aggregate benefits to others.

The fundamental division between consequentialist and contractalist approaches shows up here. Consequentialists will not take the protection of individual rights as basic, but will regard it as an instrumental means for the promotion of the general welfare. Contractualists, by contrast, will find reasons to limit the power of the state over the individual in a separate and untradeable concern for each individual's autonomy and inviolability, regarded not merely as an element in the general welfare whose total is to be maximized.

Followers of Hobbes will hold that the only legitimate ground for state action is the provision of goods that are in the collective self-interest of all the citizenry, such as police protection, defense, economic stability, and public health. Utilitarians, on the contrary, will also favor policies that increase the total welfare, even if it means redistributing resources from the rich to the poor. Contractarians will give priority to the protection of individual rights, securing equal opportunity, and raising the social minimum. Libertarians will favor the minimum of government needed to keep the peace, protect individual rights, and secure private property. Therefore, many familiar political disagreements have a moral dimension and require that we ask how much and what kind of consideration we owe to the interests of our fellow citizens through our common institutions.

The distinction between monist and dualist theories comes up again when we ask whether the same principles that govern the moral acceptability of political institutions inside existing states should also be applied to our relations to people in other societies, indeed to the world as a whole. If our most fundamental moral duties to everyone are the same, then the division of the world into separate societies with special responsibility for their members is a historically understandable contingency, but it may or may not be morally acceptable. On the other hand, moral standards for the world as a whole may be

different from those appropriate within a particular society. The question of the moral evaluation of the overall world order is a vital and wide open question.

## BOUNDARIES OF THE MORAL COMMUNITY

This entry has been discussing moral standards as if they concerned our relations to other human beings, present and future. But there are other candidates for moral consideration: most notably, other sentient creatures who are not members of our species and human organisms not yet born—embryos and fetuses. We can leave aside the value of plants and other parts of nature because it seems separate from morality, just as aesthetic value seems to be in a different category. Morality is especially concerned with how we treat one another, but it probably goes beyond this to include our treatment of beings or creatures that are sufficiently like us in relevant respects.

The first question is whether sentience itself—the capacity to have conscious experience and to feel pleasure and pain—is sufficient to bring a creature under the protection of morality. On the utilitarian theory the answer is a clear yes. Pleasure is good and pain is bad, wherever they are found, so it is right to promote the first and avoid the second in all sentient creatures.

It may be difficult to compare the quantity, quality, and value of pleasures and pains across different species, so it is not always easy to calculate what actions or policies would maximize overall utility. There may also be, in some versions of utilitarianism, forms of human pleasure or happiness that are not available to other animals, and whose value counts heavily in calculating the total to be maximized. That is maintained by John Stuart Mill in the theory of higher and lower pleasures. But many utilitarians maintain that the widely prevalent treatment of animals in factory farming and slaughter for food, as well as in much scientific experimentation, is morally unacceptable.

It is doubtful that nonhuman creatures could be excluded from moral consideration entirely, except by an ethical theory based entirely on self-interest. Since other creatures do not threaten us and cannot enter into cooperative engagements with us, we have no reasons of self-interest to adopt ways of living at peace with them.

If we accept an other-regarding consequentialist basis for ethics, animals will certainly be included under its protection, but there may be different requirements on our treatment of animals from those on our treatment of people. Avoidance of suffering is likely to be the main

thing, and limits on killing or on infringement of liberty will probably depend on whether they lessen suffering.

It is less clear how contractarian theories can handle the moral status of creatures who cannot be imagined as participants even in a hypothetical agreement on standards of conduct. But perhaps this could be done through some system of imaginary representation of their interests (Scanlon [1998] discusses this issue).

The moral status of unborn humans is a different question. If we separate it from religious doctrine about when the soul enters the body, it becomes a question about whether the potential to develop into a fully conscious human being confers on an embryo or fetus some part of the moral protection due to such a being after it is born. Answers range from the position that the embryo has all the moral rights of an infant, specifically the right not to be killed, from the time of conception, when its genetic constitution is determined, to the position that it has no moral claims before the child is born alive and may therefore be disposed of at the discretion of the pregnant woman. In between are views that as the fetus develops toward viability it becomes gradually more and more difficult to justify interrupting the pregnancy deliberately—that is, the reasons for doing so have to be progressively stronger.

The difficulty of these boundary questions reveals uncertainty about the true foundations of ethics, but that is not surprising. Human morality is a constantly developing system of norms, and its philosophical investigation by ethical theory is an indispensable part of the process.

## ETHICS, DEONTOLOGICAL

See *Deontological Ethics*

## ETHICS, HISTORY OF

The term *ethics* is used in three different but related ways, signifying (1) a general pattern or "way of life," (2) a set of rules of conduct or "moral code," and (3) inquiry about ways of life and rules of conduct. In the first sense we speak of Buddhist or Christian ethics; in the second, we speak of professional ethics and of unethical behavior. In the third sense, ethics is a branch of philosophy that is frequently given the special name of metaethics. The present discussion will be limited to the history of philosophical

or "meta" ethics, for two reasons. First, because it is impossible to cover, with any degree of thoroughness, the history of ethics in either of the first two senses. Practices and the codification of practices are the threads out of which all of human culture is woven, so that the history of ethics in either of these senses would be far too vast a subject for a brief essay. Second, although ethical philosophy is often understood in a broad way as including all significant thought about human conduct, it can well be confined within manageable limits by separating purely philosophical thought from the practical advice, moral preaching, and social engineering that it illuminates and from which it receives sustenance. This distinction, while somewhat artificial, makes sense of the common opinion that philosophy in general, and ethical philosophy in particular, was invented by the Greeks.

The central questions of philosophical ethics are: What do we or should we mean by "good" and "bad"? what are the right standards for judging things to be good or bad? how do judgments of good and bad (value judgments) differ from and depend upon judgments of value-neutral fact? But when these questions are answered, it is important to find out the differences between specific types of value judgments that are characterized by such adjectives as *useful*, *right*, *moral*, and *just*. We may therefore divide our subject matter into the search for the meaning and standards of good in general, and of well-being, right conduct, moral character, and justice in particular. Needless to say, these are not watertight compartments. Many philosophers reject sharp distinctions between them. But provisional separation of these topics, subject to reunification in accordance with particular philosophical views, will prove helpful in disentangling the various issues on which philosophers have taken opposing stands, so that the history of ethics can be seen as irregular progress toward complete clarification of each type of ethical judgment.

## GREEK ETHICS

Ethical philosophy began in the fifth century BCE, with the appearance of Socrates, a secular prophet whose self-appointed mission was to awaken his fellow men to the need for rational criticism of their beliefs and practices.

Greek society of the fifth century was in a state of rapid change from agrarian monarchy to commercial and industrial democracy. The religious and social traditions that had been handed down from one generation to the next through the natural processes of social imitation and household training were brought into question by the accession to power of a commercial class, whose mem-

bers were untrained in and scornful of the ancestral way of life. New rules of conduct were required by a market economy in which money counted more than noble birth and in which men had to be considered equals as buyers and sellers. Men who wished to be elected to public office, but had not been trained at home as rulers of serfs and household servants, needed a more explicit and general code of conduct than was embodied in the sense of honor and esprit de corps of the landed aristocracy. Occurring with the rapid political and social transformation of Greece, and interacting with it as both cause and effect, was the development of basic industrial arts and a scientific technology. These forces both expressed and intensified the developing interest in rational evaluation of beliefs. As Henry Sidgwick put it:

This emergence of an art of conduct with professional teachers cannot thoroughly be understood, unless it is viewed as a crowning result of a general tendency at this stage of Greek civilization to substitute technical skill for traditional procedure.... If bodily vigour was no longer to be left to nature and spontaneous exercise, but was to be attained by the systematic observance of rules laid down by professional trainers, it was natural to think that the same might be the case with excellences of the soul. (*Outlines of the History of Ethics*, p. 21)

Early Greek thinkers drew frequent comparisons between medicine and ethics, describing ethics as the “art of living” and the “care of the soul.” Socrates’ motto, “A sound mind in a sound body,” suggests the medical image of ethics as mental hygiene. Many thinkers took a special interest in medicine, and, recognizing the interdependence of mind and body, they practiced a rudimentary psychiatry. Alcmaeon of Croton, Empedocles, and Democritus were renowned for their psychotherapeutic skills. This biological conception of mind and soul led to a more critical and scientific approach to problems of ethical judgment. Philosophers began to search for reasons for established modes of conduct and, where no reasons were found, to suggest that action could be directed toward individual goals in defiance of tradition. The professional teachers known as Sophists, whose social role was to prepare the uncultivated nouveaux riches for positions of power in the rising democracies, employed the newfound weapon of logic with devastating effect against the code of honor of the declining aristocracy. Protagoras, Gorgias, and Thrasymachus taught methods of self-advancement and of attaining virtue. They stressed the difference between subjective values and objective facts,

arguing that good and evil are matters of personal decision or social agreement (*nomos*) rather than facts of nature (*phusis*).

**SOCRATES.** Socrates stood midway between the unexamined, traditional values of the aristocracy and the skeptical practicality of the commercial class. Like the Sophists, he demanded reasons for rules of conduct, rejecting the self-justifying claim of tradition, and for this reason he was denounced as a Sophist by conservative writers like Aristophanes. But unlike the Sophists, he believed that by the use of reason man could arrive at a set of ethical principles that would reconcile self-interest with the common good and would apply to all men at all times.

The central questions of ethical philosophy were raised for the first time by Socrates and the Sophists, but only Socrates realized the difficulty, bordering on impossibility, of finding adequate answers. In this respect, Socrates may be regarded as the first philosopher, in the strictest sense of the term. While the Sophists, after exposing the impracticality of traditional rules of conduct, then offered glib formulas in their place—such as “Justice is the rule of the stronger” (Thrasymachus) and “Man is the measure of all things” (Protagoras)—Socrates applied the same logical criticism with equally devastating results to both aristocratic and marketplace morality. He did not find the universal and self-evident code he searched for, but it was his memorable achievement to have revealed to humankind that without such a code its actions will lack justification and that moral perfection is therefore an ideal to which we can only approximate. Perfect clarity about what constitutes moral perfection is no more of this world than is moral perfection itself.

Our knowledge of Socrates is primarily derived from the dialogues of Plato, so it is not possible to draw a sharp line between the ideas of the two men. But since Plato’s early dialogues are considerably different in style and content from those that he wrote later in life, one may take the early as fairly representative of Socrates and the late as more expressive of Plato’s own thought. The chief differences discernible are the following: The more Socratic dialogues are devoted to the criticism of conventional beliefs and to the demonstration of the need for further inquiry, while the later dialogues argue for positive conclusions; the early dialogues search for definitions of ethical concepts, while the later dialogues are concerned with justifying a contemplative way of life in which pleasures of the senses are spurned in favor of pleasures of the mind; finally, the Socratic style is conver-

sational and argumentative, while that of the later years is more didactic and abstract.

The Socrates of the early dialogues raises questions about the meaning of ethical terms, such as “What is justice?” (*Republic*), “What is piety?” (*Euthyphro*), “What is courage?” (*Laches*, *Charmides*), “What is virtue?” (*Protagoras*). The answers offered by others to these questions are then subjected to a relentless cross-examination (Socratic dialectic), exposing their vagueness and inconsistency.

Although Socrates did not separate judgments of value from judgments of fact, the negative results of his line of questioning suggest a distinction that was made explicit only in modern times by David Hume and G. E. Moore. In each of his discussions of ethical concepts such as courage or justice, Socrates refutes all efforts to define them in terms of ethically neutral facts. For example, when, in the *Protagoras*, *Laches*, and *Charmides*, courage is defined as resolute facing of danger, Socrates observes that a man who faces dangers that he would be wise to avoid is a fool rather than a hero. The generalization toward which Socrates points the way, although he does not arrive at it himself, is that ethical concepts can never be adequately defined in terms of observable facts alone. Many philosophers, beginning with the Sophists, have believed that this principle leads to ethical skepticism. Plato attempted to escape such skepticism by means of his theory of Forms, and the modern school of intuitionism proposes a similar way out. Indeed, all the ethical theories developed since Socrates may be considered as alternative explanations of the relation between facts and values, naturalistic theories stressing their interdependence and nonnaturalistic theories stressing their differences. Socrates, in demanding rational grounds for ethical judgments, brought attention to the problem of tracing the logical relationships between values and facts and thereby created ethical philosophy.

**PLATO.** Plato’s thought may be regarded as an endeavor to answer the questions posed by Socrates. From the *Republic* on through the later dialogues and epistles, Plato constructed a systematic view of nature, God, and man from which he derived his ethical principles. The foundation of this metaphysical view was the theory of Forms, whose most succinct formulation may be found in the discussion of the Divided Line, toward the end of Book VI of the *Republic*. Plato divides the objects of knowledge into two main categories and each of these into two subcategories symbolized by unequal sections of the line. The main division is between the realm of changing, sen-

sible objects and that of unchanging, abstract forms. Knowledge of sensible objects acquired by sense perception is inaccurate and uncertain, for the object of sense, like the river of Heraclitus, is in continual flux. In contrast, knowledge of timeless forms is precise and rigorously provable. The realm of sensible objects is subdivided into shadows and images, in the lower section, and natural objects in the upper section. The realm of forms is subdivided into mathematical forms and ethical forms. At the apex of this ascending line is the Form of the Good, in relation to which all other objects of knowledge must be defined if they are to be adequately understood. Thus, ethics is the highest and most rigorous kind of knowledge, surpassing even mathematics, but it is also the most difficult to attain. Mathematics leads us away from reliance on visual images and sense perception, and ethical philosophy demands an even greater effort of abstraction. The objects of ethical knowledge are even less visualizable than geometrical forms and numbers—they are concepts and principles ultimately unified under the all-encompassing concept of the Good.

Although Plato suggests in this and other passages that ethical truths can be rigorously deduced from self-evident axioms, and thus introduces the mathematical model of knowledge that has guided many philosophers ever since, he does not employ a deductive procedure in his discussions of specific ethical problems, perhaps because he did not feel that he had yet attained an adequate vision of the Good that would supply him with the proper axioms from which to deduce rules of conduct. His actual procedure follows what he calls an ascending dialectic, a process of generalization through the give and take of conversation and the consideration of typical cases, a process designed to culminate in an intellectual vision of the structure of reality, from which, by a “descending dialectic” or deduction from general principles, particular judgments of value can be deduced. Plato’s main goal in his ethical philosophy is to lead the way toward a vision of the Good.

The Socratic-Platonic ethical theory identifies goodness with reality and reality with intelligible form and thus concludes that the search for value must lead away from sense perception and bodily pleasure. This suggests an ascetic and intellectualistic way of life that is spelled out in full detail in the *Republic*, in the description of the training of the guardians. Some difference in the degree of intensity of the preference for mind over body may perhaps be discerned in the increasing severity of tone from the early dialogues to the later. In the *Protagoras* and *Symposium*, Socrates argues for rational control over the

body for the sake of greater pleasure in the long run, but he does not oppose pleasure as such. In the *Symposium* the unity of body and mind is a luminous thread throughout the discussion. Love is regarded as a search for the pleasure that consists in possession of what is good, and it is shown to exist on many levels, the lowest being that of sexual desire and the highest that of aspiration toward a vision of eternity. While still under the influence of Socrates, Plato distinguishes noble pleasures from base pleasures, rather than condemning pleasure in itself. The image he draws of Socrates is of a man who eats and drinks heartily and enjoys himself on all levels of experience, but in rationally controlled proportions. Socrates enjoys the wine at the symposium as much as anyone else, but unlike the others he remains sober to the end. While the poet Agathon becomes drunk with his own rhetoric, Socrates employs richly sensual language and metaphor in a way sufficiently controlled to make a philosophical point and so remains master of his rhetoric as well as of his body.

In the extraordinarily beautiful dialogue *Phaedo*, which describes the day of Socrates' execution, the theme of superiority of soul to body is dealt with directly, as might be expected of a philosopher who is about to die. Here Socrates commits himself unequivocally to a rejection of the body and its pleasures, maintaining that a wise man looks forward to his own death, when the soul is freed from its corporeal prison. Whether this is an exact expression of Socrates' attitude toward life may, however, be doubted in view of other dialogues, such as the *Protagoras*. In any case, it is natural for a man confronting death to try to set the best possible light on it. But it was this more somber, otherworldly strain in Socrates that Plato in his later works elaborated into a mystical vision of a timeless higher world. Plato has Socrates say, in the *Philebus*, "no degree of pleasure, whether great or small, was thought to be necessary to him who chose the life of thought and wisdom" (translated by B. Jowett, New York, 1933, Para. 33).

In the *Timaeus*, where, significantly, the protagonist is no longer Socrates but the Pythagorean Timaeus, pleasure is described as "the greatest incitement to evil," and Timaeus places the "inferior soul" below the neck, separating it from the intellect. Plato's severe castigations of bodily pleasures, his sharp separation of soul from body and of the eternal from the temporal, and his mystical cosmology entail a more extreme asceticism than that preached or practiced by Socrates.

Plato's mistrust of bodily pleasure and perceptual judgment led him to take an unfavorable view of public

opinion and, consequently, of democratic institutions. In the *Republic*, and still more emphatically in the *Laws*, he proposed that society be ruled by an intellectual elite who would be trained to govern in accordance with their vision of eternal forms. He proposed, in the *Laws*, a ruthless system of punishments and the propagation of ideologically useful myths that would preserve social harmony and class distinction. Yet despite his support of severe punishment for social transgressions, Plato followed Socrates in holding, in the *Protagoras*, *Timaeus*, and *Laws*, that evil is due only to ignorance or madness and that "no man is voluntarily bad," a paradox that Aristotle later tried valiantly to resolve.

ARISTOTLE. One might expect that Aristotle, who studied at Plato's Academy for many years, would take the same view of nature and human conduct as his mentor. But the differences between Plato and Aristotle are more fundamental than the resemblances. Although Aristotle naturally used a similar terminology and shared with Plato certain principles and attitudes expressive of the rationality of Hellenic culture, his method of inquiry and his conception of the role of ethical principles in human affairs were different enough from Plato's to establish a rival philosophical tradition. Plato was the fountainhead of religious and idealistic ethics, while Aristotle engendered the naturalistic tradition. Throughout the subsequent history of Western civilization, ethical views that looked to a supranatural source, such as God or pure reason, for standards of evaluation stemmed from the metaphysics of Plato, while naturalistic philosophers who found standards of value in the basic needs, tendencies, and capacities of man were guided by Aristotle.

Aristotle was born in Stagira, Macedonia, the son of Nicomachus, court physician to Amyntas II. He received early training in biology and physiology and in methods of careful observation and classification, a fact that may account for his later differences with Plato on the role of sense perception in the acquisition of knowledge. While Plato was guided by mathematics as a model of scientific knowledge, Aristotle modeled his system on biology, stressing the importance of observation of recurrent patterns in nature. Thus Plato's goal for philosophical ethics was to make human nature conform to an ideal blueprint, while Aristotle tailored his ethical principles to the demands of human nature.

Aristotle's ethical writings, consisting of the *Eudemian Ethics*, the *Nicomachean Ethics*, and the *Politics*, all edited by his disciples from his lecture notes, constitute the first systematic investigation of the foundations

of ethics. Since the *Eudemian Ethics* is superseded by the *Nicomachean Ethics* and the *Politics* is an extension of his ethical principles to social regulation, this discussion will be confined to the ideas contained in the *Nicomachean Ethics*.

In the latter work, Aristotle's main purpose was to define the subject matter and methodology of philosophical ethics. In doing so, he both drew upon and revised the beliefs and values of the Greek society of his time. Aristotle begins his study by searching for the common feature of all things said to be good and, in contrast with Plato, who held that there is a Form of Good in which all good things "participate," Aristotle concludes that there are many different senses of "good," each of which must be defined separately for the limited area in which it applies. Each such "good" is pursued by a specific practical art or science, such as economics, military strategy, medicine, or shipbuilding. But the ends of these particular disciplines can be arranged in order of importance, so that the supreme good can be identified with the goal of the most general practical science to which the others are subordinate. On an individual level, this all-inclusive science is ethics; on a social level, it is politics. The end of ethics is personal happiness and that of politics is the general welfare, and since the good of the whole ranks above that of the part, personal ethics is subordinate to politics. However, this principle does not entail, for Aristotle, that the individual must sacrifice his interests to those of the community, except under unusual conditions such as war, because he assumed that the needs of both normally coincide.

Aristotle identifies the supreme good with "happiness," which he defines as the exercise of natural human faculties in accordance with virtue. His next task is to define virtue as a skill appropriate to a specific faculty, and he distinguishes two classes of virtues—intellectual and moral. There are five intellectual faculties, from which arise art, science, intuition, reasoning, and practical wisdom. He offers a long list of moral virtues, defining each as the mean between the extremes of either emotion or tendencies to action. For instance, courage is the mean between the excess and the deficiency of the emotion of fear, temperance is the mean between the tendencies to eat and drink too much or too little, justice is the mean with respect to the distribution of goods or of punishments. The bulk of the *Nicomachean Ethics* contains detailed analyses of the criteria of specific moral virtues. The final result of Aristotle's investigations is the definition of happiness or the good life as activity in

accordance with virtue, and thus as the harmonious fulfillment of man's natural tendencies.

**SUMMARY: SOCRATES, PLATO, AND ARISTOTLE.** Returning to the central problems of ethical theory, one may hazard an estimation of the contributions of Socrates, Plato, and Aristotle to their clarification. Socrates was the first to recognize the importance of analyzing the meaning of good, right, just, and virtuous, and of articulating the standards for ascribing these properties. Plato charted a spiritualistic direction for finding the answers in a realm of timeless ideals, while Aristotle located the answers in the scientific study of biology, psychology, and politics. Good, for Plato, means resemblance to the pure Form, or universal model of goodness, which serves as the standard for all value judgments. Actions are right, laws are just, and people are virtuous to the degree to which they conform to the ideal model. For Aristotle, good means the achievement of the goals at which human beings naturally aim, the balanced and rational satisfaction of desires to which he gives the name "happiness." Right action, just laws, and virtuous character are the means of achieving individual and social well-being. All three philosophers agree in identifying individual good with social good and in defining moral concepts such as justice and virtue in terms of the achievement of good.

**Moral responsibility.** The concept of moral responsibility that acquired crucial importance in later Christian thought was only obliquely considered by Plato and more fully, although inconclusively, dealt with by Aristotle. Plato, who identified virtue with philosophical understanding, concluded that "no one does evil voluntarily," so that wrong action is always due to intellectual error. Aristotle recognized that intellectual error must be distinguished from moral vice, since the former, unlike the latter, is involuntary. In order to distinguish punishable evil from innocent mistakes, he explained vice as due to wrong desire as well as poor judgment. The will, for Aristotle, is rationally guided desire, formed by moral education and training. But since even voluntary action is determined by natural tendencies and early training, Aristotle searched for an additional factor to account for the freedom of choice necessary for moral responsibility. He thought he found that factor in deliberation, the consideration of reasons for and against a course of action. The further question, as to whether, when an agent deliberates, he has any choice of and consequently any responsibility for the outcome of his deliberation, was not considered by Aristotle and remains an unsettled issue between determinists and libertarians. In general, the

concepts of free will and moral responsibility did not become matters of great concern until the rise of Christianity, when people became preoccupied with otherworldly rewards and punishments for moral conduct.

### HELLENISTIC AND ROMAN ETHICS

During the two millennia from the death of Aristotle in the fourth century BCE to the rise of modern philosophy in the seventeenth century CE, the interests of ethical thinkers shifted from theoretical to practical ethics, so that little advance was made in the clarification of the meanings of ethical concepts, while, on the other hand, new conceptions of the goals of human life and new codes of conduct were fashioned. The philosophical schools of Skepticism, Stoicism, Epicureanism, and Neoplatonism that set the ethical tone of Hellenistic and Roman thought offered a type of intellectual guidance that was more like religious teaching than like scientific inquiry and paved the way for the conquests of Christianity. The popular conception of philosophy as an attitude of indifference to misfortune applies best to this period, in which philosophy and religion were nearly indistinguishable.

The subtlety of Socrates' thought is attested to by the variety of schools that developed out of his teaching. Plato and, through Plato, Aristotle probably represent the Socratic influence most completely. But the Stoics, Epicureans, and Sceptics also owed their guiding principles to Socrates. Aristippus of Cyrene, at first a disciple of Socrates, founded the school of Cyrenaicism, which followed the simple hedonistic principle that pleasure is the only good. Antisthenes, another Socratic disciple, founded the Cynic school on the apparently opposite principle that the good life is one of indifference to both pleasure and pain. The Cynics, of whom Diogenes was the most renowned, rejected the comforts of civilization and lived alone in the forests, like the dogs after whom they named themselves. Cyrenaicism developed into Epicureanism, and Cynicism into Stoicism. Soon after the death of Aristotle, Pyrrho of Elis initiated the philosophy of Skepticism, influenced by both the Sophist and the Socratic criticisms of conventional beliefs. According to Skepticism, no judgments, either of fact or of value, can be adequately proved, so that the proper philosophical attitude to take toward the actions of others is one of tolerant detachment, and toward one's own actions, extreme caution. In the second century BCE, the leaders of Plato's Academy, Arcesilaus and Carneades, adopted Skepticism, and Carneades developed a theory of probability that he applied to ethical judgments. During this period, the

Peripatetic school at Aristotle's Lyceum continued the Aristotelian tradition until it merged finally with Stoicism.

**EPICUREANISM.** Epicurus (c. 341–270 BCE) founded one of the two dominant philosophical schools of the era between the death of Aristotle and the rise of Christianity. The other dominant school was, of course, Stoicism. These two traditions are often thought of as diametrical opposites, yet it may plausibly be argued that the differences between them were more verbal than substantial. Both views of life were fundamentally pessimistic, directed more toward escape from pain than toward the positive improvement of the human condition. Both encouraged individual withdrawal from the public arena of struggle for economic and political reform, in favor of personal self-mastery and independence of social conditions. The later Roman Stoics modified this extreme individualism and placed more stress on civic duties, but even they preached resignation to the imperfections of social organization rather than efforts at improvement.

Epicurus based his ethics on the atomistic materialism of Democritus, to which he added the important modification of indeterminism by postulating a tendency of the atoms that make up the human body—and particularly its “soul atoms”—to swerve unpredictably from their normal paths, resulting in unpredictable human actions. In this way, Epicurus thought he could account for freedom of the will. He assumed that freedom of choice of action is incompatible with the deterministic principle that all events are necessary results of antecedent causes. But this identification of freedom with pure chance seems to entail that a capricious person is more free than a rational and principled person, and such a conclusion would contradict Epicurus's own vision of moral life. For Epicurus's main difference with his Cyrenaic predecessors lay in his conviction that, by the use of reason, one could plan one's life and sacrifice momentary pleasures for long-run benefit. Like the Cyrenaics, Epicurus held that pleasure is the single standard of good. But he distinguished “natural pleasures,” which are moderate and healthful, from “unnatural” satiation of greed and lust. His name for moderate and natural pleasure was *ataraxia*, gentle motions in the body that he regarded as the physiological explanation of pleasure. He proposed, as the ideal way of life, a relaxed, leisurely existence, consisting in moderate indulgence of the appetites, cultivation of the intellect, and conversation with friends, which is how Epicurus himself lived and taught in his famous garden. Two centuries later, Epicureanism was established in Rome by Lucretius (c. 99–55 BCE), whose influential

poem, *On the Nature of Things*, helped to spread Epicureanism among the Roman aristocracy.

**STOICISM.** Stoicism was by far the most impressive intellectual achievement of Hellenistic and Roman culture prior to Christianity, providing an ethical framework within which metaphysical speculation, natural science, psychology, and social thought could flourish to such a high degree that Stoicism has not unjustly been identified in the public mind with philosophy itself, that is, with the distinctively “philosophical” attitude toward life. Like every great tradition, Stoicism evolved through many stages and thus comprehends a great variety of specific beliefs. Historians generally distinguish three main stages of its development:

(1) The early Stoa—which derived its name from the portico, or porch, on which the early Stoics lectured—whose important figures were Zeno of Cyprus, Cleanthes, and Chrysippus. Chrysippus made the most substantial contributions to Stoic logic and theory of knowledge. The early Stoics remained close to Cynicism in recommending withdrawal from community life so as to render oneself independent of material comforts, social fashions, and the opinions of one’s fellow men. Their ethical goal was the achievement of apathy, the state of indifference to pleasure and pain. They considered reason to be the distinctive nature of man and proposed that one should live “according to nature” and thus according to rational principles of conduct.

With the Stoics, the concept of duty acquired a central place in ethics, as conformity to moral rules that they identified with laws of human nature. The later Roman Stoics developed this doctrine into the theory of natural law on which Roman jurisprudence was largely based. Most of the Stoics were materialists, yet imbued with natural piety, and many identified God with the Logos of Heraclitus, as a universal “fire” or energy of nature embodied in its lawlike processes. Many were fatalists, maintaining that man can control his destiny only by resigning himself to it, a principle that contrasted vividly with their emphasis on rationality and self-control. They sought to reconcile this extreme determinism with freedom and moral responsibility by means of the Aristotelian distinction between external and internal causation, thus suggesting that the free man is one who, in understanding the necessity of what befalls him, accepts it and thus freely chooses it, a solution echoed in modern thought by G. W. F. Hegel’s definition of freedom as the recognition of necessity.

(2) The middle Stoics, notably Panaetius and Posidonius, brought Stoicism to Rome, shaping the doctrine to the political-mindedness of the Romans by modifying its extreme individualism and stressing the importance of social duties.

(3) The late Stoics, Seneca, Epictetus, Marcus Aurelius, and, to some extent, Cicero—who accepted only certain parts of Stoic doctrine—developed the ideal of a “cosmopolis,” or universal brotherhood of man, in which all men would be recognized as having equal rights and responsibilities, an ideal that Christianity absorbed into its conception of the “City of God” and which, in the modern age, Immanuel Kant made the cornerstone of his system of ethics.

**NEOPLATONISM.** Epicureanism offered a way of life that was open only to the leisure class. Stoicism appealed to highly reflective men of all classes, as evidenced by the fact that the two great figures of late Stoicism were the educated slave Epictetus and the emperor Marcus Aurelius. However, both philosophical views could interest only those of a sufficiently high level of education and thoughtful temperament to place intellectual values above all others. As the Roman Empire declined, and reason seemed powerless to solve the intense economic and social problems of the empire, an atmosphere of pessimism and disaffection with reason began to prevail, a situation that Gilbert Murray described as “a failure of nerve.” Interest increased in finding supernatural routes to salvation of the kind offered by various religious cults, and even in the intellectual schools the study of logic and natural science declined in favor of a search for psychological means of escape from suffering. The philosophy of Neoplatonism fashioned by Plotinus (c. 204–270) offered an intellectual road to salvation, while early Christianity paved an emotional and ritualistic highway toward the same destination. Later, these two roads converged.

Plotinus lectured in Rome and, after his death, his notes were edited by his disciple Porphyry, forming the work titled *Enneads*—so called because of its division into chapters of nine sections each. Plotinus developed one strain of Plato’s thought, the ascetic mysticism of the passages on the Form of the Good in the *Republic* and the *Symposium* and the pantheistic metaphysics of the *Timaeus*. According to Plotinus, the world is a series of emanations or overflowings of the One, the ineffable and ultimate reality of which every determinate thing is a part. The One is so transcendent as to be indescribable, “the One, transcending intellect, transcends knowing.” But if the One cannot be described, it can at least be neg-

atively characterized in terms of what it is not, namely, that it is not limited by any finite properties. This negative characterization of the One was the source of Christian “negative theology,” the description of God in terms of the denial of all modes of limitation.

The One emanates intelligible Forms or Platonic Ideas, out of which the World Soul produces individual souls that in turn emanate lower beings in a process that approaches, but does not quite reach, pure matter. Matter, as total formlessness, is so far from true being that it does not exist. Identifying evil with matter or formlessness, Plotinus concluded that evil does not exist in an absolute sense, but only as incompleteness or lack of good. This account of evil as having no positive existence was later adopted by Augustine and most subsequent theologians.

Since Plotinus, following Plato, equated goodness with reality and evil with unreality or distance from the One, it followed that virtue consists in purging the soul of reliance on sensual pleasures and imagery, so that it can ascend the ladder of being and return to its source in the One. The culmination of this process of purification through self-denial is the mystical experience of reunion with the One, which Plotinus describes—having experienced it himself at least four times—as “the flight of the Alone to the Alone.” Thus virtue, for Plotinus as later for Augustine, is not its own reward but is a means to a metaphysical state of blessedness. In the words of the historian W. T. Jones, “Like other men of his time, Plotinus found this world a sea of troubles and a vale of tears; like them he sought to leave it; and like them he found perfect peace only in otherworldliness.” How much of this view was absorbed into Christian, Islamic, and Judaic theology can hardly be overestimated, although the influence of Platonism on Judaism was mainly through Philo Judaeus (fl. 20 BCE–40 CE), an Alexandrian Jew and contemporary of Jesus, who combined elements of Stoicism with a Platonistic interpretation of Judaic theology and ethics.

(The above section on Hellenistic and Roman ethics was prepared in collaboration with Professor Richard O. Haynes of the University of Hawaii.)

## MEDIEVAL ETHICS

The rise of Christian philosophy, out of a fusion of Greco-Roman thought with Judaism and elements of other Middle Eastern religions, produced a new era in the history of ethics, although one that was prepared for by Stoicism and Neoplatonism. The Stoic concern with justice and self-mastery, and the Neoplatonic search for reunion with the source of all being, were combined in early Christian philosophy with the Judaic belief in a per-

sonal God, whose commandments are the primal source of moral authority and whose favor is the ultimate goal of human life. Two sources of ethical standards, human reason and divine will, were juxtaposed in one system of ethics, and the tension between them was reflected in conflicting sectarian interpretations of theological principles.

From the second to the fourth century, Christianity spread through the Roman Empire, offering the poor and the oppressed a hope for otherworldly happiness in compensation for their earthly suffering, and thus a way of life with which the more pessimistic and intellectualist schools of philosophy could not compete. By the fourth century, Christianity dominated Western civilization and had absorbed the main ideas and values of the secular schools of thought, as well as rival religions such as Manichaeism, Mithraism, and Judaism. Having converted the masses, it was time to win over the intelligentsia, and doing this required the hammering out of an explicit and plausible system of metaphysical and ethical principles. This task was performed by the Church Fathers, Clement of Alexandria, Origen, Tertullian, Ambrose, and, most completely and authoritatively, by Augustine.

**AUGUSTINE.** St. Augustine (354–430), born near Carthage, the son of a pagan father and a Christian mother, was first a Manichaean and later became converted to Christianity. He rose in the church to become bishop of Hippo and helped to settle the doctrinal strife among the many Christian sects by constructing a system of theology, ethics, and theory of knowledge that soon became the authoritative framework of Christian thought, modified but not supplanted by subsequent church philosophers. Augustine’s major works, *Confessions*, *The City of God*, *Enchiridion*, and *On Freedom of the Will*, wove together threads of Stoic ethics, Neoplatonic metaphysics, and the Judeo-Christian doctrine of revelation and redemption into a many-colored fabric of theology. With Augustine, theology became the bridge between philosophy and revealed religion, the one end anchored in reason and the other in faith, and ethics became a blend of the pursuit of earthly well-being with preparation of the soul for eternal salvation.

Like the Neoplatonists, Augustine rejected almost entirely the claims of bodily pleasures and community life, maintaining, as St. Paul had done, that happiness is impossible in this world, which serves only as a testing ground for reward and punishment in the afterlife. Augustine inherited the Neoplatonic conception of virtue

as the purgation of the soul of all dependence on material comforts in preparation for reunion with God. Against the Stoic and Aristotelian reliance on reason as the source of virtue, Augustine maintained that such apparently admirable traits as prudence, justice, wisdom, and fortitude—the four cardinal virtues identified by Plato and stressed by Stoics and Christians—are of no moral worth when not inspired by Christian faith. With the pessimistic view of life characteristic of an era of wars, political collapse, and economic decline—a view already apparent in the Stoic, Epicurean, and Neoplatonic modes of withdrawal from social responsibilities—intensified by his personal sense of guilt and worthlessness, Augustine saw life on Earth as a punishment for Adam's original sin. "For what flood of eloquence can suffice to detail the miseries of this life?" he laments in *The City of God*.

**Nature.** The tension between natural and supernatural values in Augustine's ethical thought shows itself most clearly in his ambivalent attitude toward nature. Nature, as God's creation, must be unqualifiedly good. Natural evils are only apparently evil, and in the long run they contribute to the fulfillment of divine purpose. Natural evil is simply imperfection that makes variety possible and thus, when viewed on a cosmic scale, does not exist at all. On the other hand, since man must be held morally responsible for his sins, human sin cannot be so easily explained away as incompleteness that promotes the cosmic good. Moreover, it is man's bodily desires that tempt him to sin. Without the aid of divine grace, the promptings of human nature, whether impulsive or rational, lead only to vice and damnation. Augustine resolves this paradoxical view of human nature by holding that man, unlike other natural species, was endowed by his Creator with free will and thus with the capacity to choose between good and evil. Through the original sin of Adam he has chosen evil, and it is for this reason, rather than because of any flaw in his original construction, that he is irresistibly inclined to further sin.

**Free will and divine foreknowledge.** If Augustine's dual conception of nature is explained by his concept of free will, the latter contains new difficulties. The problem of free will is critical in Christian ethics, which emphasizes responsibility and punishment. The Greek ideal of practical reason ensuring physical and mental well-being was supplanted by the ideal of purification of the soul through suffering, renunciation, and humble obedience to divine will.

Where the practice of virtue produces well-being as its natural consequence, as in the Greek view, virtue carries with it its own reward in accordance with the causal

processes of nature, so that causal necessity and moral desert are not merely compatible; they normally coincide. But in the Christian view, causal necessity and moral responsibility seem incompatible, for the choice between good and evil is made by the soul, independently of natural processes, and its reward or punishment is independent of the natural effects of human actions. Man is punished or rewarded to the degree to which he voluntarily obeys or disobeys the commands of God. In the Greek view, man suffers from the natural consequences of his mistakes, but in the Christian view, no matter what the natural consequences of his actions, he is held to account for the state of his soul. It is his motives and not his actions that count in assessment of his moral responsibility, and the primary motive is his desire for, or his turning away from, God.

Responsibility is thus transferred from the consequences of a person's actions to the state of his soul. Yet if the soul is created by God, and not subject to its temporary owner's control, then in what sense can man be said to have freedom of choice between good and evil? Augustine describes the soul that chooses evil as "defective," but if so, is not the Creator of the defective soul responsible for its deficiency? In absolution of God, Augustine argues that a defect is not a positive entity, thus not a created thing and not attributable to a creator—a terminological escape that is vulnerable to the objection that, on such grounds, a man who stabs another produces in his victim a deficiency rather than a positive state and therefore is not responsible for his "nonexistent" product.

Augustine's concept of free will is further complicated by his support of the theological principle of divine omniscience, which entails foreknowledge by God of human decisions. The term *predestination*, used by later theologians and notably by the Protestant reformers, suggests a determinism that Augustine rejects in his criticism of fatalism. For Augustine, God knows what man will choose to do and makes it possible for man to act on his free choices but does not compel him to any course of action. To the obvious question of how God can know in advance what has not been destined or causally necessitated, Augustine replies by means of his subtle analysis of time. God has knowledge, not of what we are compelled to do but of what we freely choose to do, because his knowledge is not the kind of advance knowledge that is based on causal processes but is due to the fact that, in the mind of God, we have already made our decisions. All of past and future time is spread out in the specious present of the divine mind, so that what, from our limited stand-

point, would be prediction of the future is, for God, simply direct awareness of contemporaneous events.

*Distinctions among ethical concepts.* While Augustine's ethical writings are mainly concerned with the substantive problem of how to achieve redemption, rather than with the clarification of ethical concepts, much of his writing is philosophical in our strict sense, in that it suggests solutions to conceptual or metaethical problems of meaning and method. Augustine opposed the classical tendency to define the moral concepts of rightness and virtue in terms of individual and social well-being and interpreted moral right and virtue as obedience to divine authority. The concept of good is split into a moral and a practical sense. Good as fulfillment of natural tendencies is subordinated to eternal beatitude, the fulfillment of the aspirations of the virtuous soul. Freedom and responsibility are interpreted as internal states of the soul and as excluding, rather than (as for Aristotle) presupposing, causal necessity.

FOURTH TO THIRTEENTH CENTURIES. From Augustine in the fourth century to Peter Abelard (1079–1142) in the eleventh century, Christian, Islamic, and Judaic philosophy was dominated by Neoplatonic mysticism and preoccupied with faith and salvation. The outstanding figure of this period was John Scotus Erigena (c. 810–c. 877), whose conception of good was the Platonic one of approximation to timeless being and whose view of life as issuing from and returning to God bordered on heretical pantheism.

By the eleventh century, interest in rational philosophical speculation had revived, and even those Schoolmen like Bernard of Clairvaux (1090–1153), who continued to defend religious mysticism and denounced reliance upon reason as inimical to faith, nevertheless employed philosophical arguments to refute contrary opinions. Augustine had asserted that one must “believe in order to understand,” and St. Anselm (1033–1109) took this to mean that faith is not incompatible with reason but, rather, prepares the soul for rational understanding. The main issues among philosophers of this time were the relation between faith and reason, and the nature of universals.

Abelard, however, an extraordinarily original and independent thinker whose vibrant personality reveals itself in his philosophical writings, rediscovered some of the unsolved problems of ethical philosophy. Abelard brought into clear view the distinctive features of Christian ethics implicit in Augustine's work, in particular, the split between moral and prudential concepts that sharply

separates Christian ethics from Greek ethics. Abelard held that morality is an inner quality, a property of motive or intention rather than of the consequences of one's actions, a principle that was later stressed by the Reformation and attained its fullest expression in the ethical system of Kant. A somewhat heretical corollary follows from Abelard's principle, namely that, as Étienne Gilson put it, “Those who do not know the Gospel obviously commit no fault in not believing in Jesus Christ,” and it seems clear from all this that Christian faith need not be the foundation for moral rules. Abelard concluded that one can attain to virtue through reason as well as through faith.

THOMAS AQUINAS. The towering figure of medieval philosophy is, of course, Thomas Aquinas (c. 1224–1274), whose philosophical aim was to reconcile Aristotelian science and philosophy with Augustinian theology. The way to this achievement had already been prepared by the revival in western Europe of interest in Aristotle, whose thought had been preserved and elaborated by Muslim and Jewish scholars such as Avicenna, Averroes, and Maimonides and had been brought to the attention of Christendom by the commentaries of Albert the Great. It remained for Aquinas to prove the compatibility of Aristotelian naturalism with Christian dogma and to construct a unified view of nature, man, and God. This he undertook with remarkable success in his *Summa Theologiae* and *Summa Contra Gentiles*.

To a large degree, Aquinas's union of Aristotelianism with Christianity consisted in arguing for the truth of both and in refuting arguments of his predecessors and contemporaries that purported to show their incompatibility. Aristotle's ethics was relativistic, rational, and prudential; Augustinian ethics was absolutist, grounded on faith, and independent of consequences. Now one of these views is totally misguided, or else there must be room for two different systems of ethical concepts and principles. Aquinas adopted the latter alternative and divided the meaning of ethical concepts into two domains, “natural” and “theological.” Natural virtues, adequately accounted for by Aristotle, can be attained by proper training and the exercise of practical reason, while theological virtues—faith, hope, and love—require faith and divine grace. Similarly, he distinguished two highest goods, or paramount goals of life, worldly happiness and eternal beatitude (which has precedence); the former is achieved through natural virtue and the latter is achieved through the church and its sacraments. Aquinas thus expressed a considerably more optimistic attitude than did Augustine toward the possibility of improving man's

lot on earth through knowledge of nature and intelligent action. This helped to prepare the climate for the rebirth of natural science, whose first stirrings were felt in the thirteenth century.

**Natural law.** At the center of Thomistic ethics was the concept of natural law. The medieval doctrine of natural law, stemming from Aristotle's teleological conception of nature and from the Stoic identification of human reason with the Logos, was a fusion of naturalistic Greek ethics with monotheistic theology. On this view, the promptings of informed reason and moral conscience represent an inherent tendency in the nature of man, and conformity to this nature fulfills both the cosmic plan of the Creator and the direct commands of God revealed in the Scriptures. Natural law is the divine law as discovered by reason, and therefore the precepts of the church and the Bible, and scientific knowledge of the universal needs and tendencies of man, provide complementary rather than competing standards of ethical judgment. Where conflicts between science and religious authority arise, they must be due to inadequate understanding of science, since church authority and dogma are infallible.

The Thomistic unification of scientific and religious ethics in the doctrine of natural law—further elaborated in subtle detail by Francisco Suárez and other legalists—was an effective way of making room, within the religious enterprise of achieving salvation, for the practical business of everyday living in pursuit of personal and social well-being. The ideological supremacy of theology was maintained, but the doctrine of natural law purported to guarantee reliable knowledge of nature, psychology, and political economy. The weakness in this system was that it placed religious barriers in the way of scientific advance, tending to sanctify and render immune from revision whichever scientific principles seemed most congenial to theology, such as instinct theory in psychology, vitalistic biology, and geocentric astronomy.

**Free will.** Aquinas's account of freedom and moral responsibility was, in general form, similar to that of Augustine, maintaining the compatibility of free will with predestination or divine foreknowledge. Aquinas also maintained the compatibility of free will with causal determinism, thus dealing with the problem on the level of prudential ethics as well on as the theological level of grace and salvation. Aquinas's solution makes effective use of Aristotle's analysis of choice and voluntary action in terms of internal causality and deliberation, and it identifies free will with rational self-determination rather than with the absence of causal influences. On the other hand, Aquinas's concept of freedom is, as a result, more

relativistic than Augustine's, and, while it explains the conditions under which an agent may be held responsible for his actions—namely, the conditions of desire, knowledge, and deliberation—it does not meet the further issue of whether these faculties that determine action are within the control of the agent, that is, whether a person can freely choose the habits and desires that determine his actions. Later writers, particularly Protestant theologians, tended to interpret Augustine as stressing predestination and Aquinas as stressing free will, but it may be argued to the contrary, that Augustine's conception of free will as an inexplicable and supernatural thrust of the soul allows the agent more independence of his formed character than does Aquinas's, but by that very token, Aquinas's account is more congenial to a scientific view of man.

Subsequent scholastic philosophy, from the fourteenth to the seventeenth centuries, added little to the clarification of metaethical problems, but it probed further into the relation between intellect and will as sources of human and divine action. John Duns Scotus (c. 1266–1308), William of Ockham (c. 1285–1349), and Nicolas of Autrecourt (c. 1300–after 1350) developed the voluntaristic doctrine that the will is free in a more absolute sense than that accounted for by Aquinas, in that it is independent both of external causality and of determination by the intellect—that is, by the agent's knowledge of what is right and good. Their view in one way strengthened the case for religious faith as against scientific reason, at least in matters of ethical judgment, but, in another way, it helped stimulate an attitude of individualism and independence of authority that prepared the ground for the secular and humanistic ethics of the modern age.

## EARLY MODERN ETHICS

Philosophy seems to flourish best in periods of rapid social transformation, when the conceptual framework of a culture crumbles, requiring a reexamination of basic concepts, principles, and standards of value. The sixteenth and seventeenth centuries, which saw the demise of medieval feudalism and ushered in the modern age of industrial democracy, were, like the fifth and fourth centuries BCE, a period of intense philosophical ferment. In both cases, the preceding century witnessed the demolition of traditional beliefs, while the succeeding century was one of systematic reconstruction. The development of commerce and industry, the discovery of new regions of the world, the Reformation, the Copernican and Galilean revolutions in science, and the rise of strong sec-

ular governments demanded new principles of individual conduct and of social organization.

In the sixteenth century, Francis Bacon demolished the logic and methodology of medieval Scholasticism. Desiderius Erasmus, Martin Luther, and John Calvin, while attempting to strengthen the bond between religion and ethics, undermined the elaborate structure of canon law based on the moral authority of the medieval church, and Niccolò Machiavelli dynamited the bridge between religious ethics and political science. The task of reconstruction in philosophy was performed in the seventeenth century by René Descartes, Thomas Hobbes, Gottfried Wilhelm Leibniz, Benedict de Spinoza, and John Locke.

**HOBBS.** Modern ethical theory began with Thomas Hobbes (1588–1679). The advent of Galilean natural science had challenged the traditional notions, supported by authority, of purpose, plan, and value in the physical world; it cast into doubt the doctrine of natural law and nullified the anthropomorphic assumptions of theology. New standards of ethical judgment had to be found, not in the cosmic plan of nature or in scriptural revelations of the divine will but in man himself, either in his biological structure, or in his agreements with his fellow men, or in the social and political institutions that he creates. Thus were born, simultaneously and to the same parent, the ethical philosophies of naturalism, cultural relativism, and subjectivism, respectively.

Born in a time of international and domestic strife, Hobbes regarded the preservation of life as the paramount goal of human action and constructed his system of ethics and political science in his major work, *Leviathan*, with the principle of self-preservation as its cornerstone. His enthusiasm for Galileo Galilei's physics and his conviction that all fields of knowledge could be modeled on this universal science (following the method of Euclid's geometry) may have suggested to him that the drive to self-preservation is the biological analogue of the Galilean principle of inertia. Hobbes conceived of man as a complex system of particles in motion and attempted to deduce ethical laws from the principle of self-preservation. He offers, however, two formulations of this principle, the first of which is his foundation of ethics, while the second is, in effect, the repudiation of ethics.

The tendency to self-preservation, according to Hobbes, expresses itself in the quest for social harmony through peacekeeping institutions and practices or, alternatively, in the aggressive drive toward power over one's fellow men. Thus he formulates his "first and fundamental" principle in two parts, the "law of nature" to the effect

that "Every man ought to endeavor to peace as far as he has hope of obtaining it," and the "right of nature," that "when he cannot obtain it, he may seek and use all the helps and advantages of war." Which of these two forms of the principle of self-preservation should be applied depends, for Hobbes, on whether the agent finds, himself in a well-organized society or in a "state of nature" in which he cannot expect cooperative behavior on the part of his fellow men. Thus, the concept of ethical law applies to social agreements and commitments, while that of rights applies to the exercise of natural powers. In the state of nature one has a right to do whatever one has the power to do.

From his fundamental law of nature, Hobbes derives a number of specific rules that prescribe the means of establishing and maintaining a peaceful society, the primary means being the willingness to make or, if already made, to maintain the social contract in which individual rights or powers are surrendered to a sovereign in return for the guarantee of personal security. The state is thus the artificial creation of reasonable men, a "Leviathan" that maintains peace by means of power relinquished to it by its citizens. Once such a commonwealth has been established by contract or conquest, other general rules of conduct follow in accordance with Hobbes's theory of psychology. To restrain the natural human tendencies to envy, mistrust, self-aggrandizement, and aggression, the virtues of accommodation, gratitude, clemency, obedience to authority, and respect for the equal rights of others are recommended by "laws of nature" as effective means of ensuring social harmony.

*Reason and ethical laws.* Hobbes's use of the term "laws of nature" in referring to ethical principles is to be distinguished sharply from the medieval concept of natural law that he rejected. There is, for Hobbes, no moral order in the cosmos, nor any natural prompting toward justice and sympathy for others in human nature. Man, like the rest of nature, is a system of particles perpetually moving and colliding in accordance with physical laws whereby direction and intensity of motion are determined solely by preponderance of force. Yet reason plays a role in human action that distinguishes man from the rest of the world machine. Ethical rules are "precepts, found out by reason, by which a man is forbidden to do that which is destructive of his life or taketh away the means of preserving the same."

In his mechanistic physiology, Hobbes explained reason as a mechanical process in the brain consisting in the combining and separating particles that serve as representations of objects and qualities; thus, cognitive

processes are a special type of physical process, governed by the same laws. But on this mechanistic view of man, it is difficult for Hobbes to account for the prescriptive character he attributes to ethical laws as distinguished from physical laws. Throughout his discussion, Hobbes vacillates between a conception of ethics as a branch of physical science that describes the behavior of human mechanisms and the quite different conception of ethics as rational advice on how to get along with one's fellow men by consciously restraining one's aggressive impulses. Both sides of the *nomos-phasis* controversy between the Sophists and Plato are represented in Hobbes's thought, and he cites both social authority and prudential reason as sources of ethical obligation. Moral virtue consists in conformity to custom and law, in opposition to the natural aggressiveness that equips a man for survival in the state of nature, yet the "precepts found out by reason" provide a natural basis for the establishment of customs and laws.

*Desire and will.* Hobbes's account of desire and will is designed to bridge the gap between rational directives and physical laws. He defines "good" as "any object of desire" and desire as the motion toward an object that results from physiological processes ("endeavors") within the body. To act rationally does not entail freedom to act contrary to one's physiological impulses, since rationality or deliberation is simply the mediating processes of the central nervous system. The will is not a supernatural power controlling desires but simply the last stage of deliberation that eventuates in overt action, and thus is itself a neurological process governed by laws of physics. Freedom of the will from causal influences is, for Hobbes, a senseless combination of concepts; freedom is the "absence of external impediments" to the will. It is the person who is free or unfree, and not his will, since his freedom consists in the determination of his overt actions by his will rather than by external forces. Yet this mechanistic account of the will seems in paradoxical contrast with his subjectivist account of civil law as deriving its obligatory force from the arbitrary will of the sovereign, an account that comes dangerously close to the Aristotelian and Augustinian notions of the will as a "first cause."

*Naturalism and nonnaturalism.* The importance of Hobbes to modern ethical theory is inestimable. In freeing ethics from bondage to revealed theology and its anthropomorphic view of nature, Hobbes brought philosophy back to the problems with which it had begun to wrestle in the time of Socrates and the Sophists, and of which it had lost sight for a millennium. At the same

time, he raised the understanding of these problems to a higher level, profiting both from the Christian insight that moral principles have an obligatory force and from the refinements of scientific method introduced by Bacon, Galileo, and Descartes.

If ethics was to become a body of reliable knowledge, it must be grounded on objective laws of psychology and biology, rather than on tradition, sentiment, and church authority. On the other hand, if nature and its scientific description are ethically neutral, then ethics is to be contrasted with science and purged of references to nature, just as natural science must be purged of references to ethical values. In that case, ethical principles must be understood as subjective expressions of emotion and desire, and not as objectively verifiable laws. This dilemma has plagued philosophy ever since, and, if it was not resolved by Hobbes, at least his thought was not completely impaled on either horn but only a bit on both.

**EARLY INTUITIONISTS.** Reaction to Hobbes's attack on the objectivity of ethical judgment was immediate. The doctrine of natural law and its vision of nature as a moral system were defended in a new form by a group of scholars at Cambridge who became known as the Cambridge Platonists, principally Ralph Cudworth (1617–1688) and Henry More (1614–1687). They maintained that moral principles are self-evident truths, as certain and immutable as the laws of mathematics. Richard Cumberland (1631–1718) attempted to deduce all the principles of ethics from a single "Law of Nature" that later became the cornerstone of utilitarian ethics, namely, the law that all actions should promote the common good. Nicolas Malebranche (1638–1715) developed the Cartesian theory of ethics as a deductive system but gave it an Augustinian slant, attributing to God the sole power to translate knowledge of ethical truth into action. Malebranche realized that the analogy between ethics and mathematics fails to explain the connection between ethics and action, and so he made a virtue of this defect by means of his "Occasionalist" account of causality as divine intervention. Samuel Clarke (1675–1729) developed an intuitionist theory of "natural religion" similar to that of Cudworth and More, holding that the quality of right or "fitness" is an intrinsic property of actions that the mind can perceive as directly as it perceives geometrical relations.

**SPINOZA.** Born in the Netherlands of Jewish refugees from the Spanish Inquisition, Benedict de Spinoza (1632–1677) combined Descartes's faith in the capacity of reason to govern action with Hobbes's mechanistic the-

ory of psychology to express a scientific vision of nature as a unified system of laws. In his *Ethics Demonstrated in the Geometric Manner* Spinoza, like Hobbes but with more formal precision, derived the principles of physics, psychology, and ethics from metaphysical axioms.

The first principle of psychology for Spinoza, as for Hobbes, is the drive to self-preservation and self-aggrandizement, corresponding to the physical principle of inertia. But Spinoza's unique achievement was to derive, as the logical corollary of this egoistic psychology, a rational, humane, and cultivated way of life. A strict determinist in his metaphysics and a thorough naturalist in his ethics, Spinoza held that every event is deducible from antecedent causes and concluded that ethical right is identical with causal necessity. The rules of conduct are therefore laws of human nature, obeyed by all but obeyed blindly by the selfish person enslaved by his passions while understood and accepted by the free man who, in achieving a vision of the necessary order of all things, experiences the "intellectual love of God" that provides both happiness and moral virtue.

While Spinoza tried more consistently than Hobbes to reduce ethics to psychology and thus to make it a branch of natural science, it has often been contended that his program was self-defeating. For if men cannot help acting in accordance with their desires, and if nothing is objectively good or bad but only appears so to those who do not understand the necessity of all events, then what sense can there be to either prudential or moral rules of conduct? Having banished values from nature, Spinoza, like Hobbes, had to relocate them in human consciousness. But then consciousness must be either a supranatural force that interrupts the causal order of nature—as it was for Descartes—or a part of nature and thus ethically neutral, in which case ethics becomes senseless; or, finally, consciousness is an illusory reflection of physical processes in the body, in which case ethics, too, is illusory. Spinoza and Hobbes vacillated between the last two alternatives although, as we have seen, Hobbes's prescriptivist account of moral right as stemming from the will of an authority may be suspected of having slipped an element of supranatural agency back into the picture.

In their social and political theories, both Spinoza and Hobbes argued for the appraisal of institutions and policies in terms of the satisfaction of human needs rather than of conformity to religious tradition. But Hobbes's conception of force as the basis of law led him to support political authoritarianism, while Spinoza's identification of value and right with rational self-interest

enabled him to argue, like Locke, for representative government and maximum civil liberty.

LOCKE. John Locke (1632–1704) is generally regarded as the founder of modern utilitarianism, although his applications of utilitarian ethics to social and political theory were more influential than his analysis of standards of individual conduct. He combined the mathematical model of ethical judgment suggested by Descartes and the Cambridge Platonists with a hedonistic theory of psychology according to which pleasure is the goal of all human action and consequently is the fundamental standard of evaluation. In his *Essay concerning Human Understanding*, Locke criticizes the doctrine of innate ideas of Descartes and Leibniz, in defense of the principle that all knowledge is founded on experience; he then, somewhat paradoxically, offers an account of ethics as a deductive science in which specific rules of conduct are derived "from self-evident propositions, by necessary consequences as incontestable as those in mathematics." The appearance of paradox dissolves, however, on noting that, for Locke, the formation of the ideas of goodness and justice is due to the sensations of pleasure and pain, and thus ethical concepts are derived from experience although their logical relations are then discoverable by reflective analysis.

Locke follows Hobbes in defining good as the object of desire, but then, assuming that the only property of things which provokes desire is their tendency to produce pleasure or reduce pain, he also defines good as "what has an aptness to produce pleasure in us." Again, like Hobbes, Locke defines moral virtue as conformity to custom and law, but he differs from Hobbes in maintaining that custom and law can in turn be evaluated by the more fundamental standards of utility and natural rights. It is in terms of these more basic standards that Locke justifies representative government and civil liberty.

Locke's main contribution to the clarification of the meaning of ethical concepts was in his distinction between "speculative" and "practical" principles. Speculative knowledge is independent of action, while practical principles (including ethical principles) can be said to be believed and known to be true only insofar as they are acted upon. This distinction accounts for the obligatory force of ethical principles and eliminates the need for a supernatural agency, "free will," to translate belief into action, although it makes it difficult to explain why, if practical principles are "self-evident propositions," we do not all behave in a morally impeccable way. Like Hobbes, Locke ridicules the notion of free will as a semantical

absurdity similar to the questions “whether sleep be swift or virtue square.” Will is the power of the mind to decide on action, and freedom the power to carry out one’s decisions, that is, to get what one wants.

**MORAL-SENSE THEORIES.** The seventeenth-century philosophers found the connection between self-interest and morality in the threat of punishment—divine, natural, or civil—that coerces the individual to be moral for the sake of self-interest. But it was soon noticed that this connection breaks down wherever the expected benefit to the individual of immoral conduct outweighs the likelihood of punishment and that, if morality is grounded in psychology, then human nature cannot be as aggressively self-centered as the apostles of self-preservation and pursuit of pleasure maintained.

The third earl of Shaftesbury (1671–1713) and Francis Hutcheson (1694–1746) proposed that moral obligation has its source in benevolent affections, such as love and pity, that are as natural and universal as the more aggressive tendencies (“self-affections”), such as envy, greed, and the impulse to self-preservation. Moreover, there is a “moral sense” in man that finds unique satisfaction in actions directed toward the common good. This moral sensibility turns us from the pursuit of pleasure toward the performance of duties toward others and explains our admiration of self-sacrifice independently of external reward or punishment.

Bernard Mandeville (c. 1670–1733), in *The Fable of the Bees*, defended egoistic psychology against this attack and ridiculed the concept of moral conscience as a hypocritical device for maintaining social privileges, a view later echoed by Baron d’Holbach, Karl Marx, and Friedrich Nietzsche. Bishop Joseph Butler (1692–1752), whose sermons in defense of Christian morality against the cynicism of Hobbes and Mandeville reveal extraordinary analytical power, argued that benevolence and conscience are as deeply rooted in human nature as is self-love. In adding conscience or intuition of duty to benevolence as the psychological source of moral obligation, Butler lessened the stress of earlier moral-sense theorists on emotion and gave more recognition to the role of rational judgment.

Moral-sense theory, refined further by David Hartley (1705–1757) and Adam Smith (1723–1790), who applied utilitarian ethics to economic theory, achieved its most persuasive formulation in the writings of David Hume.

**HUME.** David Hume (1711–1776), like Hartley and Smith, combined an emotional account of morality with a utili-

tarian theory of good. Hume’s discussions of ethics in the third part of his *A Treatise of Human Nature* and, more fully, in his *An Enquiry concerning the Principles of Morals* are attempts to answer the metaethical questions of the meaning of good, right, justice, and virtue; by what standards they are attributed to persons and actions; how it is psychologically possible for men to admire and cultivate morality at the expense of self-interest; and by what rules ethical disputes can be decided in favor of one judgment against another. Despite the clarity and good sense that Hume brings to bear on these topics, his discussion shifts inadvertently from one type of question to another, particularly from questions of meaning to questions of motivation, a shift characteristic of moral-sense theories.

Hume begins his studies of ethical judgment with a search for the meanings of ethical terms. Finding no observable facts or logical relations that answer to our concepts of goodness, justice, and moral virtue, Hume concludes that the function of ethical terms is not to denote qualities or relations but to convey a “sentiment of approbation,” so that their meaning is to be found in the feelings of the judge rather than in the object judged. We call things good for the same reason that we call them beautiful: because we find them agreeable. An object is good if it is immediately pleasant, or if it is a useful means for attaining something else that is pleasant. Virtues are qualities that render a person agreeable or useful to himself or to others, whether they are “natural virtues” such as talent, wit, and benevolence or “artificial virtues” like honesty and justice. While judgments as to what is useful in producing pleasure, insofar as they rest on knowledge of causal facts, are within the competence of reason, nevertheless they depend, for their distinctively ethical import, on feeling or taste, since rational knowledge alone is “not sufficient” to produce any moral blame or approbation. “Utility is only a tendency to a certain end; and were the end totally indifferent to us, we should feel the same indifference toward the means. It is requisite a certain *sentiment* should here display itself” (*Enquiry concerning the Principles of Morals*, Appendix I).

Thus, according to Hume, there are two possible grounds or standards of evaluation, utility and feeling, the one objective and subject to rational confirmation, the other subjective and personal. The objective standard, unfortunately, applies only to instrumental values and not to ultimate ends. However, the subjectivity of feelings is not cause for despair about achieving agreement on ethical judgments, since the sentiment that motivates them, the disinterested pleasure and approval that we feel in contemplating actions directed toward the welfare of

others, is, for Hume as for Butler, a universal tendency in human nature.

*Moral reasons and psychological motives.* In common with Hobbes and Locke, who justified moral conduct by the fear of punishment, and the earlier moral-sense theorists, who explained moral obligation in terms of the benevolent affections, Hume identifies the psychological motives that influence and often prejudice moral judgments with the logical grounds or reasons for moral judgments. From the premise that, were it not for our natural benevolence, we would not care enough about moral issues to make moral judgments, Hume draws the non sequitur that the only evidence which supports such judgments lies in the feeling of approval or disapproval that motivates them.

Hume tends to equate moral virtue with the artificial quality of justice, artificial because it is required only for the protection of property rights in a society in which goods are neither too scarce nor sufficiently abundant. The importance for social harmony of strict conformity to laws renders it dangerous and undesirable to make exceptions in the name of expediency. Consequently, the utility of strict justice outweighs the utility of any possible exceptions. But Hume realized that this rather abstract utilitarian consideration can hardly explain our sense of moral obligation and our admiration for those who demonstrate high moral character. He therefore supplements this account with the notion of “disinterested interest” that resembles the rational moral sense appealed to by Butler, Richard Price, and Thomas Reid (see below).

However, Hume is not positing any occult faculty, for he explains disinterested moral approbation as a combination of the natural quality of sympathy for others (pain at witnessing another’s pain) and the habit of following rules. Since natural sympathy alone would lead us into injustices and considerations of utility alone would seem to justify exceptions to general rules, we come to agree on general principles of conduct and transfer to these principles the sentiment of approbation that we originally felt toward the happiness or release from pain usually produced by following such principles. Thus arises the sense of moral duty and the capacity for disinterested approval. Here again, Hume offers a psychological description of the motivating processes that cause us to approve of moral virtue as an answer to the question of what criteria we use to judge persons and actions to be worthy of moral approval. Once this identity of psychological motive and logical ground is presupposed, it becomes impossible to distinguish between correct and incorrect moral judgments. The question as to whether action that

meets with general approbation actually merits such approbation cannot even be raised, since merit has already been identified with the mere fact of approbation.

*Freedom.* On the issue of free will and its relation to moral responsibility, Hume argued persuasively that responsibility presupposes the causal efficacy of threat of punishment. He developed further the arguments of Hobbes and Locke that freedom is not a quality of the will but a relation between desire, action, and environment, such that a man is free when his actions are caused by his own desires and unimpeded by external restraints, a view that William James later baptized “soft determinism.”

COMMONSENSE INTUITIONISM. Hume’s subjective account of moral judgment was countered by the commonsense intuitionism of Thomas Reid (1710–1796) and Richard Price (1723–1791), who explained the moral sense, or conscience, that enables man to distinguish right from wrong as a combination of benevolent emotion and rational intuition. Both argued, like Butler, that moral principles are not in need of utilitarian justification but are as natural to man as self-love and desire for pleasure. Reid argued that moral qualities are as directly perceived as physical properties are and thus exist in the object judged rather than in the feelings of the subject who judges. Ethics is as much a matter of objective fact as science is, except that its principles are self-evident and can be discovered by “common sense” alone, uncorrupted by bad philosophy. Reid also defended the belief in freedom of the will as the ground of moral responsibility, arguing that we are introspectively aware of our ability to choose between good and evil independently of our desires.

THE FRENCH ENLIGHTENMENT. Ethical thought in eighteenth-century France paralleled developments in Great Britain, although the French philosophers failed to establish as strong traditions as their British contemporaries. French thought subsequent to the eighteenth century added little to moral philosophy as compared with that of Germany and Great Britain. Due to their intense involvement in political issues, the French writers placed rhetorical effectiveness above clarity and consistency as a standard of philosophical value.

Voltaire (François-Marie Arouet, 1694–1778) and Jean-Jacques Rousseau (1712–1778) led the revolt against Cartesian rationalism as well as against political and religious superstition, so transforming philosophy into ideology that *idéologue* became a popular French synonym for *philosophe*. Voltaire employed acid satire in attacking religious and philosophical obscurantism in *Candide*,

*Zadig*, and his *Philosophical Dictionary*, while Rousseau inaugurated the romantic style of soul-stirring emotional intensity, in place of detached analysis and rigorous argument. Denis Diderot (1713–1784) raised philosophical writing to the highest level of literary grace and subtlety since Plato, criticizing conventional morality and religious beliefs in his remarkable essay-novels *Le neveu de Rameau*, *Jacques le fataliste*, and *Rêve de d’Alembert*. Yet while appreciating their extraordinary intellectual qualities and the permanence of their place in Western culture, it must be noted that they provided few new concepts and principles on which later ethical philosophers could build.

**Rousseau.** Rousseau’s celebrated exaltation of untutored human nature in his two *Discourses* attributed genial and cooperative tendencies to man’s innate disposition and aggressively self-serving tendencies to the harmful influence of civilization. This coincided with the British moral-sense theorists’ attacks on Hobbesian egoism. However, unlike Hume (his friend and benefactor prior to their notorious public quarrel), Rousseau considered custom and law to be arbitrary restraints on natural impulses rather than rational methods of channeling self-interest toward the common good. Whatever justification can be given for control of the individual by social institutions lay, for Rousseau, in their claim to represent the “general will,” that is, the desires of the majority, independently of whether what is so desired is good. While Rousseau argued forcefully, in *The Social Contract*, for popular sovereignty and the right of revolution, he justified the use by the state of extremely repressive measures, such as the death penalty for atheism. His rather mystical notion of the state as the embodiment of the general will helped to inspire the overthrow in France of absolute monarchy in favor of representative government, yet half a century later it was employed by Johann Gottlieb Fichte, and a century after that by V. I. Lenin, in the justification of authoritarianism.

Although Rousseau’s religious mysticism and his preference for feeling over rational prudence were contrary to the general tone of the Enlightenment, his most lasting contribution to ethical philosophy was his insistence that good and evil tendencies are due to social causes, a principle that he shared with baron de Montesquieu, Voltaire, and the Encyclopedists. The soundness of this principle is subject to question, but there can be no doubt that it served as a useful guide in the reform of social institutions.

**Montesquieu.** Charles Louis de Secondat, baron de la Brède et de Montesquieu (1689–1755), in *The Spirit of the*

*Laws* founded the relativistic conception of moral and political principles as grounded in the traditions of particular societies. The “spirit of the laws” is the system of social practices in relation to which new laws are to be evaluated. Western European governments require a division of functions and compensating checks and balances to fulfill the partly republican, partly monarchical values of European society. In treating values as historical and sociological facts, rather than as divine principles or natural laws, Montesquieu developed further the scientific approach to ethics and politics begun by Machiavelli and Hobbes.

**The Encyclopedists.** Denis Diderot, Claude-Adrien Helvétius (1715–1771), and baron d’Holbach (1723–1789) derived, from a materialistic theory of nature, an ethical view based on the self-centered pursuit of pleasure as the sole rational motive for action. A well-ordered society, on their view, is one in which the pursuit of personal well-being is unhindered by social authority. Insofar as there are conflicts between morality and self-interest, these are due to defects of social organization and perverse education, rather than to the moral defects of individuals. These Encyclopedists, and kindred spirits in other countries, such as the Italian legal philosopher Cesare Bonesana Beccaria, employed utilitarian moral theory in political campaigns for representative government and humane laws and punishments.

**KANT AND THE GERMAN ENLIGHTENMENT.** The Enlightenment attack on tradition and authority in favor of individual reason took a nonutilitarian form in the philosophy of Immanuel Kant (1724–1804). The utilitarians identified reason with practical intelligence in the pursuit of happiness. Kant, however, inherited the Cartesian and Leibnizian conception of reason as the intellectual recognition of abstract truths. In fashioning an ethical theory that became the main rival of utilitarianism, Kant combined the Augustinian emphasis, revived by Butler, Price, and Reid, on the internal sense of moral obligation with the rationalistic ideal of knowledge as a deductive system. In his *Critique of Pure Reason*, he attempted to show that the laws of science are imposed by the mind on the objects of its perceptions and can thus be known with certainty through reflection on the a priori structure of knowledge. In his *Critique of Practical Reason* he applied the same analysis to ethics, founding morality on the a priori laws with which “practical reason” regulates action. While Kant defended religious faith against the utilitarian freethinkers, he shared their view that ethics is independent of theology, and he followed the deistic tradition of interpreting God as a scientific and

ethical ideal, rather than as a supernatural source of revelation and authority.

In his most influential work on ethics, *The Foundations of the Metaphysics of Morals*, Kant made the most thorough attempt by any philosopher to clarify and explain the difference between ethical principles and laws of nature. The difference lies both in our subjective sense of obligation to obey moral laws, as contrasted with laws of nature, toward which we feel no such obligation, and in the practical—that is, prescriptive—meaning of moral laws, in contrast with the “theoretical”—that is, descriptive—meaning of laws of nature. In virtue of this difference, moral rules are expressed in the imperative mood and laws of nature in the declarative mood. To account for this disparity, Kant distinguished two realms of knowledge dealing with two metaphysically distinct subject matters. Natural science, including scientific psychology, formulates laws of nature that the mind imposes on the objects of perception in accordance with the principle of causal determinism. Ethics articulates the “laws of freedom” that a rational being imposes on his own actions and expects other rational beings to recognize and obey. The justification for these rules lies in the logical fact that to be rational means to act in accordance with general rules and that moral rules are those which can be followed consistently by all rational beings. Thus, insofar as man is moral, he is rational and, in this sense, free; insofar as he is immoral, he is an irrational slave to his natural inclinations. The reward of virtue is not happiness but dignity and freedom.

**Moral virtue: The supreme good.** Kant’s system of ethics is built on three pillars: the examination of the facts of moral experience, the analysis of the logic of ethical judgment, and the formulation of the metaphysical principles presupposed by ethical judgments, as distinct from scientific generalizations. In the first part of the *Foundations* Kant argues, like Reid, that commonsense reflection, uncorrupted by the dialectics of philosophers, informs us with unwavering certainty that duty is distinct from pleasure and utility, that moral virtue or “good will” is the supreme good to which all other values are subordinate, and that moral worth is not measured either by the consequences of a person’s actions or by his natural benevolence but by the agent’s intention to obey moral laws.

**Categorical imperatives.** In the second section of the *Foundations*, Kant attempts to explain the distinctive character of moral laws by clarifying the logical differences between three types of rules or imperatives: technical “rules of skill,” prudential “counsels” as to how to achieve happiness, and moral duties. The first two, he

argues, are “hypothetical imperatives” whose directives are contingent on the desires of the agent. Naturalistic ethics mistakes counsels of prudence for moral laws because the desire for happiness is so universal that directives toward this end have the superficial appearance of unconditional laws. But the generalization that all men seek happiness is a law of nature, not a rule commanding action, and the very possibility of a moral code entails that this psychological generalization is subject to exception. For moral duty requires that the agent sacrifice his personal happiness and even the welfare of his community rather than violate a “categorical imperative.”

A moral or genuinely categorical imperative is a rule that commands a type of action independently of any desired end, including happiness. Kant accepts the utilitarian account of hypothetical imperatives but argues that the peculiar obligatoriness of moral principles can be explained only by their unrestricted universality and thus by their independence of any facts of human nature or circumstance. It is not in virtue of what satisfies human needs, but in virtue of the demand of reason that action be in accordance with universal law, that we feel obligated to obey moral principles.

**Universalizability criterion.** To the question of whether any rule of action can qualify as a moral principle, Kant’s answer was in the negative. He maintained that there is one general or “fundamental” categorical imperative from which all specific moral duties can be derived: “Act only on that maxim which you can will to be a universal law.” All maxims or specific rules of conduct can be judged morally right or wrong according to this general criterion. If universal obedience to a proposed rule would contradict the very purpose of the rule, as is the case for rules that under certain circumstances permit lying, stealing, or taking life (somewhat inconsistently, Kant approved of capital punishment), then the rule cannot be part of a true moral code. In contrast, a rule such as “Do not make false promises” can in principle be followed without exception and thus qualifies as a moral duty.

This criterion of universalizability, that is, the logical or psychological possibility of requiring universal obedience to a rule of action (logical for “strict” duties and psychological for “meritorious” duties), was undoubtedly Kant’s most original and important contribution to ethical theory. It expresses more precisely and unambiguously the “golden rule” to be found in all the great religions, and it has been incorporated, in one form or another, in most modern systems of ethical theory. Countless writers since Kant have attempted to reformulate the criterion of universalizability in a way sufficiently

qualified to avoid reasonable objections, but without complete success.

The obvious objection to Kant's formulation is that no one would want any specific rule of action to be followed without exception. No one would want the truth to be told on occasions when unmitigated harm would result—for example, when a murderer demands to know where his intended victim is hiding. Kant's own reply to this objection is that, while one may not be psychologically inclined to tell the truth on such occasions, there is no logical contradiction in willing—that is, commanding—that it be told, come what may.

A second objection is that Kant assumes, for any rule of action, that either it or its negation must be a moral law, and yet there are few rules, if any, which we would care to have followed universally in either positive or negative form. Kant argues that, since it would be self-defeating to will that every person may make false promises when it suits his purposes, we ought to will that false promises never be made. Yet on the same reasoning one could justify all sorts of absurd laws, such as that everyone at all times wear heavy clothing, since we would not and could not will the universal prohibition of heavy clothing.

A third weakness of Kant's theory is that it provides no grounds for deciding what is right in a situation where apparent moral duties collide and one must be sacrificed in favor of another. With respect to this problem, utilitarianism seems clearly superior to Kantian ethics.

**Autonomy of the will.** The third part of Kant's ethical theory consists in the metaphysical account of the rational will as a source of action outside the sphere of causal determinism and thus not an object of scientific investigation. The autonomy of the will—that is, the capacity to obey laws of its own conception in defiance of natural causes—is, Kant argues, a necessary presupposition of any moral code. For if all actions were necessary effects of natural causes, then moral evaluation would be pointless. *Ought* implies *can*, that is, the obligation to do what is right entails the ability to do it and the ability not to do it. Since science rests on the regulative principle of universal determinism, there can be no scientific proof of freedom of the will. But this only shows the radical difference between science and ethics and the folly of attempting to derive ethics from psychology. Man as an object of scientific inquiry is an organic phenomenon obeying laws of biology and psychology. But man as an object of ethical evaluation is a noumenal being, free to obey or disobey the dictates of practical reason. From this dual conception of man as both inside and outside

nature, Kant derives an ideal way of life impressive in its purity and its faith in human perfectibility. Man as a rational agent is a member of a “kingdom of ends” in which he is both subject and sovereign, legislating for himself and for others. The highest goal of human life is to realize this ideal “kingdom” in individual and social practice.

## NINETEENTH-CENTURY ETHICS

Nineteenth-century ethical thought became a battleground for two rival traditions. Utilitarianism, stemming from Locke, Hume, and the French Encyclopedists, dominated British and French philosophy, while idealistic ethics was supreme in Germany and Italy. Both traditions took root in the United States, with idealism appealing to the religious vision of Ralph Waldo Emerson and Josiah Royce, while utilitarianism answered to the developing faith in technology that found philosophical expression toward the end of the century in the pragmatic ethics of James and John Dewey.

**UTILITARIANISM.** Christian ethics based on divine authority and natural law was given a utilitarian interpretation by William Paley (1743–1805) in his *Principles of Moral and Political Philosophy*. The source of moral obligation, he agreed with Hobbes, lies in the “violent motive resulting from the command of another,” while the ground of goodness is pleasure or utility. But moral duty and self-interest coincide because God, as the paramount authority, commands us through the Scriptures and the promptings of conscience to seek the general good as well as our own happiness. Moral obligation is supported both by natural pleasure in the welfare of others and by the fear of divine punishment that provides the selfish but rational person with a good reason to sacrifice his pleasure for the common good. Paley's psychological account of morality, like that of earlier moral-sense theories, failed to explain why anyone who lacks natural benevolence ought to have it. His alternative justification of morality in terms of the fear of divine punishment equally fails to explain why such punishment would be just and why a nonbenevolent nonbeliever in Christian theology can nevertheless be expected to behave morally.

**Bentham.** The mainstream of utilitarian thought was anticlerical. Jeremy Bentham (1748–1832) and James Mill (1773–1836) formed a political movement that helped bring about legislative reforms by criticizing social institutions in terms of their utility in producing “the greatest happiness for the greatest number.” In his influential *Introduction to the Principles of Morals and Legislation*,

Bentham formulated a theory of ethics and jurisprudence remarkable for its clarity and consistency. The great appeal of Bentham's theory lay in its apparent simplicity and ease of application, although these virtues may have been more apparent than real. Bentham attempted to make ethics and politics scientifically verifiable disciplines by formulating quantitative standards of evaluation. He began with the psychological generalization that all actions are motivated by the desire for pleasure and the fear of pain: "Nature hath placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne" (*Principles*, London, 1823, p. 1). From this equation between ethical obligation and psychological necessity, Bentham derived the general principle of utility that "approves or disapproves of every action whatsoever, according to the tendency which it appears to have to augment or diminish the happiness of the party whose interest is in question," happiness being understood as the predominance of pleasure over pain.

The most original but also the most dubious part of Bentham's theory is his "hedonic calculus" for measuring pleasures and pains, in computing the overall value of alternative policies. If such a procedure were feasible, ethical judgments would be as scientific as meteorological forecasts, even though both are subject to considerable error, due to the complexity of the factors involved. But Bentham's ideal of a science of ethics runs afoul of two internal difficulties, the resistance of pleasure to measurement and the impossibility of predicting the long-range consequences of actions. Aside from these internal defects, there remains the general objection that pleasure, unlike pain, is not a bodily sensation but a favorable response to an object grounded on the perception of value in the object, as Thomas Reid had argued. To conclude that an object is good from the fact that it pleases us involves the circular reasoning that it is good because it is judged to be good, a principle too vacuous to provide a guide to ethical judgment. If, on the other hand, pleasure is understood in a more narrow, technical sense as desirable bodily sensations, then Bentham's identification of happiness and welfare with pleasure is unacceptable because it reduces human experience to the level of animal existence. The plausibility of Bentham's theory may be due to the ease with which he shifts inadvertently from one of these senses of *pleasure* to the other.

Despite its theoretical defects, Benthamite utilitarianism, which was more socially oriented than that of Locke and Hume, had a salutary effect on social legislation. His analysis of pleasures into factors of intensity, duration, propinquity, certainty, fecundity, and "extent" (number of persons affected) offered reasonable criteria by which alternative social programs and laws can be evaluated and was a marked improvement over the sanctification of existing laws and customs by which Hobbes, Locke, and Hume had made the transition from self-interest to morality. But there is a missing link in Bentham's chain of reasoning that may not be repairable within the confines of his hedonistic psychology, namely, the link that should connect the desire for one's own pleasure with the willingness to consider "extent" or pleasure of others in deciding on a course of action. Is desire for the pleasure of others also a "sovereign master under which nature hath placed us?" If so, then desire for one's own pleasure cannot be sovereign as well. If not, then on what ground are we required to consider the factor of extent?

*Mill.* John Stuart Mill (1806–1873) recognized the defects in Bentham's formulation of utilitarianism, and in his essay "Utilitarianism" he offered a more sophisticated version that sought to incorporate the moral insights of rival ethical systems. Realizing that Bentham's emphasis on quantitative aspects of pleasure reduces pleasure to bodily sensation and tends to justify an uncultivated mode of life, Mill proposed a new factor by which pleasures could be compared, the factor of quality. Some pleasurable experiences, notably intellectual, aesthetic, and moral achievements, are qualitatively superior to the satisfaction of bodily needs: "Better to be Socrates unsatisfied than to be a fool satisfied." But like Epicurus's preference for "natural" over "unnatural" pleasures, Mill's criterion of quality introduces a standard of value other than pleasure, by which pleasure itself can be evaluated, and thus contradicts the principle of utility, that pleasure is the single standard of good.

Mill also tried to make room in utilitarian theory for the appreciation of the saintly virtues, renunciation and self-sacrifice, by arguing along Humean lines that such virtues are originally valued for their social utility but that we later become attached to them for their own sake, and that this psychological shift from appreciation of virtue as a social instrument to admiration of virtue for itself is a good tendency because it, too, is socially useful. For the appreciation of moral qualities independently of their immediate consequences ensures the social reliability of the agent and, in the long run, produces more good

than harm. This utilitarian defense of moral principles rested on an optimistic belief in the generally beneficial tendencies of man. In applying it to political theory, Mill argued for democratic institutions, minimum state interference in social life, and free economic competition. Assuming a general convergence of individual and social benefit, Mill, like Hume and Bentham, left unanswered the question why, in cases of conflict, one *ought* to place public over private interest and confined himself to explaining why we admire the person who does so. Yet if the social utility of moral self-sacrifice is the only rational ground for favorable judgment of it, then it would seem to follow that each of us has reason to approve of self-sacrifice in others but not in himself. If the step from individual happiness to the greatest good for the greatest number is justified only by the long-range coincidence of the two, then whenever we are assured that they will not coincide, we have no reason to prefer public welfare to our own other than the irrational habit of doing so, a habit that, in such case, it would be wise to break. In Kantian terms, utilitarianism, even in Mill's sophisticated version, fails to provide a logical bridge between inclination and obligation, between *is* and *ought*.

Later intuitionists, beginning with Henry Sidgwick, attempted to supply this bridge by combining the Kantian theory of rational duty with the utilitarian theory of value, maintaining that we are intuitively aware of the duty to obey moral principles at the expense of self-interest but that moral principles, in turn, are justified by their utility in promoting the common good.

**IDEALIST ETHICS.** Kant's distinction between man as noumenon, legislating and obeying "laws of freedom," and man as phenomenon, governed by laws of nature, was incorporated into new ethical systems by later German idealists, who assimilated the phenomenal side of the distinction to a part of the noumenal side, making natural science subordinate to ethics. Johann Gottlieb Fichte (1762–1814) extended the noumenal will into a universal force that creates the material world out of its own force and expresses itself partially in the free rational will of the individual conscience but more fully in social institutions and laws. The individual thus achieves self-realization in identifying himself with the universal will and voluntarily accepting his *Beruf* (vocation) as part of the social order.

*Fichte.* In his early work *Wissenschaftslehre* (*Theory of Science*, 1794) Fichte enlarged Kant's ethical concept of man into a metaphysical picture of the universe. Rejecting Kant's notion of things-in-themselves, Fichte reduced

reality to the projections of an absolute mind, and he reduced mind itself to will. The criterion of reality became a practical one: That is real which it is right or good to believe and to act upon (the beginning of pragmatism). Fichte went even further than Kant in stressing moral duty as the goal of life. Kant had sharply separated duty from self-interest in criticizing positions of the kind later referred to as utilitarianism, but Fichte moved full circle by reidentifying moral duty with a higher form of self-interest, the self-realization of an absolute will of which each person is a temporary embodiment. The logical problem created by Fichte's voluntaristic idealism is caused by the fact that it begins with Kant's primacy of moral good over prudential good but concludes with a form of supernatural utilitarianism in which prudential good of a higher self reappears as the ground of morality.

Fichte explained the function of the state as the regulation of conflicts among individuals in protection of their natural rights, and on this basis he supported democratic government. But he advanced the view, later elaborated by Hegel, that governmental restraints on individual action are not limitations of personal freedom but expressions of the higher freedom of the absolute will.

In *The Vocation of Man* (1800) Fichte, who had been accused of atheism, developed a less rationalistic and more religious view of human life. He identified the absolute will with the personal God of Christianity and moral duty with the vocation imposed on man by God. In his later *Addresses to the German Nation* (1808) he applied his notion of divinely ordained vocation to the German nation, which he claimed was destined to raise civilization to a higher level. The evolution of Fichte's thought from austere moralism to religious mysticism and then to chauvinistic nationalism provides an instructive example of the lengths to which thought can go in denying the basic distinctions from which it begins, such as that between self-interest and moral duty or between individual rights and social restraints.

*Hegel.* G. W. F. Hegel (1770–1831) developed Fichte's social basis of ethics further and in more historical terms. For Hegel value, morality, and law are among the highest forms of self-realization of absolute spirit. The Enlightenment doctrine of abstract rights is only the first stage in the development of ethical consciousness. A higher stage is reached in the Kantian sense of moral duty, which recognizes the conflict between individual rights and social responsibilities, subordinating the former to the latter. But the highest stage of self-realization of "objective mind" involves the incorporation of rights and duties in

a rational system of social and political institutions which the individual citizen recognizes as the embodiment of the national will. The perfect freedom that consists in rational self-determination is achieved when individual conscience coincides with custom and law, so that will and reason, subjective motivation and objective necessity, become identical. But this is possible, according to Hegel, only in the modern age of the national state, Christian conscience, and constitutional law. In earlier stages of human history, whatever was necessary for historical progress was, for that age, necessary and therefore right, as, for example, the institution of slavery was necessary and right in ancient Greece. "World history," he declared, "is world justice."

**POST-HEGELIAN THEORIES.** The impact of Darwin's theory of natural evolution produced naturalistic echoes of Hegelian historical relativism in the utilitarian "survival of the fittest" doctrine of Herbert Spencer (1820–1903), the Marxist philosophy of class conflict, and the cultural elitism of Nietzsche.

**Marx.** Karl Marx (1818–1883) transformed Hegel's theory of the dialectical self-realization of mind into a doctrine of dialectical development of history through class conflict. In the Marxist theory, moral principles represent the sanctification of the interests of the ruling class at each stage in the development of progressively superior modes of economic organization. Marx criticized both utilitarian and Kantian ethics as variant expressions of bourgeois marketplace procedures. Subordinating rules of individual conduct to the historical imperatives of "revolutionary praxis," the *Communist Manifesto* of Marx and Friedrich Engels called for revolutionary action to achieve a classless society in which "the free development of each is the condition for the free development of all," a society that would require neither the internal repressions of conscience nor the external repressions of laws and punishments. Both morality and the state would "wither away."

**Schopenhauer.** Arthur Schopenhauer (1788–1860), like Fichte, located the source of both egoistic pursuit of pleasure and moral obligation in the universal will. The morality of equal rights for all represents a higher development of consciousness than that of self-interest, but a still higher stage is reached in the philosophical understanding that the will, in any form, produces illusion and suffering and that the extinction of desire is the only salvation. Schopenhauer gave the Stoic and Buddhist ethic of ascetic renunciation an idealistic metaphysical basis.

**Kierkegaard.** Søren Kierkegaard (1813–1855) rejected the rationalistic and socially oriented ethic of Hegel in favor of religious individualism. While, like Hegel, he regarded the conflict between self-interest (the "aesthetic attitude") and duty (the "ethical attitude") as reconciled and transcended in a higher stage of consciousness, he denied that this stage could be achieved by reason and described it as a "leap of faith" preceded by tragic anguish. As the contemporary existentialists who have rediscovered Kierkegaard have put it, "The world is absurd" because there are no objective grounds for human decisions. What is right, according to Kierkegaard, is what the individual asserts with the total commitment born of faith, but it is right only for him. Emotional authenticity rather than conformity to rules is the proper guide to action.

**Nietzsche.** Friedrich Nietzsche (1844–1900) proposed a less mystical but equally individualistic transcendence of moral codes. Like Hobbes and Mandeville, he regarded altruism as contrary to natural impulse and denounced moral restraint as a device created by religion to contravene the natural order of dominance of the strong over the weak. The true source of value lies in the creative self-assertion of the artist and the man of genius who produce new and positive forms of good, while moral prohibitions produce only resentment, envy, and dull conformity.

**American developments.** In the United States, the transcendentalists, led by Ralph Waldo Emerson (1803–1882) and the pragmatic idealist Josiah Royce (1855–1916), fashioned still other variations on the idealist theme of self-realization as the goal of human life. The transcendentalists identified the self with the creative force of nature, the "oversoul." Royce, following Hegel, defined the fully realized self as a unity of personal and community interests. All of these post-Hegelian philosophies rejected the Kantian morality of strict adherence to general rules of conduct and proposed ways of transcending the conflict between duty and self-interest through a higher mode of consciousness in which the conflict allegedly disappears.

Toward the end of the nineteenth century, William James (1842–1910) and John Dewey (1859–1952) developed the philosophy of pragmatism, in which all of human knowledge is regarded as essentially ethical. They rejected both the Kantian separation of ethics from natural science and the traditional conception of scientific knowledge as disinterested contemplation of value-neutral truths. The split between value and fact was bridged by reinterpreting both so that they became indistinguishable. James combined utilitarianism with a creative

individualism similar to that of Nietzsche and the prescriptivism of Hobbes, by identifying the source of value with the human act of making a claim, thus bestowing value on the object claimed. Ethical judgment is a rational process of determining by empirical investigation which policies are likely to satisfy the maximum number of such claims. James defended the indeterminist concept of free will, criticizing what he called the soft determinism of Hume and Mill as a purely verbal escape from the embarrassing consequences of scientific determinism.

**BRITISH IDEALISM AND INTUITIONISM.** In the last quarter of the nineteenth century the vitality of idealism began to attract even the sober British intellect, and the ethics of self-realization became a powerful rival to utilitarianism through the influence of Thomas Hill Green, Bernard Bosanquet, and F. H. Bradley.

**Green.** Thomas Hill Green (1836–1882) introduced Oxford students to the lofty vision of idealist metaphysics. In his *Prolegomena to Ethics* (published posthumously) Green derived liberal ethical and political principles from his conception of the individual self as part of a universal and divine self. He criticized both utilitarianism and moral-sense theories for downgrading the role of reason in moral judgment and for reducing human motives to natural causes. A motive, he argued, is a goal previsionsed by a rational consciousness, not an event or process in the body. Value is therefore logically prior to desire rather than a product of desire. One can desire or find pleasure only in what one has judged to be good. The source of evil must therefore be found in defects of the understanding, in the failure of the human mind to realize its identity with the universal mind. The highest good is thus as much an object of self-interest as any other, but it is the kind of self-interest that also constitutes morality.

Green was active in social and political controversies, supporting the North in the American Civil War and supporting liberal legislation in England. Green rejected laissez-faire individualism, insisting on the more positive role of government in promoting social welfare.

Green's ethical theory was sharply criticized by Sidgwick in *The Ethics of Green, Spencer and Martineau* (1902). Sidgwick argued that Green's identification of morality with higher self-interest obliterates the all-important distinction between prudence and duty and thus fails to provide a basis for moral responsibility, a defect that, as we have seen, goes all the way back to Plato.

**Bosanquet.** Bernard Bosanquet (1848–1923), like Green, grounded ethics and politics on idealist metaphysics. Bosanquet stressed somewhat more than Green the uniqueness of individual values while at the same time taking a Hegelian view of the state as the embodiment of objective mind. Like Green, Bosanquet actively supported liberal political causes.

**Bradley.** Francis H. Bradley (1846–1924), generally considered the most distinguished ethical theorist among the British idealists, criticized both utilitarianism and Kantian formalism and favored a Hegelian conception of the community as an organic unity whose needs, expressed in social institutions, transcend those of individual citizens, a conception that he applied in the defense of conservative social policies. Bradley was probably more consistent than Green and Bosanquet. If law and custom are the expression of a higher self, then only internal inconsistencies can justify reforms, and individual rights are subordinate to group or national interests. In his *Ethical Studies* (1876) Bradley supported retributive punishment on the ground (which he held to be self-evident to common sense) that punishment is unfair unless it is deserved and that moral desert is independent of social utility. He attempted to reconcile freedom with causal determinism in the notion of an all-encompassing Reality that determines itself in accordance with rational laws. Recognizing that idealism faces the problem of accounting for evil and that its traditional solution—claiming that evil does not exist—is contrary to the judgment of common sense on which Bradley himself always relied, he employed a subtle distinction between existence and reality in holding that evil, though it exists, is unreal. From the standpoint of the totality of knowledge, evil may be seen to contribute to cosmic harmony. This “solution” was later castigated by Bertrand Russell as a morally untenable justification of evil.

**Sidgwick.** Henry Sidgwick (1838–1900) combined the social utilitarianism of Mill with the intuitionism of Butler and Kant. In *The Methods of Ethics* (1875), a work described by C. D. Broad as “the best treatise on Moral Philosophy that has ever been written,” Sidgwick raised ethical analysis to a new level of precision and logical rigor. Setting aside practical moralizing as not the business of objective philosophical analysis, Sidgwick interpreted the task of moral philosophy to be the clarification of the logic of moral judgment, a conception of philosophy that was continued by the contemporary British school of linguistic analysis.

Sidgwick held that there are just three approaches to ethics worth philosophical consideration: egoistic hedon-

nism, utilitarianism, and intuitionism. He pointed out that neither the self-centered ethics of Hobbes and the French Encyclopedists nor the socially oriented ethics of Bentham and Mill can justify the step from psychology to ethics, that is, from the description of human motivation to judgments of moral obligation. Even those who declare that one ought to pursue one's own interests must justify their use of *ought*, and this cannot be done on the grounds of psychological facts alone. Sidgwick therefore insisted on distinguishing psychological hedonism from ethical hedonism and grounding the latter on intuition. His argument is reminiscent of Hume's claim that values cannot be deduced from facts, and it anticipates G. E. Moore's later analysis of the "naturalistic fallacy."

All three "methods of ethics" rest, according to Sidgwick, on principles held to be self-evident, and thus intuitionism is, to some extent, inescapable. The egoist must assume the self-evident rightness of pursuing one's own pleasure, and the social utilitarian must assume the rightness of maximizing the common good. Intuitionists differ from utilitarians and egoists only in holding many principles and duties to be self-evident as well, and thus they expose themselves to inevitable counterinstances. The more numerous and specific the rules claimed to be self-evident, the more subject to exception and vulnerable to disproof. Sidgwick concludes that social utilitarianism offers the correct standard of moral judgment but that this standard is in turn grounded on direct awareness of moral obligation. Thus at least one, and probably at most one, moral intuition is essential for moral judgment.

Sidgwick could not finally decide between the conflicting claims of self-interest and social utility. He leaned toward the latter as definitive of moral duty, but he recognized that one's self-interest rightly carries a special weight, other things being equal. Perhaps he would have been able to reconcile these two "intuitions" more easily had he considered utilitarianism in a somewhat weaker form, as the principle that one ought always to refrain from causing unnecessary suffering, rather than the stronger claim that one ought always to aim at maximizing happiness. For while one's own welfare seems naturally to outweigh that of others, it is very close to being self-evident to any morally sensitive person that he ought not to pursue his interests at the cost of substantial suffering to others.

It would appear from our brief glance over the history of ethics through the nineteenth century that philosophers failed to find any conclusive ethical truths and merely argued, more persuasively and with a more

impressive display of learning than most, for whatever way of life and standards of conduct they happened to prefer. In some respects this impression would be justified, and it serves to remind us of the differences between scientific knowledge and ethical wisdom. The perennial character of the problems, the lack of general agreement on proposed solutions, and the return of later doctrines to principles advanced by earlier ones all contrast strikingly with the irreversible progress of scientific discovery. It has been suggested by some contemporary philosophers that the endless disputability of ethical issues is rooted in the very nature of ethical language, so that it is not a defect of philosophy to have failed to achieve general agreement on ethics. As W. B. Gallie put it (*Philosophy and the Historical Understanding*, New York, 1964), ethical concepts are "essentially contestable." It is essential to their meaning that they evoke continual disputes as to the correct standards for their application. But if we cannot find historical progress in the form of final settlement of issues, we can at least discern some degree of gradual, if irregular, advance toward greater clarity in the formulation of the issues.

On the central issue of the logical relation between facts and values, ethical theories have provided increasingly clear and sophisticated statements of two fundamental positions, naturalism and nonnaturalism (sometimes called teleology and deontology). Naturalistic theories relate values to facts by defining "good" and related concepts in terms of observable criteria, such as fulfillment of natural tendencies (Aristotle), satisfaction of desire (Hobbes and Spinoza), production of pleasure for the greatest number (utilitarianism), conduciveness to historical progress (Spencer and Marx), or efficiency of means to ends (Dewey). Nonnaturalistic theories stress the fact that the meaning of ethical terms goes beyond the observable facts on which ethical judgments are grounded, and they locate the additional component of meaning outside nature. Plato located it in a realm of abstract Forms, Christianity in the will of God, the intuitionists in the direct recognition of the quality of rightness, the moral-sense theorists in the feeling of approbation. Each of these accounts of value and moral right has revealed an additional dimension of the complex logic of ethical judgment. Naturalistic theories have brought to light various ways in which ethical judgment is grounded on the fulfillment of biological and social needs, while nonnaturalistic theories have revealed prescriptive aspects of moral concepts that are independent of prudential considerations. The main effort of twentieth-century ethical philosophy was to weave together in a consistent pattern all the threads, both nat-

uralistic and nonnaturalistic, that constitute our philosophical heritage.

### CONTEMPORARY NONNATURALISM

In much of the English-speaking world G. E. Moore's *Principia Ethica* (Cambridge, U.K., 1903) is taken to be the starting point of contemporary ethical theory. But it is important to recognize that this primacy is to a considerable degree local and distinctive of the tradition of analytical ethics. On the Continent and in Latin America the work of Max Scheler and Franz Brentano has been a pre-eminent influence. For much of American thought until about the mid-twentieth century, the work of John Dewey or Ralph Barton Perry provided the starting point. But, for all that, it is reasonable to begin with G. E. Moore.

**MOORE.** It is the critical side of Moore's work in ethics that has had the most lasting effect. His delineation of the subject matter of ethics and his very careful effort to show that any form of ethical naturalism involves a fundamental conceptual mistake—the work of the first three chapters of *Principia Ethica*—has been the part of Moore's work that has deeply affected contemporary ethical thought. However, Moore's own positive nonnaturalistic cognitivism, with its reliance on nonnatural characteristics, has found few adherents. Most philosophers—C. L. Stevenson and R. M. Hare are typical—who have been convinced that in essence Moore's case against naturalism is sound have not followed Moore's lead but have adopted some form of noncognitivism.

It was Moore's belief that if moral philosophers simply interest themselves in good conduct, they are not really starting at the beginning, for we cannot know what good conduct is until we know what goodness is. Moore's concern was with a "general enquiry into what is good." Our first question must be "What is good and what is bad?" Such knowledge of good and evil, Moore claims, is the "goal of ethical investigation"; but, he stresses, "it cannot be safely attempted at the beginning of our studies, but only at the end." First we must consider how "good" is to be defined.

Moore clearly is not interested in giving a stipulative definition of "good," and from his disclaimers in *Principia Ethica* about being interested in a merely verbal point, it would seem that he is not interested in a lexical definition either. What he is after, in seeking a definition of "good," is just this: what property or set of properties is common to and distinctive of anything that could conceivably be properly called intrinsically good, for instance, "answering to interests." Moore thinks "good" stands for a prop-

erty, and he seeks to determine what it is. Moore's answer, which he is aware will cause discontent, is that "good" is not definable. All we can finally say correctly is that good is good and not anything else. "Good," like "red," is, in the appropriate sense, indefinable. Good is a simple, unanalyzable, nonnatural characteristic. We are either directly aware of it or we are not, but there is no way of defining it or analyzing it so as to make it intelligible to someone who is not directly aware of it.

Such a radical claim on Moore's part would have little force if he could not thoroughly refute naturalistic and metaphysical theories that do purport to give the kind of characterization of intrinsic goodness that he takes to be impossible.

*Moore's case against naturalism.* Let us consider Moore's case against ethical naturalism. An ethical naturalist holds that moral judgments are true or false empirical statements ascribing an empirical property or set of properties to an action, object, or person. "Good" is defined in terms of this property or set of properties. But, Moore argues, we will not come to know what good is simply by "discovering what are those other properties belonging to all things which are good." Those who commit what Moore calls the naturalistic fallacy think that when they have "named those other properties they were actually defining good; that these properties, in fact, were simply not 'other,' but absolutely and entirely the same with goodness." But to identify good with any other property is to commit the naturalistic fallacy. The naturalists confuse the question of the meaning of the concept of good with the quite different question of what kinds of things are good.

In a famous argument, which has been dubbed the open-question argument, Moore points out that for whatever naturalistic value we substitute for the variable  $x$  in a proposed definition of "good," we can always significantly ask if it is good. If a man says "Happiness is good," or "Self-realization is good," or "The object of any interest is good," we can always significantly ask "Is happiness good?" "Is self-realization good?" "Is the object of any interest good?" Even though we agree, let us say, that happiness is good, it is an evident fact of language that these questions are not without significance. But they would be without significance if "good" did mean "happiness," or "self-realization," or "the object of any interest," just as it is pointless to ask if a father is a male parent or a puppy is a young dog. For whatever naturalistic definitions we offer—whatever naturalistic values replace the variable  $x$ —it always makes sense to ask if that thing

is good. Since this is so, these naturalistic definitions can be seen to be inadequate.

This can be seen in another way as well. If a statement like “The satisfaction of desire is good” were a definition of the sort Moore was searching for, it would be analytic and it would be self-contradictory to assert “This satisfies desire but it is not good.” For whatever naturalistic definition one proposes, however, one can assert without self-contradiction “This is  $x$  but it is not good,” but if  $x$  meant the same as “good” this would be impossible, for “ $X$  is good” would then be analytic. But since this is possible it is clear that the proposed statement is synthetic.

**Moore’s influence.** The above arguments of Moore’s, together with his famous argument in Chapter 3 of *Principia Ethica* against Mill’s alleged naturalism, have provided the background for much of the controversy in contemporary ethical theory. While few have accepted all the details of Moore’s case against ethical naturalism, it has been felt by many that Moore’s essential case is well taken. R. M. Hare in his *The Language of Morals* (Oxford, 1952), P. H. Nowell-Smith in his *Ethics* (Harmondsworth, U.K., 1954), and A. C. Ewing in his *Second Thoughts in Moral Philosophy* (London, 1959) try to restate these Moorean insights in such a way as to present a decisive case against ethical naturalism.

It should be noted, however, that the reception of Moore’s case against naturalism, even on the part of such eminent nonnaturalists as A. N. Prior and E. W. Hall, has not been that favorable. It is generally thought now that (1) the naturalistic fallacy is not, strictly speaking, a fallacy but is at best a mistake and (2) that it is not really distinctive of naturalism but should be called the definist fallacy, that is, the belief that moral terms are capable of definition in nonmoral terms.

**Criticisms of Moore.** It is easy to see that someone, though at a certain price, could be a consistent ethical naturalist and that Moore’s naturalistic fallacy would not really point to anything necessarily fallacious in such a naturalist’s reasoning. An ethical naturalist who is also a hedonist could argue: By “intrinsic good” I am just going to mean “pleasure.” This is a stipulative definition on my part and I am making no claim that it squares with ordinary usage, but it will give a clear and consistent definition of “good” that fits well with my preanalytic insight that pleasure and pleasure alone is intrinsically good. It is indeed true that on my theory “Pleasure is good” is a tautology and “Is pleasure intrinsically good?” is a self-answering question. Still, there is a normatively vital question that I can and do ask with perfect conceptual propriety. The vital open question is this: Should an indi-

vidual seek pleasure and only pleasure as the thing that, morally speaking, he ought always to do? If a man takes this position, Moore’s arguments, given above, do not show anything fallacious in his thinking, that is, he has committed no formal or informal fallacy, though it can be shown by some additions to Moore’s arguments that he has said something that is mistaken.

There is a further criticism of Moore that can be made with considerable plausibility. Though it is indeed true that *good* taken in isolation cannot be defined, the term *good* is in reality always used in specific contexts, with context-dependent meanings and with such riders as “good at” and “good for.” But in such a context *good* can be defined. “A good car,” “good teacher,” “good at ballet,” or even “good man” can be naturalistically defined, even though *good* sans phrase cannot. Finally, and perhaps most importantly, it has been pointed out that the open-question and noncontradiction arguments are not conclusive. At best they show why all the naturalistic definitions hitherto proposed do not work. They do not show that naturalistic definitions are impossible.

**DEONTOLOGICAL NONNATURALISTS.** There are other nonnaturalists who, while holding cognitive meta-ethical theories, reject Moore’s ideal utilitarianism. Moore thought that Bentham and Mill were mistaken in trying to define *good* naturalistically, but that they were not mistaken in regarding good as the fundamental moral concept and were not mistaken in arguing that it is always our duty to seek to bring the greatest total good possible into being. H. A. Prichard, W. D. Ross, E. F. Carritt, and C. D. Broad all agree with Moore that intrinsic good is a unique, nonnatural quality that is indefinable and can only be known directly. But they reject Moore’s claim that *right* means “productive of the greatest possible good.” *Right*, they argue, is also *sui generis*; it is not reducible to *good* or to any teleological concept. To say “This is a right act” means, according to Ross, “This act ought to be done.” Furthermore, even what makes an act right is not to be completely determined by teleological concepts. An act, even though it may be productive, everything considered, of the best consequences, may still not be the right thing to do. Even Broad, who makes the most concessions to the utilitarians of any of the deontologists (as they are called), argues that in determining what is suitable to the actual situation, we must consider both the total fittingness of the events that are relevant to the act in question and the utilities in question, and then without any precise measure of what is suitable to the situation, we must decide what we are to do. The utilitarians, including

Moore, the deontologists agree, oversimplify the situation here.

In 1909 H. A. Prichard, in his celebrated article “Does Moral Philosophy Rest on a Mistake?,” set forth in perceptive but uncompromising form the deontological position. But it is W. D. Ross, taking Prichard’s position as a starting point, who has been the most influential of these deontological nonnaturalists. Ross’s *The Right and the Good* (Oxford, 1930) and his *Foundations of Ethics* (Oxford, 1939) present the classical statement of these views.

**Prichard.** In “Does Moral Philosophy Rest on a Mistake?” Prichard argued that it was an endemic mistake of moral philosophy to try to give reasons for our obligations. Moral obligation cannot be reduced to acts that ought to be done because by doing them, more good is likely to result than by doing any alternative act. We do not, Prichard contended, come to appreciate an obligation by argument, but in a particular situation we are either directly aware of what it is we ought to do or we are not. Moral philosophy cannot justify these obligations; it can only (1) help us to come to understand the nature of this immediate type of awareness and (2) help us to see through the confused attempts to exhibit the “truly rational foundations” of these obligations by showing how they are grounded in human interests.

**Ross.** Ross accepted the Prichardian belief that we have an intuitive insight into our obligations, but he went on from certain hints in Prichard to develop a concept of prima-facie duty. A prima-facie duty is a conditional duty of a very distinctive kind. What is meant by saying that it is “conditional” is that it is something that always would be an actual duty were it not for the fact that in certain circumstances there are more stringent moral considerations that outweigh it. But prima-facie duties are always actual duties unless such conditions obtain. Ross takes it as “self-evident that a promise, simply as such, is something that prima facie ought to be kept, and it does not, on reflection, seem self-evident that production of the maximum good is the only thing that makes an act obligatory.” Like John Cook Wilson and Prichard before him, Ross takes as his data “the moral convictions of thoughtful and well-educated people.” They serve as his point of departure and his check on all theorizing concerning morals.

Reasoning from this base, Ross can show that we do not always reason as utilitarian moralists would have us reason. We often have duties of special obligation that conflict with the utilitarian principle that we should always maximize good. If we carefully attend to the data

of ethics—our actual moral experiences—we will note that we have prima-facie duties to fidelity, reparation, gratitude, justice, beneficence, nonmaleficence, and self-improvement. Some of these prima-facie duties are more binding than others. *Ceteris paribus*, the duty of nonmaleficence outweighs our obligation to keep a promise. But Ross stresses—as does Broad—that it is not always the case that we have a rule, a general principle, for deciding what to do when there is a conflict in prima-facie duties. Sometimes we simply have to appreciate or come to “see” what is suitable to the situation.

**Criticisms of deontology.** Many, though by no means all, philosophers would agree that the deontologists have shown that moral reasoning is not as simple as the classical utilitarians took it to be. But it has been thought by many that consequences play a far larger role in determining what makes an act right than the deontologists have been willing to admit. Their rather antiquated epistemology of intuitions, synthetic a priori judgments, and so forth, and their misleading use of mathematical analogies have stood in the way of an acceptance of deontology. It is, however, quite feasible to argue that such appeals are not essential to a deontological view.

It has also been repeatedly argued that a deontological position, with its list of prima-facie duties and its appeal to the convictions of the thoughtful and the well-educated, is thoroughly ethnocentric. To these objections it is reasonable to reply that most of Ross’s prima-facie duties are very similar to the kind of generalities that the anthropologists Ralph Linton and Robert Redfield (among others) have claimed to be cross-culturally sanctioned “universal values.” Moreover, the appeal to thoughtful and well-educated people surely need not and should not limit itself to people in one cultural circle.

Rather more important criticisms of deontology have been that it gives us no criteria for deciding what laws, practices, rules, or institutions are worthy of our acceptance. Here the kind of quasi-utilitarian reasoning concerning practices characteristic of the good-reasons approach seems to have decided advantage.

**Ewing.** It should be mentioned that A. C. Ewing in two closely reasoned books, *The Definition of Good* (New York, 1947) and *Second Thoughts in Moral Philosophy* (London, 1959), works out a theory that in many respects tries to find a middle ground between Moore and Ross. Ewing takes *ought* as his fundamental term, and in the second work he makes far more concessions to the naturalists and noncognitivists than in the first, without abandoning what he takes to be the core of his nonnaturalism.

PHENOMENOLOGICAL VIEWS. Moore, Ross, Broad, and Ewing are not the only nonnaturalists and intuitionists who have exerted a considerable influence on contemporary ethical thought. During a roughly comparable period, Franz Brentano, Nicolai Hartmann, and Max Scheler had a comparable influence on the Continent.

It is necessary to mention that in contemporary philosophical thought there is a fundamental cleavage that divides the English-speaking and Scandinavian countries, on the one hand, from the Continent, Latin America, and the Near East and Far East, on the other. In these latter areas of the world the influence, either direct or indirect, of the philosophers so far discussed has been slight, while the influence in intellectual circles of the philosophers to be discussed in this section and in the section on existentialism has been considerable. Even though Moore, Ross, and Ewing opposed empiricism, their techniques remained analytical, while the work of the philosophers about to be discussed is philosophy in the grand manner; that is, it is comparatively speculative and metaphysical.

**Brentano.** Franz Brentano's *The Origin of Our Knowledge of Right and Wrong* (Leipzig, 1889) and his later *Grundlegung und Aufbau der Ethik* (F. Mayer-Hillebrand, ed., Bern, 1952) mark the beginning of contemporary Continental ethical theory. In 1903 G. E. Moore remarked that Brentano's work more closely resembled his own than that of any writer with whom he was acquainted. Like Moore, Brentano rejected naturalistic definitions of ethical terms, regarded fundamental moral concepts as *sui generis*, and thought judgments of intrinsic value incapable of being proved.

To gain an adequate understanding of Brentano's ethical theory, it is essential to understand the rudiments of what he called descriptive psychology (the latter, in Edmund Husserl's hands, was to become phenomenology). Brentano classified mental phenomena into three fundamental classes: ideas and sensory presentations (images and the like), judgments, and emotions. That is to say, there are three fundamental ways in which one may be intentionally related to something. One may simply think of it, one may take an intellectual stance toward it by either accepting it or rejecting it, or one may take an emotional or attitudinal posture toward it. To do the last is a matter of loving or hating it. (Brentano, of course, uses *love* and *hate* here in a very stretched manner.) Brentano regarded emotions as intentional; he maintained that "certain feelings refer unmistakably to objects and language itself signifies this through expressions that make use of it." Moreover, emotions, like judgments but

unlike ideas, can properly be called either correct or incorrect. In this way Brentano differed radically from the emotivists.

How do we decide whether a given emotion is correct or incorrect? Here Brentano, who like Ross was a careful student of Aristotle, was very Aristotelian. We can come to understand what a correct emotion or, for that matter, a correct judgment is only by contrasting actual cases of emotions and judgments taken to be correct by experienced and thoughtful people with cases that are not so regarded.

To say that something is good—where we are talking about "intrinsic good"—is to say that it is impossible to love it incorrectly. To say that something is intrinsically evil is to say that it is impossible correctly to love whatever is in question. "Good" and "evil" are what Brentano called synsemantic terms: They do not refer to concrete particular things, either physical or mental. But such ethical concepts were, on Brentano's view, objective because of the impossibility of loving correctly whatever is hated correctly and of hating correctly whatever is loved correctly. The truth of these fundamental moral judgments is directly evident to the mature moral agent. Any question about the empirical evidence for them is as impossible as it is unnecessary.

**Scheler.** Max Scheler attempted to apply Husserl's phenomenological method to moral concepts. His major works in ethics, *Formalism in Ethics and the Ethics of Intrinsic Value* (Halle, 1916) and *The Nature of Sympathy* (Bonn, 1923), are among his earlier writings (*The Nature of Sympathy* is simply a second and enlarged edition of the early *Zur Phänomenologie und Theorie der Sympathiegefühle*, Halle, 1913); but his later work in philosophical anthropology, *The Forms of Knowledge and Society* (Leipzig, 1926), also has important implications for his ethical theory.

Scheler's ethics is best understood by setting it in relation to that of Kant. Scheler accepted Kant's critique of naturalistic and utilitarian ethical theories. But while he took the categorical imperative as pointing to an essential feature of morality, he thought that such Kantian formalism was incomplete. Like Husserl, Scheler believed that Kant was mistaken in limiting the a priori to the purely formal. The phenomenological method shows that we have a *Wesensschau* (an intuition of essences) in virtue of which we know certain fundamental a priori but nevertheless nonformal moral truths, such as "Spiritual values have a higher place in the scale of values than vital values, and the Holy a higher place than the spiritual."

Given this very extended sense of “a priori,” it is correct to say, according to Scheler, that there are objective nonformal moral judgments which are universal, necessary, and synthetic. These moral judgments are said to have an intrinsic content that is given in our intuition of essences.

Scheler argued that there is a hierarchy of objective values, all open to our intuitive inspection. There is, he would argue, nothing subjective about this ordering. In the hierarchy of values phenomenologically given to man, we have at the top religious values, then cultural values (aesthetic, speculative, scientific, and political), and finally, at the bottom, material values (useful things, things that satisfy needs, desires, etc.). All of these values are thought to have an ethical dimension. Questions concerning moral obligation arise when there is a conflict of values. Moral obligation is that which binds us, in such a situation, to take as the order of our incentives the values as they are ordered in the value hierarchy. Scheler was, however, sufficiently Kantian to believe that the ultimate ground of moral obligation lay not in the consequences of moral acts but in the intentions of moral agents. To someone who has studied Mill, Sidgwick, or Ross, this seems like a plain confusion between the moral “grades” we would give a person and an objective consideration of what acts are morally right.

There is another aspect of Scheler’s moral theory that should be mentioned, namely, his claim that love and sympathy are the sole means by which we gain an intuitive insight into moral reality. Like Brentano, he thought that these feelings had intentional objects, and like Blaise Pascal, he thought that there was a “logic of the heart”—that through the feelings we gain a type of cognition into essential value structures that can be had in no other way.

**Hartmann.** Nicolai Hartmann’s massive work *Ethics* was published in Berlin in 1926. It shows the influence of Scheler and Husserl and is without doubt the most extensive phenomenological discussion of value in the literature. Ethics, for Hartmann, is part of a general theory of value, though, as might be expected, ethical values are the highest values. “Value” for Hartmann, as for Scheler, is a general predicate, and under it there are more specific predicates for determinate values, for instance, “beauty” is to “value” as “red” is to “colored.” Values are said to be essences, and we have a direct though emotionally tinged intuition of essences. Being essences, values, like numbers, are thought by Hartmann to have an ideal self-existence (*Ansichsein*). But unlike numbers, values have a “material essence.”

Like Scheler, Hartmann believes that if we will but attend patiently to our feelings, we will be able to discern, though vaguely, some hierarchical ordering of those things that are valuable. Putting aside as far as possible our theoretical preconceptions concerning values, we should reflect carefully on our actual experience until we achieve a clear and evident insight into value phenomena. This, of course, is a desideratum that will never be completely achieved, for “morally no age entirely comprehends itself.” The real ethical life is “a life deeper than consciousness.” But there is a capacity on the part of the human animal to appreciate the valuable, and by ever more carefully attending to this, we can attain both a clearer view and a more purified form of the moral life.

Though values are material essences, they are not, as in Plato, identical with being. Hartmann, no more than Moore or Jean-Paul Sartre, will identify what is good or what has worth with what exists. That would destroy the autonomy of ethics and obscure the nature of value. But although values are independent of existence, they are related to existence by a “tendency to reality” that Hartmann calls the ideal Ought-to-Be. We have many different values, but it always remains the case that values ought to be. The criteria for what is good or for what is valuable vary from context to context, but the ought-to-be remains the same: “The ideal Ought-to-Be is the formal condition of value, the value is the material condition of the Ought-to-Be.” In contrast with the ideal Ought-to-Be there is the more practical, more directly morally relevant “Ought-to-Do.” Here “ought” implies “can,” and here practical moral questions arise about making something the case that is not the case.

**More recent developments in Germany.** Finally, a brief note is in order about more recent developments in ethics among German philosophers. Martin Heidegger, whose influence is completely overshadowing in Germany, took a dim view not only of the relevance of logic to philosophy but also of philosophical ethics. This has impeded systematic work in ethics in Germany, but nonetheless it is going on. There has been a reaction against the work of Scheler and Hartmann. O. F. Bollnow has argued for a *Situationsethik* and Richard Schattländer has contended that the Scheler-Hartmann approach is too speculative and theoretical and does not adequately handle the moral agent’s question: What ought I to do? But the Scheler-Hartmann school is hardly dead, for Hans Reiner, in his *Das Prinzip von Gut und Böse* (Freiburg, 1949), gives us a detailed and vigorous restatement of such a position. Against Heidegger, he defends the philosophical importance of a general theory of

value. But in an effort to blunt Heidegger's criticism that such investigations are morally and humanly irrelevant, Reiner concerns himself primarily with moral values. In his concern with moral value, he examines in some detail the problem of ethical relativism, and in this examination he stresses the importance of anthropological investigations to our understanding of morality.

### NATURALISM IN AMERICA

While ethical naturalism seemed to have received its quietus in England from Moore and Ross and certainly could not be considered a major force on the Continent, in America in various forms it was, until shortly after World War II, the dominant form of ethical theory.

PERRY. R. B. Perry developed a general theory of value with specific applications to questions of normative ethics, law, politics, economics, and education in his *General Theory of Value* (Cambridge, MA, 1926) and *Realms of Value* (Cambridge, MA, 1954). "Value" is used by Perry in a very broad sense as a generic term to group together such terms as *desirable, good, worthwhile, right, beautiful, holy, obligatory*, and the like. Perry defines *value* as follows: "a thing—anything—has value, or is valuable, in the original and generic sense when it is the object of an interest—any interest." In an attempt to make his contention overtly verifiable, Perry in turn defined *interest* quasi behavioristically as "a train of events determined by expectation of its outcome." *Interest* for Perry was an umbrella term for such terms as *like, desire, preference*, and *need* and their opposites. For something to have positive value, it must be an object of a favorable interest; for something to have negative value, it must be an object of aversion, disapproval, or dislike: In short, it must be an object of negative interest.

It should be understood that this definition of *value* is not taken by Perry to be either a lexical or a purely stipulative definition. It is, rather, a reforming definition. That is to say, it is a deliberate proposal concerning the use of a term in the language, but the proposal is not simply a stipulation, for it has some antecedent basis in the usage in question. It is proposed that this use be adopted as the standard use in order to clear up what are taken to be confusions allegedly resulting from unclear and vacillating usage. By such maneuvers Perry hoped to escape from Moore's arguments concerning the naturalistic fallacy.

Such a theory, initially at least, is extremely attractive, for it holds out a promise for a genuine "normative science" and thus for some objective, if not absolute, knowl-

edge of good and evil. It holds out the promise that we will eventually use the emerging sciences of man to gain some cross-cultural and interpersonally confirmed, and thus objective, knowledge of right and wrong.

The crucial problem for the naturalist is to show how all statements containing ethical terms can be translated into statements that do not contain such terms and are directly or indirectly confirmable or disconfirmable by empirical observation. What must be achieved to develop such a naturalism is to show the tenability of some set of naturalistic definitions of key moral terms.

Working from his initial definition of "value," Perry developed his system from the following definitions:

- (1) "X has value" equals "X is the object of any interest."
- (2) "X is bad" equals "X has negative value."
- (3) "X is good" equals "X has positive value."
- (4) "X is intrinsically good" equals "X is the object of a favorable interest for its own sake."
- (5) "X is extrinsically good" equals "X is the object of a favorable interest because X, directly or indirectly, is the most efficient means to something which is intrinsically good."
- (6) "X is morally good" equals "X is the object of interests harmoniously organized by reflective agreement."
- (7) "X is the highest good" equals "X is the object of an all-inclusive and harmonious system of interests."
- (8) "X is morally right" equals "X is conducive to the moral good."
- (9) "X is morally obligatory" equals "X is a social demand that, of any alternative demand, is most clearly called for by the ideal of harmonious happiness."

A theory based on these definitions should, Perry would argue, provide us with a systematic account of our normative concepts and exhibit the rationale of our moral judgments. However, it would be queried by many, including many who are not intuitionists, just how it can be that all moral statements are really a subspecies of empirical statement and how they all could, even in principle, be empirically confirmed or disconfirmed. To take moral statements as empirical statements asserting that so-and-so is the case seems to miss their distinctive, dynamic, and guiding function in the stream of life.

DEWEY. For John Dewey, moral philosophy had a definite normative ethical function. Dewey wanted to criticize normative standards and hoped to indicate more reasonable moral goals. “Philosophy’s central problem,” he wrote, “is the relation that exists between the beliefs about the nature of things due to natural science and beliefs about values—using that word to designate whatever is taken to have rightful authority in the direction of conduct.”

His basic proposal was that we should use what he called experimental intelligence in morals. This means that in moral inquiry we should use the same methodological principles we use in scientific inquiry. We should develop a scientific critique of our institutions and of the patterns of conduct designated “moral.” In order to do this we must show the untenability of what Dewey took to be an unjustified but ancient philosophical preconception that injects a divorce or dichotomy between scientific knowledge, on the one hand, and moral, philosophical, or religious knowledge, on the other. There is but one kind of knowledge, with one reliable method of fixing belief, the experimental method, though this knowledge and method of fixing belief must be applied to different subject matters.

To most people, the use of the experimental method in ethics heralds a drop of any normative ethical standards. In trying to establish that this is a misconception, Dewey tried to establish a severe contextualism. A central mistake of traditional moral philosophies, both naturalist and nonnaturalist, was that of looking for one bedrock *summum bonum* or one ultimate moral criterion rather than realizing that there is an irreducible plurality of moral standards and that moral problems are fully intelligible and rationally resolvable only in a definite context. Moral standards are a part of a cultural context in which means and ends are qualitatively continuous and functionally interactive.

This reference to a continuum of means and ends leads to another main element in Dewey’s moral philosophy. He argues against the specialist’s conception of ethics. To hold this conception, which is traditional with philosophers as different as Plato and Russell, is to stress the distinction between intrinsic good and instrumental good and to contend that intrinsic good is the sole object of philosophical interest. This, according to Dewey, is a mistaken dichotomy rooted in the ancient Greek dichotomy between theory and practice. It is not only intellectually bankrupt but it can, Dewey argues, have vicious social consequences. It even makes for irrationalism in ethics, for given this conception, we are easily led

to the assumption that while science can deal with mundane instrumental goods, the highest goods—the basic ends, namely, intrinsic goods—must be grasped by intuition, be vouchsafed by revelation, or be merely a matter of the whims of mortal will. Dewey argued that in concrete moral contexts, answers concerning means actually transform ends. In reasoning morally it is not a matter of discovering the most efficient means to attain a fixed end. If in considering the means it becomes apparent that our ends are utopian, we will, if we are behaving rationally, often give them up or modify them in view of this discovery. Here intelligence has a major role to play in morality. Ends cannot rationally be divorced from means. In fact, they are always functionally interactive. Furthermore, what is an end in one problematic situation is a means in another, and so on. There are never any actual normative goals or ends that are simply intrinsic goods. Ideals are always transformable in the light of what we discover about our world, and they are always imbedded in a network of other ideals.

Such considerations, it will surely be objected, hardly show that there are no intrinsic goods—but it could be contended that they effectively argue against Aristotelian final ends, or against the belief that in moral appraisal we can justifiably consider intrinsic goods independently of their consequences—and this, after all, is the major point Dewey wanted to establish.

Here we hardly have the metaethical concerns that are so distinctive of the work of Moore and Perry. But Dewey—though he did not call it that—also had a metaethical theory.

Dewey argued that moral judgments are judgments of practice. That is to say, they are made in problematic situations of choice in which a moral agent is trying to decide what to do. This gives them their distinctive normative or *de jure* force. But at the same time they remain *de facto* empirical statements. It is this puzzling amalgam that we must understand if we are to get clear what Dewey was claiming.

Dewey asserted that value judgments are not mere prizings and disprizings. They are predictions about the capacity or incapacity of actions, objects, or events to satisfy desires, needs, and interests. As such they are confirmable and disconfirmable. They predict that certain ends in view will satisfy certain vital impulses under certain conditions. Not everything that is desired is desirable, but those things which are desired “after examination of the relations upon which the object depends” are desirable. In short, to say of something that it is valuable, desirable, or good is to say that it is some-

thing which would be desired or approved after reflection upon its relevant causes and consequences.

*Criticism of Dewey.* Dewey's theory has been subject to some trenchant criticisms by Morton White and Charles Stevenson and has been staunchly defended by Sidney Hook, Gail Kennedy, and Gertrude Ezorsky. The basic considerations here are as follows: Even if  $X$  is desired after an examination of the causes and consequences of desiring  $X$ , it still does not follow that  $X$  is desirable or that  $X$  ought to be desired. However, to carry out Dewey's program of identifying moral statements as a subspecies of empirical statement, some such identity of meaning must be established.

But the admission that Dewey is wrong in claiming that moral statements are empirical statements or hypotheses is not destructive to his overall program about the place of reason in ethics. If we ask how we justify our ethical evaluations, it seems that much of Dewey's method of criticism, including much of his use of science, could still be reasonably instituted. Dewey's great failure in talking about morality was in not realizing how very different "values" and "facts" are; his great success was in seeing the extensive relevance of scientific knowledge and scientific method to the making of intelligent moral appraisals.

### CONTEMPORARY NONCOGNITIVISM

Both naturalism and nonnaturalism are cognitive theories. That is to say, they regard moral utterances in the declarative form as statement-making utterances that assert the existence of certain moral facts and are thus either true or false. But first in Sweden, and later in England and America, a quite different kind of metaethical theory developed that has been called a noncognitive theory. According to this theory, moral statements do not assert moral facts; they are neither confirmable nor disconfirmable, and there is nothing to be known by "moral intuition." It is even characteristic of this view to argue that it is either mistaken or at least misleading to characterize moral utterances as true or false.

**EMOTIVE THEORY.** The noncognitive view, which has subsequently been called the emotive theory, received its first formulation in 1911, when the Swedish philosopher Axel Hägerström drew the outlines of such a theory in his inaugural lecture, "On the Truth of Moral Propositions." In 1917 Hägerström developed his ideas with particular attention to the concept of duty in his *Till Frågan om den Gällande Rättens Begrepp* (Uppsala, 1917). Similar statements of the emotive theory have been developed in

Scandinavia by Ingmar Hedenius and Alf Ross. Independently of its Scandinavian formulation, the emotive theory was first stated in the English-speaking world by I. A. Richards and by Bertrand Russell, but it was developed in the Anglo-Saxon world by A. J. Ayer and by Charles Stevenson. There have also been interesting if somewhat atypical statements of it by Richard Robinson, Rudolf Carnap, and Hans Reichenbach.

The emotivists were convinced that moral statements are not a subspecies of factual statement, and they were further convinced that it was impossible to derive a moral statement from a set of purely factual statements. As Hägerström put it, "There is no common genus for the purely factual and the 'ought.' By using the predicate 'ought to happen' we refer an action to an altogether different category from the factual. That an action 'ought to be done' is regarded as something which holds true altogether without reference to whether it actually is done or not." The whole notion that there is a determinate character of an action that would make a moral statement true or false is, Hägerström argues, an illusion. There is nothing there for an "unmoved spectator of the actual" to observe that would either confirm or disconfirm his moral statements. Moral statements characteristically take a declarative form, but they actually function not to assert that so-and-so is true but to express an attitude toward an action or a state of affairs.

The emotive theory developed as a *via media* between intuitionism, on the one hand, and ethical naturalism, on the other. Both of these ethical theories displayed crucial difficulties. "Nonnatural qualities" and "nonnatural relations" were obscure, fantastic conceptions, to say the least, and the notion of intuition remained at best nonexplanatory. Furthermore, it was plain that moral judgments are closely linked to one's emotions, attitudes, and conations. But, as Moore in effect showed, neither "A cup of tea before bed is good" nor such general utterances as "Pleasure is good" and "Self-realization is good" are empirical or analytic.

*The function of ethical statements.* The emotivists maintained that while the grammatical function of a sentence like "A swim before bed is good" is indicative, its actual logical function is much closer to that of an optative or imperative utterance, such as "Would that we could go swimming before bed" or "Swim before bed." Because of this, emotivists have claimed that it is misleading to say that ethical sentences can be used to make statements: They do not function to assert facts.

Similarly, it is a mistake to treat all words as simply functioning to describe or designate some characteristic

or thing. Some words so function; but there are other words, like *nasty*, *saintly*, *graceful*, and *wise*, that function primarily or in part to express the attitudes of the utterer or to evoke reactions on the part of the hearer. The emotivists claim that *good*, *ought*, *right*, and the like are also emotive words. This gives them their normative function.

**Ethical argument.** Hägerström and Ayer contend that the fact that there are no moral facts carries with it the corollary that there can be no genuine moral knowledge. There are no moral facts to be learned; there is no moral information to be gained or forgotten. It makes clear sense to say “I used to know the difference between a pickerel and a pike, but by now I’ve forgotten it,” but what is meant by “I used to know the difference between right and wrong, but by now I’ve forgotten it”? The word *forgotten* could hardly do its usual job here. The utterance is so deviant that without explanation and a very special context, we do not understand it. Considerations of this sort bring us to the realization that moral utterances are not used to state facts or assert truths; their essential role is a noncognitive one. They typically express emotions, attitudes, and conations and evoke actions, attitudes, and emotional reactions.

Because of this fact about the logical status of moral utterances, it always remains at least logically possible that two or more people might agree about all the relevant facts and disagree in attitude—that is, disagree about what was desirable or worth doing.

We do, however, as Ayer and Stevenson stress, give reasons for moral judgments. If I say “MacDonald did the right thing in killing Janet,” it is perfectly in order to ask me to show why this is so. If I say “I don’t have any reasons. There aren’t any reasons, but all the same I just know that MacDonald did the right thing,” I am abusing language. I am saying something unintelligible, for we cannot “just know” like that. The person who claims that an action is right must always be prepared to give reasons for his moral claim.

Ayer and Stevenson grant all that. This is indeed how we do proceed when we are being reasonable about a moral disagreement. But Ayer says: “the question is: in what way do these reasons support the moral judgments? They do not support them in a logical sense. Ethical argument is not formal demonstration. And they do not support them in a scientific sense either. If they did, the goodness or badness of the situation, the rightness or wrongness of the action, would have to be something apart from the situation, something independently verifiable, for which the facts adduced as the reasons for the moral judgment were the evidence.” But this is just what

we cannot do. There is no procedure for examining the value of the facts, as distinct from examining the facts themselves.

If we cannot demonstratively prove or inductively establish fundamental moral claims, then what can it mean to say that a factual statement *F* is a good reason for a moral judgment *E*? The emotivist’s answer is very simple: If *F* causes the person(s) to whom *E* is addressed to adopt *E*, to share the attitude expressed by *E*, then *F* is a good reason for *E*. It is Ayer’s and Stevenson’s claim that whatever in fact determines our attitudes is ipso facto a good reason for a moral judgment.

**Criticisms of emotive theory.** It has been argued by many moral philosophers (W. D. Falk, Richard Brandt, Errol Bedford, Paul Edwards, and Kai Nielsen, among others) that so to characterize what is meant by “a good reason” in ethics is persuasively to redefine “a good reason” in ethics. As Bedford has well argued against the emotive theory, “we do use logical criteria in moral discussion, however inexplicit, unanalyzed, and relatively vague these criteria of relevance may be.” Remarks like “It doesn’t follow that you ought to” or “That’s beside the point” are just as common and just as much to the point in moral argument as elsewhere. There is no reason to think that these remarks about relevance differ in any essential way from their use in nonevaluative contexts. We don’t just seek agreement when there is a moral dispute, but we try to justify one claim over another and we rightly reject persuasion as irrelevant to this task of justification.

Stevenson has replied that to answer in this way is in effect to confuse normative ethical inquiries with metaethical ones. *Good* and *relevant* are normative terms and have their distinctive emotive force. To say that such and such are good reasons is to make a moral statement. Making such a statement involves leaving the normative ethical neutrality of metaethical inquiry. One answer to this is that to say what is meant by “good reasons” in ethics is to mention “good reasons” and not to use them.

**EXISTENTIALISM.** Noncognitivism is not limited to emotivism. The existentialists do not call themselves noncognitivists, nor do they write metaethical treatises. But reasonably definite metaethical assumptions are implicit in their writings. Their contention that “men create their values,” their stress on decision, commitment, and the impossibility of achieving ethical knowledge, strongly suggests a noncognitivist metaethic. We shall limit the examination here to two major figures, Albert Camus and Jean-Paul Sartre.

**Camus.** Unlike Sartre, Albert Camus wrote no technical philosophy, but in his *Myth of Sisyphus* (Paris, 1942), *The Rebel* (Paris, 1951), and his plays and novels he did articulate an ethical view that has been called the ethics of the absurd. To read Camus is to be immediately thrown into normative ethics via what has been called philosophical anthropology. We are immediately confronted with a picture of man and man's lot. Man is divorced from the world yet is paradoxically thrust into it. The world as we find it—given our hopes, our expectations, our ideals—is intractable. It is incommensurate with our moral and intellectual demands. Life is fragmented. We seek to discover some rational unity amidst this diversity and chaos. We discover instead that we can only impose an arbitrary unity upon it. *L'homme absurde*, as distinct from *l'homme quotidien*, sees clearly the relativity and flux of human commitment and the ultimate purposelessness of life. Yet man has a blind but overpowering attachment to life as something more powerful than any of the world's ills or any human intellectualization. But the world is ultimately unintelligible and irrational, and man's lot in the world is absurd.

Given this situation, all moral commitments are arbitrary. There is no escaping this: Reason will only show us the arbitrariness of human valuations, and a Kierkegaardian leap of faith in the face of the absurd is evasive. It is evasive because it is to consent to absurdity rather than to face up to it, recognizing it for what it is. Man's dignity comes in his refusing to compromise. His very humanity is displayed in his holding on to his intelligence and in recognizing, contra Kierkegaard, that there is no God and, contra Karl Jaspers, that there is no metaphysical unity that can overcome the absurdity of human existence.

Yet paradoxically, and some would claim inconsistently, in his novel *The Plague* (Paris, 1947), and in his essays, collected and published in English under the title *Resistance, Rebellion and Death* (New York, 1961) Camus writes with passion and conviction in defense of human freedom and intelligence. Camus's rationale for this is that we become *engagé* because we see that life has no ultimate meaning and that, finally free from a search for cosmic significance, we can take the diverse experiences of life for what they are in all their richness and variety. Yet beyond that and perhaps because of that, Camus, as a humanist, is espousing the cause of man. By this is meant, as is very evident in *Resistance, Rebellion and Death*, that Camus repeatedly defends human freedom, equality, and the alleviation of human misery and deprivation. We must become involved, but in this involvement Camus

urges a reliance on human intelligence in facing the problems of men.

What might be taken to be a conflict between the more theoretical side of Camus's thought and his more directly normative ethical side comes out in his fourth "Letter to a German Friend." Camus agrees with his "German friend" that the world has no ultimate meaning, but he does not and will not conclude from this, as his "German friend" did, "that everything was equivalent and that good and evil could be defined according to one's wishes." Camus then goes on to remark that he can find no valid argument to answer such a nihilism. His only "answer" is "a fierce love of justice, which after all, seemed to me as unreasonable as the most sudden passion." Camus felt he could only resolutely refuse to accept despair and "to fight against eternal injustice, create happiness in order to protest against the universe of unhappiness." Camus concludes with a cry of the heart that while "the world has no ultimate meaning ... something in it has a meaning, namely man because he is the only creature to insist on having one."

**Sartre.** Jean-Paul Sartre's views on man's condition are in many important respects like those of Camus, but to a far greater degree than Camus, Sartre in *Being and Nothingness* (Paris, 1943) and *Critique de la raison dialectique* (Paris, 1960) sets his ethical theorizing in the murky atmosphere of metaphysics. The promised systematic work on ethics that was to follow *Being and Nothingness* has not been forthcoming, but in one way or another all of Sartre's works are concerned with ethics. It can be said that there are two Sartres, or at least that the Sartre of *Critique de la raison dialectique* has moved from his earlier existentialism over to a kind of Marxist materialism. Here we shall for the most part (except where specifically noted) be concerned with the earlier Sartre, whose philosophical endeavor centered on his massive *Being and Nothingness*.

Sartre, like Camus, finds man's lot in the world absurd. Since there is no God, life can have no ultimate meaning and there can be no objective knowledge of good and evil. We cannot "decide a priori," or find out by investigation, what we are to do. Man in his forlornness and freedom imposes values. The choices man makes, the projects he forms for himself, and the sum of his acts constitute his values. There is no good and evil to be intuited or in any way discovered by the human animal. Man in anguish creates his values by his deliberate choices, and, to add to his anguish, in making his choices "he involves all mankind." That is to say, Sartre stresses the Kantian claim that moral judgments, in order to be moral judg-

ments, must be universalizable, but, as Sartre adds in his lecture “Existentialism Is a Humanism” (1945), though their “form is universal ... the content of ethics is variable” and there is no rational way of justifying the acceptance of moral principles with one content rather than another.

Sartre thinks this position is simply a matter of drawing out in a nonevasive manner the implications of a consistent atheism. Only if there were a God could values have an objective justification, but without God “everything is permissible” and “as a result man is forlorn, because neither within him nor without does he find anything to cling to.” In this, Sartre is surely mistaken. It does not follow that if there is no God, nothing matters, or that everything is permissible. It is not a contradiction to assert, “Though there is no God, the torturing of children is still vile,” and the nonexistence of God does not preclude the possibility of there being an objective standard on which to base such judgments.

Sartre asserts flatly, in good Moorean spirit, “Ontology itself cannot formulate ethical precepts. It is concerned solely with what is, and we cannot possibly derive imperatives from ontology’s indicatives.” (All the same, his account of morality in *Being and Nothingness* and his account of human action relevant to morality are immersed in “the language of being.”) In fact, Sartre goes on to point out that ontology and what he calls existential psychoanalysis can in a given situation constitute “a moral description, for it presents to us the ethical meaning of various human projects.” This method of description—though hardly the descriptions themselves—is very like the phenomenological method practiced by Scheler and Hartmann. Yet to proceed in this way hardly constitutes a violation of the is/ought distinction, since Sartre’s descriptions of moral evaluations—descriptions of man’s ethical life—need not themselves be evaluative, though given the language Sartre uses, they often are.

“Man,” he tells us, “pursues being blindly by hiding from himself the free project which is this pursuit.” Existential psychoanalysis can reveal to man the real goal of his pursuit. Horrified by the “death of God,” man attempts in his anguish to be God. He flees from his freedom—he does not wish to be a creator of values—but in what Sartre ironically calls the spirit of seriousness, he seeks to deny human subjectivity and attributes to value some independent cosmic significance. To the extent that we are caught up in this spirit of seriousness, we will try to fuse “being-for-itself” with the brute facticity of “being-in-itself.” (The odd phrase “being-in-itself” is simply the label for the self-contained reality of a thing,

while its mate, “being-for-itself,” is the label for the realm of consciousness that perpetually strives to transcend itself.) But if we pursue this line, we still condemned to despair, for we “discover at the same time that all human activities are equivalent ... and that all are on principle doomed to failure.” Phenomenological analysis reveals to man that though he perpetually tries to become a thing, a brute existent, the fact that he has consciousness makes this impossible. Given this ability to think and to feel, man, whether he likes it or not, is slowly led to see that without God he can have no essential nature; that is, though he may form his own projects, there is and can be no purpose to life.

It should be noted that Sartre’s view of man’s lot is even grimmer than Camus’s, for Sartre contends that even in community with others there is no surcease from suffering and alienation, for human relations are essentially relations of conflict and estrangement.

In *Critique de la raison dialectique*, Sartre tries to work out a new kind of Marxism and a new materialist conception of man. But he wishes to integrate his existentialist conceptions into a Marxist materialism in such a way that the latter can come to have a truly “human dimension.” Marxism, he argues, must purge itself of its deterministic conceptions of man and acknowledge a rational conception of human freedom. Sartre, in a reversal from *Being and Nothingness*, now argues that there is nothing intrinsic in human nature that makes conflict, war, and a reign of terror inescapable, though, like a good Marxist, he does argue that conflict is a basic factor in human history. It is scarcity, scarcity of goods and materials, that triggers human conflict. Only under these conditions of scarcity is social conflict inescapable and a rational social order impossible. Men make their own history by the choices they make in the face of problems created by history. But man remains the rider, not the horse. Human choices—human projects—are still free choices for which men remain responsible.

## RECENT VIEWS ON MORAL DISCOURSE

**LINGUISTIC PHILOSOPHY.** As has frequently been noted, there are at least superficial resemblances between the existentialists and the otherwise very different, self-consciously metaethical theories of such linguistic philosophers as R. M. Hare, P. H. Nowell-Smith, Bernard Mayo, Alan Montefiore, and John Hartland-Swann.

There is, indeed, this much similarity between these linguistic philosophers and the existentialists. All of the

former make the following contentions, all of which would be welcome to the latter:

- (1) Moore was essentially right about the naturalistic fallacy. That is to say, moral statements cannot be deduced from any statement of fact, whether biological, historical, psychological, sociological, or religious.
- (2) No moral choice or question of value can ever be guaranteed by logical rules.
- (3) We are free, as far as language or logic is concerned, to apply evaluative or prescriptive terms to anything we wish to commend or condemn, criticize or approve, prescribe or forbid.
- (4) Moral utterances are generalizable decisions, resolutions, or subscriptions.

Given that a man accepts certain moral principles, other moral principles can, together with certain factual statements, be derived from the above principles. But like Ayer and the existentialists, these linguistic philosophers hold that there must be some moral principles which are not derived from any other principles—moral or otherwise—and, being fundamental moral principles, they are not even verifiable in principle. They express moral commitments and can have no rational ground, for what is deemed worthy of acceptance ultimately depends on the very commitments (generalizable decisions, resolutions, or subscriptions) an agent is willing to make.

Many people have thought that such a view of morality is either directly or indirectly nihilistic—that both the linguistic philosophers and the existentialists espouse what is in effect an irrationalism that would undercut the very possibility of a rational normative ethic.

If we consider a reply linguistic philosophers typically make to such criticisms, we will become aware of a crucial dissimilarity between them and the existentialists and a fundamental defect in existentialist ethics.

Linguistic philosophers have frequently claimed that the existentialists have merely dramatized a logical point. That moral principles are expressions of commitment or choice, that man cannot simply discover what is good or evil or know a priori that a certain thing must be done but must “create his own values,” is not a worrisome fact about the human predicament; it is a conceptual truth concerning the nature of moral discourse. It is not a fact of the human condition that man is born into a world alien and indifferent to human purposes. What is a fact is that the phrases “the universe has a purpose” and “value and being are one” are unintelligible phrases. To say “man

creates his own values” is in reality only to say in a dramatic way that a judgment of value is an expression of choice. This statement, it is argued, is not an anguished cry of the human heart but is merely an expression of a linguistic convention.

To say “If  $x$  is a judgment of value, then  $x$  is an expression of choice” is not to say “Any choice at all is justified,” “Anything is permissible,” or “All human actions are of equal value.” These latter statements are themselves value judgments and could not follow from the above-mentioned statement, for it is not itself a statement of value but a nonnormative metaethical statement about the meaning of evaluative expressions, and, as Sartre himself stresses, one cannot derive an “ought” from an “is.” In general, Hare and Nowell-Smith, as well as Ayer and Stevenson, stress the normative neutrality of metaethical statements.

*Hare.* R. M. Hare in two very influential books, *The Language of Morals* (Oxford, 1952) and *Freedom and Reason* (Oxford, 1963), developed a very closely reasoned metaethical analysis of the type that has been discussed. In *The Language of Morals*, Hare views moral utterances as a species of prescriptive discourse, and he feels that we can most readily come to understand their actual role in the stream of life if we see how very much they are like another form of prescriptive discourse, namely, imperatives. Imperatives tell us to do something, not that something is the case. Moral utterances in their most paradigmatic employments also tell us to do something. Imperative and moral utterances do not, as the emotivists thought, have the logical function of trying to get you to do something. Rather, they tell you to do something. Furthermore, there are logical relations between prescriptive statements, just as there are logical relations between factual statements.

Moral judgments are viewed as a kind of prescriptive judgment but, unlike singular imperatives, moral judgments (as well as all value judgments) are universalizable. Hare means by this that such a judgment “logically commits the speaker to making a similar judgment about anything which is either exactly like the subject of the original judgment or like it in the relevant respects.”

Hare stresses that while almost any word in certain contexts can function evaluatively, *good*, *right*, and *ought* almost always so function. The evaluative functions of these terms are distinct from their descriptive functions and are an essential part of their meaning. In fact, the distinctive function of all value words is that they in one way or another commend or condemn. But while *good* is a general word of commendation, the criteria for goodness

vary from context to context and are dependent on what it is that is said to be “good.”

The meaning of *good* or any other value term is never tied to its criteria of application. There is nothing in the logic of our language to limit the content of a moral judgment. As far as logic is concerned, any universalizable prescription that expresses a deep concern or commitment is ipso facto a moral prescription, and we can decide without conceptual error to do anything that it is logically or physically possible to do. If we treat the resulting decision as a decision of principle, that is, a universalizable prescription, then it is a value judgment that is in good logical order. As Nowell-Smith has well put it in discussing Hare’s theory, “Nothing that we discover about the nature of moral judgments entails that it is wrong to put all Jews in gas-chambers.”

*Criticism of Hare.* Probably the most persistent dissatisfaction with Hare’s theory has resulted from the belief that it makes moral reasoning appear to be more arbitrary than it actually is. To say “Nothing that we discover about the nature of moral judgments entails that it is wrong to put all Jews in gas-chambers” is, it will be argued, a *reductio* of such a position. Hare would reply that to argue in such a way is to fail to recognize that he is talking about entailment, and that he is simply making the point that from nonnormative statements one cannot deduce normative ones.

Hare argues that his thesis about the logical status of moral utterances does not commit him to the position that there can be no rational resolution of basic conflicts in moral principle. Returning, in *Freedom and Reason*, to a stress on decisions (though with a new attention to inclinations), Hare contends that to have a morality we must have freedom. Specifically, we must have a situation in which each man must solve his own moral problems. (This is not to moralize about what we should do but to state a logical condition for the very existence of moral claims.)

Philosophers who have criticized Hare, including someone as close to him as Nowell-Smith, have suggested that Hare still has a far too Protestant conception of moral discourse. He fails really to take to heart the Wittgensteinian claim that here, as elsewhere in human discourse, we must have public criteria for what could count as a logically proper moral claim. As F. E. Sparshott—whose book *An Enquiry into Goodness* (Chicago, 1958) deserves more attention than it has received—notes: Hare’s individualism leads him to neglect the fact that a morality, any morality, will necessarily incorporate “those rules of conduct that seem necessary

for communal living.” It is not the case that just any universalizable set of prescriptions can constitute a morality or a set of moral judgments.

**THE GOOD-REASONS APPROACH.** The last metaethical theory we shall discuss has been dubbed the good-reasons approach. Stephen Toulmin, Kurt Baier, Henry Aiken, Marcus Singer, Kai Nielsen, A. I. Melden, A. E. Murphy, and John Rawls may be taken as representative figures of this point of view. It is an approach that obviously has been deeply affected by the philosophical method that we have come to associate with the work of the later Ludwig Wittgenstein. These philosophers have centered their attention on the logic of moral reasoning. Their central question has been “When is a reason a *good* reason for a moral judgment?” Accordingly, the crucial problems center on questions concerning the nature and limits of *justification* in ethics. These philosophers agree with the noncognitivists that moral sentences are used primarily as dynamic expressions to guide conduct and alter behavior. And they would also agree with ethical naturalists that moral utterances usually, at least, also make factual assertions. But they believe that the primary use of moral utterances is not theoretical or just emotive but practical. Hare and Nowell-Smith are right in stressing that they are designed to tell us what to do.

Yet while moral utterances typically tell us what to do, language with its complex and multifarious uses does not neatly divide into “the descriptive” and “the evaluative,” “the constative” and “the performative,” “the cognitive” and “the noncognitive.” These are philosophers’ specialized terms, and they do not help us to understand and clearly characterize moral discourse but actually distort our understanding of it. There can be no translation of moral terms into nonmoral terms, and the ancient problem of bridging “the is-ought gulf” is a muddle, for there is no clear distinction between such uses of language and no single function that makes a bit of discourse normative. Some moral utterances indeed bear interesting analogies to commands or resolutions, but they cannot be identified with them. It is a mistake to think ethical judgments are like scientific ones or like the judgments of any other branch of objective inquiry; yet cognitivist metaethicists were correct, not in pressing this analogy but in maintaining that there is a knowledge of good and evil and that some moral claims have a perfectly respectable objectivity. No matter how emotive or performative moral utterances may be, when we make a moral judgment, it must—logically must—satisfy certain requirements to count as a moral judgment. In making a moral judgment, we must be willing to universalize the

judgment in question, and it must be possible to give factual reasons in support of the moral claim.

The advocates of the good-reasons approach in the general tradition of the later Wittgenstein did not take it to be incumbent on the philosopher to translate moral utterances into some clearer idiom. They did not believe that there was some other favored discourse or form of life that moral discourse or morality should be modeled on. What was expected of the philosopher was that he should describe morality so as to perspicuously display the living discourse at work. In particular, philosophers should concern themselves with a conceptual cartography of the nature and limits of justification in ethics. Before we can reasonably claim that moral judgments are at bottom “all subjective” or that no moral claim can be “objectively justified,” we must come to understand what can and what cannot count as a good reason in ethics and what the limits of moral reasoning are.

*Toulmin.* Two books, Stephen Toulmin’s *An Examination of the Place of Reason in Ethics* (Cambridge, U.K., 1950) and Kurt Baier’s *The Moral Point of View* (Ithaca, NY, 1958), have most single-mindedly attacked the problem of moral reasoning. They may be taken as paradigms of the good-reasons approach. Toulmin argues that moral rules and moral principles are to be justified by discovering which of these rules or principles, if consistently acted upon, will most likely lead to the least amount of avoidable suffering all around. Those social practices that probably will cause the least amount of suffering for humankind are the social practices that ought to be accepted. Classical utilitarians maintained that a moral rule is justified if it tends to produce greater happiness all around than any alternative rule, but Toulmin favors the negative formulation because (1) though it is very difficult to determine what will make people happy or what they want, it is less difficult to determine what causes suffering, and (2) it is less the function of morality to tell men what the good life is than to tell them what not to do so that their interests, including their differing conceptions of the good life, can be realized to the maximum extent. This theory about moral reasoning, while purporting to be metaethical, is very close to the normative ethical theory sometimes called rule utilitarianism.

Toulmin argues that if we examine closely the way moral reasoning is actually carried on, it will become evident that moral rules and practices are characteristically judged by roughly utilitarian standards, while many individual actions are judged by whether or not they are in accordance with an accepted moral rule or social practice. Utilitarians point out that it is of the greatest social util-

ity that we characteristically judge moral acts in this seemingly nonutilitarian fashion. However, frequently a decision concerning how to act involves conflicting moral rules with no clear order of subordination, and in some situations there seems to be no moral rule—unless the principle of utility is taken as a moral rule—that is readily applicable. In such a situation, the thing to do is to act on a utilitarian basis when it is at all possible to make some reasonable judgment of the probable beneficial consequences to the people involved of doing one thing rather than another. If that is not possible in a given situation, then we should act as a reasonable man would act. (The concept of a reasonable man, we should not forget, is itself very much a moral concept.)

*Criticism of Toulmin.* There certainly are a host of objections that spring to mind concerning Toulmin’s account. First, it will be said that this is normative ethics, not metaethics: It tells us what we should do, what a good reason is, and how we can justify basic moral rules. Moreover, why should we accept it? Once we see through its modish trappings, it will become apparent that it has all the difficulties attendant on classical utilitarianism.

It could be replied that though the speech is in the material mode and sounds like normative ethics, in reality it is a brief description of how moral reasoning is actually carried on. Even if this reply is accepted, there are difficulties here too, for viewed this way, Toulmin’s account surely looks like an account of a basically sociological sort of how certain people in fact reason. That is to say, it appears to be an impressionistic bit of descriptive ethics and hardly a metaethical account of the logic of moral reasoning. It covertly and persuasively redefines as “moral” only a very limited pattern of reasoning—reasoning that expresses the historically and ethnographically limited views of a determinate group of people. The ethnocentric character of this linguistic analysis makes it implicitly, but surreptitiously, normative.

This contention will be rejected by many. It will be argued that moral reasoning, like any other mode of reasoning, is limited. To determine what the moral point of view is and what it is to reason morally, we need first to determine the function (purpose, overall rationale) of morality.

The function of morality, Toulmin tells us, is to adjudicate conflicting interests and to harmonize desires (that is, moderate our impulses and adjust our demands) so as to reconcile them with our fellows, in such a way that everyone can have as much as possible of whatever it is that, on reflection, he wants. Given this conception of the function of ethics, something like Toulmin’s account of

moral reasoning is very plausible, but it has been objected that morality has *no one* such function. Many people have ideals of human excellence that have nothing to do with such a conception of the function of ethics: Many Jews and Christians, with their ideals of the love of God, do not conceive the function of moral living in this way, and the Buddhist community with its ideals of arhatship certainly would not accept, either in theory or in practice, such a conception of the function of ethics. Morality is a much more complicated and varied activity. There are diverse and often conflicting functions of morality. Any attempt to claim one function or rationale of morality as the function or the purpose of morality so circumscribes what can count as moral considerations that its effect is unwittingly to advocate one limited moral outlook as the moral point of view.

Finally, even if Toulmin could make out a case for claiming that the function of morality, or the primary function of morality, is such as he claims it to be, one could still ask, concerning this descriptive account of morality, "Why keep it as the sole or primary function of morality?" If altering the function of morality somewhat alters the meaning of "moral," then why should we be such linguistic conservatives? What is so sacred about that function of morality and its attendant conception of morality?

Toulmin could claim that now his critic has confused normative issues with metaethical ones. The issues here are complex and lead us into the heart of current discussion about the nature of moral reasoning. Yet a strong case can be made for the contention that there is more to be said for a general approach such as Toulmin's and Baier's than has commonly been thought.

It seems evident that much contemporary thinking about ethics, while devoted to Moore's exacting standards of making perfectly clear precisely what is being claimed, is concerned not with the very general question of the meaning of *good* or, for that matter, *right* or *ought* but with the rich texture of moral reasoning. This brings once more to the foreground the kind of detailed descriptions of the moral life distinctive of such phenomenologists as Scheler and Hartmann, but given the present care for actual conceptual distinctions, we may develop a kind of linguistic phenomenology that may be of major importance to an understanding of morality. Perhaps the most exciting endeavors from this point of view have been those of Rawls, Philippa Foot, and Georg von Wright. Rawls, in a series of distinguished essays, has shown the central role of considerations of justice in moral deliberation and the way such considerations modify utilitarian

patterns of reasoning; Foot, also in a series of much-discussed essays, has shown the importance of a discussion of the virtues and the vices and has reinvigorated ethical naturalism. Wright's masterful discussion of the varieties of goodness in his *The Varieties of Goodness* (London, 1963) has contributed immensely to our understanding of morality.

## Bibliography

### GENERAL HISTORIES OF ETHICS

#### *Historical and Social Context of Ethical Beliefs*

Brinton, C. C. *A History of Western Morals*. New York:

Harcourt Brace, 1959. A very readable history of ethical beliefs and practices.

Bruce, A. B. *The Moral Order of the World in Ancient and Modern Thought*. 4 vols. London: Hodder and Stoughton, 1899. A detailed study of the literary and religious background of ethical thought from ancient Greece to the Reformation.

Dittrich, Ottmar. *Geschichte der Ethik*. 4 vols. Leipzig: Meiner, 1926. A scholarly study of the literary and religious origins of Western ethical ideals.

Harkness, G. E. *The Sources of Western Morality*. New York: Scribners, 1954. An exploration of the ancient origins of modern ethics. Useful comparisons of primitive with Old Testament ethics and of Greek with Christian ethics.

Kropotkin, P. A. *Ethics, Origin and Development*. Translated by L. S. Friedland and J. R. Piroshnikoff. New York: Dial Press, 1924. A Marxist account of the development of ethics from primitive to modern Western society.

Lecky, W. E. H. *History of European Morals*. 2 vols. New York, 1919. A justly celebrated study of how moral values reflect, but fail to keep up with, actual practices in the Western world. Vol. I, Ch. 1, discusses modern British ethical philosophy.

Mencken, H. L. *Treatise on Right and Wrong*. New York: Knopf, 1934. Perceptive and often caustic comments on the evolution of moral ideas in philosophy and religion; a critique of authoritarianism.

Robertson, J. M. *A Short History of Morals*. London: Watts, 1920. A relativistic view of the history of ethics, stressing the sociological sources of morality.

Westermarck, Edward. *The Origin and Development of Moral Ideas*. 2 vols. London: Macmillan, 1908. A monumental work of historical and anthropological scholarship.

#### *Histories of Ethical Philosophy*

Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. A critical study, by a distinguished intuitionist, of the ethical systems of Spinoza, Butler, Hume, Kant, and Sidgwick.

Kautsky, Karl. *Ethics and the Materialist Conception of History*. Translated by J. B. Agnew. Chicago: Kerr, 1907. A brief sketch of the evolution of ethical thought by a noted Marxist.

MacIntyre, Alasdair. *A Short History of Ethics*. New York: Macmillan, 1966. An important discussion by a contemporary analytic philosopher.

Mackinnon, D. M. *A Study in Ethical Theory*. London: A. and C. Black, 1957. A comparison of the theories of Kant, Butler, and the utilitarians as alternatives to religious ethics.

Maritain, Jacques. *Moral Philosophy*. Translated by M. Suther. New York: Scribners, 1964. A critical evaluation of secular ethical theories from the standpoint of Catholic theology.

Martineau, James. *Types of Ethical Theory*. 2 vols. Oxford: Clarendon Press, 1898. Vol. I evaluates the metaphysical and ethical views of Plato, Descartes, Malebranche, Spinoza, and Comte. Vol. II criticizes utilitarian and moral-sense theories.

Rogers, R. A. P. *A Short History of Ethics*. London: Macmillan, 1911. A brief survey of the history of ethical theory. Incomplete but clear and readable.

Sidgwick, Henry. *Outlines of the History of Ethics*. London, 1886. A brief but illuminating discussion of the most important schools of ethical thought from ancient Greece to nineteenth-century England.

Swabey, W. C. *Ethical Theory: From Hobbes to Kant*. New York: Philosophical Library, 1961. A useful summary of several philosophical systems.

### PLATO

#### *General Expositions*

Dickinson, G. L. *Plato and His Dialogues*. New York: Norton, 1932.

Field, G. X. *The Philosophy of Plato*. London, 1951.

Friedländer, Paul. *Plato*. Translated by Hans Meyerhoff. New York, 1958–1964. A multivolume work of tremendous scholarship on the cultural background of Plato's writings.

Shorey, P. *What Plato Said*. Chicago: University of Chicago Press, 1933.

Taylor, A. E. *Plato, the Man and His Work*. London, 1908.

#### *Specialized Studies*

Lodge, R. C. *Plato's Theory of Ethics*. New York: Harcourt Brace, 1928. A thorough study limited to Plato's ethical ideas.

Nettleship, R. L. *Lectures on the Republic of Plato*. New York, 1962. An extraordinarily illuminating study of Plato's most important dialogue.

#### *Relation of Plato to Other Greek Thinkers*

Burnet, John. *Platonism*. Berkeley: University of California Press, 1928. Distinguishes sharply between Socratic and Platonic views.

Cornford, F. M. *Before and After Socrates*. Cambridge, U.K.: Cambridge University Press, 1960.

Demos, R. *The Philosophy of Plato*. New York: Scribners, 1939. Rejects any systematic interpretation of Plato.

Field, G. C. *Plato and His Contemporaries*. London: Methuen, 1948.

Gould, J. *The Development of Plato's Ethics*. Cambridge, U.K.: Cambridge University Press, 1955.

Hampden, R. D. *The Fathers of Greek Philosophy*. Edinburgh: A. and C. Black, 1862.

Merlan, Philip. *From Plato to Platonism*. The Hague, 1960.

#### *Plato's Ethics and Politics*

Crossman, R. H. *Plato Today*. New York: Oxford University Press, 1939. Critical.

Fite, W. *The Platonic Legend*. New York: Scribners, 1934. Critical.

- Koyré, Alexandre. *Discovering Plato*. New York: Columbia University Press, 1945. Favorable.
- Levinson, R. B. *In Defense of Plato*. Cambridge, MA: Harvard University Press, 1953.
- Wild, J. D. *Plato's Modern Enemies*. Chicago: University of Chicago Press, 1953. Favorable.

## ARISTOTLE

*Aristotle's Ethics*

- Gauthier, R. A. *La morale d'Aristote*. Paris, 1958.
- Grene, Marjorie. *A Portrait of Aristotle*. London: Faber and Faber, 1963.
- Marshall, T. *Aristotle's Theory of Conduct*. London: Unwin, 1906.

- Randall, J. H. *Aristotle*. New York, 1960. Chs. 11–14.
- Ross, W. D. *Aristotle*. London, 1930.
- Veatch, H. B. *Rational Man*. Bloomington: Indiana University Press, 1962.
- Walsh, J. J. *Aristotle's Conception of Moral Weakness*. New York: Columbia University Press, 1963.

*Aristotle and Other Ethical Philosophers*

- Cornford, F. M. *Before and After Socrates*. Cambridge, U.K.: Cambridge University Press, 1960.
- Hampden, R. D. *The Fathers of Greek Philosophy*. Edinburgh: A. and C. Black, 1862.
- Merlan, Philip. *Studies in Epicurus and Aristotle*. Wiesbaden: Harrassowitz, 1960.
- Taylor, A. E. *Aristotle*. London, 1943.

## HELLENISTIC AND ROMAN ETHICS

*Epicureanism*

- DeWitt, N. W. *Epicurus and His Philosophy*. Minneapolis: University of Minnesota Press, 1954.
- Hadzsits, G. D. *Lucretius and His Influence*. New York: Longmans Green, 1935.
- Merlan, Philip. *Studies in Epicurus and Aristotle*. Wiesbaden: Harrassowitz, 1960.

*Stoicism*

- Arnold, E. V. *Roman Stoicism*. Cambridge, U.K.: Cambridge University Press, 1911. Middle and late Stoa.
- Bréhier, Émile. *Chrysippe et l'ancien Stoicisme*. Paris: Presses Universitaires de France, 1951. Early Stoa.
- Brussell, F. W. *Marcus Aurelius and the Later Stoics*. New York, 1910.
- Murray, Gilbert. *Stoic, Christian and Humanist*. Boston: Beacon Press, 1950.
- Wenley, R. M. *Stoicism and Its Influence*. Boston: Marshall Jones, 1924.

*Neoplatonism*

- Elsee, C. *Neoplatonism in Relation to Christianity*. Cambridge, U.K.: Cambridge University Press, 1908.
- Feibleman, J. *Religious Platonism*. London: Allen and Unwin, 1959.
- Pistorius, P. V. *Plotinus and Neoplatonism*. Cambridge, U.K.: Bowes and Bowes, 1952.

- Switalski, B. *Neoplatonism and the Ethics of St. Augustine*. New York: Polish Institute of Arts and Sciences in America, 1946.
- Whittaker, T. *The Neoplatonists*. Cambridge, U.K., 1918.

*Comparisons*

- Hicks, R. D. *Stoic and Epicurean*. New York: Scribners, 1910.
- Zeller, Eduard. *Stoics, Epicureans and Sceptics*. Translated by O. J. Reichel. London: Longmans Green, 1880.

## MEDIÉVAL ETHICS

*General Histories of Medieval Philosophy*

- Copleston, F. C. *A History of Philosophy*, Vols. II and III. Westminster, MD: Newman Press, 1950–1953.
- Gilson, Étienne. *Reason and Revelation in the Middle Ages*. New York: Scribners, 1938.
- Gilson, Étienne. *The Spirit of Medieval Philosophy*. Translated by A. Downes. New York: Scribners, 1936.
- Hawkins, D. J. B. *A Sketch of Mediaeval Philosophy*. London: Sheed and Ward, 1946.
- Husik, I. *A History of Mediaeval Jewish Philosophy*. New York: Macmillan, 1916.

*Augustine*

- Gilson, Étienne. *Introduction a l'étude de saint Augustin*. Paris: Vrin, 1943.
- Switalski, B. *Neoplatonism and the Ethics of St. Augustine*. New York: Polish Institute of Arts and Sciences in America, 1946.

*Erigena and Abelard*

- Bett, H. *Johannes Scotus Eriugena*. Cambridge, U.K., 1925.
- Sikes, J. G. *Peter Abailard*. Cambridge, U.K.: Cambridge University Press, 1932. Chs. 2 and 8.

*Thomas Aquinas*

- Copleston, F. C. *Aquinas*. London, 1955. Ch. 5.
- D'Arcy, M. C. *St. Thomas Aquinas*. Dublin, 1953. Ch. 9.
- Gilson, Étienne. *The Philosophy of St. Thomas Aquinas*. Translated by E. Bullough. St. Louis, 1934.
- Maritain, Jacques. *St. Thomas and the Problem of Evil*. Milwaukee, WI: Marquette University Press, 1942.
- Mullane, D. T. *Aristotelianism in St. Thomas*. Washington, DC: Catholic University of America, 1929.

## SEVENTEENTH-CENTURY ETHICS

*Hobbes*

- Laird, John. *Hobbes*. London: Benn, 1934.
- Peters, R. S. *Hobbes*. Harmondsworth, U.K.: Penguin, 1956.
- Stephen, Leslie. *Hobbes*. Ann Arbor: University of Michigan Press, 1961.
- Taylor, A. E. *Hobbes*. New York, 1908.

*Spinoza*

- Bidney, D. *The Psychology and Ethics of Spinoza*. New Haven, CT: Yale University Press, 1940.
- Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. Ch. 2.
- Hampshire, S. *Spinoza*. Harmondsworth, U.K.: Penguin, 1951. Chs. 4 and 5.
- Joachim, H. J. *A Study of the Ethics of Spinoza*. London: Clarendon Press, 1901.
- McKeon, R. *The Philosophy of Spinoza*. New York: Longmans Green, 1928.

**Locke**

- Aaron, R. I. *John Locke*. Oxford: Clarendon Press, 1955.  
Lamprecht, S. P. *The Moral and Political Philosophy of John Locke*. New York: Columbia University Press, 1918.

**Cambridge Platonists**

- Cassirer, Ernst. *The Platonic Renaissance in England*. Translated by J. P. Pettegrove. Austin: University of Texas Press, 1953.  
Powicke, F. J. *The Cambridge Platonists*. Cambridge, MA, 1926.

## EIGHTEENTH-CENTURY ETHICS

**Moral-Sense Theories**

- Bonar, J. *Moral Sense*. New York: Macmillan, 1930.  
Raphael, D. D. *The Moral Sense*. London: Oxford University Press, 1947.

**Clarke**

- Le Rossignol, J. E. *The Ethical Philosophy of Samuel Clarke*. Leipzig, 1892.

**Butler**

- Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. Ch. 3.  
Duncan-Jones, A. E. *Butler's Moral Philosophy*. Harmondsworth, U.K.: Penguin, 1952.

**Shaftesbury and Hutcheson**

- Fowler, Thomas. *Shaftesbury and Hutcheson*. London, 1882.

**Hume**

- Basson, A. H. *David Hume*. Harmondsworth, U.K., 1958. Ch. 5.  
Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. Ch. 4.  
Smith, Norman Kemp. *The Philosophy of David Hume*. London: Macmillan, 1941.  
Stewart, J. B. *The Moral and Political Philosophy of David Hume*. New York: Columbia University Press, 1963.

**Price and Reid**

- Raphael, D. D. *The Moral Sense*. London: Oxford University Press, 1947.

**French Enlightenment**

- Becker, C. L. *The Heavenly City of the Eighteenth Century Philosophers*. New Haven, CT: Yale University Press, 1932.  
Cassirer, Ernst. *The Philosophy of the Enlightenment*. Translated by F. Koelln and J. P. Pettegrove. Princeton, NJ: Princeton University Press, 1951.  
Crocker, L. G. *Nature and Culture*. Baltimore: Johns Hopkins Press, 1963.  
Halévy, Élie. *The Growth of Philosophic Radicalism*. Translated by M. Morris. New York: Macmillan, 1928.  
Rouston, M. *The Pioneers of the French Revolution*. Translated by F. Whyte. Boston: Little Brown, 1926. A study of the social and political involvements of the Encyclopedists.

**Kant**

- Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. Ch. 5.  
Jones, W. T. *Morality and Freedom in the Philosophy of Immanuel Kant*. Oxford: Oxford University Press, 1940.  
Körner, S. *Kant*. Harmondsworth, U.K.: Penguin, 1955. Chs. 6 and 7.  
Lindsay, A. D. *Kant*. London, 1934.

- Paton, H. J. *The Categorical Imperative*. New York: Hutchinson, 1947.

- Paton, H. J. *The Moral Law, or Kant's Groundwork of the Metaphysic of Morals*. New York: Hutchinson, 1948.

- Teale, A. E. *Kantian Ethics*. London: Oxford University Press, 1951.

## NINETEENTH-CENTURY ETHICS

**Utilitarianism**

- Halévy, Élie. *The Growth of Philosophic Radicalism*. Translated by M. Morris. New York: Macmillan, 1928.  
Stephen, Leslie. *The English Utilitarians*, 3 vols. London: Duckworth, 1900.

**German Idealism**

- Dewey, John. *German Philosophy and Politics*. New York: Putnam, 1942. Highly critical.  
Hook, Sidney. *From Hegel to Marx*. New York: Reynal and Hitchcock, 1936.  
Löwith, Karl. *From Hegel to Nietzsche*. Translated by D. Green. New York: Holt, Rinehart and Winston, 1964.  
Marcuse, Herbert. *Reason and Revolution*. London: Oxford University Press, 1941.  
Royce, Josiah. *The Spirit of Modern Philosophy*. New York, 1896.

**Fichte**

- Adamson, Robert. *Fichte*. Edinburgh, 1881.  
Royce, Josiah. *The Spirit of Modern Philosophy*. New York, 1896. Part I, Ch. 5.

**Hegel**

- Findlay, J. N. *Hegel*. London, 1958. Chs. 5 and 11.  
Marcuse, Herbert. *Reason and Revolution*. London: Oxford University Press, 1941.

**Nietzsche**

- Brinton, C. C. *Nietzsche*. Cambridge, 1941.  
Copleston, F. C. *Friedrich Nietzsche*. London, 1942.  
Lefebvre, Henri. *Nietzsche*. Paris, 1939.

**Marx**

- Berlin, Isaiah. *Karl Marx*. London: Butterworth, 1939.  
Hook, Sidney. *From Hegel to Marx*. New York: Reynal and Hitchcock, 1936.  
MacIntyre, A. C. *Marxism, an Interpretation*. London: SCM Press, 1953.  
Marcuse, Herbert. *Reason and Revolution*. London: Oxford University Press, 1941.  
Tucker, R. *Philosophy and Myth in Karl Marx*. Cambridge, U.K.: Cambridge University Press, 1961.

**American Transcendentalism**

Pochmann, H. A. *New England Transcendentalism and St. Louis Hegelianism*. Philadelphia: Carl Schurz Memorial Foundation, 1948.

Schneider, H. W. *A History of American Philosophy*. New York: Columbia University Press, 1946.

**Royce and James**

Santayana, George. *Character and Opinion in the United States*. New York: Scribners, 1920.

Smith, J. E. *Royce's Social Infinite*. New York: Liberal Arts Press, 1950.

**British Idealism**

Pfannenstill, Bertil. *Bernard Bosanquet's Philosophy of the State*. Translated by Bert Hood. Lund, Sweden: Hakan Ohlsson, 1936.

Sidgwick, Henry. *The Ethics of Green, Spencer and Martineau*. London, 1902.

Wollheim, Richard. *F. H. Bradley*. Harmondsworth, U.K., 1959. Ch. 6.

**Sidgwick**

Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930. Ch. 6.

## TWENTIETH-CENTURY ETHICS

**Assessments of Moore**

Adams, E. M. *Ethical Naturalism and the Modern World-View*. Chapel Hill: University of North Carolina Press, 1960.

Careful discussion of naturalism-nonnaturalism debate.

Broad, C. D. "G. E. Moore's Latest Published Views on Ethics." *Mind* (1961).

Field, G. C. "The Place of Definition in Ethics." *PAS* (1932). Key discussion of difficulties in Moore's conception of definition.

Frankena, W. K. "The Naturalistic Fallacy." *Mind* (1939). Classical source for discussion of naturalistic fallacy.

Hall, E. W. *Categorical Analysis*. Edited by E. M. Adams. Chapel Hill: University of North Carolina Press, 1964. Important defense of Mill against Moore.

Prior, A. N. *Logic and the Basis of Ethics*. Oxford: Clarendon Press, 1949. Crucial for history of the naturalistic fallacy.

Taylor, Paul. *Normative Discourse*. Englewood Cliffs, NJ: Prentice-Hall, 1961. Is/ought carefully discussed and a general theory of value developed along linguistic lines.

Warnock, Mary. *Ethics since 1900*. Oxford: Oxford University Press, 1960.

Wellman, Carl. *The Language of Ethics*. Cambridge, MA: Harvard University Press, 1961. Clear statement of difficulties in ethical naturalism.

**Deontological Nonnaturalism**

Broad, C. D. "Critical Notice of H. A. Prichard, *Moral Obligation*." *Mind* (1950).

Broad, C. D. *Ethics and the History of Philosophy*. London: Routledge, 1952.

Broad, C. D. *Five Types of Ethical Theory*. London: Kegan Paul, 1930.

Broad, C. D. "Imperatives, Categorical and Hypothetical." *Philosopher* (1950).

Broad, C. D. "Review of Julian S. Huxley's *Evolutionary Ethics*." *Mind* (1944).

Broad, C. D. "Some of the Main Problems of Ethics." *Philosophy* (1946).

Broad, C. D. "Some Reflections on Moral-Sense Theories in Ethics." *PAS* (1944–1945).

Carritt, E. F. "Moral Positivism and Moral Aestheticism." *Philosophy* (1938). Less important than Prichard or Ross but still influential.

Carritt, E. F. *The Theory of Morals*. London: Oxford University Press, H. Milford, 1928.

## ETHICS, HISTORY OF: OTHER DEVELOPMENTS IN TWENTIETH-CENTURY ETHICS

Even setting aside the rich interplay between naturalism, nonnaturalism, and noncognitivism that is one of the hallmarks of twentieth-century moral philosophy, a very rich history remains, one that is impossible to even fully

summarize here. Much of the story may be found elsewhere in the present volume in discussions devoted to particular moral theories and philosophers. The present entry examines just a few of the many themes that have occupied the attention of moral philosophers working within a diversity of traditions and that have thus exercised substantial influence on the shape of moral philosophy in the twentieth century.

### MORAL PRINCIPLES

Whether the number of principles governing right conduct is one, or several, or even indefinitely many is a question that has animated the development of moral philosophy over the past century. Of course, this is by no means a new problem for moral philosophy, and the responses found to it in the twentieth century are themselves shaped by earlier debates between the nineteenth-century utilitarians and their intuitionist and idealist opponents.

Indeed, the *ideal utilitarianism* developed in George Edward Moore's *Principia Ethica* (1903) can usefully be seen as a possible rapprochement between utilitarianism and more pluralistic views. Moore maintained that there was but one ultimate principle of duty that one should act so as to promote as much good (intrinsic value) as possible, and in *Principia*, he maintained this principle to be analytic. It is puzzling that Moore did not take his own Open Question Argument to tell against this identity claim, but setting that aside, Moore appears to be an archmonist about ultimate principles of right action.

If we take note of Moore's innovative and influential value theory, however, it becomes clear that Moore is in a position (assuming his view is otherwise sustainable) to accommodate many of the insights of pluralists. Two aspects of Moore's value theory are critical. First, Moore held that goodness (or intrinsic value) is not identical to any natural property. Consequently, the bearers of intrinsic value may form an ultimately heterogenous group, having nothing salient in common other than their goodness. Indeed, Moore is a pluralist about the bearers of intrinsic value. Second, Moore argued that the value of a whole need not be the same as the value of the sum of its parts; such wholes are *organic unities*.

This pluralism about the bearers of intrinsic value and the flexibility that the doctrine of organic unities affords when it comes to the value of a whole, yield a view that seems well poised to accommodate the concerns of pluralists about ultimate principles. For pluralists have long emphasized that there are seemingly many potential grounds of duty and have challenged utilitarians to show

that their view could leave in tact the seeming legitimacy of many moral rules that are not directly concerned with promoting utility. For the consequentialist who identifies goodness with a specific natural property and denies the doctrine of organic unities, these are very difficult challenges to meet. For one must then show that the apparently diverse grounds of duty really all involve the (naturalistically construed) property of goodness or else explain away the appearances. And one must show that apparently legitimate moral rules (e.g., rules governing the keeping of promises) really do serve to promote goodness. To a consequentialist of Moore's stripe, however, it is always open to identify further bearers of intrinsic value to accommodate our intuitions about the diverse grounds of duty and to appeal to the doctrine of organic unities to maintain the legitimacy of accepted moral rules even when these seem to lead to a universe with very disvaluable *parts*. Indeed, it may seem that provided a sufficiently flexible theory of value, the determined consequentialist will be able to say just about anything when it comes to duty.

Shortly, Moore's consequentialism was subjected to influential critique by William David Ross. Where earlier pluralists had identified many principles of (all things considered) duty, in *The Right and the Good* (1930), Ross sought principles of *prima facie* duty. For Ross, *prima facie* duties were acts of a type that tend to be our duty all things considered. Moreover, if someone had a *prima facie* duty to wash his neighbor's car (say because he had promised to do so), then this would be an all-things-considered duty if it did not pose any conflict with other *prima facie* duties. Ross argued forcefully that our apprehension of certain kinds of acts as *prima facie* duties does not depend upon our apprehension of them as being productive of more rather than less good.

In most, or perhaps all, cases, however, an agent will have conflicting *prima facie* duties. How is one to determine what duty requires, all things considered? To this, Ross answered that there are no principles (or at least no principles we have any prospect of identifying and using) that would determine the answer to this question, and that the best one can do is to exercise good judgment regarding which *prima facie* duty is, in the circumstances, most weighty. In taking this position, Ross appears to avoid an influential argument for monism about ultimate principles to which John Stuart Mill had given powerful voice in his *System of Logic* (1843/1874). Mill had argued that there could only be one possible ultimate moral principle because any set of several principles were liable to conflict about a given case, and there would need to be

a higher principle to be an *umpire* between them. By construing principles as principles of *prima facie* duty and by denying that there are any principles determining final duty, Ross seems to sidestep Mill's argument.

At the same time, Ross cast serious doubt on whether the systematic advantages often credited to monism about principles (especially by the nineteenth-century hedonistic utilitarians) could really survive the death of naturalistic accounts of the good, a death that Moore's arguments were at the time widely held to have confirmed. Ross recognized that some may be dissatisfied that a system of *prima facie* duties leaves no clear method for determining final duty. Ross plausibly replied that his view was no worse off in this regard than was the *ideal utilitarianism* of Moore. While Ross's view provides no discernible method for determining which of several *prima facie* duties is most weighty, Moore's view provides no discernible method for determining which of the various goods (as well as combinations thereof) that we might produce through our action have the greatest intrinsic value. One consequence of this debate between Moore and Ross was that the debate between monists and pluralists was revealed to depend critically on views of value and moral conflict.

Despite Ross's influential case for pluralism, the two dominant normative theories of the twentieth century, utilitarianism and Kantian deontology, both hold that there is only one ultimate principle of duty though, of course, they disagree about what this principle is. A perennial challenge for such views is to explain and/or to justify the seeming legitimacy of a diverse set of common moral rules. It is worth looking briefly, then, at some of the resources developed by principle monists to meet this challenge.

For the principle monist, it is critical to define some relationship between whatever principle is taken to be ultimate and more particular midlevel moral rules, such as rules against promise-breaking or against dishonesty. One possibility, discussed influentially by John Rawls in "Two Concepts of Rules" (1955) is that some rules might be constitutive of a practice while other rules serve to justify that rule-constituted practice. Thus, Rawls imagines that a utilitarian might use a consequentialist principle to justify a practice of punishment that is itself constituted by backward-looking retributive rules. For example, a practice of punishment might be constituted in part by a rule that only those who have committed a crime are to be punished (no matter how much good punishing an innocent might do) even while the practice is justified by the good it brings about. Despite what the example

of punishment might seem to suggest, this distinction does not entail that the only apt justifications of rule-constituted practices are consequentialist ones. Indeed, a Kantian could claim that the justification for a practice is that it best expresses respect for the dignity of each person even while that practice is constituted by rules that do not directly concern the dignity of persons. Rawls was quick to emphasize that his distinction was not a new one. Nevertheless, his clear and forceful discussion of it led moral philosophers to more steadfastly distinguish different levels of justification.

The latter half of the twentieth century saw the careful development of a variety of views about the relationship between ultimate standards and the more particular and diverse moral rules familiar from everyday life. Many of these developments were advanced by consequentialists. One influential view was put forward by Richard M. Hare in *Moral Thinking* (1981). According to Hare, there are two distinct levels of moral thinking. One, which Hare called *intuitive moral thinking*, involves the deployment of familiar and relatively simple moral principles in deciding how to act.

Hare claimed that intuitive moral thinking is characterized by a plurality of such principles and that such principles can conflict with one another by recommending different and incompatible courses of action. When this occurs, Hare argued, we can ascend to *critical moral thinking*. Doing so requires deploying a superior principle (for Hare, a version of the principle of utility). This principle is capable of both adjudicating the conflict between rival principles at the intuitive level and (in conjunction with facts about human psychology) justifying our everyday use of intuitive moral thinking. For example, instead of trying to determine which of two conflicting intuitive principles is more weighty (as Ross advocated), we can ask directly what course of action would best satisfy the utilitarian principle. Nevertheless, our everyday use of intuitive principles is justified because (for agents like us) directly applying the principle of utility to all of our decisions would be cumbersome, costly, and error prone.

Importantly, Hare's *two-level* view of the relationship between the principle of utility and more particular moral principles differs from classic versions of rule utilitarianism as well as from other forms of *indirect utilitarianism*. On the rule utilitarian view, the rightness of an act is defined in terms of its conformity to the best (i.e., best at promoting good consequences) rules whereas for Hare, it is possible both for an act to be in conformity with intuitive principles and yet wrong as well as for an act to be violative of intuitive rules and yet right. Right-

ness is determined by the principle governing critical moral thinking.

The resources of Hare's view can be deployed not only in considering familiar moral rules, but also in considering qualities of character. For just as the principle of utility might recommend the adoption of a range of more or less simple moral rules, so, too, it might recommend the cultivation of useful character traits. Again, though, one must be careful to distinguish what principle is actually the standard of rightness or duty. For some philosophers, such as Peter Railton, the act-consequentialist principle remains the ultimate moral standard even while it recommends that we develop the kinds of character traits that will sometimes lead us to act contrary to it. Others, however, suggest that the proper way for the utilitarian to evaluate acts is by reference to the motive that leads an agent to act with motives being evaluated by reference to their consequences.

Not surprisingly, the increased attention to indirect and two-level versions of principle monism also spawned more careful criticisms. In the case of indirect theories such as rule utilitarianism, one important worry—nicely and influentially discussed by David Lyons (1935–) in *Forms and Limits of Utilitarianism* (1965)—has been that such views inevitably *collapse* into their more direct progenitors. In the case of rule utilitarianism, for example, the collapse supposedly occurs because the really best rules would recommend the very same choices and actions as would a direct application of the principle of utility. In the case of two-level theories, an important set of worries has concerned the stability of the view. Some philosophers worry whether human beings really can smoothly ride the escalator between intuitive and critical thinking more or less as circumstances warrant.

In other cases the worry is more conceptual. For if (as Hare's view seems to require) it is sometimes advisable to set aside the ultimately correct standard, then it seems possible that there could be circumstances in which it is advisable to permanently set aside (or even to banish from thought entirely) the putatively correct standard. Whether a proper standard of conduct could be *self-effacing* (to borrow a term from Derek Parfit's influential discussion in *Reasons and Persons* [1984]), has been a matter of intense dispute, especially with regard to moral standards. Some, following philosophers such as Henry Sidgwick, welcome the possibility; others see in it a deep confusion. In some cases the thought has been that moral standards are essentially deliberative tools and so must have some place in the psychology of moral agents. In other cases the thought has been that moral standards

essentially play a role in interpersonal relations and so must remain *public*, where they can be appealed to, criticized, and defended.

Despite the development of new tools to defend principle monism, the last quarter of the twentieth century saw a notable (and ongoing) revival of pluralism, sometimes of a new and more radical variety. Some of this interest centered on the ways in which various values might conflict. Where Ross was cautiously skeptical of identifying principles that would systematically rank *prima facie* duties, some philosophers, such as Thomas Nagel (1970), began to argue that various values might be fundamentally incommensurable, perhaps because they arise or make sense only within certain standpoints or perspectives. Clearly incommensurable values would seriously complicate the prospects for reasoned and justified choice when such values conflict, and there is no general agreement on whether it would remain possible at all.

But the revival of interest in pluralism has also been inspired by careful reflection on the sheer variety of considerations that can acquire moral significance. Where Ross had countenanced a limited set of principles governing *prima facie* (but not final) duty, a new breed of pluralists (sometimes called particularists) seek to challenge whether there are any moral principles at all—or at least whether a proper understanding of morality must make reference to them. On such views our moral understanding is not best represented as the application of universal rules but, rather, should be seen as kind of direct appreciation of the moral relevance of the particular features before us. The advantages and liabilities of this position are still being explored and debated.

## MORAL AND PERSONAL VALUE

According to a dominant view of moral value, what is of moral value should be an object of care and concern for any rational agent. This view goes back at least to Plato, and according to it, moral value is of universal appeal; one has reason to care about it no matter who one is. Though widely held this view raises a number of important questions, in part because there seem to be many values that do not necessarily have a claim on any rational person. We might call such values *personal values* to denote that whether (or perhaps how) one ought to care about them depends upon what sort of person one is. Such values are also commonly referred to as *nonmoral values*. Among the most commonly offered examples are the value we find in personal relationships, such as the value of one friend to another, the value of achieving a personal goal or project such as the goal of amassing the

world's most comprehensive collection of glass paperweights, and the value of living up to a personal ideal such as being a good marine or a good writer.

It is now widely agreed that such personal values need not be self-interested in any intuitive sense since a person's projects and concerns might be directed outward to others and to the world. Intuitively, the person whose project is to save land for a bird sanctuary is working to benefit the birds or the environment and not, at least in the first instance, herself. It is often thought that personal values depend upon the particular relationship in which a person stands to the object of value (as the value a parent finds in their child may depend on it being *their* child) or upon the particular preferences or choices the person has made (amassing those paperweights may be of importance only because the agent has come, perhaps by choice, to care about doing so).

If we accept some distinction between moral and personal value, then a number of issues arise. Since distinguishing moral and personal value raises the possibility of their coming into conflict, one must wonder whether they really do so. One view, associated with Immanuel Kant, is that personal values cease to be of value if ever their pursuit runs afoul of moral value. Consistent with this, though, one might hold that moral values themselves must make room for the pursuit of nonmoral ends and that our understanding of what moral value requires of us should be shaped by our intuitions about the reasonable pursuit of other values. Then there is the possibility that there is a genuine conflict between moral and personal values, and this raises questions about what the appropriate response to such a conflict would be. Before turning to these issues in more depth, however, it is worth pausing to ask whether they might be sidestepped.

Given the immense energy devoted to understanding the relationship between moral and personal value, it is notable that the twentieth century opened with a classic rejection of the problem. Moore argued that the tendency to distinguish moral and personal value rested on confusion and that in fact there is no such thing as personal value. Though couched as an argument against egoism, Moore's reasoning, if sound, would undermine the possibility of something being valuable to me but not to others. For Moore held that any putative claim of the form *X* is good for *A* must be resolved into a claim of absolute value (either into the claim that *X* is absolutely good and so in having *X*, *A* would have something absolutely good or else into the claim that it is absolutely good that *A* have *X*) or else into a psychological claim, such as the claim

that *A* desires *X*, which Moore argues is not really a value claim at all. To be sure, Moore did not deny that many of the supposed examples of personal value are in fact valuable (if anything, he emphasized their value), but he argued that properly understood, such value must be *absolute* and so equally of value from any point of view. Few now accept Moore's argument or its conclusion. For a representative criticism see John Leslie Mackie's "Sidgwick's Pessimism" (1976); for a more recent defense of an argument that is similar in spirit to Moore's, see Brian Medlin's (1927–2004) "Ultimate Principles and Ethical Egoism" (1957).

Setting Moore's position aside, there remain a host of questions about the relationship between moral and personal value. During the heyday of Ross and his fellow intuitionists, these questions received comparatively less attention. But as Rossian pluralism receded from center stage and utilitarianism and Kantian ethics (and later virtue ethics) began to be perceived as the main alternatives, the relationship between moral and personal value became a central topic of debate for moral philosophers.

According to one influential critique initiated by Bernard Williams, some moral theories fail precisely because they do not give a proper place to personal values. In his "Critique of Utilitarianism" (1973), Williams charged that utilitarianism requires agents, in so far as they take up a moral point of view, to regard their own projects and values as of no greater importance than the values and projects of others. Indeed, the value of anyone achieving their personal aims depends not at all on whose aims they are but on what contribution they make to the overall amount of happiness in the world. However, having personal values in the first place seems to presuppose attaching some significant importance to them, and such values are part of what make us who we are.

The problem, Williams charged, is not that utilitarianism implies implausible moral verdicts but that it leaves us thinking about matters in the wrong way. And if utilitarianism asks us to treat our own values and projects as having no greater importance than anyone else's, then, as Williams put it, it amounts to an assault on our psychological health, on our *integrity*. Though officially directed at utilitarianism, Williams's argument was more broadly influential. It inspired further close attention to the character and variety of personal values and to the ways in which they are an essential element of any familiar picture of human life and agency. Some philosophers were also quick to attempt to extend Williams's point to moral theories other than utilitarianism and to take his

critique to undermine any normative theory that embodied a very strict impartiality.

As moral philosophers gave greater attention to personal values in the 1970s and 1980s, there was at the same time a great increase in the moral discussion of concrete moral problems. None received greater attention than the grave problem of hunger and poverty. In light of these developments, a new interest in the *demandingness* of morality arose. It is important to distinguish the issue of demandingness from the question whether moral requirements represent categorical or hypothetical imperatives. While the latter is a matter of whether moral requirements represent actions as good (or bad) in virtue of the ends that may be brought about by acting on them, the former is a matter of the imposition that complying with morality makes upon the other interests and concerns of the agent. A moral requirement might be categorical (requiring an agent to perform certain actions *whether they serve certain purposes or not*) and yet still not be very demanding if complying with it would not frequently or profoundly interfere with an agent pursuing other aims. Conversely, an imperative might be hypothetical and still be very demanding. While the question of whether moral requirements represent categorical or hypothetical imperatives is a matter, in some sense, of the logic of moral requirements, the demandingness of moral requirements depends crucially upon both the content of moral requirements and also upon contingent facts about the aims of the agents to whom moral requirements apply, and also the state of the world.

Demandingness has come to be such an important issue, in part because, given the state of the world, it seems likely that virtually any plausible moral theory threatens to be extremely demanding. While this may be obvious in the case of utilitarianism, it may be no less true of any moral theory that recognizes a duty to aid others in need, as virtually any plausible view must do. As philosophers such as Peter Singer in his famous paper "Famine, Affluence, and Morality" (1972) have emphasized, most people in developed countries, even those of modest means, are in a position to take actions that would save the lives of many other people simply by sacrificing what in the light of comparison seem like trivial personal goods. And yet there is no obvious stopping point to this argument, and if there is not, then morality might require us to sacrifice nearly everything—at least until circumstances change and our aid is no longer needed (which is unlikely to say the least!).

Philosophers have explored various responses to the issue of demandingness. Three will be noted here. First,

for some, the problem is not with any account of morality that leaves morality demanding. Morality simply is demanding—or at least can be in a world such as ours—and if people are often unwilling to do what morality requires, this is because they do not care as much as they should about morality. As an alternative to such rigorism, many philosophers have argued that theories of morality that leave morality highly demanding are dubious for that reason. The task is then to find a plausible revision. In the case of our duties to the needy, some have suggested that those duties are less stringent when those in need are far away and unfamiliar. Others suggest that morality requires us only to do our fair share of the helping, even if this leaves many of those in desperate need without help at all. Still others argue that our duty to aid, especially when applied to those in faraway lands, is a collective not an individual one.

A third approach is to argue that morality may be very demanding but that morality should not be the sole or even dominating concern of a good person. On this view our ideal of a person is of one whose concern with morality is itself tempered by other (possibly conflicting) concerns. This last possibility shows further that the issue of demandingness must be distinguished from the question of whether moral demands are *overriding*. Just as a job might be very demanding even while only a fool would allow its demands always to override other concerns, so, too, some suspect that morality might be highly demanding but that one can also give it too high a place in one's life.

Though the view that moral value has a claim on all rational agents has been a dominant one, it has also been subjected to interesting and influential critique. In the first half of the twentieth century, much effort was made to understand what attitude is involved in the judgment that something is of moral value. Under the influence of Moore's Open Question Argument and along with the rise of the early noncognitivists, it was often thought that virtually anything could be coherently judged to have moral value. After all, if (as Moore held) moral value is not identical to any natural property, or (as the early noncognitivists maintained) to hold something to have moral value is just to take a special favorable attitude towards it, then there seems to be no conceptual bar to holding virtually anything to have moral value. In the latter half of the twentieth century, however, following the lead of philosophers such as Philippa Foot and Gertrude Elizabeth Margaret Anscombe, many moral theorists began to think that there was a necessary connection between judgments of moral value and particular human

concerns. To claim, for example, that painting two of one's toenails green is morally good is, philosophers such as Foot argued, simply unintelligible (absent some special background story) since doing so has no discernible connection to human flourishing or well being.

Once philosophers began to look to the possibility that there might be a necessary connection between moral evaluation and specific human concerns and interests, they also began to look carefully at evaluative concepts that seem clearly to implicate such a connection, such as specific virtue concepts like courage and modesty. Where the first half of the twentieth century was dominated by discussion of ethical concepts such as *good* and *right* (sometimes called *thin* ethical concepts), the latter half of the century saw steadily increasing interest in *thick* ethical concepts, such as virtue concepts, that single out specific forms of action and practical orientation as worthy of esteem.

To think that moral evaluation must somehow be directed at specific human concerns and interests is clearly consistent with the possibility that the relevant concerns are (or at least can be) universally the concerns of any rational being. Thus, one might suppose that in seeing courage as a moral value one must suppose that it is worthy of the esteem of any rational agent. As the century progressed, however, philosophers such as Alasdair MacIntyre (1981) and Williams began to argue that the very way in which we make moral or ethical evaluations is shaped by particular institutions and practices—by what we might call culture. And since these differ from place to place and time to time, it is not clear that all rational agents must even share a mode of evaluation, much less that there is some thing (*moral value*) with which all rational beings should be concerned. Indeed, for such philosophers, the very idea that moral value is that value which has a claim on any rational being is itself a (dubious) product of Enlightenment culture, with Kant receiving a large share of blame. Though such philosophers are not skeptical about moral value, they are denying a particular way of demarcating moral value from supposedly other values. If such philosophers are correct, moral values would seem to have some of the hallmarks commonly associated with personal values: they depend upon the particular position and concerns of agents.

## AGENCY

It is scarcely possible to imagine a moral theory that does not depend upon claims about the nature of human or rational agency, but the degree to which moral philosophers actively look to accounts of agency in developing

and defending normative theories fluctuates over time. Philosophers such as David Hume and Kant based their moral philosophy on sophisticated and original accounts of agency. By contrast, the beginning of the twentieth century saw a comparative neglect of agency. At least two factors may provide a partial explanation.

The first is that the early intuitionists, beginning with Moore, were highly interested in human agents as knowers of moral propositions or facts. If moral propositions were intuitive or self-evident, then the serious and difficult question became how human beings have such knowledge. On the surface this does not preclude a deep interest in agency (perhaps, in a Kantian vein, human beings know about the moral necessity of certain acts by knowing something about human agency). But the surrounding philosophical climate tended to eclipse this alternative. The nineteenth century saw the rapid and exciting development of psychology as an empirical science. Add to this the fact that Moore's Open Question Argument made it seem scandalous even to appear to derive moral conclusions from empirical observation. But if human agency is ultimately a matter of psychology and psychology is a matter to be settled by empirical methods, then the intuitive moral knowledge the intuitionists attributed to human beings could not be based upon knowledge of agency lest the dreaded naturalistic fallacy be committed. The second factor that may partially explain philosopher's relative neglect of agency is the fact that philosophers were busy looking elsewhere, especially to linguistic phenomena.

The latter part of the twentieth century, however, saw renewed and intense interest in the integration of normative theories with theories of agency. In part, this may be traced to the rise of Kantian ethics that treats moral principles as principles of rational willing. It was also no doubt influenced by the rise of *action theory* in the latter half of the twentieth century as well as by the renewed interest philosophers showed in problems of personal identity and by exciting work done on the issue of free will. All of these developments had the effect of drawing attention to human beings as actors with values, ideals, beliefs, emotions, evolving desires and interests, plans, habits, addictions, and more. This is quite different from looking to human beings as perceivers of value.

It is not possible to summarize all of the ways in which moral philosophy has been impacted by its renewed and increasing attention to agency. One important theme concerns the possible analogy between the interest agents are rational to take in their own future concerns and the interest agents are morally required to

take in the concerns of others. We think of agents as unified across time. To reprise an example of Nagel's: If I expect that I will want to eat a persimmon next week, then I will be concerned to take the steps necessary to make this possible (even if I do not now care whether I eat a persimmon next week or care whether I come to want to eat a persimmon next week). Indeed, the ability to integrate one's desires and concerns this way is considered a hallmark of prudential rationality. In *The Possibility of Altruism* (1970), Nagel argued that, properly understood, vindicating the rationality of caring about the interests of your own future self also shows how one may vindicate the rationality of caring about the interests of others. Though he later abandoned this argument, Nagel's effort to integrate the justification of important moral norms with an account of an agent as a person persisting through time and potentially aware of other persons and their interests was of lasting importance. Philosophers such as Parfit, as well as Nagel himself, continued to develop these themes.

One such development was an increased attention to a distinction, first introduced by Nagel, between *agent relative* and *agent neutral reasons*. Though the proper way of drawing the distinction is a difficult technical matter, the intuitive heart of the distinction is between those reasons that are reasons for some agents but not for others and those reasons that are reasons no matter who you are. For example, I may have a reason to hold a birthday party for my child because it is my child. But many would doubt that you have a reason to hold a party for my child or even to help me hold one (though you might have a reason to hold a birthday party for *your* child). The reason depends on who I am. By contrast, if a stranger is about to step accidentally in front of an oncoming bus and I can pull him back, then I have a reason to do so. In this case, however, many people are inclined to agree that this is a reason anyone else has as well, or at least would have, provided only that they were in a position to do something about the matter.

The contrast between agent-relative and agent-neutral reasons is of importance in part because agent-relative reasons seem to be at play in the kinds of personal values discussed in the prior section. But many philosophers have also come to see them at work in important aspects of moral thinking, especially in the nature of *deontological* prohibitions on certain kinds of action. On one plausible interpretation, a person committed to a prohibition against, for example, killing the innocent, will care deeply about who does any killing. Though such a person may recognize any killing of the innocent to be

bad, it may matter greatly to them that they not be the one doing the killing. Because many philosophers are interested in defending the rationality of such moral norms, locating their place in an account of the kinds of reasons that agents may have has become a critical question.

### THE RISE OF NATURALISM IN MORAL PHILOSOPHY

For much of the twentieth century, the empirical study of moral judgment, norms, and behavior was given little attention by moral philosophers. This state of affairs is undergoing a profound reversal. The present discussion will not attempt to summarize the state of developing research, but three types of inquiry are notable.

First, the rapid development of evolutionary biology spawned renewed interest in developing accounts of how moral norms might have arisen out of a process of evolution. Of course, the suspicion that moral norms do have some such history is an ancient one, but the techniques of modern evolutionary research, including the tools of game theory and the computer simulation, have made it possible to better develop and critically assess possible explanations. Of particular interest are norms regarding helping behavior (or altruism), cooperation, and fair dealing. There are often significant differences in the use of terminology between those conducting this empirical research and those engaged in more traditional moral philosophy. For example, in discussions of the evolution of moral norms, altruistic behavior is often any behavior that in fact benefits another whereas for many traditional moral philosophers, behavior is altruistic only if it is undertaken for the sake of benefiting another. So long as these terminological issues are treated with care, however, they do not seem to present any decisive obstacles.

Another area of rapidly developing research is the application of neuroscience and cognitive science to the topic of moral judgment. While moral philosophers have long deployed hypothetical cases as intuition pumps, the recent use of brain scanning techniques appears to reveal that moral thinking about different kinds of cases involves activity in distinct brain regions. Such results are of interest not least because many moral arguments depend upon claims that different cases are analogous and so merit comparable analysis. The science involved in these studies is both complex and rapidly evolving, and many philosophers and scientists expect increasingly fine-grained and thorough results.

A third area where empirical research has blossomed and impacted moral philosophy is in the area of social

psychology. Moral theories of all stripes attribute to human beings beliefs in moral principles, or acceptance of moral norms, or possession of virtuous character traits. In each case the attribution typically brings along with it an expectation that an agent of whom it is true will be appropriately motivated to act accordingly. In this way, moral theories claim that agents have certain moral outlooks and that these outlooks impact the agents' behavior. In short, moral theories make claims about agency. Whether agents really are so motivated, however, appears to many to be an empirically testable hypothesis. Using the tools of social psychology, some scientists and philosophers have begun to emphasize the degree to which human beings of all stripes seem to be influenced by what would seem to be morally irrelevant factors.

For example, one might have thought that whether a person would help a stranger would depend largely on whether that person was a good person (perhaps because they have the virtue of kindness, or because they accept some moral principle that dictates helping others). Experimental studies, however, seem to reveal that whether people help each other is highly correlated with such factors as whether they are in a good mood, a factor that most would count as morally irrelevant and as precisely the kind of thing that sound moral commitment would get round. Thus, some have suggested that certain moral theories may rest upon dubious or false presuppositions about human agency.

In each of these cases, the precise relevance of empirical findings to more familiar questions of moral philosophy is disputed and uncertain. Few, if any, researchers believe that such empirical findings straightforwardly reveal which of our moral commitments are worthy of our endorsement and which are not. Brain scans do not tell us whether a moral intuition is to be trusted or not; evolutionary accounts of the development of norms do not tell us whether those norms are morally worthy or not. At least they do not do so in any simplistic way. Neither, however, do many philosophers assume that such empirical findings are ultimately irrelevant to the familiar normative questions of moral philosophy. For many moral philosophers, the question is not whether empirical science is relevant but how so. The absence of any consensus answer to this question may be due in part to the fact that the empirical sciences in question are not yet fully developed. Perhaps as we get a better scientific picture of the nature and history of moral norms and judgment, the relevance of this picture to normative questions will become clearer. Of note as well, though, is the fact that there is no agreed-upon epistemology for settling

normative questions, and unless there is, it seems unlikely that philosophers will be able to agree about the relevance of empirical studies. Indeed, one may suspect that questions of how empirical results are relevant to normative questions will itself become an important locus of dispute (if it is not so already) in assessing rival moral epistemologies. It is often remarked that Moore's writings set the stage for the development of twentieth-century moral philosophy, and in many ways, they did. But he surely would not have written this ending.

## ETHICS AND ECONOMICS

Economics is linked to both ethics and the theory of rationality. Economics complements and intersects with moral philosophy in both the concepts it has constructed and in its treatment of normative problems.

### RATIONALITY, UTILITY THEORY, AND WELFARE

At the foundation of economics lies a normative theory of individual rationality. The theory raises no questions about the rationality of ultimate ends and few questions about the rationality of beliefs. It maintains that an agent A chooses (acts) rationally if A's preferences are rational and A never prefers an available option to the option chosen. A's preferences are rational only if they are transitive and complete—that is, A can consistently rank all alternatives. If an agent's preferences are complete and transitive and satisfy some technical conditions, they can be represented by numbers. These numbers, which are arbitrary apart from their order, are "ordinal utilities." If an agent's preferences satisfy additional conditions concerning risky or uncertain alternatives, then they can be represented by a cardinal utility function. In contemporary economic theory, utility is merely an index locating alternatives in a preference ranking, not a substantive good.

Given economists' commitments to utility theory in explaining human choices, it is natural that they would look to levels of utility (preference satisfaction) as the

measure of welfare. It is, however, difficult to justify identifying welfare with the satisfaction of preferences, even as a simplification. Satisfying preferences that depend on false beliefs is often harmful, whereas satisfying preferences that do not concern oneself is typically irrelevant to one's welfare. Many philosophers endorse a more nuanced identification of well-being with the satisfaction of "informed" and self-interested preferences, and they can thus employ some of the framework of normative economics. Even with these qualifications, it is questionable whether taking well-being to be the satisfaction of preferences is suitable for assessing claims to scarce resources. Should one measure the well-being of those who have learned—possibly quite rationally—not to want what they have not gotten by the satisfaction of their preferences?

Some economists propose different conceptions of well-being. Of particular contemporary interest is Amartya Sen's capability approach. In Sen's view, a capability is the ability to achieve a certain sort of "functioning": literacy is a capability; reading is a functioning. People may value capabilities for their own sake as well as for the kinds of functioning they permit; someone who stays in his or her room may still be glad to know that the door is not locked.

One advantage of more objective approaches such as Sen's is that they avoid the problems of interpersonal comparison that derive from identifying well-being and preference satisfaction. Formerly, economists such as Pigou cited diminishing marginal utility of income to argue that a more equal distribution of income would increase total welfare. This argument compares the contributions income makes to the well-being of different people.

Once one takes seriously the preference-satisfaction view of well-being, these comparisons become problematic. Lionel Robbins argued that there is no objective way to compare the extent to which A's and B's preferences are satisfied, and most (though not all) economists maintain that economic evaluations must not rely on interpersonal-utility comparisons.

## EFFICIENCY AND PARETO OPTIMALITY

*Efficiency* has a technical meaning within normative economics. Suppose that utility is the satisfaction of preferences. Consider some allocation of resources  $S$ — $S$  is a "Pareto Improvement" over some other allocation  $R$  if and only if it increases the utility (preference satisfaction) of at least one person without decreasing anyone's utility.

In other words,  $S$  is a Pareto improvement over  $R$  if and only if someone prefers to  $R$ , and nobody prefers  $R$  to  $S$ .  $S$  is "efficient" or "Pareto optimal" if no other allocation is a Pareto improvement over  $S$ . If  $S$  is Pareto optimal, then every alternative that satisfies someone's preferences better leads to someone else's preferences being less well satisfied. The Pareto concepts permit economists to rank some social states in terms of preference satisfaction without making interpersonal-utility comparisons.

If one is minimally benevolent and favors satisfying people's preferences, then, other things being equal, one will endorse Pareto efficiency. Moreover, it can be proved that competitive equilibria under certain idealized conditions (no externalities, no public goods, no informational limits, and so on) are Pareto efficient. Minimal benevolence then implies that competitive equilibria are (other things being equal) morally good economic states. A second theorem shows that an efficient economic outcome with any desired distribution of welfare can be attained by a competitive market, given the right initial distribution of endowments to agents. A preference-satisfaction view of well-being combined with minimal beneficence establishes the moral claims of efficiency.

Efficiency judgments capture only one moral dimension along which to assess economic policies, institutions, processes, and outcomes. Rather than pretending that efficiency judgments are conclusive or conceding that they reflect only one of a great many evaluative perspectives, economists generally regard economic evaluation as two-dimensional. In addition to questions of efficiency—with respect to which economists claim a special competence—there are also questions concerning distribution or equity, about which economists typically have little to say.

This view of economic evaluation is inadequate because the Pareto concepts have very limited applicability: Economic changes usually involve winners and losers. One way to extend the assessment of efficiency is via the notion of a potential Pareto improvement, where there are winners and losers in terms of preference satisfaction but the winners are able to compensate the losers. No compensation is actually required. Kaldor and Hicks thought that a potential Pareto improvement showed that the economic "pie" had grown larger, whereas questions about who wins and who loses concern equity not efficiency and should be left to the political process. This view is subject to technical difficulties, and the bottom line is that there is no way to judge changes that affect distributions while remaining neutral on distributive questions.

## MORAL MATHEMATICS

The tools and theories of economists have contributed significantly to moral philosophy. Contemporary examples can be found in the literature on egalitarianism or on measures of freedom. The two branches of economics that have been most relevant to moral philosophy are social choice theory and game theory.

One can call any ranking of social states a “social-welfare function,” and normative principles can be regarded as constraints on social-welfare functions. The Pareto principle, for example, picks out those social welfare functions that rank R over S if somebody prefers R to S and nobody prefers S to R. Economists have hoped to identify additional plausible normative principles relating individual and social welfare and from them to deduce some general method of evaluating outcomes, policies, and institutions. This framework is quite limited. Procedural matters such as fairness or due process apparently count only instrumentally. Furthermore, in investigating the implications of principles constraining acceptable relationships between individual and social values, Kenneth Arrow wound up establishing a striking impossibility theorem.

Social choice theory is the proof and interpretation of theorems concerning the aggregation of preferences, judgments, and interests. The relevance of social-choice theorems to morality depends on what is being aggregated and for what purpose. Does one seek principles for making social decisions or for carrying out social evaluations? Is one aggregating preferences or judgments? A good deal of social-choice theory, like John Harsanyi’s derivation of utilitarianism, consists of formal arguments for moral conclusions, but the most important role of social choice theorems has been to reveal ambiguities and difficulties in apparently plausible moral principles. The interpretation of social-choice theorems is a subtle and complex task.

Game theory is concerned with strategic circumstances, where outcomes depend on the choices of several agents. The theory of games is particularly relevant to moral philosophy in its analysis of interaction problems of moral importance. Problems of social cooperation are often complicated, and it may be enlightening to think about recurring patterns. The most famous of these is the so-called “prisoner’s dilemma,” in which individuals who act in their self-interest reach a worse outcome for everyone than agents who do not. Prisoner’s dilemmas vividly represent problems of social cooperation, free-riding, and public-goods provision.

Modeling interactions with game theory is a subtle task, because there are many different simple games and because simple models abstract from so much. Actual interactions, unlike prisoner’s dilemmas, are rarely “one-shot” games, and game-theoretic analyses of repeated interactions are complicated and controversial. Even if game theory were in a more settled state, there would be grounds to hesitate before employing it to address ethical questions. One may have qualms about its focus on preference satisfaction and about whether the only perspective for individuals to adopt in social interactions is individual maximization. Nevertheless, some philosophers and economists such as Geoffrey Brennan, James Buchanan, David Gauthier, and Ken Binmore have used game theory to argue for views of justice.

## CONCLUSION

Economists and moral philosophers share interests in rationality and in evaluating social institutions, processes, outcomes, and policies. Although the theoretical starting points of economists and moral philosophers differ, the two subjects have a great deal to offer each other. Moral philosophers who want their work to bear on social institutions, policies, and outcomes have much to learn from economists, who have studied the consequences of alternative policies and who have sought operational measures of theoretical concepts. Economists also offer moral philosophers formal and conceptual tools. At the same time, economists concerned with evaluating institutions and policies cannot avoid thinking about ethics.

## ETHICS AND EPISTEMOLOGY

See *Epistemology and Ethics, Parallel Between*

## ETHICS AND MORALITY

*Ethics* signifies an aspect of human life that can also be called *morality*. There seem only minor differences in usage between the two terms. We speak more naturally of *professional ethics* than of *professional morals* to refer to virtues and codes of behavior of specific professions. This is not, however, because the word *moral* is restricted to human beings, or rational persons, as such, because we also speak naturally of *role morality*. A somewhat more substantial difference is that some forms of behavior especially related to sexuality, such as homosexuality, abortion, and premarital intercourse, are condemned (by some) as *immoral* where *unethical* would not be used. This usage may require a notion of a natural order (possibly of a religious character) that certain actions violate, even if they do not cause harm in some other way. At the same time, *immoral* and *unethical* are often used interchangeably, and both historically and contemporaneously, both can connote wrongness in actions and vice in character.

One influential attempt to get philosophical mileage out of the distinction between morality and ethics is Bernard Williams's *Ethics and the Limits of Philosophy* (1985). Williams proposed that ethics concerns how one should live (although excluding purely egoistic answers to

that question), and morality a systematic but narrower set of concerns that constitute one among many approaches to the ethical. Common usage does not support this linguistic suggestion, but the suggestion of broader and narrower ways of construing the subject with which moral philosophy deals has been influential in its own right.

What Williams refers to as *morality* is essentially Kant's view of it, although that view shares features with other philosophers, and contemporary Kantians have challenged aspects of Williams's reading of Kant. Prominent distinguishing features of the morality system, according to Williams, are the following:

(1) *Obligation is the fundamental moral notion.* However, considerations that render an action obligatory, such as its reducing the suffering of others, or involving defending an honorable person against attack, may also, in some circumstances, render an action good but not obligatory (sometimes called *supererogatory*). In *ethics*, by contrast, good actions can be those instantiating virtues, such as courage, justice, or compassion, without further assessment of the action as obligatory or supererogatory.

(2) *The source of moral demand lies within the agent's own autonomous self.* Yet most moral outlooks recognize some obligations and moral demands as arising, irreducibly, from outside ourselves, for example, from social or institutional roles we occupy, or relationships, such as familial ones, that are not simply voluntarily assumed.

(3) *Ethical assessment encompasses only that for which we are fully responsible*—that is, voluntary actions. Yet, Williams notes, we standardly treat as reflecting on an agent's ethicality responses (such as emotions and feelings) as well as actions, a dimension of the moral life especially emphasized by Aristotle and Iris Murdoch (1970). More generally, we see assessment of character, which is never entirely voluntary, as morally appropriate. Here Williams fails to note, and sometimes implies otherwise, that in the virtue tradition some degree of voluntariness is required for moral assessment. An emotional reaction or disposition over which (or over whose causal antecedents) the agent had absolutely no control whatsoever would not be a fit object of ethical assessment.

A comparable, but not equivalent, view of the difference in question here is that between universal moral requirements and the good life or personal flourishing. Like Williams's distinction between ethics or virtue and the morality system, this distinction is far from sharp.

## EUCKEN, RUDOLF CHRISTOPH

(1846–1926)

Rudolf Christoph Eucken, the German philosopher of life, was born in Aurich, East Friesland. He studied philology and philosophy at the University of Göttingen; after attaining his doctoral degree, he taught several years at Frankfurt Gymnasium. In 1871 he became professor of philosophy at the University of Basel, and in 1874 at Jena, where he remained until his death. In 1908 he received the Nobel Prize in literature.

Eucken was not a systematic philosopher. He began with life as man experiences it. Life inevitably tends to organize into "systems of life" that are organic or institutional. The function of philosophy is to make the meaning of each system explicit and, by explicating each, to raise the question, Which is to be preferred? But philosophy does not merely explicate; it also helps to transform existing life systems. Men assess these explications practically, in terms of their fruitfulness for life or for a particular life system. Each man chooses a life system, but he does not choose one simply for himself. Every act of such choosing inevitably involves other men. There is no escape for any man from this social involvement.

Life is a process, an evolution; it cannot be contained within the boundaries of any philosophy or life system. The strains and stresses created when life breaks its established boundaries raises the deep need for a new philosophy or new philosophies, and inevitably men develop them. Eucken believed that every significant new philosophy is more comprehensive and clearly defined than any past philosophy.

The elaboration of new philosophies comes only through action (i.e., activism), through man's relentless affirmation of life—an affirmation which recognizes both the good and evil inherent in life. No significant phi-

losophy is ever purely intellectualistic, for life is more than an idea or a theory. At its best, life is creative energy bursting into expression and molding past and present experience into a higher, more spiritual unity and order. For Eucken, life is neither noological nor psychological nor cosmological; its basis and meaning are to be found in man.

Life in man is self-conscious; as such, it goes beyond the subjective individual to bind together all conscious beings. Through this transcendence, it becomes the “independent spiritual life,” or man reaching through action toward the absolute truth, beauty, and goodness. This “independent spiritual life” is attained only as personality is developed, but it is never a final achievement, since it is always a process that evolves as history. It is not rooted in the external world but in the soul, and it manifests itself more and more completely as the soul becomes independent of this world, self-willed yet subordinate to the ultimate trinity of truth, beauty, and goodness. These ultimates are not theoretical abstractions; they are concrete human experiences that push man beyond cosmic nature to something transcendently spiritual.

Man has his beginning in nature, but through his soul evolves beyond it. His soul raises questions such as “Why?” and “Whence?” and opposes nature at all points. His soul seeks to become timeless and above nature, even as it feels helpless in the grasp of nature. In spite of this feeling of helplessness, it continues to seek freedom—a freedom realized through the creation of a consistent philosophy that makes possible man’s physical and spiritual survival. For Eucken, thought is not something intrinsic to itself but a means, or organ, of life itself.

The need for a new philosophy, Eucken felt, arises from two social conditions—modern man’s drive for a “broader, freer, cleaner life, a life of greater independence and spiritual spontaneity” and his drive for a “naturalistic culture . . . which limits all its activity to the world around us” (*Can We Still Be Christians?*, p. 51).

The first drive provides modern man with a basis for radically transforming classical Christianity. Man’s new problems, created by science, transcend the theological and ritualistic solutions that Christianity offered for millennia. The eternal contribution of Christianity is its religious affirmation of universal redemption. But redemption must be combined with new elements of faith (science as the true complement of religion; religious democracy, or the political equality of all religions before man; complete separation of church and state) if Christianity is to help give birth to the new spiritual philosophy needed by man.

Eucken was very critical of naturalism. A naturalistic culture imposes false limitations upon man’s essential spirituality. The conception of a naturalistic culture is a result of the impact of science upon man’s life—an impact that is essentially good, but dangerous if it leads to the restriction of man’s potentialities to the realm of nature only. In two works, *Individual and Society* (1923) and *Socialism: An Analysis* (1921), Eucken clarified the grounds of his criticism of naturalism. The naturalistic approach opens the door to individual freedom, but it is unable to guide man in the proper use of his freedom, since it lacks an overarching conception of unity. It fails to understand the necessity of social cooperation and social cohesion. Intellectualistic idealism understands the necessity for cooperation, cohesion, and unity, but fails to understand the need for individual freedom. The only proper answer, Eucken believed, is spiritual autonomy. Autonomy gives primacy to the whole of which the individual is a part, but it never reduces him to a state of utter subordination to that whole. The individual realizes his own unique freedom through this whole.

In *Socialism: An Analysis* Eucken also offers six criticisms of socialism: It cannot give unity to the life process; it fails to understand man’s need for an inner life; it makes the present the only significant moment in man’s life and thus cuts him off from the past and future; by reducing men to mathematical equality, it fails to appreciate genuine cultural and spiritual differences among men; espousing no higher faith than naturalism, it reduces social life to a struggle of man against man; and by considering man in purely economic terms, it stunts and aborts his true nature.

Eucken illustrated the attainment of freedom in terms of science and the peaceful society. In science the primary objective is to give man control over nature, but this task can be accomplished only when scientists cooperate by working together. Science, in other words, is essentially social, but it accomplishes its task through the freedom to investigate that is given to scientists. The peaceful society, although not yet attained, plainly depends upon human cooperation, upon no man raising his hand against another.

However, spiritual autonomy is not possible in a naturalistic culture. It rests upon a faith that goes beyond naturalism—the spiritual belief that man can produce a better and a freer world for all of humanity. Such a belief cannot find support in external circumstances alone. It requires the presence in each man of an inner life, a life constantly struggling to attain the good.

## EURASIANISM

(Classical) Eurasianism (Russian: *evraziistvo*) was an ideological-philosophical movement among Russian émigré intellectuals in the 1920s and 1930s. Its founders were the ethnologist and linguist Nikolai Sergeevich Trubetskoi, the geologist and economist P. N. Savitskii (1895–1968), the musicologist P. P. Suvchinskii (1892–1985), and the religious philosopher Georgii Vasil'evich Florovskii. Later in the 1920s major supporters and theoreticians joined the movement, including the historian G.

V. Vernadskii (1886–1967) and the philosopher Lev Platonovich Karsavin.

Eurasianism was born as a reaction to the Russian revolution and the political situation in Russia after the crisis of World War I, revolution and civil war, and the Bolsheviks' rise to power. The Eurasians were not opposed to the revolution, as it put an end to the bankrupt European tsarist regime, but were against communism, which in their view was also a typical European product. As Russians were not Europeans according to the Eurasians, Russia needed its own ideology, which would do justice to its own particular historical and cultural development.

The Eurasians' anti-European attitude manifested itself from their first joint publication, *Ischod k vostoku. Predchuvstviia i sversheniia. Utverzhdienie Evraziitsev* (Exodus to the East: Forebodings and events: An affirmation of the Eurasians; 1921). It was, in a sense, a continuation of a book published by Trubetskoi in 1920, *Evropa i chelovechestvo* (Europe and mankind). In this book Trubetskoi warned against the imminent Europeanization of the world, which was the direct result of Romano-Germanic chauvinism. The colonialist countries of western Europe considered other cultures inferior to their own culture and tried to put their stamp everywhere in the world. Russia, according to Trubetskoi, had to stand up to this pernicious influence and follow its own path.

A central concept of Eurasianism was a geographical one. The Eurasianists did not divide the enormous surface of land of the Northern Hemisphere into two (Europe and Asia), but into three parts: (Western) Europe, including Poland, the Baltic states and the Balkans, Asia—the Far East, Southwest Asia, and Southeast Asia—and in between as a separate geographical world the relatively flat area extending from the Danube estuary to the Lena River basin. It is the area that was formerly controlled by the Mongol ruler Genghis Khan (c. 1162–1227) and that roughly corresponded with the territory of the Russian tsarist regime and with that of the Soviet Union. Contrary to Europe and Asia, Eurasia is not open to the sea; it has a continental climate with hot summers and cold winters.

Eurasia is inhabited by various peoples, Slavic as well as non-Slavic or, as Trubetskoi calls them, Turanic peoples, including the Finno-Ugrians, Samoyeds, Tartars, Turkmenians, and Kalmyks. For historical and geographical reasons all these Eurasian peoples form a unity, as do their languages. Culturally and spiritually—and in this respect the Eurasians differ from the nineteenth-century Slavophiles from whom they borrowed much of their ide-

ology—the Russians are closer to the peoples of Eurasia than to their Slavic brothers such as the Czechs and the Poles, who belong to an entirely different world: catholic Europe.

The geopolitical idea of Eurasia was for the first time realized by Genghis, who submitted the entire Eurasian territory for some 150 years to the mogul yoke. Generally, this period is considered as a time of stagnation and decline, but for the Eurasians it was the beginning of the Russian empire, triumphantly continued by the Muscovite state that, after having defeated the Mongols, was even better suited to establish the unity of Eurasia as it had a clear ideology: that of the Orthodox Church. The Eurasians considered Orthodoxy as one of the pillars of Eurasia's cultural identity. Different from the heretical rationalistic and individualistic Catholicism and Protestantism, it was based on brotherhood (*sobornost*) and therefore in an excellent position to unite all the Eurasian peoples, be they Slavic, Islamic, or heathen.

For the Eurasians the reign of Peter the Great (1672–1725), who wanted to bridge the gap between Russia and Europe and make his country one of the European powers, on a par with England and France, was disastrous for Russia's development. In particular, it led to the fragmentation of Russian society: on the one hand a Europeanized upper class, consisting of the tsar, his civil servants, and the intelligentsia; on the other hand the Russian people. Instead of stimulating cooperation between and assimilation of Russians and Turanians, the Russian monarchy aimed at enforced Russification of the Turanian peoples. Moreover, it considered the Orthodox Church primarily as a means of becoming a European power; it suppressed the independence of the church and submitted it to its own secular authority. Peter's policy was continued by the Romanovs who ruled after him. It resulted in the introduction into Russia of all kinds of notions that were strange to the Eurasianist mentality: imperialism, militarism, and capitalism by the state, and liberalism, parliamentarism, and socialism by other, progressive groups in Russian society. As the Soviet state was based on European ideas, it missed the opportunity to start a really new period, based on Russia's national character, history, and civilization. The only way to "save" Russia was to return to its roots, that meant to the spirit of its pre-Petrine past.

The Eurasians did not consider themselves utopians, but tried to start from historic and social facts. In the joint publication *Evrzhiistvo* (Eurasianism; 1926), which appeared when the movement was at its height, they developed the idea of a real people's party that would

endorse their ideology and not that of the communists, but would leave intact many of the economic and political structures the Bolsheviks had introduced. In the 1930s the Eurasian movement gradually declined. The communist ideology proved to be much stronger than expected and in émigré circles many people were opposed to the growing contacts between members of the Eurasian movement and the Soviet regime.

Neo-eurasianism arose at the end of the twentieth century. It builds on the ideas of classical Eurasianism and the ethnogenesis theory of Lev Gumilev (1912–1992; the son of the famous poets Anna Akhmatova [1889–1966] and Nikolai Gumilev [1886–1921]). The movement holds particular geopolitical intentions and considers Eurasia as a separate civilization that under the leadership of the Russians as a young and fresh ethnos will break the dominance of the dying European ethnoses and in this way will change the political and cultural map of the world. Its main theoretician is the (nationalistic) philosopher Aleksandr Dugin (1962–), who is also the leader of the political party Partiiia Evraziia (Eurasia Party).

## EUSEBIUS

(265–339 or 340)

Eusebius, the church historian and Christian apologist, was bishop of Caesarea (Palestine) early in the fourth

century. He is best known for his enthusiastic support of the emperor Constantine and for his pioneering *Historia Ecclesiastica*, intended to show how the church expanded but always remained the same because of its leaders' fidelity to tradition. Though Eusebius was essentially a historian rather than a philosopher, he did produce one work of significance for the history of philosophy. This is his *Praeparatio Evangelica* (Preparation for the Gospel), probably written between 312 and 318. It consists of fifteen books, perhaps because Porphyry's treatise, *Kata Christianon* (Against the Christians), contained the same number. Eusebius claimed that his treatise went beyond earlier works of controversy or exegesis; the novelty seems to have lain in the method of quoting passages in which philosophers contradict one another, although he obviously found materials for this technique in some of his pagan sources.

The *Praeparatio* may be outlined thus: the earliest cosmogony (I. 7–8); the earliest theology (I. 9); Phoenician theology (I. 10); Egyptian theology (II. 1); Greek mythology (II. 2–8); Greek "physical" theology (III. 1–17); Greek oracles (IV–VI), leading on to the doctrines of Greek philosophers on fate, free will, and foreknowledge (VI); Hebrew doctrines (VII–IX); the chronological priority of Hebrew learning to Greek (X); the agreements and disagreements of Greek philosophy with the Hebrew oracles (XI–XIII); and the inconsistency of Greek philosophy, culminating with a transcription of part of the treatise "On the Doctrines of Philosophers" ascribed to Plutarch (XIV–XV).

The sources used by Eusebius reflect the predominantly Platonic character of the books assembled in church libraries, especially at Caesarea, by Origen and others. Eusebius made extensive use of Plato and Philo, but not of Aristotle. His other sources include the textbooks by Arius Didymus and Pseudo-Plutarch, as well as works by eclectic Platonists of the second Christian century (Atticus, Numenius, Plutarch, Severus) and a few of their contemporaries (the Peripatetic Aristocles, the Epicurean Diogenianus, the Cynic Oenomaus). From the third century he used the treatise "On Fate" by Alexander of Aphrodisias, the school text of Plotinus (earlier than that found in Porphyry's edition), several works by Porphyry ("On Abstinence," "Letter to Anebo," "Against the Christians," "Philological Lectures," "On the Philosophy to Be Derived from Oracles," "On the Soul against Boethus," "On Statues"), and a fragment by a Christian Neoplatonist named Amelius.

His basic viewpoint is that of a Christian ecclesiastic and a historian; he has considerable sympathy for his

favorite philosophers (especially Plato), but he is not really at home with them. Indeed, in his later work, *Theophania* (On the theophany), written after 337, his attitude toward philosophy is markedly hostile.

In later times the *Praeparatio* was used as a mine of philosophical quotations by such Christian apologists as Theodoret and Cyril of Alexandria (Cyril often looked up Eusebius' sources and provided slightly different quotations). It would appear that this is its principal value.

## Bibliography

### WORKS BY EUSEBIUS

The best Greek texts are in *Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte*, published by the Berlin Academy from 1902 on, although the first volume needs to be reedited (see F. Winkelmann, *Die Textbezeugung der Vita Constantini des Eusebius von Caesarea*, Berlin: Akademie-Verlag, 1962). Translations include H. J. Lawlor and J. Oulton, *Eusebius: The Ecclesiastical History and the Martyrs of Palestine*, 2 vols. (London, 1928), valuable commentary; W. J. Ferrar, *The Proof of the Gospel (Demonstratio Evangelica)*, 2 vols. (London: Society for Promoting Christian Knowledge, 1920); and E. H. Gifford, *Eusebii Pamphili Evangelicae Praeparationis Libri XV*, 4 vols. in 5 (Oxford, 1903).

### WORKS ON EUSEBIUS

Full bibliography in J. Quasten, *Patrology* (Utrecht: Spectrum, 1960), Vol. III, pp. 309–345 (on the *Praeparatio*, pp. 329–331). Later titles include D. S. Wallace-Hadrill, *Eusebius of Caesarea* (London: A.R. Mowbray, 1960) and J. Sirinelli, *Les vues historiques d'Eusèbe de Césarée* (Dakar, Senegal, 1961). On early use of Eusebius' works see Pierre Canivet, *Histoire d'une entreprise d'apologétique au V<sup>e</sup> siècle* (Paris: Bloud & Gay, 1958); R. M. Grant, "Greek Literature in the Treatise *De Trinitate* and Cyril *Contra Julianum*," *Journal of Theological Studies* 15 (1964): 265–279.

**Robert M. Grant (1967)**

## EUTHANASIA

Euthanasia used to refer to an easy and gentle death, but it has come to refer to methods of inducing that kind of death, or more precisely, methods of bringing about death sooner and usually with less pain and suffering. Euthanasia used to be limited to patients in the terminal stage of an illness, but it is now thought to be appropriate in some cases of nonterminal patients, for example, those in a persistent vegetative state and those suffering from an

incurable and very painful chronic disease such as multiple sclerosis.

### VOLUNTARY ACTIVE EUTHANASIA

Voluntary active euthanasia (VAE) is when a physician accedes to a rational *request* of an adequately informed, competent patient to be killed, for example, with a lethal intravenous injection of pentothal.

### PHYSICIAN-ASSISTED SUICIDE

Physician-assisted suicide (PAS) is when a physician, at a rational *request* of an adequately informed, competent patient who plans to commit suicide, knowingly provides that patient with the medical means to commit suicide and the patient uses those means to commit suicide.

### VOLUNTARY PASSIVE EUTHANASIA

Voluntary passive euthanasia (VPE) is when a physician abides by a valid rational *refusal* of treatment by an adequately informed, competent patient knowing that doing so will result in the patient dying, for example, complying with the refusal of a ventilator-dependent patient with motor neuron disease to receive further mechanical ventilatory support. Abiding by *patient refusal of hydration and nutrition* (PRHN) is another example of VPE, as is abiding by such refusals given in advance directives—either living wills or durable powers of attorney for health care—even though the patient is incompetent at the time the treatment is withheld or withdrawn.

Patients are *competent* to make a decision about their health care if they have the ability to make a rational decision. This requires both that they have no relevant mental disorder that prevents them from making a rational decision and that they have the capacity to understand and appreciate all the information necessary to make that decision. They are adequately informed when they have all the information necessary to make a rational decision. Patient competence, having adequate information, and no coercion by the health care team, are the elements of valid (informed) consent or refusal of treatment. If participation in research or donating an organ, rather than treatment, is involved, coercion by anyone invalidates consent.

Decisions by patients are *irrational* if they know the decisions will result in serious harm to them, for example, death, chronic pain, or significant disability, and they do not have adequate reasons for suffering that harm, for example, beliefs that some people, either themselves or others, will thereby avoid suffering an equal or greater

harm by that decision. Only those decisions count as irrational that result in the person suffering significant harm and for which almost no one in the person's culture would rank the benefit gained or harm avoided as providing an adequate reason. Often, however, rational people rank harms in different ways; for example, it is rational to rank several months of suffering from a chronic or terminal disease as worse than death and it is also rational to rank death as worse.

### INVOLUNTARY ACTIVE EUTHANASIA

Involuntary active euthanasia (IAE) is the killing of a patient who is suffering in order to relieve that suffering but without a request from the patient to be killed. This is most likely to occur with permanently incompetent patients who are unable to make such a request.

### INVOLUNTARY PASSIVE EUTHANASIA

Involuntary passive euthanasia (IPE) is allowing a suffering patient to die by ceasing treatment, in order to relieve that suffering, when the patient has neither refused that treatment nor has an advance directive refusing that treatment. This is most likely to occur with permanently incompetent patients who are unable to refuse treatment and do not have an advance directive refusing that treatment. Ceasing treatment for permanently incompetent patients who do not have advance directives refusing that treatment but who have communicated to their families that they would not want to live in this kind of condition, is usually considered to be VPE rather than IPE.

As of 2005, VAE and IAE are illegal in every state in the United States, but PAS is legal in Oregon, and many people have begun to argue for its legalization in other states. IPE is also illegal, except when continuing treatment is considered futile, but almost all those who do bioethics hold either that the definition of futility be broadened so that all treatment of patients in a persistent vegetative state be classified as futile or that some other method be established that allows discontinuing all treatment, including hydration and nutrition, for those in a persistent vegetative state when there is no religious reason for the treatment to be continued.

The United States Supreme Court has explicitly distinguished between VPE and PAS, and by consequence, VAE, holding that only the former is based on a fundamental right to be left alone. The Court correctly regards terminal sedation, that is, being sedated to unconsciousness until one dies, as VPE for those patients who have refused hydration and nutrition and whose pain and suffering cannot be controlled in other ways. VPE is

approved by the American Medical Association and all other medical and legal organizations. Philosophers have attempted to provide an account of VPE that explains its almost universal acceptance. All of these attempts have identified VAE with killing and VPE with allowing to die. Two of the most common ways of distinguishing between VAE (killing) and VPE (allowing to die) are (1) acts versus omissions and (2) withholding versus withdrawing.

The philosophical distinction between acts and omissions seems a natural way to distinguish between killing and allowing to die. On this account, if a physician *does* something, for example, injects an overdose of morphine or turns off the respirator, that is an action and should count as VAE, should be considered killing, and should be prohibited. If the physician does nothing but, rather, simply fails to do something, for example, does not turn on the respirator or does not provide essential antibiotics, that is an omission and should count as VPE, should be considered allowing to die, and should be permitted. However, it seems pointless to distinguish between an authorized physician who turns a knob that stops the flow of life-sustaining antibiotics and one who omits filling the bag when it runs out of those antibiotics. Those who have used the distinction between acts and omissions to distinguish between VAE and VPE have usually concluded that the distinction has no moral significance.

The distinction between withholding and withdrawing treatment seems to have great appeal for some doctors as a way of distinguishing between killing and allowing to die. Some maintain that if patients validly refuse to start a life-saving treatment, doctors do not have a duty to force it on them and so are only allowing them to die. However, once treatment is started, if discontinuing it would lead to the patient's death, they have a duty to continue, and it is killing not to do so. Doctors are not required to force patients to go on the ventilator if they refuse, but once patients have accepted going on the ventilator, doctors have a duty to keep them on if taking them off would result in their death, even if they have had a change of mind.

As with the previous distinction between acts and omissions, there seems to be no morally significant difference between withholding and withdrawing treatment. Physicians do not have a duty to continue treatment if an adequately informed, competent patient rationally refuses to have it continued. Imagine two unconscious patients who are going to be put on a respirator; one becomes conscious *before* being put on and the other *after* being put on, but both are competent, adequately

informed, and rationally refuse treatment. This accident of timing is morally irrelevant. Further, this way of distinguishing between active and passive euthanasia may create serious practical problems. Patients who had not been adequately evaluated (often at the scene of an accident) may be judged inappropriate for rescue efforts because the doctors believe that once the patient is on a ventilator they cannot legitimately withdraw it.

The inadequacy of these two attempts to distinguish between VAE and VPE has led many to doubt that there is a morally relevant distinction between them. However, closer attention to the way the distinction is actually made, both in law and medicine, shows that what was overlooked is the crucial role played by the patient. When a patient rationally and validly *refuses* what is offered, the physician is legally and morally required not to overrule that refusal. Abiding by a valid rational refusal, knowing that death will result, counts as VPE whether this involves (1) an act or an omission or is (2) withholding or withdrawing. That everyone acknowledges that a physician must abide by a valid refusal of treatment, whether this involves an action or is a case of withdrawing, explains why VPE is almost universally considered to be morally acceptable.

If a patient *requests* the physician to do something, however, the physician is not morally required to do it if in the physician's judgment it is inappropriate to do so. Physicians may accede to patient requests if they regard them as appropriate, but rarely are they required to do so. If a patient requests that a doctor do something illegal or that the doctor considers immoral, the doctor usually is not required to accede to that request. Killing patients at their rational request is illegal, and even if it were to be legalized, many physicians would still consider it to be immoral. Even granted that it is sometimes morally acceptable for physicians to kill patients at their request, it will never be legally or morally required for them to do so. This is sufficient to distinguish VAE from VPE, for it is legally and morally required for physicians to abide by the rational valid refusals of their patients.

Confusion sometimes arises because a patient's refusal is framed as a request. For example, a patient's *request* that no cardiopulmonary resuscitation (CPR) be attempted counts as a refusal of permission for CPR. Similarly, written advance directives requesting the cessation of other therapies or of hydration and nutrition, count as refusals. Any request for not starting or stopping a treatment is a refusal of treatment, and if the patient is competent and the request is rational, doctors are morally and legally required to abide by it.

Distinguishing between refusals and requests becomes more difficult when the life-prolonging treatment is provided by a device such as a pacemaker that has been implanted in the patient. Even though a pacemaker can be reprogrammed to cease functioning without any surgical procedure, some have considered the pacemaker to have become part of the person and so regard the request to turn it off as a genuine request and not as a refusal. However, the dominant view is that whether the artificial device that is keeping the person alive is inside or outside is not the important consideration. If the device can be turned off from the outside, then the patient's request can be counted as a refusal and should be honored. However, because it is not clear that the patient's request should be counted as a refusal, it is not clear whether the doctor is legally required to have the pacemaker turned off. On the other hand, if a surgical procedure is required, for example, to take out an implanted heart valve, no one would count the request to have it taken out as a refusal, and if any doctor agreed to such a request, that doctor would be regarded as having killed the patient.

Using valid refusal versus requests as the way of distinguishing VPE from VAE, while it explains the moral acceptability of VPE, does not make VAE morally unacceptable. Given present knowledge and technology, a physician can kill a patient absolutely painlessly within a matter of minutes. If there were no way for patients to shorten the time of their dying or for their pain to be controlled, VAE would seem to be clearly morally acceptable. However, PRHN, which, contrary to common belief, does not cause suffering, normally results in patients becoming unconscious within a week and dying within another week, and there is no limit on ways to control their other pain during that time. Because all proposals to legalize VAE or PAS involve at least a two-week waiting period, it seems pointless to argue for legalizing VAE or PAS, which are controversial, rather than providing education about PRHN, a form of VPE, which is already universally accepted. Failure to appreciate the available alternative of PRHN makes arguments such as those presented to the Supreme Court in *The Philosopher's Brief* in favor of declaring Washington and New York states prohibition of assisted suicide unconstitutional far less persuasive than they otherwise would be.

Abiding by the refusal of an advance directive of a competent patient, when that patient becomes incompetent, is also regarded as VPE. If competent patients explicitly state in advance directives that should they become permanently incompetent they want all life prolonging treatments to be discontinued, then the physician is

morally required to abide by that refusal. However, some challenge this view, claiming that the views of the competent person who filled out the advance directive may not be the same as the views of the incompetent person to whom they are being applied. Some hold that advance directives need not be followed if the physician believes that the incompetent person would no longer choose to have life-prolonging treatment withdrawn. A public policy must be judged, however, in terms of the effects that this policy would have on everyone affected if all of them knew of the policy. Competent persons who fill out advance directives refusing life-prolonging treatment if they become permanently incompetent consider it distasteful and devoid of dignity to live as a permanently incompetent person, but after becoming permanently incompetent, the person, having no sense of dignity, does not view life with distaste.

If everyone knew that advance directives would not be honored in these cases, some permanently incompetent persons would live longer than they would if such advance directives were honored. This might be a positive result although it is not clear whether the incompetent person views it in that way. However, it is clear that another result of everyone knowing that their advance directives would not be honored would be anxiety, anger, and other unpleasant feelings by those competent persons who had made out such advance directives. This could result in an increase in deaths of such competent persons in order to avoid the unwanted prolongation of their lives as incompetent persons. That the public policy of honoring advance directives is likely to have better consequences than the public policy of not honoring them justifies the policy.

## EVANS, GARETH (1946–1980)

As an undergraduate from 1964 to 1967, Gareth Evans, a British philosopher of language and mind, studied for the PPE degree (philosophy, politics, and economics) at University College, Oxford, where his philosophy tutor was Peter Strawson. In 1968, less than a year after completing his degree, Evans was elected to a fellowship at University College. He took up the position in 1969, succeeding Strawson, who had become Waynflete Professor of Metaphysical Philosophy at Oxford. During the 1970s Evans and his University College colleague John McDowell played leading roles in developing a distinctive conception of truth-theoretic semantics, drawing on the work of Strawson, Michael Dummett, and especially Donald Davidson. Their coedited collection, *Truth and Meaning: Essays in Semantics*, appeared in 1976.

While philosophy of language enjoyed a central position in Oxford philosophy of that period, Evans did not share the view (regarded by Dummett as constitutive of analytic philosophy) that philosophy of language is foundational and so takes priority over philosophy of mind in the order of philosophical explanation. He attached particular importance to the mentalistic notion of understanding, and his work on the theory of reference was set within a theory of thought and especially thought about particular objects. Evans's published work ranged over philosophy of language, metaphysics, philosophy of mind, and philosophy of psychology. In 1979 he was elected to the Wilde Readership in Mental Philosophy at Oxford. He died in August 1980, at the age of thirty-four. His book *The Varieties of Reference* (1982), incomplete at the time of his death, was edited and brought to publication by McDowell. A collection of thirteen of his papers and two shorter notes appeared in 1985, and a further note was published in 2004.

### NAMES AND REFERENCE

In his first published paper, "The Causal Theory of Names" (1973/1985) Evans contrasted two theories about the reference of names: the description theory and the causal theory. Evans agreed with Kripke (1972) in rejecting the description theory of reference, which he regarded as drawing support from a flawed account of what is involved in thought directed toward a particular object. In opposition to this description-theoretic account of object-directed thoughts, Evans maintained that a subject may think about a particular object in virtue of standing in a contextual relation to it and without being able to frame any description that the object uniquely satisfies. However, Evans did not accept the causal theory of reference suggested by Kripke's remarks. In the Kripkean picture, the reference of a name is established by an initial baptism and is then passed on from earlier to later users of the name. Evans challenged this picture by highlighting the fact that a name may change its reference over time and, more generally, he argued that a bare causal connection is not sufficient to underwrite reference. As against both the description theory and the Kripkean causal theory, Evans proposed that the bearer of a name is the object that is the dominant source of the body of information that speakers associate with the name.

Many of the themes of his early paper on names—including opposition to description-theoretic accounts of object-directed thoughts, rejection of causal theories as insufficiently demanding, and appeal to the notion of information—recur in *The Varieties of Reference*, set

against the historical background of Gottlob Frege and Bertrand Russell. Evans read Frege as committed to the principle that if a name has no reference, then a sentence containing the name has no truth-value and does not express a thought; a speaker using the sentence does not literally say anything. This “no reference, no thought” principle is in line with Frege’s view that the semantic function of a name is to introduce an object, but it appears to rule out the possibility of names with sense but no reference, a possibility that Frege clearly allowed once his distinction between sense and reference was in place. Evans sought to reduce the tension that this reading finds in Frege’s position by appealing to Frege’s assimilation of the use of empty names to fictional uses of language, which express pretended senses or “mock thoughts.”

Evans held that many singular terms—especially demonstratives such as “that ball” or “that vase”—conform to the “no reference, no thought” principle, and he called such expressions “Russellian” singular terms. He also held, following Russell, that definite descriptions, even though they appear superficially to occupy name positions, are not really referring expressions but rather quantifier expressions; “the *F*” semantically resembles “some *F*” and “every *F*.” The contrast between a Russellian singular term, whose significance depends on its having a referent, and a definite description, whose significance can be grasped independently of whether it has a denotation, was fundamental for much of Evans’s work on reference (Sainsbury 1985).

## OBJECT-DIRECTED THOUGHT

Although *The Varieties of Reference* begins and ends with philosophy of language (returning to the topic of names and name-using practices in its final chapter), the central chapters address the issue of thoughts directed toward particular objects. According to the description theory of object-directed thoughts, thought about a perceived, remembered, heard-about, or recognized object, about an occupied place or about a present time, is a matter of the object, place, or time uniquely satisfying a descriptive condition that the thinker frames and deploys in thought. Alternative theories of *de re* (or object-directed) thought appeal to the causal relations implicated in perception, memory, and testimony and to contextual relations to places and times (Burge 1977). While Evans was opposed to the description theory, he was also concerned, here as in philosophy of language, that causal theories were liable to be insufficiently demanding. He was particularly critical of what he called “the photograph model of mental

representation,” according to which the causal ancestry of a mental state is sufficient to determine which object the state represents (as causal ancestry is sufficient to determine which object a photograph is an image of).

Evans’s own theorizing about object-directed thoughts was guided by Russell’s principle, which says that to think about a particular object, a thinker must know which object is at issue. Evans interpreted the principle as requiring discriminating knowledge, that is, the capacity to discriminate the object of thought from all other things, and this, at least initially, sounds so demanding as to make object-directed thought an extraordinary achievement. But Evans’s examples of how to meet the principle make it seem more tractable: presently perceiving the object, being able to recognize it, knowing discriminating facts about it.

When a thinker meets the requirement of Russell’s principle by having discriminating knowledge of a particular object, the thinker is said to have an adequate Idea of the object. In this technical use of the term, an Idea deployed in thought about an object is analogous to a concept deployed in thought about a property. Evans was particularly concerned with cases (centrally, cases of demonstrative identification) in which a thinker’s Idea of an object depends on an information link between the thinker and the object, so that the Idea of the object, and thoughts in which the Idea is deployed, are information-invoking. The picture here is not that the information link contributes to the thought about the object, because the thinker frames a descriptive condition along the lines of “the object, whichever it is, that is the source of this information.” It is the information link itself, and not a thought about the information link, that plays a role in making object-directed thought possible.

If, as a result of malfunction or hallucination, there is really no information link to an object, then the thinker has no adequate Idea of this information-invoking kind. A thinker who is unaware of the problem may essay a thought and yet fail to think about any particular object at all. Information-invoking thoughts (centrally, demonstrative thoughts) are object-dependent; where there is no object, there is no thought. Evans was especially interested in cases where understanding a singular term requires an information-invoking thought, and hence object-dependent thought, on the part of the hearer. For in such cases, it is possible to argue that the singular term is Russellian, that its significance depends on its having a referent.

## DESCRIPTIVE NAMES

Despite the central role played by Russellian singular terms in *The Varieties of Reference*, Evans did not equate the categories of Russellian singular terms and referring expressions. In “Reference and Contingency” (1979/1985), he considered descriptive names (names whose referents are fixed by description). His example was the name “Julius,” introduced with the stipulation “Let us use ‘Julius’ to refer to whoever invented the zip fastener [or zipper].” “Julius” behaves epistemically and modally like the definite description “the actual inventor of the zip.” Evans offered “If anyone uniquely invented the zip, Julius invented the zip” as an example of a sentence whose truth can be known a priori, even though it is contingent. Evans argued that the thought expressed by the nonmodal sentence “Julius is *F*” is the same as the thought expressed by “The inventor of the zip is *F*”—a thought that can be grasped whether or not “Julius” refers to anyone. But he rejected the suggestion that descriptive names belong semantically with definite descriptions and maintained that, although the descriptive name “Julius” is not a Russellian singular term, it is still a referring expression. His argument for placing descriptive names in the category of referring expressions, alongside Russellian singular terms and separate from definite descriptions, involved two main points. First, as the introducing stipulation makes clear, the semantic contribution of “Julius” is stated using the relation of reference, no less than is the semantic contribution of a Russellian singular term (“John” refers to John). Second, even in a semantic theory for a modal language, the semantic contribution of a descriptive name, like that of a Russellian singular term, can be stated using a reference relation that is not relativized to possible worlds, but this is not generally so for definite descriptions.

## INFORMATION AND NONCONCEPTUAL CONTENT

The notion of information, as Evans used it, is not the notion of what a subject believes. Indeed, Evans suggested that we should take the notion of being in an information state as a primitive notion, not to be explained in terms of belief, judgment, and reasons. Because perceptual-information states can be present in a creature that does not think or apply concepts, Evans maintained that the representational content of perceptual states is a kind of nonconceptual content. To be in states with such content (perhaps the nonconceptual content that a sound is coming from direction *d*) a creature does not need to apply, or even to possess, the concepts that we use to specify the

content of the states (concepts such as those of sound and direction).

Evans held a distinctive view of the relationship between perceptual-information states and perceptual experiences according to which conscious perceptual experience requires that perceptual-information states should function as inputs to a system for thinking and reasoning. Thus, only a creature with concepts can enjoy perceptual experiences. Nevertheless, a perceiving, thinking, concept-applying creature need not possess all the concepts that would be required fully to specify the content of a perceptual experience and, in having the experience, need not employ even those concepts that are possessed. Evans allowed that the representational content of perceptual experience need not be conceptual content, and in subsequent work, the notion of nonconceptual content has played a major role in accounts of the representational content of perceptual experience (Crane 1992, Gunther 2003, Peacocke 2001).

## FURTHER THEMES

Several of Evans’s papers—beginning with “Identity and Predication” (1975/1985) and including “Semantic Structure and Logical Form” (1976/1985) and “Does Tense Logic Rest upon a Mistake?” (1985)—contributed to the foundations of semantics and particularly to constraints on semantic theories that show how the meanings of whole sentences depend on the meanings of their parts. In “Semantic Theory and Tacit Knowledge” (1981/1985), he connected the requirement that a semantic theory should reveal semantic structure in sentences with the idea that speakers of a language have tacit knowledge of such a theory. Evans developed a substantive account of tacit knowledge (see also Davies 1987, Peacocke 1989) and distinguished the nonconceptualized content of tacit-knowledge states from the conceptualized content of belief states.

Evans’s account of the semantic properties of descriptive names, put forward in “Reference and Contingency” (1979/1985), led to developments in two-dimensional modal logic (Davies and Humberstone 1980; see also Evans 2004), and he made further use of the notion of a singular term with its reference fixed by description in seminal work on pronouns. In “Pronouns, Quantifiers, and Relative Clauses” (1977/1985) and in “Pronouns” (1980/1985), Evans developed an influential account of the semantic function of pronouns that depend for their interpretation on an earlier quantifier phrase yet without being interpretable as bound variables (Neale 1990; King 2005). Finally, “Things without the

Mind” (1980/1985) and “Molyneux’s Question” (1985), along with the central chapters of *The Varieties of Reference*, have had a profound influence on subsequent work in philosophy of psychology, particularly work concerning the perception and representation of space and, more generally, the conditions for an objective conception of a spatial world (Eilan, McCarthy, and Brewer 1993).

## EVENTS IN SEMANTIC THEORY

It is an ancient idea that many verbs are used to describe events—things that happen, in places and at times. Frank Plumpton Ramsey introduced an important twist, in the context of distinguishing events from facts. Suppose that Aggie hit Pat. Then on Ramsey’s view, the fact reported with (1)

(1) Aggie hit Pat

is the general proposition that there was a hitting of Pat by Aggie. This existential generalization, unlike any event, has no specific spatiotemporal properties. But any event of Aggie hitting Pat verifies (1). So the action report seems to mean that an event of a certain sort occurred. Though at least initially, it is not clear how to square this with the compositionality of linguistic meaning. Let the invented monadic predicate *Aghipatish*<sub>1</sub> be satisfied by *z* if and only if (iff) *z* was a hitting of Pat by Aggie. Then plausibly, (1) is true iff  $\exists z[\text{Aghipatish}_1(z)]$ . But this biconditional reveals nothing about how the meaning of (1) is determined by the constituent words. And *prima facie*, the logical form of (1) is  $\text{Hit}_2(\mathbf{a}, \mathbf{p})$ ; where **a** and **p** are names for Aggie and Pat, respectively, and  $\text{Hit}_2$  is satisfied by an ordered pair  $\langle x, y \rangle$  iff *x* hit *y*. Donald Davidson (1967, 1985) shows how to represent the meaning of (1) compositionally and “eventishly,” and he offers an argument for doing so. Others develop his proposal and provide independent support for it.

### ADVERBIAL MODIFICATION

Let  $\text{Hit}_3$  be satisfied by an ordered triple  $\langle x, y, z \rangle$  iff *z* was a hitting of *y* by *x*, so that  $\forall x \forall y \{ \text{Hit}_2(x, y) \leftrightarrow \exists z [\text{Hit}_3(x, y, z)] \}$ . Then (1a),

(1a)  $\exists z [\text{Hit}_3(\mathbf{a}, \mathbf{p}, z)]$

which is true iff  $\exists z [\text{Aghipatish}_1(z)]$ , has parts corresponding to the words in (1). If we represent the meaning of (1) with (1a), we can explain the apparent synonymy of (1) with (2):

(2) There was a hitting of Pat by Aggie

But one wants to see further evidence of the alleged covert variable.

An action report can be extended as in (3–8):

(3) Aggie hit Pat softly

(4) Aggie hit Pat with a red stick

(5) Aggie hit Pat in March

- (6) Aggie hit Pat with a red stick in March  
 (7) Aggie hit Pat in March with a red stick  
 (8) Aggie hit Pat softly with a red stick in March

One might be inclined to represent the meaning of (3) with  $\text{SoftlyHit}_2(\mathbf{a}, \mathbf{p})$ ; where the invented binary predicate is satisfied by  $\langle x, y \rangle$  iff  $x$  hit  $y$  softly. But if an inference from (3) to (1) is of the form  $\Phi_2(\alpha, \beta)$ , so  $\Psi_2(\alpha, \beta)$ , we need some other explanation for why the truth of (3) guarantees the truth of (1). One can stipulate that  $\forall x \forall y [\text{SoftlyHit}_2(x, y) \rightarrow \text{Hit}_2(x, y)]$ . However, one wants to know why the corresponding English sentences are related in this fashion. Furthermore, (3) seems to be synonymous with “There was a soft hitting of Pat by Aggie,” which implies (2). Such implications are reminiscent of conjunction-reduction, as in inferences like the following:  $\exists x [\text{Red}(x) \& \text{Stick}(x)]$ , so  $\exists x [\text{Stick}(x)]$ .

This invites Davidson’s (1967) hypothesis that the logical form of (3) is (3a);

- (3a)  $\exists z [\text{Hit}_3(\text{Aggie}, \text{Pat}, z) \& \text{Soft}_1(z)]$

where  $\text{Soft}_1(z)$  means that  $z$  was done softly. Furthermore, sentences like (1–8) exhibit a network of entailments. The truth of (4) or (5) also guarantees the truth of (1); (6) implies (7), which implies each of (4–6); and (8) implies each of (1–7). These facts, which illustrate that adverb-reduction is often a valid form of inference in natural language, go unexplained if we represent the meanings of (3–8) with binary predicates like  $\text{HitInMarchWithARedStick}_2$ . But we can explain the entailments by analyzing the adverbial modifiers as predicates conjoined with others, as in (7a);

- (7a)  $\exists z [\text{Hit}_3(\text{Aggie}, \text{Pat}, z) \& \text{In}_2(z, \text{March}) \& \text{With}_2(z, \text{a red stick})]$

where  $\text{In}_2(z, \text{March})$  and  $\text{With}_2(z, \text{a red stick})$  mean that  $z$  occurred in March, and that  $z$  was done with a red stick. By analogy, “There was a red stick on the table touching the chalk” implies that there was a red stick on the table, a stick touching the chalk, a red stick, and so on.

There are also nonimplications to account for. Each of (3–5) could be true, even if (8) is false. Aggie may have hit Pat more than once, but never softly with a red stick in March. Let’s suppose, though, that Aggie hit Pat exactly twice: once in March with a red stick, and once in April with a blue stick. Then (9–11) are true, like (4–6), but (12–13) are false.

- (9) Aggie hit Pat with a blue stick  
 (10) Aggie hit Pat in April

- (11) Aggie hit Pat with a blue stick in April  
 (12) Aggie hit Pat with a red stick in April  
 (13) Aggie hit Pat with a blue stick in March

The truth of (9) and (5) does not guarantee the truth of (13). Nor does the truth of (4) and (10) guarantee the truth of (12). This is what Davidson’s (1967) account predicts.

If (4) and (10) are true, there were events  $z_1$  and  $z_2$ , such that  $\text{Hit}_3(\text{Aggie}, \text{Pat}, z_1) \& \text{With}_2(z_1, \text{a red stick}) \& \text{Hit}_3(\text{Aggie}, \text{Pat}, z_2) \& \text{In}_2(z_2, \text{April})$ . But it does not follow that there was an event  $z$  such that  $\text{With}_2(z, \text{a red stick}) \& \text{In}_2(z, \text{April})$ . So (12) can be false, and likewise for (13). If we represent the meanings of (1–13) with predicates like  $\text{HitWithARedStickInApril}_2$ , we must add stipulations corresponding to the network of implications, and then explain why the English sentences exhibit these implications and not the others. (Note that appealing to times, instead of events, will not account for the facts. Aggie may have hit Pat simultaneously with a red stick softly and with a blue stick sharply.)

## OTHER EVIDENCE

We can specify the meaning of (14) with (14a):

- (14) Aggie fled after Pat fell  
 (14a)  $\exists z \{ \text{Fled}_2(\mathbf{a}, z) \& \exists w [(\text{After}_2(z, w) \& \text{Fell}_2(\mathbf{p}, w))] \}$

which is true iff an event of Aggie’s fleeing occurred after an event Pat’s falling. Words like *after* can thus be analyzed as devices for expressing relations between events. Perceptual reports are also relevant. In (15) as opposed to (16):

- (15) Pat heard Aggie shout  
 (16) Pat heard that Aggie shouted

*shout* is untensed, and replacing *Aggie* with another name for the same individual is sure to preserve truth. Thus, one might render (15) as (15a),

- (15a)  $\exists z \exists w [\text{Heard}_3(\mathbf{p}, w, z) \& \text{Shout}_2(\mathbf{a}, w)]$

which is true iff there was a hearing by Pat of a shouting by Aggie. This lets us account for the ambiguity of (16), which can imply that the hearing took place in the hall or that the shout did:

- (16) Pat heard Aggie shout in the hall  
 (16a)  $\exists z \exists w [\text{Heard}_3(\mathbf{p}, w, z) \& \text{Shout}_2(\mathbf{a}, w) \& \text{In}_2(\text{the hall}, z)]$

(16b)  $\exists z \exists w [\text{Heard}_3(\mathbf{p}, w, z) \ \& \ \text{Shout}_2(\mathbf{a}, w) \ \& \ \text{In}_2(\text{the hall}, w)]$

Another kind of evidence concerns the intuitive unacceptability of certain adverbial modifications. While (18) sounds somehow wrong, (17) and (19) do not:

(17) Aggie ran for an hour

(18) Aggie ran in an hour

(19) Aggie ran to the store in an hour

If we represent the verb–phrase meanings in (17) and (19) with  $\text{RanForAnHour}_2$  and  $\text{RanToTheStoreInAnHour}_2$ , not only do we fail to capture implications, we are left wondering why “ran in an hour” is a defective complex monadic predicate. By contrast, (17a) and (19a)

(17a)  $\exists z [\text{Ran}_2(\mathbf{a}, z) \ \& \ \text{For}_2(z, \text{an hour})]$

(19a)  $\exists z [\text{Ran}_2(\mathbf{a}, z) \ \& \ \text{To}_2(z, \text{the store}) \ \& \ \text{In}_2(z, \text{an hour})]$

suggest that “for an hour,” unlike “in an hour,” can be part of an event description that does not provide an independent way of saying when the events described are finished. This hypothesis is confirmed by examples like (20–21):

(20) Aggie painted the walls for/in an hour

(21) Aggie painted walls for/in an hour

While (20) is fine with either modifier, (21) is not. Furthermore, with “in an hour” (20) implies an event that ended when the walls in question were covered with paint. With “for an hour” neither sentence implies that Aggie finished painting any wall.

A striking generalization about action reports of the form “Subject Verb Object,” with the verb in active voice, is that such reports invariably imply that the subject of the sentence was the actor. We can invent a predicate  $\text{Tih}_2$  satisfied by  $\langle x, y \rangle$  iff  $y$  hit  $x$ ; and we can imagine a language in which a homophone of (1), with *Aggie* as the subject, means that  $\text{Tih}_2(\mathbf{a}, \mathbf{p})$ —or equivalently,  $\text{Hit}_2(\mathbf{p}, \mathbf{a})$ . However, there are no such expressions in natural human languages. And while the source of this fact is a matter of debate, a great deal of evidence suggests a constraint on how grammatical relations are related to thematic relations that hold between events and their participants. In which case, event variables (and thematic relations) are introduced somehow. However, there is more than one way to introduce them.

## THEMATIC ELABORATION

Let  $\text{Hitting}_1$  be satisfied by  $z$  iff  $z$  was an event of hitting, ignoring tense for simplicity. Let  $\text{Agent}_2$  and  $\text{Patient}_2$  signify thematic relations, without worrying here about how to get beyond intuitive specifications of these relations, so that  $\forall x \forall y \{ \exists z [\text{Hit}_3(x, y, z)] \text{ iff } \exists z [\text{Agent}_2(z, x) \ \& \ \text{Hitting}_1(z) \ \& \ \text{Patient}_2(z, y)] \}$ .

This makes it easy to explain why it follows from (1) that Aggie did something, there was a hitting, and something happened to Pat. This view also preserves a sense in which the transitive verb *hit* is a binary predicate. For while the verb itself is associated with a monadic predicates of events, *hit* is also associated with two thematic relations. Correlatively, one can capture the distinction— independently motivated in many languages that mark nominative and accusative case—between intransitive verbs like *fled* that implicate action, and those that do not. Intuitively, events of falling (like deaths) are things that happen to individuals (not things done), even if such events are intended effects of actions. Besides, one can supplement Davidson’s (1967) original proposal—as Davidson (1985) did—with hypotheses like the following:

$\forall x \{ \exists z [\text{Fled}_2(x, z)] \leftrightarrow \{ \exists z [\text{Agent}_2(z, x)] \ \& \ \text{Fleeing}_1(z) \} \}$ ;

$\forall x \{ \exists z [\text{Fell}_2(x, z)] \leftrightarrow \{ \exists z [\text{Patient}_2(z, x)] \ \& \ \text{Falling}_1(z) \} \}$ .

But there are at least two construals of such hypotheses.

One might view them as analyses of multiply unsaturated verb-meanings. From this perspective the verb *hit* is satisfied by ordered triples  $\langle x, y, z \rangle$  such that  $z$  was a hitting whose Patient was  $y$  and whose Agent was  $x$ . In which case, given standard assumptions about semantic compositionality, *hit Pat* is satisfied by ordered pairs  $\langle x, z \rangle$  such that  $z$  was a hitting whose Patient was Pat and whose Agent was  $x$ . Less standardly, one might say that *hit* is satisfied by events of hitting (period) and that *hit Pat* is satisfied by each event of hitting whose Patient is Pat. This is, in effect, to adopt the following hypothesis: combining *hit* with a direct object corresponds to predicate-conjunction, not predicate-saturation; and the thematic relation “being the Patient of” is expressed by a certain grammatical relation, between the verb and its object, not simply by the lexical meaning of *hit*.

Barry Schein (1993, 2002) and others argue that considerations involving plurality, along with the need for second-order quantification, favor the second perspective. On this kind of view, “Five boys ate two pizzas” has a (collective) reading according to which there some events of eating whose Agents were five boys, and whose Patients

were two pizzas; where this does not imply that any one event had all five boys and both pizzas as participants. The first view fits more naturally with the following formulation of the collective reading: There was an event whose (plural) Agent was a collection of five boys, and whose Patient was a collection of two pizzas. Still, however one thinks of thematic elaboration, it both extends the scope of event analyses and highlights difficulties.

As many authors have discussed, verbs like *boil* can appear in transitive and intransitive forms, with a characteristic entailment illustrated in (22):

(22) Aggie boiled the soup; so the soup boiled

Treating the two forms as independent predicates,  $\text{Boiled}_2(x, y)$  and  $\text{Boiled}_1(x)$ , makes the implication mysterious. So one might analyze (22) as in (23) or (24):

(23)  $\exists z\{\text{Agent}_2(z, \mathbf{a}) \ \& \ \exists w[\text{C}_2(z, w) \ \& \ \text{Boiling}_1(w) \ \& \ \text{Patient}_2(w, \mathbf{s})]\}$ ; so  $\exists z[\text{Patient}_2(z, \mathbf{s}) \ \& \ \text{Boiling}_1(z)]$

(24)  $\exists z[\text{Agent}_2(z, \mathbf{a}) \ \& \ \exists w[\text{M}_2(z, w) \ \& \ \text{Boiling}_1(w)] \ \& \ \text{Patient}_2(z, \mathbf{s})]$ ; so  $\exists z[\text{Patient}_2(z, \mathbf{s}) \ \& \ \text{Boiling}_1(z)]$

Here,  $\mathbf{s}$  stands for the soup,  $\text{C}_2$  indicates a causal relation holding between an action and some of its effects, and  $\text{M}_2$  indicates a mereological relation holding between processes that start with actions and end with effects of those actions. Many linguists argue that some such analysis is required, especially given the constraints on how grammatical relations are mapped to thematic relations. But specifying the requisite causal/mereological relation has proven difficult. Moreover, (23) fails to represent Aggie and the soup as coparticipants in some event describable with an adverbial phrase; yet, if Aggie boiled the soup on Monday, both Aggie's action and the resultant boiling occurred on Monday. And given (24), a background premise is required to reveal the inference as valid:  $\forall y\forall z\forall w[\text{M}_2(z, w) \ \& \ \text{Patient}_2(z, y) \rightarrow \text{Patient}_2(w, y)]$ .

This raises hard questions about the individuation of actions and their relation to thematic relations. More generally, it is unclear what event variables range over, given the kinds of considerations that motivate such variables. Suppose that Aggie drank a pint of beer (and nothing else) in ten minutes. Then for those ten minutes Aggie drank beer. Let  $z_1$  be this event of Aggie drinking beer, and let  $z_2$  be the event of Aggie drinking the pint in question. Intuitively,  $z_1$  is  $z_2$ ; Aggie's beer drinking was none other than the drinking of that pint. In which case,  $z_1$  satisfies "in ten minutes" iff  $z_2$  does; and  $z_2$  does. However, if  $z_1$  satisfies "in ten minutes," why is "Aggie drank beer in

ten minutes" anomalous? This kind of question arises often.

Consider two billiard balls,  $\mathbf{b}$  and  $\mathbf{c}$ , that came into contact exactly once. At that moment,  $\mathbf{b}$  touched  $\mathbf{c}$ , and  $\mathbf{c}$  touched  $\mathbf{b}$ . Perhaps *touched*, used in this way, does not mark its subject as an Agent, but letting  $\text{Sub}_2$  and  $\text{Ob}_2$  signify the relevant thematic relations, whatever they are:  $\exists z[\text{Sub}_2(z, \mathbf{b}) \ \& \ \text{Touching}_1(z) \ \& \ \text{Ob}_2(z, \mathbf{c})]$ , and  $\exists z[\text{Sub}_2(\mathbf{c}, z) \ \& \ \text{Touching}_1(z) \ \& \ \text{Ob}_2(\mathbf{b}, z)]$ . One might have expected the touching of  $\mathbf{c}$  by  $\mathbf{b}$  to be identical with the touching of  $\mathbf{b}$  by  $\mathbf{c}$ . But how can any one event of touching,  $z$ , be such that:  $\text{Sub}_2(z, \mathbf{b}) \ \& \ \text{Ob}_2(z, \mathbf{c}) \ \& \ \text{Sub}_2(z, \mathbf{c}) \ \& \ \text{Ob}_2(z, \mathbf{b})$ ? Presumably,  $\text{Sub}_2(z, \mathbf{b})$  implies that  $\mathbf{b}$  is the unique individual that bears the relevant thematic relation to  $z$ —and likewise for  $\text{Sub}_2(z, \mathbf{c})$ —since Aggie touched/lifted Pat does not mean merely that there was a touching/lifting with Aggie as one of potentially many touchers/lifters, and Pat as one of potentially many things touched/lifted.

One can avoid the false implication that  $\mathbf{b} = \mathbf{c}$  by denying that event variables in semantic theories range over language-independent occurrences. However, this has implications for the relations among meaning, truth, and ontology. Another option is to elaborate further, treating notation like  $\text{Sub}_2(z, \mathbf{b})$  as shorthand for claims of the form:  $\exists e[\text{R}_2(e, z) \ \& \ \text{P}_2(e, \mathbf{b})]$ ; where  $e$  ranges over language-independent spatiotemporal particulars individuated (at least roughly) in accordance with intuitions about events,  $\text{R}_2$  signifies a relation that holds between such particulars and their grammatical presentations, and  $\text{P}_2$  signifies a suitable participation relation. But if  $z$  ranges over things individuated partly in terms of the grammatical relations that verbs bear to their arguments, we still face questions about the individuation of events and their relation to any thematic relations appealed to in theories of meaning.

## EVENT THEORY

An event is anything that happens, an occurrence. The idea of an event began to take on a philosophical life of its own in the twentieth century, due to a reawakening of interest in the concept of change, to which the concept of an event seems inextricably tied, and to the growing use of the concept of an event in scientific and metascientific writing (see Broad 1933, McTaggart 1927, and Whitehead 1929). Interest in events has also been sparked by versions of the mind-body identity thesis formulated in terms of events and by the idea that a clearer picture of events will facilitate discussion of other philosophical issues.

Discussions of events have focused on whether there are events and, if so, what the nature of events is. Since whether there are events depends in part on what they would be like if there were any, the two issues have usually been treated together.

Some philosophers (e.g., J. J. Thomson) simply assume that there are events; others argue for that assumption. Donald Davidson has asserted that there are events (and actions) by arguing that, to explain the meanings of claims involving adverbial modifiers (e.g., "Jones killed Smith in the kitchen") and singular causal claims (e.g., "the short circuit caused the fire"), we should suppose that such claims implicitly quantify over, or posit,

actions and events (e.g., killings, short circuits, and fires). Opponents of Davidson's analyses (e.g., Terence Horgan) have argued that alternative semantic theories, which do not posit events, are able to explain the semantic features of Davidson's target sentences.

While some singular terms purporting to refer to events are proper names (e.g., "World War I"), many are definite descriptions (e.g., "the killing of Caesar by Brutus"). The semantics of singular descriptions for events has been studied by Zeno Vendler and Jonathan Bennett. Of particular interest is the distinction between perfect nominals, such as "Quisling's betraying of Norway," which refer to events (or actions or states), and imperfect nominals, such as "Quisling's betraying Norway," which refer to factlike entities. Bennett has argued that much of what is wrong in Jaegwon Kim's theory of events can be traced to confusions involving these two sorts of nominals and to expressions (e.g., "the betrayal") that are ambiguous and can refer either to events or to facts.

Most philosophers take events to be abstract particulars: particulars in that they are nonrepeatable and spatially locatable, abstract in that more than one event can occur simultaneously in the same place. Some philosophers who think this way (e.g., Lawrence Brian Lombard) take events to be the changes that objects undergo when they alter. (Others, such as Bennett, have doubts about this; others, such as Kim and David Lewis, deny it outright.) Thus, the time at which an event occurs is the (shortest) time at which the subject of that event changes from the having of one to the having of another, contrary property. Since no object can have both a property and one of its contraries simultaneously, there can be no instantaneous events.

Events inherit their spatial locations from the spatial locations, if any, of the things in which those events are changes. Events do not get their spatial locations by occupying them; if they did, then distinct events, like distinct physical objects, could not occur in the same place simultaneously. But more than one event apparently can occur at the same time and place. However, some philosophers (e.g., W. V. O. Quine) hold that events are concrete and that events and physical objects do not belong to distinct metaphysical kinds.

Though it seems clear that some events are composed of others, it is not clear what the principles are that determine when events compose more complex events. Some views of events (perhaps A. N. Whitehead's) seem compatible with there being subjectless events, events that are not changes in anything whatsoever. However, subjectless events could not be changes, for it seems

absurd to suppose that there could be a change that was not a change in or of anything.

Theories about the nature of entities belonging to some metaphysically interesting kind must address the issue of what properties such entities essentially have. In the case of events, the issue is made pressing by the fact that certain theories concerning causation (e.g., Lewis's) require that judgments be made about whether certain events would occur under certain, counterfactual circumstances.

In the literature on events, attention has been given to four essentialist issues. The first is whether the causes (or effects) of events are essential to the events that have them; Peter van Inwagen has suggested that an event's causes are essential to the events that have them, while Lombard has argued that neither the causes nor the effects of events are essential to them. The second concerns the subjects of events; Bennett and Lewis suggest that the subjects of events are not essential, while Lombard and Kim argue that they are. The third is whether an event's time of occurrence is essential to it. Lombard has argued in favor of this essentialist claim, while Bennett and Lewis have argued against it. And the fourth is whether it is essential that each event be a change with respect to the properties to which it is in fact a change. Though the first three issues have received some attention, the fourth has attracted the most, due to the prominence given to debates between the defenders and opponents of Kim's and Davidson's views on the identity of events.

Theories about events typically contain, as a chief component, a "criterion of identity," a principle giving necessary and sufficient conditions for an event *e* and an event *e'* to be identical. Though there is no general agreement on this, such a principle is sought because, when it satisfies certain constraints, it becomes a vehicle for articulating a view about what it is to be an event and how events are related to objects belonging to other kinds.

Quine holds that events are the temporal parts of physical objects and thus that events and physical objects share the same condition of identity: sameness of spatiotemporal location. Kim's interest in events centers in part on the idea that they are the objects of empirical explanations. Since what is typically explained is an object's having a property at a certain time, Kim takes an event to be the exemplification of a property (or relation) by an object (or objects) at a time. This idea, combined with some others, led him to hold that an event *e* is the same as an event *e'* if and only if *e* and *e'* are the exemplifications of the same property by the same object(s) at the

same time. Kim's view has been criticized, principally by Lombard and Bennett, on the grounds that what it says about events is more plausibly seen as truths about facts. Kim's view has also been criticized by those whose intuitions concerning the identity of events more closely match Davidson's.

Davidson once proposed that events, being essentially the links in causal chains, are identical just in case they have the same causes and effects. He has since abandoned this position in favor of Quine's.

Another view that places causation at the heart of the idea of an event is due to Lewis, who has tried to construct a theory in which events have just those features that would allow them to fit neatly into his counterfactual analysis of causation. In some respects, Lewis's view is like Myles Brand's in that both are moved in part by the idea that more than one event can occur simultaneously in the same place. Lewis takes an event to be a property-intension of a spatiotemporal region, so that events that in fact occur simultaneously in the same place but could have had different spatiotemporal locations are distinct.

Bennett thinks that the concept of an event is not precise enough to withstand much critical examination on its own and that events should be thought to be (only) whatever they need to be in order to make constructive use of them in the discussion of other philosophical issues. Like Lewis, Bennett takes an event to be a property; but, for Bennett, the property seems to be a property-in-extension and is a particular. That is, Bennett thinks that events are tropes.

Lombard's view is, like Kim's, a variation on a property exemplification account. Lombard's version is derived from the idea of events as the changes that objects undergo when they alter, and it takes events to be the exemplifications of "dynamic" properties at intervals of time. Such alterations are the "movements" by objects from the having of one to the having of another property through densely populated quality spaces, where each quality space is a class of contrary properties, the mere having of any member of which by an object does not imply change.

## EVIDENTIALISM

"Evidentialism" is the view about epistemic justification that identifies the extent to which a person is justified in believing a proposition with the extent to which the evidence the person has supports the truth of the proposition. Other doxastic attitudes such as withholding judgment and denying are also justified by the character of the person's evidence.

A full-scale evidentialist theory would explain what constitutes evidence, what it means to have a certain body of evidence, and what it means for a body of evidence to support a proposition to any given extent. Ordinarily,

people count as evidence external things such as fingerprints and bank records. However, according to evidentialists, our fundamental evidence is constituted by our perceptual experiences, our apparent memories, and other mental states. A full-scale theory requires an account of what we have as this ultimate sort of evidence: It is unclear, for example, whether someone's unactivated memories are part of the person's current evidence. The evidential support relation to which evidentialists appeal is not a familiar logical relation. Perceptual states can support beliefs about the external world, yet there is no familiar logical relation between those states and the beliefs they support. Furthermore, one's evidence on its own does not support its distant and unnoticed logical consequences. A complete evidentialist theory would clarify the justifying connection between a body of evidence and a proposition.

Leading skeptical controversies are usefully understood to concern what sort of evidence is required for knowledge. For example, if knowledge requires complete epistemic justification, and this requires having entailing evidence, then skeptics can cogently argue that we have no such evidence for any empirical proposition and that therefore we have no empirical knowledge. On the other hand, standard skeptical arguments fail if nonentailing evidence can completely justify belief. An evidentialist theory can resolve this dispute either way.

Diverse theories of justification can be understood as evidentialist views that differ on the nature of evidence, its possession, and how it supports belief. For instance, a typical coherentist theory in effect holds that a person has her beliefs as evidence and that support by evidence consists in coherence with it. A typical foundationalist theory in effect holds that justified beliefs must include some that are defended by a foundational sort of evidence—for example, by perceptual states—and that this evidence is had by the person by being consciously accessible.

Evidentialism entirely discounts factors that figure centrally in some theories of justified belief. These factors include the intellectual pedigree of the belief, the believer's capacity or intention to fulfill intellectual duties or to exemplify cognitive virtues, and the normal functioning of the operative belief-forming mechanism. Justifying evidence for a belief might happen to arise in an irresponsibly haphazard inquiry with no attempt to fulfill any epistemic duty, as a fluke result of some abnormal cognitive activity lacking in intellectual virtue. The evidentialist view is that regardless of all this, belief is justified because the evidence possessed supports the proposition.

## EVIL

For most twentieth-century philosophers, intent on dividing philosophy into discrete subdivisions, the problem of evil was a matter for philosophical theology, or—more rarely—for ethics and moral psychology. The theological question is as easy to state as it is hard to answer: How is a world full of evil and suffering compatible with the existence of an omnipotent, benevolent creator? The ethical question is altogether different: How can rational beings commit evil acts? The first question has preoccupied theists since *The Book of Job*; the difficulty of finding a satisfactory answer has served many as a reason for rejecting theism. The second question has been answered in some religious traditions by the appeal to original sin, but in recent years more it has often been viewed as outside the focus of traditional philosophy. The history of modern philosophy reveals that the problems are related, and part of a larger set of questions that precedes both: Can we make sense of the lives we are given? Does human reason have the ability to find or make the world intelligible? These are not questions that are driven primarily by theological or ethical concerns, but that drive those concerns, and arguably philosophy itself.

Aristotle claimed that philosophy begins in wonder; for Schopenhauer the main subject of this wonder is the world's evil and wickedness. Even if misery were visited only on the wicked or completely outweighed by good-

ness, alone might well question why it should exist at all. Idle curiosity alone might inspire such questioning about why things are as they are in general; but that questioning is likely to become urgent when things go wrong. If the principle of sufficient reason is the claim that nothing happens without a reason, then there are two choices: to seek an explanation for the evils in the world or to abandon the principle of sufficient reason itself.

Orthodox thinkers have often taken the latter route, maintaining that belief is not only a matter of faith but of absurd faith. Pierre Bayle (1647–1706), the French philosopher known as “the arsenal of the Enlightenment,” took this view to its logical conclusion. He thought that Manicheism, the belief that the universe is controlled by equally powerful good and evil forces, is the scientific explanation that best conforms to the data. Insofar as faith prescribes monotheism, however, Manicheism is precluded—along with any attempt at scientific explanation altogether. After all, Bayle concludes, the new Cartesian philosophy teaches that properties like color are only secondary to mathematical properties, which we do not perceive but infer. With this great a gap between experience and scientific explanation, why take the latter seriously at all?

Bayle's “theory of the incomprehensibility of all things” was the target of Leibniz's *Theodicy* (published 1710). Concerned to reconcile faith and science by proving that both were based on the principle of sufficient reason, Leibniz argued that anguish over God's seeming tolerance for evil resulted from ignorance of His ways. Ptolemaic astronomy did not challenge the work of the divine creator but rather that of the early cosmologists. Similarly, Leibniz promises, later scientific discoveries will reveal our discontent with the world to be a function of our ignorance. God has reasons we do not yet understand, but if our knowledge were as infinite as the creator's, we too could recognize this world as the best possible one.

Voltaire's *Candide* ridiculed such arguments, and Hume's *Dialogues concerning Natural Religion* demolished them. The later Kant found Leibnizian attempts to verge on blasphemy and thought the appeal to God's unknown reasons to be a mockery of suffering that required “no refutation but the abomination of anyone with the least feeling for morality” (1968). What unites their rejection of Leibniz's theodicy is the rejection of a metaphysical tradition extending back to Plato. For this rationalist metaphysics, the appearances we see appear to reflect evil and corruption; the reality behind them is truer and better than what we experience. Against this

view, the more empirical outlook of Voltaire, Hume, and Kant can be seen as a moral imperative, for it implies keeping faith with the world's victims by acknowledging the reality of their suffering. But can that reality be acknowledged without entirely capitulating to it? Is it possible to maintain that evil is not essential to the world but rather an unhappy accident?

Jean-Jacques Rousseau (1712–1778) adopted just such an approach, and Kant found his solution so extraordinary that he called him “the Newton of the mind” (1942). Rousseau substituted the idea of history for the idea of original sin that had seeped into the most sober discussions of evil. Humankind was created morally neutral; a series of accidents based on minor instances of vanity and greed cascaded into the moral deterioration known as civilized society. At any particular point, we might have stopped the process, which has now gone so far that only the most radical measures hold promise of salvation. *The Discourse on Inequality* is Rousseau's diagnosis of evil, and his own replacement for the myth of the Fall; *Emile* is his recipe for a cure and the hope of salvation. The mixture of self-help manual and sacred text, science and literature is crucial: Rousseau argues that the problem of evil was so deep that it could only be approached on all fronts. Different forms of pedagogy, arts, political organization, religion, and metaphysics are all required to respond to it. Small wonder that Rousseau's plans for simultaneously reshaping individual human beings and their societies spurred the French Revolution.

The worry fueling debates about the difference between appearance and reality was not the fear that the world might be different than it seems, but rather the fear it might *not*. By acknowledging the reality of evil while maintaining that reality could be changed, Rousseau dislodged the problem of evil from the theological context in which it had been embedded.

That context is exemplified in Christian Wolff's work, which still divides evils into metaphysical, natural, and moral evils. The first evil was the imperfection in the substance(s) of which the world is made; the second was the suffering we experience through earthquakes, floods, plagues, and the like; the third was the cruelty and injustice we visit upon each other. After the mid-eighteenth century the two former evils were viewed as natural limits and natural catastrophes, devoid of significance. The only remaining evil is the moral evil committed by intentionally acting human beings. This absolves God of responsibility for evil while turning our attention to questions of ethics, psychology, history, education, and

economics. With these issues in the forefront, nineteenth-century philosophy carried on the discussion of evil. While theistic discourse receded ever farther to the margins, modern thinkers remained preoccupied with the meaning of life and the intelligibility of a world full of evil. This was true not only for philosophers sometimes considered peripheral to the canon (for example, Rousseau, Voltaire, and Schopenhauer) but also for those central to it (for example, Spinoza, Leibniz, Hume, Kant, and Hegel). Nor is it a matter of national heritage: the sober Briton John Stuart Mill could write about the problem in terms almost as vehement as Nietzsche's.

The problem of evil was no longer central in twentieth-century philosophy, but it persisted in different forms, retaining the bond between ethics and metaphysics. No one would take up Hegel's project of “theodicy, a justification of the ways of God (such as Leibniz attempted in his own metaphysical manner, but using categories which were as yet abstract and indeterminate)” (1975, p. 43). In the wake of Auschwitz, every form of theodicy was viewed with suspicion. But thanks to the work of two very different twentieth-century philosophers, the problem of evil remained a major concern of philosophy. Hannah Arendt's *Eichmann in Jerusalem: A Report on the Banality of Evil* was criticized for deflating the gravity of Eichmann's crimes by calling them banal. In fact she sought to justify a world in which criminals like Eichmann are possible, by showing they are not the result of deep or demonic impulses but of mindless and not entirely intentional behavior. With this work Arendt takes up a project going back to Rousseau: Explaining the existence of evil allows us to show that it does not belong to the essence of the world, and that it may be at least partially eradicable. In thereby reducing the role of intention in moral evil, Arendt challenged a conception of evil that had dominated modern thought.

The other twentieth-century philosopher in question, John Rawls, is known for his insistence that political philosophy is independent of metaphysics, but in later works and conversations he made clear that the problem of evil was a major concern behind his work. The author of the first major English book of substantive ethics since Mill, Rawls wrote in response to two metaphysical and moral problems that ground the problem of evil: the problem of contingency and the problem of reconciliation. In *Justice as Fairness* he invokes Hegel to stress political philosophy's role in providing reconciliation. Rawls's goal is to show that a realistic utopia, in which greatest evils are eliminated, is possible; without that hope “one might reasonably ask, with Kant, whether it is worthwhile

to live on earth” (1999, p. 128). Such passages encourage renewed attention to his main work, *A Theory of Justice*, the two principles of which show that human beings need not resign themselves to fate but can meet “the arbitrariness of fortune” with measures of their own (p. 102). If the problem of evil is evident in the work of two such different contemporary philosophers, it is likely to occupy major philosophers, whether theist or not, for the foreseeable future.

## EVIL, THE PROBLEM OF

The problem of evil concerns the contradiction, or apparent contradiction, between the reality of evil on the one hand, and religious beliefs in the goodness and power of God or of the Ultimate on the other. In a very general classification, the religions of the world have offered three main types of solution: (1) There is the monism of the Vedanta teachings of Hinduism, according to which the phenomenal world, with all its evils, is *maya*, or illusion. A confused echo of this doctrine is heard in contemporary Western Christian Science, which affirms that “evil is but an illusion, and it has no real basis. Evil is a false belief” (Mary Baker Eddy, *Science and Health*, auth. ed., Boston, 1934, p. 480:23,24). Considered as a response to the problem of evil as stated above, this view is defective in that it redescribes the problem but does not attempt to solve it, for it leaves unexplained the evil of our suffering from the compulsive illusion of evil. (2) There is the dualism exemplified most dramatically in ancient Zoroastrianism, with its opposed good and evil deities, Ahura Mazda and Angra Mainyu. A much less extreme dualism was propounded by Plato (*Timaeus* 30A and 48A) and is found in various forms in the finite deity doctrines of such modern Western philosophers as J. S. Mill (expounded in “Attributes,” *Three Essays in Religion*, London, 1874) and Edgar Brightman (*A Philosophy of Religion*, New York, 1940, Chs. 8–10). (3) There is the distinctive combination of monism and dualism, or of an ethical dualism set within an ultimate metaphysical monism (in the form of monotheism) that has been developed within Christianity and that represents the main contribution of Western thought to the subject.

Since the terms of the problem of evil vary with the character of the religious beliefs which give rise to it, a separate study is required for each of the great religious systems. In the present article, however, the problem will be treated only in the context of the Christian tradition.

Christianity (like Judaism and Islam) is committed to a monotheistic doctrine of God as absolute in goodness and power and as the creator of the universe ex nihilo. The challenge of the fact of evil to this faith has accordingly been formulated as a dilemma: If God is all-powerful, he must be able to prevent evil. If he is all-good,

he must want to prevent evil. But evil exists. Therefore, God is either not all-powerful or not all-good. A theodicy (from *theos*, god, and *dikē*, justice) is accordingly an attempt to reconcile the unlimited goodness of an all-powerful God with the reality of evil.

The kinds of evil distinguished in the literature of theodicy are (1) the evil originated by human beings (and angels), that is, moral evil or sin; (2) the physical sensation of pain and the mental anguish of suffering, which may be caused either by sin or by (3) natural evil, that is, disease, tornado, earthquake, and so forth; and (4) the finitude, contingency, and hence imperfection of all created things which some have called metaphysical evil. The last two topics will be treated in the course of discussing the others in response to the questions: “Why has an infinitely powerful and good God permitted moral evil in his universe?” and “Why has an infinitely powerful and good God permitted pain and suffering in his universe?”

## THE PROBLEM OF MORAL EVIL

**THE TRADITIONAL AUGUSTINIAN THEODICY.** The problem of evil was a lifelong preoccupation of Augustine (354–430), and the main lines of thought that he established have been followed by the majority of subsequent Christian thinkers. Before his conversion to Christianity, Augustine was attracted by Manichaeism, a powerful contemporary religious movement with Eastern and Gnostic roots, which affirmed an ultimate dualism of good and evil in the forms of light, or spirit, and darkness, or matter. In turning from this doctrine to Christianity, Augustine rejected a final dualism in favor of belief in a good God as the sole ultimate reality, and rejected the Manichaean disparagement of matter in favor of an acceptance of the material world as reflecting the goodness of its creator.

But if the sole ultimate power is unambiguously good, what is evil and whence does it come? In answer to this question, Augustine develops two interlocking lines of thought, presenting the *privative* and the *aesthetic* conceptions of evil.

**Evil as privation.** Augustine counters the Manichaean conception of evil as an independent reality and power coeternal with good by his analysis of evil (derived from Plotinus, *Enneads*, I, Eighth Tractate) as the privation, corruption, or perversion of something good. Evil, he taught, has no independent existence, but is always parasitic upon good, which alone has substantial being. “Nothing evil exists in itself, but only as an evil aspect of some actual entity” (*Enchiridion*, Ch. 4). Thus, everything

that God has created is good, and the phenomenon of evil occurs only when beings which are intrinsically good (though mutable) become corrupted and spoiled.

Augustine expresses the same thought from another perspective when he equates being with goodness. God, as the highest, richest, and most intensely real being, is the supreme good, and everything that he has brought into existence is ipso facto good. For this reason the corruption that we call evil can never be complete; for if a thing becomes so vitiated in nature that it ceases to exist, the evil which is parasitic upon it must also cease to exist. Hence, there can be no wholly evil being.

How does this spoiling of God’s initially good creation come about? Augustine’s answer is that evil has entered into the universe through the culpable volitions of free creatures, angels and humans. Their sin consisted, not in choosing positive evil (for there is no positive evil to choose), but in turning away from the higher good, namely God, to a lower good. “For when the will abandons what is above itself, and turns to what is lower, it becomes evil—not because that is evil to which it turns, but because the turning itself is wicked” (*City of God*, XII, 6). Augustine holds that natural evils, such as disease, are divinely ordained consequences of the primeval fall of man, and thus traces all evils either directly or indirectly to a wicked misuse of creaturely freedom: “There are two kinds of evil, sin and the penalty for sin” (*Against Fortunatus*, 15).

When we ask what caused man to fall, Augustine’s answer is his doctrine of deficient causation. There is no efficient, or positive, cause of evil willing. Rather, evil willing is itself a negation or deficiency, and to seek for its cause “is as if one sought to see darkness, or hear silence” (*City of God*, XII, 7). Perhaps the best way to interpret this obscure teaching is as an assertion of the inexplicability, in principle, of free volitions; for “what cause of willing can there be which is prior to willing?” (*Free Will*, III, xvii, 49). Augustine is saying that the origin of moral evil lies hidden within the mystery of human and angelic freedom. The freely acting will is an originating cause, and its operations are not explicable in terms of other prior causes.

**Aesthetic conception of evil.** The other main theme in Augustine is the aesthetic conception of evil, which is also derived from Plotinus (*Enneads*, III, 2, 17). According to this view, what appears to be evil, when seen in isolation or in a too limited context, is a necessary element in a universe that, viewed as a totality, is wholly good. From the viewpoint of God, who sees timelessly and as a whole the entire moving panorama of created history, the uni-

verse is good: “To thee there is no such thing as evil, and even in thy whole creation, taken as a whole, there is not” (*Confessions*, VII, 13).

The presupposition of this aesthetic view is the ancient conception, deriving from Plato (*Timaeus*, 41 B–C), which Arthur Lovejoy has called the principle of plenitude (*The Great Chain of Being*, Cambridge, MA, 1936). According to this principle, a universe in which all the varied potentialities of being are realized and which contains as many different kinds of entity as are possible (lower as well as higher, lesser as well as greater), is a better universe—one which more adequately expresses the infinite creativity of God—than would a universe which contains only the highest type of created beings. There is thus an immense hierarchy of forms of created existence, and each creature, in its own proper place in the scheme of nature, is good and glorifies its Maker. Those that are lower in the scale of being are not on that account evil; they are just different goods, contributing in their different ways to the perfection of the universe. Again, things that are transitory by nature, appearing and then perishing within the ever-changing pattern of nature’s beauty, contribute, even by their death, to the perfection of the created order. As a very minor subtheme within this aesthetic conception, Augustine sometimes also uses the notion of evil as providing a contrast by which good shines the more brightly.

As an application of the principle of plenitude, Augustine holds that the universe must contain mutable and corruptible creatures, compounded of being and nonbeing. It is better that the universe should include free beings who may, and do, fall than that it should omit them. Thus, Augustine brings even moral evil within the scope of his aesthetic conception. In doing so, he employs the further principle (later invoked by Anselm, in his atonement theory) that as long as sin is exactly balanced by just punishment, it does not upset the moral harmony of the universe. “Since there is happiness for those who do not sin, the universe is perfect; and it is no less perfect because there is misery for sinners. . . . So, whatever a soul may choose, ever beautiful and well-ordered in all its parts is the universe whose Maker and Governor is God” (*Free Will*, III, 9, 26–27).

**Influence of the Augustinian analyses.** Both of these main Augustinian themes reappear in the thought of Thomas Aquinas in the thirteenth century (*Summa Theologiae*, I, 47–49).

Martin Luther and John Calvin, the Reformers of the sixteenth century, were not interested in developing a general theodicy, although they followed Augustine in his

doctrine that all the evils of human life flow ultimately from the culpable fall of man.

Gottfried Wilhelm Leibniz, in his *Théodicée* (1710), employed the two Augustinian themes, the privative and aesthetic conceptions, in the course of his argument that this is the best of all possible worlds (or, more strictly, the best of all possible universes, for he uses “world” in its most comprehensive sense)—a notion pointedly satirized in Voltaire’s *Candide* (1759). It is the best, not because it contains no evil, but because any other possible universe would contain more evil. The eternal possibilities of existence are individually present to the Divine Mind which, like an infallible calculating machine, surveys all possible combinations and selects the best, to which it then gives existence.

**SUMMARY AND CRITICISM OF THE AUGUSTINIAN THEODICY.** The traditional Augustinian theodicy in respect to moral evil asserts that God created man with no sin in him and set him in a world devoid of evil. But man willfully misused his God-given freedom and fell into sin. Some men will be redeemed by God’s grace, and others will be condemned to eternal punishment. In all this, God’s goodness and justice alike are manifested.

This traditional theodicy has been criticized for its accounts of the origin and of the final disposition of moral evil.

**The origin of moral evil.** It is urged that the notion of finitely perfect beings willfully falling into sin is self-contradictory and unintelligible (cf. Friedrich Schleiermacher, *Der christliche Glaube*, 2nd ed., Berlin, 1830–1831, par. 72). A truly perfect being, though free to sin, would in fact never do so. To attribute the origin of evil to the willful crime of a perfect being is thus to assert the sheer contradiction that evil has created itself *ex nihilo*.

There appears, further, to be a disharmony between this theodicy and Augustine’s doctrine of predestination, which in effect sets the origin of moral evil within the purpose and responsibility of God. Augustine’s doctrine (*City of God*, XI, 11 and 13, and XII, 9) refers to the fall of the angels. Calvin (*Institutes*, III, 23, 7 and 8,) has a parallel doctrine referring to the fall of man.

The assumption of the traditional theodicy that it is logically impossible for God to have created humans such that they would always freely make right moral choices has recently been attacked under the name of “the free will defense.” Defining a free action as one that flows from the nature of the agent, without external compulsion, recent writers have claimed that, without logical contra-

diction, God might initially have given men a nature that would always freely express itself in right actions. (See J. L. Mackie, "God and Omnipotence," *Mind* [April 1955], and Antony Flew, "Divine Omnipotence and Human Freedom," *New Essays in Philosophical Theology*, 1955. For an important critical comment on these two articles, see Ninian Smart, "Omnipotence, Evil and Supermen," *Philosophy* [April 1961], and replies in the same journal by Flew [January 1962], and Mackie [April 1962].) Three of the questions involved in this debate are: (1) In denying that we do what we do because we are what we are, and that therefore we might have been made so that we would always freely act rightly, can we avoid equating free behavior with merely random behavior? (2) Is there any important difference between a good will that has been created ready-made as such, and one which has become steadfastly good as the outcome of a history of moral endeavor and struggle? (3) If God's primary purpose for humans is to evoke in them a free and uncompelled love and trust in relation to himself, would this purpose be frustrated by his creating people so that they cannot do other than make this response?

*The final disposition of moral evil.* The criticism of the eschatological aspect of the traditional Augustinian (and also, on this point, the Calvinist) theodicy has been expressed as a dilemma. If God desires to save all his human creatures, but is unable to do so, he is limited in power. If, on the other hand, he does not desire the salvation of all, but has created some for damnation, he is limited in goodness. In either case, the doctrine of eternal damnation stands as an obstacle in the way of Christian theodicy.

THE IRENAEAN TYPE OF THEODICY. Prior to Augustine and the development of his theology by the Latin fathers of the Christian church, a significantly different conception of the fall of man was prevalent among many of the Greek-speaking fathers, chief among them Irenaeus (c. 120–202). Whereas Augustine held that before his fall, Adam was in a state of original righteousness, and that his first sin was the inexplicable turning of a wholly good being toward evil, Irenaeus and others regarded the pre-Fall Adam as more like a child than a mature, responsible adult. According to this earlier conception, Adam stood at the beginning of a long process of development. He had been created as a personal being in the "image" of God, but had yet to be brought into the finite "likeness" of God. His fall is seen, not as disastrously transforming and totally ruining man's situation, but rather as delaying and complicating his advance from the "image" to the "likeness" of his Maker. Thus, man is viewed as neither

having fallen from so great a height of original righteousness, nor to so profound a depth of total depravity, as in the Augustinian and Calvinist theologies; rather, he fell in the early stages of his spiritual development and now needs greater help than he otherwise would have required. (The contrast between the Latin and Greek doctrines of the Fall is most fully presented in N. P. Williams, *The Ideas of the Fall and of Original Sin*. London, 1927.)

In much of the British theology from the mid-nineteenth to the mid-twentieth century, which has been influenced by Friedrich Schleiermacher's discussion of evil, this earlier, less dramatic conception of the Fall has been carried further. The Fall is regarded as a virtually inevitable incident in man's development as a child of God. If man is to enter into a genuinely personal relationship with his Maker, he must first experience some degree of freedom and autonomy. For only a relatively independent being can enter into a relationship of love and trust with his Creator, and man's fall is seen as a fall into this independence. It is thus analogous to the phase of disobedience which signals a young child's assertion of his own individuality in relation to his parents.

This line of thought may be carried further on the basis of the awareness in much modern theology that the "Fall" does not refer to a historical or prehistorical, but rather a mythological event. That is to say, man has never actually existed in a state of pre-Fall perfection. The Fall story is an analysis of man's present condition of estrangement from God, but not an account of how he came to be in this condition. Using our knowledge of the early state of humankind, we may say that man, as he emerged from the lower forms of life, was endowed with only dim and rudimentary conceptions of his Maker. He existed at an epistemic distance from God, which allowed him to respond to modes of divine revelation that do not coerce the human mind but which preserve man's relative autonomy. Man's existence at this epistemic distance from God constitutes his fallen estate, and from this flows the moral and spiritual cleavage and estrangement which is traditionally called "original sin." In this type of theodicy, God bears the *ultimate* responsibility for (in other words, is the necessary and knowing cause of) man's existence as a fallen creature, although, on his own level, man remains individually responsible for his personal choices and actions. Further, though the significance of this cannot be pursued here, the God who has thus created man as imperfect but perfectible has also entered into human life, in Christ, to bring about man's redemption.

## THE PROBLEM OF PAIN AND SUFFERING

**HUMAN PAIN AND SUFFERING.** Some instances of suffering—for example, those caused by war, injustice, and the many forms of “man’s inhumanity to man”—are traceable to human wrongdoing, and thus fall within the problem of moral evil. But other sources of pain, such as disease, earthquake, flood, drought, and storm, are built into the structure of the world itself. Surely, it is urged, they make it incredible that the world should have been designed by a Creator who is both perfectly good and infinitely powerful. The theist’s reply is that this reasoning presupposes that God’s purpose in making the world must have been to produce a hedonic paradise for man to inhabit. (This is the assumption, for example, of David Hume in his *Dialogues concerning Natural Religion*, XI.) It is assumed by the critic of Christian theodicy that the Creator’s problem was analogous to that of a human being who is making a cage for a pet animal. He will naturally make it as safe and agreeable as he can, and any remaining sources of danger or discomfort are evidences of either his want of care or want of means. But the Christian conception of the divine purpose in creation differs from the one which is presumed in such a criticism. According to the Augustinian and Calvinist theologies, nature was created free from defect, and its present perils and hardships are punishments which man has brought upon himself. According to the Irenaean type of Christian theodicy, the purpose of the world is to be a place of “soul-making,” an environment in which the higher potentialities of human personality may develop. To this end, it is claimed, nature is an autonomous system operating by its own laws, which men must learn to obey.

If God had created a world in which natural law were continuously adjusted for the avoidance of all pain, the more heroic human virtues would never be evoked. Indeed, a great part of our present moral language would be meaningless. There would be no such thing as “doing harm,” for no one would be able to suffer any kind of injury; there would be no such thing as “doing good,” for there would be no needs, deficiencies or occasions for improvement; there would be no such thing as a crime or a benefaction, an act of generosity or of meanness, of kindness or unkindness; and there would be no situations to which such qualities as courage, fortitude, loyalty, honesty, and the caring and protective aspects of love would be appropriate responses. There would thus be no occasions for moral choice. Such a world would be ill-designed to evoke many of the human traits which we value most highly. Indeed, it would seem that the “rough

edges” of the world—its challenges, dangers, tasks, difficulties, and possibilities of real failure and loss—constitute a necessary element in an environment which is to call forth humanity’s finer qualities.

But might not men have been created by God already possessed of these virtues? This is one of the points of contemporary debate. On the one side it is argued that, in principle, there are no limitations to an omnipotent God’s capacity to create beings endowed with specific personal characteristics. On the other side it is argued that a virtue which has been formed as a result of making real decisions in real situations of moral choice is of greater value than the analogous virtue created by divine fiat, and that it is reasonable to suppose that the Creator is not content to build into men the merely ready-made and unearned qualities.

However, the discernible connection between the more heroic human virtues and the kind of world in which we live remains a very general one. It does not by any means amount to a one-to-one correspondence between each item of evil in human experience and some moral gain accruing to those who undergo it. Further, it appears that evil has crushed the human spirit as often as it has developed it, and that men have collapsed before life’s challenges and opportunities as often as they have risen triumphantly to meet them. Accordingly, this type of theodicy demands completion in an eschatology. It points toward the eternal happiness of human beings in society with one another and in communion with God, which is symbolized by the “Kingdom of Heaven”; and its fuller claim is that the final fulfillment of God’s purpose for his creatures in his heavenly kingdom constitutes a good so great and enduring that it justifies all the pains which have been experienced in order to reach it. (At this point, again, theodicy excludes the notion of eternal torment, for such torment could never serve any good end beyond itself, and would thus constitute precisely the kind of unredeemed evil which would make a theodicy impossible.)

A fundamental objection that is raised against this appeal to eschatology is that there is a contradiction between justifying a first-order evil, such as danger, as being required for the second-order good of courage, and then justifying the process by which courage is produced out of evil by reference to a future heavenly state in which, presumably, there will no longer be any dangers, and hence no need to have developed the virtue of courage in the first place. More generally, if heaven is free from “rough edges,” how will virtues, so dearly bought in this world, survive within it?

Possibly the difficulty might be met in terms of heavenly analogues of earthly virtues, created by the development of the latter but no longer requiring the situations which evoked them; or in terms of the transmutation of a particular virtue (courage, for example) into an aspect of faith in God. However, Christian theology has not developed any definitive answer to this question.

**ANIMAL PAIN.** Thus far this article has been concerned with evil as it directly affects humankind in the forms of sin, pain, and suffering. There is also, however, the baffling problem of animal pain beneath the human level. Throughout the animal kingdom, one species devours another, and painful accidents and lingering diseases disable and then kill. How is this spectacle of “nature, red in tooth and claw” to be reconciled with the religious belief in an omnipotent and perfect Creator?

Certain solutions of the problem have been proposed. It is claimed that the lower animals live wholly in the present moment and lack the high-level capacities of memory, anticipation, and conscience that give rise to the human experience of suffering as distinct from the experience of physical pain; that the pain mechanism is a necessary warning device in bodily organisms that move about within a material environment; and that an animal’s life, even though violently terminated, is predominantly active and pleasurable.

Solutions of a more speculative nature have been sought in two main directions. From the viewpoint of the Augustinian type of theodicy, it has been suggested that the premundane fall of Satan has had cosmic consequences, perverting the entire evolutionary process to a savage struggle for existence (see for example, C. S. Lewis, *The Problem of Pain*, pp. 122–124). The criticisms that have been made of the Augustinian account of the origin of evil apply also to this extension of it.

From another point of view, which adopts a theme of Eastern thought, it has been suggested that there may be a continuous reincarnation of souls through the levels of animal existence up to self-consciousness in human life. Thus, the pain of the animals is not wasted, but is part of a long constructive process (see Nels Ferré, *Evil and the Christian Faith*, pp. 62–65). The aspect of this suggestion that is most readily open to criticism is its entirely speculative and unverifiable character.

## Bibliography

### STATEMENTS AND HISTORIES

The problem of evil is forcibly stated in J. S. Mill, “Nature,” *Three Essays on Religion* (London: Longmans, 1874) and David Hume, *Dialogues concerning Natural Religion*, edited by Norman Kemp Smith, 2nd ed., X and XI (London, 1947). For historical treatments of the attempts to meet the problem, see Julius Müller, *Die Christliche Lehre von der Sünde*, 3rd ed., 2 vols. (Breslau: Josef Max, 1849), translated by William Urwick as *The Christian Doctrine of Sin* (Edinburgh: T. & T. Clark, 1868); F. Billicsich, *Das Problem des Übels in der Philosophie des Abendlandes*, 3 vols. (Vienna, 1952–1959); Charles Werner, *Le problème du mal dans la pensée humaine* (Paris, 1944); R. A. Tsanoff, *The Nature of Evil* (New York, 1931); A. G. Sertillanges, *Le problème du mal*, Vol. I (Paris, 1948); and N. P. Williams, *The Ideas of the Fall and of Original Sin* (London: Longmans, 1927).

### PLOTINUS AND AUGUSTINE

Plotinus deals with the problem in the *Enneads*, First Ennead, Eighth Tractate, and Third Ennead, Second Tractate, which appear in *The Enneads*, translated from Greek by Stephen Mackenna (London, 1917–1921). See also B. A. G. Fuller, *The Problem of Evil in Plotinus* (Cambridge, U.K.: Cambridge University Press, 1912). Augustine’s main discussions of evil are in *De Libero Arbitrio*, *De Vera Religione*, and *De Natura Boni*, among his anti-Manichaean works, translated by J. H. S. Burleigh in *Augustine: Earlier Writings* (London and Philadelphia, 1943); and in his *Confessions*, Bk. VII, Chs. 3–5 and 12–16, and *Enchiridion*, Chs. 3–5 in *Confessions and Enchiridion*, translated and edited by A. C. Autler (London and Philadelphia: Westminster, 1955); and *De Civitate Dei*, Bk. XI, Chs. 16–18 and Bk. XII, Chs. 1–9, translated and edited by Marcus Dods (Edinburgh, 1871). See also M. L. Burton, *The Problem of Evil: A criticism of the Augustinian point of view* (Chicago and London: Open Court, 1909); Régis Jolivet, *Le problème du mal d’après saint Augustin* (Paris: G. Beauchesne, 1936).

### THOMAS AQUINAS

Thomas Aquinas deals with the problem of evil in his *Summa Theologiae*, First Part, Questions 47–49, and *De Malo* (second of the *Quaestiones Disputatae*); see A. C. Pegis, ed., *The Basic Writings of Saint Thomas Aquinas* (New York: Random House, 1945). See also Jacques Maritain, St. Thomas and the Problem of Evil (Milwaukee, WI: Marquette University Press, 1942).

### LEIBNIZ

Leibniz’s famous work is titled *Essais de théodicée sur la bonté de Dieu, la liberté de l’homme, et l’origine du mal* (Amsterdam, 1710), translated by E. M. Huggard as *Theodicy; Essays on the Goodness of God, the Freedom of Man, and the Origin of Evil* (London: Routledge & K. Paul, 1951). For a contemporary theological critique of Leibniz, see Karl Barth, *Die Kirchliche Dogmatik* (Munich: Kaiser, 1932), Vol. 3, Part 1, par. 42,3; translated into English as

*Church Dogmatics*, edited by T. F. Torrance and G. W. Bromiley (Edinburgh, 1959–1960).

#### HELLENISTIC THEODICY

For origins, see Irenaeus, *Adversus Haereses*, edited by W. W. Harvey, 2 vols. (Cambridge, U.K., 1857), Bk. IV, Chs. 37–38, also found in A. Roberts and J. Donaldson, eds., *The Writings of the Ante-Nicene Fathers* (Edinburgh, 1867; Grand Rapids, MI, 1885), Vol. I; and A. Harnack, ed., *Epideixis* (Leipzig, 1807), translated by J. P. Smith as *Proof of the Apostolic Preaching* (Westminster, MD: Newman, 1952).

#### JEWISH WRITINGS

Some major Jewish writings on the problem of evil are Maimonides, *Guide of the Perplexed*, translated by M. Friedländer, 3 vols. (London: Trubner, 1881–1885), Book III, and Martin Buber, *Bilder von Gut und Böse* (Cologne: J. Hegner, 1952), translated by Michael Bullock as *Images of Good and Evil* (London: Routledge & K. Paul, 1952).

#### NINETEENTH-CENTURY STUDIES

The Idealist treatment of the problem is found in Josiah Royce, *Studies of Good and Evil* (New York: D. Appleton, 1898). Arthur Schopenhauer's views are in his *Parerga und Paralipomena* (Berlin: A. W. Hahn, 1851), from which T. B. Saunders has assembled and translated passages under the title "On the Sufferings of the World," in *Studies in Pessimism* (London: Sonnenschein; New York: Macmillan, 1890).

#### TWENTIETH-CENTURY DISCUSSIONS

The following are some modern Augustinian discussions: A. G. Sertillanges, *Le problème du mal* (Paris: Aubier, 1951), Vol. 2; Paul Siwek, *The Philosophy of Evil* (New York: Ronald, 1951); François Petit, *Le problème du mal* (Paris, 1958), translated by C. Williams as *The Problem of Evil* (New York: Hawthorne, 1959); Charles Journet, *Le mal* (Paris, 1961), translated by Michael Barry as *The Meaning of Evil* (London: G. Chapman, 1963); Mark Pontifex, "The Question of Evil" in *Prospect for Metaphysics*, edited by Ian Ramsey (London and New York: Allen & Unwin, 1961); and among Protestant writers, C. S. Lewis, *The Problem of Pain* (London: Bles, 1940); Austin Farrer, *Love Almighty and Ills Unlimited* (New York: Doubleday, 1961).

The Irenaean type of theodicy finds classic expression in Friedrich Schleiermacher, *Der Christliche Glaube*, 1st ed. (Berlin: G. Reimer, 1821), Part I, 3, and Part II, translated and edited by H. R. Mackintosh and J. S. Stewart as *The Christian Faith* (Edinburgh: T. & T. Clark, 1928). More recent writers who tend in this direction include F. R. Tennant, *Philosophical Theology*, Vol. 2, Ch. VII (Cambridge, U.K.: Cambridge University Press, 1930); William Temple, *Nature, Man and God*, Ch. XIV (London: Macmillan, 1934); and Nels Ferré, *Evil and the Christian Faith* (New York: Harper & Row, 1947); J. S. Whale, *The Christian Answer to the Problem of Evil* (London, 1939). John Hick, *God and Evil* (London: Macmillan, 1966) traces the two types of theodicy, Augustinian and Irenaean, and presents an Irenaean theodicy for today.

Some philosophical discussions are: A. C. Ewing, *Fundamental Problems of Philosophy*, pp. 247–250 (London, 1951); J. E. MacTaggart, *Some Dogmas of Religion* (London: E. Arnold, 1906), Chs. 6 and 7; C. H. Whiteley, *An Introduction to*

*Metaphysics* (London: Methuen, 1950), Ch. 11. In addition to the articles referred to in the body of this article, see John Wisdom, "God and Evil," in *Mind* 44 (173) (1935): 1–20, and H. D. Aiken "God and Evil," in *Ethics* 68, (2) (1958): 77–97, (1949), reprinted in Aiken's *Reason and Conduct* (New York: Knopf, 1962).

More purely theological discussions occur in P. T. Forsyth, *The Justification of God* (London: Duckworth, 1916) and Karl Barth, *Die Kirchliche Dogmatik* (Munich: Kaiser, 1932), Vol. 3, Pt. 3, par. 50, translated as *Church Dogmatics*, edited by T. F. Torrance and G. W. Bromiley (Edinburgh: T. & T. Clark, 1959–1960). A book discussing Karl Barth's views on the problem of evil is Kurt Lüthi, *Gott und das Böse* (Zürich: Zwingli-Verlag, 1961).

See also C. G. Jung, *Antwort auf Hiob* (Zürich: Rascher, 1952), translated by R. F. C. Hull as *Answer to Job* (London: Kegan Paul, 1954). On the problem of animal pain, see the relevant chapters in the works cited by Ferré, Farrer, and Lewis.

*John Hick (1967)*

## EVIL, THE PROBLEM OF [ADDENDUM]

The problem of evil concerns whether the existence of an all-powerful, all-knowing, perfectly good creator is rendered unlikely (or less likely than it would otherwise be) given the horrendous evils that afflict the world. John Hick's soul-making theodicy is perhaps the best known of the attempts to provide a plausible account of the role that evils may play in the divine plan for human life. Two other important theodicies are due to Marilyn Adams and Richard Swinburne.

In "The Problem of Hell: A Problem of Evil for Christians" (1993), Marilyn Adams discusses the problem of evil from the perspective of Christian theism, acknowledging the distinctive values of Christian theism as well as its dark side, "the postmortem evil of hell, in which the omnipotent creator turns effectively and finally against a creature's good" (p. 302). As a Christian philosopher, her own view is that God's goodness to the creatures he creates is such that he will provide to each person a life that is a great good to that person on the whole. Accordingly, she rejects the traditional doctrine of an eternal hell in favor of universal salvation. In developing her view Adams carefully discusses the alternative view that some creatures so misuse their free will that God has no choice but to condemn them to an eternal life in hell, a place of constant torment whose inhabitants would be better off had they not been born.

Adams's view is that a careful look at how some people exist in the world—such as kids brought up in crack

houses, or the abused—makes it simply unrealistic to suppose that each person freely chooses an evil life or a good life. She insists on seeing God as the loving, forgiving father, rather than as the vengeful lord bent on punishing those who disobey his rules. To the objection that withdrawing the threat of eternal punishment leads to moral and religious laxity, she replies that her pastoral experience as an Anglican priest suggests otherwise: “the disproportionate threat of hell produces despair that masquerades as skepticism, rebellion, and unbelief. If your father threatens to kill you if you disobey him, you may cower in terrorized submission, but you may also (reasonably) run away from home” (Adams 1999, p. 325). Because it is abundantly clear that the majority of humankind fail in this life to grow into true children of God, Adams must suppose that there are postmortem lives in which the slow progression in growth continues until all become true children of God. She also must suppose that undergoing suffering is somehow an important step to fully entering into a life with a God.

In “Some Major Strands of Theodicy” (1996) Swinburne cites certain good states of affairs—for example, enjoyment and pleasure owing to the satisfaction of desires—that God may bring about; he cogently argues that sometimes these good states of affairs cannot be brought about without certain evils occurring or its being in the power of some created beings to produce those evils. For example, Swinburne notes that compassion is a good state that requires the existence of the bad state of suffering. Moreover, the unique goodness of compassion may justify God’s permission of some degree of suffering in the world. But may it reasonably be thought that the compassion of others for the victims of the Holocaust justifies a loving being’s permission of that human tragedy?

Swinburne is aware of this common objection to his theodicy. His critics may agree with him that certain good states require the existence of bad states. They may also agree with him that one should not neglect the intrinsic value of being of help to those who suffer, as well as the intrinsic value of experiencing being helped and comforted. What his critics reject is the idea that these goods require God to permit the extraordinary amount of horrendous suffering that is known to exist in the world. Swinburne’s response, “Yet it must be stressed that each evil or possible evil removed takes away one more actual good” (1996, p. 44), may strike many readers as doubtful. Surely, they may say, not every fawn’s death by fire serves the good of teaching other deer to avoid fires. And would many great goods have been lost if only four million—

rather than six million—perished in the Holocaust? The connections between evils and goods do not appear to be as fine-tuned as Swinburne takes them to be. In response, Swinburne suggests that the world his critics think God must bring about is a kind of “toy world” where every evil is clearly seen by everyone to directly result in some outweighing good.

## EVOLUTION

See *Darwinism*

## EVOLUTIONARY ETHICS

Evolutionary theory came of age with the publication of Charles Darwin’s *Origin of Species* (1859), in which he argued that all organisms, living and dead, including humans, are the end result of a long, slow, natural process of development from one or a few simple life forms. Believing this new world history to be the death knell of traditional ways of thinking, many were inspired to find evolutionary parallels in other fields, including ethics—in both evolution of appropriate guides for proper human conduct (substantive ethics) as well as the justificatory foundations for all such social behavior (metaethics).

At the substantive level the evolutionary ethicist’s usual point of departure was Darwin’s own suggested mechanism of change—the “natural selection” of the

“fittest” organisms in the struggle for existence—seeking to find an analogue in human conduct. Although this philosophy became known as Social Darwinism, its widespread popularity, especially in America, owed less to Darwin himself and more to the voluminous writings of his countryman Herbert Spencer, a notorious enthusiast for extreme libertarian *laissez-faire* social and economic policies.

In later writings Spencer tempered the harshness of his philosophy, seeing a definite role for cooperation in society, and this ambiguity about his real position led to his followers making contradictory claims, all in the name of the same philosophy. At one end of the spectrum there were supporters like the sociologist J. B. Sumner, who saw a place only for the success of the successful, and at the other end were American Marxists who saw in biology, as interpreted by Spencer, the true rules of moral conduct. Softer and more subtle forms of Social Darwinism tried to combine social responsibility with enlightened capitalism.

In this century the debt to Spencer is ignored and unknown, and the term Social Darwinism, burdened by history, is avoided. Nevertheless, particularly among biologists and politicians, the tradition has continued of seeking rules of conduct in what are believed to be the sound principles of the evolutionary process. At the beginning of the century there was the exiled Russian anarchist, Prince Peter Kropotkin, who argued that all animals are subject to a cooperating tendency toward “mutual aid” and that this can and will function once we dismantle the apparatus of the modern state. Later, the English biologist Julian Huxley became the first director general of UNESCO and based his policies on a biologically oriented religion of humanity directed toward the survival of the human species. And today we have the Harvard entomologist and sociobiologist Edward O. Wilson, who urges the preservation of the rain forests lest humans, who live in symbiotic relation with the rest of nature, fade and die. It is less than obvious, from a historical or conceptual point of view, that some of the more racist ideologies of this century owe much to evolutionary biology. The Nazis, for instance, shrank from the implication that all humans have a common origin, ultimately simian (although they were happy with the idea that within the human species there were biological differences).

Evolutionary ethics has long fallen from favor in philosophical circles, chiefly because of its supposed metaethical inadequacy. In his *Principia Ethica* (1903), G. E. Moore penned the classic critique, complaining that

systems like that of Spencer commit the “naturalistic fallacy,” trying to define the nonnatural property of goodness in terms of natural properties, in Spencer’s case the happiness supposedly produced by the evolutionary process. Psychologically, however, enthusiasts for evolutionary ethics find this critique most unconvincing. It is more effective to point to the earlier attack of Thomas Henry Huxley (Julian’s grandfather), who argued that systems deriving morality from evolution invariably rely on the hidden—and dubious—premise that evolution is in some sense progressive and that value is thus increased as one goes up the scale. Recently, with the increased biological interest in the evolution of animal social behavior (“sociobiology”), there has been renewed interest by philosophers in the possibility of fruitful connections between biology and morality. In his influential *A Theory of Justice*, John Rawls suggested that social contract theorists might explore fruitfully the possibility that in real life morality is end result of the evolutionary process rather than the construct of a hypothesized group of rational beings. Rawls drew attention to the similarities between his own beliefs in “justice as fairness” and the results of such sociobiological mechanisms as “reciprocal altruism.”

This position taken by Rawls and others is a naturalistic position on ethics. If the science fails, then so does the philosophy. Have we any reason to think that—even if we agree that a Rawlsian type of situation is that which could and would be maintained by selection—that this position would ever come into being? This position of Rawls is an option for intelligent agents rather than beings that are basically under the control of the genes and hence, in crucial respects, might not be planning at all for themselves. There are various ways in which one might start to approach the empirical questions. Much interest has been shown in our close relatives, the chimpanzees. Students of their behavior argue strongly that we do find actions strongly suggestive of cooperation that simulates the moral.
